Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Formatting table (continued)

Name	htmlArea icon	TinyMCE icon	Description
*New document			Creates a document without any formatting.
Non-breaking			Inserts a non-breaking space into the editor.
Numbered List			Applies or removes ordered list tags for the selected paragraphs. Select the arrow to choose a different number type.
Outdent			Removes indentation from the current or selected paragraphs, removing 30 px of left padding. **Note:** Padding can't be less than 0. Code reference: `padding-left`
*Page-break			Inserts a page-break into the editor.
*Remove format			Removes the formatting from the selected text.
*RTL (Right to Left)			Sets the directionality of contents to right to left.
Strike through			Applies strikethough formatting to the selected text.
*Subscript			Applies subscript formatting to the selected text.
*Superscript			Applies superscript formatting to the selected text.
Text Color			Applies text color to the selected text. Select the button to use the current color. Select **More Colors...** to view various color options and the hexadecimal codes.
Underline			Applies underline formatting to the selected text or current word. Keyboard shortcut: CTRL + U

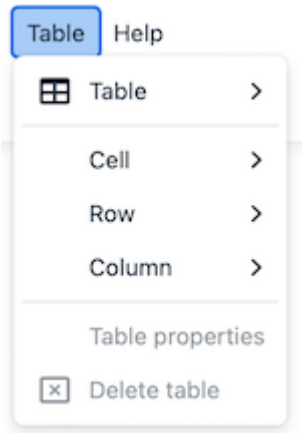
Highlight text in TinyMCE

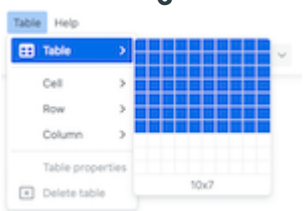
On the bottom bar of TinyMCE, the path of HTML tags for the text at the cursor position is displayed.

Click a tag in the path to highlight the text affected by the tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insert a line break in the HTML editor

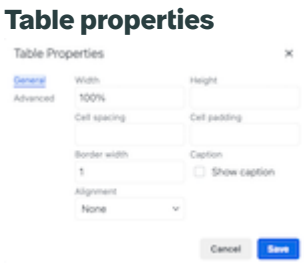


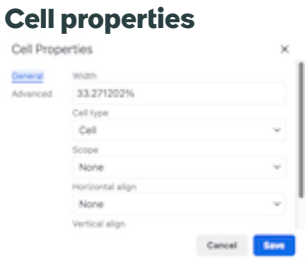


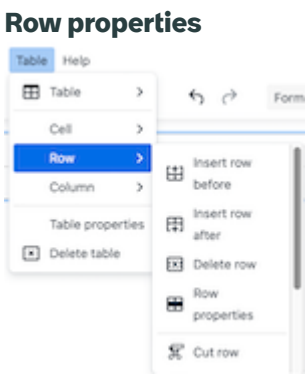
When you use the `Enter` key, the editor creates a paragraph element (`<p>`) tag, which appears as a double space.

To enter a single-line space, use the `Shift` + `Enter` key combination, which inserts a line break (`<br>`) tag.

Table functions in HTML field editor







TinyMCE version 8.3.0 uses menus and menu selections to create and edit tables.

TinyMCE version 8.3.0

UI element	Action
Table menu 	Select the table icon (⊞) to access the TinyMCE version 8.3.0 table menu. Use the table menu to: • Insert or delete a table • Modify table properties • Add, move, or delete rows and columns • Modify row and column properties • Split and merge cells
Table insert grid 	To insert a table in the HTML field, select **Insert table** and highlight squares in the grid to represent the desired number of rows and columns. Select the last highlighted square to insert the table. After you insert the table, you can modify the size by selecting and dragging the handles at the table edges.
Table of Contents 	The Table of Contents plugin generates a basic table of contents (ToC) and inserts it into the editor at the current cursor position. ToC entries are generated from header elements in the content.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TinyMCE version 8.3.0 (continued)

UI element	Action
	From the table menu, select the **Table properties** button to open the Table properties dialog box. From this menu, you can take any of the following actions: • General tab: ○ Set table width and height ○ Set cell spacing and padding ○ Enable borders and captions ○ Set the table alignment • Advanced tab: ○ Configure the table style ○ Select the border color ○ Select the background color
	With the cursor in the desired table cell, open the table menu and select **Cell properties**. From this menu, you can set the following properties for table cells: • General tab: ○ Width and height ○ Type and scope ○ Horizontal and vertical alignment • Advanced tab: ○ Cell style ○ Border color ○ Background color
	With the cursor in a table cell in the desired row, open the table menu and select **Row properties**. From this menu, you can set the following properties for rows: • General tab: ○ Row type ○ Alignment ○ Height • Advanced tab: ○ Row style ○ Border color ○ Background color

You can also paste tables into HTML fields from table-based editors.

Add a table to an HTML editor

Add and format an example table to a knowledge article using HTML field controls.

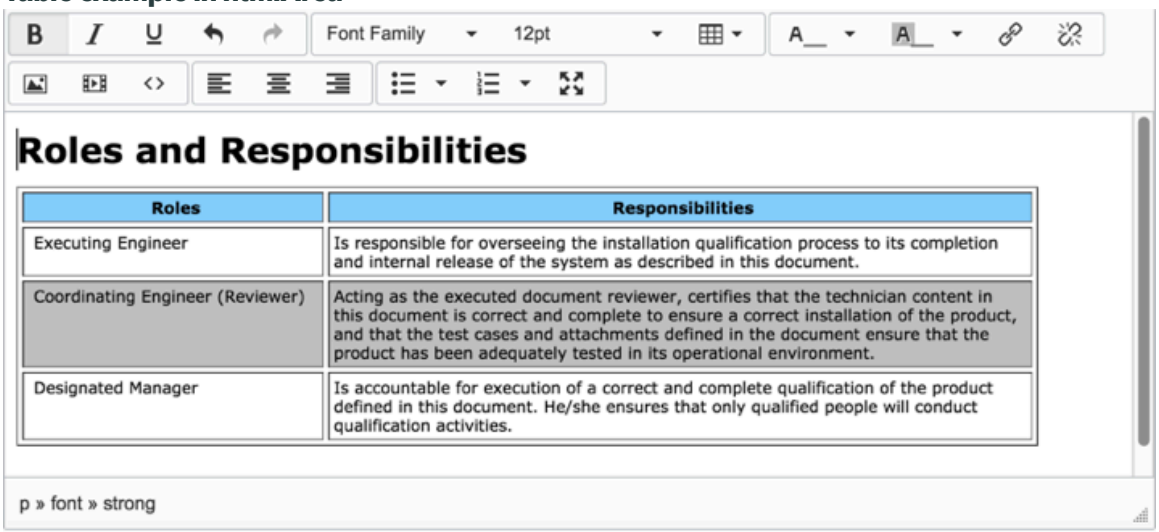
Before you begin

Role required: admin

About this task

In this task, you create and format a table in either htmlArea or TinyMCE v8.3.0. The resulting tables should look similar to one of the following images.

Table example in htmlArea



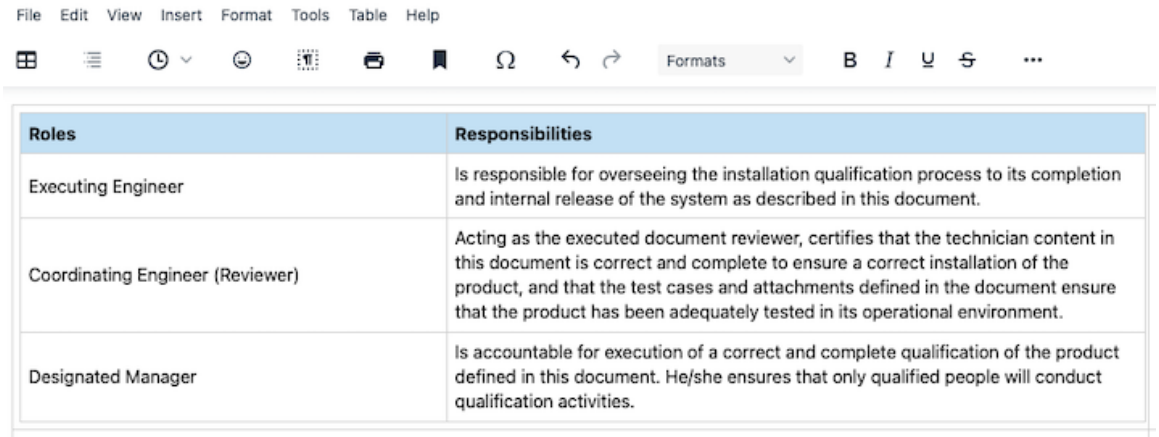


Table example in TinyMCE v8.3.0

If you enter alternative values for aspects such as width, cell spacing, cell padding, border, and alignment, the resulting table varies from the examples given.

Procedure

1. Navigate to **All** > **Knowledge** > **Edit** and select the knowledge article that you want to edit.
2. In the HTML field, position the cursor at the location where you want to add the table.
3. Select the table icon, select **Insert table**, and then select the number of rows and columns.
4. Edit the table properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Position your cursor in the table, select the table icon, and select **Table properties**.

b. Enter the following values on the **General** tab.

- Width: 75%
- Cell spacing: 3
- Cell padding: 3
- Border: 1
- Alignment: Left

c. On the **Advanced** tab, select the text field next to **Border color** and enter `Gray`.
The color picker box turns gray to indicate the color that you entered. You can also select the box and select the colors in the palette.

d. Select **Ok**.

5. Update the header table row.

a. Select the cells in the first table row, select the table icon, and select **Row** > **Row properties**.

b. Enter the following values on the **General** tab.

- Row type: Header
- Alignment: Center

c. On the **Advanced tab**, enter `#87cefa` in the text box beside **Background color** to set it to a light blue.

d. Select **Ok**.

6. Set the table cell properties.

a. Select all table cells in the first column except the cells in the header row.

b. Select the table icon and select **Cell** > **Cell properties**.

c. Enter the following values on the **General** tab:

- H Align: Left
- V Align: Top

d. Select **Ok**.

e. Repeat these steps for the table cells in the second column.

7. Set the background color of the middle row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Position your cursor in the middle table row, select the table icon, and select **Row** > **Row properties**.

b. On the **Advanced tab**, enter `Silver` in the text box beside **Background color** to set it to color #c0c0c0.

c. Select **Ok**.

d. Repeat this procedure for every other table row.

8. Set the width of the columns.

a. Select the first column of the table, select the table icon, and select **Cell** > **Cell properties**.

b. On the **General** tab, enter `30%` in the **Width** text field.

c. Select **Ok**.

9. Select and hold (or right-click) the form header and select **Save**.

10. Enter data in the table cells and then save the article.

Editing functions in HTML field editor

Several editing functions are built into TinyMCE.

You can add more edit functions to TinyMCE v8.3.0 using the *`glide.ui.html.editor.toolbar`* property and properties on the **UI Properties** page. For more information on configuring the edit functions, see Configure the HTML toolbar.

Editing functions

Name	Icon	TinyMCE v8.3.0 Icon	Description
Cut*			Cuts the selected text. Not supported in all browsers; use keyboard shortcut. Keyboard shortcut: CTRL + X
Copy*			Copies the selected text. Not supported in all browsers; use keyboard shortcut. Keyboard shortcut: CTRL + C
Find/ Replace			Enables you to replace the next (Replace) or all (Replace All) occurrences of a text string in the HTML field. Keyboard shortcuts: CTRL + F, Cmd + F
Paste*			Pastes the selected text. Not supported in all browsers; use keyboard shortcut. Keyboard shortcut: CTRL + V
Paste as Plain Text*			Enables you to paste as plain text without source formatting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Editing functions (continued)

Name	Icon	TinyMCE v8.3.0 Icon	Description
Paste from Word			Opens a new window that enables you to copy and paste content from Microsoft Word into the HTML field.
Undo*			Reverts the previous edit.
Redo*			Reapplies the last reverted edit.

Note: *These options aren't available with htmlArea.

Paste content into an HTML editor

Paste content from a desktop application to the HTML editor. Content might not paste the same from every application.

Before you begin

Role required: admin

Procedure

1. Navigate to an HTML field.
   For example, the **Text** field of a Knowledge article.
2. Paste the content from another application.
   Google Chrome and Mozilla Firefox don't support paste using the Paste icon. Use the command/control+V keyboard shortcut instead.
3. From the paste formatting options dialogue, choose to **Keep** or **Remove** the text formatting for the pasted content.

Result

The HTML editor has the following pasting limitations:

- Pasting images: Pasting images and text from OneNote works in Microsoft browsers. Pasting from OneNote into Google Chrome or Firefox works, but styles and images aren't included. You can still select images individually and paste them into the HTML field. Pasting images and text from Microsoft Word into any browser works as expected.
- Pasting tables: Pasting tables into Safari doesn't always work correctly. Pasting tables into Internet Explorer only works from Microsoft Excel.

Extended functions in HTML field editor

The extended functions available for working with HTML content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extended functions

Name	HTML Icon	TinyMCE v8.3.0 Icon	Description
Accordion*			Executes the `InsertAccordion` command, adding an Accordion element at the current location.
Add character map*			Inserts a special character at the current cursor location. Select the button to view a list of available characters. Point to a character to view the name and HTML code. Select a character to insert it.
Anchor*			Inserts an anchor into the editor.
Cleanup Messy Code			Fixes standard HTML errors for the selected text, such as invalid tags. Selecting this button might change the layout of existing content. If you don't like the results, you can select **Undo** to revert this action.
Edit HTML Source/ Code	HTML		Opens HTML source code in a separate window. See Editing in HTML Source Mode.
Emoticons*			Opens the Emojis dialog.
Insert date/time*			Inserts the current date and time into the editor.
Insert/Edit Embedded Media			Embeds a video from the video library or an attachment. You can also add videos to the video library with this feature. To learn more, see Embedding Video in HTML Fields.
Insert/Edit Image			Inserts an image from the image library or an attachment. You can also add images to the image library with this feature. To learn more, see Embedding Images in HTML Fields.
Insert/Edit Link			Configures a link for the selected text. You can define the link URL, title (additional information that appears in the tooltip), and the target (same window or new window or tab). Code reference: `<a>`
Insert Horizontal Line			Inserts a horizontal line at the current location.
Preview*			Opens a preview of the HTML field in a separate window without saving changes.
Print*			Prints the current document.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extended functions (continued)

Name	HTML Icon	TinyMCE v8.3.0 Icon	Description
Remove link*			Removes the current hyperlink.
Spell Checker			Checks the spelling of text in the HTML field. **Note:** Spell Checker is only available in the htmlArea editor.
Toggle Full Screen Mode*			Expands the HTML field to use the full form view. Select the button again to return to standard form view. **Note:** This feature is available only for the htmlArea editor and isn't available for Internet Explorer.
Visual blocks*			Toggles block visibility on or off.
Visual chars*			Shows or hides invisible elements in the article, such as collapsed table borders.

Note: *These options aren't available with htmlArea.

Embed images in the HTML editor

You can use the HTML field image picker to embed images into HTML fields, and to add images to the image library.

Before you begin

Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and embed an image in it.

About this task

Note: Administrators and users with the image_admin role manage the image library at **System UI** > **Images**. See Storing images in the database .

Procedure

1. Open the form that contains the HTML field.
2. Click the position where the image is to appear, or to modify an existing image, click the image.
3. Click the insert/edit image icon ( ) on the HTML editor toolbar.
4. In the Insert/Modify image form, enter information in each field.

Insert/Modify Image form

Field	Description
Type	Select the image type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Image Library**: Images stored in the db_image table. You can reuse images in the image library in multiple locations. ○ **Attachment**: Available in the current record only
Image	Begin typing a file name and select an image from the list, or click the reference lookup icon and select an image. To upload a new image, click **New**, click **Choose File**, locate the image, and click **Upload**. If you chose the **Attachment** type, click **Choose File**, locate the image, and click **Attach**.
Tooltip	Enter alternate text that appears when a user points to the image.
Alt	Enter alternate text that can be used to improve accessibility. For example, it could be used with a screen reader. If this field is left blank, it defaults to the text entered in the **Tooltip** field.

Note: To resize an embedded image, click the image. The sizing frame appears. Drag a sizing point until the image is the desired size. Corner points adjust the size proportionally. Depending on your browser, you may need to highlight the image before the sizing frame appears.

5. **Optional:** To provide additional control over the appearance of an image, click **Advanced options**.

Advanced options

Field	Description
Layout	Select the image **Alignment** (default is **Baseline**) and enter the **Border thickness**.
Spacing	Enter the number of **Horizontal** and **Vertical** pixels around the image.
Size	Enter the **Width** and **Height** of the image (in pixels).

6. Click **OK**.
7. **Optional:** Paste an image into the HTML editor.
   To edit the image, save the entry then select the image. Click the insert/edit image icon and complete the form using the same tables for adding an image.

   (Optional) Pasted images are saved in the system as attachments.

Link a website in HTML editor

You can insert a link to a website in an HTML field.

Before you begin

Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and link to a website in the article text.

Procedure

1. Move the cursor to the position where the link is to appear.
2. Select the insert/edit link icon (🔗) in the HTML toolbar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter information in each field.

Insert/Edit Link form

Field	Description
URL	Enter the URL for the link. Copying and pasting is usually the easiest method.
Text	Enter the text you want to display for the link.
Target	Select the target window for the URL. For files, the **None (use implicit)** selection is generally the best choice. However, if you're linking to a complete web page, choose **New window (_blank)** so the browser opens the link in a new tab or window.

4. Select **OK** to insert the link into the field.

Embed videos in the HTML editor

You can insert videos into HTML fields. You can also add videos to the video library using the HTML Insert/Modify Video form.

Before you begin

Note: The Videos [db_video] table is a public table that does not have any security restrictions. Unauthenticated users have full access to videos uploaded to the db_video table.

Role required: The role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and embed a video in it.

About this task

The following file formats are supported in the base system.

- MPEG-4 video `.mp4`
- WebM Video `.webm`

The larger the file size, the longer it takes to download before the video starts. To reduce file size, you can reduce the bit rate, but doing so reduces the quality of the video. The following bit rates optimize download speed and video quality:

Video resolution	Recommended bitrate
Standard definition (480p)	1.5–2.5 megabits per second (mbps)
High definition (720p)	3–5 mbps
High definition (1080p)	6–8 mbps

Note: For the best viewing experience the following specifications are suggested:

Optimal viewing settings

Type	Definition
Size	20MB
Bit rate	320KBPS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Optimal viewing settings (continued)

Type	Definition
Resolution	480*320

Internet Explorer and Safari have difficulty streaming videos uploaded to the database. Attach a file rather than embedding if you intend to use one of these browsers or an unsupported file type. For more information on attaching files, see Add and manage attachments.

Note: Administrators and users with the image_admin role can manage the video library at **System UI** > **Videos**.

Procedure

1. Open the form that contains the HTML field.
2. Click the position where the video is to appear, or to modify an existing video, click the video.
3. Click the insert/edit video icon ( ) on the HTML editor toolbar.
4. Enter information in each field.

Insert/Modify Video

Field	Description
Type	Select the video type. ○ **Video Library**: List of videos stored in the db_video table. You can reuse it. ○ **URL**: from an external source ○ **Attachment**: available in the current record only For an attachment or video library file, select a video from the list or click **New**. For an external URL, enter the URL.
Size	Enter the **Width** and **Height** of the video in pixels.

5. Click **OK**.

Define video file types for HTML fields

You can define the types of video files that can be added to HTML fields.

Before you begin

Role required: image_admin

About this task

Users can add videos to HTML fields. By default, users can add one of the following types of videos to HTML fields: `.mp4`, `.webm`, and `.swf` video file types. You can inactivate video types that you do not want to allow users to add, or add new video types. `.swf` files are only minimally supported. `.mp4` files might be limited by browser type.

Note: By default, the HTML Sanitizer removes videos from HTML fields. To allow video file types, see Embed videos in the HTML editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System UI** > **Embed Object Types**.
2. To deactivate a video type, set the **Active** field to **false**.
3. To add an additional video type, click **New** and complete the form.

> **Note:** If you specify values for the **Codebase** or **Pluginspage** fields, which instruct the browser where to get the plugin, point to `https` pages to avoid warnings from Internet Explorer about unsecure content on the page.

Disable user access to the image library for HTML area

By default, users can use and upload images to the image library from an HTML field. You can disable access to the image library from HTML fields. This is only applicable to HTML area and not TinyMCE.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **UI Pages**.
2. Select **html_insert_image_dialog**.
3. Locate the following lines of code in the **HTML** field and comment them out.

```
<g:evaluate var="jvar_use_dbimage">
 var imageGR = new GlideRecord('db_image');
  if(imageGR.isValid())
  imageGR.canRead();
</g:evaluate>
```

and

```
<j:if test= "${jvar_write_dbimage}">
    <j:set var = "jvar_default_insert_image_type" value =
 "dbimage" />
    <g:ui_select_option text = "${gs.getMessage('Image
 Library')}" value = "dbimage" selected =
 "${jvar_default_insert_image_type}" />
</j:if>
```

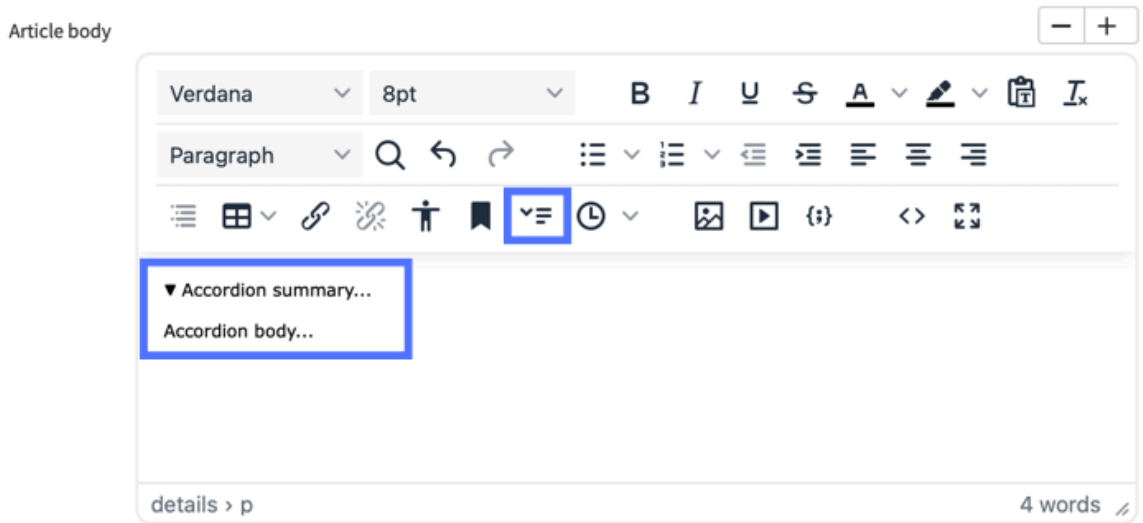
4. Select **Update**.

What to do next
To remove the **Upload from URL** option in the HTML editor, add a new property named *`glide.ui.html.image.allow_url`* and set the **Value** to **false**.

Related topics

Add a system property

Configure accordion in TinyMCE HTML editor



You can enable the accordion on the TinyMCE HTML editor in both CoreUI and workspaces. When enabled, the accordion button appears on the HTML editor and can be used to expand/collapse content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Add an accordion to the TinyMCE HTML editor.
   a. Navigate to **All** > **System Properties** > **UI Properties**.
   b. Locate the system property, **glide.ui.html.editor.toolbar**.
   c. Add an accordion as an option in the **value** field.
   d. Select **save**.
2. Use accordion in TinyMCE HTML editor.
   a. Verify you have the role necessary to update the record that contains the HTML field.

      For example, any user with a role can create a knowledge article and embed an image in it.
   b. Open the form that contains the HTML field.
   c. Select the accordion button on the toolbar.
   d. Add the accordion summary and body.

   e. Select the accordion to expand and collapse the content.

Configuring the TinyMCE toolbar via Dictionary attributes
You can configure the TinyMCE HTML editor for a specific table by configuring the dictionary attributes.

Change the TinyMCE default toolbar
Set the toolbar items in your system properties to enable or disable throughout Workspace.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Update the **Configures the editing toolbar for HTML fields(TinyMCE v8.3.0)** (glide.ui.html.editor.toolbar) property to add or remove buttons for the toolbar.

   Note: Use a vertical bar ("|") to add a section separator.

Type	Buttons
Default buttons	`bold italic underline undo redo | fontfamily fontsize table | forecolor backcolor link unlink | image media code | alignleft aligncenter alignright | bullist numlist fullscreen`
Available buttons	`newdocument, bold, italic, underline, strikethrough, justifyleft, justifycenter, justifyright, justifyfull, blocks, fontfamily, fontsize, tablecontrols, cut, copy, paste, pastetext, pasteword, search, replace, bullist, numlist, outdent, indent, blockquote, undo, redo, link, unlink, image, cleanup, code, forecolor, backcolor, removeformat, hr, visualaid, sub, sup, charmap, media, preview, fullscreen, accordion`

3. Select **Save**.

Change the TinyMCE toolbar for a specific table

Set the attributes in the TinyMCE dictionary to determine which TinyMCE attributes show in a specific table.

Before you begin

Role required: admin

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. In the Related Links section, select **Advanced View**.
4. In the **Attributes** field, input `editor.toolbar=` followed by the desired toolbar buttons.
   For example, `editor.toolbar=blocks|bold italic underline strikethrough blockquote subscript superscript removeformat| bullist numlist outdent indent|undo redo|table hr|link unlink| image media code|visualblocks preview fullscreen`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Include all the toolbar items that you want displayed, not just the toolbar items you want to add.
- The configurations made to a field's Attribute field on the associated Dictionary record overrides the value of the System Property glide.ui.html.editor.toolbar.
- Multiple attributes, such as height, toolbar buttons, and toolbar plugins, can be combined within the Attributes field. For example, `editor.height=300,editor.plugins=table colorpicker textcolor link image media codemirror lists advlist fullscreen charmap directionality emoticons hr insertdatetime nonbreaking pagebreak print searchreplace wordcount anchor codesample visualblocks visualchars compat3x autolink align_listitems,editor.toolbar= fontfamily fontsize | bold italic underline strikethrough forecolor backcolor pastetext removeformat | blocks searchreplace undo redo | bullist numlist outdent indent alignleft aligncenter alignright | tableofcontents table link unlink image media codesample | code fullscreen`.

5. Select **Update**.

Change TinyMCE plugins for a specific table

Set the attributes in the TinyMCE dictionary to enable or disable plugins in a specific HTML field.

Before you begin

Role required: admin

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. In the Related Links section, select **Advanced View**.
4. In the **Attributes** field, input `editor.plugins=` followed by the desired plugins, separated with a space.

   For example, `editor.plugins=table colorpicker textcolor link image media codemirror lists advlist fullscreen charmap directionality emoticons hr insertdatetime nonbreaking pagebreak print searchreplace wordcount anchor tableofcontents codesample visualblocks visualchars compat3x autolink align_listitems`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Include all the toolbar items that you want displayed, not just the toolbar items you want to add.
- The configurations made to a field's Attribute field on the associated Dictionary record overrides the value of the System Property glide.ui.html.editor.toolbar.
- Allowed plugins include: advlist align_listitems anchor autolink autoresize bbcode charmap codemirror codesample colorpicker directionality emoticons fullscreen hr image insertdatetime link lists media nonbreaking pagebreak preview print readonlynoborder searchreplace table textcolor tableofcontents visualblocks visualchars wordcount
- Multiple attributes, such as height, toolbar buttons, and toolbar plugins, can be combined within the Attributes field. For example, `editor.height=300,editor.plugins=table colorpicker textcolor link image media codemirror lists advlist fullscreen charmap directionality emoticons hr insertdatetime nonbreaking pagebreak print searchreplace wordcount anchor codesample visualblocks visualchars compat3x autolink align_listitems,editor.toolbar= fontfamily fontsize | bold italic underline strikethrough forecolor backcolor pastetext removeformat | blocks searchreplace undo redo | bullist numlist outdent indent alignleft aligncenter alignright | tableofcontents table link unlink image media codesample | code fullscreen`.

5. Select **Update**.

Change the default height of an HTML field

Change the default height of a specific HTML field to expand the size of a journal field.

Before you begin

Role required: admin

About this task

HTML field height is configured per HTML field.

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. In the Related Links section, select **Advanced View**.
4. In the **Attributes** field, enter `editor.height=X`, where X is the desired height.
   For example, `editor.height=250`

   Note:

   HTML fields can range from 72 to 2000. HTML fields are by default 64.

5. Select **Update**.
6. To configure the height of form fields dynamically as the text line increases rather than providing a specific height, complete the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **System Properties** > **All Properties**

b. In the search bar, enter `glide.ui.html.editor.enabled_plugins` and select the property.

c. In the value field, add `autoresize`.

d. Select **Update**.
The autoresize plugin is active.

Change the default font size of an HTML field

Change the default font size of a specific HTML field to use a standard font size across forms.

Before you begin
Role required: admin

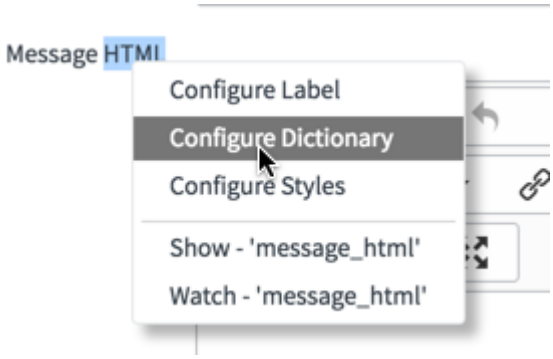
About this task
HTML font size is configured per HTML field.

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (for example, Article body) and select **Configure Dictionary**.
3. Select the Default Value tab.
4. In the **Default value** field, enter `<p style="font-size:X;"></p>`, where X is the default value.
   For example:
   - To set the font to large, enter `<p style="font-size:large;"></p>`
   - To set the size to 10, enter `<p style="font-size:10pt;"></p>`
5. Select **Update**.

Configure TinyMCE to allow deprecated tags

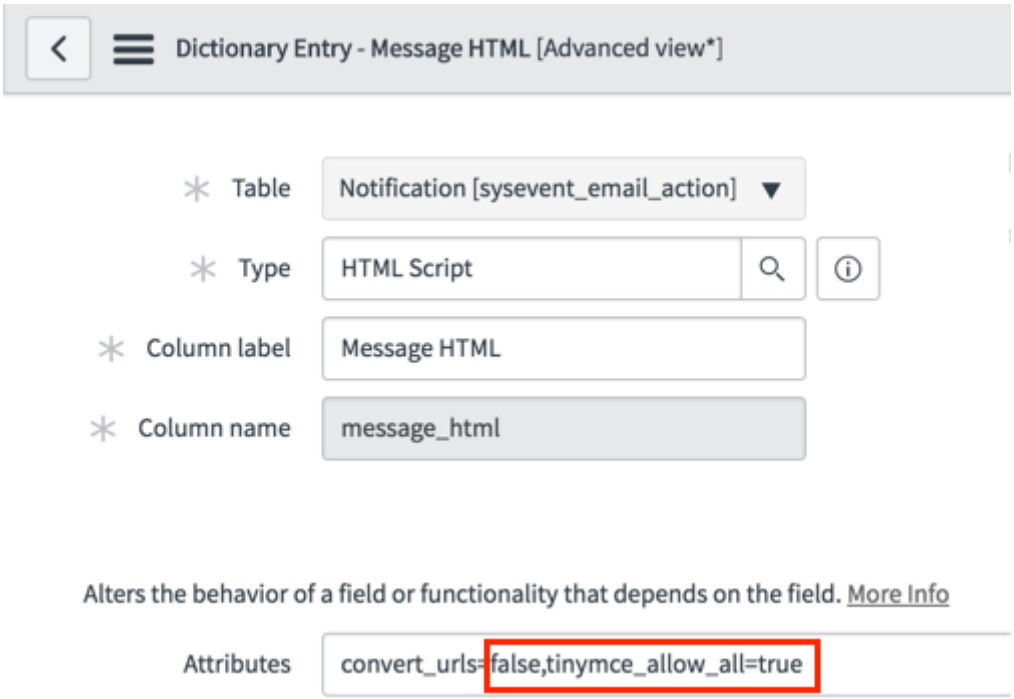
You can set a dictionary attribute on a TinyMCE field to allow the use of deprecated HTML tags, such as <b> and <i>. By default, TinyMCE uses the and tags for bold and italic formatting.



Before you begin
Role required: personalize_dictionary or admin

About this task
After you set the dictionary attribute, use code view to manually enter deprecated tags. The editor does not validate any tags you enter manually, for example, if you type an incorrect character.

Procedure



1. Navigate to the form with an HTML field that uses TinyMCE.
2. Right-click the HTML field label and select **Configure dictionary**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Attributes** field, enter `tinymce_allow_all=true`, separated by a comma if needed.

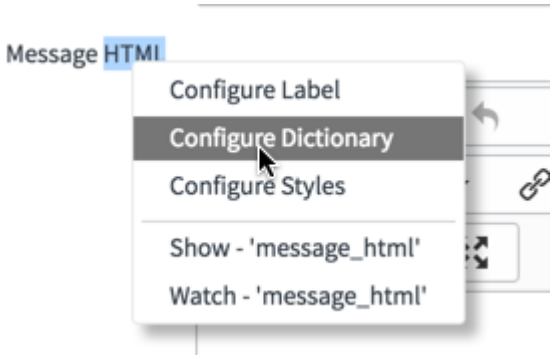
   Dictionary entry attributes can only be added to when the dictionary entry form is in advanced view, as they are not shown in default view.

   If other attributes are already listed, use a comma as a separator.

4. Select **Update**.

Configure TinyMCE to allow JavaScript in URLs

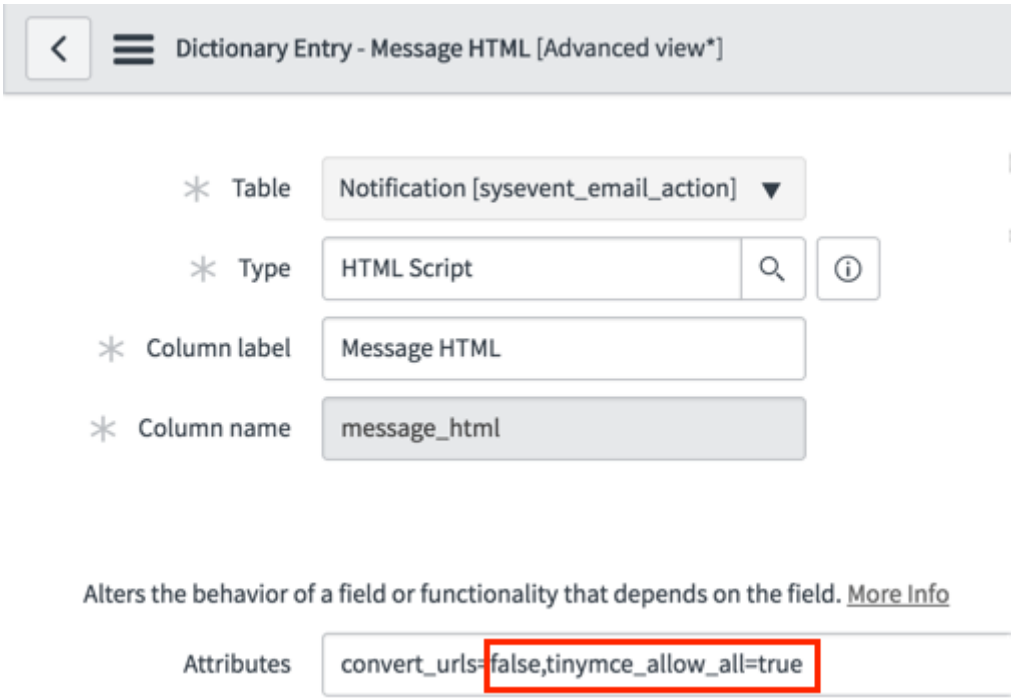
You can set a dictionary attribute on a TinyMCE field to allow the use of JavaScript in a URL.



Before you begin

Role required: personalize_dictionary or admin

Procedure



1. Navigate to the form with an HTML field that uses TinyMCE.
2. Right-click the HTML field label and select **Configure dictionary**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Attributes** field, enter `tinymce_allow_script_urls=true`, separated by a comma if needed.

   Dictionary entry attributes can only be added to when the dictionary entry form is in advanced view, as they are not shown in default view.

   If other attributes are already listed, use a comma as a separator.

4. Select **Update**.

Configure the menu bar on the TinyMCE HTML editor

You can enable the menu bar on the TinyMCE HTML editor in both CoreUI and workspaces. When enabled, the menu bar appears on the top of the HTML editor which can be used to create, edit and format content. By default, the menu bar is inactive. You can enable it for a specific table via dictionary attribute configuration.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to a record with an HTML-type field that you want to change.
2. Right-click the field label and select **Configure Dictionary**.
3. In the Related Links section, select Advanced View.
4. In the Attributes field, input `editor.config=new TinymceConfigScript().getConfiguration()`.

   This editor.config attribute points to a script: TinymceConfigScript().

5. Access the **TinymceConfigScript**.

   a. Navigate to **All** > **System Definition** > **Script Includes**.

   b. Enter `TinymceConfigScript` in the search bar near the top of the form, and select **enter** or **return**.

   c. Select **TinymceConfigScript**.

   You will be able to see the following script by default.

```
var TinymceConfigScript = Class.create();
TinymceConfigScript.prototype = {
    initialize: function() {
    },
    setTinymceConfig: function() {
    var tinyConfig = {
        menubar: 'edit format',
        menu: {
            file: { title: 'File', items: 'importword
 exportpdf exportword | print | deleteallconversations' },
            edit: { title: 'Edit', items: 'undo redo | cut
 copy paste pastetext | selectall | searchreplace' },
            view: { title: 'View', items: 'code
 revisionhistory | visualaid visualchars visualblocks |
 spellchecker | preview fullscreen | showcomments' }
        },
        style_formats: [
            { title: 'Headings', items: [
                { title: 'Heading 1', format: 'h1' },
                { title: 'Heading 2', format: 'h2' },
                { title: 'Heading 3', format: 'h3' },
                { title: 'Heading 4', format: 'h4' },
                { title: 'Heading 5', format: 'h5' },
                { title: 'Heading 6', format: 'h6' }
            ]},
            { title: 'Inline', items: [
                { title: 'Bold', format: 'bold' },
                { title: 'Italic', format: 'italic' },
                { title: 'Underline', format: 'underline' },
                { title: 'Strikethrough', format:
 'strikethrough' },
                { title: 'Superscript', format:
 'superscript' },
                { title: 'Subscript', format: 'subscript' },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                { title: 'Code', format: 'code' }
            ]},
            { title: 'Blocks', items: [
                { title: 'Paragraph', format: 'p' },
                { title: 'Blockquote', format:
 'blockquote' },
                { title: 'Div', format: 'div' },
                { title: 'Pre', format: 'pre' }
            ]},
            { title: 'Align', items: [
                { title: 'Left', format: 'alignleft' },
                { title: 'Center', format: 'aligncenter' },
                { title: 'Right', format: 'alignright' },
                { title: 'Justify', format: 'alignjustify' }
            ]}
        ]
    };
    return tinyConfig;
},
getConfiguration: function() {
    var config = this.setTinymceConfig();
    answer = JSON.parse(JSON.stringify(config));
},

    type: 'TinymceConfigScript'
};
```

d. Set the menu bar attribute to **true** in the script to enable the menu bar.
This will enable these options in the menu bar: File, Edit, View, Insert, Format, and Table.

e. If you want to disable the menu bar set the menu bar attribute to **false**.

f. If you only want to enable specific options on the menu bar, you can change the script by listing those specific options in the menu bar.

For example, menu bar: 'file edit format' so that only these 3 options appear on the menu bar.

g. You can also configure the buttons that display within a menu by changing the script.

```
tinymce.init({
    selector: 'textarea', // change this value according to
 your HTML
    menu:{
        file: { title: 'File', items: 'newdocument
 restordraft | preview | importword exportpdf exportword |
 print | deleteallconversations' },
        edit: { title: 'Edit', items: 'undo redo | cut copy
 paste pastetext | selectall | searchreplace' },
        view: { title: 'View', items: 'code revision history
 | visualaid visualchars visualblocks | spellchecker |
 preview fullscreen | showcomments' },
        insert: { title: 'Insert', items: 'image link media
 addcomment pageembed codesample inserttable | math | charmap
 emoticons hr | pagebreak nonbreaking anchor tableofcontents
 | insertdatetime' },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        format: { title: 'Format', items: 'bold italic
 underline strikethrough superscript subscript codeformat
 | styles blocks fontfamily fontsize align lineheight |
 forecolor backcolor | language | removeformat' },
        tools: { title: 'Tools', items: 'spellchecker
 spellcheckerlanguage | a11ycheck code wordcount' },
        table: { title: 'Table', items: 'inserttable | cell
 row column | advtablesort | tableprops deletetable' },
        help: { title: 'Help', items: 'help' }
    }
});
```

6. Configure custom style format options in the TinyMCEConfigScript by appending the CSS in the style_formats section.

   Example of style_formats section of the TinyMCEConfigScript:

```
style_formats: [
  { title: 'Headings', items: [
    { title: 'Heading 1', format: 'h1' },
    { title: 'Heading 2', format: 'h2' },
    { title: 'Heading 3', format: 'h3' },
    { title: 'Heading 4', format: 'h4' },
    { title: 'Heading 5', format: 'h5' },
    { title: 'Heading 6', format: 'h6' }
  ]},
  { title: 'Inline', items: [
    { title: 'Bold', format: 'bold' },
    { title: 'Italic', format: 'italic' },
    { title: 'Underline', format: 'underline' },
    { title: 'Strikethrough', format: 'strikethrough' },
    { title: 'Superscript', format: 'superscript' },
    { title: 'Subscript', format: 'subscript' },
    { title: 'Code', format: 'code' }
  ]},
  { title: 'Blocks', items: [
    { title: 'Paragraph', format: 'p' },
    { title: 'Blockquote', format: 'blockquote' },
    { title: 'Div', format: 'div' },
    { title: 'Pre', format: 'pre' }
  ]},
  { title: 'Align', items: [
    { title: 'Left', format: 'alignleft' },
    { title: 'Center', format: 'aligncenter' },
    { title: 'Right', format: 'alignright' },
    { title: 'Justify', format: 'alignjustify' }
  ]}
]
```

   Example with three new style formats added (Bold text, Red text, My-inline):

```
tinymce.init({
  selector: 'textarea',  // change this value according to your
 HTML
  style_formats: [
    { title: 'Bold text', inline: 'b' },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    { title: 'Red text', inline: 'span', styles: { color:
 '#ff0000' } },
    { name: 'my-inline', title: 'My inline', inline: 'span',
 classes: [ 'my-inline' ] }
  ],
  // The following option is used to append style formats
 rather than overwrite the default style formats.
  style_formats_merge: true
});
```

Access the HTML editor and you will see that the new custom style formats (Bold text, Red text, My-inline) appear in the formats section of the menu bar.

Image field type

Image fields enable you to add images to forms.

Before you begin

Role required: personalize_form

About this task

For example, you can add portraits to the user records in your system. The image type must be `.gif`, `.jpg`/`.jpeg`, or `.png`.

Image resizing is defined by the CSS. Larger images are resized to 250 pixels. For most browsers, the larger of the height and width measurements is reduced to 250 pixels and the proportion of the image is maintained. For example, an image with a size of 1508 x 663 pixels is resized to 250 x 110 pixels. Some browsers resize both the height and width measurements to 250 pixels, resulting in a square image.

You can add a new image field.

Procedure

1. Open the desired form.
2. Create a new field with the **Type** set to **Image**.
   For instructions, see Add and customize a field in a table.
3. Add the new field to the form and save your customization.
   The form displays the new blank image field.
4. Click **Click to add** in the image field, select an image to upload, and click **OK**.
   The selected image is attached to the form and displayed in the image field.

Configuring the form layout

IP address field type

The **IP Address (Validated IPV4, IPV6)** [ip_addr] field type stores valid IPv4 and IPv6 addresses.

Support for IPv4 and IPv6

Standard dot-decimal notation is supported for IPv4 and standard hex notation is supported for IPv6. For IPv6, you can use canonical notation to compress zeros. Familiarize yourself with IETF RFC5952 for examples and guidelines on text representation for IPv6 addresses.

The following are examples of valid IP addresses:

- **A standard IPv4 address in dot-decimal notation**:

  `10.34.51.20`

- **An expanded IPv4 address would be zero padded**:

  `10.1.10.210` would be represented as `010.001.010.210`

- **An IPv6 address in fully expanded notation**:

  `1507:f0d0:1002:0051:0000:0000:0000:0004`

- **The same IPv6 address above using the canonical notation**:

  `1507:f0d0:1002:51::4`

How IP addresses are stored in the database

The IP address `ip_addr` field is a Variable Character (VARCHAR) field with a length of 40 characters. The values are normally stored in standard (dot-decimal or canonical) notation for both IPv4 and IPv6 addresses regardless of the notation you use when you input values in the field.

For example, if you enter an IPv6 address in a non-canonical format (expanded or any other valid formats per IETF RFC5952), by default, the system will store it in canonical format unless an IP Data Control attribute value is defined on that column with a different address format. See the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[ip_data_control] glide attribute section in Altering tables and fields using dictionary attributes for more details.

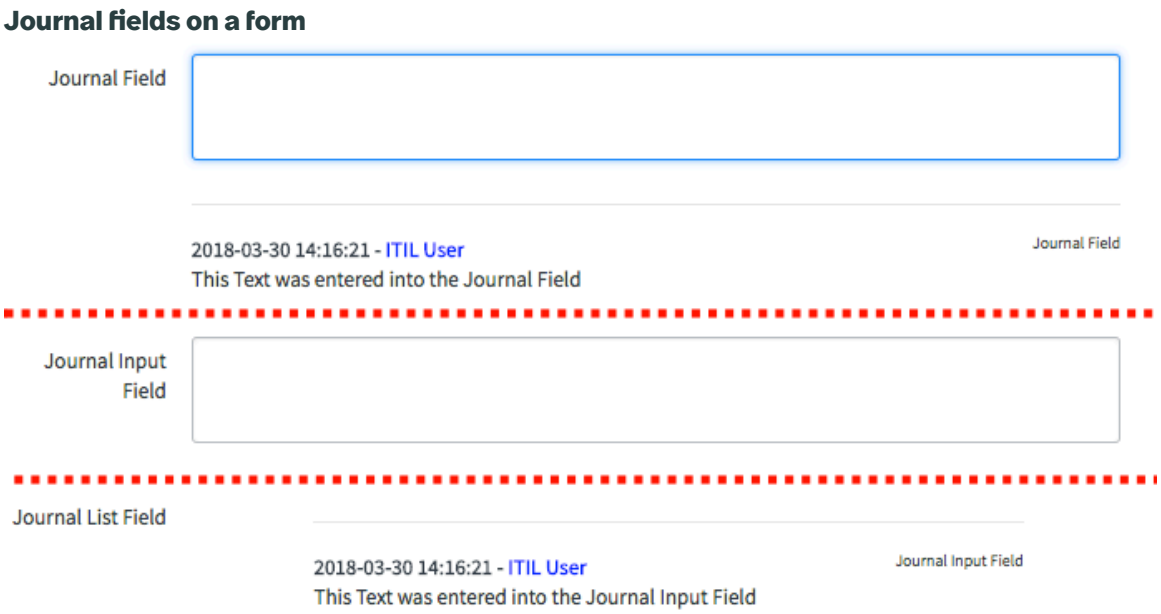
Support for data migration

Provide support in migrating IP addresses stored as string fields to the new **IP Address(Validated IPV4,IPV6)** type. The new IP address type accepts only a valid IP address. The existing data is formatted according to the ip_data_control attribute. The ip_data_control attriute can be set to exactly one of the following four values:

- *canonical*: Incoming IP addresses are validated and canonicalized before they are entered in the database. Invalid IP addresses are rejected.
- *canonicalize_when_possible*: Valid IP addresses are canonicalized before before being entered in to the database. Invalid IP addresses are also entered in to the database without being changed.

  Note: *canonicalize_when_possible* is the default value for the ip_data_control attribute, unless it's otherwise specified.

- *expanded*: The IP addresses are validated and stored in an expanded form to support efficient database range queries. Invalid IP addresses are rejected.
- *none*: No validation or normalization is performed in this value type. It is used only as an emergency mechanism as it essentially reverts this type to a plain string field.



Journal field type

There are three types of journal field: journal, journal_list, and journal_input.

Journal field types

Journal field types	Description
journal	Allow and store input, and display the combined inputs below the input box. Journal fields display in the activity stream in the form and in the list view.
journal_input	Allow and store input, but do not display the combined inputs. Journal input fields only display with the record they are associated with, so they do not display in the activity stream on the list view.
journal_list	Do not allow or store input; they merely display the contents of other Journal fields upon which the journal_list field is dependent. If a journal_list field is dependent on more than one Journal field, it will chronologically interweave those fields' inputs. The journal_list field does not display content within the activity stream, but rather in a separate block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example image contains the three available journal field types. The first is a journal field, with its inputs displayed below the field. The second is a journal input field, which does not show its previous inputs. The third is Journal list field, which is configured to show the input from the journal input field above it.

Restricting journal entries sent in a notification

Administrators can control the number of journal entries notifications include with the following system property.

Property	Label	Description
glide.email.journal.lines	Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all).	Specifies the number of entries from a journal field (such as **Additional comments** and **Work notes**) included in email notifications. A value of -1 includes all journal entries. • Type: integer • Default value: 3 • Location: System Properties > Email

Code for getting the contents of a journal field into an array

To put the contents of a journal field into an array so that you can iterate through each entry, you can use the code in this page.

```
var notes = current.work_notes.getJournalEntry(-1);
//gets all journal entries as a string where each entry is
 delimited by '\n\n'
var na = notes.split("\n\n");

//stores each entry into an array of strings
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 for (var i = 0; i < na.length; i++)
  gs.print(na[i]);
```

Journal field script values

The *setValue()* method is not supported for journal fields. Instead, assign values in script as in the following example.

```
var now_GR = new GlideRecord('incident');

//query priority 1 incidents in the state of either 'new' or
 'active'.
gr.addQuery('priority', 1);
var gc = gr.addQuery('state', 1);
gc.addOrCondition('state', 2);
gr.query();

while(gr.next())
{

//print a list of the incident numbers updated
gs.print(gr.number);

//add an entry to the 'work notes' journal field for each
 incident
gr.work_notes = "This is a high-priority incident. Please
 prioritize.";
gr.update();
}
```

Render journal field entries as HTML

Journal fields can render text enclosed within code tags as HTML.

Before you begin

- Role required: any role that grants write access to a journal field
- System property: the glide.ui.security.allow_codetag is set to the default value of **true**

> **Note:**
>
> To learn more about this property, see Allow JavaScript tags in embedded HTML (instance security hardening) in Instance Security Hardening Settings.

About this task

By default, a High Security Setting escapes any HTML code you type in a journal field by replacing it with its equivalent HTML entity value. Escaping causes the system to display HTML code as text rather than forwarding it to the browser as rendering instructions.

Procedure

1. Enter `[code]` `[/code]` tags around any code you want to render as HTML.

> **Note:** A single journal entry can contain multiple code tags as long as each code tag has a beginning and ending tag.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
For example, enter these lines:

Results of entering HTML code

Code entered	Result
`[code]<a href="http://www.service-now.com">ServiceNow</a>[/code]`	The system renders a hyperlink to the ServiceNow web site.
`[code]<b>This text will be bold.</b>[/code]`	The system renders the sentence in bold.
`<b>This text will not be bold.</b>`	The system escapes the bold tags and renders them as text.
`[code]<script>gs.info(gs.getUserDisplayName());</script>[/code]`	The system escapes the content of the script tag. **Note:** By default, the HTML Sanitizer prevents the entry of <script> elements.

For more examples of HTML formatting options, see the blog post Formatting within Journal fields using HTML & [code] by a ServiceNow Technical Support Engineer in the ServiceNow Community.

2. Click **Post**.

Note: You cannot edit previous journal entries.

Result
The system renders the text within code tags as HTML.

General security settings properties

HTML sanitizer

Restrict the CODE tag in journal fields

You can prevent journal fields from rendering HTML code by disabling support for the `[code]` tag.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Clear the check box for **Allow support for embedding HTML code by using the [code] tag** (the *glide.ui.security.allow_codetag* property).

Note: To learn more about this property, see Allow embedded HTML code (instance security hardening) in the Instance Security Hardening Settings.

3. Click **Save**.

Journal field display limits

Journal fields can greatly increase the size of task records because they allow users to enter very large string values.

Display limits prevent the instance from loading the entire journal field into memory. Administrators have the option to:

- Set the length at which journal fields stop displaying the entire field's contents and instead only display a portion (called a preview) of the field's contents. Users can still access the field's entire contents by clicking a **Show All** button.
- Set the size of the preview text the journal field displays.
- Set the maximum number of journal entries journal fields can display.

In Core UI, journal fields and the activity formatter must be in the same form section. You cannot place another field in between a journal field and the activities formatter. The Activity Stream is built to keep journal fields stacked on top of the activity formatter.

Note: Journal field display limits are not supported in the legacy **Comments and Worknotes** field.

Set the maximum display size for journal fields

You can set the maximum display size for journal fields by adding a system property.

Before you begin
Role required: admin

About this task
When a journal field exceeds the length set in this property, the instance shows a preview of the journal field instead of the field's entire contents. The preview includes a **Show All** button to display the rest of the field's contents. A separate property determines the number of characters the preview displays.

Procedure
1. Add a system property with the following settings.

Property	Value
Name	glide.max_journal_list_size
Description	Size in megabytes when a journal field should display a preview rather than the field's entire contents.
Type	Integer
Value	10

2. Click **Submit**.

Set the journal preview size

Set the size of the *glide.max_journal_list_size* system property. When a journal field exceeds this size, the instance displays a preview rather than the field's entire contents. Users can click the **Show All** button to see the rest of the field's contents.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Select **New**.
3. Set the values for the property as listed in the table.

Property	Value
Name	glide.shortened_journal_length
Description	Number of characters to display as a preview of journal fields.
Type	Integer
Value	512000

4. Select **Submit**.

Set the maximum number of journal entries

To set the maximum number of entries the system shows in the activity formatter, edit the following system property. The activity formatter displays the entries starting with the most recent entry up to the maximum number.

Before you begin
Role required: admin

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Search for the property *`glide.history.max_entries`*.
3. Edit the **Value** of the property.

Property	Value
Name	glide.history.max_entries
Description	Maximum number of entries the system shows in the activity formatter. The default is 250.
Type	Integer
Value	250

4. Click **Update**.

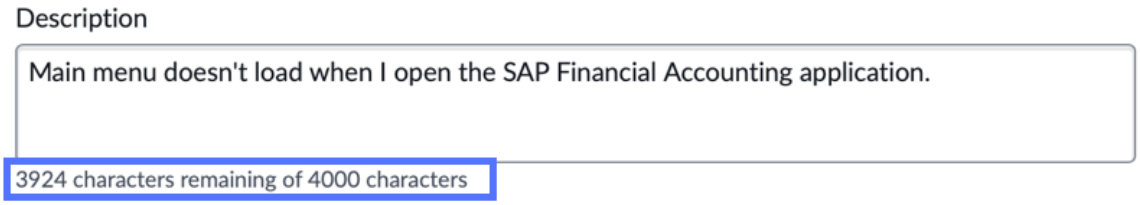
Related topics

Activity formatter

Enable the text field character counter

By default, multi-line text fields have a 4000 character limit. To help users see how many characters remain before they reach the limit, you can enable the *`glide.ui.textarea.character_counter`* property.

Before you begin
Role required: admin



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

This property adds a counter under text fields, such as the **Additional Comments** and **Work notes** fields. The counter is dynamically updated as users enter text.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Select the check box next to **Character counter for textarea (journal and multi line text fields)**.
3. Select **Save**.

Markdown field type

The Markdown field type enables users to write, edit, and store Markdown content in the ServiceNow AI Platform.

The Markdown field type is supported in Core UI and configurable workspaces. Admins can add Markdown fields to forms using the form layout, similar to other field types.

Features

The Markdown field type provides the following capabilities:

Write in Markdown

Users can write or edit Markdown content using standard Markdown features.

Store without loss

Markdown content is saved exactly as written.

View a clean preview

The Markdown editor shows the rendered HTML in the **Preview** tab.

View the source anytime

Users can switch to the raw Markdown to see what is stored and the rendered HTML.

Use the toolbar

The editor includes a toolbar for formatting Markdown content.

Standard field features

The Markdown field type supports standard field features including read-only mode, unsaved field indicator, field decorators, AI indicators, highlighted value, field styles, resize, and keyboard shortcuts.

Configure Markdown toolbar using system properties

Configure the toolbar options for Markdown editors across all tables in the platform using a system property.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The Markdown field type provides a default toolbar. You can customize the toolbar options globally for all Markdown editors in the platform.

Procedure
1. In the application navigator, enter `sys_properties.list` to navigate to the System Properties [sys_properties] table.
2. In the Name column, search for *`glide.ui.markdown.editor.toolbar`*.
3. Select the *`glide.ui.markdown.editor.toolbar`* property.
4. In the Value field, modify the toolbar options.

   The default value is: `heading | bold italic strike code | ul ol tasklist | link table codeblock | quote hr | download fullscreen`

   Available toolbar options: `heading`, `bold`, `italic`, `strike`, `highlight`, `subscript`, `superscript`, `code`, `ul`, `ol`, `tasklist`, `link`, `table`, `codeblock`, `quote`, `hr`, `download`, `fullscreen`.

   Use the pipe character (|) to separate groups of options.
5. Select **Update**.

Markdown toolbar options and syntax

Configure Markdown toolbar using dictionary attributes
Configure the toolbar options for a specific Markdown field using a dictionary attribute.

Before you begin
Role required: admin

About this task
You can customize the toolbar options for a specific Markdown field without affecting other Markdown fields in the platform.

Procedure
1. Navigate to the dictionary configuration screen for the Markdown field.
2. Select **Advanced view**.
3. In the Attributes field, add the dictionary attribute *`markdown_toolbar`* and specify the toolbar options.

   Available toolbar options: `heading`, `bold`, `italic`, `strike`, `highlight`, `subscript`, `superscript`, `code`, `ul`, `ol`, `tasklist`, `link`, `table`, `codeblock`, `quote`, `hr`, `download`, `fullscreen`.

   Use the pipe character (|) to separate groups of options.

Markdown toolbar options and syntax

The Markdown field type supports standard Markdown syntax and toolbar options for formatting content.

Default toolbar options

The following options are available by default on the Markdown toolbar.

Default Markdown toolbar options

Toolbar option	Markdown syntax	Description
Heading	`# H1, ## H2, ### H3, #### H4, ##### H5, ###### H6`	Organize content into section titles (sizes H1-H6)
Bold	`**bold text**`	Emphasize important text
Italic	`*italicized text*`	Italicize text
Strikethrough	`~~Strikethrough text~~`	Strikethrough text
Code	`` `code` ``	Format inline technical terms or commands
Highlight	`==Highlighted words==`	Draw attention to key information
Subscript	`H~2~O`	Position text below the line
Superscript	`X^2^`	Position text above the line
Bullet List	`- First item`	Unordered list for non-sequential items
Numbered List	`1. First item`	Ordered list for sequential or priority items
Task List	`- [ ] point 1`	Checklist for tracking action items
Link	`[title](https://www.example.com)`	Create clickable references to URLs or resources
Table	`| Header | Header |`	Display structured data in rows and columns
Code Block	```` ```code``` ````	Format multi-line code or technical content
Quote	`> quote`	Highlight important statements or references
Horizontal Rule	`---`	Insert visual divider between sections

© 2026 ServiceNow, Inc. All rights reserved.

Default Markdown toolbar options (continued)

Toolbar option	Markdown syntax	Description
Download	N/A	Save the current Markdown as a .md file
Full Screen	N/A	Change the editor into full screen mode

Additional supported Markdown syntax

The following Markdown elements are supported in addition to the toolbar options.

Additional supported Markdown elements

Markdown element	Markdown syntax	Description
Image	`![Image](/url)`	Embed images
Fenced code block	```` ```json ````	Display formatted code snippets with syntax preservation
Footnote	`[^1]: This is the footnote.`	Add reference notes at the bottom of the page
Heading ID	`### My Great Heading {#custom-id}`	Create custom anchor links for direct navigation within documents
Definition List	`term : definition`	Present terms with their corresponding definitions
Emojis	`:joy:`	Insert emoji characters

Markdown field keyboard shortcuts

Keyboard shortcuts are available for common Markdown formatting actions.

The following keyboard shortcuts are available in Markdown fields.

Markdown keyboard shortcuts

Action	Mac	Windows and Linux
Bold	#B	Ctrl+B
Italic	#I	Ctrl+I
Inline code	#E	Ctrl+E
Code block	##C	Ctrl+Alt+C
Blockquote	##.	Ctrl+Shift+.
Link	#K	Ctrl+K
Focus toolbar	#F8	Alt+F8 or Alt+F10
Return to editor or exit full screen	Escape	Escape
Resize (focus the handle first)	↑ or ↓	↑ or ↓

Name-value pairs field type

You can access the values stored in a name-value pairs field in scripts using the name.

Sample script

The following example demonstrates how to add mappings to a name-value pairs field, and how to query existing values using the name.

```
// Script example demonstrating setting and getting values
var gr = new GlideRecord('u_nv_table');
gr.initialize();

gr.nv_field.name1 = "value1"; //add a name-value Pair mapping
 with the name "name1" and value "value1"
gr.nv_field.name2 = "value2"; //add another name-value Pair
 mapping with the name "name2" and value "value2"

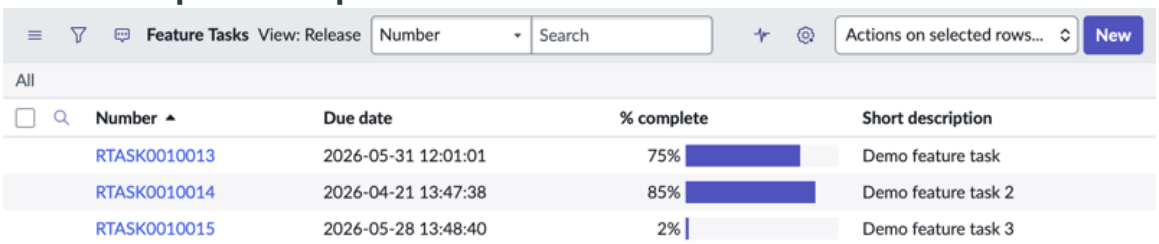
// Access by dot notation
gs.print("name1 = " + gr.nv_field.name1); // Expected output:
 name1 = value1

// Iterate over each property and print name and value
for(var name in gr.nv_field) {
    gs.print(name + " = " + gr.nv_field[name]);
}

gs.print(gr.nv_field); // Expected output:
 {"name1":"value1","name2":"value2"}
```

Percent complete field type

Administrators can create percent complete fields, which accept decimal input and appear as progress bars when displayed in lists.



For example, use a percent complete field to set the completion percentage for a task or project in a form and then see that percentage displayed as a progress bar in a list.

Administrators can also configure views that compare actual progress with a target value to determine if goals are being met and then apply color to provide visual alerts where progress does not meet expectations.

Form view of a percent complete field

List view of a percent complete field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target threshold colors attribute

If the *target_field* attribute is configured, a second attribute called *target_threshold_colors* enables an administrator to define additional parameters.

The parameters are:

- Different thresholds at which the colored bar should change color
- A specific color for each threshold

The format of this attribute's value is **number1:color1;number2:color2** and so on. Use this attribute to apply warning colors to completion percentages that are lower than target percentages. These values are defined as the percentage of target accomplished. For example, a value of **0:red;50:yellow;90:green** displays a red bar if the progress to target pecentage is between 0-49. If the percent of target is between 50 and 89, the color is yellow. Percent of target 90 and above displays in green. Completion percentages that exceed target percentages also display in green. Order the color attributes from the smallest percentage to the largest.

If you do not specify a target_field, then a target of 100 is used, allowing you to use the color thresholds with a single field value.

```
target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen
```

The following table lists examples of percent of target calculation using the colors defined above.

Target threshold colors attribute

Target percent	Percent field value	Percent of target calculation	Color
100	40	40%	tomato
65	59	90.7%	lightgreen
15	10	66.7%	khaki

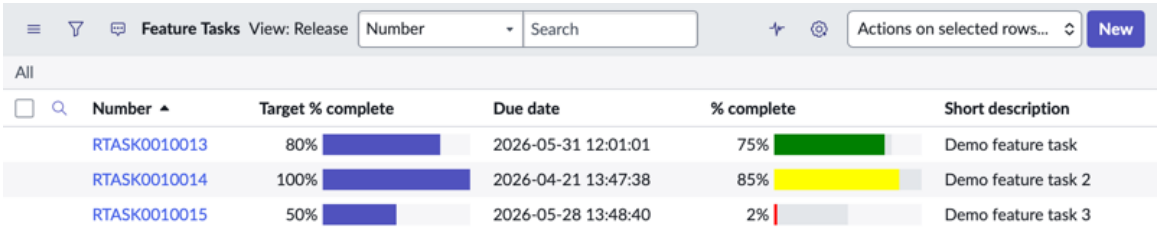
Add a target field attribute

Add an optional attribute (*target_field*) to a percent complete field to compare the actual completion percentage of a task or project with a target percentage in a different decimal field that specifies where the task should be at this point.

Before you begin

Role required: personalize_dictionary

About this task



If a target field is not specified, the target of 100 is assumed.

Procedure

1. Right-click the **% Complete** field in a form.
2. Select **Configure Dictionary** from the pop-up menu.
3. In the Dictionary Entry form, add the following attribute:
   target_field=percent_complete_target
4. Update the dictionary record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the list, a gray bar appears behind the colored bar to indicate the target value. The gray target bar appears only if you defined a target field.

Phone number field type

The E.164 phone number standard ensures that all necessary information for a phone number is included and properly formatted to successfully route an international call over a territory's public telephone network.

When a user enters a phone number, it is received and stored as a string of numbers. An E.164 phone number field automatically formats and validates the numbers so that they are E.164-compliant when displayed as local and international numbers. The E.164 phone number field type does not replace the phone field type.

An E.164 phone number field displays:

- [Optional] A choice list for the phone number territory.
- [Always] An input box for entering phone numbers.
- [By Default] A red underline when a phone number does not match the format for the selected phone territory and cannot be saved.
- [Optional] A green underline when a phone number does not match the format for the selected phone territory but can be saved with **Other / Unknown** as the territory.

Territories assigned

Territories are assigned to locations, and are not assigned directly to users.

A user's territory, and so the user's E.164-compliant phone functionality, is based on the user's location. For example, if a user has a location of **SHS quadra 5, Bloco E., Brasilia** defined in the User [sys_user] table, the parent record for Brazil in the location table defines the phone territory. The phone territory may be assigned at any level of the Map pages hierarchy, which is searched going up to the next parent until the territory is found or no parents remain.

Dependent fields

In the dictionary, you can specify a dependent field in the **User** or **Location** field, which displays the appropriate territory in the selector choice list when a user enters a phone number.

For example, if you enter `caller_id` in the dependent field in the Incident table, the appropriate territory is added to the territory selector choice list when a user enters caller information.

Related topics

Make a field dependent

E.164 phone number field configuration

Administrators can use the phone number system properties and dictionary attributes to do certain things.

The system properties apply the configuration option to all phone number fields that do not have a comparable dictionary attribute. The dictionary attributes apply the configuration only to the phone number field it is added to. Since dictionary attributes take precedence over system properties, administrators can set a global configuration with a property and then apply exceptions on a field-by-field basis.

Note: Alpha numeric characters are not allowed and is not considered as a valid phone number.

Requiring territory format validation

By default, phone number fields require that a phone number match the display format of the selected territory.

By default, phone number fields require that a phone number match the display format of the selected territory. If a phone number does not match this format, users are prevented from saving it.

Setting the *glide.phone_number_e164.strict* system property to **false** or adding the *pn_strict* dictionary attribute allows the phone number input box to display a green line underneath numbers that do not match the territory format listed for the selected territory or the whole box turns green. You can use the **Other / Unknown** territory to store otherwise invalid phone numbers.

Warning: Switching from optional territory format validation to required territory format validation may result in some phone numbers failing validation altogether. In such cases, the E.164 phone number field displays an error message.

Requiring entry of international format

By default, users can enter phone numbers in their territory's local format and do not have to format the number for international dialing.

The phone number field automatically formats local phone numbers into E.164-compliant international phone numbers when the user finishes editing the field. As long as the phone number entered matches the territory's format for a local number, users can save the phone number.

Changing the *glide.phone_number_e164.allow_national_entry* system property or adding the *pn_allow_national_entry* dictionary attribute requires users to enter a phone number in the territory's international format, which starts with the plus (+) character. Users cannot save a locally formatted phone number, and the phone number input box displays a red line underneath phone numbers without the proper international formatting.

Configure the display of the local format

By default, an E.164 phone number field always displays phone numbers in an international format.

Change the E.164 phone number to use the local format in certain circumstances by adding the following system property:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.phone_number_e164.display_national	• **Type**: string • **Default value**: false • **Other possible values**: ○ **true or form**: Displays phone numbers in a local format on forms, but displays an international format on lists. ○ **all**: Always displays phone numbers in a local format. ○ **user**: Only displays phone numbers in a local format when the phone number matches the local setting of the current user. ○ **false**: Does not display phone numbers in local format.

Select one of the possible values to determine how the system handles the E.164 phone number.

You can also add the following dictionary attribute to a specific field to override the system property:

Dictionary attribute	Description
pn_display_national	Overrides the *glide.phone_number_e164.display_national* property setting for how an E.164 phone number field displays phone numbers. Available values are identical to those described for the *glide.phone_number_e164.display_national* property. • Type: string • Default value: false • Example:pn_display_national=all

Configure the display of territory labels

A property controls how territory labels are displayed.

You can display territory labels next to the number in an E.164 phone number field by setting the system property or adding the dictionary attribute. This display is useful if the territory selector choice list is turned off and you want the user to see the territory for the entered phone number.

Enabling territory labels also displays the phone territory in lists.

Add the following system property to display the territory label next to the number in an E.164 phone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.phone_number_e164.display_territory	Determines when an E.164 phone number field displays a territory label. • **Type** : string • **Default value**: read-only • **Other possible values**: ○ **all**: Displays the territory label. ○ **national**: Displays the territory label only if the phone number is in local format. ○ **read-only**: Displays the territory label in read-only mode, regardless of whether the number is in local or international format. ○ **read-only-national**: Displays the territory label in read-only mode only if the number is in local format. ○ **list**: Displays the territory label in a list. ○ **list-national**: Displays the territory label in a list if the number is in national format. ○ **none**: Does not display the territory label.

You can also add the following dictionary attribute to a specific field to override the system property:

Dictionary attribute	Description
pn_display_territory_text	Overrides the *glide.phone_number_e164.display_territory_t* property that defines when a phone number field displays a territory label. Available values are identical to those described previously for the *glide.phone_number_e164.display_territory_t* property. • Type: string • Default value: read-only • Example:pn_display_territory_text=all

Configure the international direct dialing prefixes

A property is available to control the display of prefixes.

You can enable the display of the international direct dialing prefix, which appears between the territory selector choice list and the input box for an E.164 phone number field on forms, by setting the system property or adding the dictionary attribute.

Add the following system property to display the international direct dialing prefix.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.phone_number_e164.display_users_idd	Determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. • Type: true | false • Default value: false

You can also add the following dictionary attribute to a specific field to override the system property:

Dictionary attribute	Description
pn_display_users_idd	Overrides the *glide.phone_number_e164.display_users_idd* property that determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. Available values are identical to those described above for the *glide.phone_number_e164.display_users_idd* property. • Type: true | false • Default value: false • Example:pn_display_users_idd=false

Configure the phone territory selector choice list

By default, an E.164 phone number field always displays the phone territory that is associated with the phone number.

Changing the system property or adding the dictionary attribute hides the territory selector choice list. If the territory selector choice list is hidden, users can only enter a local or national number.

Add the following system property to show or hide the territory selector choice list.

Property	Description
glide.phone_number_e164.display_territories	Determines whether to display the territory selector choice list. Hiding the territory selector choice list restricts users to entering only local or national phone numbers. • Type: true | false • Default value: true

You can also add the following dictionary attribute to a specific field to override the system property:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary attribute	Description
pn_display_territory_selector	Overrides the *glide.phone_number_e164.display_territory_s* property setting that determines whether to display the territory selector choice list. Available values are identical to those described above for the *glide.phone_number_e164.display_territory_s* property. • Type: true | false • Default value: true • Example: pn_display_territory_selector=false

E.164 phone number field system properties

Several properties are available to configure E.164 phone number fields.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

e.164 phone number field system properties

Property	Description
glide.phone_number_e164.strict	Determines whether all phone number fields must match the display format for the selected territory. When the value is **true**, the phone number input field displays a red line underneath the phone numbers that do not match the format for the selected territory. Users cannot save the phone number. When the value is **false**, the phone number input field displays a green line underneath phone numbers that do not match the format for the selected territory. Users can save the phone number. The territory selector choice list offers the option to select an **Other / Unknown** territory format. • Type: true | false • Default value: true • Location: Add to the System Properties [sys_properties] table.
glide.phone_number_e164.allow_national_entry	Determines whether users can enter phone numbers in the local format or

© 2026 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e.164 phone number field dictionary attributes (continued)

Dictionary attribute	Description
	• Type: string • Default value: read-only • Example:pn_display_territory_text=all
pn_display_users_idd	Overrides the *glide.phone_number_e164.display_users_idd* property that determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. Available values are identical to those described for the *glide.phone_number_e164.display_users_idd* property. • Type: true | false • Default value: false • Example:pn_display_users_idd=false

Configure a territory phone display rule

The string of numbers that make up a phone number is automatically validated and formatted for a specific territory by applying a series of regular expressions.

Before you begin

Role required: admin

About this task

The number is first validated against the phone validations that have been defined for the territory, and in the order specified by the **Order** field. To be valid, the number must match the regular expression defined in the **Condition** field for at least one phone validation.

After a number has been validated, the **Condition** expression for each format defined for the territory is applied to the number in the order determined by the **Order** fields. The **Pattern** and **Format** regular expressions are applied to produce a phone number that is formatted correctly for the territory.

The Sys Phone Territory screen allows administrators to edit the display rules for a given territory. Administrators may want to modify the **Active**, **Display**, or **Order** fields. To edit the display rules for a territory:

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Telephone Display Rules**.
2. Click a territory **Name**.
3. Edit the fields, as appropriate (see table).
4. Click **Update**.

Territory phone display rules

Field	Description
Name	The unique name of the territory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Country calling code	The country code for dialing numbers from outside the territory.
International direct dial	The prefix for calling internationally from the territory, such as 00 or 001.
STD	The subscriber trunk dialing code, also know as the direct distance dialing code, which is a sequence of numbers before the telephone number that indicate whether the call is to be routed outside of the local calling area.
International prefix	The prefix required to dial an international call, such as a plus sign (+).
National prefix	The prefix required to dial a local call.
Active	An indicator for whether the territory phone definition is active. If deactivated, this territory unavailable to users.
Trunk dialing code optional	An indicator for whether the STD code is optional.
STD follows country	An indicator for whether the STD code should be displayed to the right of the country calling code.
Display	An indicator for whether to display the territory in the choice list. Clearing this check box removes the territory from the choice list. If an international number is entered for a territory that is not displayed in the territory selector choice list, that territory is temporarily added to the selector choice list for that field only. For example, If the United Kingdom **Display** field is not selected, the United Kingdom does not appear in the territory selector choice list. However, if the user enters an international number beginning with +44, the United Kingdom is added to the list and the number is formatted and validated accordingly.
Order	The order in which a territory appears in a choice list. Territories are sorted numerically by the number assigned here. If more than one territory is assigned the same number, they are subsorted alphabetically. All territories are assigned a default value of 100. To display a territory at the top of the list, assign a value that is less than 100. To display a territory at the end of the list, assign a value that is greater than 100. For example, if a territory is assigned an order of 500, it is displayed at the end of the list, and if more than one territory is assigned an order of 500, they are listed alphabetically at the end of the list.

Phone validations

Phone validations are already configured for all territories and are automatically applied to the phone number to ensure that the number is valid for the territory.

Actions on selected rows... | 1 to 7 of 7

Phone formats

Phone formats are already configured for all territories and are automatically applied to the phone number to ensure that the number is valid for the territory.

Reference field type

A reference field stores a reference to a field on another table. For example, the **Caller** field on the Incident table is a reference to the User [sys_user] table.

When you define a reference field, the system creates a relationship between the two tables. Adding a reference field to a form makes the other fields in the referenced table available to the form.

Note: A reference field can refer only to records from one other table. To add a field that can refer to records on any table, use the Document ID element type.

Administrators can create new reference fields and configure several options for reference fields.

Reference field options

Option	Description
Display values	Each reference field stores a sys_id for each referenced record in the database, but the sys_id is not shown. The reference field shows the specified display value.
Decorations	A reference decoration is an icon that appears next to a reference field.
Reference styles	Reference styles are specialized field styles that control the appearance of reference fields.
Reference qualifiers	Reference qualifiers restrict the records that are available for reference fields.
Cascade delete rules	Cascade delete rules specify what should happen to records that reference a record that is deleted.
Auto-complete	By default, a reference field auto-completes as the user types in the field. Administrators can configure auto-complete settings.
Reference key	A reference key saves a field other than sys_id as the unique identifier for a reference field.
Enable dynamic creation	When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.

Add a reference field

Add reference fields to a table using the same method as for any other field.

Before you begin
Role required: personalize_form

About this task
The related table also appears in the Available Tables list for future form customizations.

Procedure
1. Open the desired form.
2. Right-click the header and select **Configure** > **Form Layout**.
3. Use dot-walking to locate and select the field in the referenced table that you want to add.

   Example
   It appears as *`Table name.Field`*. For example, the caller's email address appears as *`Caller.Email`*.
4. Click **Save**.

Enable dynamic creation for reference fields

When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.

Before you begin
Role required: personalize_dictionary

About this task
By default, a user must enter a value in a reference field that matches an existing record in the table that the reference field refers to. For example, the **Caller** field in an Incident must have a value that is an existing user. You can enable dynamic creation to create a new record on the referenced table when a user enter a nonexistent value in a reference field instead of returning an error.

Procedure
1. Right-click the field label in the form and select **Configure Dictionary**.
2. Populate the following fields (you may need to configure the Dictionary form):
   - **dynamic_creation**: Select the check box.
   - **dynamic_creation_script**: Enter a script that dynamically creates the record.
3. Click **Update**.
   Examples:

   You could use the following `dynamic_creation_script` to create a record on the referenced table.

   ```
   current.name = value;
   current.insert();
   ```

   Note: The parent object can be used to access anything from the parent record.

   You could create a script include named *`MyUserReferenceCreator`* with the following contents:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var MyUserReferenceCreator = Class.create();
MyUserReferenceCreator.prototype = {
    initialize: function() {
    },

    create: function(current, value) {
        current.name=value;
        return current.insert();
    },

    type: 'MyUserReferenceCreator'
}
```

When the script include is created, the following `dynamic_creation_script` generates a new location for an invalid reference field value:

```
new MyUserReferenceCreator().create(current, value);
```

Configuring the form layout

Configure cascade delete rules

When a record is deleted, there are different options for how the deletion will affect records that reference the deleted record. You can configure what happens to records that reference a record when that record is deleted.

Before you begin

Role required: personalize_dictionary

About this task

For example, if you delete a user record that is referenced in the **Caller ID** field on several incident records, you can configure what happens to those incident records. By default, the references are cleared, so the incident records are maintained with an empty **Caller ID** field.

Procedure

1. Navigate to a reference field on a form.
2. Right-click the field label and select **Configure Dictionary**.
3. Under **Related Links**, click **Advanced view**.
4. Locate the Reference Specification section.
5. In the **Reference cascade rule** field, select one of the following options.

Note: The option for this field have no effect for tables with m2m relationships, meaning that in this example, if the tables have an m2m relationship, the user record is deleted.

Option	Description
Clear or -- None --	Deleting a record clears references (default option).
Delete or Cascade	Deleting a record also deletes all referencing records. For example, when a user record is deleted, any incidents assigned to the user are also deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Caution: Use this method with caution.
Restrict	Deleting a record is restricted unless there are no references to the record. For example, prevent the user record from being deleted if any incident includes a reference to the user.
None	Deleting a record does not change records that reference the record.

6. Click **Update**.

Related topics

Modify dictionary entries

Define the reference key

By default, reference fields store the sys_id of the record in the database.

Before you begin
Role required: personalize_dictionary

About this task
By defining a reference key, you can identify a field other than sys_id to use as the unique identifier for the reference field. The value of the reference key field, instead of the sys_id, is stored in the database for that reference field.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the field record (for example, **resolved_by** on the Incident table).
3. In the **Reference key** field, enter a field name on the referenced table (for example, email on the sys_user table).

   Note: Always choose a field from the referenced table that is both required and unique.

4. Select **Update**.

Display a reference field as a choice list

You can display a reference field as a choice list instead of opening a lookup window.

Before you begin
Role required: personalize_dictionary

About this task
Note: A choice reference field with a defined reference key won't function.

Procedure

1. In the form, right-click the label for the reference field and select **Configure Dictionary**.
2. In the Choice List Specification section, select one of the following options in the **Choice** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Dropdown with --None--**
- **Dropdown without --None--**

3. Right-click the form header and click **Save**.
4. Under **Related Links**, click **Advanced view**.
5. In the **Attributes** field, add the following attribute, separated from other attributes by a comma.

```
ref_auto_completer=AJAXReferenceChoice
```

6. Click **Update**.
   The form reopens, with the reference field as a choice list.

Note:

The *glide.ui.max_ref_dropdown* system property determines whether a reference field is displayed as a choice list or a reference icon. When the number of available choices exceeds the value of this property, a reference icon displays instead of a choice list. The default value of this property is 25. This property affects the entire instance, however you can override this property on an individual field by using the *max_ref_dropdown* dictionary attribute. Modifying dictionary attributes requires the personalize_dictionary role.

The *glide.xmlhttp.max_choices* system property determines how many choices display on a choice list. This property has a value of 15 by default, however, when the property is not present on the instance, the instance uses a hard coded value of 10.

System dictionary

Display values

Reference fields store a sys_id for each referenced record in the database, but the sys_id is not shown.

The reference field shows the display value. For example, an incident's **Assigned to** field stores the sys_id of a particular user, but actually displays the user's name. The following example shows how **Charlie Witherspoon**, which is the display value of a user record, is shown in the **Assigned to** field.

Display value xml

```
<xml>
    <incident>
        <active>true</active>
        <activity_due/>
        <approval/>
        <approval_history/>
        <approval_set/>
        <assigned_to display_value="Charlie Witherspoon">46b87022a9fe198101a78787e40d7547</assigned_to>
        <assignment_group/>
```

Reference field

Reference field	Value stored in database	Display value field of source table	Value displayed in UI
Assigned to [task.assigned_to]	46b87022a9fe198101a78787e40d7547	Name [sys_user.name]	Charlie Witherspoon

Reference fields show display values in:

Unique record identifier (sys_id)

Select a field as the table display value

Only one field can be defined as the display value for a table.

Before you begin

Role required: personalize_dictionary

About this task

When you set the **Display** value to **true**, a business rule sets the **Display** value to **false** for all other fields on the table. In previous versions, you must manually ensure that no other fields on the table have a value of **true** in the **Display** column.

Note: Extended tables inherit the display value of the parent table. Setting a separate display value for the extended table overrides the parent table's display value.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Filter on **[Table] [is] [<name of the referenced table>]**.
3. Locate the desired field and set **Display** to **true**.

   For best results, choose a field that is required and unique in each record as the display value field.

   Note: If you make a field the display field for a table, be sure to translate all values for the field in the Translated Text [sys_translated_text] table into all the languages provided. Display field options left untranslated are not presented by the autocomplete (type ahead) feature.

   Reference fields look for the display value in the following order:

   a. A field with display=true in the system dictionary on the lowest sub-table for extended tables.
   b. A field with display=true in the system dictionary on the parent table.
   c. A field named **name** or **u_name** or **x_name**.
   d. A field named **number** or **u_number** or **x_number**.
   e. The field named in the Glide Property *glide.record.display_value_default*
   f. The **Created on** field of the referenced record.

Decorations

Reference decorations are icons that appear next to a reference field on a form, providing quick access to related records and actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Four decoration types can appear next to a reference field. Each decoration serves a distinct purpose and appears under different conditions.

Reference lookup

Appears next to editable reference fields. Selecting the reference lookup icon opens a list of records from the referenced table, letting you select a record to populate the field. For more information, see Reference lookup.

Reference icon

Appears next to populated reference fields. Selecting the reference icon opens a read-only preview of the referenced record. Select **Open Record** in the preview to navigate to the full record. For more information, see Reference field icon.

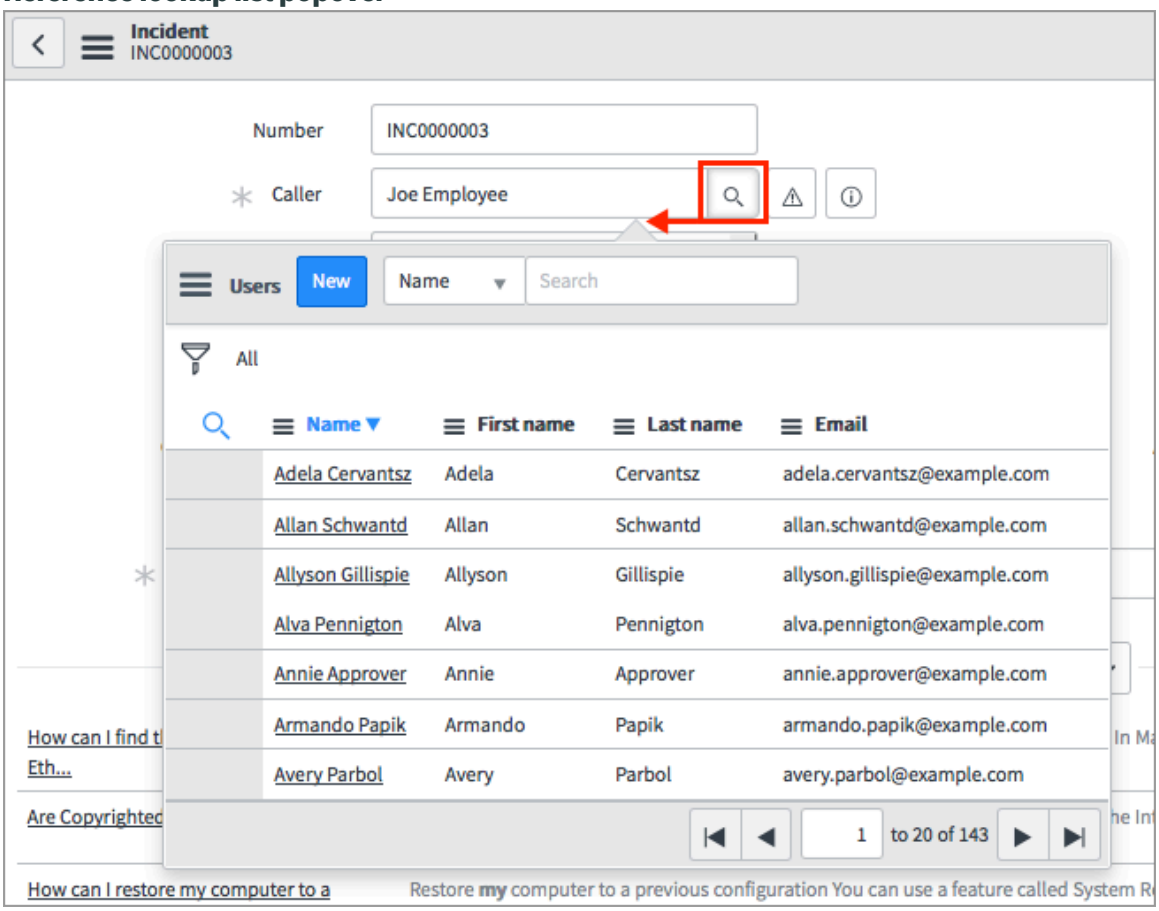
Related incidents icon

Displays incidents related to the record referenced in the field. This decoration requires a dictionary attribute and is not enabled by default. For configuration instructions, see Configure the related incidents icon.

Show workflow icon

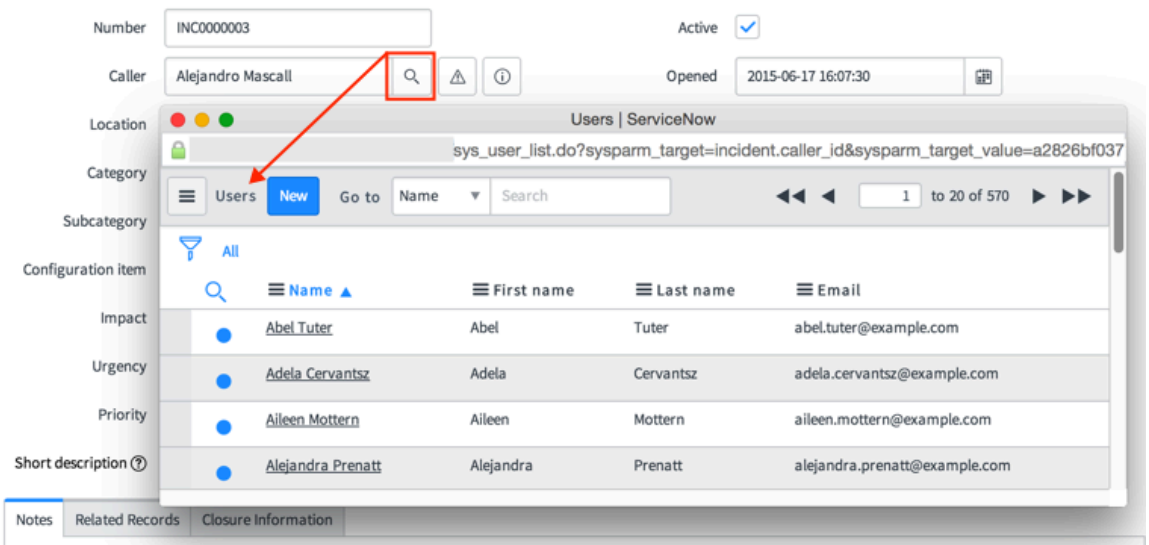
Appears next to a workflow field and opens the related workflow in the Workflow Editor. This decoration requires a dictionary attribute and is not enabled by default. For configuration instructions, see Configure the show workflow icon.

The reference lookup icon is visible whenever the reference field is editable. Other decorations appear only after a record is selected in the field.



Reference lookup

On forms, the reference lookup icon ( ) appears by editable reference fields. Clicking the reference lookup icon displays a list of records on the referenced table.



When List v3 is enabled, the list appears in a popover. Otherwise, the list appears in a pop-up window.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reference lookup list popover

Reference lookup list pop-up

Tree picker lookup

The reference lookup can be rendered in the tree picker format by modifying the dictionary and adding the attribute *`tree_picker`*.

You cannot customize the label names used in the tree picker. The label names are taken from the values in the table.

Note: The tree display hierarchy does not appear in reference fields when using mobile applications.

Related topics

Tree picker

Reference field icon

On forms, the reference icon (ⓘ) appears by populated reference fields. Clicking the icon opens a read-only preview of the referenced record.

Referenced record preview on a form

The preview remains open until you click somewhere else on the form.

Click **Open Record** to navigate to the referenced record.

Note: When using a reference icon in Service Portal, a form opens using the default view of the form rather than a popup view. Write permissions to this form are the same as opening the form in the default view in the standard UI.

Configure the reference icon view of fields

Use a table's sys_popup form view to configure the fields in the pop-up form that appear when pointing to a reference icon. If the table has no sys_popup view, the pop-up uses the default view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: personalize_form

About this task
The pop-up form displays in the top form section only.

Procedure
1. To configure a reference field popup form for a table using the default sys_popup view, navigate to the following URL format, substituting the instance name and table name:

```
<your instance name>.service-now.com/<table
 name>.do?sysparm_view=sys_popup
```

Note: This URL format only shows a table and default sys_popup view. It does not work for records that use a different view.

Example
An example of an instance for Acme, the sys_user table, and the sys_popup default view:

```
acme.service-now.com/sys_user.do?sysparm_view=sys_popup
```

2. **Optional:** To configure a reference field popup form for a table using a non-default sys_popup view, navigate to the following URL format, substituting the instance name, table name, and name of view:

```
<your instance name>.service-now.com/<table
 name>.do?sysparm_view=sys_popup,<name_of_view>
```

Example
An example of an instance for Acme, the sys_user table, and the sys_popup ESS view:

```
acme.service-now.com/sys_user.do?sysparm_view=sys_popup,ess
```

3. Configure the form to add or remove fields as appropriate.

Related topics
Configuring the form layout

Configure pop-ups on read-only fields
Reference pop-ups and click-throughs are hidden by default when a client script, UI policy, variable, or ACL makes the field read-only. The ability to see or click through to the target record does not depend on whether the reference field is writable. You can change the read-only setting.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Change the value of the **Enable click-through of a reference field when the reference field is read-only.** (*glide.ui.reference.readonly.clickthrough*) property.
If set to true, the pop-up appears for read-only fields and for variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

If this system value is set to **false**, you can override the setting for a specific read-only reference field. Configure the dictionary entry and add the *readonly_clickthrough=true* attribute.

Configure the related incidents icon

You can configure an icon to appear beside a reference field in a form, such as the **Caller** field, to display related incidents.

Before you begin

Role required: admin

About this task

The show related incidents icon () displays other incidents related to the referenced record.

Procedure

1. In the form, right-click the label for the reference field and select **Configure Dictionary**.
2. Add the *ref_contributions=user_show_incidents* dictionary attribute in the **Attributes** field.
3. Click **Update**.
   The form reopens and the related incidents icon appears beside the field on the right.

Related topics

Altering tables and fields using dictionary attributes

Configure the show workflow icon

You can configure an icon to appear beside a workflow field to display the related workflow in the Workflow Editor.

Before you begin

Role required: admin

About this task

The show workflow icon () opens the workflow in the Workflow Editor.

Procedure

1. In the form, select and hold (or right-click) the label for the workflow field and select **Configure** > **Configure Dictionary**.
2. Add the *ref_contributions=show_workflow* dictionary attribute in the **Attributes** field.
3. Select **Update**.
   The form reopens and the show workflow icon appears beside the field on the right.

Altering tables and fields using dictionary attributes

Reference qualifiers

Use reference qualifiers to filter the data that is returned for a reference field.

A reference field stores a link (reference) to a field on another table, making the records/fields in the referenced table available to the form containing the reference field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, the **Assigned to** field on the Incident table is a reference to the User [sys_user] table. By default, all values for the field that is being referenced appear in the reference lookup and can be directly accessed through the reference field (type ahead). Expanding on the prior example, if a reference qualifier is not defined, all users in the User table appear in the reference lookup. Including those users that are inactive. Sometimes, this might be the desired functionality. In other cases however, only a subset of the available values may be desired. In this case, create a reference qualifier to filter the available data so that only the desired values are returned and made available to the form. Such as only the active users or users that have a specific role. Reference qualifiers are robust and can consist of simple AND/OR conditions, inline JavaScript, or complex script include.

You can modify the reference qualifier for a table, and any table based on that table (parent or extended), by defining a reference qualifier through the Dictionary Entry form. You can also modify the reference qualifier only on an extended table and its children (not the parent table), through a dictionary override. You can only define a single reference qualifier per field, per form/table. Reference qualifiers are not applicable to condition builders. For information on using filtering in condition builders, see Create a dynamic filter option.

Note:

- Creating reference qualifiers requires knowledge of the underlying ServiceNow data model (tables and fields) and knowledge of the Web services and Scripts.
- To restrict what data specific users can access, use ACLs not reference qualifiers.

You can define a reference qualifier using one of the following methods.

Simple reference qualifier

Simple reference qualifiers use AND/OR statements (conditions) to create simple filters. Use simple reference qualifiers when filtering on conditions such as whether a company is active, a user has a specific role, and/or a caller is in a specific time zone. Simple reference qualifiers can have a maximum of 13 reference qualifier conditions. For additional information on how to use condition builders, see Condition builder.

Dynamic reference qualifiers

Dynamic reference qualifiers enable you to use a Create a dynamic filter option to run a query against a reference field to filter the returned data set. Dynamic filter options are stored filters that can contain Encoded query strings, JavaScript, or script includes, and can be used in multiple dynamic reference qualifiers. Changes made to a dynamic filter option automatically apply to all reference qualifiers that use the same dynamic filter option. Use this type of reference qualifier when you want to use the same filter on multiple forms or to provide filter functionality to "non-code savvy" implementers.

The base instance provides several OOB dynamic filter options. If a dynamic filter option that meets your needs does not exist, you can create a new dynamic filter option that is specific to your requirements. An example of an OOB dynamic filter option is the reference qualifier on the **Model ID** field on a configuration item form, such as the Computer form. The reference qualifier calls the **CI Model Qualifier** dynamic filter option, which in turn calls the `ModelAndCategoryFilters` script include. This script include filters the data set based on the class of the CI. The only options for the model ID are options that belong to the same class as the current CI. For example, only CIs that belong to the Computer class are available in the **Model ID** field on the Computer form.

To locate the available dynamic filter options, navigate to **System Definition** → **Dynamic Filter Options**. In the right-corner of the Dynamic Filter Options list, click the filter icon and create the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

filter condition `Available for ref qual is true`. All dynamic filter options that can be used in dynamic reference qualifiers appear.

Advanced reference qualifier

Advanced reference qualifiers enable you to define an inline encoded query string or JavaScript (actual code or the name of an existing script include or business rule) filter directly in the **Reference qual** field of the reference qualifier. Similar to the other reference qualifier types, when the form loads, the filter is executed, and only the records that match the filter appear in the reference field. Use this type of reference qualifier for implementations that only require a simple, unique filter, that cannot be handled by a simple reference qualifier, and is not used across multiple reference fields.

Note: As a good practice, make JavaScript calls to functions in a script include instead of a global business rule.

An example of an encoded query string is `vendor=true`, which returns all companies that are designated as vendors. Entering this string is the same as using the condition builder as shown in the example for the simple reference qualifier. For additional information on valid encoded query string syntax and examples, see Encoded query strings.

An example of a JavaScript call is `javascript:new myScriptInclude().my_refqual()`. This code calls the function *`my_refqual()`* in the script include *`myScriptInclude()`*. The function must return a query string that can filter the options available on a reference field.

Note: You can also use encoded JavaScript filters such as `javascript:'u_active=true^' + "u_hr_service="+current.hr_service` in reference qualifiers.

In another example, if you are trying to filter based on the current company, you don't have use a lookup script but can simply add this line to your dynamic qualifier:

```
return "company=" + current.company;
```

You can also simplify this and use an advanced reference qualifier instead of a dynamic one:

```
javascript:"company=" + current.company
```

For an additional example, configuring the reference field to show only users of a specific group, see the How to select only users of a specific group into a reference field [KB0831564] article in the Now Support Knowledge Base

.

Related lists and reference qualifiers

When a field appears on multiple Related lists on a single form view, it may be necessary to validate which related list is being referenced to properly build the reference qualifier for the field. In this situation, configure the list control for the related list and enter a unique tag in the **List edit tag** field. This tag value is available to filter scripts as a variable named *`listEditRefQualTag`*. The following script include code is an example of a function that uses this type of tag.

```
// Advanced reference qualifier on the CI Relationship Child
 field that takes into account
// the related list that we are editing the child field on, if
 the field is being edited
// from a tagged related list.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
cmdb_rel_ci_child_refQual:function(){

 if(listEditRefQualTag =="application") return "sys_class_name
= cmdb_ci_appl";

 if(listEditRefQualTag =="database") return "sys_class_name =
cmdb_ci_database"

 }
```

Using Javascript current syntax in reference qualifiers

`current` is a JavaScript object that contains the fields and field values of the active (current) record. For forms, this is the record that is displayed (loaded) in the form. Within advanced and dynamic reference qualifiers, you can use the JavaScript `current` object to define filters such as `javascript:"company=" + current.company`.

This JavaScript, within a reference qualifier, only returns the records from the referenced table that are equal to the company field value of the current record. So, if the value that appears in the **Company** field is Acme, the JavaScript returns all reference field records whose company value is equal to Acme (company="Acme"). If you then bring up a record whose company value is "ViewRite", the JavaScript resolves to company="ViewRite."

All fields within the currently loaded form (tables) are available for use with the `current` object. Use dot-walking to access values in a table, including the referenced table. For example, on the Incident form, the **Assigned To** field references the User table. To access the email address of the user, use the following syntax: `javascript:"emailAddress=" + current.assigned_to.email`.

Configure reference qualifiers

System administrators can configure reference qualifiers that enable filtering of the associated reference field.

About this task

This task walks you through creating a reference qualifier in the system dictionary. When creating a reference qualifier in the system dictionary, it not only applies to that table, but also to all the children of the table.

> **Note:** You can also create reference qualifiers on extended tables through dictionary overrides. Dictionary overrides only impact the extended table and any of its children, not the parent table.

Procedure

1. Navigate to the reference field on the form or table on which you want to define a reference qualifier.
2. Right-click the reference field label and select **Configure Dictionary**.
3. Under **Related Links**, select **Advanced view**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The simple reference qualifier is available in both the default view and the advanced view. The dynamic and advanced reference qualifiers are available only in the advanced view.

4. In the Reference Specification section, verify that the table in the **Reference** field contains the table that you want associated with the reference field, or select another table if necessary.
5. From the **Use reference qualifier** choice list, select the reference qualifier to implement.
6. Configure the qualifier based on the type of reference qualifier.
   - **Simple**: Build the condition using the choice lists.
   - **Dynamic**: Either select an existing dynamic filter option or Create a dynamic filter option.
   - **Advanced**: In the **Reference qual** field, enter an Encoded query strings, JavaScript that returns a query string, or the name of a script include or business rule to run.
7. Complete the **Reference Specification — Additional Customization** section, as appropriate.

Field	Description
Reference key	Identifies a field other than sys_ID to use as the unique identifier for the reference field.
Reference cascade rule	Defines what happens to a record if the record it references is deleted. Possible options include: ○ None ○ Cascade ○ Clear ○ Delete ○ Delete no workflow ○ Restrict
Reference floats	Flag that determines whether to Configure the edit option for one-to-many relationships.
Dynamic creation	Flag that determines if the system should create a new record when a value for the reference field does not match an existing record. If you select this option, enter a script that specifies how to create the record in the **Dynamic creation script** field.

8. Click **Update**.

Constrain the assigned to field by role

This example shows how to use JavaScript and a business rule to restrict the incident **Assigned to** field choices to only the users with the itil_admin role.

Before you begin

Role required: personalize_dictionary or admin

About this task

You can also change itil_admin to any other role on a reference field that refers to the User [sys_user] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open an incident.
2. In the upper-left corner of the screen, click the form context menu, and then select **Configure** > **Dictionary**.
3. In the **Reference qual** field, enter `javascript:"sys_idIN"+getRoledUsers("itil_admin").join(",")`.
4. Save the record.
5. To see the base system business rule that this JavaScript code calls, navigate to **System Definition** > **Business Rules**.
6. Open **getRoledUsers**.
   The business rule uses the following JavaScript code.

```
// Return an array of sys_ids of the users that have at least
 one role
// optional parameters allow the exclusion (NOT IN) of some
 roles or
// look for specific roles (IN)
//
// optional: queryCondition - 'IN' or 'NOT IN'
// optional: roleList - a comma separated list of role names
//
function getRoledUsers(queryCondition, roleList) {
   var roleListIds;
   if (queryCondition && roleList) {
      roleListIds = getRoleListIds(roleList);
   }

   var users = {};
   var now_GR = new GlideRecord('sys_user_has_role');
   if (roleListIds) {
      now_GR.addQuery('role', queryCondition, roleListIds);
   }
   now_GR.query();
   while (now_GR.next()) {
      users[now_GR.user.toString()] = true;
   }

   var ids = [];
   for (var id in users)
      ids.push(id);

   return ids;
}

// get sys_id's for the named roles
function getRoleListIds(roleList) {
   var ids = [];
   var now_GR = new GlideRecord('sys_user_role');
   now_GR.addQuery('name','IN',roleList);
   now_GR.query();
   while (now_GR.next()) {
      ids.push(now_GR.sys_id.toString());
   }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   return ids;
}
```

Constrain the assignment group field

This example shows how to use an advanced reference qualifier with JavaScript and a script include to restrict the incident **Assignment group** choices to only the groups that contain the user specified in the **Assigned to** field.

Before you begin

Role required: personalize_dictionary or admin

Procedure

1. Open an incident.
2. Right-click the **Assignment group** label and select **Configure Dictionary**.
3. If the form appears in **Default view**, under **Related Links**, click **Advanced view**.
4. In the **Use reference qualifier** field, ensure that the **Advanced** option is selected.
5. In the **Reference qual** field, enter `javascript:new ReferenceQualifierHelper().backfillAssignmentGroup()`.
6. Save the record.
7. Navigate to **System Definitions** > **Script Includes**.
8. Click **New**.
9. Name your script includes as `ReferenceQualifierHelper` to match the Javascript in the following step.
   This name ensures the API Name is generated correctly, based on the Name field.
10. Script includes with the following JavaScript code.
    Ensure that the **Accessible form** field is properly set for the environment.

```
var ReferenceQualifierHelper = Class.create();
ReferenceQualifierHelper.prototype = {

 backfillAssignmentGroup:function() {
  var assigneeGroupsQualifier = '';
  var assignee = current.assigned_to;

  //return if the assigned_to value is empty (this causes all
 groups to be returned)
  if(!assignee)
   return;

  //sys_user_grmember has the user to group relationship
  var grAssigneeGroups = new GlideRecord('sys_user_grmember');

  grAssigneeGroups.addQuery('user',assignee);
  grAssigneeGroups.query();

  while(grAssigneeGroups.next()) {
   if (assigneeGroupsQualifier.length == 0) {
    // Create the beginning of the qualifier and add the 1st
 group
    assigneeGroupsQualifier = 'sys_idIN' +
 grAssigneeGroups.getValue('group');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   }
   else {
    // build a comma separated string of groups if there is
 more than one
    assigneeGroupsQualifier += (',' + grAssigneeGroups.group);
   }
  }
  // return Groups where assigned to is in those groups we use
 IN for lists

  gs.log('DP: RefQual = ' + assigneeGroupsQualifier);

  return assigneeGroupsQualifier;
 },
 type: 'ReferenceQualifierHelper'
};
```

What to do next

To test, create an incident and select a user in the **Assigned to** field. Click the **Assignment group** lookup icon. Only the groups that contain the user you selected appear. For example, you assign an incident to Bob Smith, who belongs to the **Database** group and the **Networking** group. The only options that appear in the assignment group are **Database** and **Networking**.

The INSTANCEOF operator in reference qualifiers

You can use the INSTANCEOF operator in a reference qualifier to shorten or simplify a complex class qualifier.

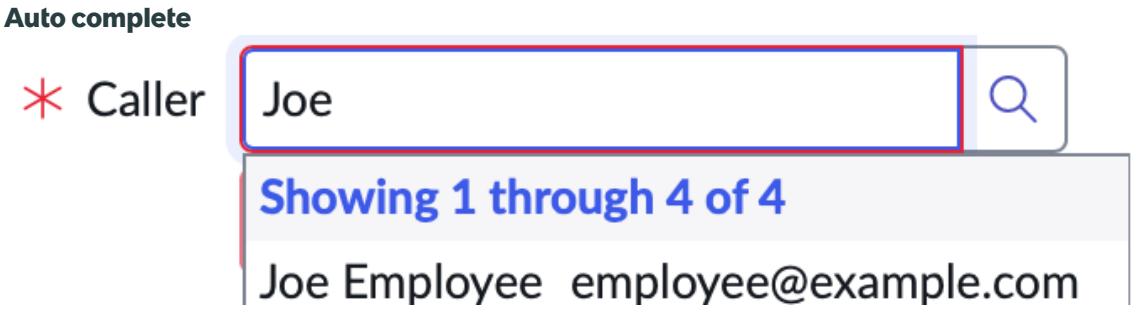
For example, use the INSTANCEOF operator for a reference field to the cmdb_ci table to specify that all subclasses of a class are included in the results. The following reference qualifier returns all servers, including Linux, UNIX, Windows, and so on, because each of those subclasses extend the cmdb_ci_server class.

```
sys_class_nameINSTANCEOFcmdb_ci_server
```

In another example, you can simplify the following reference qualifier in a similar way.

```
 u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_name=cmdb_ci_computer
^ORsys_class_name=cmdb_ci_server
^ORsys_class_name=cmdb_ci_win_server
^ORsys_class_name=cmdb_ci_unix_server
^ORsys_class_name=cmdb_ci_linux_server
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```

Using the INSTANCEOF operator, the reference qualifier is rewritten as follows because the server subclasses extend the cmdb_ci_computer class.



```
 u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_nameINSTANCEOFcmdb_ci_computer
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```

Auto-complete for reference fields

By default, a reference field auto-completes as the user types in the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

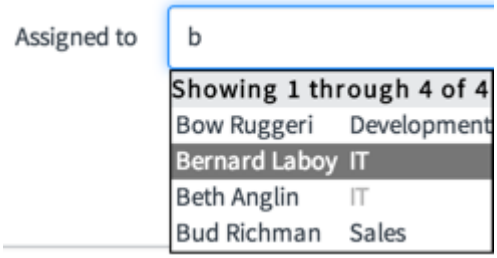
Administrators can configure additional auto-complete options. A user must have table-level read permission on the referenced table for auto-complete to display any options.

Dictionary attributes for auto-completion of reference fields

There are dictionary attributes that are specific to reference fields and that determine auto-complete behavior.

Reference field auto-completion dictionary attributes

Attribute	Description
ref_auto_completer	Specifies the name of the client-side JavaScript class that creates the drop-down auto completion choices. Valid class values include: • *AJAXReferenceCompleter*: Displays matching auto-complete choices as a drop-down choice list. The list only displays the reference table's display value column. Reference fields automatically use this class if there is no other auto-completion class specified. • *AJAXTableCompleter*: Displays matching auto-complete choices as rows in a table. The table displays the reference table's display value column and any columns listed in the *ref_ac_columns* attribute. • *AJAXReferenceChoice*: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the reference table's display value column. Furthermore, the list only displays up to 25 matching choices. If there are more than 25 auto-complete choices, the reference field instead displays the choices with the AJAXTableCompleter class.
ref_ac_columns	Specifies the list of reference table columns to display. Separate column names with a semi-colon. For example, *ref_ac_columns=user_name;email;sys_created_on* allows auto-complete to match text from the user_name, email, and sys_created_on columns.
ref_ac_order_by	Specifies the reference table column that sorts the auto-completion choices. For example, *ref_ac_order_by=name* sorts the auto-completion choices alphabetically by name.



Auto-complete UI features

The AJAX table completer class has a number of UI improvements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The table completer always displays the number of records the auto-complete query finds.
- The table completer highlights the entire selected row by changing the color of the background and text.
- The table completer lists a value for every column.
  - The first time a value appears in a column, the table completer displays it in black text.
  - The table completer displays subsequent duplicate values in grey text. Previously, the table completer displayed an empty cell in a column containing a duplicate value.

Selected row highlight

Set the *ref_auto_completer=AJAXTableCompleter* dictionary attribute to use these improvements.

Define auto-complete attributes for all references to a table

A field inherits and uses the reference table's auto-complete attributes unless the field has its own value for the same attributes. You can define the attributes for references to a table, and it affects every form that references that table.

Before you begin

Role required: personalize_dictionary

About this task

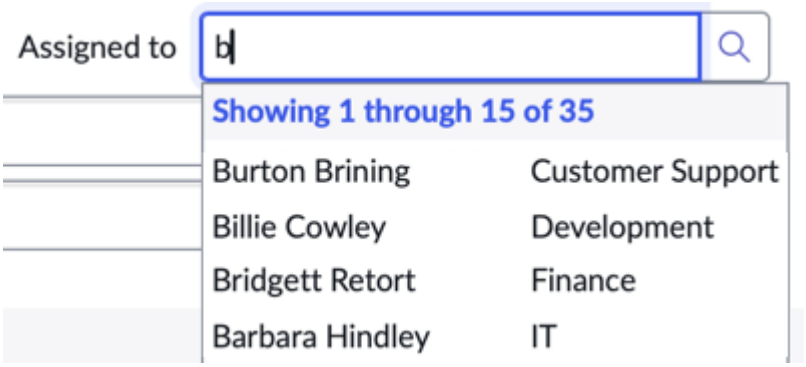
A field-level attribute overrides a table-level attribute of the same name. If a field uses different reference attributes from those that are defined for the reference table, then the field uses both sets of attributes.

Use these steps to define auto-complete attributes for all fields in a table that do not already have their own auto-complete attributes. This example describes how to define auto-complete attributes for all references to the User [sys_user] table.

Note: A field's auto-complete attribute value supersedes a table's auto-complete attribute value. This means that any existing field-level value for an auto-complete attribute supersedes any value the administrator applies to the auto-complete attribute from the reference table.

Procedure

1. Navigate to a list of the target table, such as **All** > **User Administration** > **Users**.
2. Right-click the column header and click **Configure** > **Dictionary**.
3. Select the row that does not list a column name.
   This row is typically the first row in the list. For example, select the first **sys_user** link.
4. Under **Related Links**, click **Advanced view**.
5. In the **Attributes** field, enter a comma-separated list of auto-complete attributes you want to apply to all fields in the table.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
For example, to display the user's department with all references to the sys_user table, enter:

```
ref_auto_completer=AJAXTableCompleter,ref_ac_columns=department
,ref_ac_order_by=department
```

6. Click **Update**.

What to do next
To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the **Assigned to** field. The auto-complete options now include both the user name and department.

Remove the display value column

You can remove the display value column from a reference field by setting the *ref_ac_display_value* attribute to false.

Before you begin
Role required: personalize_dictionary

About this task
This causes the reference field to remove the display value column and only display the columns listed in the *ref_ac_columns* attribute. This feature requires the use of the *AJAXTableCompleter* class and the *ref_ac_columns*, *ref_ac_columns_search*, and *ref_ac_display_value* attributes.

Note: Auto-complete cannot match text from additional columns when the reference field is a product of the *ui_reference* UI macro. This means any auto-complete action against a selector, such as the Impersonate User list, can only match text against the display value.

This example describes how to remove the display value column from references to the User [sys_user] table and replace it with references to the first_name and last_name columns.

Procedure
1. Navigate to a list of the target table, such as **All** > **User Administration** > **Users**.
2. Right-click the column header and click **Configure** > **Dictionary**.
3. Select the row that does not list a column name.
   This row is typically the first row in the list. For example, select the first **sys_user** link.
4. Under **Related Links**, click **Advanced view**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

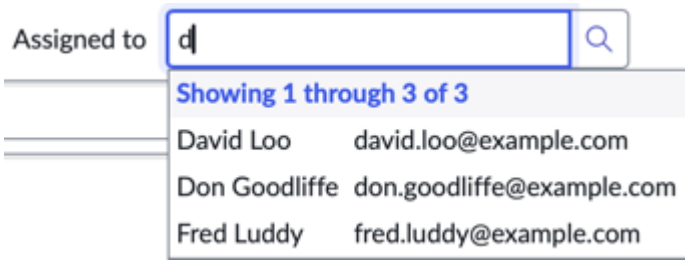
5. In the **Attributes** field, add the *ref_auto_completer*, *ref_ac_columns*,*ref_ac_columns_search* , and *ref_ac_display_value* attributes.

   Example
   For example, to hide the display value column and only display the user's first and last names enter the following.

   ```
   ref_auto_completer=AJAXTableCompleter,ref_ac_columns=first_name
   ;last_name,ref_ac_columns_search=true,ref_ac_display_value=fa
   lse
   ```

6. Click **Update**.

What to do next
To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the **Assigned to** field. The auto-complete options now hide the display value column (user_name) and only display the first_name and last_name columns.



Improve auto-complete queries

By default, all reference fields use a **starts with** query to search for matching text in the reference table. This prevents auto-complete from executing inefficient **contains** queries every time a user searches a reference field. You can require all reference fields to use a **starts with** query.

Before you begin
Role required: admin

About this task
The following example illustrates a **contains** query. Note that the letter "d" appears anywhere in the user's first or last name.

This procedure describes how to change the *glide.ui.ref_ac.startswith* system property to always use a *starts with* query.

Procedure

1. In the navigation filter, enter `sys_properties.list` and press the Enter key.
2. Select the *glide.ui.ref_ac.startswith* property.
   To search for the property, enter `*startswith` in the **Go to** search filter for the **Name** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Value** field, replace **false** with **true**.

   Note: Setting the *glide.ui.ref_ac.startswith* system property to **true** overrides any existing *autocomplete.contains* settings in both user and system level preferences. This property changes the autocomplete query method for all users regardless of preferences.

4. Click **Update**.
5. Test the change by opening a record with a reference field and entering a character in it, as illustrated in the example below.

Configure auto-complete to match text from any reference field

By default, auto-complete only matches text in the display value column. You can configure a reference field to match text from any additional column the reference field displays.

Before you begin

Role required: personalize_dictionary

About this task

You can add the *ref_ac_columns_search* attribute to enable auto-complete to match text in any column listed in the *ref_ac_columns* attribute. Set the *ref_ac_columns_search* attribute to **true** to match text from all reference field columns. By default (or when this attribute is **false**) auto-complete only matches text in the display value column.

Procedure

1. Select and hold (or right-click) the label of a reference field.
2. Select **Configure Dictionary** from the list.
3. Under **Related Links**, click **Advanced view**.
4. In the **Attributes** field, add the desired auto-completion attributes.
   For example, these attributes add the department field to the caller list and sort callers by their department:

```
ref_auto_completer=AJAXTableCompleter,ref_ac_columns=department
,ref_ac_order_by=department,ref_ac_columns_search=true
```

5. Click **Update**.

Example:

The following example describes how to set the **Configuration Item** field display the CI class names from auto-complete choices for the Configuration item [cmdb_ci] table.

```
ref_auto_completer=AJAXTableCompleter ,ref_ac_columns
 =sys_class_name ,ref_ac_order_by
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
=sys_class_name ,ref_contributions
=task_show_ci_map ;ci_show_incidents
```

Note: The *ref_contributions* attribute controls the icons that appear next to the reference field.

Enable contains auto-complete searches

By default, the reference auto-complete uses a **starts with** search. A user preference can be created to implement a **contains** search.

Before you begin
Role required: admin

Procedure

1. Disable the *glide.ui.ref_ac.startswith* system property.
   For more information, see Improve auto-complete queries.

   Note: Setting the *glide.ui.ref_ac.startswith* system property to **true** overrides any existing "autocomplete.contains" settings in both user and system level preferences. This property changes the auto-complete query method for all users regardless of preferences.

2. Navigate to **User Administration** > **User Preferences**.
3. Select the preference **"'<referenced table>.autocomplete.contains'"**.
4. Set the **value** field to **true**.
5. Select **Update**.

What to do next
Log out and log back in to display the updated search.

Wildcards in reference auto-completes

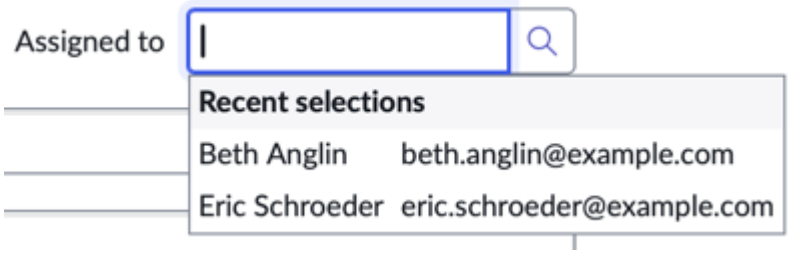
Wildcard searches use the auto-complete functionality.

Use an asterisk in the reference field for wildcard searches.

If two asterisks are entered, a list of available records display in the auto-complete suggestions.

Recent selections

Reference fields store a list of each user's recent selections to enable you to quickly select past values when filling in a reference field.



By default, the system stores up to 15 selections from a reference field for each user in the Recent Selection [sys_ui_recent_selection] table. You can see the recent selections list by selecting an empty reference field.

Note:

- The system doesn't store recent selections for Service Catalog reference variables.
- Recent selections aren't available in the Service Portal or mobile user interfaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recent selections

The system uses auto-complete to filter the list of recent selections to match the values that you enter.

Recent selections filtered

The system adds a Recent Selection record whenever you insert or update a reference field value. Administrators can control the number of recent selections the system displays with the *glide.xmlhttp.max_choices* system property. Setting the property to zero disables recent selections.

Note:

- The *glide.xmlhttp.max_choices* property also controls the number of entries the system displays in lists.
- For information on clearing recent selections, see the How to clear out the "Recent Selections" that appears up on the reference fields. [KB0747334] article in the Now Support Knowledge Base.

Available system properties

Suggestion field type

To help users find what they are looking for, you can add a suggestion field to any form.

Before you begin

Role required: personalize_dictionary

Procedure

1. Open the form to which you're adding a suggestion field.
2. Add a new field or locate an existing field.
3. Right-click the field label and select **Configure Dictionary**.
4. In the **Choice** field, select **Suggestion**.
5. Select **Update**.

Configure suggested text for string fields

You can configure the suggested text options for string fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: personalize_choices

Procedure
1. Select and hold (or right-click) the field label and select **Configure Choices**.
2. Select options and the order in which you want them to appear.
   - To create a new option, enter the suggested text in the **Enter new item field** and click **Add**.
   - The **Apply to Table** field is available when the current table extends another table (for example, Incident extends Task). This field allows suggested text options to be configured for all tables that extend the parent or for only the current (child) table.
3. Select **Save**.
4. To edit existing options, select and hold (or right-click) the field label and select **Show Choice List.**.

Configure suggested text for journal fields

You can configure the suggested text options for journal fields, such as work notes or the activity stream. Suggested text options for journal fields are unavailable in Core UI.

Before you begin
Role required: personalize_responses

Procedure
1. Select and hold (or right-click) the field label and select **Configure Responses**.
2. Select **New**.
3. Enter a label, or brief description, for the option.
4. Enter the complete text in **Response text**.
5. Select **Save**.

Wiki field type

Wikitext fields use the basic wiki markup language and support links to external URLs and to sources within the system.

Some fields in the base system support Wikitext and administrators can add Wikitext fields on any form in the system.

Supported wiki tags

Basic tags are supported for Wikitext fields in the system.

Supported wiki tags

Format	Wiki tag
Headers	= Header 1 =, == Header 2 ==, etc.
Numbered step	#Step 1
Bullets (multi-level)	*Bullet 1, **Bullet 2
Indentation	:Level 1, ::Level 2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported wiki tags (continued)

Format	Wiki tag
Line break	

Tables	Full table support, including cell spacing, padding, borders, background shading, and width measurements.
	
	For example:
	`{| class="wikitable"`
	`|-`
	`! Header 1`
	`! Header 2`
	`|-`
	`| row 1, cell 1`
	`| row 1, cell 2`
	`|-`
	`| row 2, cell 1`
	`| row 2, cell 2`
	`|}`
	
	Note: Sortable tables are not supported (class="sortable").

Code blocks	<pre> Generic block </pre> <javascript> Javascript Syntax </javascript> <xml> XML Syntax </xml>
Bold	'''text'''
Italics	''text''
Ignore Wiki and HTML formatting	<nowiki> wikitext </nowiki>
Web link	[http://community.service-now.com/ <link text>]
Placed images	[[Image:<image name>]] For more information on uploading images or files to the database, see Storing images in the database.
HTML	Most common HTML tags are supported bold, strong, italics, header1 , header2 , header3 , paragraph , _{sub}, ^{sup}, center

Create a Wikitext field

You can create a Wikitext field on any form.

Before you begin

Role required: personalize_form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

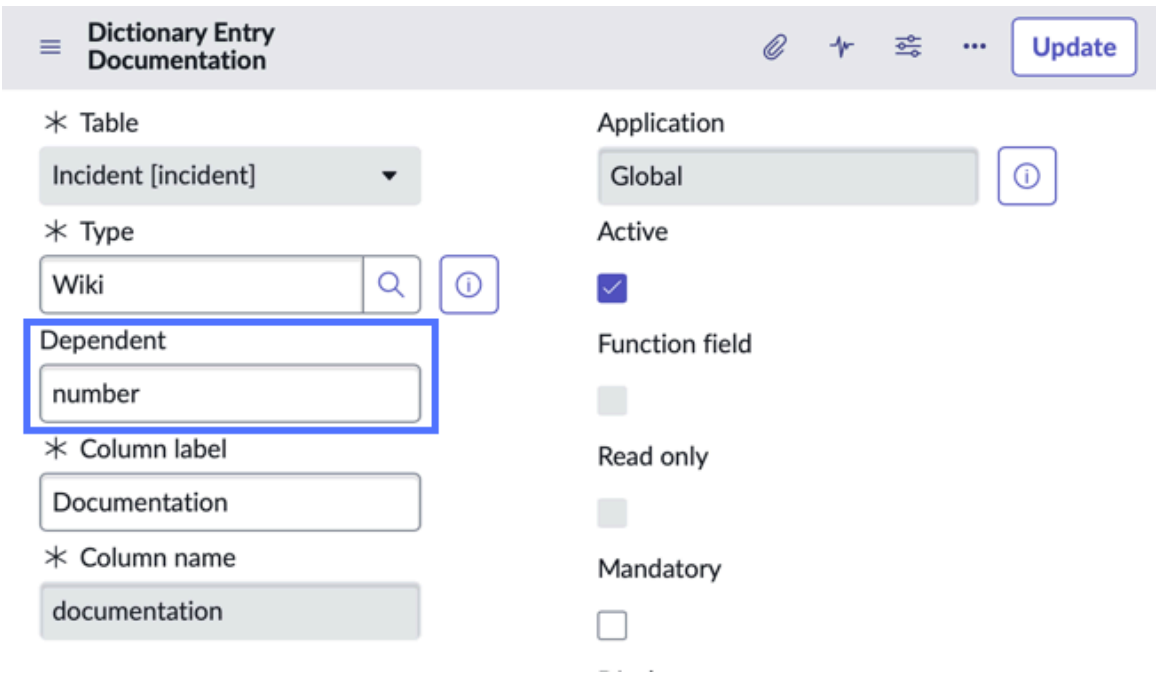
1. Create a field with the **Type** set to **Wiki**.
2. On the form with the new Wiki type field, select **Wikitext** to begin editing.
   The Wikitext field appears on the form.

Related topics

Add and customize a field in a table

Extend the functionality of a Wikitext field

Configure the Wikitext field to link to other sources within the system.



Before you begin

Role required: personalize_dictionary

Procedure

1. Right-click in the header of the new Wikitext field.
2. Select **Configure Dictionary**
3. In the **Dependent** field of the dictionary form, enter the field you want to use for linking to other pages.

   For example, on the Incident table, you might choose the **number** field.

   This configuration enables you to link to any incident by using that incident's number. For example, to open INC0000002, you enter `[[INC0000002]]`.

   The following dictionary attributes are available for wiki_text fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *preview_first=true* - sets the preview mode to display on page load, otherwise editor will be displayed
- *preview_selector=true* - enables the toggle button to switch between the editor and preview
- *dual_mode=true* - enables displaying both the editor and the preview simultaneously during edit mode.

ServiceNow AI Platform® list administration

Administrators control the data presented to end users in a list, the controls that appear, and the behavior of the controls.

Get started

Note: For information about using lists, see Lists.

Configure	Administer
	
Configure lists for all users.	Administer list behavior and allow personalization for individual users.

Configuring lists on the ServiceNow AI Platform®

Users with the appropriate roles can configure various aspects of lists. Configuration changes apply to all users.

With list configuration, you can add, remove, and reorder list columns. You can configure calculations to appear under columns. You can also hide controls and define access conditions by role for existing list controls. Configuring lists is called personalizing lists in versions prior to the Fuji release.

Note: Configuring a list in this way modifies the list for all users. To make changes to a list that are visible to you only, see Personal lists.

Configure the list layout

You can configure a list to choose which columns appear in a list, create list views, and create fields on the table.

Before you begin

Role required: personalize_list

About this task

https://player.vimeo.com/video/1198909309?h=c2a44f3071&badge=0&autopause=0&player_id=0&app_id=58479%22

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the list you want to configure.
2. Open the **List controls** menu ( ) and select **View** > **(view name)**to select the view you want to configure.
3. Right-click any column heading and select **Configure** > **List Layout**.
4. Add, remove, or reorder fields to configure the columns displayed and their order of appearance.
   The first non-reference field automatically links to the form view of the record. For this reason, consider using the record number as the first column in the list layout.
5. Select **Save**.

Note:

- If you use Personal lists and then configure the list view differently, the changes do not appear until you reset your personal list to column defaults.
- Inactive fields display in admin-configured lists until an admin updates the list layout to remove them.

Trouble?

If a reference field in a list displays as (empty) instead of the expected value, it is due to another field in the list containing an incorrect reference to either an orphaned record or a sys_id that does not exist in the referenced table. The solution is to remove the incorrect reference data from any reference fields in that table.

Add an extended field to a base table list

Administrators can configure a property that determines whether fields on extended tables can be added to a parent table list. For example, when this feature is enabled, you can view and filter on the **Caller** field, from the Incident table, on a Task table list.

Before you begin

Role required: admin

Note: Enabling this property does not show the extended table fields in the personalize list.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the property **Allow base table lists (task, cmdb_ci, etc.) to include extended table fields (incident_state, os_version, etc.), and allow filtering on extended table fields** (*glide.ui.list.allow_extended_fields*).
3. Select the check box to enable extended fields on parent table lists, or clear the check box to disable the feature.
4. Select **Save**.

Configure list calculations

You can configure list calculations for columns, which calculate column totals, minimums, maximums, and averages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: personalize_list

About this task
You can configure list calculations for multiple columns in the same list. List calculations apply only to the view of the list in which they are configured. All users can see configured list calculations.

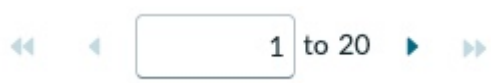
Note:

- List calculations are also available in list reports.
- List calculations for a calculated field can only operate on the *current values stored in the database for each record and not the values as calculated fresh when the list is rendered.

Procedure

1. In a list of records, right-click the header of a numeric column you want to evaluate with list calculations.
2. Select **Configure** > **List Calculations**.
3. Select one or more of the following list calculation options:
   - Total value (not available for string, date, or date/time fields)
   - Minimum value
   - Maximum value
   - Average value (not available for string, date, or date/time fields)
4. Select **OK**.
   The calculations appear below the last record in the column. If the list is grouped, in addition to the overall calculations at the bottom of the list, group calculations appear below the last record in each group.

Omit record count in a list



Speed up how fast lists load by removing the calculation of the total number of records in a list.

Before you begin
Role required: workspace_admin

About this task
Calculating the total number of records included in a list that's filtered from large tables can take a long time. Platform displays the total number of records in the list.

To load lists faster, you can remove the page calculation for all or only specified filtered lists. When you remove the calculation, the total record count is not displayed and the Last Page icon ( ) is grayed out.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a list, for example navigate to **Incident** > **All**.
2. Right-click a header in the list and navigate to **Configure** > **List Control**.
3. Select **Remove pagination count**.
4. **Optional:** To omit the record count only in specific view:
   a. Select **Remove pagination count for specific views**.
   b. Beside **Specific list of views prevented from getting full record count**, select the lock icon ( ).
   c. Select the search icon ( ) and select the view where platform omits the page count.
   d. Repeat the previous step for as many views as necessary.
5. Select **Update**.

Configure list controls

You can configure list controls, such as buttons and filters.

Before you begin

Role required: personalize_control

Procedure

1. Open a list.
2. Right-click any column heading and select **Configure** > **List Control**.
3. Complete the form.

Note: The list control fields that are available for embedded lists are more limited. Unless otherwise noted, the list control fields in the following table are available for both standard and embedded lists.

List Control form

Field	Description
Table	Name of the table for the list or related list. For example, **Change Request [change_request]**. The system automatically sets this value.
Related list	Name of the table and field that define the related list. For example,**sysapproval_approver.sysapproval**. The system automatically sets this value.
Label	Label to display for this list. Allows an admin to customize the label for a related list or list. If not supplied, the default plural label for the file is used. For example, the label for the Incident table would be **Incidents**.
Omit new button	Option to prevent the **New** button from displaying on this list. Clear the check box to display the **New** button or to control the **New** button with roles (**New roles** field). This field is available for standard lists only.
Omit edit button	Option to prevent the **Edit** button from displaying on this list. Clear this check box to display the **Edit** button or to control the **Edit** button with roles (**New roles** field). The **Edit** button does not apply to all lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is available for standard lists only.
Omit if empty	Option to omit the **Related List** from the form entirely (no header) if there are no entries for the **Related List**.
Omit columns if empty	Option for a top-level list to omit the column headers AND filters/breadcrumbs for an empty column.
Omit filters	Option to hide filters or breadcrumbs for this list. Clear this check box if you always want filters or breadcrumbs or to control filters/breadcrumbs with roles (**Filter roles** field). This field is available for standard lists only.
Omit links	Option to hide links for fields that reference other files in this list. Leave this button unchecked to generate links or to control the use of links with roles (**Link roles** field).
Omit drill-down link	Option to disable the link to the record from the first column in list view. Users can still select the reference icon to access the record. This field is available for standard lists only.
Omit related list count	Option to hide the related list count from displaying on initial load. Set it to **False** to restore it.
Hierarchical lists	See Enable a hierarchical list. Hierarchical list inserted into a record list. Hierarchical lists enable a user to view the contents of a record's related lists without leaving the record list form. This field is available for standard lists only.
List edit type	Ability for the user to edit values directly in individual cells in a list. The options are: ○ **Save immediately (cell edit mode):** enables cell editing. The entire row is saved when the user enters a new value. ○ **Save data by rows:** enables cell editing. The row is saved only when the user navigates away from the row or selects the **Save** icon ( ). This mode allows the user to modify multiple values before saving a record. ○ **Disable list editing:** prevents users from editing cells in the list. This field is available for standard lists only.
List edit tag	Unique tag that is sent to a reference qualifier as the script variable *`listEditRefQualTag`*. Enter an arbitrary string of letters or numbers.
List edit insert row	Ability for a user to create records in list view. When it is enabled, an empty row appears at the bottom of the list. This field is available for standard lists only.
Remove pagination count	Option to remove pagination count from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Disable Natural Language Query (NLQ)	Option to disable the NLQ filter in specific lists when NLQ on lists is enabled in the instance. The NLQ filter enables you to use natural language to filter lists instead of using the condition builder. For more information on NLQ filters, see Natural Language Query. **Note:** When the system property *com.snc.listv2.nlq.lists.enabled* (com.snc.listv2.nlq.lists.enabled) is set to **false**, the query destructs. Text entered in the search replaces existing conditions.
Application	Scope of this setting's applicability. Global means that all workspaces can use this setting.
New roles	User roles that can access the **New** button on this list. Leave the field blank to enable all users to access the **New** button. This option does not apply to embedded lists, which do not contain **New** buttons.
Filter roles	User roles required to have the filter appear in the list. This field is available for standard lists only.
Link roles	User roles required to have links generated for fields that reference other files.

Example of configuring list controls

The following example shows how to configure a list of related incidents in a problem record to suit specific business needs.

Before you begin
Role required: personalize_control

About this task
In this example, a related list label is configured to say `Child Incidents`, not just `Incidents`. The related list is also configured to remove the **New** button to prevent users from creating incidents from the Problem form.

Procedure
1. Navigate to a problem record.
2. Open the list context menu in the **Incidents** related list and select **Configure** > **List Control**.
3. On the List Control form, change the **Label** field to `Child Incidents`.
4. Select the **Omit new button** check box.
5. Select **Submit** to save your changes and return to the previous record, in this case, the problem record.
   In the problem record, the label for the embedded incident list has changed and the **New** button is no longer available.

Advanced list control with scripts

You can write scripts to specify which list elements, such as links, filters, and buttons, are present.

These scripts can react to the record that is being displayed. For related list controls, the global variable **parent** identifies the parent record. For primary lists, there is no parent record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the List Control form and add the script field that you need:

- **Omit Columns Condition:** If there are no conditions, omit column headings.
- **Omit Edit Condition:** Omit the **Edit** button.
- **Omit Empty Condition:** If there are no conditions, omit the list header.
- **Omit Filter Condition:** Omit the list filter.
- **Omit Links Condition:** Omit related links.
- **Omit New Condition:** Omit the **New** button.

In these script fields, if the script evaluates to **true**, the item is omitted. The following script is an example that you can use on the **Affected CIs** related list to show only the **Edit** button if the parent task is active. This script is placed in the **Omit Edit Condition** script field.

```
var answer;
 if (parent.active == true ) {
 //Do not remove the 'Edit' button
  answer = false;
}
else {
 //Remove the 'Edit' button
  answer = true;
}
answer;
```

Configure a list UI action

You can create a UI action that opens the slushbucket interface to customize lists in the list view.

Before you begin

Role required: ui_action_admin

Procedure

1. Navigate to **All** > **System Definition** > **UI Actions**.
2. Click **New**.
3. In the **Table** field, select the **List [sys_ui_list]** table.
4. Select the **List context menu** check box.
5. Ensure the **Active** check box is selected.
6. Paste the following script in the **Script** field:

```
var url  = "slushbucket.do?sysparm_form=list&sysparm_list=" +
 current. name + "&sysparm_view=" + current. view. name ;
url  += "&sysparm_collection=" + current. parent +
 "&sysparm_collection_relationship=" + current. relationship ;
url  += "&sysparm_referring_url=sys_ui_view.do?sys_id=" +
 current. view. toString ( ) ;
action. setRedirectURL (url ) ;
```

7. Click **Submit**.

Show/hide filter controls

The Show/hide filter used in the list configuration, lists the fields to configure in the filter conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The fields mentioned in the Show/hide filter are sorted in an alphabetical order.

Note: If the name of the fields start with an accented character, those fields are placed at the end of the list.

You can enable the *guide.ui.condition_builder.sort_labels_by_locale* sys property to sort the fields of the Show/hide filter as per the locale-based language. The sys property is set to **False**, by default. If you have a customized script that's based on alphabetical sorting of the fields, the locale-based language setting might break your script. So, you can enable the sys property only when you need the filter to be locale-based language.

Note: If the sys property is not enabled, the fields are sorted in an alphabetical order. The fields starting with an accented character are placed at the end of the list.

Administering lists on the ServiceNow AI Platform®

Administrators can control the sort sequence, allow personal lists, restrict filters and breadcrumbs, allow context ranking and more.

Administration overview

- Controlling the sort sequence used to display lists

  All lists have a default sort sequence based on the type of fields present in the list.

- List editor administration

  The list editor allows users to edit field values directly from a list without navigating to a form.

- Personal list administration

  Users can customize the layout for any list view by personalizing a list. Administrators can configure options related to list personalization.

- Administer detail rows

  Detail rows provide additional information about records in a list.

- Restrict filters and breadcrumbs with fixed queries

  The record list view allows users to navigate to different subsets of a table using breadcrumbs and filters. You can limit access to parts of the table by restricting active links in breadcrumbs or by suppressing breadcrumbs and filters for specific roles.

- Enable a hierarchical list

  You can enable hierarchical lists to make data from related lists directly accessible from within a v2 list.

- Context ranking

  Context ranking allows a user to sort a collection of records preferentially; that is, independently of the attributes of those records.

- Customize list context menus

  You can customize the content and behavior of list context menus.

Controlling the sort sequence used to display lists

All lists have a default sort sequence based on the type of fields present in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a user displays a list for the first time, it is sorted by one of the following items.

- The **ORDERBY** arguments found the URL. (See the following section on sort order control.)
- The **<table>.db.order** and **<table>.db.order.direction** user preferences.
- The **isOrder** dictionary attribute.
- The **Order** field if one is present in the table.
- The **Number** field if one is present in the table.
- The **Name** field if one is present in the table.
- The field specified as the display field for the table.

Note: The task table is an exception to the preceding sequence. Task and tables extended from task use the **Number** field when no URL arguments or user preferences are found.

Setting default order with user preferences

The **<table>.db.order** and **<table>.db.order.direction** user preferences determine the field and sort direction seen by the user. A default sort can be created by creating user preference records with no value in the **User** field and checking the **System** check box. This preference is applied to any users who do not have their own preference.

Setting the default sort order in the system dictionary

An administrator can set the sort order of records displayed for a table in the system dictionary when there is no other sort specified. This is done by adding an attribute called **isOrder** with a value of **true** to the dictionary entry of the desired field. This sort is the sort order presented to all users initially. Once a user sorts a list, that user preference is saved, and the list is always sorted for that user based on the previous sorting preference.

Note: **isOrder** can define which field is used for list sorting, but cannot control the sort direction.

Sorting a column in a list according to session language

By default, when sorting columns in lists, the field values are ordered according to the English alphabet. To support sorting a column according to the user's session language, you can configure the instance behavior and behavior of individual columns. See Sorting according to the session language.

Related topics

System dictionary

User preferences

Altering tables and fields using dictionary attributes

Sort order control

For any list, if the user has clicked a column header to sort by that column, then that action is remembered. The next time that list is displayed, the same field is used to order the list.

This remembered sort field can be overridden by adding a *sysparm_order* specification to the definition of the module. For example, if each time **News** is displayed, you want the new items listed in order of importance, then the **News** module can be updated accordingly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set module sort order to the Importance field value

The actual order (ascending or descending) can be specified by adding a *sysparm_order_direction* specification. Here are two examples of sorting a list by the **sys_created_on** field, one ascending and one descending:

```
&sysparm_order=sys_created_on &sysparm_order_direction=desc
&sysparm_order=sys_created_on &sysparm_order_direction=asc
```

Sort by multiple fields

To sort a list by multiple fields, remove everything from the filter field and place it in the arguments field. For example, if the filter specifies **[Active] [is] [true]** and you want to sort by category and subcategory, remove the condition and put the following in the module arguments:

```
active=true^ORDERBYcategory^ORDERBYsubcategory
```

This argument first orders by the category and then orders by the subcategory. If you want any field to be a descending sort, then change *ORDERBY* to be *ORDERBYDESC*.

List editor administration

The list editor allows users to edit field values directly from a list without navigating to a form.

Administrators can manage this feature by using the following options. Some of the options are not supported in List v3.

- Configure global properties
- Configure list control settings for a table
- Configure contextual security rules
- Manage user preferences (List v2 only)

Warning: In List v2, the list editor does not enforce client scripts or UI policies. In List v3, the list editor enforces UI policies and mandatory dictionary attributes, but not client scripts. Allowing list editing with client scripts running on fields in a form can result in incorrect data being saved to the record. For systems in which client scripts or UI policies apply to forms, consider disabling list editing or creating appropriate business rules or access control to control the setting of values in the list editor. See Use business rules and client scripts to control field values for information on managing form and list editing.

Warning: You cannot edit state fields that are extended from the Task [task] table from a list of task records. Examples include:

- problem_state
- incident_state
- phase_state
- request_state

While these fields are visible from the task list, they must be edited from the extended table.

Configure list editor properties

Configure list editor properties that control whether lists can be edited and, in List v2, which field types cannot be edited.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. To disable list editing, set the **Enable list editing** (*glide.ui.list_edit*) property to **No** by clearing the check box.
   This property is enabled by default, and it globally enables list editing. When you disable it, the list editor is disabled globally.
3. To configure the field types that cannot be edited for v2 lists, complete the following steps.

   a. Locate the **List of element types (comma-separated) that cannot be edited in the list editor** (*glide.ui.list_edit_ignore_types*) property, which contains several element types that cannot be edited by default.

   Note: This property does not impact v3 lists. There is no equivalent property for List v3.

   The following field types are not editable from the list editor by default.

   - Conditions [conditions]
   - Currency [currency]
   - Document ID [document_id]
   - Field List [field_list]
   - HTML [html]
   - Image [user_image]
   - List [glide_list]
   - Price [price]
   - Template Value [template_value]
   - Time [glide_time]
   - User Roles [user_roles]
   - Video [video]
   - Array [array]

   b. Add any other field types you want to disable to the end of the list, separated by a comma.
4. Select **Save**.

Configure list control settings for the list editor

You can configure the list control settings that affect the list editor.

Before you begin

Role required: personalize_control

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

List control settings customize the behavior of list functions for a table.

Procedure

1. Navigate to a list view for the desired table.
2. Right-click any column heading and select **Configure** > **List Control**.
3. On the List Control form, select the desired settings.

List control settings for the list editor

Field	Description
List edit type	Ability for the user to edit values directly in individual cells in a list. The options are: ○ **Save immediately (cell edit mode):** enables cell editing. The entire row is saved when the user enters a new value. ○ **Save data by rows:** enables cell editing. The row is saved only when the user navigates away from the row or selects the **Save** icon ( ). This mode allows the user to modify multiple values before saving a record. ○ **Disable list editing:** prevents users from editing cells in the list. This field is available for standard lists only.
List edit insert row	Ability for a user to create records in list view. When it is enabled, an empty row appears at the bottom of the list.  This field is available for standard lists only.

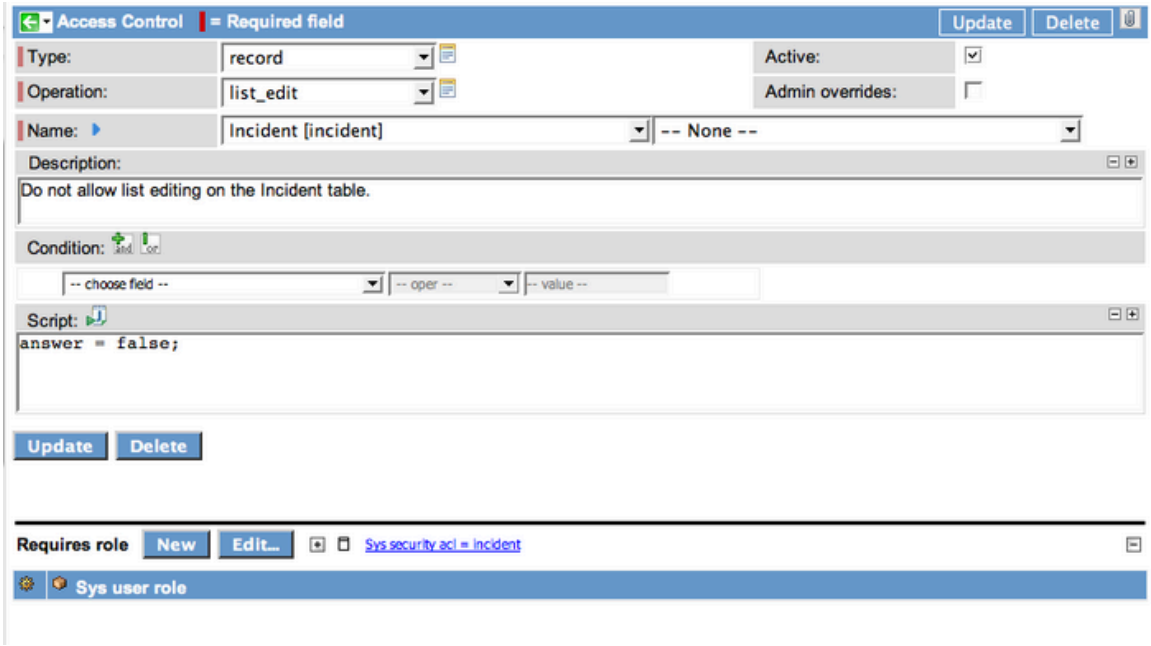
4. Click **Update**.

Configuring contextual security for the list editor

The list editor enforces existing access control rules (ACLs) and additional security controls to restrict editing from a list.

The list_edit security operation specifically controls the ability to edit information in a list. Apply this operation in the same manner as the write operation to limit list editing for fields that require the user to navigate to the form. Reasons you may require a user to edit a field in a form include complex UI policy constraints or other policies you have in place.

- write and list_edit access to the field
- write and list_edit access to any dependent fields of the field
- write and list_edit access to any fields that depend on the field being edited



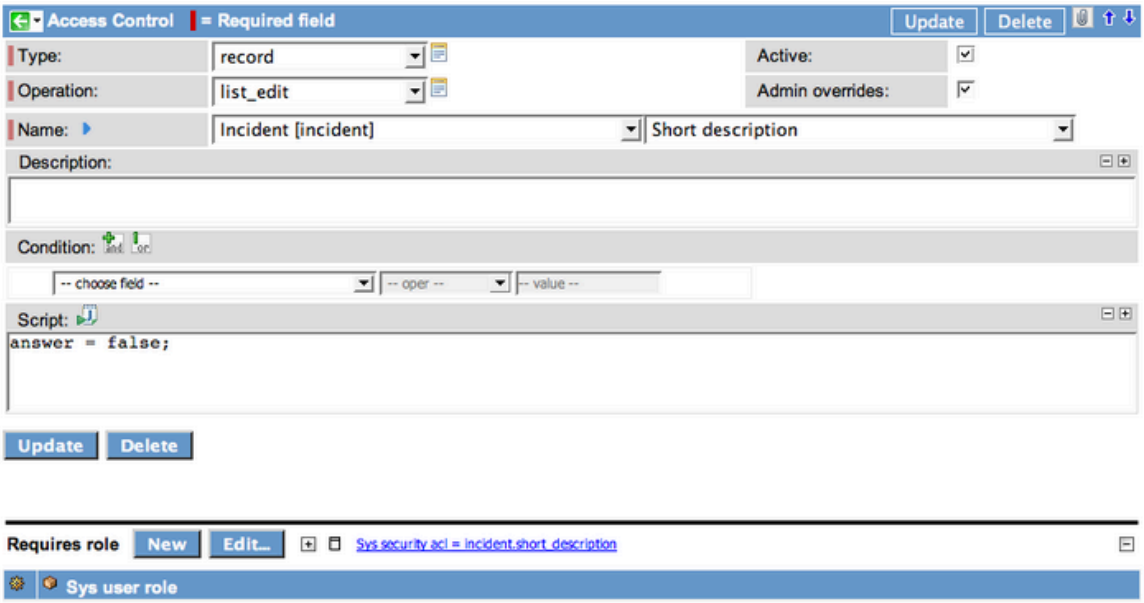
To configure access controls, navigate to **System Security** > **Access Controls**. The following examples use the list_edit security operation to restrict list editing in certain contexts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example - Restrict a table

This access control prevents everyone from editing all fields in the Incident table in a list.

Restrict the Incident Table



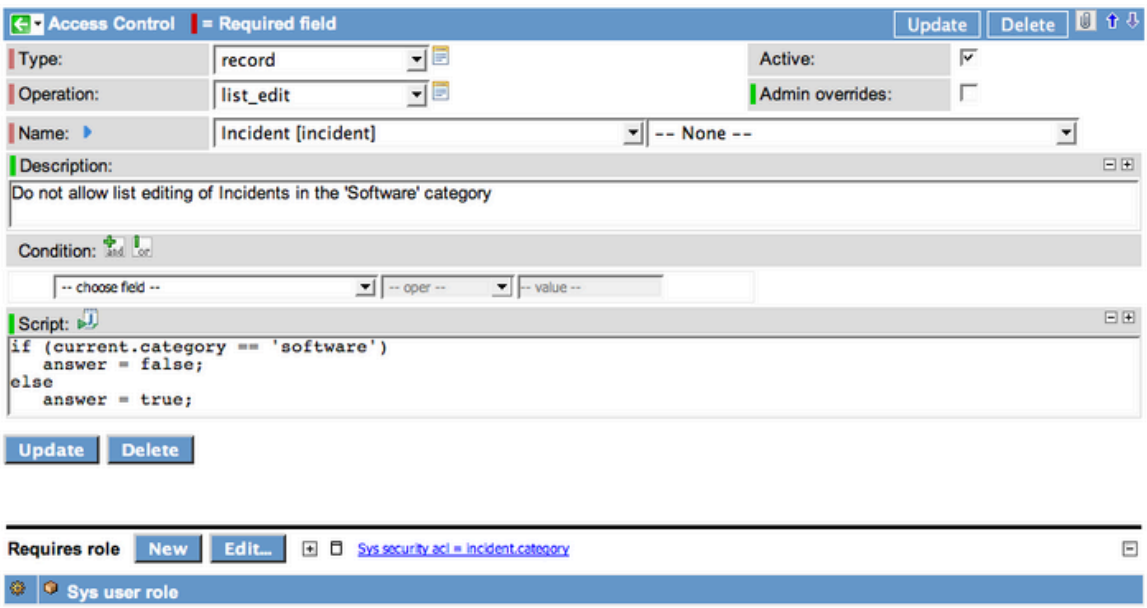
- **Type:** record
- **Operation:** list_edit
- **Name Incident:**[incident]
- **Admin overrides:** Clear the check box.
- **Script:** `answer = false;`

Example - Restrict a field

This access control prevents everyone except an administrator from editing the Short Description field of an incident record in a list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Restrict the Incident Short Description



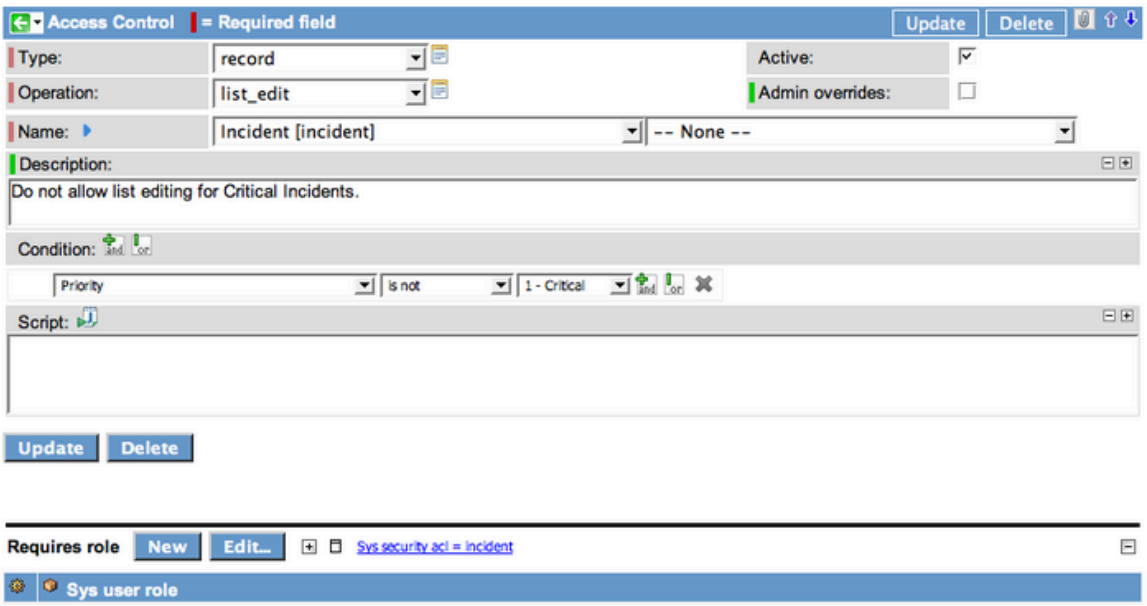
- **Type:** record
- **Operation:** list_edit
- **Name:** Incident [incident], Short Description
- **Admin overrides:** Select the check box.
- **Script:** `answer = false;`

Example - Restrict a field with a script

This access control prevents everyone from editing an incident with a category of Software in a list. It is defined by a script.

Restrict Software Incidents

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- **Type:** record
- **Operation:** list_edit
- **Name Incident:**[incident]
- **Admin overrides:** Clear the check box.
- **Script:**

```
if (current.category == 'software')
answer = false;
else
answer = true;
```

Example - Restrict a field with a condition

This access control prevents everyone from editing a Critical Incident in a list. It is defined by a condition.

Restrict Critical Incidents

- **Type:** record
- **Operation:** list_edit
- **Name Incident:**[incident]
- **Admin overrides:** Clear the check box.
- **Condition:** Priority is not 1 - Critical

User preferences for list editing

Users can set user preferences for list editing by personalizing a list (available when the list mechanic is activated).

To view and manage list editor user preferences, navigate to **User Administration** > **User Preferences**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User preferences for list editing

User preference name	Description
list_edit_enable	Set the value to **true** to enable or **false** to disable list editing. Default value is **true**.
list_edit_double	Set the value to **true** for double-click or **false** for single-click. Default value is **true**.

Related topics

Personal list administration

Personal list administration

Users can customize the layout for any list view by personalizing a list. Administrators can configure options related to list personalization.

In List v2, administrators can also disable or restrict access to list personalization. This functionality is not supported in List v3.

Enable or disable personal lists

You can enable or disable personal lists through the UI Macros module.

Before you begin
Role required: ui_macro_admin

Procedure

1. Navigate to **All** > **System UI** > **UI Macros**.
2. Activate (or deactivate) the *list_mechanic2* UI macro.

Control which roles can personalize lists

You can control who can create personal lists.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the property labeled **List of roles (comma-separated) that can use Personal Lists. If blank, all can use** (*glide.ui.list_mechanic.roles*).
3. Enter the roles for which personal lists are available, separated by commas, or leave the field blank to allow access for all users (default).

Manage personal lists

Administrators can manage personal lists.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System UI** > **Lists**.
2. Personal lists have a user value in the **User** field.

Related topics

Personal lists

Administer detail rows

Detail rows provide additional information about records in a list.

Before you begin
Role required: admin

About this task
To display detail rows, an administrator must enable them globally and add them to lists.

Note: Detail rows are not supported in List v3.

Procedure

1. To enable detail rows, add a new system property with the following field values.

Name	glide.ui.list.detail_row
Type	true | false
Value	true

2. To add detail rows to a list, complete the following steps.

   a. Add the *detail_row* dictionary attribute to the table.
   Specify the name of the field to display in the following format:
   `detail_row=short_description`

   b. Use the *all_tables* element descriptor with the *detail_row* attribute to display detail rows for all child tables that contain the designated field.

   Example
   For example, *all_tables.detail_row=short_description* is on the Task [task] table by default, so the short description detail row appears in lists for Incident [incident], Problem [problem], and other child tables unless you set *detail_row* to a different field for each one.

Lists

Altering tables and fields using dictionary attributes

Restrict filters and breadcrumbs with fixed queries

The record list view allows users to navigate to different subsets of a table using breadcrumbs and filters. You can limit access to parts of the table by restricting active links in breadcrumbs or by suppressing breadcrumbs and filters for specific roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
A breadcrumb option enables an administrator to control the base view of a record list presented to users. By adding a fixed query to the argument for a module, an administrator can prevent users from expanding their view past a specified starting point. The argument for this fixed query is written as *`&sysparm_fixed_query=active=true`*. A use case for this query is to prevent users from using the breadcrumbs to switch a list of open incidents to a list of all incidents. When users select **Incident** > **Open**, they are limited to viewing and filtering a list of open (active=true) incidents.

Note: A new Create ACL allows all users to save filters by default. This overrides any custom ACLs in place if administrators are restricting filter access. The new ACL gives all users access to the User field by default, and access to the Group field only if users have the filter_group role and are in the currently selected group.

Procedure
1. Point to the application menu that contains the module to edit and click the edit application (pencil) icon.
   To open the module directly, point to the module and click the edit module (pencil) icon.
2. Select the module to edit.
   For example, select **Open**.
3. In the **Link Type** section of the Module form, select **List of Records** for the **Link type**.
4. Delete the **Active is true** filter, if present.
5. Add `&sysparm_fixed_query=active=true` to the **Arguments** field and update the record.

Suppress filters and breadcrumbs with list controls

Use list controls to suppress filters and breadcrumbs on defined tables for users with specific roles.

Before you begin
Role required: personalize_control

Procedure
1. Navigate to the list view of the table to restrict breadcrumbs.
2. Open list control by performing the appropriate action for the list version.

Version	Action
List v2	Right-click any column header and select **Configure** > **List Control**.
List v3	Open the list title menu and select **List Control**.

   You can also navigate to **System UI** > **List Control**.
3. On the List Control form, select the **Omit Filters** check box, or clear the check box to include filters.
   The **Filter Roles** field allows an administrator to specify certain roles that can see the filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use script includes to suppress filters and breadcrumbs

You can use a script to restrict filters and breadcrumbs to specific roles, either on a per-table or global basis. Using a script is an advanced option that offers additional flexibility compared to using list control.

Before you begin

Using a script include requires knowledge of JavaScript.
Role required: script_include_admin

About this task

The examples shown must be modified for your environment.

Procedure

1. Create a script include with the name *<tablename>DisplayFilter.*
   The script section contains one function with the same name as the script include.
2. Use your function to set the global variable *answer* to either true (show the filters and breadcrumbs) or false (hide them.)

   Example
   The following example restricts filters and breadcrumbs on the Incident table to users with any role. Be sure that the name of the script matches the function name exactly, including case.

```
function incidentDisplayFilter() {
    if (gs.getUser().hasRoles()) {
        answer = "true";
    } else {
        answer = "false";
    }

    return answer;
}
```

3. **Optional:** To exclude a specific role from having access to filters and breadcrumbs, make the following change.

```
function incidentDisplayFilter() {
    if (gs.getUser().hasRoles()
 && !gs.getUser().hasRoles('newrole')) {
        answer = "true";
    } else {
        answer = "false";
    }

    return answer;
}
```

   Users with the role `newRole` do not have access to filters and breadcrumbs.

4. **Optional:** To let all users use filters and breadcrumbs on the Incident table, make the following change to your script.

```
function incidentDisplayFilter() {
    var answer = true;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

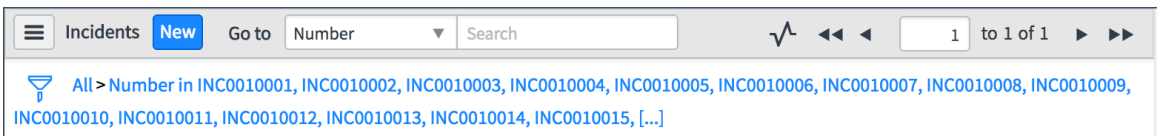
```
    return answer;
}
```

5. **Optional:** To modify filter and breadcrumb access for another table, create a script include using the name of that table instead of Incident.

Increase the allowed number of breadcrumb entries

You can add a property to allow for a larger number of breadcrumb entries in the filter.

Before you begin
Role required: admin



Procedure

1. Enter `sys_properties.list` in the Navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property does not exist by searching for *`glide.ui.breadcrumb_max_entries`*.
3. Click **New**.
4. Complete the form.

Field	Value
Name	glide.ui.breadcrumb_max_entries
Type	integer
Value	The number of breadcrumb entries you want to appear in the filter, for example, 15.The de fault number is 10.

5. To verify this property, go to any table and use the filter modifier **is one of** to search for any number of items.
   The number of entries you entered in the Value field displays before ending in a [...].

Breadcrumb entries

Enable a hierarchical list

You can enable hierarchical lists to make data from related lists directly accessible from within a list.

Before you begin
Role required: personalize_control

About this task
Hierarchical lists enable a user to view the contents of the related lists of a record without leaving the record list form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

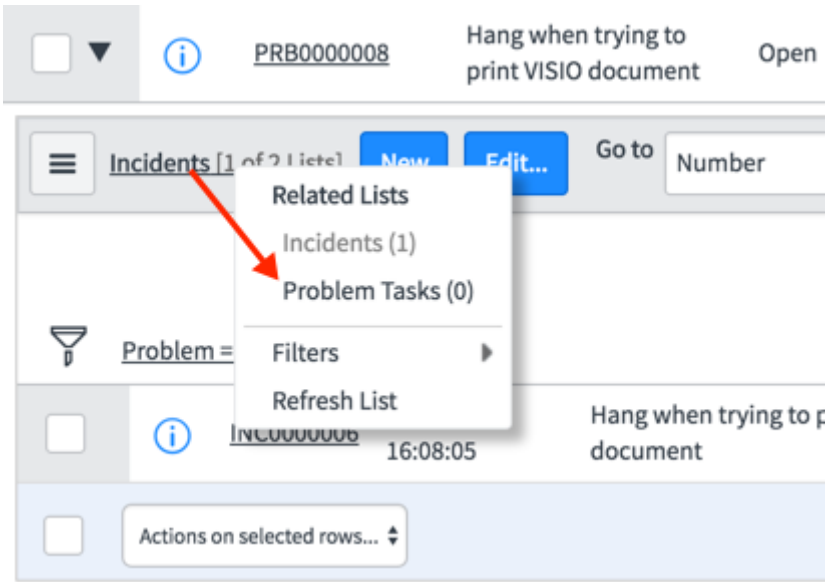
Procedure

1. Right-click any column header, and select **Configure** > **List Control** from the context menu.
2. Select the **Hierarchical lists** check box in the List Control dialog box and then select **Submit** or **Update**.
3. Select the arrow beside a record number to display the related lists for the record.

Use list controls in hierarchical lists

By default, no related list tabs are visible in a hierarchical list and only a single related list is displayed at a time. The column headers are hidden by default.

Before you begin



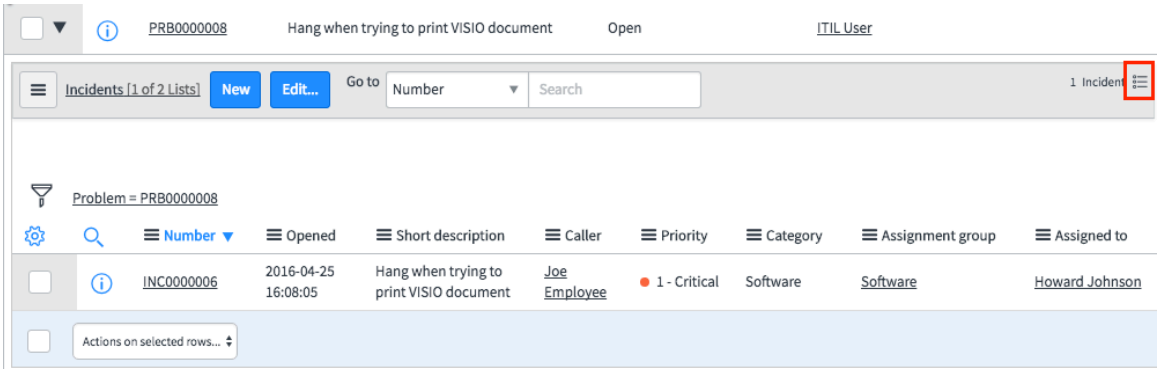
Role required: none

About this task

Note: Hierarchical lists are not supported in List v3.

Procedure

1. To select a different related list, click the link in the list title.
2. Select a list from the menu.



If the related list is empty, the hierarchical list indicates that there are no records to display.

The platform remembers this preference and displays the last selected related list for each table when you open another hierarchical list within that table.

3. To display column headers in the related list, click the show/hide headers icon in the upper right corner of the hierarchical list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The platform remembers this preference and opens all hierarchical lists with column headers enabled until the headers are hidden.

Context ranking

Context ranking allows a user to sort a collection of records preferentially; that is, independently of the attributes of those records.

For example, a Customer Support manager can organize a list of incidents in the order in which a technician should work on the tasks. Creating such an arbitrary list with a list filter is not possible.

Activate context ranking

If you have the admin role, you can activate the Context Ranking plugin (com.glide.sorting). This plugin activates related plugins if they are not already active.

Before you begin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Context Ranking plugin (com.glide.sorting) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Create a ranking definition

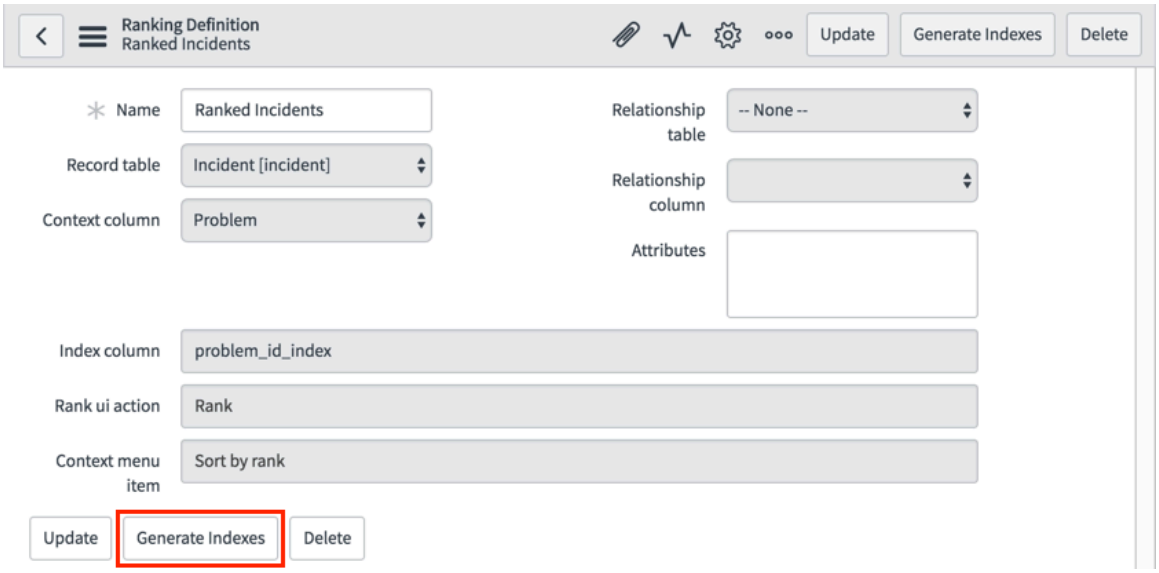
Enable context ranking for a related list by creating a ranking definition.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **All** > **System Definition** > **Ranking Definitions**.
2. Click **New**.
3. Enter a **Name** for the ranking definition.
4. In the **Record table** field, select the table for which ranking is enabled.
   This is the table of the records in the ranked related list. For example, to enable ranking for a related list of incidents in the Problem form, select the Incident [incident] table.
5. In the **Context column** field, select the reference column providing the context in which ranking is to be performed.
   The context in this case is the form in which the related list appears and not a table name. For example, a related list with a **Record table** of Incident [incident] can have several contexts, including the **Problem** form or a **Configuration item** form.
6. Complete the relationship-based fields if the ranking is to be performed on a related list that is defined by a relationship.
   - **Relationship table:** select the table forming the other side of the relationship. In the case of the ranking definition for Product stories in scrum, you might use the Product Model [cmdb_model] table.
   - **Relationship column:** select the column from the relationship table to compare with the context column. To avoid adding a related list of user stories to the Product Model [cmdb_model] table, you might use the **Sys ID** column, which defines a subclass of the Product Model table (cmdb_model.sys_id).
7. In the **Attributes** field, enter attributes to change and restrict the contents of the Rank dialog box, as appropriate.
   - *visible_columns:* a semi-colon separated list of columns to be displayed in the Rank dialog box. If not specified, the Rank dialog box uses the default view of the related list you selected in the **Record table** field.
   - *extra_conditions:* an encoded query to restrict the records shown in the Rank dialog box. For example, the query `extra_conditions=^state!=7` displays all incidents whose state is not **Closed**. If not specified, the Rank dialog box shows all records for the relationship.
8. Click **Submit**.
   The index is generated automatically. The system completes these read-only fields:
   - Index column
   - Rank ui action
   - Context menu item

   Note: After you submit a ranking definition, only the **Attributes** field can be edited. If additional changes are required, delete the record and create a new one with the revised settings.

What to do next

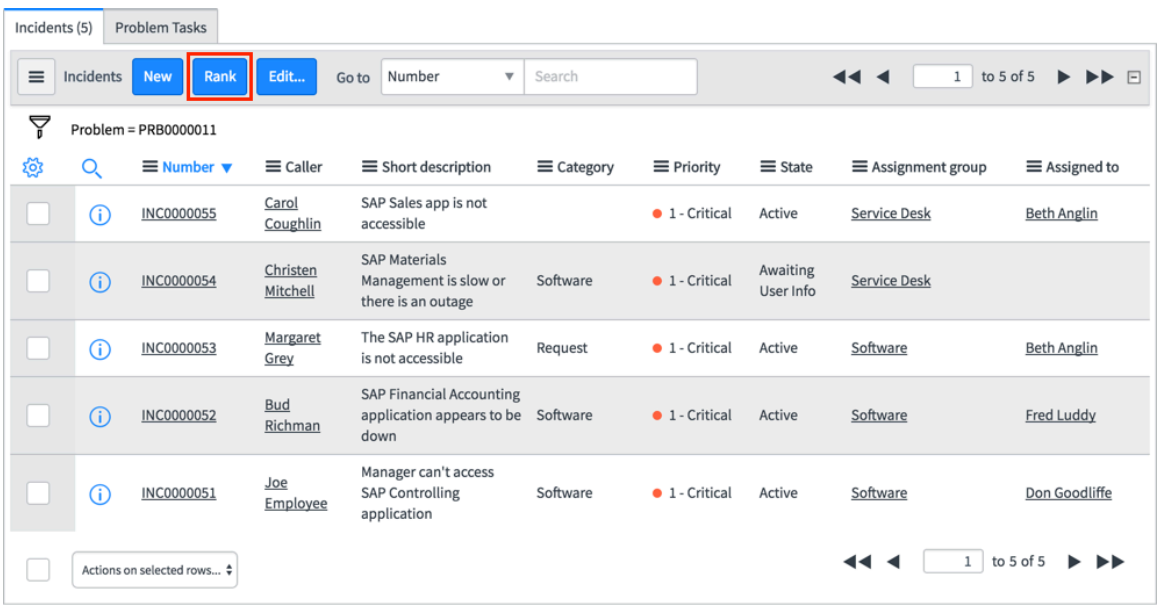
The system does not generate indexes for ranking definitions inserted into the database by an update set. To use a ranking definition inserted by an update set, you must generate the indexes manually. To generate indexes, open the Ranking Definition form, and click **Generate Indexes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rank a list

After you create a ranking definition for a table, related lists based on that table and context include options for ranking the list and displaying the list by rank.

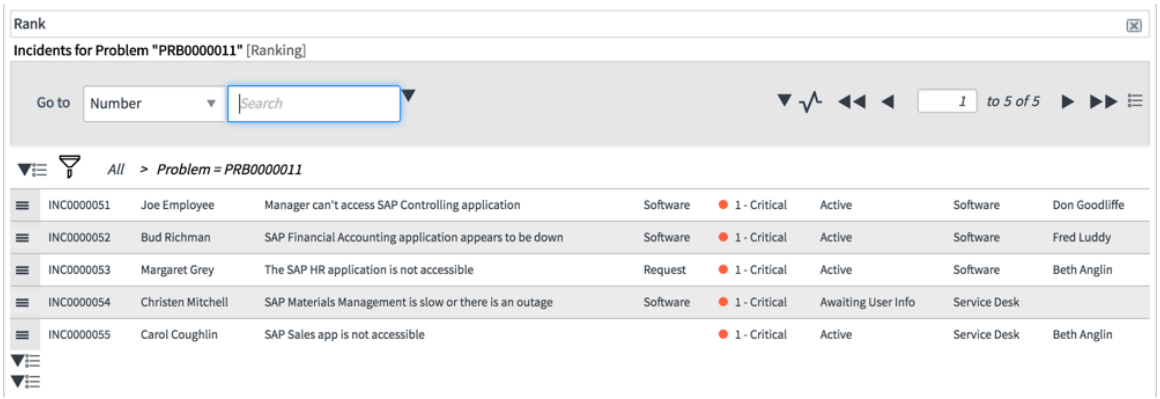
Before you begin



Role required: none

About this task

You can set the preferential order of records.



Procedure

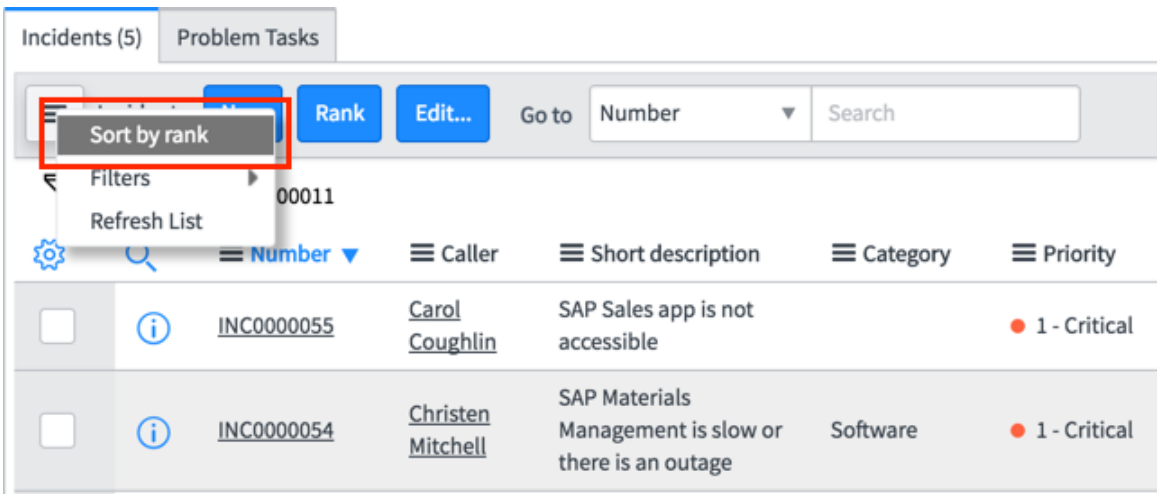
1. Click the **Rank** button in the related list to reorder the records.

The Rank dialog box appears, allowing you to sort the records in any order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click and drag the move icon ( ) to change the position of a record.

Note: Administrators can define which columns appear in the Rank dialog box in the **Attributes** field of the Ranking Definition form.



Apply a new sort order to a list

You can apply a new sort order to the records in a list.

Before you begin
Role required: none

Procedure

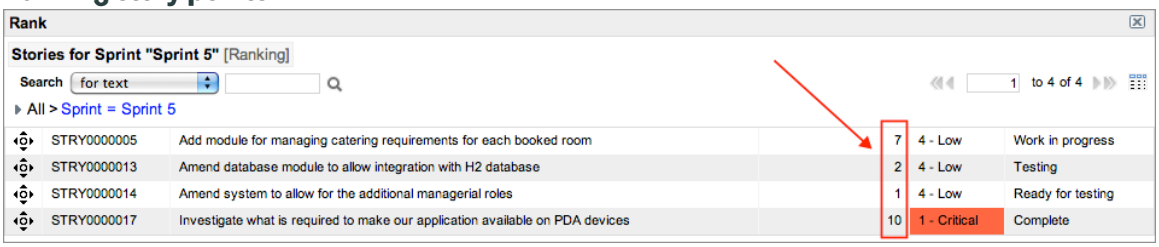
1. Open the context menu from the list title and select **Sort by rank**.

2. To remove the ranking and return to the original order of the list, click the label in any column that contains data.

Scrum ranking definitions

Ranking definitions for user stories are part of the SDLC (scrum process) application.

These ranking definitions enable scrum users with the proper roles to rank related lists of stories in these tables:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Product stories: Application Model [cmdb_application_product_model] table
- Release stories: Release [rm_release] table
- Sprint stories: Sprint [rm_sprint] table

Users can rank stories in the scrum planning board by priority. Story lists ranked in the planning board appear in the new order in product, release, and sprint forms. Stories ranked in one of these scrum forms changes the order in the planning board.

Story points for each story are listed in a ranked view, which is useful for prioritizing stories.

Ranking story points

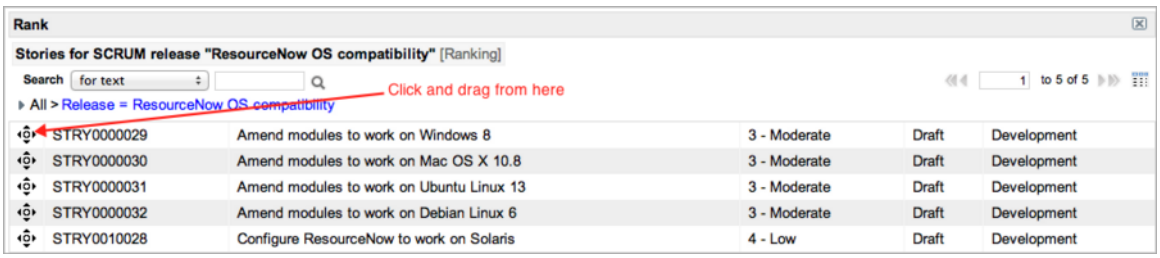
Agile Development

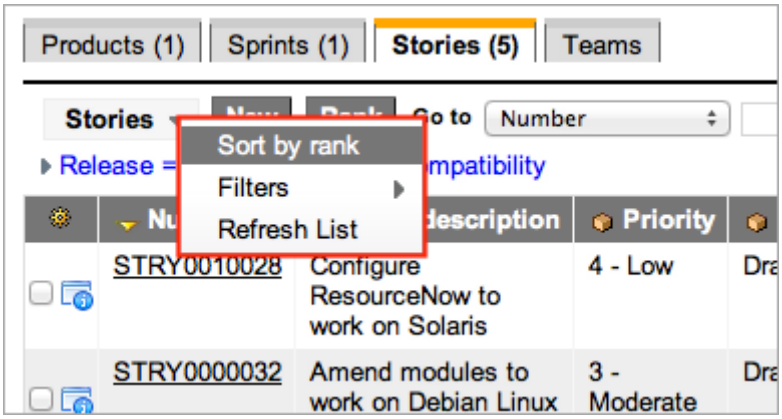
Rank stories in a related list



The Context Ranking feature enables all scrum users to manually sort a related list of stories by priority.

About this task

A product owner or release planner uses this tool to establish the order in which to work the stories. Stories ranked in a related list (in the Product, Release, and Sprint forms) appear in the same order in the planning board when the appropriate backlog is displayed. Conversely, stories ranked in the planning board appear in that order when viewed in the related list in the form. Users can switch the view in a Stories related list from ranked to any sort order without changing the ranking in the planning board.



Procedure

1. In the **Stories** related list, click **Rank**.
   A dialog box appears, allowing you to arrange the stories in any order, such as by priority.
2. Click and drag each story into position using the move icon to the left of the story number.

3. When you are done, click the **X** in the upper right corner to close the list.
   The **Stories** related list is not sorted by your ranking initially.
4. To view the related list in its ranked order, open the context menu from the related list and select **Sort by rank**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To return the sort order of the list to an unranked state, click once in the heading of any column that contains data.
   The system uses this ranked list to display the appropriate backlog in the planning board. For example, if you rank stories in the **Stories** related list in the Release form, the release backlog in the planning board uses the same ranking to display the stories. Conversely, scrum masters, product owners, and release planners can create a new ranking order for the **Stories** related list by rearranging the list of stories in the planning board.

Customize list context menus

You can customize the content and behavior of list context menus.

Before you begin
Role required: admin

About this task
For example, you might add an option to the list column heading menu for a specific table. You might also want to change the roles required to access a global context menu option.

Procedure

1. Navigate to **All** > **System UI** > **UI Context Menus**.
2. Select **New**.
3. Complete the form.

Context menu form fields

Field	Description
Table	Select the table to which this context menu option is attached. The base system menu items are attached to the Global [global] table, which applies the context menu option to all lists for all tables. If you specify a particular table, the option is available only on context menus in lists from that table. **Note:** The list shows only tables and database views that are in the same scope as the context menu.
Menu	Select the list context menu in which this option appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ List title menus ○ Column headings ○ List fields
Type	Select the type of menu option to create: ○ **Action**: A menu option that performs an immediate action. ○ **Menu**: Creates a parent menu that can display a submenu. ○ **Separator**: Draws a line between groups of options on a menu. Menus do not display separator lines next to one another or at the bottom of a menu. If a condition that removes options for a role forces two separators together, one of the separators is removed from the view. ○ **Label**: Create an unlinked label for a menu or section of a menu. ○ **Dynamic actions**: Menu options dynamically created, such as the available views or user filters that can only be generated at the time the list is displayed.
Name	Enter the label for the action as it will appear in the menu.
Parent	If this action is part of a submenu, type the name of the parent menu item. For example, in the base system, **Configure** is a parent.
Order	Assign an order number to this item, menu, or separator to specify where in the menu it appears.
Active	Enable or disable this context menu item. Only active items are shown in the context menu.
Run onShow script	Select this check box to display the **onShow script** field.
Condition	Create the conditions under which this menu option appears. For example, define the role that has permission to see this item.
Action script	The action script runs when someone selects the context menu option. For more information, see Action script for list context menus.
Dynamic actions script	The dynamic actions script populates the context menu with dynamic options, such as filters or views. For more information, see Dynamic actions script for list context menus.
onShow script	The onShow script runs before the context menu is displayed, to determine which options appear in the context menu. For more information, see onShow script for list context menus.

4. Select **Submit**.

Action script for list context menus

The **Action script** field, on the Context Menu form, defines a script. The script runs when someone selects the context menu option.

This script is client-side and runs in the user's browser. The following JavaScript variables are available to the Action script when it is executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action script variables

Variable	Description
g_list	GlideList2 against which the script runs.
g_fieldName	Name of the field against which the context menu runs.
g_fieldLabel	Label of the field against which the context menu runs.
g_sysId	The sys_id of the row or form against which the script runs.

The base system uses the following code in an action script to refresh the platform view.

```
g_list.refresh(1);
```

Another example is the use of these variables in a list header menu to sort a list by the selected field in descending order (z to a).

```
g_list.sortDescending(g_fieldName);
```

Dynamic actions script for list context menus

The **Dynamic actions script** field, on the Context Menu form, defines a script. The script populates a list context menu with dynamic options, such as filters or views.

The following JavaScript variables are available to the dynamic actions script when it is executed.

Dynamic actions script variables

Variable	Description
g_tableName	Name of the current table.
g_listId	ID of the list for which the context menu is built.
g_itemName	Name defined in the UI context menu record.
g_itemOrder	Order defined in the UI context menu record. Use this variable to pass the value of the **Order** field to the dynamic actions script.
g_contextMenu.addAction(item_id, label, script_string, order)	Add options to the context menu and select the order in which they appear.

The following example displays a list title menu item that controls the number of records per page in the list view.

```
g_contextMenu.addAction('50', g_itemName,
 'showRowsPerPage("50");', g_itemOrder);
```

Note: The action script for this item must define the *showRowsPerPage* function so that when selecting this menu item, that function is called with an argument of 50.

onShow script for list context menus

The **onShow script** field defines a script that runs before the context menu is displayed to determine which options appear in the context menu.

Use this script to change the menu items on the list header menu based on the current field column. The following JavaScript variables are available to the *onShow* script when it is executed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

onShow script variables

Variable	Description
g_menu	Context menu to be displayed.
g_item	Current context menu item.
g_list	GlideList2 against which the script runs.
g_fieldName	Name of the field against which the context menu runs.
g_fieldLabel	Label of the field against which the context menu runs.
g_sysId	The sys_id of the row or form against which the script runs.

An example of an *onShow* script is one that determines when to enable or disable the **Ungroup** option in a list column heading menu based on whether the list is grouped or not.

```
if (g_list.getGroupBy()) {
   // list is grouped so enable to Ungroup menu item
   g_menu.setEnabled(g_item);
} else {
   // list is not grouped, so disable the Ungroup menu item
   g_menu.setDisabled(g_item);
}
```

Search administration

The ServiceNow AI Platform® includes multiple search engines and interfaces to help users easily and quickly find the information they need.

Search engines

The ServiceNow AI Platform includes two search engines:

AI Search

AI Search is the default search engine for the ServiceNow AI Platform. It provides consumer-grade search capabilities for Customer Service Management, Now Mobile, Service Portal, and Virtual Agent .

Zing text indexing and search engine

Zing is a legacy search engine which provides fast results and emphasizes relevancy scoring.

Search plugins

These search plugins offer specialized search experiences for particular search contexts.

Contextual Search

The Contextual Search plugin enables search that focuses on query context and user intent to fetch the most relevant set of results. Contextual search displays related results within a form or record producer based on the text you enter in a field.

Intelligent Search for CMDB

Intelligent Search for CMDB enables users to query for a set of Configuration Items in the CMDB. Complex queries open in CMDB Query Builder, where you can refine them or run them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search interfaces and widgets

These are search fields and widgets offered in the ServiceNow AI Platform UI or in ServiceNow AI Platform applications.

Global search

Global search in the Next Experience UI allows you to search multiple tables from a single search field.

Service Portal

The Service Portal framework displays search data within a widget on the search page.

Service Portal search widgets

Service Portal includes widgets for multiple forms of search.

Now Mobile app

The Now® Mobile app provides global search, voice search, and photo search.

Mobile Agent

The Mobile Agent app enables service desk agents to promptly manage and resolve end user issues from their mobile devices.

Virtual Agent

The Virtual Agent platform uses search to help parse user statements and intents in chats.

Machine learning solutions for Search administration

Machine learning in Search administration helps to enhance business scalability and improve business operations for organizations.

Businesses face a challenge with growing volumes of data, in extracting meaningful information from a huge set of raw data, and in deriving meaningful business insights. Machine learning can serve as a solution to a variety of business complexities as its algorithm is built using historical data. It helps avoid duplicate and inaccurate data being entered into the database and enables businesses to compute and process information much faster.

Predictive Intelligence for Contextual Search

The Predictive Intelligence for Contextual Search capability uses machine-learning algorithms to search for Similar Incidents, Similar Knowledge Articles, Similar Open Incidents, and Similar Resolved Incidents.

Predictive Intelligence suggests related results to help you solve an issue or resolve a question.

The sources such as Similar Incidents, Similar Knowledge Articles, Similar Open Incidents, and Similar Resolved Incidents are available only when the Predictive Intelligence plugin (com.glide.platform_ml) and the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) are active.

For more information, see Predictive Intelligence.

Features of Search administration

Enable and configure Search administration features.

Feature	Description	Top tasks	Status
Zing text indexing and search engine	Index and search record data by table.	• Configure a table for indexing and searching • Zing can expand search results with synonyms • Zing can include attachments in search results	Active
Contextual search	Display search results on forms and record producers when users enter text in a field.	Define a search context	Active

Search Suggestions

The Search Suggestions application uses saved user search data to create auto-complete suggestions for AI Search applications and search suggestions for Zing. These suggestions appear as you enter terms into an application's search field. You can refine your search or jump to a relevant search result by selecting an applicable suggestion.

Get started

Explore

Learn about Search Suggestions concepts, workflow, and benefits.

Configure

Configure settings for creation of auto-complete suggestions and search suggestions from saved search results.

Use

View and select suggestions in AI Search applications and Zing. Analyze saved search data to learn how users interact with search.

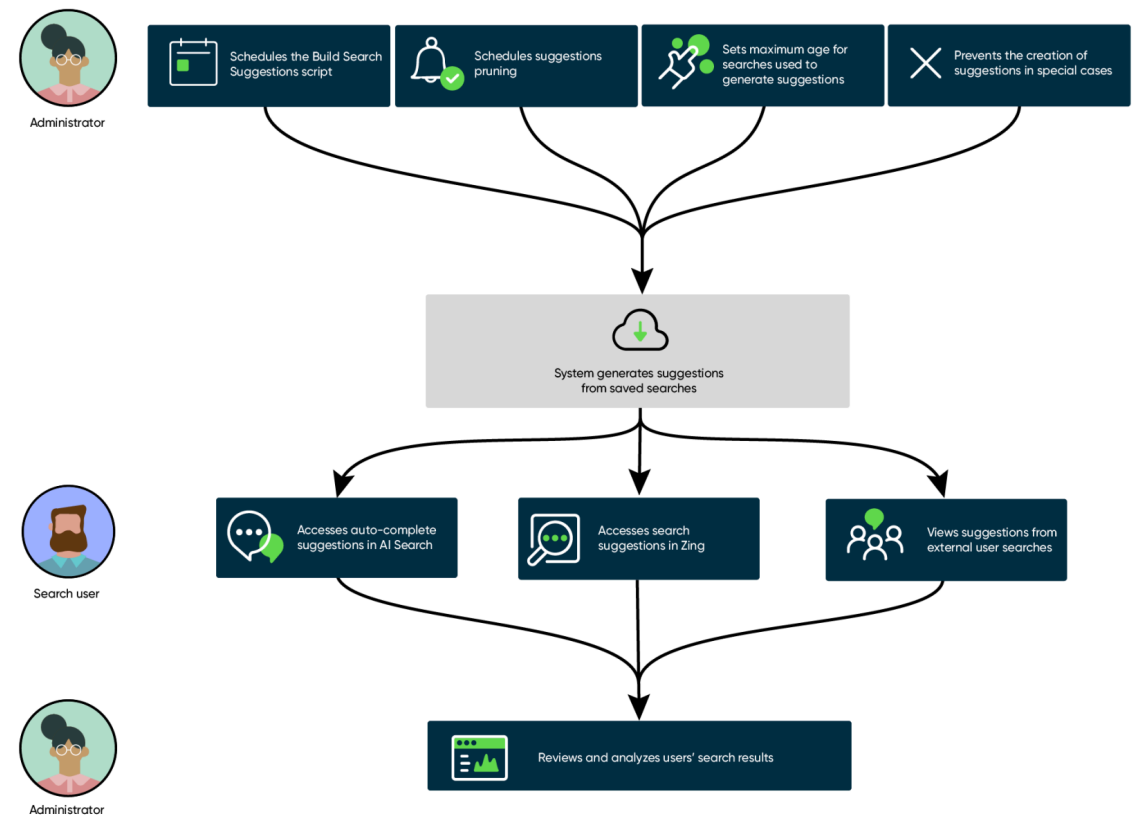
Exploring Search Suggestions

Learn how Search Suggestions displays suggestions to users in AI Search applications and the Zing text indexing and search engine. Review the rules that dictate which suggestions are offered in each search application and context.

Search Suggestions overview

The Search Suggestions application makes it possible for search applications to display suggested search completions or results to users as they enter terms into a search field.



Search Suggestions saves query terms and results from user searches. A Build Search Suggestions script runs against this saved data periodically to generate auto-complete suggestions for AI Search and search suggestions for Zing text search. The Prune Search Suggestions script runs periodically to remove low-relevancy suggestions.

Administrators can limit the age of saved search data used to generate suggestions. They can also configure specific suggestions to prevent them from being displayed to search application users.

Search Suggestions workflow

In this infographic, see a sample workflow of how different users in an organization configure and use auto-complete suggestions and search suggestions with the Search Suggestions application.

Configuring and using Search Suggestions

In this Search Suggestions workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. ○ Administrators configure Search Suggestions settings, including scheduling of scripts and restrictions on which saved search results the system uses to create auto-complete suggestions and search suggestions.
   ○ The system saves users' search results and uses them to generate new auto-complete suggestions and search suggestions.
2. ○ Search users view and select generated auto-complete suggestions in AI Search applications.
   ○ Search users view and select generated search suggestions in Zing.
   ○ Non-authenticated guest users access and review the list of generated suggestions created from searches by external users.
3. Administrators review and analyze saved search results to improve understanding of how users interact with generated suggestions, allowing for more effective tuning of Search Suggestions settings.

Search Suggestions benefits

Benefit	Feature	Users
View and select relevant auto-complete suggestions when searching in AI Search applications.	Auto-complete suggestions in AI Search applications	AI Search users
View and select relevant search suggestions when searching with the Zing text search engine.	Zing displays search suggestions as users enter search terms	Zing search users
See the list of auto-complete suggestions and search suggestions created from searches by external users.	Use the GraphQL REST API to view suggestions created from external user searches	Non-authenticated guest user
Control suggestion generation time by configuring how often the system builds auto-complete suggestions and search suggestions from user search strings.	Schedule the Build Search Suggestions script	Administrator
Improve suggestion relevancy by configuring how often the system prunes the least relevant auto-complete suggestions and search suggestions from the Search Suggestion [sys_search_suggestion] table.	Schedule suggestion pruning	Administrator
Increase suggestion freshness by using only the most recent search event records to create auto-complete suggestions and search suggestions.	Set maximum age for searches used in suggestion generation	Administrator
Prevent creation of unwanted auto-complete suggestions and search suggestions.	Prevent the creation of suggestions in special cases	Administrator
Understand how users interact with search by analyzing data from the Search Suggestions tables.	Analyze search relevancy	Administrator

Configuring Search Suggestions

You can configure Search Suggestions settings to control the creation of auto-complete suggestions and search suggestions on your instance.

Configuration overview

Task	Description
Schedule the Build Search Suggestions script	Specify how often and at what time the system generates auto-complete suggestions and search suggestions from stored search strings. By default, this task runs daily.
Schedule suggestion pruning	Specify how often and at what time the system prunes the lowest-rated suggestions to limit the Search Suggestion [sys_search_suggestion] table to 500,000 suggestions. By default, this task runs weekly.
Set maximum age for searches used in suggestion generation	Specify the maximum age of search strings the system considers when creating auto-complete suggestions and search suggestions. By default, the system only generates suggestions using search strings from the last 180 days.
Prevent the creation of suggestions in special cases	Disable generation of suggestions from specific search strings to keep unhelpful terms from appearing in suggestions or to prevent disclosure of personal or secure information. As part of this task, you may want to test regular expression patterns in your Search Suggestion Exclusion List Rule entries.

Schedule the Build Search Suggestions script

Specify when to run the script that builds auto-complete suggestions and search suggestions from user search strings.

Before you begin

Role required: admin

About this task

Search Suggestions stores search strings entered by users in the Search Event [sys_search_event] table. The *`Build Search Suggestions`* script turns those search strings into auto-complete suggestions and search suggestions and stores them in the Search Suggestion [sys_search_suggestion] table.

By default, this script runs daily. You can customize how often and at what time the script runs. How often you run the script depends on how frequently you want to update suggestions for users. When you run the script might depend on performance considerations.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs** and select **Build Search Suggestions**.
2. In the Scheduled Search Execution form, edit how often the script runs in the **Run** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Edit the time of day the script runs in the **Time** field.
4. Select **Update**.
5. **Optional:** Select **Execute Now** to run the script immediately.

Schedule suggestion pruning

Search Suggestions limits the number of auto-complete suggestions and search suggestions stored in the Search Suggestion [sys_search_suggestion] table to 500,000. A periodic pruning job removes the least relevant suggestions and increases the overall relevancy of suggestions.

Before you begin

Role required: admin

About this task

By default, the pruning job runs once a week and limits the Search Suggestion [sys_search_suggestion] table to 500,000 suggestions. Once the table reaches that limit, the pruning job removes the lowest-rated auto-complete suggestions and search suggestions to keep the maximum number of suggestions at 500,000. Pruning the least relevant suggestions improves the relevancy of the suggestions.

How often you run the pruning job might depend on how frequently you generate suggestions from the Search Suggestion table, and how quickly the table exceeds 500,000 suggestions.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the **Prune Search Suggestions** job.
3. On the Scheduled Script Execution form, edit the following fields.

Field	Description
Run	Frequency of execution for the pruning job. To execute the job manually, select **On Demand** and select **Execute Now**.
Day	Day of the week to run the pruning job.
Time zone	Time zone to use when interpreting the **Time** field value.
Time	Time of day to run the pruning job. Specify hours (00–23), minutes (00–59), and seconds (00–59).
Repeat interval	Interval between executions of the pruning job when **Run** is set to *Periodically*. Specify days (01–07, where 01 is Sunday), hours (00–23), minutes (00–59), and seconds (00–59).
Conditional	Script to run when executing the pruning job.

Note: The fields on the form change with the choice of the **Run** value.

4. Select **Update**.

Set maximum age for searches used in suggestion generation

Set the Auto Flush parameter to limit the age of search strings used to create auto-complete suggestions and search suggestions.

Before you begin
Role required: ais_admin

About this task
The Search Event [sys_search_event] table contains all of the strings used in searches. Scripts use this table to generate search analytics, search suggestions, and auto-complete suggestions. A system property sets the maximum age for records preserved in the table. The default is 180 days, but you can change this number to preserve search events for a shorter or longer duration. Longer durations increase the size of the table and its disk consumption.

Procedure

1. Navigate to the Auto Flush [sys_auto_flush] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_auto_flush.list`.
   c. Press Enter.
2. Search on `*search` and open the **sys_search_event** record.
3. On the Auto Flush form, edit the **Age in seconds** value.
   The default is 15,552,000 seconds, which is 180 days.

Prevent the creation of suggestions in special cases

Disable generation of suggestions from specific search strings to keep unhelpful terms from appearing in suggestions or to prevent disclosure of personal or secure information.

Before you begin
Make sure you're familiar with Java's regular expression pattern syntax. To learn about regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

Role required: admin

About this task
Search Suggestions generates auto-complete suggestions and search suggestions from the search strings that users enter. You may not want to create suggestions from all search strings. You can prevent the generation of suggestions using one of the following approaches:

- Exclude words or regular expression patterns from auto-complete suggestions and search suggestions.

  For example, a user might search on `KB2938272`. This search string is too opaque to provide a meaningful suggestion. Or, someone might enter a social security number or phone number as search strings which shouldn't be surfaced as suggestions to anyone else. So, you might exclude all search strings that contain multiple numbers. Likewise, if someone uses an expletive in a search string, you may not want to surface that word in suggestions. The Search Suggestion Exclusion List [sys_search_suggestion_blacklist] table contains the list of excluded words and regular expression patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: In the base system, the Search Suggestion Exclusion List table contains excluded words for English and language-independent regular expression patterns. Search Suggestions inserts additional language-specific excluded words into this table when you activate any of the following languages: Chinese, Czech, Dutch, Finnish, French, German, Hebrew, Hungarian, Italian, Japanese, Norwegian, Polish, Portuguese, Russian, Spanish, Swedish, Thai, or Turkish.

- Assign roles to users that prevent the generation of suggestions from their search strings.

  There may be individuals whose searches shouldn't appear in search or auto-complete suggestions for privacy or security reasons. To prevent their searches from generating suggestions, assign them the suggestion_exempt role. This role is unnecessary in most situations. Search Suggestions never shows who performed the initial search. To prevent people from seeing auto-complete suggestions and search suggestions, assign them the cannot_read_suggestions role.

Procedure

1. Navigate to the Search Suggestion Exclusion List [sys_search_suggestion_blacklist] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_search_suggestion_blacklist.list`.
   c. Press Enter.
2. To make a word or regular expression pattern active or inactive:
   a. Select the term in the list that you want to activate or deactivate.
   b. In the Search Suggestion Exclusion List form that appears, select or clear the **Active** option.
3. To add a new excluded word or regular expression pattern:
   a. Select **New**.
   b. On the Search Suggestion Exclusion List form, fill in the fields.

Search Suggestion Exclusion List form

Field	Description
Phrase	Word or regular expression pattern to exclude.
Language	The language that the excluded word is in. Use the ISO 639-1 code for the language, such as "en" for English. Because regular expression patterns work for all languages, search suggestions ignores this field for regular expression patterns.
Description	Explanation of why you excluded the word or regular expression pattern if it's not obvious. This field is especially important for regular expression patterns.
Active	Option to remove the excluded word or regular expression pattern from suggestions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	Option that specifies whether the **Phrase** field represents one word or a regular expression pattern.

Note: If you use regular expression patterns, you should verify that they exclude the words you want. For more information, see Test regular expression patterns in Search Suggestion Exclusion List Rule entries.

4. To assign someone a role that prevents them from seeing auto-complete suggestions and search suggestions, or to prevent their search strings from becoming suggestions:
   a. Navigate to **All** > **User Administration** > **Users** and select the name of a user.
   b. In the Roles related list, select **Edit**.
   c. To prevent a user from seeing auto-complete suggestions and search suggestions, move **cannot_read_suggestions** from the Collections column to the Roles List column and select **Save**.
   d. To prevent a user's search strings from generating auto-complete suggestions and search suggestions, move **suggestion_exempt** from the Collections column to the Roles List column and select **Save**.

Test regular expression patterns in Search Suggestion Exclusion List Rule entries

Regular expression patterns are powerful and often require editing to get the correct behavior. When using regular expression patterns to exclude search strings, test the patterns thoroughly so as not to have unintended results.

Before you begin

Make sure you're familiar with Java's regular expression pattern syntax. To learn about regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

Role required: admin

About this task

The Exclusion List Rule and Search Suggestion Relations [m2m_blacklist_search_suggestion] table lists the suggestions eliminated from the Search Suggestion [sys_search_suggestion] table by entries in the Search Suggestion Exclusion List [sys_search_suggestion_blacklist] table.

Procedure

1. In your browser, navigate to `https://<instance name>.service-now.com/m2m_blacklist_search_suggestion_list`.
   A list of words excluded from search suggestions appears in the Exclusion List Rule and Search Suggestion Relations table. The Suggestion column shows the search string that was eliminated in the creation of suggestions.
2. Add a regular expression pattern to the exclusion list table.
   For more information, see Preventing suggestions in special cases.
3. In a search field, for example, on the ServiceNow® Service Portal, enter words that satisfy the regular expression pattern.
4. Run the script that builds the search suggestions.
   For more information, see Schedule the Build Search Suggestions script. Select **Execute Now** to run the script immediately.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the m2m_blacklist_search_suggestion_list table, select the menu icon for the Exclusion List column heading, then select **Group By Exclusion List** to see the regular expression patterns and what they eliminated.
6. Review the suggestions in the table to see if the regular expression patterns removed the suggestions they should have and no more.
7. In the sys_search_suggestion_blacklist table, set an excluded regular expression pattern's **Active** field to **false**, then run the Build Search Suggestions script again to make sure that only excluded suggestions were removed.
8. Revise the regular expression patterns if necessary and repeat the procedure.

Using Search Suggestions

Search applications display auto-complete suggestions and search suggestions as you type in their search fields. Administrators can analyze data from Search Suggestions tables to learn how users interact with search. Guest users can view suggestions created from self-registered external user searches.

Using Search Suggestions in AI Search

AI Search applications display auto-complete suggestions created by the Build Search Suggestions script. Auto-complete suggestions appear as you enter terms into the application's search field. You can select an auto-complete suggestion to accept it as your search query.

To learn more about auto-complete suggestion usage and configuration in AI Search applications, see Auto-complete suggestions in AI Search applications.

Using Search Suggestions in Zing text indexing and search engine

Zing displays search suggestions created by the Build Search Suggestions script. Search suggestions appear as you enter terms into the Zing search field. You can select a search suggestion to accept it as your search.

For more details on how search suggestions appear in Zing, see Zing displays search suggestions as users enter search terms.

Analyze search relevancy

Analyze data from the Search Suggestions tables to understand how your users interact with search.

Before you begin

Role required: ais_admin

About this task

Search Suggestions uses the following tables:

- Search Event [sys_search_event]: Stores all search strings and search results.
- Search Source Event [sys_search_source_event]: Stores search strings and search results and ties them to a data source, for example, the suggestion came from the knowledge base table rather than the catalog table.
- Search Suggestion [sys_search_suggestion]: Stores suggestions for searches.

For details on the Search Suggestions tables, see Search Suggestions tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Display the Search Event [sys_search_event] table by navigating in your browser to `https://<instance name>.service-now.com/sys_search_event_list.do`.
2. Find search queries with **Has results** column values of **false**.
   A value of false means that someone searched but didn't get any search results. You can choose to create information, such as a Knowledge article, to provide search results in the future, create synonyms for the search words that would surface a search result, or not provide information if the question is irrelevant.
3. Average the numbers in the **Click rank** column.
   Click rank shows which search result you selected. If you click the first result in the list of search results, the click rank value is 1. If you click the 6th result listed, the click rank value is 6. If you click multiple search results, the click rank is the highest listing value. For example, if you click the first result, return to the search page and click the 6th result, return to the search page and click the 4th result and find an answer, the click rank is 6 (not 4). A click rank of 0 means that you didn't select any search result, or that you selected a Genius Result answer card in AI Search. Lower positive click rank values indicate that the top search results are the most relevant, so the goal is to reduce the average value for this field.
4. Determine the click-through rate by dividing the number of records where the click rank isn't zero by the total number of records.

   Higher click-through rate numbers are better. Click-through rate is a good indicator of how often users find relevant results, but it doesn't reveal how much effort it took to find those results. That's where click rank comes in. Click rank describes how much effort it took the user to find what they perceived to be a relevant result.

5. Average the numbers in the **Refinements** column.
   Refinement is the number of actions a user took to reduce the number of search results. Actions include sorting and filtering. More refinements means more effort to find relevant search results, so lower numbers are better.
6. Display the Search Source Event [sys_search_source_event] table by navigating in your browser to `https://<instance name>.service-now.com/sys_search_source_event_list.do`.
7. Find search queries with **Has results** column values of **false**.
   False means that someone searched but didn't get any search results from a particular source table, for example, the Knowledge Base table. You can choose to create information, such as a Knowledge article, on the source to provide search results in the future, create synonyms for the search words that would surface a search result in that source table, or not provide information if the question is irrelevant.

Use the GraphQL REST API to view suggestions created from external user searches

Submit a request to the GraphQL REST API endpoint to retrieve search suggestions created from searches by self-registered external users. This endpoint allows access by non-authenticated guest users.

Before you begin

Ensure that the following conditions are met in your instance:

- The Domain Separation plugin isn't activated. For details on this plugin, see Domain separation plugin.
- The Explicit Roles plugin (com.glide.explicit_roles) is activated. To learn more about this plugin, see Explicit Roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- External users with the snc_external role have submitted searches in search applications that generate search suggestions, such as ServiceNow® Service Portal, Now Mobile, or ServiceNow® Virtual Agent.
- The *glide.search.suggestions.allow_guest_user* system property is set to **true**. For details on setting a system property value, see Add a system property.

Obtain the sys_id of the search application that you want to retrieve external user search suggestions for.

Note: Users with the search_application_admin, agent_workspace_user, or workspace_user roles can obtain this sys_id by copying it from the search application record in the Search Application Configuration [sys_search_context_config] table.

Download a third-party GraphQL client, such as the GraphiQL, Insomnia, or Postman client.

Role required: none

About this task

Search Suggestions creates suggestions for searches performed by self-registered external users. When the *glide.search.suggestions.allow_guest_user* system property is set to **true**, non-authenticated guest users can access the GraphQL REST API endpoint for your instance to retrieve external user search suggestions for a search application.

No authentication is required or enforced for this GraphQL REST API endpoint.

Note: Non-authenticated guest users can only retrieve search suggestions from the Global domain. If domain separation is enabled in your instance, guest users can't retrieve any search suggestions.

Procedure

1. In your third-party GraphQL client, configure a new request that uses the HTTP POST method.
2. Set the endpoint for the request to the GraphQL REST API endpoint for your instance, `https://<instance name>.service-now.com/api/now/graphql`.
3. Set the request body to the following GraphQL query, replacing `<search_application_sys_id>` with the sys_id of the search application that you want to retrieve external user search suggestions for:

```
{
  GlideSearch_Query {
    suggestions(searchContextConfigId:
 "<search_application_sys_id>", searchTerm: "") {
      term
      data {
        name
        records {
          type
          columns {
            label
            fieldName
            value
            displayValue
          }
        }
      }
    }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
```

Result

The system returns search suggestions from application searches by self-registered external users as a JSON object, as shown in this example:

```
{
  "data": {
    "GlideSearch_Query": {
      "suggestions": {
        "term": "",
        "data": [
          {
            "records": [
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "automatic replies",
                    "value": "automatic replies",
                    "fieldName": "name"
                  }
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "contact group",
                    "value": "contact group",
                    "fieldName": "name"
                  }
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "tablet",
                    "value": "tablet",
                    "fieldName": "name"
                  }
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "laptop",
                    "value": "laptop",
                    "fieldName": "name"
                  }
```

```
                ]
              },
              {
                "type": "POPULAR_QUERY",
                "columns": [
                  {
                    "label": "name",
                    "displayValue": "new email account",
                    "value": "new email account",
                    "fieldName": "name"
                  }
                ]
              }
            ],
            "name": "Popular searches"
          }
        ]
      }
    }
  }
}
```

Search Suggestions reference

Reference topics provide additional information about components and domain separation behavior for Search Suggestions.

Installed with Search Suggestions

Several types of components are installed with activation of the Search Suggestions plugin, including tables, user roles, and scheduled jobs.

Roles installed

Role title [name]	Description	Contains roles
Search Suggestions blocked searcher [cannot_read_suggestions]	Doesn't see search or auto-complete suggestions displayed when searching.	None
Search Suggestions exempt searcher [suggestion_exempt]	Submits searches that the system ignores when generating search or auto-complete suggestions.	None

For more details on restricting generation of search suggestions, see Prevent the creation of suggestions in special cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed

Scheduled job	Description
Build Search Suggestions	Converts searches stored in the Search Event [sys_search_event] table into auto-complete suggestions and search suggestions stored in the Search Suggestion [sys_search_suggestion] table.
Prune Search Suggestions	Removes the lowest-rated auto-complete suggestions and search suggestions from the Search Suggestion [sys_search_suggestion] table to keep the maximum number of suggestions at 500,000.

Tables installed

Table	Description
Search Event [sys_search_event]	Search strings and details about their associated results, including the search user, application, UI source, session, and language, and any user-specified click rank and refinements.
Search Event per source table [sys_search_source_event]	Correlations between search strings with search results from a specific table (data source). A search that queries multiple tables produces multiple Search Event per source records.
Search Suggestion [sys_search_suggestion]	auto-complete suggestions and search suggestions generated from user searches by the Build Search Suggestions scheduled job. The Prune Search Suggestions scheduled job removes the lowest-rated auto-complete suggestions and search suggestions from this table to keep its maximum size at 500,000 suggestion records.

To learn about individual columns on these tables, see Search Suggestions tables.

Search Suggestions tables

Search Suggestions uses tables to generate and track relevant search suggestions. You can review data from these tables to gain insight into search suggestions offered in your system.

Note: Because the Search Suggestions tables are system tables, they are excluded from the Reporting module by default. To learn about enabling reporting on system tables, see Reporting on system tables.

Search Event table

The Search Event [sys_search_event] table stores search strings and their search results.

sys_search_event table

Column	Description
Search query	Search string that the user entered.
Has results	Boolean value that specifies whether the search did (true) or didn't (false) return results. For all false values, consider adding information so that the same search would return suggestions in the future.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sys_search_event table (continued)

Column	Description
Click rank	Click rank shows which search result you selected. If you click the first result in the list of search results, the click rank value is 1. If you click the 6th result listed, the click rank value is 6. If you click multiple search results, the click rank is the highest listing value. For example, if you click the first result, return to the search page and click the 6th result, return to the search page and click the 4th result and find an answer, the click rank is 6 (not 4). A click rank of 0 means that you didn't select any search result, or that you selected a Genius Result answer card in AI Search. Lower positive click rank values indicate that the top search results are the most relevant, so the goal is to reduce the average value for this field.
User	User who performed the search.
Application ID	Application where the search feature was used, for example, you did a search in the Service Portal. See **UI source**.
Language	Language of the query. Search only returns results that are in the same language as the search query.
Refinements	Number of actions that you took to reduce the number of search results. Actions include sorting and filtering. The goal is to reduce this number.
UI source	Specific page (mobile) or page (portal) where the search query came from. See **Application ID**.
Session	ID of the session, which specifies when the search happened.
AI Search Profile	Name of the search profile used for the search. Only applicable for searches made with the AI Search engine.
GR Configurations Executed	Shows the list of Genius Result configurations that the system evaluated for the search. Genius Result configurations in this list may or may not have displayed answer cards for the search. Only applicable for searches made with the AI Search engine.
Genius Result Displayed	Shows whether or not any Genius Result answer cards were displayed for the search. Only applicable for searches made with the AI Search engine.
GR Configurations with Result Displayed	Shows the list of evaluated Genius Result configurations that displayed answer cards for the search. A Genius Result configuration can appear multiple times in this list if it displayed multiple answer cards for the search. Only applicable for searches made with the AI Search engine.
Last Clicked Genius Result Position	Shows which Genius Result answer card you selected an action from. If you select an action from the first displayed Genius Result answer card, the position value is 1. If you select an action from the third answer card, the value is 3. A value of 0 means that you didn't select actions from any Genius Result answer card. Only applicable for searches made with the AI Search engine.
Genius Result Events	JSON document showing details of actions you selected from Genius Result answer cards displayed for the search. Only applicable for searches made with the AI Search engine.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Event per source table

The Search Event per source [sys_search_source_event] table stores records correlating search strings with results from a specific table, here called a data source. A search can query multiple tables. The sys_search_event table lists one record for the entire search, while the sys_search_source_event table lists one record for each data source (table) queried.

sys_search_source_event

Column	Description
Search query	Search string that you entered.
Source	System ID of the data source. For example, the system ID of the Knowledge Base might be c45067sample3c82eef3e. Suggestions from one source are used as suggestions for that source only. For example, a suggestion derived from the Service Portal wouldn't be used as a suggestion in Now Mobile.
Has results	Boolean value that specifies whether the source did (true) or didn't (false) supply search results. For all false values, consider adding information so that the same search query would return suggestions in the future.
Created	Time stamp of the search query.

Search Suggestion table

The Search Suggestion [sys_search_suggestion] table stores auto-complete suggestions and search suggestions. A scheduled job uses the sys_search_event table to build the content of the suggestion table. This job segregates generated suggestions by source. Suggestions generated from searches on the Service Portal, for example, are only returned for other Service Portal searches. These suggestions aren't returned for Now Mobile queries.

sys_search_suggestion

Column	Description
Application ID	Application where the search feature was used, for example, you did a search in the Service Portal.
User group	Specifies whether an internal or external user generated the search query. Suggestions for internal users aren't shared with external users and vice versa.
Language	Language of the query. Search only returns suggestions that are in the same language as the search query.
Score	Suggestion rank. The higher the score, the more relevant the suggestion. Once all suggestions are returned for a search query, the suggestions are sorted by **Score**, the highest listed first. Scores reflect how often you selected a suggestion. A popular suggestion implies that it answers the query.
Source	System ID of the data source. For example, the system ID of the Knowledge Base might be c45067sample3c82eef3e. Suggestions from one source are used as suggestions for that source only. For example, a suggestion derived from the Service Portal wouldn't be used as a suggestion in Now Mobile.

Domain separation and Search Suggestions

Domain separation is unsupported in the Search Suggestions application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Search Suggestions domain separation overview

Domain separation provides complete data isolation for domain-specific users.

How domain separation works with Search Suggestions

By default, Search Suggestions results are limited to the specific domain of the logged-in user. Search and auto-complete suggestions aren't shared in parent or child domains.

Domain separation

Search signals

Search stores signal data from user searches. The aggregated signal data helps improve search result relevancy in your system.

Signals record details of user searches, search refinements, and interactions with search results.

AI Search machine learning relevancy analyzes aggregated signal data and automatically tunes search relevancy scoring to reflect user behavior patterns. This tuning helps improve result relevancy for search users.

To learn more about AI Search machine learning relevancy, see Machine learning relevancy in AI Search.

Search signal tables

Search uses tables to store details from user searches, search refinements, and interactions with search results. These details are called search signals. Data from the search signal tables helps improve the relevancy of search results in your system.

Search signals refer to user, query, and similar data stored in columns on search suggestion tables. For a guide to search suggestion tables and their columns, see Search Suggestions tables.

Note: Because the search signal tables are system tables, they are excluded from the Reporting module by default. To learn about enabling reporting on system tables, see Reporting on system tables.

Search Signal Event table

The Search Signal Event [sys_search_signal_event] table stores signal data produced when users submit a search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sys_search_signal_event

Column	Description
Search event	Reference to the record for the search event on the Search Event [sys_search_event] table.
Browser	User browser agent string.
Latitude	Latitude coordinate of the user location in decimal degrees.
Longitude	Longitude coordinate of the user location in decimal degrees.
Matched Query Intents	List of query intents matched in the user search query.
First page results	JSON array of objects in which each node represents a single result returned in the first page of results for the search. The result order is preserved. Each object includes the unique record identifier (sys_id) of a result and the table where the result is located. **Note:** The first page results aren't updated when you refine a search.
Search Response Time(ms)	Time taken by the search, in milliseconds.
User Query Language	Language of the user search query.

Search Signal Result Event table

The Search Signal Result Event [sys_search_signal_result_event] table stores signal data for search results that users select.

sys_search_signal_result_event

Column	Description
Search query	Search query that led to the search result selection.
User	User that selected the search result.
Result DocID	Source table and record names for the selected search result.
Description	Short description for the selected search result.
Source Table	Source table for the selected search result.
AIS DocID	Source table name and record sys_id for the selected search result.
Result Type	Type of search result selected. For example, *REGULAR* for a regular search result or *GENIUS* for a Genius Result answer card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sys_search_signal_result_event (continued)

Column	Description
Search Signal Event	Reference to the record for the search on the Search Signal Event [sys_search_signal_event] table.
Number	Record number for the selected search result.
Domain	Domain to which the selected search result belongs.
Use for Suggestions	Option indicating whether AI Search uses this result selection when computing auto-complete suggestions. For more details, see Auto-complete suggestions in AI Search applications
Source URL	URL for the selected search result.
Action Data	JSON array of objects representing the search result selection action.

Search Signal Result Event Action table

The Search Signal Result Event Action [sys_search_signal_result_event_action] table stores signal data for user interactions with search results.

sys_search_signal_result_event_action

Column	Description
Signal Type	The type of user interaction signal recorded for the search result. For example, *CLICK* indicates that the user selected a search result.
Signal Value	The value for the user interaction signal. For example, when the signal type is *CLICK*, the signal value is the numeric index for the search result that the user selected.
Search Signal Result Event	Reference to the record for the search result on the Search Signal Result Event [sys_search_signal_result_event] table.

Search Autocomplete Query Event table

The Search Autocomplete Query Event [sys_search_autocomplete_query_event] table stores signal data for auto-complete suggestions that users select from the search input field.

sys_search_autocomplete_query_event

Column	Description
Selected Query	The auto-complete suggested query that the user selected in the search input field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sys_search_autocomplete_query_event (continued)

Column	Description
Click Index	The numeric index of the auto-complete suggestion that the user selected in the search input field.
Latitude	Latitude coordinate of the user location in decimal degrees.
Longitude	Longitude coordinate of the user location in decimal degrees.
Search Profile	Reference to the search profile used for the search query.

Genius Result Event Action table

The Genius Result Event Action [sys_search_genius_result_event_action] table stores signal data for user interactions with Genius Result answer cards.

sys_search_genius_result_event_action

Column	Description
Action Id	The identifier for this Genius Result event action signal.
Action Type	The type of action taken from the Genius Result answer card.
Action Value	The value, if any, for the action taken from the Genius Result answer card.
Matched Genius Result Intents	List of NLU model intents matched by the action taken from the Genius Result answer card. **Note:** This field is only populated for Genius Result configurations with NLU triggers.
Card Type	The type of Genius Result answer card that the user interacted with.
Search Signal Result Event	Reference to the record for the Genius Result answer card on the Search Signal Result Event [sys_search_signal_result_event] table.

Zing text indexing and search engine

Index and search record data by table.

The ServiceNow® Zing text indexing and search engine is a legacy search engine that you can use to search ServiceNow AI Platform® record data. Its engine is created entirely with ServiceNow code and implemented within the relational model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To learn about the AI Search engine, which is the default search engine for ServiceNow AI Platform record data, see AI Search.

The Zing text search index is split into multiple database shards for parallel querying. Its search engine logic yields fast results and emphasizes relevancy scoring. Relevancy scores include frequency and proximity weighting. Scores also include weighting for specific indexed fields such as title, short description, and metadata.

Zing provides type-ahead search suggestions and **Did you mean:** global search suggestions.

Administrators and users with the ts_admin role can configure the following Zing text search settings:

- match relevance
- relevancy field weights for each indexed table
- global stop words
- stop words for each index
- synonym dictionaries for each table
- tables with attachment indexing

Explore	Set up	Administer
• Brazil • Features of Search administration • Features of Zing text indexing and search engine	• Set global text search properties • Zing can include attachments in search results • Zing can expand search results with synonyms	• Zing indexes words • Global search finds records from multiple tables • List search finds records from the current table

Zing can include attachments in search results	Search content from attachments on indexed tables. Display attachments for search results from the Knowledge [kb_knowledge] table.	• Index attachments on a table • Configure a table for indexing and searching	Active
Zing removes stop words from queries	Remove common words from search queries that don't produce meaningful results.	• Configure a global stop word • Configure a table-specific stop word	Active
Zing matches derived words with stemming	Convert any multiple-character search keyword to its stem form to find derived versions of the word.	• System Localization properties • Activate a language	Active
Zing can expand search results with synonyms	Expand search results to include additional search terms. Requires configuration before use	• Enable search synonyms • Create synonym dictionaries	Inactive

Available search options

Zing offers users several search interfaces and search operators to conduct text searches.

Available search interfaces

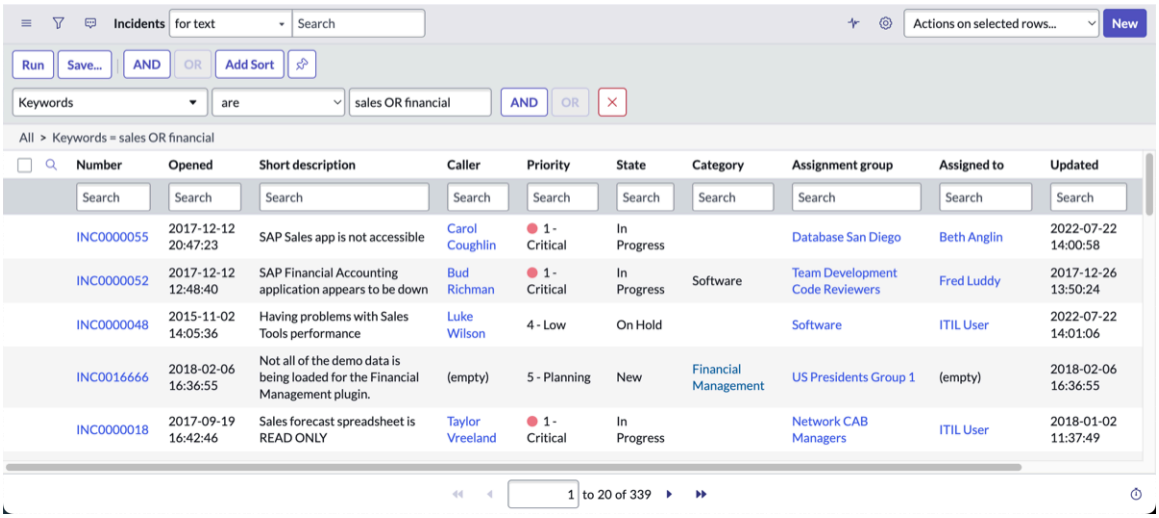
Search interface	Description
Global search	Find records in multiple tables using the global search field in the Next Experience Unified Navigation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available search interfaces (continued)

Search interface	Description
Search a list	Find records in a list; search in a specific field (Go to), all fields (Search), or in a specific column.
Knowledge Base	Find knowledge articles.
Live feed	Filter, search, or sort messages in live feed.
UI pages	Create a custom UI page to search for records in a table.

Available search operators



Search operator	Description
Boolean operators	Construct complex searches using Boolean AND, OR, and NOT operators in global text searches.
Quotation marks	Wrap search terms in quotation marks to search for an exact phrase consisting of one or more words.
Wildcard characters	Expand search results to match any non-space character. Zing supports both single-character and multiple-character wildcards.

List search finds records from the current table

Search records from a table list view.

Indexed tables display the *for text* option in the list title bar, which searches all records for matching field values.

List search

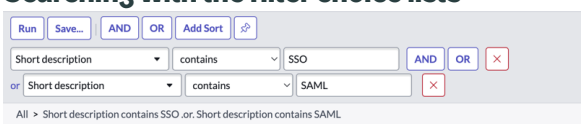
The list search field accepts Boolean operators (AND, OR, and NOT) in search queries. When a user adds a Boolean operator to a search query, the system only returns records that match all search conditions of the query.

The system also converts any search query into an equivalent keyword condition in the list breadcrumbs and filter. For example, searching for the text "Oracle OR SAP" produces the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

condition **[Keywords] [are] [Oracle OR SAP]**. The standard list controls can modify or remove these breadcrumbs and conditions.

Boolean operators allow conditional search results



Construct complex searches using Boolean AND, OR, and NOT operators in global text searches.

You can use Boolean operators in all global text search interfaces:

- Global text search field
- Knowledge Base search
- List search for text

Note: Boolean operators are case-sensitive. As an example, the system recognizes `OR` as a Boolean operator, but treats `Or` and `or` as regular search terms.

Boolean operators

Operator	Description
OR or vertical bar symbol (|)	Finds a match if any of the search terms exist in a document (a union of sets). For example, to find documents that contain either `email password` or just `email`, you can search for `"email password" OR email` or `"email password" | email`. Using the `.or.` operator, which the system uses when you create OR condition groups for fields other than Keywords with the condition builder, can produce different results. For example, this filter searches for records with short descriptions containing SSO and then searches separately for records with short descriptions containing SAML: **Searching with the filter choice lists**  **Note:** By design, you can only have one Keywords filter condition per condition set. If you select the Keywords field in a filter choice list, the OR button for that filter condition becomes unavailable. Similarly, if you construct an OR filter condition, the Keywords field becomes unavailable in the filter choice lists.
AND	Finds a match if all search terms exist in a document (an intersection of sets). For example, to find documents that contain both "CPU load" and "10 minutes", search for `"CPU load" AND "10 minutes"` By default, Zing applies an AND operator between all search terms not separated by OR or NOT operators. For example, if you enter `email server down` as your search terms, the system searches for `email AND server AND down`. **Note:** For Knowledge Base searches, if the default AND search returns poor results, the search is automatically re-run with the OR operator. Administrators can configure the knowledge base search to always use OR by modifying the *`glide.knowman.search.operator`* system property.
NOT, minus (-), or	Excludes documents that contain the search term after the NOT operator (a difference of sets). For example, to find documents that contain "CPU load" but

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Boolean operators (continued)

Operator	Description
exclamation point (!)	not "10 minutes", you can search for `"CPU load" NOT "10 minutes"` or `"CPU load" -"10 minutes"` or `"CPU load" !"10 minutes"`. NOT must be a stand-alone term in your search. For example, `atom NOT ion` excludes the term `ion`, but `NOTION` searches for the term `notion`. The minus and exclamation point symbols must immediately precede the search term that you want to exclude. For example, a search for `email !Joe` excludes `Joe` but a search for `email ! Joe` includes `Joe`. You can't use the NOT operator to exclude all terms in your search. For example, the following search returns no results: `NOT "10 minutes"`.

Related topics

Knowledge properties

Quotation marks allow exact phrase searches

Wrap search terms in quotation marks to search for an exact phrase consisting of one or more words.

Search terms in quotation marks are treated as exact phrase searches. When you search for an exact phrase, Zing only matches documents that contain the quoted words in the exact order you specify.

As an example, searching for `email password` returns search results that include `email` and `password` in any order, including records with these text strings:

- `enter your email password`
- `your email account password`

If you search for the quoted phrase `"email password"`, Zing returns search results with text `enter your email password` because they contain `email password` as an exact phrase. It doesn't return results with text `your email account password` because the search terms don't occur in the exact order specified in your search phrase.

Exact phrase searches ignore:

- stop words
- punctuation marks
- wildcard characters

Note: Wildcard characters are ignored as punctuation.

For example, searching for the phrase `"email password"` returns the same search results as these phrases:

- `"email the password"` because the stop word `the` is ignored.
- `"email password?"` because the punctuation mark ? is ignored.
- `"email password*"` because the wildcard character * is ignored as punctuation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Wildcard characters allow searching for patterns and variations

Expand search results to match any non-space character. Zing supports both single-character and multiple-character wildcards.

The following searches support Zing wildcard characters.

- Global text search
- Knowledge Base

> **Note:** Users with the admin role can enable wildcard search in the Knowledge context by navigating to **All** > **Contextual Search** > **Search Contexts**, editing the **Knowledge Base Search** record, and selecting the **Enable wildcard searches** check box.

- Search a list

> **Note:** To perform a wildcard text search of a list, you must select **for text** as the search field. If you select a list field instead of **for text**, wildcard characters in search terms will be interpreted as list search wildcards (for non-reference fields) or as auto-complete wildcards (for reference fields).

To perform a single-character wildcard search, use the percent sign (`%`) character. This wildcard finds words that contain any one character in place of the percent-sign-character. For example, to find words such as **text** or **test**, search for `te%t`.

To perform a multiple-character wildcard search, use the asterisk (`*`) character. This wildcard finds words that contain zero or more characters in place of the asterisk-character. For example, to find words such as **planned** or **placed**, search for `pl*d`.

You can use wildcard characters anywhere in a search string, and can include multiple wildcards in the same word. For example, to find words including **affordable**, **effort**, and **offering**, search for `%ff%r*`.

If a wildcard search returns too many hits, the system displays a message asking you to refine the search. Administrators can set a global text search property to change the limit for wildcard search results.

> **Note:** Wildcard text searches are only effective with multiple character words. A wildcard within a sequence of pictogram characters returns too many options for an efficient search. Wildcards are best used with letter-based words.

Wildcard characters and synonym matching

Zing doesn't expand the `%` and `*` wildcard characters when looking for synonyms that match your search term. These characters are treated as literal characters when finding matching synonyms. As an example, if you search for `issu*`, Zing doesn't find synonyms for `issue`, but it does find synonyms for `issu*`.

Enable or disable the Zing junk filter

When its junk filter is enabled, Zing doesn't index or search for 2-digit numbers or single-character words (unless they are Chinese or Japanese characters). You can enable or disable the junk filter for individual tables.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For example, to disable matches for search terms like `a` or `40` in the Knowledge Base, turn on junk filtering for the kb_knowledge table.

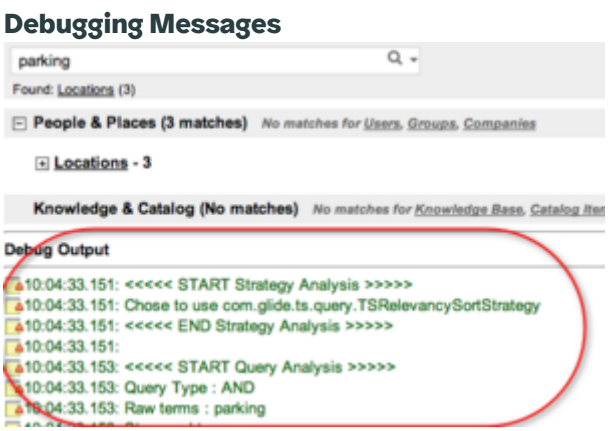
Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary entry for the table.
3. In the Attributes related list, set the value of the **Text index filter junk** attribute:
   a. If you want Zing to include 2-digit numbers and single-character words when indexing and searching the table, set the attribute value to `false`.
   b. If you want Zing to ignore 2-digit numbers and single-character words when indexing and searching the table, set the attribute value to `true`.
4. Select the additional actions icon in the Dictionary Entry form header, then select **Save**.
5. Select the **Generate Text Index** related link and select **OK**.

Note:

- To have the desired effect, you may also need to reconfigure the automatic stop words. For example, if a specific 2-digit number appears in all of your problem numbers (92-0001, 92-0002, and so on), the automatic stop word threshold is quickly exceeded and the word is no longer found in searches. To find that 2-digit number in the problem table, you must disable both junk filtering and automatic stop words.
- Disabling the junk filter results in a larger table index. For optimal performance, don't apply this attribute unless it's required.

Debug Zing



Debugging messages create a log of search processes as they occur. These messages may help administrators configure optimal performance settings.

Before you begin

Role required: admin

About this task

- To view debugging messages, navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug Text Search**. The search log messages appear at the bottom of the results page for the remainder of your session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To debug text indexing problems, you may want to view text_index events in the system log.
- In rare cases, you may need to reset the text search caches after regenerating a text index. If text search fails for known words, diagnose and fix this problem:

Procedure

1. Enable text search debugging messages.
2. In any table with search problems, search for the problem text.
3. In the debug output, note the numbers used for the Stemmed terms.
4. Navigate to the Ts Word [ts_word] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `ts_word.list`.
   c. Press Enter.
5. Locate the stemmed terms and compare the numbers in the list to the debug output from step 3.
   If the numbers are different, the UI node's cache is stale.
6. Navigate to **All** > **System Definition** > **Text Indexes**.
7. Select the **Reset Text Search Caches** related link and select **OK**.

Global search finds records from multiple tables

Search multiple record types from a single search field.

To perform a global search, perform one of the following actions based on your UI version.

UI version	Action
Next Experience UI	Enter your search terms in the Unified Navigation search field, then select **View results** or press Enter.
Core UI	Select the search icon in the banner on the upper right of the System settings for the user interface (UI) , then enter your search terms and press Enter.

All UI versions also have a global search keyboard shortcut. The `ui_global_text_search` UI Macro provides the global search field.

For a list of search source tables that the system searches by default, along with steps for adding new search source tables, see Default global search sources for Next Experience UI and Default global text search groups for Core UI.

Global search supports Boolean operators, quoted phrases, and wildcard characters. For details on these search features, see Boolean operators allow conditional search results, Quotation marks allow exact phrase searches, and Wildcard characters allow searching for patterns and variations.

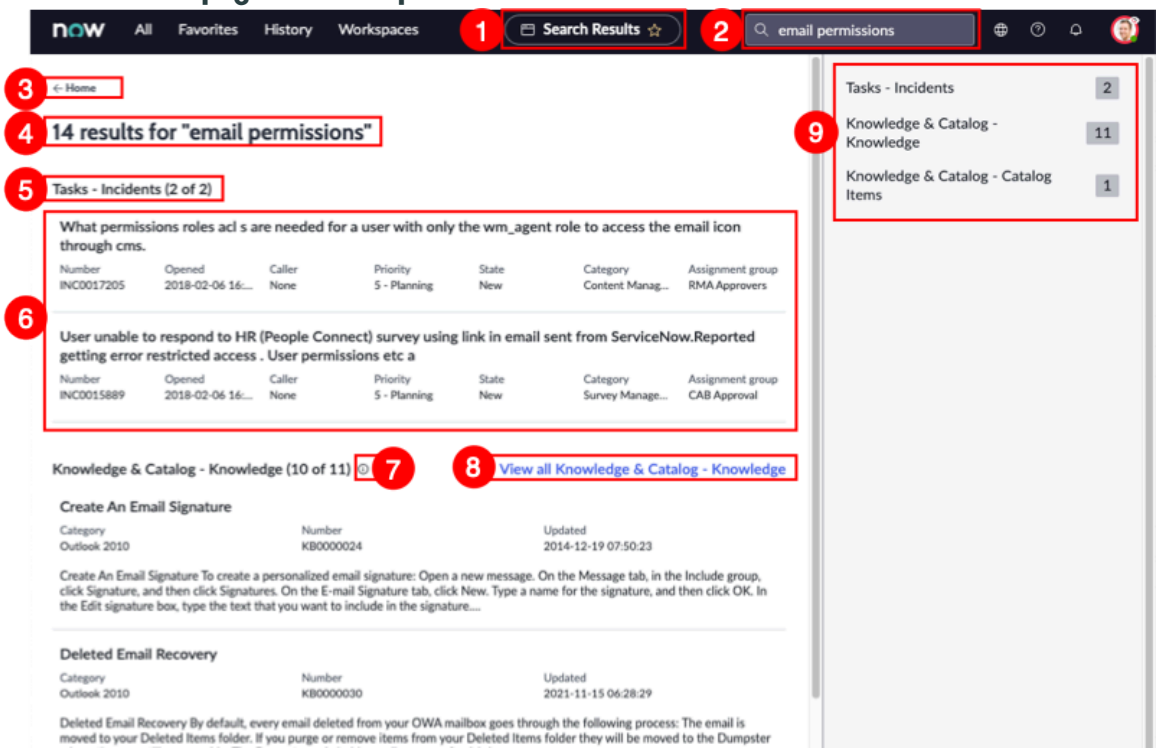
Global search displays a page of matching results

Global search displays a page of results that match your search, grouped by table.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The elements included on the search results page differ by UI, as described in the following sections.

Search results page in Next Experience UI

Global search displays a Search Results page containing results that match your search terms, grouped by search source. Results appear when the search is complete.

Search Results page in Next Experience UI

Zing displays global search results in a dedicated page consisting of these elements.

Elements of the global search results page in Next Experience UI

UI element	Description
1. Search Results page title	Contextual app pill for the search results page.
2. Global search field	Field displaying your current search terms. If you edit these terms, refresh the results page by selecting the **View results** link that appears in a panel below the search field.
3. Contextual return link	Link to return to the page you were on when you performed the search. The title of this link depends on which page you searched from.
4. Total result count	Total number of records matching your search.
5. Search source table name	Name of a search source table and the number of previewed and total matching records in that table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements of the global search results page in Next Experience UI (continued)

UI element	Description
and result count	Users with the admin or ui_builder_admin roles can hide the per-table counts of matching records. For details on making this change, see Hide per-table search result counts in Next Experience UI.
6. Preview of matching records for table	Partial list of matching records for the specified table, with maximum count controlled by the preview limit. By default, the system displays up to 10 matching records per table, sorted from highest to lowest document score. The system displays a separate list for each table in the search source. By default, the system displays fields from the table's text_search list view for each search result. If this view doesn't exist for the table, it instead displays fields from the default list view. For more details on the text_search list view and the format of individual result listings, see Text search views control format of global search results for tables. Users with the admin role can override the preview results limit for a search application by modifying the application's record in the Workspace Global Search Configuration [sys_aw_global_search_config] table. For more details on this procedure, see Set the preview limit for global or workspace search in Next Experience UI. Administrators can also modify the search results table list view by modifying the value of the *glide.ui.text_search.view* system property. For details on changing this value, see Set global text search properties.
7. Table filter	Icon indicating that a filter was applied to results from this search source table. Pointing to the information icon displays a pop-up containing the search filter applied.
8. Link to all table results	Link to all matching records from the searched table. Select the link to launch a filtered list view based on the query. This link only displays when the total number of matching records in the table exceeds the preview limit.
9. Results summary	List of search source tables, showing the number of matching search results per table. Select the search source table name to display the associated preview list results. Search source tables with no matching results don't appear in this list. Users with the admin or ui_builder_admin roles can hide the per-table counts of matching records. For details on making this change, see Hide per-table search result counts in Next Experience UI.

View and open search results using workspace applications in Next Experience Unified Navigation

Use the search context menu to view and open results for your current search in workspace applications.

Before you begin

You must be using Next Experience UI.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In addition to global search, you may have access to workspace search applications, such as CSM/FSM Configurable Workspace. If you have access to multiple search applications, the search field's drop-down search context menu displays all available search applications, with the current application preselected. To view and open search results in another application, select it from the search context menu.

Users with the administrator role can add workspace applications to the search context menu. For details on this procedure, see Add a workspace application to the Unified Navigation search context menu.

Procedure

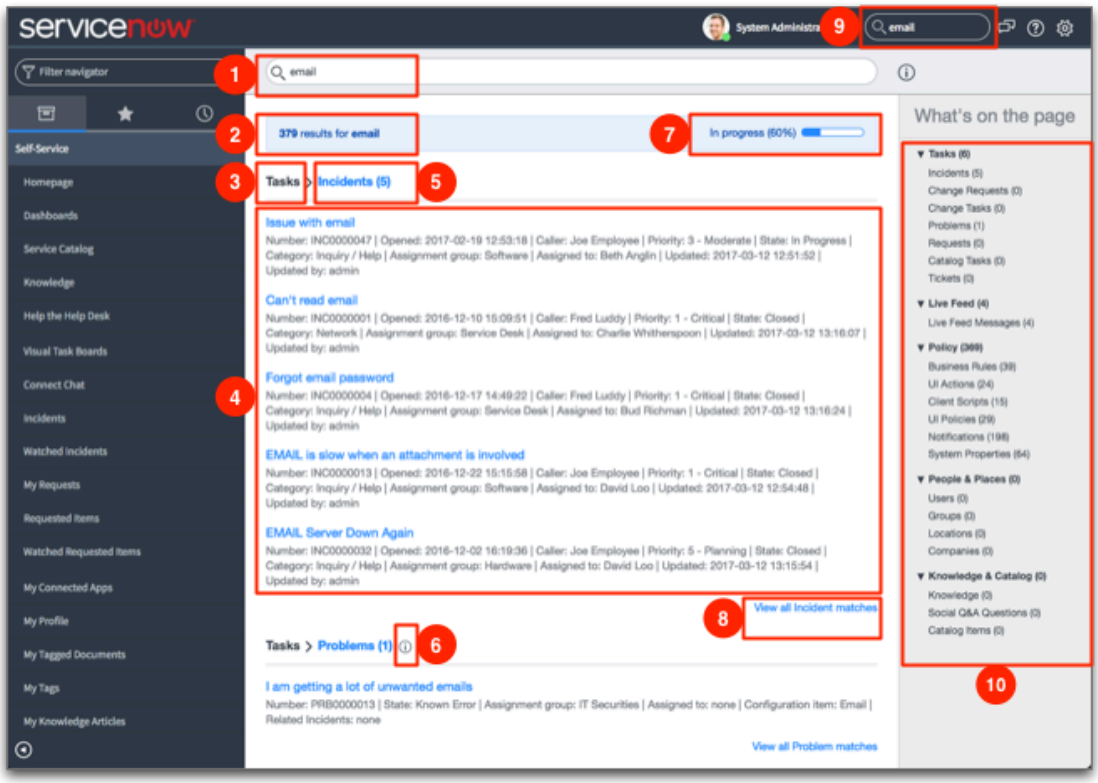
1. Use the search field to perform a search and view search results.
2. To open the search context menu, select the **Choose search context** icon in the search field.

   Note: If the **Choose search context** icon isn't displayed in the search field, the current search applications is the only one available. You can't switch search applications.

   A drop-down menu of available search applications displays, with the current search applications preselected.

3. Select an alternate search application from the drop-down menu.
   The drop-down menu disappears and the **View results** link appears.
4. To view search results in the selected application, select **View results** or press Enter.

Result



The page reloads and displays results for your current search from the selected search application. If you select a previewed matching record, it opens in the selected search application.

Search results page in Core UI and UI15

Global text search displays a page of results that match your search terms. Search results appear dynamically on this page as Zing generates them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global text search results page in Core UI

Zing displays global text search results in a dedicated page consisting of these elements.

Elements of the global text search results page in Core UI and UI15

UI element	Description
1. Search terms	Field displaying your current search terms. If you edit these terms, refresh the results page by selecting the search icon or pressing Enter. **Note:** If you delete your search terms and select the search icon or press Enter, the search results page doesn't refresh. To refresh the page, enter search terms, then select the search icon or press Enter.
2. Total results	Total number of records matching your search.
3. Search group name	Name of the search group that includes the table with matching records.
4. Preview of matching records	Partial list of matching records for the specified table, with maximum count controlled by the preview limit. By default, the system displays up to 10 matching records per table, sorted from highest to lowest document score. The system displays a separate list for each table in the search group. By default, the system uses the table's text_search list view if available. Otherwise, it displays fields with the default list view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements of the global text search results page in Core UI and UI15 (continued)

UI element	Description
	Users with the admin role can modify the default preview results limit and search results table list view by changing the values of the *glide.ui.text_search.rowcount* and *glide.ui.text_search.view* system properties. For more details on these properties, see Set global text search properties.
5. Table name	Name of the search group table and the number of matching records in the table. Click the link to launch a filtered list view based on the query. Users with the admin role can hide matching record counts by setting the *sn_global_searchui.hide_results_count* property to **true** in the System Property table.
6. Table filter	Current filter applied to search results from this table. Pointing to the information icon displays a pop-up containing the search filter applied. For information on applying a table filter to a search group, see Add a search group for Core UI.
7. Progress bar	Current percentage of tables searched. The system hides this element after the search is complete.
8. Link to all table results	Link to see all matching records from the search group table. Click the link to launch a filtered list view based on the query.
9. Global search field	Global search field. **Note:** If you delete your search terms and select the search icon or press Enter, the search results page refreshes, displaying zero search results.
10. Results summary	List of search groups and tables with the number of search results per group and table. Select the table name to display the associated preview list results.

Text search views control format of global search results for tables

The text_search view for a table determines how global search displays results from that table.

Results displayed by global search include multiple elements. For each search result, the system populates these elements with values of fields included in the table's text_search list view.

Sample search result listing in Next Experience UI

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample search result listing in Core UI

Search result elements

Element	Description	Matching criteria
1. Title	The title is the first line of the search result block. It links to the matching record of the search result.	Global search uses the first string field in the table's text_search list view that is not the number field. If there is no matching string field or the contents of the field is empty, the system displays the text "No title" in the session language. For example, in the default text_search view for the Incident table, the short description field satisfies the title criteria. Global search uses this field as the search result title.
2. Field list	The field list is the second line of the search results. It displays field name-value pairs, separated by the pipe character, for up to 10 fields.	Global search uses the first 10 fields in the table's text_search list view that don't match the title or description criteria. For example, in the default text_search view for the Incident table, the number, opened, caller, priority, state, category, and assignment group fields satisfy the field list criteria. Global search displays the names and values for these fields in the search result field list.
3. Description	The description is the third line of the search results. This line is optional and may not appear for all search results.	Global search uses the first string field in the table's text_search list view that is not the title and is over 100 characters in length. If no field matches these criteria, the search results omit this line. For example, in the default text_search view for the Incident table, the description field satisfies the description criteria. Global search uses this field as the search result description.

By default, the system uses the text_search list view for a table to format global text search results for that table. If a text_search view doesn't exist for the table, the system instead formats search results using the table's default form view. Implementers can specify which view the system uses to format search results by modifying the value of the *glide.ui.text_search.view* system property.

Default display fields for global search tables

Multiple tables are enabled for global search in the base system. Each global search table has its own set of fields included in the table's default text_search list view. The system uses fields from this view to format global search results from these tables.

Table	Display fields
Catalog Item [sc_cat_item]	Short description, Description, Category, Price
Catalog Task [sc_task]	Short description, Description, Number, Priority, State, Assignment group, Request item
Change [change_request]	Short description, Description, Number, Type, Assignment group, State, Risk, Priority
Change Task [change_task]	Short description, Description, Number, Type, State, Assignment group
Company [core_company]	Name, Street, City, Zip / Postal code, Phone
Group [sys_user_group]	Name, Description, Type
Incident [incident]	Short description, Description, Number, Opened, Caller, Priority, State, Category, Assignment group
Knowledge [kb_knowledge]	Short description, Article body, Category, Number, Updated
Problem [problem]	Problem statement, Description, Number, State, Resolution code, Assignment group, Configuration item, Related Incidents
Request [sc_request]	Short description, Number, Requested for, State, Opened by
Requested Item [sc_req_item]	Number, Item, Stage, State, Requested for, Opened by, Opened
User [sys_user]	Name, Email, Company, Department, Title

Search settings filter and group global search results by table

Global search filters and groups matching results by table. You can configure search sources (in Next Experience UI) or search groups to define tables and groups for global search.

The configuration settings for table-based filtering and grouping of global search results differ by UI, as described in the following sections.

Search sources filter global search results by table in Next Experience UI

Global search in Next Experience UI displays search results broken out by search source. A search source is a collection of global search settings for a ServiceNow AI Platform® table.

A user must have read access to a table to see search results for it.

Default global search sources for Next Experience UI

The base system includes these default search sources for global search in Next Experience UI.

When Next Experience UI is activated, the following search sources are defined for global search. These search sources appear in the Application Search Sources related list for the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Now Experience Search Configuration record in the Search Application Configuration [sys_search_context_config] table.

Search source	Table searched
Tasks - Incidents	Incident [incident]
Tasks - Change Requests	Change Request [change_request]
Tasks - Change Tasks	Change Task [change_task]
Tasks - Problems	Problem [problem]
Tasks - Requests	Request [sc_request]
Tasks - Catalog Tasks	Catalog Task [sc_task]
People & Places - Users	User [sys_user]
Tasks - Requested Items	Requested Item [sc_req_item]
People & Places - Groups	Group [sys_user_group]
Knowledge & Catalog - Knowledge	Knowledge [kb_knowledge]
People & Places - Companies	Company [core_company]
Knowledge & Catalog - Catalog Items	Catalog Item [sc_cat_item]

Note: Search sources only affect filtering of global search results in Next Experience UI. In Core UI, global text search filters results based on settings defined in text search groups. For details on these settings, see Search groups filter global text search results by table in Core UI.

Add a search source for Next Experience UI

Add a new search source to make a table searchable by global search or workspace search in Next Experience UI.

Before you begin

You must be using Next Experience UI.

Note: You can configure tables for global text search in Core UI by adding new text search groups. For more details, see Add a search group for Core UI.

The tables you want to include in the search group must have text indexing enabled. To enable text indexing for a table, see Configure a table for indexing and searching.

Role required: search_application_admin or workspace_admin

About this task

A search source defines a table that is searchable by global or workspace search in Next Experience UI. Define new search sources to add to the default set of tables configured for global search or your workspace search. For the list of global search sources included in the base system, see Default global search sources for Next Experience UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Define the new search source in the Search Source [sys_search_source] table.

   a. Select **All**.

   b. In the **Filter** field, enter `sys_search_source.list`.

   c. Press Enter.

   d. Select **New**.

   e. On the Search Source form, fill in the fields.

Field	Description
Name	Name to display for the search source in the global search results page.
Table	Table to make searchable for global search.
Conditions	Filter conditions that table records must satisfy to be searchable.
Application	Application scope for the search source. This field is automatically set.

   f. Select **Submit**.

2. Link the new search source to the record for the global or workspace search application in the Search Application Configurations [m2m_search_context_config_search_source] table.

   a. Select **All**.

   b. In the **Filter** field, enter `m2m_search_context_config_search_source.list`.

   c. Press Enter.

   d. Select **New**.

   e. Select the additional actions icon  , then select **Configure** > **Form Layout**.

   f. Use the slushbucket to add the Search context config field to the selected field list, then select **Save**.

   g. On the Application Search Sources form, fill in the fields.

Field	Description
Source	Name to display for the search source in the global search results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order of appearance for the search source in the search application configuration context.
Application	Application scope for the search source. This field is automatically set.
Search context config	Record for the global or workspace search application in the Search Application Configuration [sys_search_context_config] table. To add the search source for global search, select the **Now Experience Search Configuration** record. To add the search source for a workspace application, select the record for that application. For example, to add a search source for Agent Workspace, select the **Agent Workspace Search Config** record.

h. Select **Submit**.

3. **Optional:** Reorder search sources for the global or workspace search application.

a. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.

b. Open the record for the search application.

Note: For global search, open the **Now Experience Search Configuration** record. For a workspace application, open the record for that application, such as the **Agent Workspace Search Config** record for Agent Workspace.

c. In the Application Search Sources related list, edit the **Order** values for search source records to alter the display order for table filters on the application's search results page.

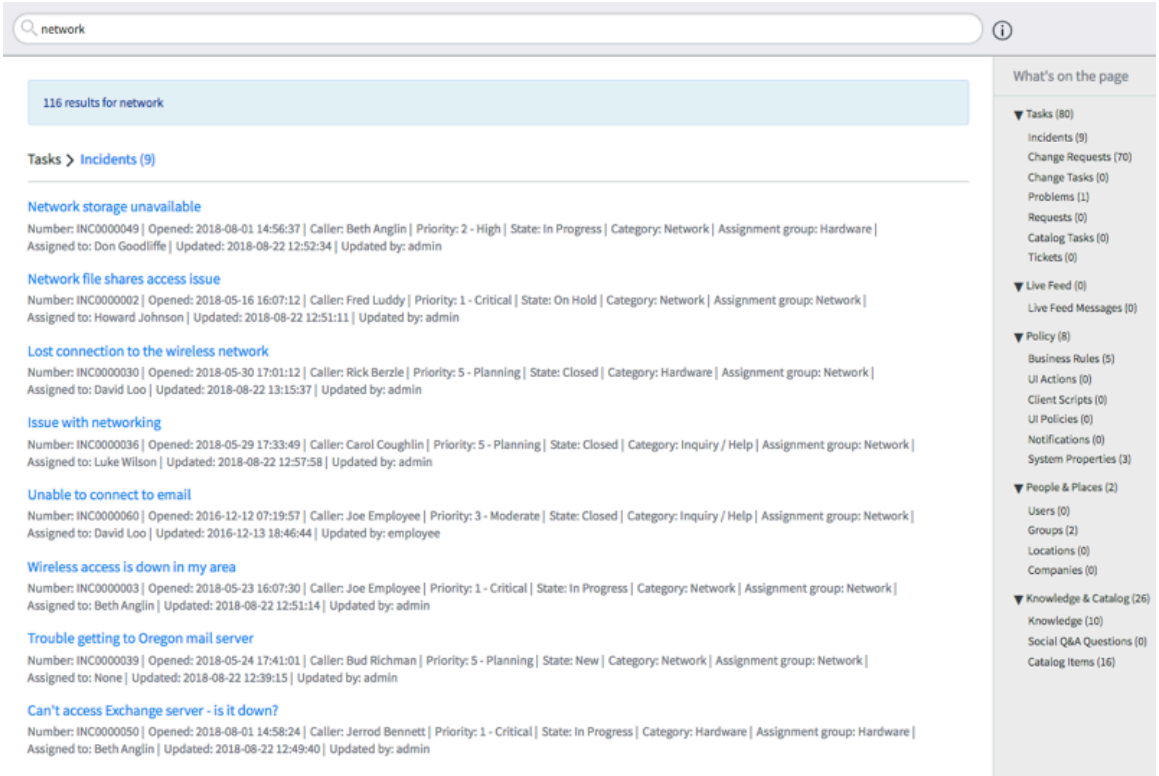
Result
The new search source appears in global or workspace search results.

Search groups filter global text search results by table in Core UI

Global text search in Core UI displays search results broken out by search group. A search group is a collection of related searchable tables.

Within each search group, the system divides search results by table. A user must have read access to a table to see search results for it.

Displaying search results by group



The system displays knowledge and service catalog search results within their respective search results pages. The system displays other results in list format.

For exact match searches, the system only returns records from the Task (task) and Knowledge (kb_knowledge) tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The system filters global search results to display only knowledge articles that are in the same language as the preferred language setting.

Example global text search results

Options for administrators

Administrators can customize these search group settings for all users:

- Specifying which tables are part of the group.
- Specifying whether the search group is available for use.
- Specifying whether searches include results from this search group by default.
- Creating new search groups.

Enabling a search group allows users to see records from the search group's tables. Disabling a search group hides records from the search group's tables.

Default global text search groups for Core UI

The base system includes these default text search groups for global text search in Core UI.

Search group	Tables searched
Tasks	• Incident [incident] • Change Request [change_request] • Change Task [change_task] • Problem [problem] • Request [sc_request]

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search group	Tables searched
	• Catalog Task [sc_task] • Requested Item [sc_req_item]
People & Places	• User [sys_user] • Group [sys_user_group] • Company [core_company]
Knowledge & Catalog	• Knowledge [kb_knowledge] • Catalog Item [sc_cat_item]

Note: Text search groups only affect filtering of global text search results in Core UI and UI15. In Next Experience UI, global search filters results based on search sources linked to the **Now Experience Search Configuration** record in the Search Application Configuration [sys_search_context_config] table. For details on the search sources included in the base system, see Default global search sources for Next Experience UI.

Add a search group for Core UI

Add a new text search group to filter global text search results by table in Core UI.

Before you begin

You must be using Core UI.

Note: You can configure tables for global search in Next Experience UI by adding new search sources. For more details, see Add a search source for Next Experience UI.

The tables you want to include in the search group must have text indexing enabled. To enable text indexing for a table, see Configure a table for indexing and searching.

Role required: text_search_admin

About this task

A text search group defines a set of tables to use as filters for global text search results in Core UI. Define new search groups to add to the default set of text search groups configured for global text search.

For the list of text search groups included in the base system, see Default global text search groups for Core UI.

Procedure

1. Navigate to **All** > **System Definition** > **Search Groups**.
2. Select **New**.
3. On the Text Search Groups form, fill in the fields.

Field	Description
Name	Enter a name for the search group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Roles	Select one or more user roles if you want to restrict access to the search group to those roles.
User group	Select a user group if you want to restrict access to the search group to users in that user group.
Description	Enter text to display as a tooltip for the search group.
Active	Ensure the check box is selected to make the search group available.
Searched	Clear the check box if you want to exclude results from this search group.
Order	Enter a number to determine the order in which this search group is listed relative to other search groups.

4. Select the additional actions icon, then select **Save**.
5. For each table that you want to add to the search group, perform the following steps.

   a. In the search group record's Text Search Tables related list, select **New**.

   b. On the Text Search Table form, fill in the fields.

Text search table

Field	Description
Search group	The search group that you want to add a table to.
Table	Select the table to include in the search group. **Note:** You can select any table not excluded by the *glide.ui.no_text_search* system property, but global search only displays search results for tables that have text indexing enabled.
Application	Application scope for the text search table record. This field is automatically set.
Active	Option to search the table as part of the search group.
Searched	If you want to exclude results from this table by default, clear this option. A user can manually choose to show results from this table on the search results page.
Order	Order in which this table is listed relative to other tables in the search group.
Conditions	Select one or more conditions to determine which records on the selected **Table** are searched.

   c. Select **Submit**.

Global search displays exact matching records

When your search exactly matches the **Number** field value for a record, global search takes you directly to that record, bypassing the search results page.

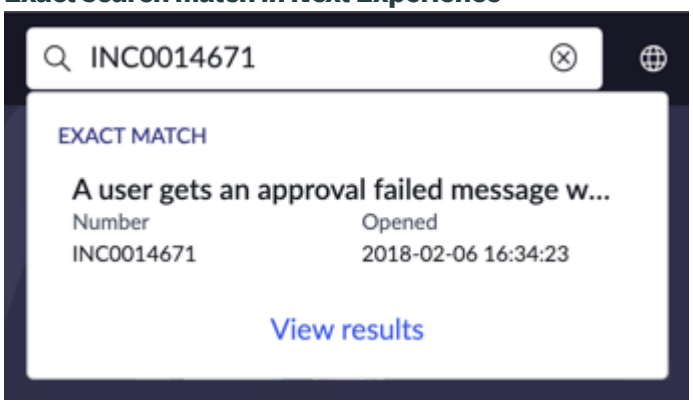
As an example, if you search for `INC0038278`, global search shows Incident record INC0038278 in form view instead of showing the search results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Exact match respects security settings. If you don't have permission to view the record that matches your search, global search won't show you that record.

If more than one record has a **Number** field value that exactly matches your search, global search displays the first exact match. An informational message reports the total number of exact matches and provides links to the other exact matches.

Exact match configuration settings



Exact match only returns matches for Number values that contain prefixes defined in the Numbers [sys_number] table. To view prefixes and their matching tables, navigate to **All** > **System Definition** > **Number Maintenance**.

Search behavior for exact match is controlled by the *com.snc.agent_workspace.global_search.typeahead.exact_match_request_criterion* system property. This property's value is a Java regular expression pattern. Only search queries that match the regular expression pattern are evaluated as possible exact record matches. For details on Java regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

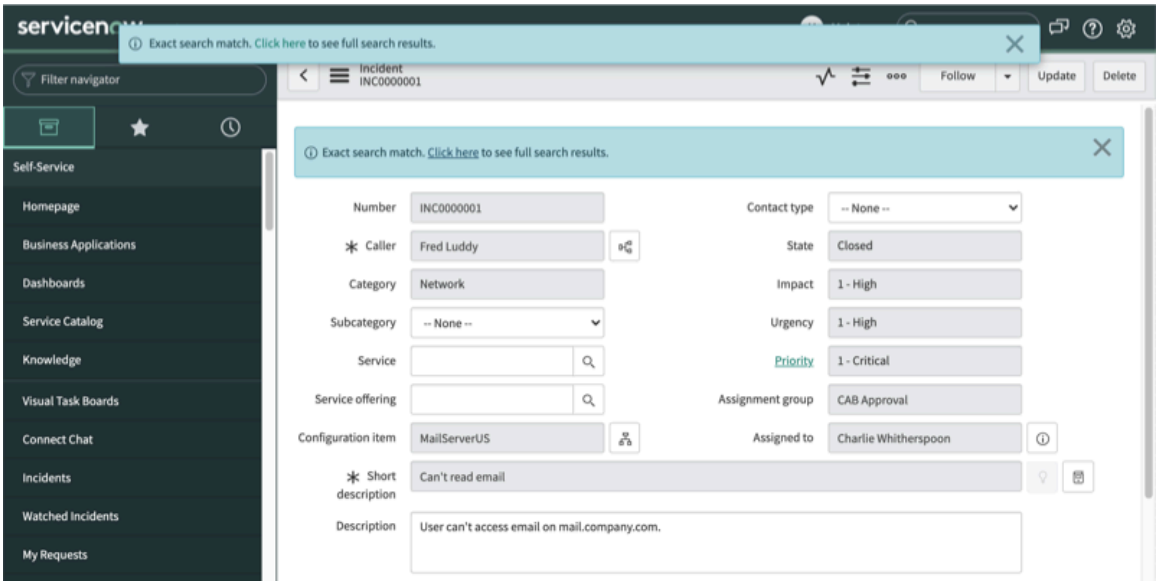
Exact search matches in Next Experience UI

When your search in Next Experience UI exactly matches a searchable record, the Unified Navigation search field displays a preview of that record. Selecting the preview takes you directly to that record and bypasses the search results page.

Exact search match in Next Experience

The preview of the matching record appears below the Unified Navigation search field with an **Exact Match** tag. Select this tag or press Enter to navigate directly to the record.

To see the full search results page for your search, select **View results**. For details on the elements that make up the search results page, see Search results page in Next Experience UI.



Note: You may need to wait a few seconds after entering your record number into the search field for the system to process your search request and display the preview. Once the preview appears, you can press Enter to go directly to the matched record. If you press Enter before the preview appears, the system shows you the full search results page for your search instead.

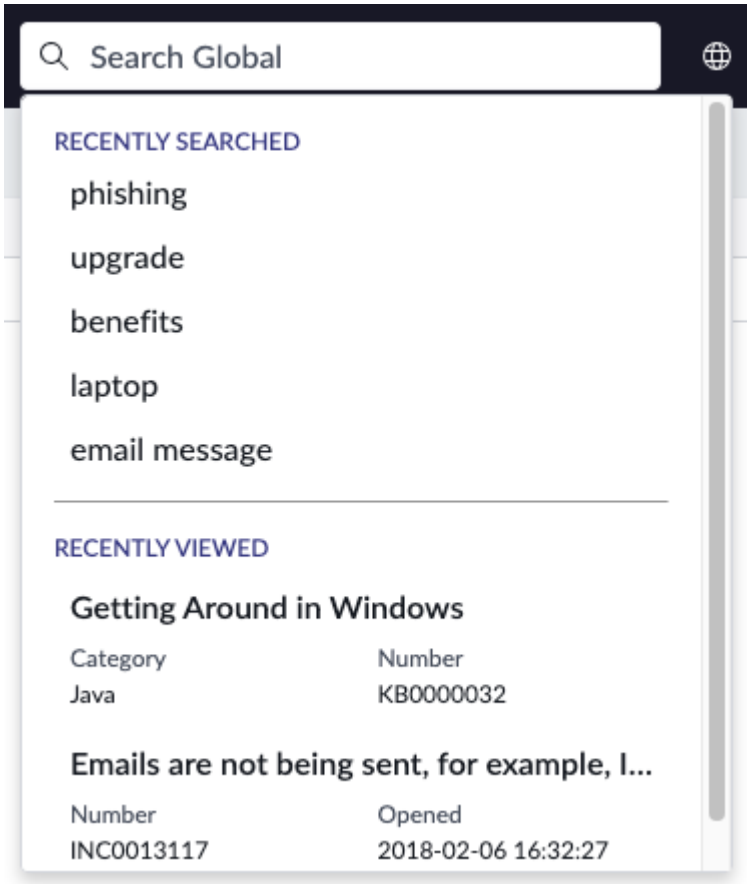
Exact search matches in Core UI

When your search in Core UI exactly matches a searchable record, global search takes you directly to that record, bypassing the search results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exact search match in Core UI

The system displays the matching record with an informational message indicating that your search produced an exact search match.



To see the full search results page for your search, select the link in the informational message. For details on the elements that make up the search results page, see Search results page in Core UI and UI15.

Global search displays your most recent search queries and results in Next Experience UI

When you select the empty Unified Navigation search field, the system displays lists showing your most recent search queries and your most recently viewed search results. Select a **Recently Searched** query to repeat it, or select a **Recently Viewed** search result record to navigate to it.

The **Recently Searched** and **Recently Viewed** lists appear below the Unified Navigation search field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Recently Searched** list shows the most recent search queries from your personal search history. This list only appears when your search history includes previous search queries.

The **Recently Viewed** list shows the most recently viewed search results from your personal search history. This list only appears when your search history includes previously viewed search results.

Set global text search properties

Administrators can control how global text search behaves with system properties.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **Global Text Search**.
2. Review the values for the following global text search properties and change them as needed.

UI properties for global text search

Property	Description
Enable Global Text Search (*glide.ui.text_search.enable*)	Option to enable global search in Core UI and UI15. ○ Type: Boolean ○ Default value: *true* ○ Supported values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	▪ *true*: Global search is enabled in Core UI. ▪ *false*: Global search is disabled in Core UI. **Note:** When Next Experience is enabled, this system property has no effect. To enable or disable the Unified Navigation search field in Next Experience, set the *glide.ui.polaris.global_search* system property described in Next Experience system properties.
List of roles (comma-separated) that can use the Global Text Search capability (*glide.ui.can_search*)	Comma-separated list of user roles that allow access to global search. To enable global search for users with a role, add the role to this list. ○ Type: String ○ Default value: *itil, text_search_admin, admin*
List of tables (comma-separated) that won't appear as options when setting up Global Text Search tables (*glide.ui.no_text_search*)	Comma-separated list of tables that don't appear as options when defining text search groups for Core UI. Examples are system or maintenance tables. ○ Type: String ○ Default value: *sys_audit, sys_event, ecc_queue, ecc_event, syslog, syslog_transaction, sys_journal_field, sys_audit_relation, ecc_agent_log, ecc_mi_result, sysrule_escalate_history, sys_user_token, sys_time_dimension, sys_attachment_doc, sys_audit_delete*
Number of Global Text Search matches returned per table (*glide.ui.text_search.rowcount*)	Maximum number of matching records previewed for each table on the global text search results page. Users can select a table to see all matching results for that table. ○ Type: Integer ○ Default value: 10 **Note:** This system property only controls the global text search preview limit in Core UI. In Next Experience UI, you can set the global search preview limit by editing the **Now Experience Search Configuration** record in the Workspace Global Search Configurations [sys_aw_global_search_config] table.
Global Text Search background color for Knowledge Base results (*css.textsearch.kb.background.color*)	Background color for Knowledge article global text search results. This property only affects display of results on the legacy global search results page. ○ Type: String ○ Default value: *#f0f7f9*
Global Text Search background color for Catalog results (*css.textsearch.catalog.background.color*)	Background color for Catalog global text search results. This property only affects display of results on the legacy global search results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	○ Type: String ○ Default value: *#ffffdd*
Form view to use for Global Text Search exact match - blank means Default view (*glide.ui.text_search.match_view*)	Name of the form view that global text search uses to display exact match results. If no value is specified, global text search uses the default form view. For information on creating and managing views, see View management. ○ Type: String ○ Default value: (empty)
List and form view to use for Global Text Search results. Blank means default view (*glide.ui.text_search.view*)	Name of the list view that global text search uses to format results for each searched table. If no value is specified, global text search uses the default list view. For information on creating and managing views, see View management. ○ Type: String ○ Default value: *text_search*
Query method for global text search. Run a query for each table, for each base class (parent table), against a single index regardless of table (requires text index regeneration), or let GlideRecord handle the query (simple). With the Zing text search engine, the preferred value is "simple" (*glide.ir.query_method*)	Query method to use for global text search. **Note:** The *base*, *single*, and *table* values aren't supported. Leave this system property set to its default *simple* value. ○ Type: Choice list ○ Default value: *simple* ○ Available values: ▪ *base*: Run a search query for each base class. This value is no longer supported. ▪ *simple*: Let GlideRecord handle the search query. ▪ *single*: Run a search query against a single text search index. To use this method, you must regenerate text search indexes. This value is no longer supported. ▪ *table*: Run a search query for each searchable table. This value is no longer supported.
The maximum number of results that will be returned during a text index search. This limits the number of records that will be extracted from the text index and displayed (*glide.lucene.base_result_max*)	Maximum number of results that global text search will return when searching a text search index. **Note:** When the query method is set to *simple*, this property is ignored. ○ Type: Integer ○ Default value: 100
The maximum number of entries that will be retrieved from the text index. Only the	Maximum number of entries that global text search will retrieve from a text search index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
table that is involved will be returned from the text index for all entries that are between the value specified for maximum results and this value. This is done so that it can be indicated that more results exists for any given table that are going to be displayed (*glide.lucene.base_hits_max*)	**Note:** When the query method is set to *simple*, this property is ignored. ○ Type: Integer ○ Default value: 500
Number of simultaneous processes (1 to 16) used when searching though multiple groups in a global search (*glide.ts.global_search.parallelism*)	Number of concurrent threads global text search uses when searching multiple search groups. Each search group requires one thread. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits. ○ Type: Integer ○ Default value: 4

3. Select **Save**.
   The business rule **Text Search Property Change Rationally** validates the new values and aborts the update if they are outside its acceptable ranges.
4. To set the maximum number of matches to display for a wildcard search term, follow these steps.

   a. Open the System Properties table and search for the property **glide.ts.max_wildcard_expansion**.

Field	Description
Name	glide.ts.max_wildcard_expansion
Description	Maximum number of matches for a wildcard search term that are allowed as unambiguous.
Type	Integer
Default value	500

   b. Edit the **Value**.
   If a wildcard search matches more words than this value, the system displays a message asking the user to refine the search.

   c. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To set the Zing text search stemming language, follow these steps.

   a. Install the internationalization (i18n) plugin for the language you want to stem text search terms in.

   b. Add a new system property, *glide.ts.stemming_language*:

Field	Description
Name	glide.ts.stemming_language
Description	Language to use for text search stemming. For details on stemming, see Zing matches derived words with stemming.
Type	String
Values supported	▪ English ▪ French ▪ German
Default value	English

   c. To make tables use the new stemming language for text search, manually regenerate their text search indexes.
   For details on this procedure, see Regenerate a text index for a table.

6. **Optional:** To enable and configure fallback number search for exact matches, follow these steps.

   Note: Fallback number search is disabled by default. When it's enabled, if a global text search finds no exact match for a record number, the system searches a list of specified tables for matches. This additional search can make global text searches take longer, so enable fallback number search only if you need it.

   a. To enable fallback number search, add a new system property, *glide.ui.text_search.enable_fallback_number_search*:

Field	Description
Name	glide.ui.text_search.enable_fallback_number_search
Description	Option to enable fallback number search for use when global text search finds no exact matches for a record number. **Note:** Fallback number search can make global text searches take longer. Enable the option only if you need it.
Type	Boolean
Default value	false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. To configure the list of tables searched by fallback number search, add a new system property, *glide.ui.text_search.fallback_table_list*:

Field	Description
Name	glide.ui.text_search.fallback_table_list
Description	Comma-separated list of names of tables to search when performing fallback number search. Use the special value *all* to search all tables that have prefixes defined in the Number [sys_number] table. **Note:** Increasing the number of tables to search may increase the time required for fallback number search. Test any changes to this system property before putting them into production.
Type	String
Default value	task,kb_knowledge

Configure parallel processing of search groups

To improve performance, only activate search groups and tables that are necessary to meet business needs.

Before you begin
Role required: admin

About this task
For example, if you don't need Change Task results, deactivate that table in the Tasks search group. If only one group of users needs Change Task results, set up a separate search group that includes Change Tasks. Other users search using a group that doesn't contain Change Tasks.

Global text search can render results in parallel to improve performance. To configure the number of parallel processes:

Procedure

1. Navigate to **All** > **System Properties** > **Global Text Search**.
2. Locate the property called **Number of simultaneous processes(1 to 16) used when searching though multiple groups in a global search**.
3. Enter the number of processes to run in parallel.
   Each search group uses one thread to render results. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits.
4. Select **Save**.

Revert to the legacy global search UI

Disable the dynamic global search UI to preserve customizations you made to the legacy global search UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You must have Next Experience disabled on your instance. The legacy global search UI is only available in Core UI.

Role required: admin

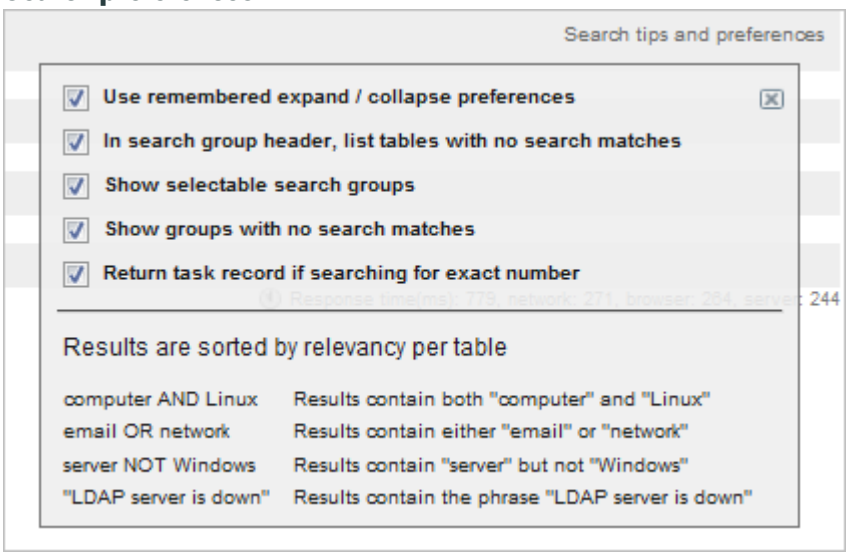
Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Select **New**.
3. Enter these field values.

Field	Value
Name	glide.ui.use_legacy_global_search
Type	true | false
Value	true

4. Select **Submit**.

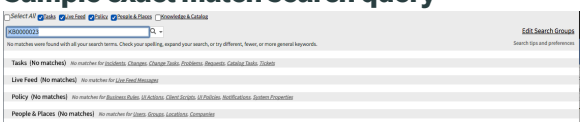
Result



The system displays the global search UI and uses the legacy display logic.

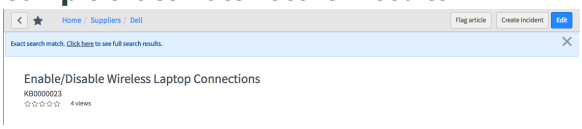
Legacy global search user preferences

The global text search results page allows users to set several user preferences for global text search.



The following search preferences are available from the **Search tips and preferences** link.

Search preferences



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search preferences

User preference	Description
Label Use remembered expand / collapse preferences **Preference** ts.remember.expanded	Specifies whether you want the collapse state of any search groups/tables remembered for your next search. If selected and you collapse the search results for the People & Places search group for example, that group will be collapsed on your next search. If cleared, all groups and tables are expanded for every search.
Label Show list of tables with no search matches **Preference** ts.show_negative_result_info	Specifies whether or not you want to see a summary of tables that had no search matches. For example: No matches for Requests, Catalog Tasks, Tickets.
Label Show selectable search groups **Preference** ts.show_search_groups	Shows or hides the search group check box row.
Label Show groups with no search matches **Preference** ts.show_empty_groups	Shows or hides a search group if it returns no matches. If selected, the search results display a placeholder row stating there were no matches for that group.
Label Return task record if searching for exact number **Preference** ts.match	Shows or hides the full search results page if the search term matches a task record number. When selected, an exact match to a record number causes the system to hide the full search results and instead display the record with an exact match message. Exact search matches ignore most additional search conditions normally applied to the record such as the currently selected search groups or the knowledge article published state. For example, an exact search match for a knowledge article returns the article in any state as long as the current user has read access to it. **Note:** The system filters exact search results to display only knowledge records that are in the same language as the preferred language setting. **Sample exact match search query** 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search preferences (continued)

User preference	Description
	In this sample search, the **Knowledge & Catalog** search filter is cleared, which would normally prevent returning any knowledge articles. **Sample exact match search results**  In this sample exact match, the system displays the matching article and an information message in the form header reading `Exact search match. Click here to see full search results.`

Set the preview limit for global or workspace search in Next Experience UI

Override the default limit of 5 preview results per search source on the Next Experience UI search results page for global or workspace search.

Before you begin

You must be using Next Experience UI.

Role required: workspace_admin

About this task

The preview limit for a search application specifies how many preview results can appear for each search source on the search results page. By default, the system displays up to 5 preview results per search source. Workspace administrators can override this default limit separately for global search and for all workspace searches.

Procedure

1. Navigate to the Workspace Global Search Configuration [sys_aw_global_search_config] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_aw_global_search_config.list`.
   c. Press Enter.
2. Open the configuration record for the search application that you want to modify the preview limit for:
   - To modify the preview limit for global search, open the **Now Experience Search Configuration** record.
   - To modify the preview limit for a workspace application, open the **Workspace search settings** record.
3. On the Workspace Global Search Configuration form, enter your desired preview limit into the **Tab overview items per section** field, then select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The search results page for global or workspace search displays preview results up to the new limit for each search source.

Hide per-table search result counts in Next Experience UI

Suppress display of per-table search result counts in the Next Experience UI search results page.

Before you begin
You must be using Next Experience UI.

Role required: ui_builder_admin or admin

About this task
By default, the search results page displays the total number of search results along with per-table result counts for each searchable table that contains matching records. You can hide the per-table result counts for search users by following this procedure.

Procedure
1. Navigate to **All** > *Next Experience* **Framework** > *UI Builder*.
   UI Builder opens in a new browser tab.
2. In the list of available experiences, open the *Unified Navigation* **App** record.
3. In the Pages and variants listing, open the **Search Results** > **search Default** record.
   UI Builder reloads and displays settings for the Search Results (search Default) page.
4. In the Content pane, select the **Body (Grid)** > **Search Result Wrapper 1** component.
   Properties, styles, and events for the selected component appear in the configuration panel.
5. If a `Different application scope` informational message appears, select **Edit in original scope**.
   The system displays an informational message indicating that you are editing in the application scope.
6. On the configuration panel's Config tab, enable the **Hide search results count** option.
7. Select **Save**.

Result
Per-table search result counts no longer display on the search results page.

Add a workspace application to the Unified Navigation search context menu

Enable users to view results for their Unified Navigation searches in workspace applications as well as in global search.

Before you begin
You must be using Next Experience UI.

The workspace application that you want to add to the search context menu must be installed. A search application configuration record must exist for the workspace, with AI Search specified as the search engine. If you need to create a new search application configuration record for the workspace, see Create a search application configuration for AI Search.

Role required: admin

About this task
You can add a workspace application, such as CSM/FSM Configurable Workspace, to the Unified Navigation search context menu. Adding the workspace application to the search context menu enables users to switch between global search results and search results from the specified workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Copy the sys_id of the record for the search application configuration for the chosen workspace:

   a. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.

   b. Open the record for the chosen workspace's search application configuration.
   As an example, for Agent Workspace, open the **Agent Workspace Search Config** record.

   c. Select the Additional actions icon, then select **Copy sys_id**.

2. Define a globalSearchDataConfigId UX page property to map the search application configuration record to the workspace's UX application:

   a. Navigate to the UX Page Property [sys_ux_page_property] table's list view by selecting **All**, entering `sys_ux_page_property.list` in the **Filter** field, and pressing Enter.

   b. Select **New**.

   c. On the UX Page Property form, fill in the fields as follows:

Field	Description
Page	Use the Lookup using list icon to select the UX Application record for your workspace.
Name	Enter `globalSearchDataConfigId`.
Type	Select **string**.
Value	Enter the search application configuration record sys_id that you copied in step 1.c.

   d. Select **Submit**.

3. Copy the sys_id of the record for the Workspace Global Search Configuration that you want workspace search to use:

   a. Navigate to the Workspace Global Search Configuration [sys_aw_global_search_config] table's list view by selecting **All**, entering `sys_aw_global_search_config.list` in the navigation filter, and pressing Enter.

   b. Open the record for the Workspace Global Search Configuration that you want workspace search to use.
   If you have a custom Workspace Global Search Configuration record that you want to use, open that record. Otherwise, open the Workspace search settings record.

   c. Select the Additional actions icon, then select **Copy sys_id**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Define a global_search_configurations UX page property to configure the workspace's search settings:

   a. Navigate to the UX Page Property [sys_ux_page_property] table's list view by selecting **All**, entering `sys_ux_page_property.list` in the **Filter** field, and pressing Enter.

   b. Select **New**.

   c. On the UX Page Property form, fill in the fields as follows:

Field	Description
Page	Use the Lookup using list icon to select the UX Application record for your workspace.
Name	Enter `global_search_configurations`.
Type	Select **json**.
Value	Enter the following JSON: `{ "globalSearchViewConfigId": "00000000000000000000000000000000", "globalSearchRoute": "search" }` Replace the `globalSearchViewConfigId` value of `00000000000000000000000000000000` with the Workspace Global Search Configuration record sys_id that you copied in step 3.c. For example, if you selected the Workspace search settings record, replace the value with `97a574ea53c0130084acddeeff7b12a6`.

   d. Select **Submit**.

5. Enable Unified Navigation search for the chosen workspace:

   a. Navigate to the UX Page Property [sys_ux_page_property] table's list view by selecting **All**, entering `sys_ux_page_property.list` in the **Filter** field, and pressing Enter.

   b. Look for a UX Page Property record with name **chrome_header** and page matching the chosen workspace.
   As an example, for Asset Workspace, look for a record with name **chrome_header** and page **Asset Workspace**.

   c. If a **chrome_header** record exists for the workspace, edit it and change the **searchEnabled** JSON element to true in its **Value** field, then select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. If no **chrome_header** record exists for the workspace, select **New** and fill in the UX Page Property form fields as follows, then select **Submit**.

Field	Description
Page	Use the Lookup using list icon to select the UX Application record for your workspace.
Name	Enter `chrome_header`.
Type	Select **json**.
Value	Enter the following JSON: `{ "privatePage": { "searchEnabled": true } }`

6. Refresh your browser tab to reload the ServiceNow AI Platform®.
7. Clear your instance's system cache by entering `<instance-name>.service-now.com/cache.do` in your browser's address bar and pressing Enter.

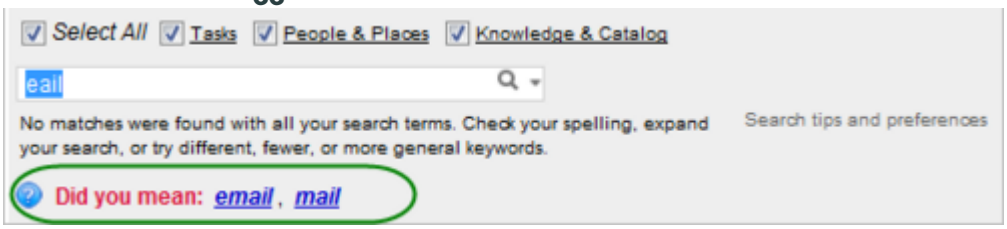
> **Important:** Clearing the system cache can affect overall performance and degrade system response times. Don't run cache flushes during business hours, and don't trigger cache flushes automatically.

Result
The chosen workspace appears as an option in the Unified Navigation search context menu for users who have it assigned. Users can switch to the workspace's search context. For more details on using the search context menu to switch application contexts, see View and open search results using workspace applications in Next Experience Unified Navigation.

Global text search suggestions

Global text search offers two types of search suggestions.

The knowledge base and global text searches provide suggestions as you type. Type-ahead suggestions appear under the search box. Suggestions are based on similar searches that begin with the same characters.



Type-ahead search suggestions

The knowledge base and global text searches also provide suggestions for alternate search terms. Suggestions appear if your original search doesn't return any results and an alternate spelling or similar recent search does. For example, if you misspell a search term (such as eail), the correct spelling (email) may appear as an alternate search suggestion. Suggestions appear beneath the search box on the results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternate search suggestions

Note: The type-ahead search suggestions feature is only available in the UI15 interface.

Update a type-ahead suggestion

The knowledge base and global text searches provide suggestions as you type. These type-ahead suggestions are compiled on a nightly basis by a scheduled job.

Before you begin

The type-ahead search suggestions feature is only available in the UI15 interface.

Role required: admin

About this task

Use the following procedure if you need to refresh the type-ahead suggestions list before the next run of the scheduled job.

Note: Type-ahead suggestions aren't configurable. For more about how suggestions are generated and maintained, see the blog post Global Text Search Suggestions by a ServiceNow Technical Support Engineer in the ServiceNow Community.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. Open **TS Search Stats**.
3. Run the scheduled job.

Configure "Did you mean?" suggestions

The Knowledge Base and global text searches can provide "Did you mean?" suggestions. Suggestions appear if a search doesn't return any results and an alternate spelling or similar recent search does. This feature is disabled by default.

Before you begin

Role required: admin

About this task

Set system properties to enable "Did you mean?" suggestions in the Knowledge Base and legacy global search tools.

Procedure

1. Navigate to **All** > **System Properties** > **Text Search**.
2. Select any of the following check boxes:
   - **Suggest alternate search spellings for knowledge or global search** (the *glide.ts.dym.enable_spell_correct* property).
   - **Suggest related searches for knowledge or global search** (the *glide.ts.dym.enable_chain_suggest* property); uses search chains, which generate suggestions by tracking occurrences of similar searches, in order, over time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

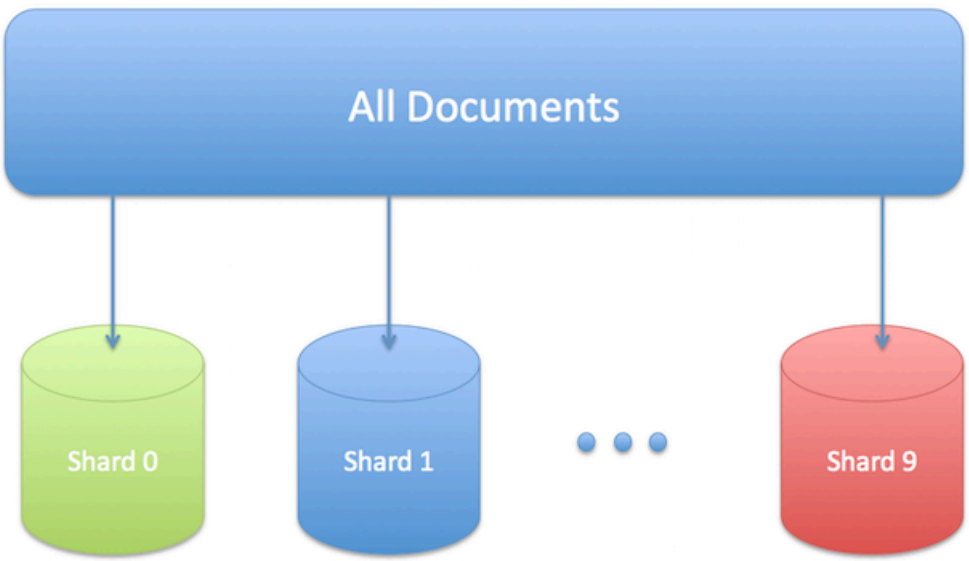
Note: The global search references in these check boxes only apply to the legacy global search functionality. They don't apply to the global search functionality introduced in the New York release, because the "Did you mean?" functionality isn't available.

3. Select **Save**.

Zing generates search results in four phases

Generate search results by dividing documents among shards, searching shard documents, scoring shard documents, and merging scores into an index.

Zing generates search results in four phases:



1. Divide searchable documents among index shards.
2. Search and filter shard documents.
3. Score shard documents.
4. Merge shard document scores into an index.

Phase 1: Divide searchable documents among index shards

When a search is executed, the system equally divides all searchable documents among 10 index shards. Each shard has a unique list of documents.

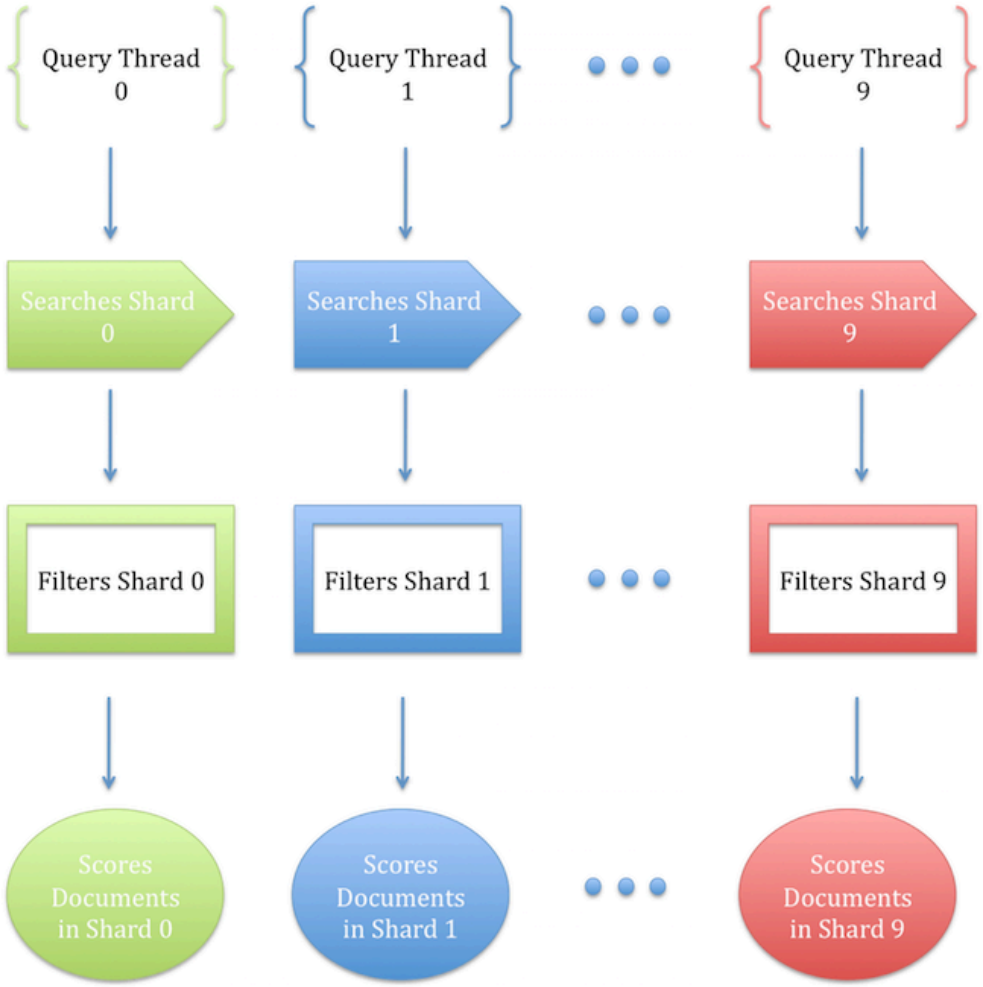
To maximize search efficiency, the system creates 10 query threads to simultaneously search each index shard.

Divide documents among index shards

Phase 2: Search and filter shard documents

Each query thread searches through its list of shard documents to identify documents that match the search criteria. For example, if you search for "`wifi network`," the system returns all documents containing both "`wifi`" and "`network`" in no particular order.

Note: A multiple word search is equivalent to multiple single word searches connected by an AND operator. For example, **[contains][wifi][AND][contains][network]**.



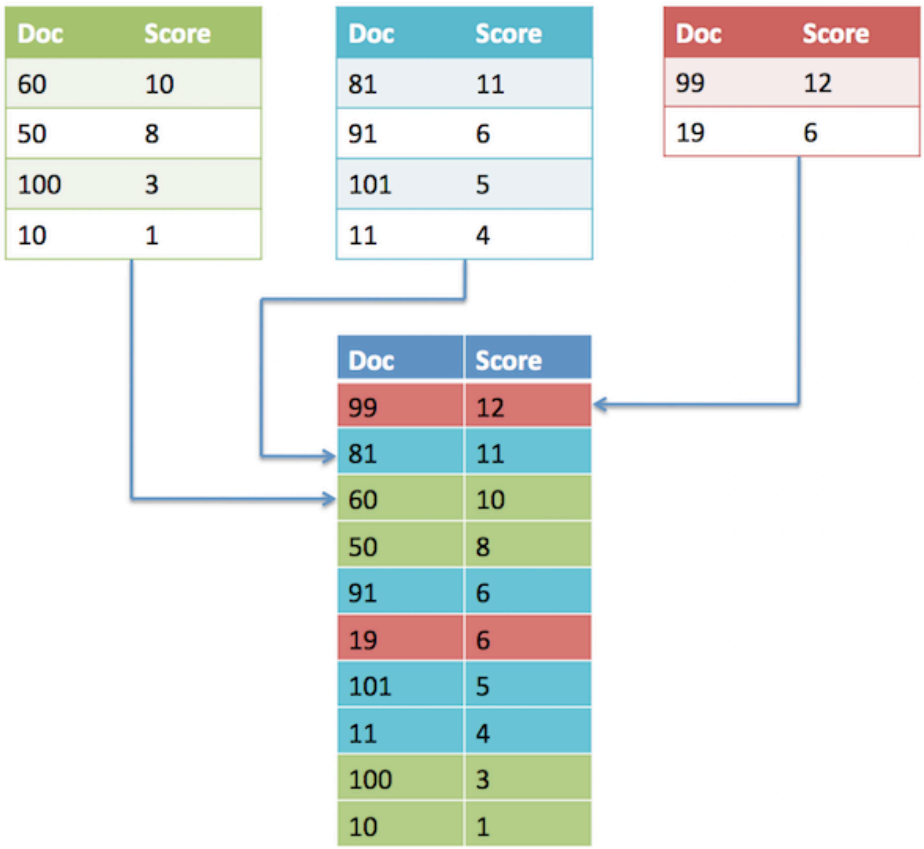
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The query thread assigns each matching document a numeric value (a document ID) to uniquely identify it. All other documents are ignored.

Phase 3: Score shard documents

The query thread scores each matching shard document.

Query threads search, filter, and score shard documents

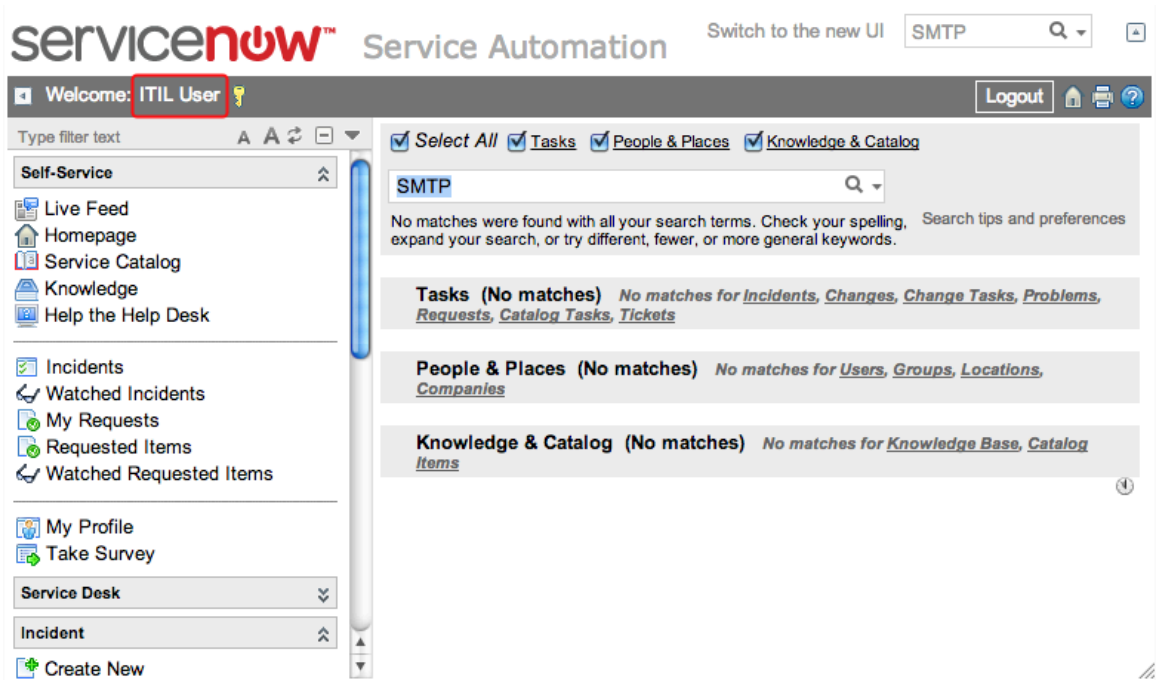


Phase 4: Merge and sort shard document scores

The system merges the document scores into a single index and sorts the documents from highest to lowest document score. The documents with the highest document score are most relevant to the search query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

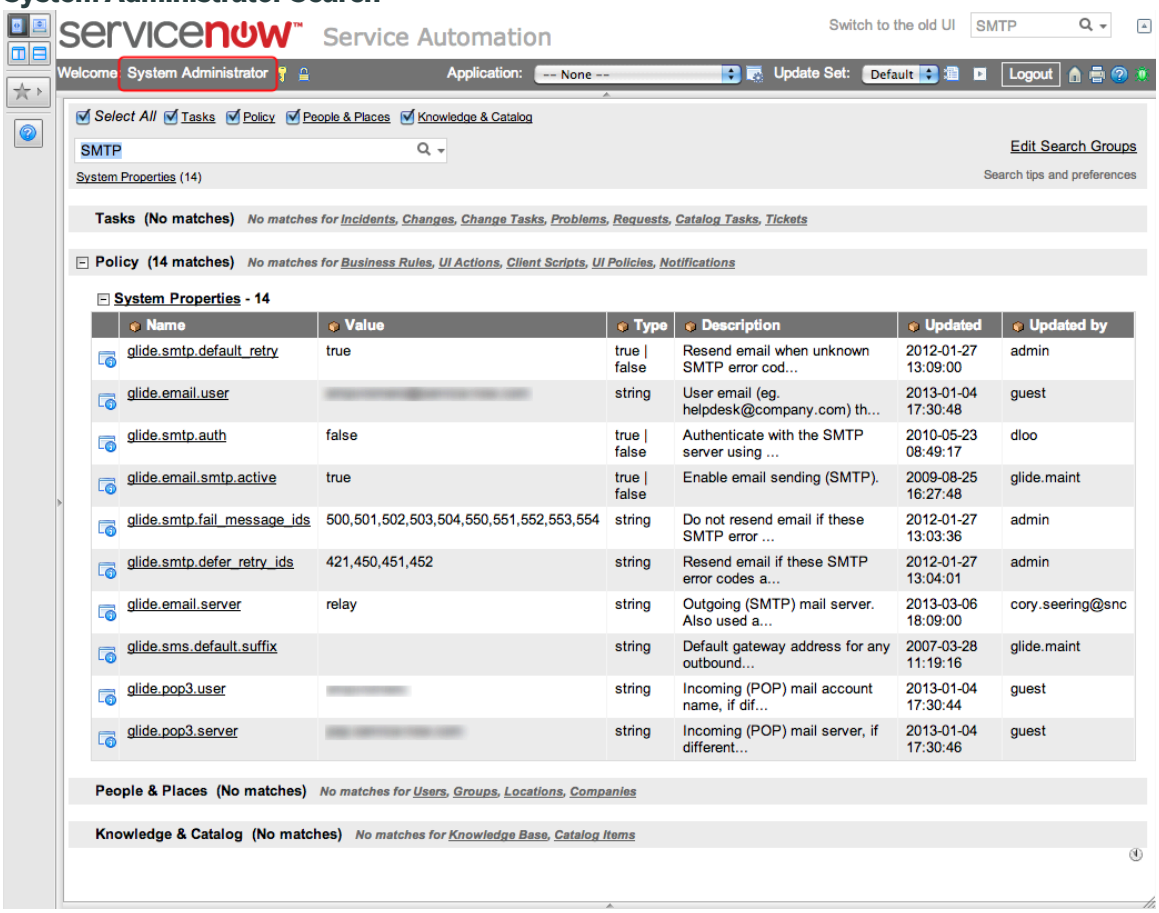
Merge and sort shard document scores



Zing filters search results with access controls

Zing filters search results to only display records the user can access.

For example, suppose you index the System Property [sys_properties] table. When the ITIL user searches for a term in the System Property table, Zing returns no search results because the ITIL user doesn't meet the ACL rule requirements.



ITIL User Search

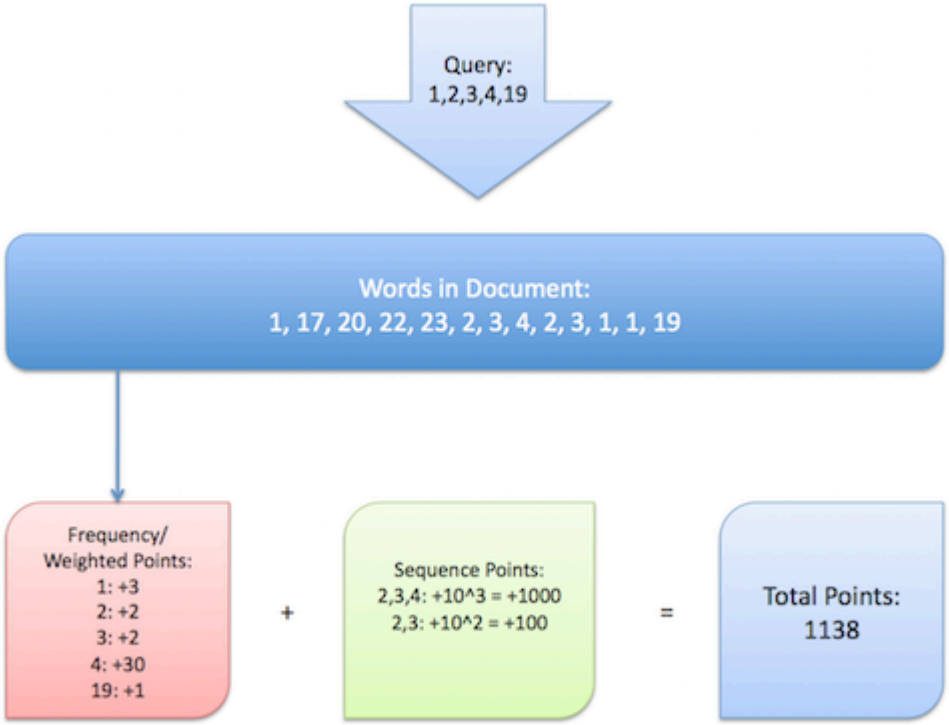
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a system administrator searches for the same property, Zing returns search results from the System Property table because the administrator meets the ACL rule requirements.

System Administrator Search

Zing computes document scores using three components

The Zing search engine computes document scores based on the frequency, sequence, and weight of search terms in the document.



Document scores

The components of a document score for a search query are:

- Frequency: how often the search terms appear in the document.
- Sequence: how often the search terms appear in the same order as the search query.
- Weight: how heavily weighted the source field is in which the search terms appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample document score computation

Frequency points

Zing awards one point whenever a search term appears anywhere in the document. For example, when searching for `distributed database server`, a document that contains `distributed` three times, `database` five times, and `server` 17 times would have 25 frequency points.

To increase search result scores of search terms that appear more frequently in a document, but less frequently in a document set, you can Score search terms by inverse document frequency (IDF). When TF-IDF is enabled, search term scores are calculated by multiplying the term frequency score by the inverse document frequency score. Because enabling TF-IDF increases the weight of less common search terms, search results for that table are more likely to be relevant. For example, when searching for `distributed database server`, the term `distributed` might receive a higher score than `server` if it appears frequently in one document but less frequently in the document set as a whole.

Zing applies a multiplier to frequency points based on the value of the *`ts_weight`* attribute for the field in which the search term appears. A field with a text search scoring weight of 30 (*`ts_weight=30`*) would add 30 points for each inclusion of a search term.

Sequence points

Zing awards a document more points when it contains the search terms in the same order in which they were typed. The more search terms in sequence there are, the exponentially higher the score becomes. Zing awards sequence points as 10^x, where x is the number of search terms that appear in sequence.

In the `distributed database server` search example, Zing awards a document 100 (10^2) sequence points for each time it includes the two-term string `database server`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Likewise, Zing awards a document 1000 (10^3) sequence points each time it includes the three-term string `distributed database server`.

Zing applies a multiplier to sequence points based on the value of the *ts_weight* attribute for the field in which the sequence appears. The sequence points use the calculation (10^x * field *ts_weight* attribute).

Field scoring weights

The system elevates the default scoring weight of Knowledge record numbers, Knowledge short descriptions and metadata, task record numbers, and task short descriptions. Default *ts_weight* attributes for these fields are as follows:

- *kb_knowledge.number = 50*
- *kb_knowledge.short_description = 10*
- *kb_knowledge.meta = 10*
- *task.number = 50*
- *task.short_description = 10*

All other fields have a default *ts_weight* attribute of 1. The maximum possible weight value is 255.

Score search terms by inverse document frequency (IDF)

Enable term frequency–inverse document frequency (TF-IDF) to increase the search result scores of search terms that appear more frequently in a document, but less frequently in the whole collection of searchable documents.

Before you begin

To enable TF-IDF scoring, a text index must be present for the table. Make sure that text indexing is enabled for the table before changing the query mode. See Configure a table for indexing and searching.

Role required: ts_admin or admin

About this task

Administrators can enable TF-IDF scoring on a table to improve search results. The Knowledge table [kb_knowledge] has TF-IDF scoring enabled by default.

Note: This task requires that you regenerate an index and therefore should be done with system performance in mind. Regenerating an index may take a while to complete depending on table size and other factors. You may notice performance degradation or incomplete search results while the system regenerates the index.

Procedure

1. Navigate to the system dictionary and open the entry for the desired table.
2. In the **Attributes** related list, select **New**.
3. In the **Attributes** field, select **Text search Enable IDF**.
4. Select **Submit**.
   The **Enable IDF Score** check box in the table's text index record can now be configured.
5. Navigate to **All** > **System Definition** > **Text Indexes**.
6. Open the text index created for the table.
7. Select **Enable IDF Score**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Under **Related Links**, select **Regenerate Document Frequency**.
   Regenerating document frequency is a one-time task. Regenerate document frequency when TF-IDF scoring is first enabled for a table.
9. Configure the desired notification and select **OK**.

Set the relative weight of a field

To improve search results, the Zing search engine assigns to each potential match a numeric score that represents its relevancy to the query.

Before you begin

Text indexing must be enabled for the table containing the fields you want to modify the relative weight for. To learn about enabling text indexing for a table, see Configure a table for indexing and searching.

Role required: admin

About this task

Administrators can control the relative importance of a match for each field in a table with the ts_weight attribute. The majority of fields have no ts_weight attribute. Zing treats these fields as having weight 1 when scoring search matches.

The following fields have ts_weight attribute values by default:

- kb_knowledge.number = 50
- kb_knowledge.short_description = 10
- kb_knowledge.meta = 10
- task.number = 50
- task.short_description = 10

When scoring records, Zing compares the relative weights of fields that produced search term matches. For example, if the **Title** field has `ts_weight=50` and the **Description** field has `ts_weight=10`, then a match in **Title** is 5 times as relevant as a match in **Description** and 50 times as relevant as a field without the ts_weight attribute.

Note: To view the complete scoring system, see Document Scoring.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the system dictionary record for the field's table and column.
   For example, to modify the ts_weight for the kb_knowledge.number field, open the dictionary record with **Table** "kb_knowledge" and **Column name** "number".
3. In the Dictionary Entry form's **Attributes** field, perform one of the following steps:
   - If a ts_weight attribute appears in the list of attributes, change its integer value to the relative weight you want to set for the field.
   - If no ts_weight attribute appears in the list, add a new `ts_weight=<value>` comma-separated list entry, where <value> is the relative weight you want to set for the field.
4. Select **Update**.
5. Refresh the table's text index:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the system dictionary record for the field's table.
The table's system dictionary record is the one with the table name as its **Table** value, an empty **Column name** field, and "Collection" as its **Type** value.

b. On the Dictionary Entry form, select the **Generate Text Index** link in the Related Links section.

Result

Once Zing finishes regenerating the text index for the table, search result scoring uses your new relative weights for fields.

Zing indexes words

Index documents by dividing them into words. Depending on the languages your instance supports, a word may be a single character such as a Chinese or Japanese pictogram or a sequence of characters separated by spaces such as with Latin, Arabic, and Pinyin languages.

Zing uses spaces to define the basic unit of word separation. Zing uses the following rules to index words.

Zing word indexing rules

Rule	Behavior
Punctuation	Zing indexes some punctuation marks as part of some words to improve search results for common search terms. Zing converts any non-indexed punctuation characters to spaces. See Zing indexes punctuation as part of some words.
Pictograms	Zing supports the full range of Unicode pictogram characters. Each Chinese or Japanese pictogram is indexed as a separate word as if it were a single Latin-1 character surrounded by spaces.
Letter	Zing treats Latin-1, Arabic, and Pinyin characters as individual letters of space-separated-words. Sequences of letters define indexable words.

Zing indexes punctuation as part of some words

Zing indexes some punctuation marks as part of some words to improve search results for common search terms.

Punctuation indexed as part of a word

Punctuation	Indexed to find	Search behavior
Ampersands [&]	Company names	Zing locates terms containing punctuation characters that are common in company names: ampersands (&), plus signs (+), or hyphens (-). For example, a search for `H&R Block` locates exact matches to the search term.
Apostrophes [']	Proper names	Zing ignores trailing possessives and retains most others to find company names. For example, a search for `O'Reilly's` locates matches to O'Reilly and O'Reilly's.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Punctuation indexed as part of a word (continued)

Punctuation	Indexed to find	Search behavior
Hyphens [-]	Company names	Zing locates terms containing punctuation characters that are common in company names: ampersands (&), plus signs (+), or hyphens (-). For example, a search for `Coca-Cola` locates exact matches to the search term.
	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD-10-987` locates exact matches to the search term.
Numbers [123]	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD10987` locates exact matches to the search term.
	Record numbers	Zing locates record numbers that follow a typical pattern. To meet this pattern, search terms must start with a recognized record number prefix. For example, a search for `INT1234567` locates exact matches to the Incident record.
Periods [.]	Acronyms	Zing locates acronyms whether they are separated by periods or not. For example, a search for `u.s.a.` locates matches to usa or u.s.a.. Note that wildcard searches may affect acronym handling. In another example, a search for `u.s.*` may yield better results than a search for `u.s*`.
	Host names	Zing locates sequences of letters and numbers separated only by periods. For example, a search for `en.myhost123.com` locates exact matches to the search term.
	IP addresses	Zing locates numbers that follow a typical IPv4 address pattern.

Punctuation indexed as part of a word (continued)

Punctuation	Indexed to find	Search behavior
		For example, a search for `10.0.0.1` locates exact matches to the search term.
	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD.10.987` locates exact matches to the search term.
Plus signs [+]	Company names	Zing locates terms containing punctuation characters that are common in company names: ampersands (&), plus signs (+), or hyphens (-). For example, a search for `Google+` locates exact matches to the search term.
Underscores [_]	Product numbers	Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for `PROD_10_987` locates exact matches to the search term.

Note: The punctuation handling described here doesn't affect wildcard and boolean operators. These operators provide separate Zing functions.

Zing indexes some HTML elements

Zing indexes the contents of certain HTML elements to improve document search results. This indexing is addition to the normal indexing by word.

Indexed HTML elements

HTML element	Description
Title attribute	Zing indexes the contents of the *`title`* attribute of any HTML element. This is separate from the *`title`* element, which Zing already indexes when identifying the words of the document.
Anchor link target	Zing indexes the target URL specified in the *`href`* attribute of any anchor element.
Alt text for an image	Zing indexes the alternative text of any image element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a table for indexing and searching

Enable Zing text indexing for a table to allow users to search its records for string values. Configure the table's text indexing attributes, stop words, and synonym dictionaries to control search behavior.

Before you begin

Role required: ts_admin or admin

About this task

Enabling text indexing for a table allows users to search for string values in records on that table. You can configure attributes, stop words, and synonym dictionaries to control indexing and search behavior for an indexed table.

By default, the system creates text indexes for the tables with a Text index record (**All** > **System Definition** > **Text Indexes**). For example:

- Knowledge-related tables
- Core-data-related tables
- Connect-related tables
- Task table
- User table

Enabling text indexing for a table also enables it for all child tables. If you want to disable text indexing for a child table, see Remove the text index for a child table.

Note: Whenever you create an index table, the system also creates Access Control Roles (ACLs) for new tables.

Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical text indexing statistics.

Note:

New tables created by update set transfers have text indexing disabled, even if it's enabled for the tables included in the update set.

To enable users to search tables created by update set transfers, you must manually enable text indexing for those tables.

Procedure

1. Navigate to **All** > **System Definition** > **Text Index Configurations** and select **New**.
2. In **Applies to**, select **Table**.
3. In **Table**, select the table that you want to configure text indexing for.
4. **Optional:** If you intend to use the table in multi-table searches or if you want to use the BM25 scoring algorithm on the table, upgrade its indexing format to V4.

   a. If the value in **Format** isn't grayed out, select **v4**, then select **Submit** and skip to step 5.

   b. If the value in **Format** is grayed out, select **Submit**.
   The grayed-out value means that the table has already been indexed and needs its indexing upgraded to V4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Navigate to **All** > **System Definition** > **Text Index Configurations** and select the table you submitted.

d. Under **Related Links**, select **Show index name record**.

e. Under **Related Links**, select **Upgrade to V4** and select **Submit**.
The specified table's indexing is upgraded from V3 to V4. Now, this table can be part of multiple-table indexing and BM25 is used to score the table's relevance score. Optionally, select **Show Configuration** under **Related Links**to show the table indexing format on the **Text Index Configuration** page.

5. Configure indexing and search attributes on the selected table.

a. Navigate to **All** > **System Definition** > **Text Index Configurations** and select the table you configured.

b. In the Text Index Table Attribute Maps related list, select **New**.
Attributes pertain to the way Zing indexes documents and ranks documents returned in search results.

c. On the Text Index Table Attribute Maps form, fill in the fields.

Field	Description
Table	Table to define attributes for.
Attribute name	Search engine attribute. For a list of the attributes and valid values, see Zing index and search attributes.
Value	Value for attribute.

d. Repeat this procedure to define additional attributes for the table.

e. In the Related Links section, select **Generate Text Index**.

6. Configure column-level attributes.

a. Navigate to **All** > **System Definition** > **Text Index Configurations** and select a table.

b. In the Text Index Column Attribute Maps related list, select **New**.

c. On the Text Index Column Attribute Map form, fill in the fields.

Field	Description
Table	Table that contains the column you want to define attributes for. Only tables in the index group and their child tables display.
Attribute name	Attribute. For a list of the attributes and valid values, see Zing index and search attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Column	The name of the column in the selected table you want to apply the search attribute to.
Value	Value for attribute.

d. Select **Submit**.

e. Repeat this procedure to define additional search engine parameters for table columns in the index group.

f. In the Related Links section, select **Generate Text Index**.

7. **Optional:** Add stop words.
   Stop words are words that you don't want to index, such as `the`, `a`, or `an`. There is a global list of common stop words, so you only have to add stop words specific to your situation. To see the global list of stop words, navigate in your browser to `https://<instance name>.service-now.com/ts_stop_list.do`.
   a. On the **Index Stop Words** tab, select **New**.
   b. In **Index**, select the index to add the stop word to.
   c. In **Word**, enter a single word you don't want to index and select **Submit**.
8. **Optional:** Add a synonym dictionary.
   Specifying a synonym dictionary searches on the search term as well as synonyms of the search term, such as car, and its synonym, auto. Zing provides a default synonym dictionary.
   a. On the **Index synonym Dictionaries** tab, select **New**.
   b. In **Index**, select the index to add the stop words to.
   c. In **Synonym dictionary**, select the synonym dictionary to use on the specified table. To add a dictionary, select **New** and follow the procedure in Create synonym dictionaries.

Result

The list search *for text* option appears on the list views for the table and its child tables.

What to do next

You can search records on the indexed table using list search in form view. To learn more about using list search, see List search finds records from the current table.

You can also query the indexed table for string matches using the `GlideRecord.addQuery(name, value)` or `GlideRecord.addEncodedQuery(name, value)` methods with the `123TEXTQUERY321` reserved name. For more information about querying for string matches, see Querying tables in script.

Fields excluded from text indexing

Text indexing excludes fields that meet certain name, type, attribute, or encryption conditions. User searches don't match or return values from excluded fields.

Text indexing excludes a field if it meets any of the conditions in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Description
Field name	Text indexing includes the **sys_class_name** and **sys_tags** fields but excludes all other fields whose names begin with **sys_**.
Field type	Text indexing excludes fields of these types: • Date • Date/Time • Duration • True/False • Workflow For more information on these types, see Field types reference.
Field attributes	Text indexing excludes fields that have the **no_text_index** attribute set to **true**. For more information on this attribute, see Remove an index for a specific field.
Field encryption	Text indexing excludes fields configured for Edge Encryption. For more information on configuring fields with Edge Encryption, see Encrypt fields using encryption configurations.

Configure a text index group to search across multiple tables

Update tables to the V4 indexing format and include them in a text index group to facilitate searching across multiple tables.

Before you begin

Role required: ts_admin or admin

About this task

Text index groups enable you to index and search across multiple tables.

Performing searches across multiple tables requires normalizing the tables first so the relevance scores mean the same thing for all tables. V4 indexing provides that normalization. Zing uses the Okapi BM25 ranking function to calculate the relevancy score of search results.

The V4 table indexing format is optimized for documentation, such as knowledge base articles. You don't need to reindex tables that use this format when you change the value of an indexing attribute, such as the weight of a field. If you want to use the BM25 ranking function on a single table, you can convert it to the V4 format.

To enable search across multiple tables, you:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Configure all of your chosen tables to use the V4 index format if they don't already use it.

   Note: In new instances, the Catalog Item [sc_cat_item], Knowledge [kb_knowledge], Social Q&A Questions [kb_social_qa_question], and User [sys_user] tables use the V4 index format. If you upgrade your instance from a previous release, the indexing format of these tables remains the same as it was in the older release.

2. Add the tables to a text index group so they can be indexed and searched together.

   Note: You can't add the Task [task] table or any tables that extend it to a text index group.

Procedure

1. Configure the tables that you want to include in multiple table searches to use the V4 index format.

   Note: Upgrading from V3 to V4 is easy. Downgrading from V4 to V3 is more difficult and discouraged.

   a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

   b. Open the record for the table that you want to upgrade to the V4 index format.

   c. If **Format** isn't disabled, select **V4**, select **Submit**, and then skip to step 2.
   You can choose index formatting in this step because no index exists for the table.

   d. If **Format** is disabled, select the **Show index name record** related link.
   The disabled field means that an index already exists for the table and you must explicitly update the index format.
   The Text Index page displays.

   e. Select the **Upgrade to V4** related link, then select **OK**.
   The system schedules a task to upgrade the text index from V3 to V4, enabling this table to participate in multiple-table indexing.

2. Create a text index group that specifies the tables you want to index together so you can search them together.

   a. Navigate to **All** > **System Definition** > **Text Index Groups**.

   b. Select **New**.

   c. Enter the following field values:

Field	Value
Label	Name for the group of tables that you want to index and search together.
Tables	List of tables that you want to include in the text index group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add tables formatted with V3 and V4 to text index groups. If you add V3 tables, the text index group remains inactive.

d. Select **Submit**.

3. Configure the indexing and search attributes on tables in a text index group.

a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

b. Select **New**.
The Text Index configuration form displays. If you already have a text index group in the list, skip to step 3.d.

c. In **Applies to**, select **Index Group**.

d. In **Index group**, select the magnifying glass and select the text index group you created, then select **Submit**.
The only text index groups that display are the ones you have already created.
The Text Index Configuration table displays.

e. Open the record for your text index group.

f. On the **Text Index Table Attribute Maps** tab, select **New**.
The Text Index Table Attribute Map form displays. Attributes pertain to the way Zing indexes or searches individual tables in the text index group.

g. In **Table**, select a table to define attributes for.
Only tables in the specified text index group and their child tables display.

h. In **Attribute name**, select the magnifying glass and select an attribute.
To see the list of attributes, enter `ts_configuration_attribute.list` in the application navigator. For attribute definitions, see Zing index and search attributes.

i. In **Value** enter a value and select **Submit**.
Valid values depend on the attribute. For information on valid values, see Zing index and search attributes.

j. Repeat this procedure to define additional search engine parameters for other tables in the text index group.

k. Under **Related Links**, select **Generate Text Index**.

4. Configure search parameters on individual table columns in the text index group.

a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

b. Open the record for your text index group.

c. On the **Text Index Column Attribute Maps** tab, select **New**.
The Text Index Column Attribute Map form displays. Attributes pertain to the way Zing indexes or searches individual table columns in the text index group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In **Table**, select a table to define attributes for.
Only tables in the text index group and their child tables display.

e. In **Attribute name**, select a search engine parameter, enter a value for that parameter in **Value**, and select **Submit**.
To see the list of attributes, enter `ts_configuration_attribute.list` in the application navigator. For attribute definitions, see Zing index and search attributes.

f. In **Column**, specify the name of the column in the selected table you want to apply the search attribute to.

g. In **Value**, specify the attribute's value that governs the search.

h. Select **Submit**.

i. Repeat this procedure to define additional search engine parameters for table columns in the text index group.

j. Under **Related Links**, select **Generate Text Index**.

5. **Optional:** Add a synonym dictionary.
Specifying a dictionary enables searches on the search term and synonyms of the search term, such as `car` and its synonym `auto`. Zing provides a default synonym dictionary.

a. Navigate to **All** > **System Definition** > **Text Index Configurations**.

b. Open the record for your text index group.

c. On the **Index synonym Dictionaries** tab, select **New**.

d. In **Index**, select the table index to add the stop words to.

e. In **Synonym dictionary**, select the dictionary to use.
To add a dictionary, select **New** and follow the procedure in Create synonym dictionaries.

f. Select **Submit**.

g. Under **Related Links**, select **Generate Text Index**.

6. Select **Update**.

What to do next

You can query the tables in the text index group for string matches using the `GlideRecord.addQuery(name, value)` or `GlideRecord.addEncodedQuery(name, value)` methods with the `123TEXTINDEXGROUP321` reserved name. For more information about querying text index groups for string matches, see Querying tables in script.

Zing index and search dictionary attributes

The following dictionary attributes either affect the way Zing indexes tables or ranks search results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Index and search dictionary attributes

Zing uses dictionary attributes set at the table or field level to configure the following settings:

- indexing behavior
- ranking of search results
- the BM25 relevancy ranking algorithm

Zing index and search dictionary attributes

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
attachment_index	boolean	Table	Both	If true, attachments on the table are indexed for search purposes.	Attachment Index	TRUE	FALSE
no_text_index	boolean	Both	Both	This attribute on a field prevents the field from being included in a text index.	No Text Index	TRUE	FALSE
text_index_attachment_weight	float	Table	V4	Specifies how much consideration (weight, a float value) to give a search term found in the body of an attachment. For more information on how weight value affect search result relevancy, see Zing computes document	Text Index Attachment Body Weight	FALSE	TRUE

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				scores using three components.			
text_index_attachment	boolean t_displayed	Table	Both	Displays attachments in text search results.	Text Index Attachment Displayed	FALSE	FALSE
text_index_attachment_title_weight	float	Table	V4	Specifies how much consideration (weight, a float value) to give a search term found in the title of an attachment. For more information on how weight value affect search result relevancy, see Zing computes document scores using three components.	Text Index Attachment Title Weight	FALSE	TRUE
text_index_auto_stop	boolean	Table	Both	Automatically identifies stop words and doesn't index them. Based on the threshold specified	Text Index Auto Stop	TRUE	TRUE

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zing index and search dictionary attributes (continued)

Name	Data Type	Applies To	Applies to V3 or V4	Description	Label	Needs re-indexing?	Root Table Only
				in text_index_auto_stop_threshold.			
text_index_auto_stop_threshold	integer	Table	Both	Threshold (integer, number of occurrences) for a word to become a stop word automatically. See text_index_auto_stop.	Text Index Auto Stop Threshold	TRUE	TRUE
text_index_default_partial_matching_rule	String	Table	Both	String for partial matching rule configuration. Input should be based on Change the query mode of an indexed table.	Text Index Default Partial Matching Rule	FALSE	TRUE
text_index_default_query_mode	String	Table	Both	String for query mode configuration. Input should be based on Change the query mode of an indexed table	Text Index Default Query Mode	FALSE	TRUE
text_index_disable_synonym	boolean	Table	Both	TRUE disables searching on synonyms as well as the search term.	Text Index Disable Synonym	FALSE	TRUE

no_text_index

For Customer Service and Support guidelines on setting the **no_text_index** option for different field types, see KB0859922 on the Now Support site.

text_index_scorer_bm25_b

This dictionary attribute is part of the BM25 algorithm. The attribute impacts the importance of the length of a document in search results. If this attribute is 0, the length has no bearing. In this case, a document of two words would be valued equally as a document with 1000 words. Very short documents are often weighted lower than longer documents. The default is 0.75.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

text_index_scorer_bm25_k1

This dictionary attribute is part of the BM25 algorithm. The attribute helps determine term frequency saturation characteristics, that is, having the search term appear in a document increases the relevancy of the document, but the increase is less impactful as the numbers climb. For example, a search term occurring 10 times in a document makes it more relevant than a document that has only one occurrence. However, a document that has 100 occurrences of the search term may not be ten times more impactful than a document that has 10 occurrences. The relevance approaches a maximum effect asymptote. The higher the attribute value, the lower the maximum effect of multiple occurrences. Typical values are between 1.25 - 2.0.

Regenerate a text index for a table

You can regenerate a table text index when you change table stop words or display values.

Before you begin

The table that you want to regenerate the text index for must already be configured for indexing and searching. For details on this configuration process, see Configure a table for indexing and searching.

Role required: ts_admin or admin

About this task

By default, the system maintains text indexes on a daily schedule. Typically, you only need to manually regenerate a text index when you change these values.

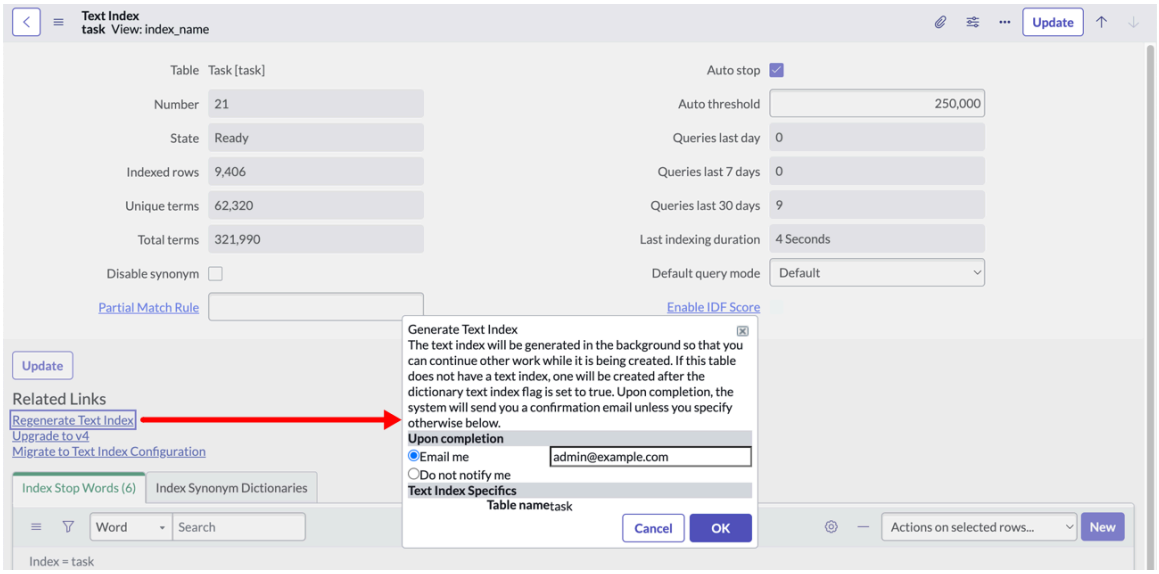
- You change the list of table-specific stop words.
- You change the display value of a record such as changing a user or group name. Until you regenerate the index, text searches for old display values will still produce results and searches for the new display value won't show results.

You can also regenerate a text index if you observe incorrect search results for the indexed table. This is rare and usually only occurs if text indexing was interrupted.

Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

Note: This index regeneration process purges the existing text search index for the table before it regenerates it. While it's processing, no search results are returned if you perform a text search before the regeneration is complete. An alternate method is available that doesn't impact use of text searches for the table while the regeneration is in process. See Reindex a table without impacting text search results.

Procedure



1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Open the text index for the table.

Example

For example, select **task**.
The system displays the Text Index record for the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Regenerate Text Index** related link, then select **OK**.

Result

The system schedules the selected table for text indexing.

Reindex a table without impacting text search results

Rebuild text search indexes without adversely impacting search results. You can continue to perform text searches on a table while the index regeneration takes place.

Before you begin

The table that you want to rebuild the index for must already be configured for indexing and searching. For details on this configuration process, see Configure a table for indexing and searching.

Role required: admin

Note: If the *glide.script_processor.admin* system property's value has been changed from the default value, you need the role specified by that property value. For details on this property value and its effects, see Restrict access to background script.

About this task

This reindexing method doesn't purge the entire text search index before the rebuild takes place. It rebuilds the text search table index one record at a time, and reindexes the target table hierarchy only. For example, if you select the sc_cat_item table, only the sc_cat_item table is reindexed.

Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.

   Note: If the *glide.script_processor.admin* system property's value is set to security_admin, you must elevate to that privileged role to access this module. For more information on elevating privileges, see Elevated privilege roles.

2. In the **Run script (JavaScript executed on server)** text field, enter the following background script, being sure to enclose both arguments in quotes as shown:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
new GlideTextIndexEvent ( ).indexUpdate('TABLE_NAME',
 'EMAIL_ADDRESS');
```

Where:

- `TABLE_NAME` is the name of the table you want to reindex.

  Note: Only the specified table and its child tables are reindexed.

- `EMAIL_ADDRESS` is the address to which an email notification should be sent when the table reindex completes. Type `null` for no email notification.

Example
For example, to regenerate the kb_knowledge table text search index, and specify that no email notification is required after the rebuild completes, create the following background script:

```
new GlideTextIndexEvent ( ).indexUpdate('kb_knowledge',
 'null');
```

The script creates an event that the index handler processes, so the script completes without blocking on completion of the reindexing job.

3. Select **Run script**.

Result
The system reindexes the text search for the specified table. For large tables, such as sys_metadata, reindexing can take a couple of hours, but you can still perform text searches on the table while the script is running.

Regenerate the text index for a single record

Update the text search index for a single record. Use this approach to quickly verify whether text indexing is the cause of a search issue without rebuilding the full text index for an entire table.

Before you begin
Identify the following:

- A search term that doesn't return the expected results
- A record containing the identified search term that isn't returned when searching for the term
- The table that includes the identified record

The identified table must already be configured for indexing and searching. For details on this configuration process, see Configure a table for indexing and searching.

Role required: admin

Note: If the *glide.script_processor.admin* system property's value has been changed from the default value, you need the role specified by that property value. For details on this property value and its effects, see Restrict access to background script.

About this task
This reindexing method rebuilds the text search index for a single record. It takes less time than rebuilding the text index for all records in a table.

You can use this method to quickly determine whether text indexing is the cause of a search issue. Doing so avoids the delay associated with rebuilding the entire table's text search index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Copy the sys_id for the identified record by selecting **Copy sys_id** from its context menu.
2. Navigate to **All** > **System Definition** > **Scripts - Background**.

   Note: If the *glide.script_processor.admin* system property's value is set to security_admin, you must elevate to that privileged role to access this module. For more information on elevating privileges, see Elevated privilege roles.

3. In the **Run script (JavaScript executed on server)** text field, enter the following script, replacing `TABLE_NAME` with the name of the table containing the identified record and `SYS_ID` with the record's sys_id that you copied in step 1:

   ```
   var gr = new GlideRecord('TABLE_NAME');
   gr.get('SYS_ID');
   gs.eventQueue("text_index", gr,
    '[TABLE_NAME]','update','text_index');
   ```

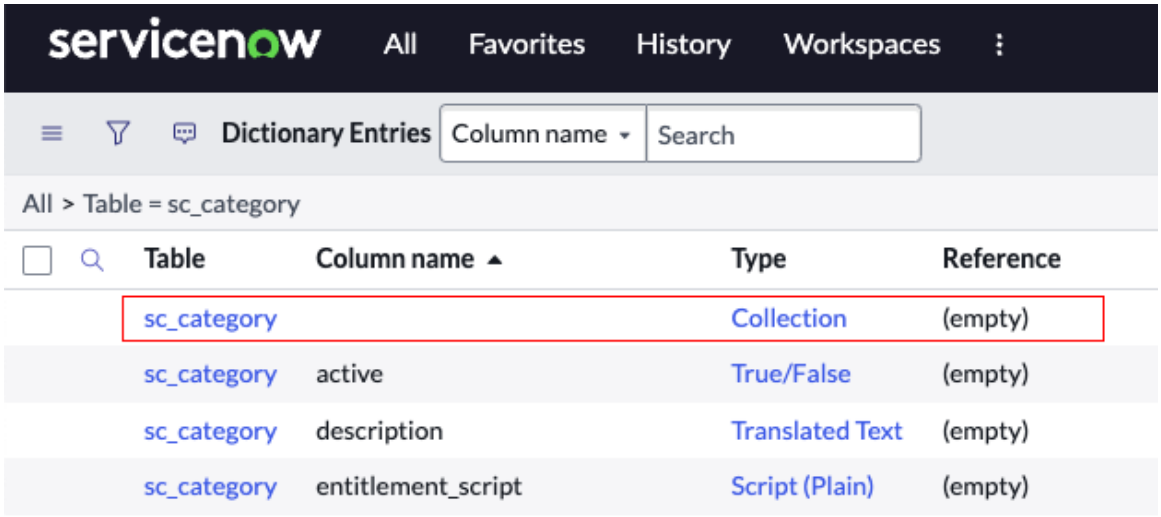
4. Select **Run script**.
   The script creates a text_index update event for the specified table in the text_index queue.
5. Navigate to **All** > **System Policy** > **Events** > **Event Log** and wait for the new text_index update event's state to change to **processed**.
   To find the new event, you can apply a **[Name][contains][text_index]** filter and sort the Event list view by **Created** date/time in descending (z to a) order.

Result
The system updates the text index for the specified record in the specified table.

What to do next
Repeat your sample search. If this search returns the identified record, you may want to update the text index for the entire table that contains that record. For details, see Regenerate a text index for a table.

Remove an index

You can remove the index for a table if you no longer want the search engine to return results for that table. This procedure also removes the index for all tables that extend the specified table.



Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary record for the table.

   The dictionary record for a table is the record with **Table** matching the table's name, an empty column name, and a **Type** value of **Collection**, as shown in the following example image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** If the **Text index** option field is hidden, configure the form layout to show it. For details on showing and hiding fields on a form, see Configuring the form layout.
4. Clear the record's **Text index** option, then select **Update**.

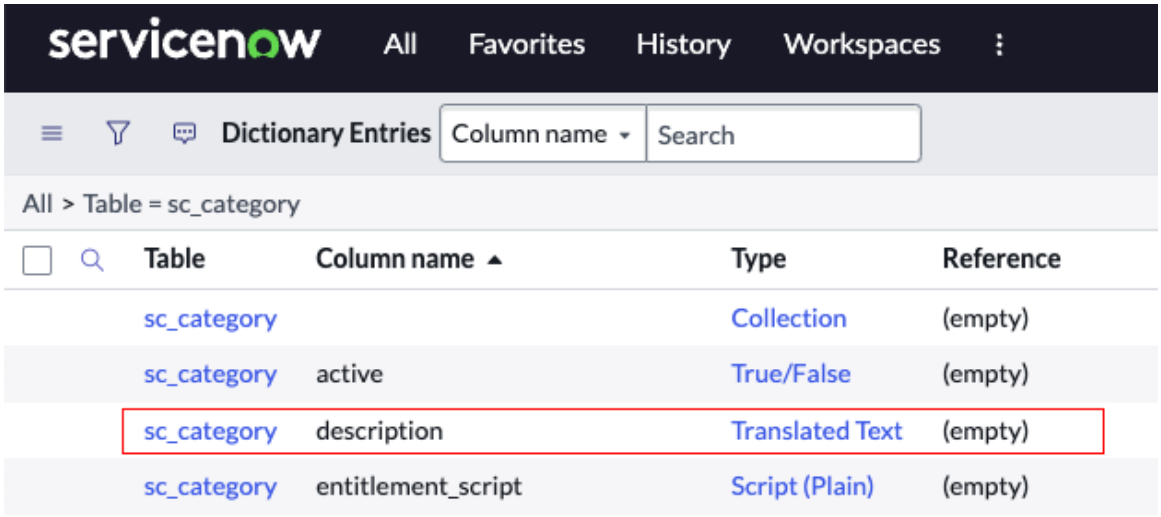
Result

The system no longer indexes text from the specified table or queries it for text search results. This change also disables text indexing and search for all tables that extend the specified table.

Remove an index for a specific field

You can remove the index for a specific field in a table if you no longer want the search engine to return results for that field.

Before you begin



Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary record for the table field.

   The dictionary record for a table field is the record with **Table** matching the table's name and **Column name** matching the field's name, as shown in the following example image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Attributes related list, select **New**.
4. On the Dictionary Attribute form, fill in the fields.

Field	Value
Attribute	No text index
Value	true

5. Select **Submit**.
6. Select **Update**.

Result

The system no longer indexes text from the specified table field or queries it for text search results. This change also disables text indexing and search for the specified field in all tables that extend the specified table.

Remove the text index for a child table

You can remove the text index for a child table if you no longer want the search engine to return results for that child table.

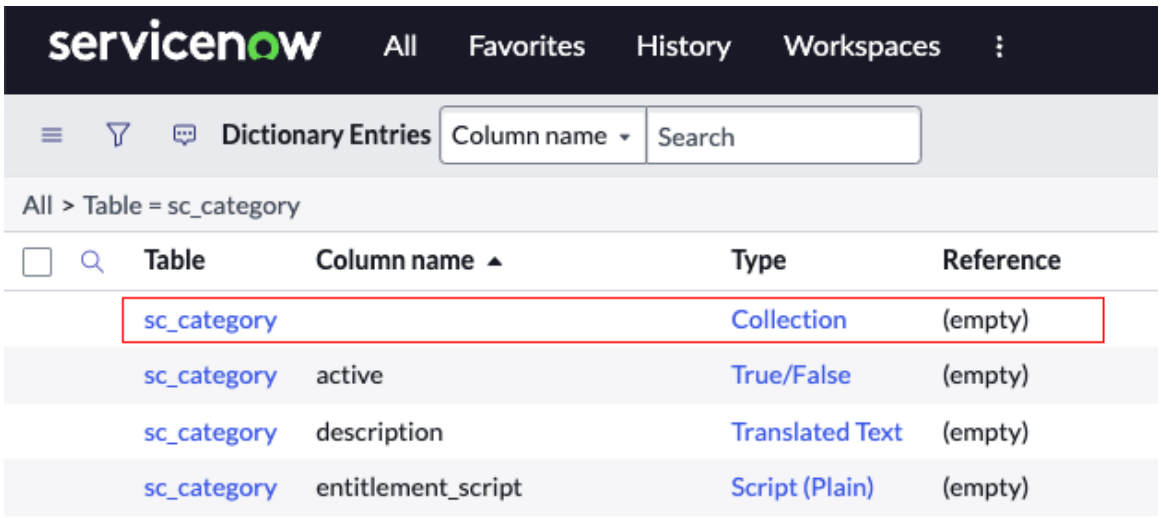
Before you begin

Role required: admin

About this task

The **Text index** option for a table is inherited by all of that table's child tables. Clearing this option for an individual child table has no effect.

For example, **Text index** is selected for the Task table in the base system. This setting enables text indexing for the Task table. All tables that extend Task, such as Catalog Task, Incident, and Request, inherit this option. Clearing the **Text index** option in the Incident child table doesn't disable text indexing for Incident records.



To disable text indexing for a specific child table, set that table's *No text index* attribute. This attribute overrides the table's inherited **Text index** option without affecting indexing behavior for other tables in its hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary record for the child table.

   The dictionary record for a table is the record with an empty column name and a **Type** value of **Collection**, as shown in the following example image.

3. In the Attributes related list, select **New**.
4. On the Dictionary Attribute form, fill in the fields:

Field	Value
Attribute	No text index
Value	true

5. Select **Submit**.
6. Select **Update**.

Result

The system no longer indexes or queries the child table for text search results. Indexing continues for other tables in the table's hierarchy.

Change the query mode of an indexed table

Set the query mode to specify whether searches on an indexed table must match all or only some of the search terms.

Before you begin

To change the query mode of an indexed table, a text index must be present for the table. Make sure that text indexing is enabled for the table before changing the query mode. See Configure a table for indexing and searching.

Role required: ts_admin or admin

About this task

Once a table is indexed, the data within the table can be searched through the global search bar. Change the query mode for the indexed table to allow global search to match all or only some of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the searched terms. Enable a partial match rule to return results that partially match the searched terms.

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Select the table you want to configure from the list of indexed tables.
3. Use the combo box to select a **Default query mode**.

Option	Description
Default	The default query mode for a table is an AND query.
AND	Matches all search terms.
OR	Matches one or more search terms.
AND_OR	Matches all search terms. If no results are found, matches one or more search terms.

4. To enable partial matching of search terms, configure the partial match rule in the **Partial Match Rule** field.
   Partial match rules return results that partially match the search terms. Use a partial match rule if queries often include many keywords (if, for example, users cut and paste phrases into the global search bar).

Partial match rules

Input type	Example	Description
Integer	3	Indicates the minimum number of search terms to be matched.
Negative integer	-2	Indicates that the number of search terms, minus this number, should be matched.
Percentage	75%	Indicates the minimum percentage of search terms to be matched. The minimum number of search terms is the number computed from the percentage rounded down.
Negative percentage	-25%	Indicates that the number of search terms, minus this percentage, should be matched. The minimum number of search terms is the number computed from the percentage rounded down and subtracted from the total number of search terms.
Combination	3<70%	A positive integer, followed by a less than symbol, followed by any of the previously mentioned input types. Indicates that if the number of search terms is equal to or less than the integer, all search terms are required. If the number of search terms is greater than the integer, the specification applies. In this example: if there are 1–3 search terms, all are required. If there are 4 or more search terms, only 70% are required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input type	Example	Description
Multiple combinations	3<-25%, 9<-5	Multiple conditional specifications separated by commas. In this example: if there are 1–3 search terms, all are required. If there are 4–9 search terms, all but 25% are required. If there are more than 9 search terms, all but 5 are required.

Enable indexing of text in multi-row variable sets

Make text from multi-row Service Catalog variable sets searchable in global search.

Before you begin

Role required: admin

About this task

By default, Zing doesn't index text from multi-row Service Catalog variable sets. Global search doesn't return results for text in these variable sets.

Administrators can override this default behavior by adding the *glide.ts.index.variableset* system property and setting its value to **true**. With this value set, Zing indexes text in multi-row variable sets, and global search returns results for that text.

To learn more about variable sets, see Service catalog variable sets.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search the table for a system property with name *glide.ts.index.variableset*.
   - If the property already exists, change its value to **true** and skip the following steps.
   - If the property doesn't exist, go on to the following steps.
3. Select **New**.
4. On the System Property form, fill in the fields.

Field	Value
Name	glide.ts.index.variableset
Type	true | false
Value	true

5. Select **Submit**.

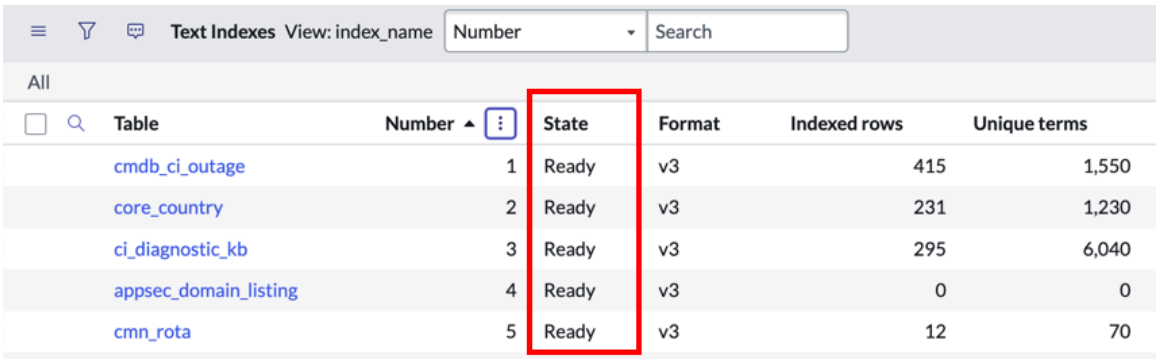
Result

Zing indexes text from multi-row Service Catalog variable sets so that you can find it using global search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

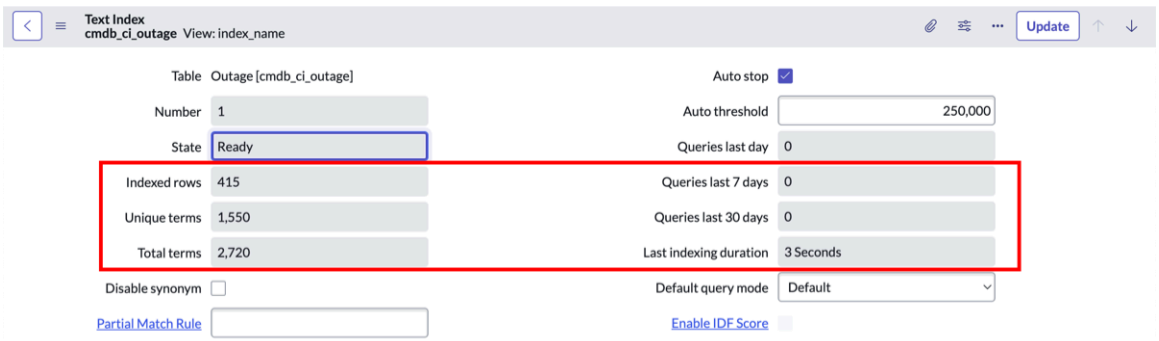
What to do next

To see text from multi-row variable sets immediately in global searches, regenerate the text indexes for the affected tables. For details on this procedure, see Regenerate a text index for a table.



If you don't regenerate the text indexes for the affected tables, records on those tables will be reindexed as they are updated or added. Global searches will only return text from multi-row variable sets on reindexed records.

Text indexing statistics and status



To view text indexing statistics and status, navigate to **All** > **System Definition** > **Text Indexes**.

- If text indexing is in progress, view the status of each index in the **State** field. Refresh the list to view updates. Tables are indexed one at a time.
- To see how long it takes to index a specific table, view the **Last indexing duration** field for the table entry. Although each process varies based on activity and data, historical data can provide a good estimate.
- View statistics (such as the number of indexed rows, terms, and queries in the past week) in the list or on the form for a specific table.

Text Index Status

Text Index Statistics

Configure tables to use the Japanese tokenizer

Improve search results in Japanese language searches by configuring individual tables to use the Japanese tokenizer.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Japanese language searches use the Kuromoji Japanese tokenizer in Zing. The Japanese tokenizer attribute is active by default, but you must configure individual tables to use it and then regenerate the text index.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Search for the table name.
3. In the search results, open the table, which is the list item that has an empty **Column name** and a **Type** of **Collection**.
4. Scroll down the page and select the **Attributes** tab, and then select **New**.
5. Fill in the fields on the form.

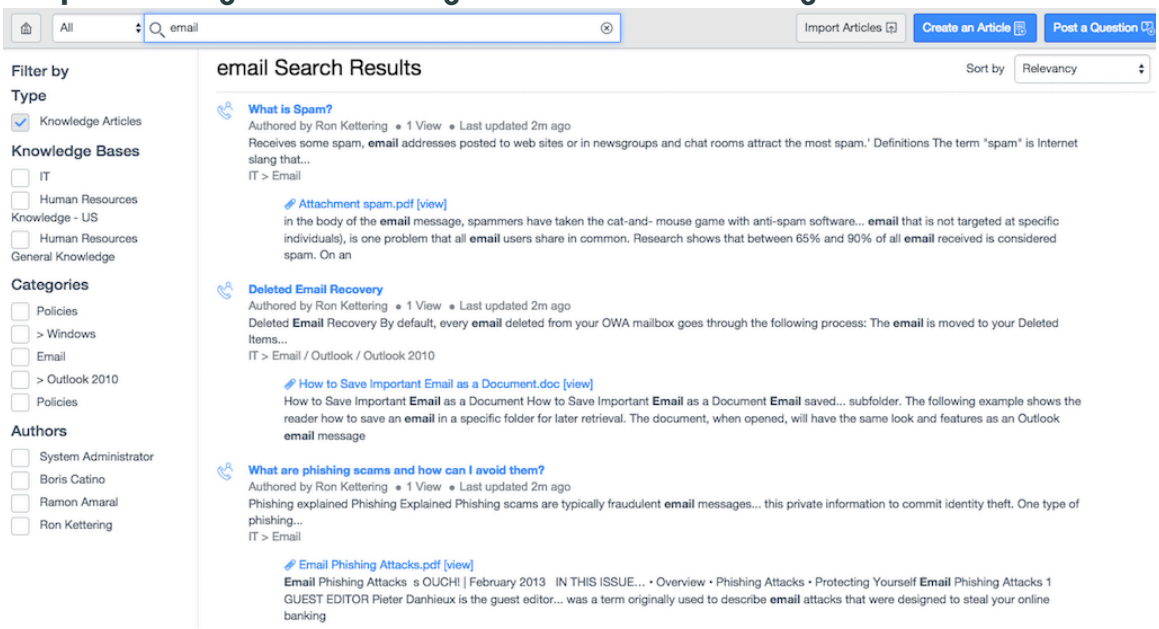
Attributes fields

Field	Description
Attribute	Enter **Text index tokenizer language**.
Dictionary entry	Defaults to the name of the table.
Value	Enter **ja** for the Japanese tokenizer.

6. Select **Submit**.
7. Regenerate a text index for a table.

> **Note:** Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

Result



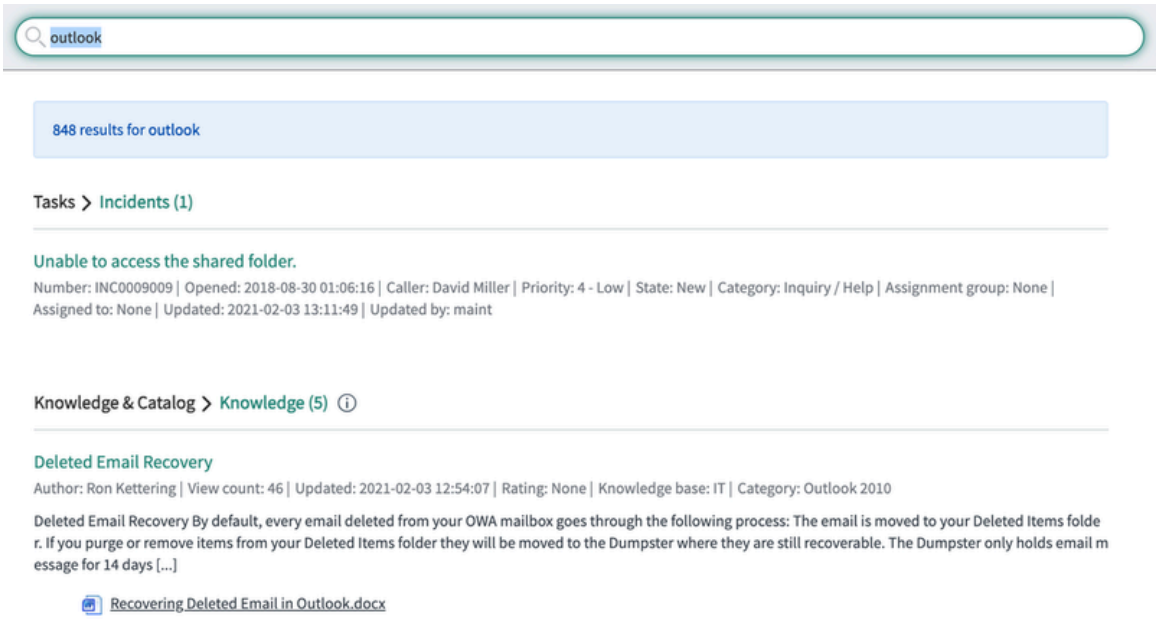
When the text index is generated and you go to the table you configured, the table now uses the Japanese tokenizer.

Zing can include attachments in search results

Search content from attachments on indexed tables. Display attachments for search results from the Knowledge [kb_knowledge] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample Knowledge search showing attachments with matching content



By default, search only matches content from attachments on Knowledge [kb_knowledge] records. Administrators can enable search for attachments on other tables, but doing so causes the system to re-index the selected table, its parent table, and any children of the parent table.

Warning: For large tables, such as the Task table, re-indexing can take several hours and slows down the system until complete. Re-indexing is best performed during non-peak times.

The search results page only displays attachments for search results from the Knowledge [kb_knowledge] table, even if other tables have attachment search enabled.

Global search displays attachments for Knowledge search results but not for search results from other tables

Zing supports indexing and searching these attachment file types.

Related topics

Index attachments on a table

Index attachments on a table

You can enable attachment indexing for a table so text searches can return matches from the record and its file attachments.

Before you begin

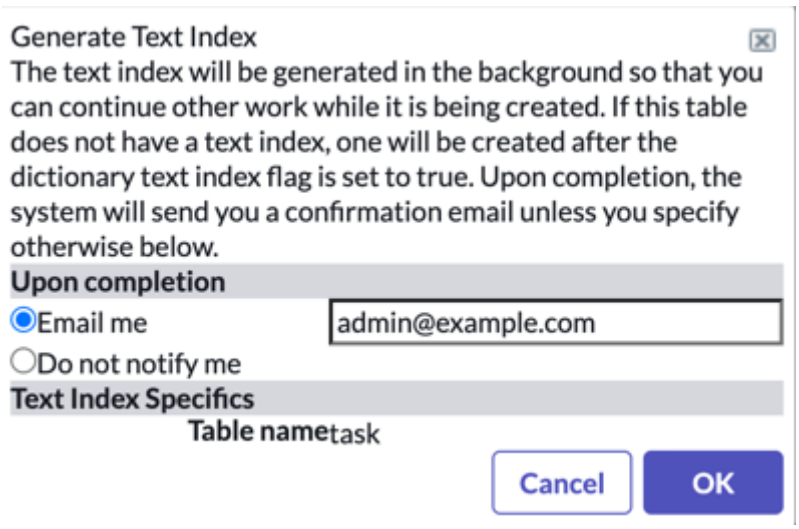
Role required: admin

About this task

By default, attachment indexing is enabled for the Knowledge Base. You can enable attachment indexing for other tables. Enabling attachment indexing causes the platform to reindex the selected table, its parent table, and any children of the parent table. For large tables, such as the Task table, reindexing can take several hours and slows down the system until complete. Reindexing is best performed during non-peak times.

Procedure

1. Navigate to **All** > **System Definition** > **Text Index Configurations**.
2. Edit the record for the table that you want to enable attachment indexing for.
3. In the Text Index Table Attribute Maps related list, select **New**.
4. On the Text Index Table Attribute Map form, fill in the fields.



Field	Value
Table	<table name>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Attribute name	Attachment index
Value	true

Note: The attachment index attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, enabling indexing of attachments on the Task table does not enable indexing of attachments on the Incident table. Not all file types are supported for attachment indexing. For a list of supported file types, see Zing can include attachments in search results.

5. Select **Submit**.
   A message appears indicating that the attachment index attribute change will not take effect until you reindex the selected table.
6. Dismiss the reindexing message by selecting **OK**.
7. On the Text Index Configuration form, select the **Generate Text Index** related link.
8. In the confirmation window, perform one of these two steps:
   - To receive an email notification from the system when text indexing for the table is complete, enter your email address and select **OK**.
   - If you do not want to receive an email notification, select **Do not notify me**, then select **OK**.

9. Dismiss the confirmation message by selecting **OK**.

Result

The system begins text indexing for the table. When it is complete, attachments can be searched on that table.

Zing removes stop words from queries

Remove common words from search queries that don't produce meaningful results.

Stop words are common words that aren't indexed because they aren't meaningful in search results. Articles, conjunctions, personal pronouns, and prepositions are examples of stop words that aren't used in keyword searches. Administrators can configure stop words for all indexed tables and for specific tables.

By default, the system maintains two types of stop words.

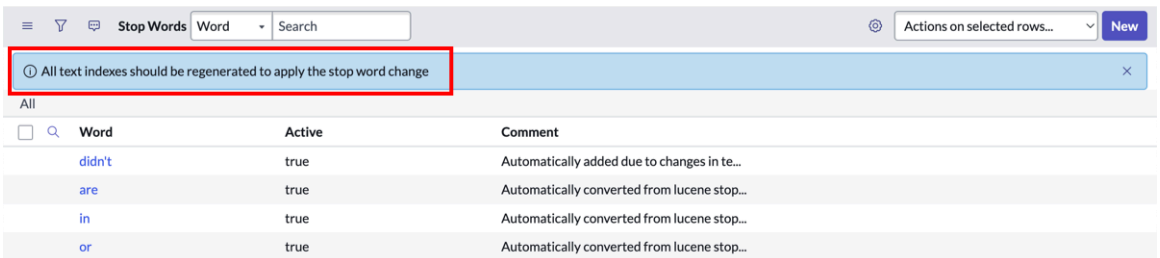
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of stop words

Stop word type	Description
System-wide text index stop words	The system always ignores system-wide text index stop words when generating text indexes. Any search for a system-wide stop word returns no search results.
Table-specific stop words	The system uses the table-specific Text Index record to determine whether to index the stop word or to just remove it from keyword search queries against the table.

By default, the system has stops words for common English words. Search administrators typically create stop words from search terms that produce too many search results such as articles, conjunctions, personal pronouns, and prepositions.

Configure a global stop word



Configure stop words that shouldn't be indexed by the search.

Before you begin

Role required: ts_admin or admin

Procedure

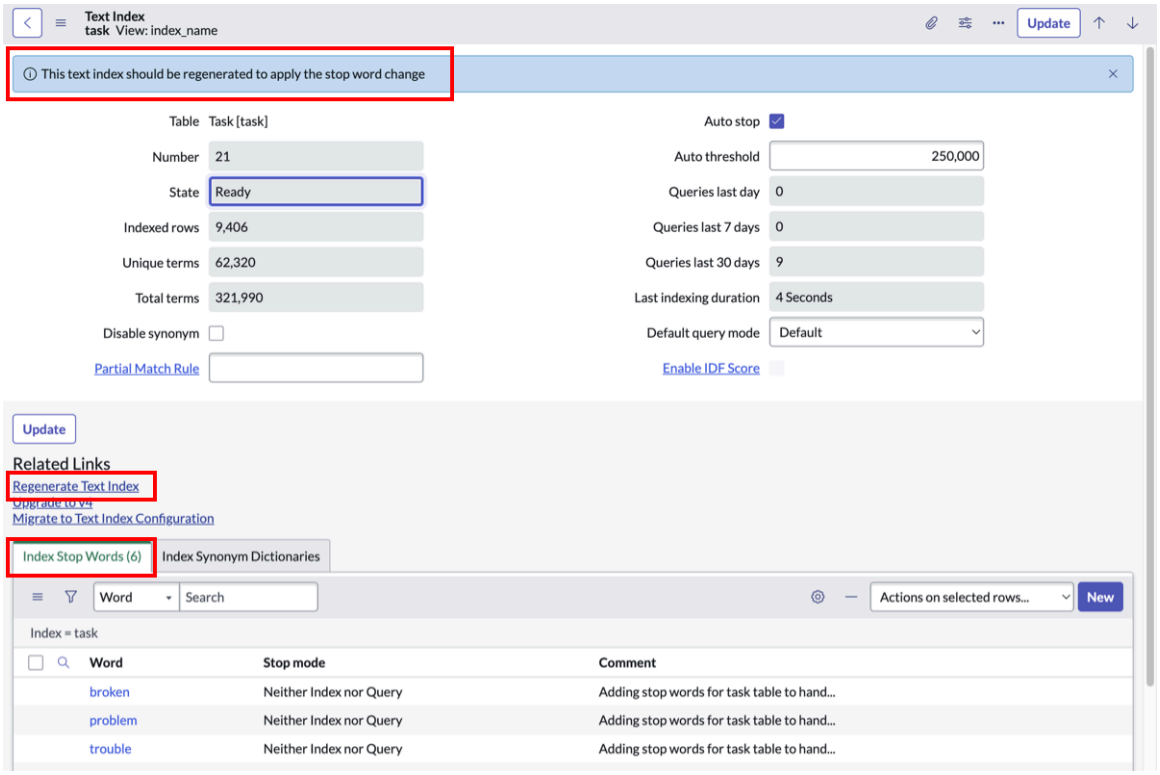
1. Navigate to **All** > **System Definition** > **Text Index Stop Words**.
2. Add or remove stop words from the list.
3. If a message appears at the top of the list, contact Technical Support to regenerate all indexes. You must regenerate indexes whenever words may be missing from an index. For example, if you delete, inactivate, or change an active global stop word, the word may be missing from the index. An after business rule checks these conditions and generates the notification message when index regeneration is necessary.

Configure a table-specific stop word

You can configure stop words for a specific table.

Before you begin

Role required: ts_admin or admin



Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Open the text index entry for the table.
3. Add or remove stop words from the **Index Stop Words** related list.
   For each word, select the desired **Stop mode** (Not a Stop Word (inactivates the stop word), Neither Index nor Query, or Index but do not Query).
4. If a message appears at the top of the form, select **Regenerate Text Index**, then select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must regenerate indexes whenever words may be missing from an index. For example, if you delete or change a stop word for which the mode was Neither Index nor Query, the word may be missing from the index. An after Business rules checks these conditions and generates the notification message when index regeneration is necessary.

Note: Text search uses the global list plus the table-specific list of stop words when indexing the table.

Enable automatic stop words for a table

The system can identify and generate stop words when a search term exceeds an occurrence threshold.

Before you begin

Enable text indexing for the table.

Role required: ts_admin or admin

About this task

By default, the TS Index Stats scheduled job identifies and creates stop words for tables with text indexes on a nightly basis. Automatically adding stop words improves your search results by removing search terms that return too many search results.

Procedure

1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Open the text index entry for the table.
3. Select the **Auto stop** check box.
4. In **Auto threshold**, enter the maximum number of occurrences a search term can have in search results.
   When a search term generates more search results than the threshold, the system automatically creates a stop word for the search term.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
For example, to create stop words for the task table, see the blog post Configuring auto stop words and regenerating text indexes from a ServiceNow employee on the ServiceNow Community.

5. Select **Update**.

Result
The job identifies and creates stop words for the table with a **Stop mode** value of *Index but do not Query* and inserts a **Comment** to indicate that the stop word was generated automatically.

Disable a stop word in Zing

Configure Zing to return results for text search terms that match a stop word's stemmed form.

Before you begin
Role required: admin

About this task
Zing's stemming feature can cause search to return no results for an acronym or short word if its stemmed form is defined as a stop word.

Indications that a search term may be stemmed to a stop word include:

- Text search returns no results for the affected term.
- The system displays an informational message: `Your text query contained only common words or ambiguous wildcards, please refine your search and try again.`

As an example, imagine that a user searches for the acronym `AMS`. Zing stems this search term to `am`. Because `am` is defined as a stop word, Zing ignores the search term. The user's `AMS` search returns no results, and the system displays the informational message.

To enable correct search results for an affected term, administrators can disable the relevant stop word in the global and table-specific stop word lists.

Note: Disabling a stop word can impact search performance and relevancy. Text search will return matching results for the disabled stop word as well as for its stemmed forms.

For more details on stemming in Zing, see Zing matches derived words with stemming.

Procedure
1. To disable a stop word in the global stop word list, perform the following steps:
   a. Navigate to **All** > **System Definition** > **Text Index Stop Words**.
   b. Open the record for the stop word you want to disable.
   c. On the Stop Word form, clear the **Active** option, then select **Update**.
2. To disable a stop word in table-specific stop word lists, perform the following steps for each table that includes the stop word:
   a. Navigate to **All** > **System Definition** > **Text Indexes**.
   b. Open the table's text index record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Index Stop Words related list, open the record for the stop word.

> **Note:** If the Index Stop Words related list isn't visible, open the form context menu and select **View** > **Default view**.

d. On the Index Stop Word form, set the stop word's stop mode to **Not a Stop Word** and select **Update**.

e. On the Text Index form, select the **Regenerate Text Index** related link.

Result

Zing no longer ignores the disabled stop word and its stemmed forms in text searches.

Zing matches derived words with stemming

Convert any multiple-character search keyword to its stem form to find derived versions of the word.

Stemming removes a variety of common word inflections, such as plurals and past tense forms. Zing treats all words with a common stem as synonyms of the original search term. Stemming doesn't apply to searches involving single-character words such as Chinese and Japanese pictograms.

Zing uses the Porter Stemming Algorithm, which is most effective for English text, but supports stemming in these languages.

- English
- French
- German

The stemming language determines how the system generates indexes of record data. The system only supports one stemming language at a time regardless of how many languages the instance supports. When you change the stemming language, the system creates any new index entries based on the new language stemming rules, but doesn't regenerate any existing index records. You must manually regenerate indexes for tables you want to use the new stemming language.

Zing can expand search results with synonyms

Expand search results to include additional search terms.

By default, Zing includes a sample synonym dictionary consisting of a list of synonym sets (synsets). Zing supports two types of synonym sets.

Synonym set types

Synonym set type	Description	Example
Synonym list	A synonym list is a list of words separated by commas. When a search uses any word from the list, Zing expands the search to include all words in the list.	Cyber,Internet,Cybercafe

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synonym set types (continued)

Synonym set type	Description	Example
Synonym map	A synonym map is two word lists separated by the equal and greater than characters => . When a search uses any word from the list on the left, Zing expands the search to include all words from the list on the right. When a search uses a word from the list on the right, Zing doesn't expand the search to include terms from the list on the left.	IOT,Internet of Things=>Chip,Nest thermostat,RFID,IOT

Search results, synonym expansion and weighting

In search results, documents containing the original search keywords have a higher score than documents containing the search synonyms. For example, documents with the search keyword `IOT` have a higher score than documents with the synonym `Internet of Things`.

- One-way synonym expansion to/from multiple terms `(blork, cork => malork, elastic)` works as expected. `Blork` and `cork` both expand to `malork` and `elastic`.
- Multi-level one-way expansion `(blork => cork => malork)` doesn't work transitively. Neither `blork` nor `cork` expands to `malork`.
- Multi-level one-way expansion split between multiple synonym set records `(blork => cork)(cork => malork)` doesn't work transitively. Only `cork` expands to `malork`, `blork` only expands to `cork` but not `malork`.

By default, synonyms don't use the same weight as regular search terms. Synonyms are only weighted at 10% of the default search weight. Additionally, multiple instances of a synonym in a single doc/field don't increase the search weight. The weight of synonyms is controlled by the property *`glide.ts.synonym.expanded.boost`*. When this property value = 1, synonyms are weighted equally to normal search terms. 0.5 = 50% weight etc.

Wildcard characters and synonym matching

Zing doesn't expand the `%` and `*` wildcard characters when looking for synonyms that match your search term. These characters are treated as literal characters when finding matching synonyms. As an example, if you search for `issu*`, Zing doesn't find synonyms for `issue`, but it does find synonyms for `issu*`.

Enable search synonyms

Enabling text index synonyms allows Zing to expand text searches with additional search keywords.

Before you begin
Role required: ts_admin or admin

About this task
By default, text searches don't use text index synonyms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **Text Search**.
2. Scroll down to **Enable Synonym**, and select **Yes**.

Result

Text searches use active synonym dictionaries to expand keyword searches.

Create synonym dictionaries

You can create synonym dictionaries to expand Zing text searches with additional search keywords.

Before you begin

Role required: ts_admin or admin

About this task

By default, the system provides a sample Zing synonym dictionary called **Example synonym dictionary**. You can add synonyms to this dictionary or create your own synonym dictionaries.

Procedure

1. Navigate to **All** > **System Definition** > **Text Index Synonym Dictionaries**.
2. Select **New**.
3. On the Synonym Dictionary form, fill in the fields.

Synonym Dictionary form

Field	Description
Name	Unique name for the synonym dictionary.
Active	Option to make the synonym dictionary active. Zing only uses active synonym dictionaries when expanding searches.
Global	Option to use the synonym dictionary for searches against all tables that have not been individually configured.
State	Publication state for the synonym dictionary. This field is read-only.
Order	Order of evaluation for the synonym dictionary. Zing evaluates synonym dictionaries with lower *`Order`* values before dictionaries with higher values.
Description	Description of the synonym dictionary.

4. For each set of synonyms you want to add to the synonym dictionary, insert a new Synonym Set row and fill in the fields.

Synonym set fields

Field	Description
Synset	Comma-separated set of synonym expansions. Zing expands searches

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	containing any one of these terms to include all of these terms. As an example, if you define the synonym set `medicalise,médicalisé` and search for `medicalise`, Zing expands your search to match records containing either `medicalise` or `médicalisé`.
Active	Option to make this synonym set active. Zing only uses active synonym sets when expanding searches.
Description	Description of the synonym set.

5. Select **Submit**.
6. Select the **Publish All Dictionaries** related link.
   A message indicates that publication of your synonym dictionaries has been scheduled. Refresh the page to see whether publication is complete. The dictionary is published when its state changes from **Draft** to **Published**.

Select synonym dictionaries for a table

Search administrators can specify one or more synonym dictionaries available to a particular table.

Before you begin
Role required: ts_admin or admin

Procedure
1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Select the table for which you want to change search behavior.
   The system displays the Text index record for the table.
3. Select the **Index Synonym Dictionaries** tab.
4. Select **New**.
5. Select a synonym dictionary in the **Synonym Dictionary** field on the **Index Synonym Dictionary** form.
6. Select **Submit**.

Result
Text searches on this table use the selected synonym dictionaries.

Disable synonyms for a table

By default, Zing uses all active synonym dictionaries when a user performs a text search. Search administrators can disable synonym dictionary usage on a per-table basis.

Before you begin
Role required: ts_admin or admin

Procedure
1. Navigate to **All** > **System Definition** > **Text Indexes**.
2. Select the table for which you want to change search behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays the Text index record for the table.

3. Select **Disable synonym**, so the check appears.
4. Select **Update**.

Debug synonym searches

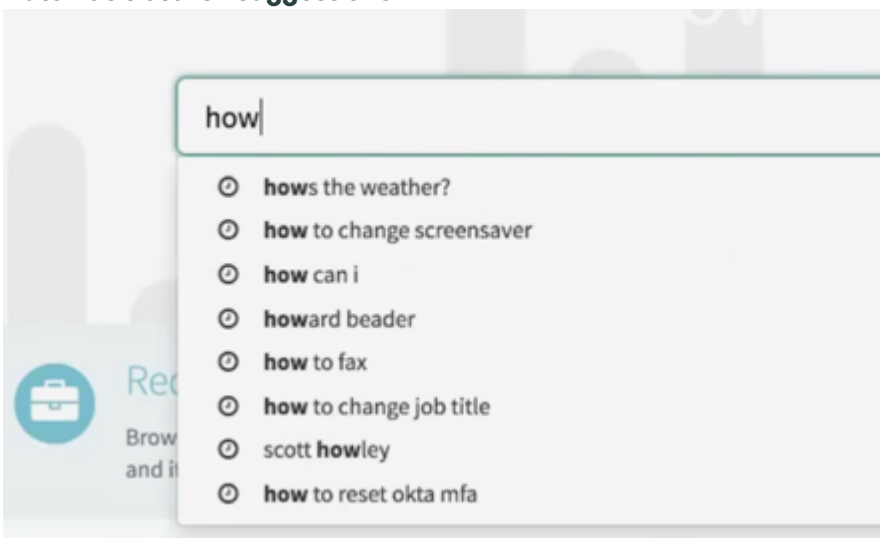
You can view debug messages to determine if synonym searches are working as expected.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug Text Search**.
2. Perform a search using a term in a synonym dictionary.
3. View the session debug output.

> **Note:** You can only view the debug output on a table view (_list.do). You can't view it on a UI page itself.



Zing displays search suggestions as users enter search terms

Display possible search query completions as users enter search terms.

To use the Search Suggestions application, activate the com.glide.search.suggestions plugin if it's not already installed. For information, see Request a plugin and Activate a plugin.

Once you enable Search Suggestions, suggestions appear automatically when users enter text into Zing search fields in the Service Portal or Now Mobile.

Automatic search suggestions

If there are any matching suggestions from the user's own previous searches, those suggestions appear first, with a clock icon. The remaining suggestions are those suggestions coming from the searches of other users.

In the Service Portal, you can use Search Suggestions or type-ahead functionality, but not both at the same time. In Now Mobile, only Search Suggestions is available. By default, new ServiceNow instances use Search Suggestions in the Service Portal. Upgraded instances use whatever was previously enabled. You can easily enable Search Suggestions on upgraded instances. To learn more, see Enable and disable Search Suggestions in Zing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For full details on configuration and use of the Search Suggestions application, see Search Suggestions.

Enable and disable Search Suggestions in Zing

Enable the Search Suggestions application to improve the Zing search user experience.

Before you begin

ServiceNow personnel installed and activated the com.glide.search.suggestions plugin.

Role required: admin

About this task

The Search Suggestions application is available on new instances by default. On upgraded instances, Search Suggestions is enabled for Now Mobile and disabled for Service Portal by default.

The following system properties enable and disable Search Suggestions:

- *glide.search.suggestions.enabled*: Set to **true** (default) to enable Search Suggestions in Zing, or set to **false** to disable Search Suggestions in Zing.
- *glide.service_portal.search_as_you_type_behavior*: Select **Suggestions** or **Typeahead** functionality in the Service Portal.

On new instances, the first parameter is set to **true** and the second is set to **Suggestions**. In upgraded instances, the parameters are set to whatever was previously enabled.

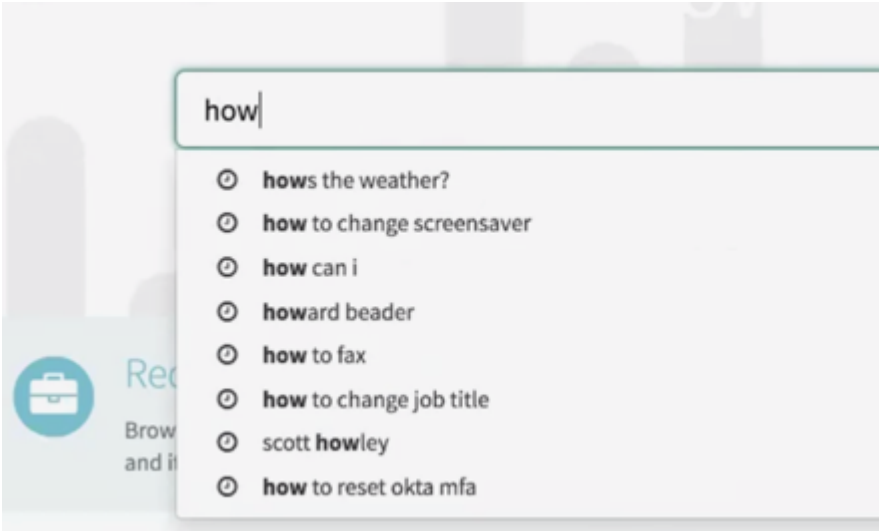
Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. To switch between Search Suggestions and type-ahead functionality in Service Portal, follow these steps.
   a. In the **Name** search column, enter *glide.service_portal.search_as_you_type_behavior*.
   b. On the System Property page, in the **Value** field, enter `Suggestions` to enable Search Suggestions, or `Typeahead` to enable type-ahead functionality.
   You can only enter one of these options.
3. To turn Search Suggestions on or off globally, follow these steps.
   a. In the **Name** search column, enter *glide.search.suggestions.enabled*.
   b. In the **Value** field, double-click the value and select **true** to enable suggestions, or **false** to disable Search Suggestions globally.

Set the maximum number of search suggestions Zing displays

Set the maximum number of search suggestions Zing displays when users enter search strings in search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Before you begin

You must be using a search application that has Zing specified as its Search Engine in its search application configuration record. For details on search application configuration record fields, see Search Application Configuration form.

Role required: admin

About this task

Zing displays suggestions generated by the Search Suggestions application when users enter text in a search field in a supported search application. You can control the number of suggested search strings displayed by editing the search application configuration records for your search applications that use Zing.

Note: You can also configure a search suggestion limit for Knowledge and System Status searches in Service Portal by editing the instance options for the Typeahead Search widget. For details on these instance options, including the Limit option, see Typeahead Search widget. To learn how to configure instances of the Typeahead Search widget for the Knowledge and System Status portal pages, see Configure widget instances.

Procedure

Set the maximum number of search strings displayed in a search application that uses Zing.

a. Navigate to the Search Application Configurations [sys_search_context_config] table's list view by selecting **All**, entering `sys_search_context_config.list` in the navigation filter, and pressing Enter.

b. Open the Search Application Configuration record for your Zing search application.

c. If a warning message about the current application scope appears, select the link in the message to switch to the correct application scope for the record.

d. In the **Suggestions Limit** field, enter the new maximum number of search suggestions you want the application to display.

e. Select **Update**.

Verify that user roles have access to your searchable tables

Evaluate your Zing text index configurations to see whether any user roles lack access to indexed columns in your searchable tables. The checker tool provides guidance on correcting access issues for each affected table's index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: ts_admin

About this task
Starting with the Brazil release, Zing text search and indexing honors column-level query_range read ACLs on table columns that are indexed for search. This change was made as part of improvements to security for search. In previous releases, Zing only honored table-level read ACLs.

This change affects searchable tables with text indexes that use the v3 legacy format and older formats. A user role may grant access to such a table without granting query_range access to all of that table's indexed columns. In this case, Zing returns no results when users with the role search the table.

The Text Search Query Range ACL Checker tool helps you see which user roles are affected by this behavior change. It shows whether Zing currently honors query_range ACLs for each of your searchable tables. You can evaluate the configuration for each table. Evaluation shows whether any user roles that grant access to the table lack query_range access to all of its indexed columns. If this is the case, the tool provides guidance on modifying your configuration to resolve the search access issue. You can also accept the configuration as is, with the understanding that doing so will impact search for users with affected roles.

You only need to perform this procedure for text indexes that use the legacy v3 format or earlier formats. Zing's v4 text index format enforces query_range read ACLs at the level of individual columns. Using the v4 format, when an indexed column is inaccessible by the search user, search ignores that column but still returns results from accessible indexed columns.

Note: To check the format for a searchable table's text index, navigate to **All** > **System Definition** > **Text Indexes**, find the record for your searchable table, and find the value of its **Format** field.

Procedure
1. In your web browser, navigate to the Text Search Query Range ACL Checker page at `https://<instance-name>.service-now.com/ts_query_range_acl_checker.do`, replacing `<instance-name>` with the name of your ServiceNow AI Platform® instance.
2. In the **Text Search V3 Tables Restricted Search Status** section, use the **Index Name** filter and **Query Range ACL enforced** drop-down menu to locate the text search index for a searchable table.
   A value of **Enabled** in the **Query Range ACL enforced** column means the table's text index currently honors column-level query_range ACLs. This configuration provides better security, but blocks searches by users with roles that lack query_range access to all of the table's indexed columns.

   A value of **Disabled** means the table's text index doesn't currently honor column-level query_range ACLs. This configuration offers less security, but doesn't block searches by users with roles that lack query_range access to all of the table's indexed columns.
3. Select **Evaluate**.
   An **Evaluation Result for <table-name>** section appears for your chosen table.
4. In the **Evaluation Result for <table-name>** section, review the list of user roles which lack access to one or more columns in the chosen table's text index.
   The entry for a user role includes a list of columns on the chosen table that are inaccessible by users with the role. It also lists the ACLs that block access to those columns. Each ACL entry is a link to the relevant record in the Access Control [sys_security_acl] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** In the **Options to address blocking ACLs** section, choose one of the listed options and follow the tool's guidelines to resolve the access blockage for the listed user roles.
   - Mark the inaccessible columns as unrestricted.

     Note: This option reduces security for search. Unrestricted columns can be searched by any user regardless of their role.

   - Modify the ACLs that prevent access.

     (Optional) Add the listed user roles to the existing ACLs, granting them access to the specified columns on the chosen table.

     Note: If you prefer, you can instead create additional ACLs that grant the listed roles access to the specified columns on the chosen table.

   - Upgrade the table's text index format to v4.

     (Optional) Using the v4 text index format, search ignores any blocked columns but still returns results from accessible columns, rather than returning no results if any column is blocked.

     Note: Upgrading a searchable table's text index to v4 may increase the space required for the index. The v4 index may rank results differently than the index with the previous format.

6. **Optional:** To accept the current text index configuration, select **Enable Restricted Search in <table-name>**, where `<table-name>` is the name of your chosen table.

   Note: If you haven't resolved the access blockages reported for the table, users with the listed roles will be unable to search the table once you enable restricted search.

Installed with Zing

Several types of components are installed with Zing.

Tables installed with Zing

Table	Description
Text Index [ts_index_name]	Stores the tables the system indexes.
Index Stop Word [ts_index_stop]	Stores the stop words for a specific table.
Stop Word [ts_stop]	Stores the global stop words.
Text Search Groups [ts_group]	Stores search groups for global text search.
• ts_attachment • ts_chain_summary • ts_chain • ts_deleted_doc • ts_document	System tables that support Zing. Extending or modifying these tables isn't recommended.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with Zing (continued)

Table	Description
• ts_index_stats • ts_phrase • ts_search_stats • ts_search_summary • ts_word_roots • ts_word	

Business rules installed with Zing

Business Rule	Description
Text Search Property Change Rationally	Ensures that valid values are entered for Zing text search properties.
Text Index Stop Reminder	Warns the user of stop word changes that require the index to be rebuilt (table-specific). The warning is issued if record is deleted that had a stop mode "neither index nor query", if record's stop mode is updated to something else and was "neither index nor query", and if record's word is updated to something else and stop mode is "neither index nor query".
Stop Word Reminder	Warns the user of stop word changes that require the index to be rebuilt (global). The warning is issued if record is deleted and it was active, if record is inactivated, and if record's word is changed and was active.

Scheduled jobs installed with Zing

Scheduled job	Description
TS Search Stats	Compiles type-ahead suggestions each night. See Update A Type-Ahead Suggestion.
TS Index Stats	Collects statistics and performs maintenance for text search and indexing. Runs nightly.
text index events process	Collects statistics and performs maintenance for text search and indexing. Runs every 30 seconds.
TS Chain Summary	Compiles search chain statistics each hour.

UI action installed with Zing

UI action	Description
Regenerate Text Index	Displays the **Regenerate Text Index** link on Text Index forms.

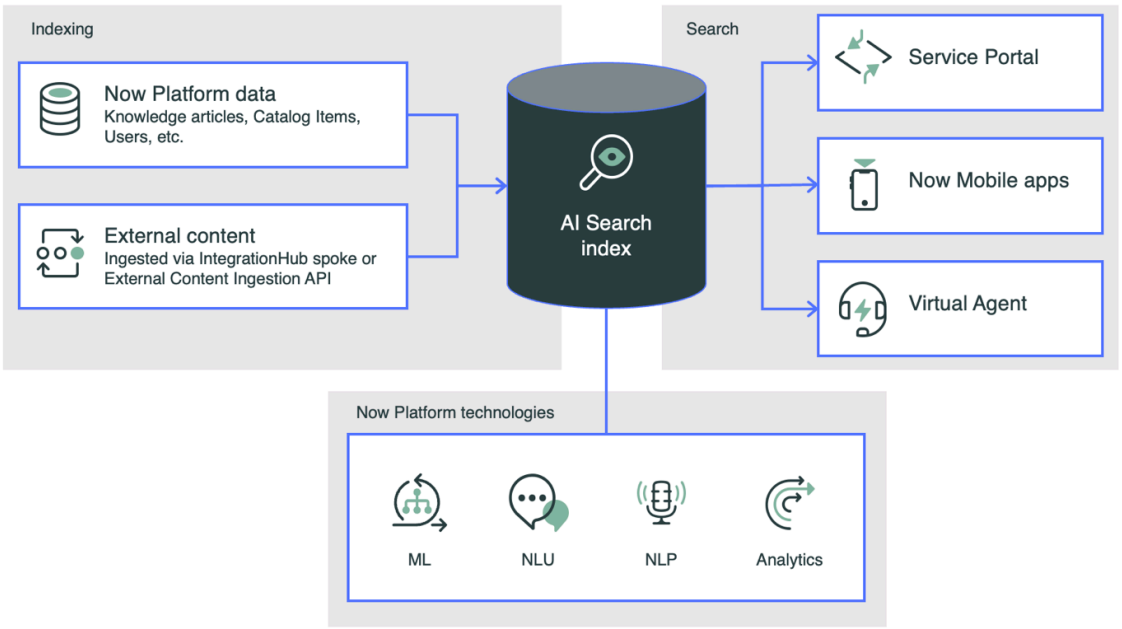
Exploring AI Search

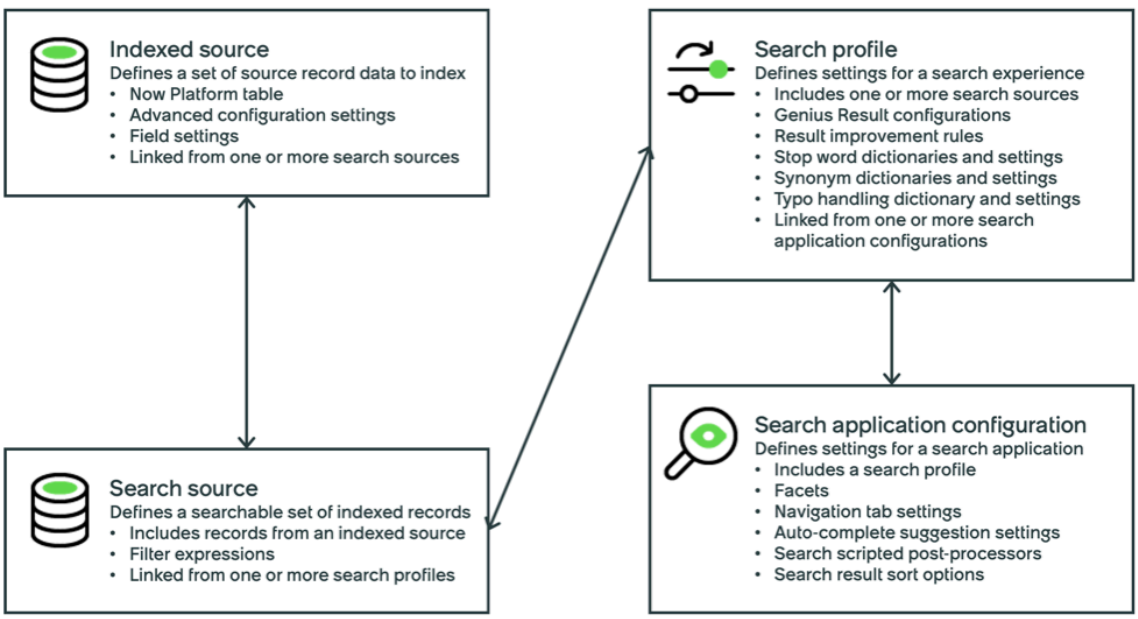


Learn about AI Search features that enable you to provide consumer-grade search experiences for your users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search architecture

The AI Search index stores data from ServiceNow AI Platform® records or external sources and makes that data available for users to search in multiple applications. Search query features use ServiceNow AI Platform technologies to improve the search user experience.



AI Search architecture diagram

AI Search configuration

Search administrators configure AI Search indexing and search settings in indexed sources, search sources, search profiles, and search application configurations.

AI Search configuration diagram

Index searchable content from ServiceNow AI Platform® tables and external sources

Make alphanumeric content from text and string fields on your records searchable by configuring an indexed source. Each indexed source retrieves data from a table and adds it to the AI Search index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define an indexed source for each ServiceNow AI Platform table with records that you want to make searchable. Search administrators can configure settings for each indexed source:

- Enable indexing for child tables of the source table.
- Configure indexing of alphanumeric content from source record tags, attachments, translated fields, and referenced fields.
- Map source table fields to AI Search index fields for ease of search.

The base system includes preconfigured indexed sources for Knowledge Base articles, Catalog Items, and user records. You can create your own indexed sources to index records from other ServiceNow AI Platform tables.

To learn more about configuring and using indexed sources for ServiceNow AI Platform table records, see Indexed sources in AI Search.

Note: AI Search doesn't index Unicode characters from the High Surrogate Area (code units in the range U+D800 to U+DBFF). Characters from this range are replaced with spaces during indexing.

By activating the External Content for AI Search plugin (com.glide.ais.external_content), you can enable indexing and search for record content from external sources. Supported sources include SharePoint collections, Confluence sites, and remote tables. For more details, see Indexing and searching external content in AI Search.

Control access to searchable content using search sources

A search source defines a subset of indexed content that users can search using a search profile. Create search sources by applying filter conditions to content from indexed sources.

Search administrators link search sources to search profiles, enabling precise control of the content that users can search. For details on creating search sources, see Search sources in AI Search.

Define search experience settings in search profiles

Search profiles define search sources and settings for linguistic search query features. Each search profile represents an individual search experience that you want to offer users in a supported ServiceNow AI Platform® application.

Each search profile can include the following settings:

- One or more search sources defining content that users can search using the profile.
- Dictionaries of synonyms, stop words, and typo handling auto-correction terms applied to searches using the profile.
- Genius Result configurations applied to searches using the profile.
- Result improvement rules applied to searches using the profile.

Search administrators create search profiles, link search sources to them, configure their settings, and publish them. For information on creating, configuring, and publishing search profiles, see Search profiles in AI Search.

Enable AI Search in supported ServiceNow AI Platform® applications

Provide multiple search entry points across your organization by enabling AI Search as the search engine for search applications. The base system enables AI Search as the search engine for global and workspace search, Customer Service Management, Now Mobile, Service Portal, and Virtual Agent .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search administrators define search application configurations for ServiceNow AI Platform applications. Each configuration links to a search profile defining the search experience for the application. Administrators can configure the application's behavior in the following ways:

- Enable or disable typo handling auto-correction for search queries.
- Configure source facet bucket and facet filters to enable users to refine search results.
- Limit the maximum number of search suggestions and Genius Result cards the application can display for a search.
- Limit the number of search results the application displays on each result page.

To learn more about configuring and enabling AI Search in supported ServiceNow AI Platform applications, see Search application configurations and Enabling and configuring AI Search in ServiceNow AI Platform applications.

Provide users with powerful and flexible search

AI Search includes search features that help users find the answers they need.

Powerful query language

Query for indexed terms and phrases. Control query logic with Boolean operators. Match a range of indexed terms using wildcard operators.

For a complete guide to supported query language syntax and operators, see AI Search query language.

Auto-complete search queries

Display suggestions in the input field as users compose their searches. Suggestions include recent and popular search queries and results as well as entries from the user's personal search history.

Auto-complete suggestions are linguistic features that search administrators configure in search application configurations. For more information on auto-complete suggestion type settings, see Configure an auto-complete suggestion type in an AI Search application configuration.

Language-sensitive lemma and Unicode normalization of search query terms

Support natural language search by expanding search query terms to match alternate inflections and forms. AI Search supports language-specific lemma normalization for Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish. It supports Unicode normalization for content in all ServiceNow AI Platform® languages.

Lemma and Unicode normalization are linguistic features that don't require configuration. For more details on normalization behavior, see Lemma and Unicode normalization.

Expand search query terms using configurable synonyms

Improve search recall by configuring language-specific dictionaries of terms with equivalent meanings or usage. When a search query includes any of these terms, AI Search expands it to include all equivalent terms, providing users with a more natural search experience.

Synonyms are linguistic features that search administrators configure in search profiles. For details on configuring synonyms and synonym dictionaries, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synonyms. AI Search supports synonym dictionaries for Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish.

Remove excessively frequent search terms using configurable stop words

Increase search precision by configuring language-specific dictionaries of frequently appearing terms that dilute search relevancy. AI Search removes these stop words from user search queries to exclude irrelevant results.

Stop words are linguistic features that search administrators configure in search profiles. For details on configuring stop words and stop word dictionaries, see Stop words. AI Search supports stop word dictionaries for Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French - Canada, French, German, Hebrew, Hungarian, Italian, Norwegian (Bokmål), Polish, Portuguese, Russian, Spanish, Swedish, and Turkish.

Auto-correct typos in search query terms

Automatically replace misspelled search query terms with spellings found in indexed content. Typo corrections are displayed above search results. Users can choose to repeat the search with their original query terms.

Typo handling auto-correction is a linguistic feature that search administrators configure in search profiles. For details on controlling the set of available auto-correction terms, see Typo handling. AI Search supports derivation of auto-correction terms for Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French - Canada, French, German, Hebrew, Hungarian, Italian, Norwegian (Bokmål), Polish, Portuguese, Russian, Spanish, Swedish, and Turkish.

Generate multi-content synthesized responses

Multi-content source synthesis lets AI Search gather and combine information from any indexed source in your system to provide comprehensive AI-generated responses to your questions.

By default, ServiceNow Otto for AI Search Genius Results and Virtual Assistant pull answers from four source types:

- External Content integrations
- Knowledge Base articles
- Service Catalog items
- Skills

Multi-content source synthesis expands this capability to include any indexed source in your ServiceNow instance, such as:

- Custom tables
- Documents module
- Incidents
- Microsites
- News content

When your administrator activates multi-content source synthesis, Genius Results and Virtual Assistant pull answers from all these sources, giving you faster, more complete responses in a single result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administrators can activate and configure multi-source content synthesized sources. See Configure multi-content synthesized sources for more information.

Enable search result refinement filters

AI Search enables users to refine searches by filtering their results. Use source facet buckets to filter results by source, or select facets to apply filters dynamically generated from the result set.

Filter results by source using source facet buckets

Display pre-defined categories that users can select to immediately exclude unwanted search results.

Search administrators configure source facet buckets in search application configurations. For details on available settings, see Configure source facet buckets in an AI Search application configuration.

Filter results dynamically using facets

Display field value-based filter selections generated dynamically from the search query's result set. Users can select multiple facet values to narrow their area of focus. Facets only display when they produce results, so users don't need to worry about dead ends.

Search administrators define facets in search application configurations. For details on creating and configuring facets, see Create a facet in an AI Search application configuration.

Display relevant and actionable search results

AI Search provides users with clear answers for their search queries.

Hit highlighting

AI Search highlights search query terms that appear in search results. This highlighting enables users to see which query terms contributed to record matches.

Display the most relevant results first with machine learning relevancy

AI Search orders search results in decreasing order of relevancy. Machine learning automatically tunes and improves search result relevancy scoring for each search profile based on aggregated user interaction data and A/B testing evaluations of live search traffic.

Machine learning relevancy is automatically enabled and not configurable, though search administrators can exclude specific search profiles from automatic relevancy-model updates. For more details on automatic relevancy score tuning, see Machine learning relevancy in AI Search.

Display the best answers as actionable Genius Result cards

Configure Genius Results to analyze search query intent and put the best answers first. Search users can read a Knowledge article, view a user's profile or organization chart, or request a Catalog Item directly from a Genius Result answer card.

Search administrators can link Genius Results to search profiles, modify their settings, and create new configurations. To learn more about Genius Results configurations, see Genius Results.

Boost, block, or promote search results

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define result improvement rules with configurable trigger conditions. A rule can boost search result relevancy based on the search query or user context, or can block or promote specific results for a particular search query.

Search administrators define result improvement rules in search profiles. For details on creating rules and configuring their boost, block, or promote actions, see Result improvement rules. AI Search supports result improvement rules for Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish search queries.

Content security in AI Search

When indexing records, AI Search preserves their ServiceNow AI Platform® security features. At query time, AI Search filters search query results and displays only records that the user can access.

For more information on how AI Search handles security features for ServiceNow AI Platform table records, see Content security in AI Search.

Internationalization support

AI Search supports indexing and search for all languages offered by the ServiceNow AI Platform®. Search administrators can configure AI Search search features for languages activated in your instance.

For full details on language support in AI Search search features, see Internationalization support for AI Search.

Search features

The following table lists the AI Search search features available for specific ServiceNow AI Platform languages.

Search features supported by language

Language	Search features supported
Arabic, Brazilian Portuguese, Czech, Dutch, English, French, French - Canada, Hebrew, Italian, Polish, Russian, Spanish, and Turkish	• Genius Results • Language identification • Lemma and Unicode normalization • Result improvement rules • Stop words • Synonyms • Typo handling
Danish, Finnish, German, Hungarian, Norwegian (Bokmål), and Swedish	• Genius Results • Language identification • Lemma and Unicode normalization (including decompounding)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search features supported by language (continued)

Language	Search features supported
	• Result improvement rules • Stop words • Synonyms • Typo handling
Japanese, Simplified Chinese, and Traditional Chinese	• Language identification (including text-region and search-term identification) • Lemma and Unicode normalization • Result improvement rules • Stop words • Synonyms
Korean	• Genius Results • Language identification • Lemma and Unicode normalization (including decompounding) • Result improvement rules • Stop words • Synonyms
All other ServiceNow AI Platform languages activated in your instance	• Unicode normalization • Result improvement rules • Stop words • Synonyms

Translated content search

By default, AI Search only returns results for records with translated content, such as knowledge articles, that are in the user's ServiceNow AI Platform session language. You can modify this default behavior in the following ways:

Assign Knowledge article search languages by country

Improve multilingual search recall by defining a set of Knowledge article search languages for each user country. User searches can match Knowledge articles in any of the search languages specified for their country as well as in the language associated with their ServiceNow AI Platform session.

Configure globally searchable knowledge articles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define an encoded query to match knowledge articles that you want to make searchable regardless of the user's session language.

Configure a fallback language

Set a fallback language for the user's session language. AI Search returns translated content results from the selected fallback language as well as the user's session language.

Enable a global fallback locale for translated content

Configure a global fallback locale to use for all translated content searches. AI Search returns translated content results from the global fallback locale's language as well as the user's session language.

> **Note:** The global fallback locale works best if you need to make all English-language records globally searchable.

Use AI Search for global search and configurable workspace search in Next Experience

AI Search is the default search engine for Unified Navigation searches in Next Experience, including global search and configurable workspace search.

Search administrators can configure global search and configurable workspace search settings using the AI Search for Next Experience application.

> **Note:** The AI Search for Next Experience application is automatically installed and enabled in new Brazil instances. If you upgrade to Brazil from a previous release, your administrators can manually install and enable the application.

For details on AI Search for Next Experience, including configuration steps and a usage guide, see AI Search for Next Experience.

Deflect incidents in Service Portal with the AI Search Assist widget

Improve incident deflection for Service Portal users by displaying the most relevant search results within a record producer.

AI Search Assist can help an agent or user find the most relevant items in a search on your portal. For example:

- An agent working on an Incident record can use AI Search Assist to find and attach knowledge articles, order a catalog item on behalf of the caller, or search for an article and link it to a related incident or problem.
- A user creating an Incident via the Service Portal can see related Catalog Items that they can order. The user can also view related knowledge articles to help them resolve the issue on their own without involving the service desk operators.

AI Search Assist helps with incident deflection for the following areas:

- Incident record producers: Deflect incidents by helping end users resolve issues before they raise an incident.
- Incident forms: Help service desk staff resolve incidents quickly by providing relevant knowledge.
- Incident email notifications: Help end users resolve their incidents themselves without requiring manual intervention from service desk staff.

To learn more about configuring and using the AI Search Assist widget in Service Portal, see AI Search Assist record producer integration for Service Portal.

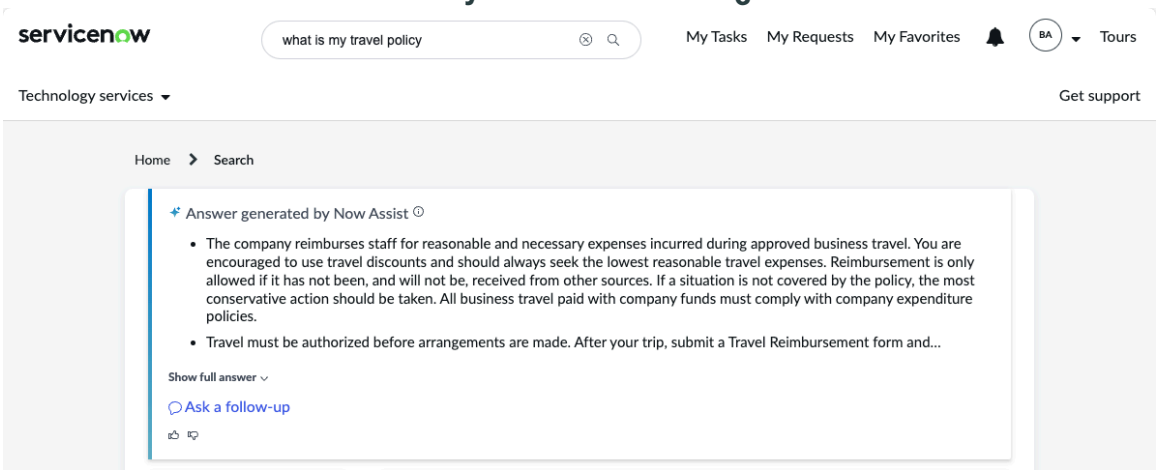
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

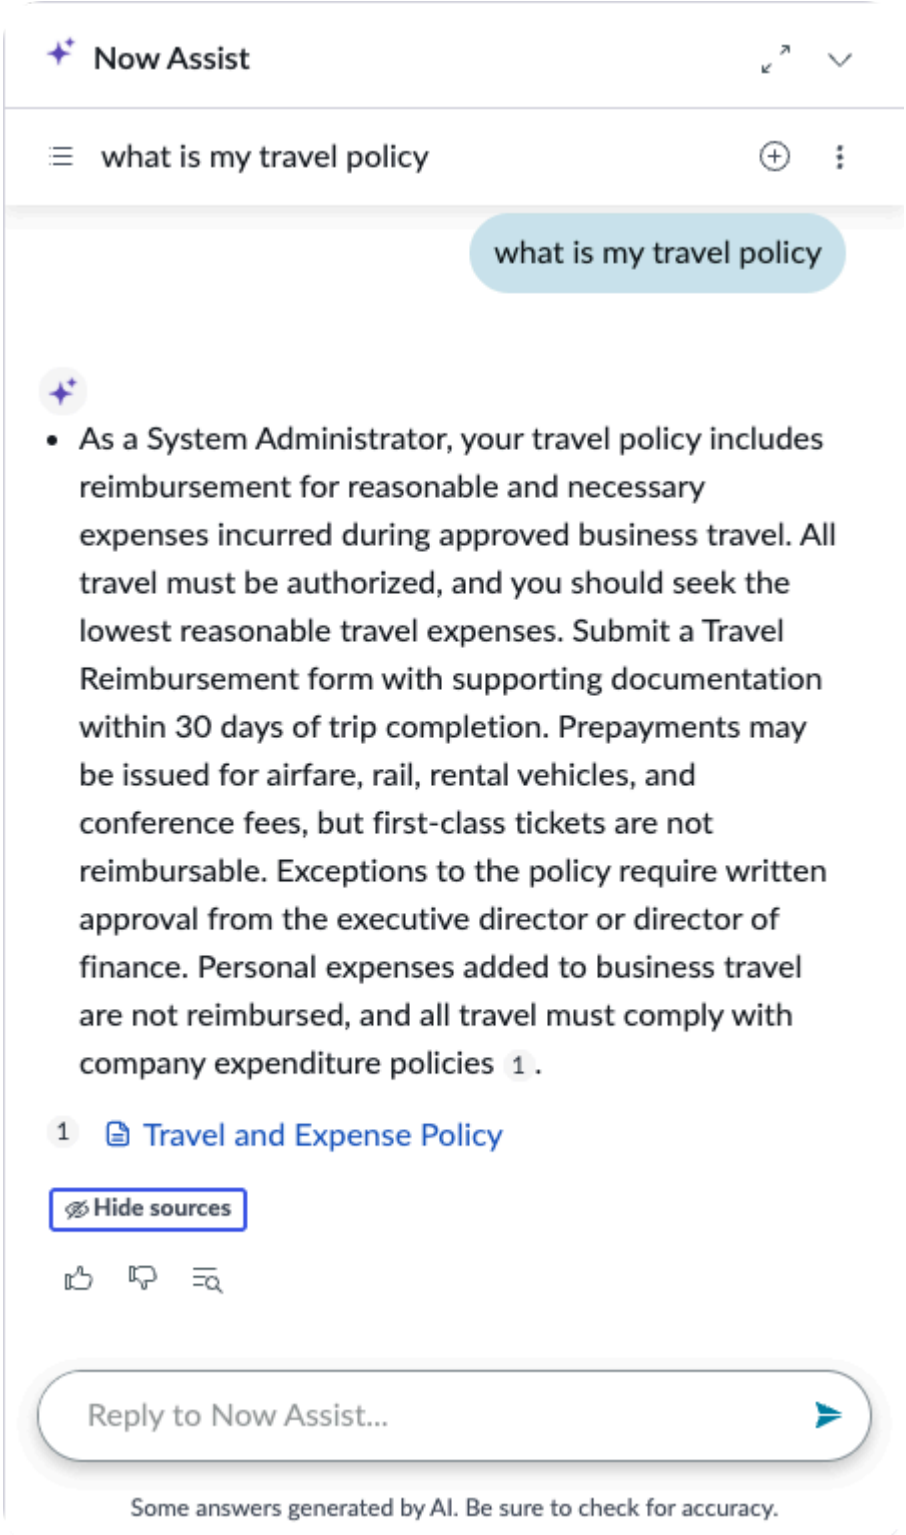
Search result disparities between AI Search and ServiceNow Otto® search features



The ServiceNow AI Platform® offers a variety of search tools, which may return different answers for the same or similar searches. This disparity in results is expected. It occurs because each tool uses a different approach and architecture to find results and generate answers that match your search.

As an example of the same search returning different answers in different search tools, consider these results that might be displayed to a user searching for `what is my travel policy`:

Search results from AI Search in Employee Center



Genius Result answer from Summary Genius Result configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chat answer from ServiceNow Otto for Virtual Agent

In this example, each search tool returns a different answer even though the user's search (or question) is the same in all three tools. This is expected behavior, since the search tools all handle searches differently.

AI Search

The AI Search engine uses keyword search, meaning that it looks for the best matches for your search terms in its indexed source data. Search features such as lemma and Unicode

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

normalization, synonyms, stop words, and typo handling may modify the set of terms that AI Search considers matches for your search, but the matching is always done on a per-term basis.

Keyword search should return consistent results for the same search until your source data is updated. Machine learning relevancy can affect the exact order in which your results appear over time, though, so even if your data doesn't change, your search may not return exactly the same result set today as it did the previous month.

ServiceNow Otto Genius Results

The ServiceNow Otto Genius Result configurations offered in ServiceNow Otto for AI Search use a hybrid search mode. This mode blends keyword search with semantic vector search to find results in the AI Search index based on the intention and meaning of your search as well as on the best term matches.

The most relevant matching results are merged into a prompt that's sent to a large language model (LLM) for answer generation. Because LLMs aren't deterministic, they don't always produce the same output even when given the same input. As a result of the non-deterministic behavior of the LLM, ServiceNow Otto Genius Results are likely to return varying results for the same search, even when submitted at the same time.

Note: For more information on how LLMs introduce variations into their results, see Discrepancies when using different AI search tools.

Between the non-deterministic LLM behavior and the difference in search matching modes, ServiceNow Otto Genius Result answers can be expected to vary significantly from results returned by AI Search for the same search terms, even when using the same search configuration in both tools. This variance is expected because the two search tools take such different approaches when finding and generating answers for your search.

ServiceNow Otto for Virtual Agent

ServiceNow Otto for Virtual Agent uses hybrid search to find matching results in the AI Search index, like the ServiceNow Otto Genius Result configurations do.

Unlike those Genius Result configurations, however, ServiceNow Otto for Virtual Agent has its own agentic AI back-end architecture for generating responses. This architecture doesn't rely on sending a single prompt to the LLM for answer creation the way the ServiceNow Otto Genius Result architecture does.

Because of this architectural difference, results from ServiceNow Otto for Virtual Agent searches can vary from those returned by ServiceNow Otto Genius Results, even when processing the same search and using the same search configuration. Similarly, ServiceNow Otto for Virtual Agent results may vary from the results returned by AI Search keyword searches.

Note: If you're seeing different results for the same search in ServiceNow Otto for Virtual Agent than you are in AI Search and ServiceNow Otto Genius Results, it's worth checking that your ServiceNow Otto for Virtual Agent chat assistant uses the same search configuration as your portal's search field does. For details on copying an existing search configuration to a chat assistant, see Assign search sources to a chat assistant.

As previously described, using the same search configuration in the portal and your chat assistant doesn't guarantee that you will see exactly the same search results in ServiceNow Otto for Virtual Agent as you see in the portal using AI Search, but it does remove one possible source of difference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary of differences between search tools

The following table summarizes some of the key differences between AI Search, ServiceNow Otto Genius Results, and ServiceNow Otto for Virtual Agent.

Search tool	Search mode	Interaction	LLM usage
AI Search	Keyword search	Query-based (search field)	None
ServiceNow Otto Genius Results	Hybrid (blend of keyword and semantic vector) search	Query-based (search field)	Most relevant search results sent to LLM in a single prompt for answer generation
ServiceNow Otto for Virtual Agent	Hybrid (blend of keyword and semantic vector) search	Conversation-based (chat)	Agentic AI which maintains conversational context when submitting prompts to LLM

Configuring AI Search

Plan and configure your AI Search implementation.

AI Search configuration overview

Configuration stage	Description
Assign roles to AI Search administrators and users	Assign the ais_admin role to users who need to create, read, update, and delete content indexing and search settings for AI Search. Assign the ais_high_security_admin elevated privilege role to users who need to access High Security settings for AI Search. Assign the search_application_admin to users who need to create, read, update, and delete search application configurations.
Define indexed sources	Create and configure an indexed source for each ServiceNow AI Platform® table that has content you want to make searchable. Index source tables to add their searchable content to the AI Search index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration stage	Description
	The base system includes pre-configured indexed sources for the Catalog Item, Knowledge, and User tables.
Define search sources	Apply filter conditions to indexed sources to define search sources that users can access in your search experiences. The base system includes pre-configured search sources that reference the default indexed sources.
Define search profiles	Create and publish a search profile for each distinct search experience that you want to offer in search applications. Specify the data that users can search by linking search sources to the search profile. Control search behavior by configuring synonyms, stop words, typo handling settings, Genius Results, and result improvement rules. The base system includes pre-configured search profiles for use with Service Portal, Now Mobile, and the AI Search Assist Service Portal widget.
Define search application configurations	Create a configuration for each ServiceNow AI Platform application that supports AI Search. Select a search profile for the application to use. Configure application-specific search settings. The base system includes pre-configured search application configurations for Service Portal, Virtual Agent, and the AI Search Assist Service Portal widget.
Enable and configure AI Search in ServiceNow AI Platform applications	Specify AI Search as the search engine in supported ServiceNow AI Platform applications. Select a search application configuration for each application to use and configure available search UX settings.
Create a custom search matcher for global search	Optionally configure exact-match global searches that only match results from a specified column (field) on a particular ServiceNow AI Platform table.

Using guided setup to implement AI Search

Guided setup provides a sequence of tasks that help you configure AI Search on your ServiceNow instance. To open AI Search guided setup, navigate to **All** > *AI Search* > **Guided Setup**.

For more information about using the guided setup interface, see Using guided setup.

Assign roles to AI Search administrators and users

Grant users the ais_admin, ais_external_content, ais_high_security_admin, and search_application_admin roles so they can configure and manage settings and content for AI Search and search applications.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Users with the following roles can access and configure settings and content for the AI Search application.

Role	Description
AI Search administrator [ais_admin]	Manages configuration settings for the AI Search application, including the following: • Creates, reads, updates, and deletes indexed sources • Creates, reads, updates, and deletes search sources • Creates and deletes mappings between search sources and search profiles • Creates, reads, updates, and deletes search profiles • Creates, reads, updates, and deletes synonym and stop word dictionaries • Creates and deletes mappings between dictionaries and search profiles • Reads and updates typo handling auto-correction dictionaries linked to search profiles • Creates, reads, updates, and deletes Genius Result configurations • Creates and deletes mappings between Genius Result configurations and search profiles • Creates, reads, updates, and deletes result improvement rules • Creates and deletes mappings between result improvement rules and search profiles
AI Search high security administrator [ais_high_security_admin]	Accesses High Security settings for AI Search, including the following: • Bypasses all search filters from search sources and content security in the Search Preview UI, viewing all search query results available in the AI Search index • Reads external content user mapping import history records • Reads indexed content item records in the index inspector tool for External Content Connectors This is an elevated privilege role. Elevated privilege roles aren't assigned to users or groups, and must be used by elevation. For more information on elevated privilege roles, see Elevated privilege roles. To learn about elevation, see Elevate to a privileged role. The Instance Security Center **Users with High Privilege Roles** user metric displays the count of users assigned this role. For more details, see .
Search application administrator [search_application_admin]	Creates, reads, updates, and deletes search application configurations for Zing and AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description
	This role includes the ais_admin and personalize_dictionary roles.
AI Search external content API user [ais_external_content]	Accesses endpoints for AI Search external content APIs, including the following: • Feeds external documents for AI Search to index as search results, or deletes records for external documents from the index, using the External Content Ingestion API. • Imports user mappings for external content security using the AI Search External User Mapping API. Assign this role to non-interactive users and integration users who require access to external content API endpoints. For more information on non-interactive users, see Non-interactive sessions. For details on integration users, see Mark service accounts as internal integration users. Users with the admin role don't need this role to access external content API endpoints.

Assign these roles to users and groups to enable them as search administrators or external content API users for AI Search.

Procedure

- Assign a role to a user
- Assign a role to a group

Activate the Platform Multimodal Service plugin

Enable automatic generation of searchable descriptive captions for images, tables, charts, and other visual elements found in indexed attachments.

Before you begin
Role required: admin

About this task
AI Search offers optional automatic multimodal generation of searchable descriptive captions for images, tables, charts, and other visual elements found in attachments that you index for search. These generated captions improve search recall, allowing you to find attachments using search keywords that match generated terms.

As an example, an attachment might include an image that yields the generated caption `man on bicycle`. Searches for `man` or `bicycle` can match the caption terms. Such searches return the attachment as a search result even if its text doesn't otherwise contain either of those terms.

To use the automatic multimodal caption generation feature, you must activate the Platform Multimodal Service (com.glide.platform_mm_service) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Multimodal captioning is only supported for Knowledge [kb_knowledge] table records from the Knowledge Table indexed source and for content retrieved by external content connectors.

The multimodal captioning feature has been validated and tested for English-language content. For content in other languages, it may function but hasn't been evaluated for caption quality or accuracy. Multimodal captioning for non-English content is not currently supported.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Platform Multimodal Service (com.glide.platform_mm_service) plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

With the plugin activated, administrators have additional configuration options available, as follows:

- AI Search administrators can activate multimodal captioning for individual AI Search indexed sources. For details on this procedure, see Activate multimodal captioning for attachments from an indexed source.
- Connector administrators can activate multimodal captioning in the crawl settings for an external content connector. To learn about configuring crawl settings for external content connectors, see Configuring crawl settings for external content connectors.
- AI Search administrators can select the VLM (visual learning model) provider and model used by the Platform Multimodal Service. For details on this process, see Configure multimodal captioning for AI Search.

Indexed sources in AI Search

Indexed sources designate ServiceNow AI Platform® tables and external document sets with alphanumeric text and string field content that you want to make searchable. AI Search ingests text and string fields from table records or external documents and stores their searchable alphanumeric content in its search index.

For instructions on creating an indexed source, see Create an indexed source.

Indexed source types

AI Search supports the following indexed source types.

Internal indexed source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An internal indexed source retrieves alphanumeric content and metadata from text and string fields on ServiceNow AI Platform records. It includes a unique name and a reference to a ServiceNow AI Platform table with records that you want to make searchable. AI Search extracts and indexes searchable alphanumeric content and metadata from text and string fields on records in this table and in any of its child tables that you configure for indexing.

AI Search excludes some ServiceNow AI Platform tables from indexing. You can't define indexed sources for these excluded tables or their derived tables. For a list of excluded tables, see ServiceNow AI Platform tables excluded from AI Search indexing.

You can't index remote tables with internal indexed sources. To index content from a remote table, create an external indexed source.

External indexed source

An external indexed source retrieves alphanumeric content and metadata from text and string fields of documents in an external repository or a remote table. It includes a unique name and a reference to an external content schema table instead of a ServiceNow AI Platform table. For more details on configuring indexed sources for external content, see Indexing and searching external content in AI Search.

Note: AI Search doesn't index Unicode characters from the High Surrogate Area (code units in the range U+D800 to U+DBFF). Characters from this range are replaced with spaces during indexing.

Search performance considerations for indexing

Search performance for AI Search is affected by several customer-controlled factors related to content indexing. Changes to these factors can impact search performance as follows.

Index size

Indexing more content produces a larger index, which takes more time to search. Avoid indexing content that isn't needed for search.

Indexing large source tables, such as the Task [task] table and tables that extend it, can add significant numbers of records to the AI Search index.

Number of indexed sources

An index with more indexed sources takes longer to search than one with fewer indexed sources. This is true even if the two indexes are the same size.

Number of indexed fields

Increasing the number of fields you index across your indexed sources makes the system take longer to find search results. This effect is independent of index size and number of indexed sources.

Indexing frequency

The more often your indexed content is synchronized and updated, the more often search will compete with indexing for compute resources, increasing search response time. This is especially pertinent for indexed sources with frequently modified fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indexed source retention policies and filter conditions

To limit the size of your index and the frequency of index updates, you can define retention policies and filter conditions for your indexed sources.

As an example, you can define a retention policy for an indexed source to exclude records that are more than two years old. This policy keeps your search results more current and reduces the size of your index. Changes made to the excluded records don't trigger index updates, so this policy also reduces indexing frequency.

Similarly, you can define a filter condition for an indexed source that excludes source table records with a specific status, such as Open. This filter condition reduces the number of records indexed from the source table, which in turn reduces the total amount of data you index. Excluding open records that have frequent updates also reduces indexing frequency.

AI Search also uses your retention policy and filter condition settings to automatically purge stale records from the index, reducing its size.

To learn more about creating retention policies and filter conditions for your indexed sources, see Indexed source retention policies and filter conditions.

Note: Retention policies are required for indexed sources that index records from the Task [task] table or tables that extend it. They are optional for other indexed sources.

Indexed source attributes and field settings

You can configure attributes and field settings for an indexed source to control indexing behavior for source records. Attributes control the indexed source's behavior at the record level, while field settings define its behavior for individual fields on indexed records. For more information, including lists of available attributes and field settings, see Indexed source attributes for AI Search and Field settings for AI Search.

Indexing content from an indexed source

After you define an indexed source, AI Search begins automatically indexing to reflect changes to records in the selected source table and its specified child tables. The results of all record create, update, and delete operations in these tables are reflected in the search index. AI Search doesn't index content from unmodified records in these tables until you perform a full table index. For more information on indexing behavior, including steps for full table indexing, see Indexing content from AI Search indexed sources.

Note: The pre-configured indexed sources included with AI Search only index content from text and string fields on source records. When searching records from these indexed sources, you can use numeric fields to facet or filter your search results, but you can't find records using their numeric field values. To search on a record's numeric field values, copy them into a text or string field so they can be indexed.

Indexing content from knowledge articles

When indexing content from records in the Knowledge [kb_knowledge] table, AI Search defaults to including content defined in knowledge blocks. Administrators can override this default behavior and configure AI Search to exclude content from knowledge blocks when indexing knowledge articles. For details on making this change, see Exclude knowledge block content from the AI Search index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multiple indexed sources for the same ServiceNow AI Platform table

You can't create more than one indexed source for a single ServiceNow AI Platform table. However, plugins and applications may define duplicate indexed sources for a ServiceNow AI Platform table. For example, the base system includes an indexed source defined for the User [sys_user] table, but a plugin or application might define a second indexed source for this table under a different name.

Note: Only one indexed source can be active at a time for a given ServiceNow AI Platform table. The system makes duplicate indexed sources for a table inactive by default. Before you can make one of these duplicate sources active, you must edit the currently active source and make it inactive. AI Search only indexes content and metadata from active indexed sources.

Create an indexed source

Define an indexed source to make content and metadata from ServiceNow AI Platform® table records searchable using AI Search.

Before you begin

Role required: ais_admin

About this task

When you create an indexed source, you specify a ServiceNow AI Platform table. AI Search indexes alphanumeric content and metadata from text and string fields found on records in the specified source table, making that content and metadata available for inclusion in search sources.

Note: AI Search doesn't index Unicode characters from the High Surrogate Area (code units in the range U+D800 to U+DBFF). Characters from this range are replaced with spaces during indexing.

By default, AI Search indexes alphanumeric content and metadata from all text and string fields found on records in the specified source table. You can limit which records are indexed by configuring a retention policy and filter conditions for the indexed source. For more information about retention policies and filter conditions, see Indexed source retention policies and filter conditions.

Note: Retention policies are required for indexed sources that index records from the Task [task] table or tables that extend it. They are optional for other indexed sources.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Select **New**.
3. On the Indexed Source form, fill in the fields.

   For a description of the field values, see Indexed Source form.

   Note: You can't create more than one indexed source for a single ServiceNow AI Platform table.

4. Select **Submit**.
   The new indexed source appears in the AI Search Indexed Sources list with the **State** set to **New**. If the new indexed source requires manual indexing, an informational message and an alert triangle icon ⚠ appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** To configure indexing for child tables of the selected source table, open the new indexed source and create a related list record for each child table:

   a. In the Child Tables related list, select **New**.

   b. On the Child Table form, fill in the fields.
   For a description of the field values, see Child Table form.

   c. Select **Submit**.
   The new child table appears in the Child Tables related list.

What to do next

To control how your new indexed source processes source records and fields during indexing, configure its indexed source attributes and field settings. For more information, see Indexed source attributes for AI Search and Field settings for AI Search.

To make content from source records searchable, perform a full table index for your new indexed source. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source.

Indexed source retention policies and filter conditions

To limit the set of records indexed from source tables, you can configure retention policies and filter conditions for your indexed sources. AI Search also uses these settings to automatically purge stale records from the index, optimizing search performance.

Indexed source retention policies

Indexing large source tables, such as the Task [task] table and tables that extend it, can add significant numbers of records to the AI Search index. To limit the set of source table records indexed based on the time since they were last updated, select a retention policy for your indexed source.

AI Search only indexes source records updated within the time period defined for the retention policy. For example, if you select a two-year retention policy, AI Search excludes source records that were last updated more than two years ago.

When the time since a source record's last update exceeds the limit from the indexed source's retention policy, AI Search marks the corresponding indexed record as stale.

Note: Retention policies are required for indexed sources that index records from the Task [task] table or tables that extend it. They are optional for other indexed sources.

Indexed source filter conditions

To limit the set of records indexed from a source table, define filter conditions for your indexed source. AI Search only indexes records that match all defined filter conditions.

Adding filter conditions can reduce the number of records indexed from a source table and reduce indexing frequency. As an example, if you exclude frequently updated open records based on their status, AI Search doesn't index data from those records. Excluding these records reduces your index size and the compute resources needed to index changes from the source table.

When a source record no longer satisfies the indexed source's filter conditions, AI Search marks the corresponding indexed record as stale.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Adding filter conditions doesn't reduce the number of AI Search indexing events generated for the indexed source. The system generates indexing events for every change to an indexed source table, unless the change is to a column that has a *no_text_index* field setting defined in the indexed source. The filter condition can reduce the number of records indexed for each event, however.

Purging stale records

AI Search automatically purges stale records from the index daily. Users with the admin role can manually purge stale records. For details on this procedure, see Purge stale records from the AI Search index.

Purge stale records from the AI Search index

Execute a scheduled job to delete stale records from the AI Search index.

Before you begin

Role required: admin

Note: If the *glide.script_processor.admin* system property's value has been changed from the default value, you need the role specified by that property value. For details on this property value and its effects, see Restrict access to background script.

About this task

If either of these conditions is satisfied for a record in the AI Search index, AI Search marks the record as stale.

- The time since the record's last update exceeds the age limit from its indexed source's retention policy
- The record no longer satisfies the filter conditions defined for its indexed source

AI Search automatically purges stale records from the index daily. Administrators can purge records manually by running a background script.

For more information on running background scripts, see Background scripts.

Procedure

1. Navigate to **All** > **System Definition** > **Scripts - Background**.

   Note: If the *glide.script_processor.admin* system property's value is set to security_admin, you must elevate to that privileged role to access this module. For more information on elevating privileges, see Elevated privilege roles.

2. In the **Run script (JavaScript executed on server)** text field, enter one of the following background scripts.
   - To purge stale records indexed from a specific table, enter this script, replacing `TABLE_NAME` with the name of your chosen table:

     ```
     new sn_ais.IndexEvent().purgeFilteredDocuments('TABLE_NAME');
     ```

     For example, to purge all stale records indexed from the Knowledge Table indexed source, replace `TABLE_NAME` with `kb_knowledge` in the script.
   - To purge all stale records in the index, regardless of which table they were indexed from, enter this script:

     ```
     new sn_ais.IndexEvent().purgeFilteredDocuments();
     ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Run script**.
   The script creates an event that the index handler processes, so the script completes without blocking on completion of the purge job.

Result
The background script executes, deleting stale records from the AI Search index.

Indexed source guardrails

Reduce index size and increase search performance with guardrails that limit the number of task and alert source records indexed from indexed sources.

Guardrails overview

The Task [task] and Alert [em_alert] tables and their child tables contain large numbers of records. Indexing the full set of records from these tables for search increases the size of the AI Search index and can impact performance for indexing and search.

To reduce index size and preserve indexing and search performance, AI Search applies guardrails when indexing records from these tables. These guardrails limit the maximum number of records that can be indexed from the Task and Alert tables.

Guardrails are enabled in the base system for the Task and Alert tables and their child tables. By default, AI Search indexes a maximum of 10 million records for each of these tables.

How guardrails work

When guardrails are enabled, AI Search first checks the Guard Rail Limit for Indexed Data Sources [`ais_guard_rail_limit_data_source`] table to see whether a record exists for the indexed source (defining the maximum number of records to index for that indexed source). If no table entry exists, AI Search checks the `glide.ais.ingestion.guard_rails_enabled_datasources` system property value to see whether a limit is defined there for the indexed source. If no limit is found in either place, AI Search doesn't apply guardrail limits to the indexed source.

Guardrail limits on the number of records indexed are applied after the set of source records is limited by the indexed source's filter conditions and retention policy. For details on indexed source filter conditions and retention policies, see Indexed source retention policies and filter conditions.

AI Search indexes the most recently modified records from the indexed source table. If indexing causes the record count for the table to exceed the guardrail limit, AI Search discards older records from the index to make room for the newer records.

Modifying guardrail settings

A ServiceNow® employee can modify guardrail settings for your instance as follows:

- Override the base system record-count limits for the Task and Alert table guardrails
- Create custom guardrails to limit the maximum number of records indexed from other source tables
- Disable guardrails

Note: Changes to your instance's guardrail settings may take up to 24 hours to be reflected in AI Search's indexing behavior.

Search performance considerations for indexing

Search performance for AI Search is affected by several customer-controlled factors related to content indexing. Changes to these factors can impact search performance as follows.

Index size

Indexing more content produces a larger index, which takes more time to search. Avoid indexing content that isn't needed for search.

Indexing large source tables, such as the Task [task] table and tables that extend it, can add significant numbers of records to the AI Search index.

Number of indexed sources

An index with more indexed sources takes longer to search than one with fewer indexed sources. This is true even if the two indexes are the same size.

Number of indexed fields

Increasing the number of fields you index across your indexed sources makes the system take longer to find search results. This effect is independent of index size and number of indexed sources.

Indexing frequency

The more often your indexed content is synchronized and updated, the more often search will compete with indexing for compute resources, increasing search response time. This is especially pertinent for indexed sources with frequently modified fields.

Indexed source retention policies and filter conditions

To limit the size of your index and the frequency of index updates, you can define retention policies and filter conditions for your indexed sources.

As an example, you can define a retention policy for an indexed source to exclude records that are more than two years old. This policy keeps your search results more current and reduces the size of your index. Changes made to the excluded records don't trigger index updates, so this policy also reduces indexing frequency.

Similarly, you can define a filter condition for an indexed source that excludes source table records with a specific status, such as Open. This filter condition reduces the number of records indexed from the source table, which in turn reduces the total amount of data you index. Excluding open records that have frequent updates also reduces indexing frequency.

AI Search also uses your retention policy and filter condition settings to automatically purge stale records from the index, reducing its size.

To learn more about creating retention policies and filter conditions for your indexed sources, see Indexed source retention policies and filter conditions.

Note: Retention policies are required for indexed sources that index records from the Task [task] table or tables that extend it. They are optional for other indexed sources.

Semantic index configuration for indexed sources

The AI Search generalized RAG (Retrieval-Augmented Generation) framework offers a streamlined way to configure semantic indexing settings for records indexed from ServiceNow AI Platform® tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Semantic index configuration overview

AI Search admins can configure semantic indexing settings for an indexed source. These settings specify how AI Search indexes content from the indexed source for use with semantic vector search. The group of semantic indexing settings for a particular indexed source is called a semantic index configuration.

Each semantic index configuration includes the following elements:

Indexed source

A reference to an existing indexed source with field values or attachments that you want indexed for semantic vector search.

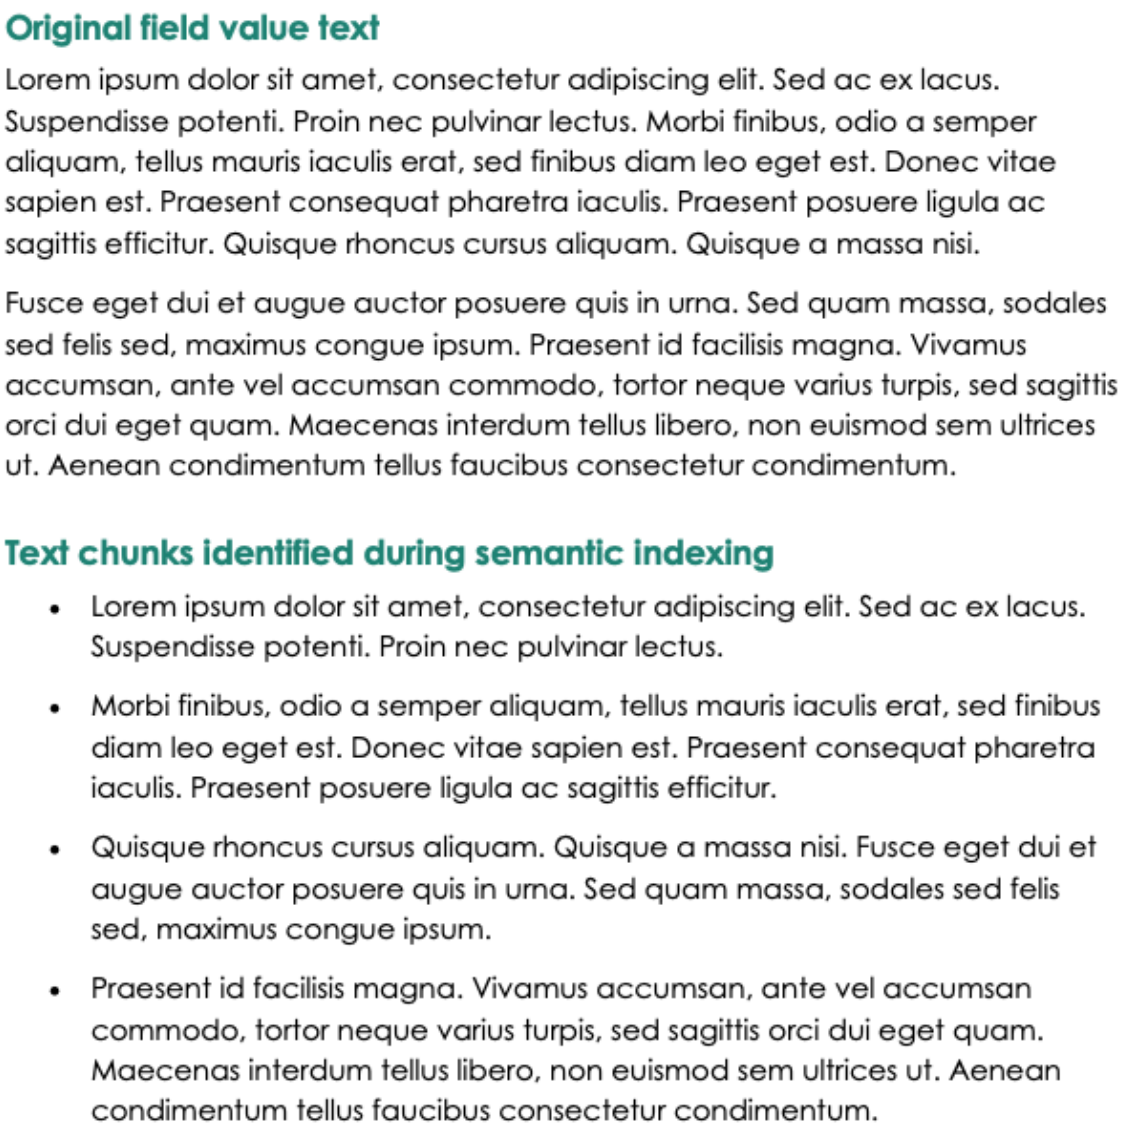
For more information on indexed sources, see Indexed sources in AI Search. To learn more about semantic vector search, see Semantic vector search in AI Search.

Embedding models

A list of one or more embedding models for the system to use when indexing content from the indexed source for semantic vector search.

An embedding model specifies how information found in your indexed content is encoded in a vector map. Semantic vector search uses the encoded information from the vector map to find search results that have meanings similar to those of your search terms.

Chunking strategy and related parameters



A chunking strategy and related parameter values that together determine how content from the indexed source's selected fields and attachments is handled during indexing for semantic vector search.

Chunking is the process of breaking text down into smaller portions (called chunks) during indexing. By chunking your content, AI Search reduces search load and improves context and relevancy for semantic vector matches.

The following image shows how a two-paragraph block of sample field value text might be broken into chunks for semantic indexing. As shown, chunks can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

contain multiple sentences and may span paragraph breaks found in the original

text.

Semantic index fields

References to one or more semantic index fields that provide semantic indexing settings for content from the indexed source.

Each semantic index field defines semantic indexing settings for a single field from the indexed source table, or for attachments from that table. You can specify the order in which semantic index fields are evaluated when indexing content from the indexed source for semantic vector search.

Note: You can define multiple semantic index configurations for an indexed source, but each configuration after the first imposes an additional performance cost at indexing time.

Activating semantic index configuration

Semantic index configuration functionality is provided by the AI Search Semantic Controller plugin (com.glide.ais.semantic_search). This plugin is automatically activated for your instance when you install any ServiceNow Otto® application.

You can verify whether semantic index configuration is activated by navigating to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources** and selecting an indexed source record. If

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

you see the Semantic Index Configuration related list on the Indexed Source form, the plugin is activated.

Configure semantic indexing settings for an indexed source

Specify the semantic indexing configuration settings you want to apply when AI Search indexes records from your indexed sources.

Before you begin

The AI Search Semantic Controller plugin (com.glide.ais.semantic_search) must be active on your instance. This plugin is automatically activated when any ServiceNow Otto® application is installed on your instance.

Role required: ais_admin

About this task

As an AI Search admin, you can perform this task to choose the fields from and indexed source's table that you want the system to index for semantic vector search. You can also choose the embedding models and content chunking strategy to use for semantically indexed content from the source table.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Select the indexed source that you want to configure semantic indexing settings for.
   The selected indexed source opens in Indexed Source form view.
3. In the Semantic Index Configuration related list, select **New**.

   Note: If you don't see the Semantic Index Configuration related list on the Indexed Source form, check with your administrator to make sure that your instance has at least one ServiceNow Otto application installed. Installing any ServiceNow Otto application activates the AI Search Semantic Controller plugin (com.glide.ais.semantic_search), which is required for semantic index configuration.

4. On the Semantic Index Configuration form, fill in the fields.
   For a description of the field values, see Semantic Index Configuration form.
5. Select **Submit**.
   If you're updating an existing semantic index configuration, select **Update** instead.
   The Semantic Index Configuration form reloads and displays your selected field values and the Semantic Index Fields related list.
6. In the Semantic Index Fields related list, create a record for each field with content that you want to include in the semantic index for the specified indexed source.

   a. Select **New**.

   b. On the Semantic Index Field form, fill in the fields.
   For a description of the field values, see Semantic Index Field form.

   c. Select **Submit**.
   The new semantic index field record appears in the Semantic Index Fields related list.

What to do next

After changing the semantic index configuration settings for an indexed source, you must reindex content from that indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Indexing content for semantic vector search is typically slower than indexing for keyword search. Your indexed source may take more time to reindex once you have defined a semantic index configuration for it.

AI Search RAG (Retrieval-Augmented Generation)

The AI Search RAG (Retrieval-Augmented Generation) capability provides a framework that enhances the search accuracy of AI Search results by narrowing the focus of your large language model (LLM) to a specific, contextual data set, instead of the vast, general data it was trained on.

AI Search RAG overview

RAG (Retrieval Augmented Generation) technology helps enhance search capabilities of your AI Search application by combining information retrieval with text generation. It includes the following steps:

Indexing

Prepare and organize data to make it searchable. It includes the ais_datasource table and semantic indexing configurations. For more information, see Indexed sources in AI Search.

Searching

Find the most relevant results from the indexed data using a query. It includes RAG retrieval API to run search on indexed data of the search profile, and RAG capability that manages the RAG process, including retriever and re-ranker to deliver relevant results.

Components of AI Search RAG

The AI Search RAG capability orchestrates the complete RAG process using components, such as query rewrite, retriever, and re-ranker to deliver the most relevant results.

- Query Rewrite: Rewrites the complex or long queries into concise, short form to avoid truncation issues with the embedding model's token limit.
- Retriever: Uses the rewritten query to retrieve the most relevant results from indexed sources.
- Re-ranker: Uses LLM to further refine the ranking of retrieved results.
- Final Response: The output of the re-ranker is returned as the final response.

The following diagram shows how AI Search RAG components work together.

The AI Search RAG system works by first organizing data into a searchable format using specific indexing configurations. When a user asks a question, the system processes it and may rephrase the query for better understanding. It then searches for relevant information with the help of retriever and the re-ranker uses AI to arrange them in the most useful order. All of these steps work together under the guidance of a search profile to produce an accurate and context-rich answer for the user.

Embedding model in AI Search RAG

AI Search RAG uses the advanced search methods, such as semantic or vector search to find relevant and more context-oriented information from the configured indexed sources. The semantic search further uses embedding model to retrieve the most relevant data based on the user search query for embedding generation. This retrieved information along with the search query then prompts the LLM model to generate the relevant response.

An embedding model is the engine behind RAG that helps it to search and retrieve the correct information from the indexed sources and embed that information into vector map before sending it to the LLM model. ServiceNow AI Search RAG uses the default ServiceNow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Embedding (E5) model and it also supports additional third-party embedding models, such as Azure OpenAI Embedding and Gemini Text Embedding. You can also bring your own third-party hosted custom embedding model to create embeddings for your RAG use case.

Activating AI Search RAG (Retrieval-Augmented Generation)

AI Search RAG (Retrieval-Augmented Generation) functionality is provided by the AI Search RAG plugin (sn_ais_rag). This plugin is automatically activated for your instance when you install Generative AI Controller or any ServiceNow Otto® application.

Configuring your embedding model

Connect and configure your external or custom embedding model to enable it generate embeddings.

ServiceNow AI Search RAG application offers a Bring Your Own Model (BYOM) feature that you can use to create your own custom embedding model. It also supports third-party embedding models such as Azure OpenAI Embedding model and Gemini Text Embedding model for generating embeddings. You can use the default connection and credential aliases provided for the Azure OpenAI and Gemini embedding models. These aliases can be configured based on your requirements to authenticate and enable integration between your instance and the selected embedding model.

The end-to-end configuration for your preferred third-party embedding model includes:

- Setting up connection and credentials for third-party embedding model
- Activating the third-party embedding model

The end-to-end configuration for your custom embedding model includes using the BYOM capability. For more information see, Configuring bring your own model (BYOM).

Set up connection and credential alias for third-party embedding model

Set up connection and credential record for your aliases to authenticate an integration between your ServiceNow instance and third-party embedding model.

Before you begin

Role required: admin

About this task

The system provides the default connection and credential alias for Azure OpenAI Embedding model (text-embedding-3-large) and Gemini Text Embedding model (text-embedding-004). Set up these default aliases to manage the secure connection of your ServiceNow instance with either of the embedding model. A connection and credential alias includes the endpoint URL of the models and the login details, such as OAuth token or API keys to tell the system how to connect to these third-party models.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select an alias that you want to set up.
   - To set up the embedding model alias for Azure OpenAI Embedding, select **Azure OpenAI**.
   - To set up the embedding model alias for Google Gemini Text Embedding, select **Google Gemini API**.
3. Create a connection record for your alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
Update the existing connection record	**a.** In the Connections related list, select a connection from the connection alias list. ▪ Select **Azure OpenAI Connection** for the Azure OpenAI alias. ▪ Select **Google gemini API connection** for the Google gemini API alias. **b.** Update the **Name** and **Connection URL** fields based on your requirement. **c.** Select **Update**.
Create a new connection record	**a.** In the Connections related list, click **New**. **b.** On the form, fill in the fields. For a description of the field values, see **c.** Select **Submit**.

The connection record is created.

4. Create a credential record for your alias.

Option	Procedure
Update the existing credential record	**a.** In the Connections related list, select a connection record from the connection alias list. ▪ Select **Azure OpenAI Connection** for the Azure OpenAI alias. ▪ Select **Google gemini API connection** for the Google gemini API alias. **b.** In the Credentials field, select the Preview this record icon and then select **Open Record**. The API Key Credentials record opens. **c.** Update the **API Key** field. **d.** Select **Update**. **e.** Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
Create a new credential record	**a.** In the Connections related list, select a con nection record from the connection alias list. ▪ Select **Azure OpenAI Connection** for the Azure OpenAI alias. ▪ Select **Google gemini API connection** for the Google gemini API alias. **b.** In the Credentials field, select the search icon and then select **New**. **c.** From the list of credentials, select a creden tial type. ▪ To create a credential record for Azure OpenAI alias, select **API Key Creden tials**. ▪ To create a credential record for Google Gemini API alias, select **OAuth 2.0 Cre dentials**. **d.** On the form, fill in the fields. For a description of the field values, see [illegible] or OAuth 2.0 creden [illegible]. **e.** Select **Submit**. **f.** Select **Update**.

The credential record is created.

What to do next

Activate the embedding model to start using it. For more information, see Activate the third-party embedding model.

Activate the third-party embedding model

Activate your preferred embedding model so that your AI Search RAG application knows which model to use for generating embeddings.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** and then enter `ais_semantic_embedding_model.list` in the filter.
2. Select an embedding model from the list of AI Search Semantic Embedding Models.
   The selected AI Search Semantic Embedding Model page opens.
3. Select the **Active** option to turn on the embedding model.
4. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Select the **Validate** button to run a quick check if everything is setup correctly.

> **Note:** You must validate the embedding model if you make any changes to its configuration.

Result
The preferred embedding model ready to use in the AI Search RAG application.

What to do next
Add your embedding model to the semantic index configuration to enable content ingestion using that model. For more information, see Configure semantic indexing settings for an indexed source.

Configuring bring your own model (BYOM)

As an administrator, you can create your own custom embedding model to use in AI Search RAG application to generate embeddings for semantic indexing.

The end-to end configuration for onboarding a bring your own custom embedding model includes:

1. Create a connection and credential alias for the embedding model and complete its setup. For more information, see Create a connection and credential alias for a custom embedding model.
2. Configure a custom embedding model
3. Set a provider for embedding model
4. Connect your custom embedding model with Generative AI
5. Enable the custom embedding model for semantic indexing
6. Configure semantic indexing settings for an indexed source

Create a custom embedding model

Create your custom embedding model in the Generative AI Model Configuration table so that your AI Search RAG application can use it to generate embeddings for semantic indexing. This setup ensures the model is recognized and properly connected to send and receive requests.

Before you begin
You must create a connection and credential alias for your embedding model. For more information, see Create a Connection & Credential alias

Role required: admin

Procedure
1. Navigate to **All**, and then enter `sys_generative_ai_model_config.list` in the filter to go to the Generative AI Model Configuration [sys_generative_ai_model_config] table.
2. Select **New**.
3. On the form, fill in the fields.

Generative AI Model Configuration

Field	Description
Active	Option to activate the embedding model.
Model	A unique name for your embedding model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Domain	Domain you want to associate the model with. For example, AI Search RAG.
External	Option to make this model available for external use.
Connection and Credential Alias	Connection and credential alias that you created on your own for the custom embedding model.
Supported Language	Languages supported for this model. By default, the supported language is English.
Model Type	The type of model used for a specific purpose. For example Embedding Model.
Vector Dimension	The value shouldn't exceed 4096. This field appears only if you have selected `Embedding Model` in the **Model Type** field.
Application	Name of the application this model is configured for.
Provider	Name of the Generative AI provider mapping.
Max Tokens	Maximum limit to generate embeddings.

4. Select **Submit**.

Result
The new embedding model is created.

What to do next
Set a provider for an embedding model.

Set a provider for embedding model

Determine which AI provider to use for your embedding model to work in the AI Search RAG application.

Before you begin
Configure a connection and credential alias for your preferred provider. See Create a Connection & Credential alias.

Role required: admin

Procedure
1. Navigate to **All**, and then enter `sys_one_extend_capability.list` in the filter to go to the OneExtend Capabilities table.
2. Select the **Bring Your Own Embedding Model** capability to configure.
3. In the OneExtend Capability Definitions related list, select **New**.
4. In the **Name** field, enter the name of the capability definition.
5. In the **API type** field, select **system**.
6. In the **API** field, select the search icon to select the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Table name** field, select One API System Executor [one_api_system_executor].

b. In the **Document** field, select **Generic Embedder**.

c. Select **OK**.

7. In the Connection And Credential Alias, select the alias that you want to integrate with your custom embedding model.

8. Select the **Advanced** option.

9. Write pre-processing and post-processing scripts.
To have AI Search RAG application understand the format of the inputs and outputs of your embedding model, you must write pre-processing and post-processing scripts. These scripts depend on the expected request and response objects that are interpreted by your model.

For example, the Azure OpenAI request structure looks like the following script:

```
{"messages": [{"role":"user", "content":"Summarize the
 following text: <<content>>"}], "max_tokens": 800,
 "temperature": 0.7}
```

The preprocessor script for that request structure is the following script:

```
(function(inputs) {
    /* write code here to transform capability input to
 definition input.*/

 inputs = JSON.parse(inputs);

 return inputs;
})(inputs);
```

The response structure from Azure OpenAI looks like this script:

```
{
    "choices": [{
    "finish_reason": "stop",
    "index": 0,
    "message": {
        "content": "<<response>>",
        "role": "assistant"
        }
    }],
    "created": 1714994995,
    "id": "chatcmpl-9LqpXeLVXDAi6kciPfLeIDjmALeea",
    "model": "gpt-35-turbo-16k",
    "object": "chat.completion",
    "usage": {
        "completion_tokens": 47,
        "prompt_tokens": 70,
        "total_tokens": 117
    }
}
```

Because of that response structure, the response postprocessor script looks like this script:

```
(function(inputs) {
    /* write code here to transform definition output to
 capability output.*/ to transform the llm response into an
 array of text responses, using the inputs object
    inputs structure: {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        inputs = JSON.parse(inputs);

 return inputs;

})(inputs);
```

10. Select **Submit**.

Connect your custom embedding model with Generative AI

Integrate a capability definition with your custom embedding model.

Before you begin

Role required: admin

Procedure

1. Navigate to **All**, and then enter `sys_generative_ai_config.list` in the filter to go to the Generative AI Configurations [sys_generative_ai_config] table.
2. Select **New**.
3. Verify that **Definition Table** field is prepopulated with sys_one_extend_capability_definition.
4. In the **Definition** field, select the search icon to select the definition document.
   a. In the **Table name** field, select One API System Executor [one_api_system_executor].
   b. In the **Document** field, select the OneExtend capability definition that you want to integrate with the embedding model.
   c. Select **OK**.
5. In the **Model** field, select an embedding model of your choice.
6. Select the **Active** option.
7. Populate the **Additional Configurations** field.
   - In the **Name** field, enter `resource_path`.
   - In the **Value** field, enter the end point path of the connection alias URL, the one you created for your embedding model. For example, deployments/text-embedding-3-large/embeddings?api-version=2023-05-15.
8. Select **Submit**.

Create error handler extension point

Create a scripted extension point to handle embedding generation errors that occur when custom embedding models generate semantic vectors. Using extension point enables you to create a primary ticket type as per the extension point definition.

Before you begin

Role required: admin

About this task

The `BYOMEmbeddingGenerationErrorHandler` script enables you to control retry logic, batch failure handling, and passage modification during embedding generation. These flexible strategies improve the robustness of large-scale semantic indexing pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. In the **API Name** field, search and select the **BYOMEmbeddingGenerationErrorHandler** extension point.
3. From Related Links, select **Create implementation**.
4. On the Script Include form, update the script as required.

   a. To handle the embedding generation errors by a custom embedding model, defines a process(inputParams) method in the extension point script. This method must return a structured response based on predefined error categories:

```
var BYOMEmbeddingGenerationErrorHandler = Class.create();
BYOMEmbeddingGenerationErrorHandler.prototype = {
    initialize: function() {},

    process: function(inputParams) {
        var responseStatus = inputParams.responseStatus;
        var responseErrorCode =
 parseInt(inputParams.responseErrorCode);
        var responseBody = inputParams.responseBody;
        var responseHeaders = inputParams.responseHeaders;
        var responseErrorMessage =
 inputParams.responseErrorMessage;
        var passages = inputParams.passages;
        var maxTokens = inputParams.maxTokens;
        var additionalParams = {};

        var response = BYOMEmbeddingUtil.buildErrorResponse(
            BYOMEmbeddingUtil.ErrorCodeEnum.UNKNOWN_ERROR,
            "unknown error",
            additionalParams
        );
```

   b. To categorize errors, use the following `BYOMEmbeddingUtil.ErrorCodeEnum` codes:

```
BYOMEmbeddingUtil.ErrorCodeEnum = {
    REQUEST_SIZE_TOO_LARGE_ERROR: "RequestSizeTooLargeError",
        // Reduce batch size and retry
    RATE_LIMIT_ERROR: "RateLimitError",
        // Retry without reducing batch size
    PASSAGE_SIZE_TOO_LARGE_ERROR: "PassageSizeTooLargeError",
        // Retry with reduced passage size
    UNKNOWN_ERROR: "UnknowError",
         // Ignore this run; retry in next job
    SKIP_BATCH_ERROR: "SkipBatchError",
        // Skip the entire batch, no retry
    UPDATE_PASSAGE_CONTENT_ERROR:
 "UpdatePassageContentError",       // Retry with updated
 passage content
    RETRY_SKIP_ON_FAIL_ERROR: "RetrySkipOnFailError"
        // Retry with backoff; skip on failure
};
```

   c. Allowed Fields for `buildErrorResponse` includes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var allowedFieldsByErrorCode = {
    REQUEST_SIZE_TOO_LARGE_ERROR: ['error_code',
 'error_message'],
    RATE_LIMIT_ERROR: ['error_code', 'error_message',
 'retry_after_seconds'],
    PASSAGE_SIZE_TOO_LARGE_ERROR: ['error_code',
 'error_message', 'passages'],
    UNKNOWN_ERROR: ['error_code', 'error_message'],
    SKIP_BATCH_ERROR: ['error_code', 'error_message'],
    UPDATE_PASSAGE_CONTENT_ERROR: ['error_code',
 'error_message', 'passages'],
    RETRY_SKIP_ON_FAIL_ERROR: ['error_code', 'error_message']
};
```

d. Retry Behavior by Error Code includes:

Error Code	Description	Retry Strategy
REQUEST_SIZE_TOO_LARGE_ERROR	Batch too large	Reduces batch size, retries exponentially.
RATE_LIMIT_ERROR	Rate limit reached	Waits for `retry_after_seconds`, then retries.
PASSAGE_SIZE_TOO_LARGE_ERROR	Passage too large	Reduces passage length (usually half), then retries.
UNKNOWN_ERROR	Unknown issue	Skips retry this run, automatically retried in the next scheduled job.
SKIP_BATCH_ERROR	Irrecoverable issue with batch	Skips entire batch without retry.
UPDATE_PASSAGE_CONTENT_ERROR	Retry with corrected content	Uses corrected passages from response and retries.
RETRY_SKIP_ON_FAIL_ERROR	Retry then skip	Retries with exponential back off, marks as failed after max retries.

5. Select **Update**.

Enable the custom embedding model for semantic indexing

Add your newly created embedding model in the semantic indexing table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All**, and then enter `ais_symantic_embedding_model.list` in the filter to go to the AI Search Semantic Embedding Models [sys_generative_ai_config] table.
2. Select **New**.
3. In the **Name** field, enter a unique name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Model Id field, enter a unique id.
5. In the **One Extend Capability Definition** field, select a BYOM capability definition you created to set a provider for embedding model.
6. In the **Model Config** field, select a configured embedding model.
7. Select the **Active** option.
8. Select the **Batching Supported** option if you want to configure batching for your embedding model.
9. In the **Minimum Batch Size** and **Maximum Batch Size** fields, enter the required values.
10. In the **Error Handler Extension Instance** field, select an error handler instance.
    For more information, see Create error handler extension point.
11. Select **Submit**.

What to do next

Add your embedding model to the semantic index configuration to enable content ingestion using that model. For more information, see Configure semantic indexing settings for an indexed source.

Exclude knowledge block content from the AI Search index

Prevent AI Search from indexing content found in your knowledge blocks.

Before you begin

Role required: admin

About this task

AI Search includes content specified in your published knowledge blocks when it indexes content and metadata from your knowledge articles.

Administrators can override this default behavior and exclude your knowledge block content from the search index by setting the value of the *glide.ais.disable_kbb* system property. If this system property's value is set to **true**, AI Search ignores knowledge block content when indexing content and metadata from your knowledge articles.

To learn more about creating and publishing knowledge blocks for reference in your knowledge articles, see Using knowledge blocks.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search for a system property record with name *glide.ais.disable_kbb*.
   - If a system property record with this name exists, open the record by selecting it.
   - If no system property record with this name exists, select **New**, then enter `glide.ais.disable_kbb` in the System Property form's **Name** field.
3. In the System Property form's **Value** field, enter *true*.
4. Save the modified System Property record by selecting **Submit** or **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
To make the new setting take effect, reindex the Knowledge Table indexed source. For details on reindexing, see Perform a full table index or reindex for a single AI Search indexed source.

Activate indexing of catalog variable content on Catalog Item records

Activate indexing of searchable content from variables on Catalog Item records. Configure the set of Catalog Items eligible for catalog variable indexing and the set of variables to index.

Before you begin
Role required: admin

About this task
AI Search supports indexing of searchable content from variables on records in the Catalog Item [sc_cat_item] table and tables that extend it. By default, this functionality is not active. Administrators can activate indexing of catalog variable content and configure the set of Catalog Items and catalog variables to index content from.

For details on the catalog variable types that AI Search can index content from, see Variable types supported by AI Search indexing.

Procedure
1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Activate indexing of searchable content from catalog variables that are accessible to all users.
   a. Locate and open the *glide.ais.ingestion.index_catalog_variables* system property record.
   If this system property record doesn't exist, select **New**, then enter *glide.ais.ingestion.index_catalog_variables* as the new record's name and select *true | false* as its type.
   b. Set the record's value to *true*.
   c. Select **Update**.
   If you created a new system property record, select **Submit** instead.

   AI Search indexes content from catalog variables that don't require any role to read.
3. **Optional:** Activate indexing of searchable content from catalog variables that require specific roles for read access.

   Note: This step has no effect if *glide.ais.ingestion.index_catalog_variables* is set to *false*.

   a. Open the *glide.ais.ingestion.ignore_catalog_variables_read_roles* system property record.
   If this system property record doesn't exist, select **New**, then enter *glide.ais.ingestion.ignore_catalog_variables_read_roles* as the new record's name and select *true | false* as its type.
   b. Set the record's value to *true*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Update**.
If you created a new system property record, select **Submit** instead.

AI Search indexes content from catalog variables that are only readable by users with specific roles.

4. **Optional:** Filter the set of Catalog Item records from which AI Search indexes catalog variables.

Note: This step has no effect if *glide.ais.ingestion.index_catalog_variables* is set to *false*.

a. Open the *glide.ais.ingestion.catalog_variables_filter_query* system property record.
If this system property record doesn't exist, select **New**, then enter *glide.ais.ingestion.catalog_variables_filter_query* as the new record's name and select *string* as its type.

b. In the **Value** field, enter an encoded query string to restrict the set of Catalog Item records that AI Search indexes catalog variables from.
As an example, enter *active=true* if you only want AI Search to index catalog variables from active Catalog Item records. For details on creating encoded query strings, see Encoded query strings.

c. Select **Update**.
If you created a new system property record, select **Submit** instead.

What to do next

After changing the values of these system properties, reindex content from the Catalog Item Table indexed source and any indexed sources for tables that extend the Catalog Item [sc_cat_item] table. For details on reindexing content from indexed sources, see Perform a full table index or reindex for a single AI Search indexed source and Perform a full table index or reindex for multiple AI Search indexed sources.

Indexed source attributes for AI Search

An indexed source attribute defines indexing behavior for all records from an indexed source.

Examples of how you might use indexed source attributes include the following.

- Define a filter to limit the set of records indexed from the source table
- Modify default indexing behavior for attachments or tags found on source table records
- Specify whether to index translated fields from source table records

An indexed source's attributes appear in its Advanced Configuration related list.

Create an indexed source attribute in AI Search

Define an indexed source attribute to configure the AI Search content indexing behavior for all records on a source table.

Before you begin

Role required: ais_admin

About this task

For details on available indexed source attributes and values, see List of AI Search indexed source attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source that you want to define an attribute for.
3. In the Advanced Configuration related list, select **New**.
4. On the Indexed Source Attribute form, fill in the fields.
   For a description of the field values, see Indexed Source Attribute form.
5. Select **Submit**.

Result
The new indexed source attribute appears in the Advanced Configuration related list.

What to do next
To make the new indexed source attribute take effect, perform a full table reindex for the indexed source. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source.

Enable indexing of tags for an AI Search indexed source

Configure an indexed source attribute to enable indexing of content from tags found on records from an indexed source.

Before you begin
Role required: ais_admin

About this task
By default, AI Search indexing ignores tags from source records. You can enable indexing of tags for all records from an indexed source. Choose whether to index all shared and globally visible tags or only globally visible tags. Private tags are not indexed.

For more general instructions on defining indexed source attributes, see Create an indexed source attribute in AI Search.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source that you want to enable tag indexing for.
3. In the Advanced Configuration related list, select **New**.
4. On the Indexed Source Attribute form, fill in the fields.
   a. In the **Attribute** field, enter `index_tags`.
   b. In the **Value** field, enter one of the following options:

Option	Description
everyone_only	Only tags shared with everyone are indexed.
all_shared	All shared tags (**Everyone**, **Groups and Users**) are indexed.

   For a description of the field values, see Indexed Source Attribute form.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The new *index_tags* indexed source attribute appears in the Advanced Configuration related list.

What to do next
To make the new *index_tags* attribute take effect, perform a full table reindex for the indexed source. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source.

Enable indexing of attachments for an AI Search indexed source

Configure an indexed source attribute to enable indexing of content from attachments found on records from an indexed source.

Before you begin
Role required: ais_admin

About this task
By default, AI Search indexes searchable content and metadata (such as file size and date) for attachments found on source table records. Indexing supports the following attachment file formats:

- Active Server Page Extended (`.aspx`)
- Email Message (`.eml`, `.msg`)
- Extensible Markup Language (`.xml`)
- Hypertext Markup Language (`.html`, `.htm`)
- Microsoft Excel (`.xls`, `.xlsx`)
- Microsoft PowerPoint (`.pot`, `.potx`, `.ppt`, `.pptm`, `.pptx`)
- Microsoft Word (`.doc`, `.docx`, `.dot`, `.dotx`)
- Plain Text (`.txt`)
- Portable Document Format (`.pdf`) with searchable text

Note: The maximum file size for binary files is 25 MB. Keyword indexing processes up to the first 1MB of text. Use semantic search to index data containing between 1MB and 25 MB of text.

AI Search provides limited support for encrypted record attachments:

- When indexing an encrypted attachment, AI Search extracts metadata such as the attachment file's size and date, but it doesn't extract searchable content.
- The encrypted attachment's MIME type is detected as `application/octet-stream`.
- No feedback for the encrypted attachment appears in ingestion log messages.

Attachment indexing is controlled by an indexed source's *index_attachments* attribute:

- true (default value): Attachments are indexed for records from the indexed source.
- false: Attachments aren't indexed for records from the indexed source.

The following procedure explains how to make sure this attribute is set to **true** for an indexed source. For more general instructions on defining indexed source attributes, see Create an indexed source attribute in AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source that you want to verify or change attachment indexing for.
3. In the Advanced Configuration related list, check for an *index_attachments* attribute with value *false*.

   Note: If no *index_attachments* attribute exists in the related list, or the attribute exists with value *true*, attachment indexing is already enabled for the indexed source. No further steps are required.

4. Open the *index_attachments* attribute and change its value from *false* to *true*.

Result
Attachment indexing is enabled for the indexed source.

What to do next
If you changed the *index_attachments* attribute's value from *false* to *true*, reindex content for the indexed source. For details on reindexing, see Perform a full table index or reindex for a single AI Search indexed source.

Activate multimodal captioning for attachments from an indexed source

Generate descriptive captions for images, tables, charts, and other visual elements in attachments from records in an indexed source table. You can find these attachments by searching for terms from their generated captions.

Before you begin
An administrator must have activated the Platform Multimodal Service plugin on your instance. For details on this procedure, see Activate the Platform Multimodal Service plugin.

Note: An AI Search administrator can select the VLM (visual learning model) provider and model used by the Platform Multimodal Service. For details on this process, see Configure multimodal captioning for AI Search.

Role required: ais_admin

About this task
By default, when indexing attachments for search, AI Search includes the attachment's text but ignores its images. For tables, charts, and other visual elements, indexing extracts text but doesn't necessarily preserve the context of that text.

To improve search recall, you can configure the Platform Multimodal Service to automatically generate descriptive captions for images, tables, charts, and other visual elements in attachments found on records from an indexed source table. With the service activated, you can find indexed source content attachments with these entity types by searching for terms that match the generated captions.

As an example, an attachment might include an image that yields the generated caption `woman in office`. Searches for `woman` or `office` can match the caption terms. Such searches return the attachment as a search result even if its text doesn't otherwise contain either of those terms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Multimodal captioning is only supported for Knowledge [kb_knowledge] table records from the Knowledge Table indexed source and for content retrieved by external content connectors.

The multimodal captioning feature has been validated and tested for English-language content. For content in other languages, it may function but hasn't been evaluated for caption quality or accuracy. Multimodal captioning for non-English content is not currently supported.

Multimodal captioning runs as a separate process after text indexing is completed for the attachment in question. Records with attachments that contain images, tables, charts, and other visual elements won't show generated captions until multimodal captioning completes.

Note: Activating multimodal captioning for attachments found in an indexed source has no effect if the *index_attachments* attribute is set to *false* for that indexed source. Make sure this attribute is set to *true* if you want to index attachments and generate captions for their content.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source that you want to activate multimodal captioning for.

   Note: Multimodal captioning is currently only supported for the Knowledge Table indexed source that indexes records on the Knowledge [kb_knowledge] table.

3. In the Advanced Configuration related list, check for an existing *index_mms_attachments* attribute.
   - If an *index_mms_attachments* attribute already exists with value *false*, change its value to *true*. No further steps are needed.
   - If an *index_mms_attachments* attribute exists with value *true*, multimodal captioning is already enabled for the indexed source. No further steps are needed.
   - If no *index_mms_attachments* attribute exists, continue with the following steps.
4. In the Advanced Configuration related list, select **New**.
5. On the Indexed Source Attribute form, fill in the following fields.

Field	Value
Attribute	index_mms_attachments
Value	true

6. Select **Submit**.

Result

The new *index_mms_attachments* indexed source attribute appears in the Advanced Configuration related list.

What to do next

To make the new indexed source attribute take effect, perform a full table reindex for the indexed source. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of AI Search indexed source attributes

You can adjust indexing behavior for an AI Search indexed source by configuring indexed source attributes and values.

For instructions on defining AI Search indexed source attributes, see Create an indexed source attribute in AI Search.

Attribute	Description
filter	Specify a filter condition that applies on the indexed source table and all of its child tables configured for indexing. Indexing ignores source records that don't pass this filter condition. If you change the value of this attribute for an indexed source, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
index_attachments	Control indexing behavior for attachments from indexed records. Supported values: • *true*: Enable indexing of attachments for records on this table. • *false*: Disable indexing of attachments for records on this table. Default value: *true* If you change the value of this attribute for an indexed source, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
index_mms_attachments	Control multimodal generation of searchable descriptive captions for images, tables, charts, and other visual elements found in attachments on records from this table. To learn more about multimodal caption generation, see Activate multimodal captioning for attachments from an indexed source. Supported values: • *true*: Activate multimodal captioning for attachments on records from this table. • *false*: Deactivate multimodal captioning for attachments on records from this table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
	Default value: *true* This attribute has no effect if *index_attachments* is set to *false* for the indexed source. If you change the value of this attribute for an indexed source, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
index_tags	Control indexing behavior for tags from indexed records. Supported values: • *all_shared*: Index shared tags and globally visible tags. • *everyone_only*: Only index globally visible tags. • *none*: Disable indexing of tags. Default value: *none* **Note:** Search results display indexed tags based on the visibility of the result record instead of the visibility of the tag. If you change the value of this attribute for an indexed source, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
index_translated_fields	Control indexing behavior for translated fields from indexed records. Supported values: • *true*: Enable indexing of translated fields for this table. • *false*: Disable indexing of translated fields for this table. Default value: *false* **Note:** For tables with manually mapped records, such as kb_knowledge, indexing ignores this attribute and honors the manual mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
	If you change the value of this attribute for an indexed source, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
index_translated_reference_fields	Control indexing behavior for translated reference fields from indexed records. Supported values: • *true*: Enable indexing of translated reference fields for this table. • *false*: Disable indexing of translated reference fields for this table. Default value: *true* If you change the value of this attribute for an indexed source, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
user_read_takes_precedence_over_group_deny	Control precedence of external user read access permissions and external group deny access permissions for external document search results from the indexed source. Supported values: • *true*: External user read access permissions take precedence over external group deny access permissions for external document search results from the indexed source. • *false*: External group deny access permissions take precedence over external user read access permissions for external document search results from the indexed source. Default value: *true* on indexed sources for external content schema tables. Not set on indexed sources for internal tables. **Note:** This attribute only applies to indexed sources for external content schema tables. If you apply this attribute to an indexed source for an internal table, it has no effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Indexed source attributes are records on the AI Search Configuration Attribute [ais_configuration_attribute] table that have Table as their **Applies To** field value. Records on this table that have Column as their **Applies To** field value are Field settings for AI Search.

Field settings for AI Search

A field setting controls indexing behavior for a specified field (column) on all records from an indexed source.

Examples of how you might use field settings include the following.

- Disable text indexing or searchability for a field found on source table records
- Modify default mappings between source table fields and fields in the AI Search index
- Add a referenced table field to the index by dot-walking from a reference field on source table records

An indexed source's field settings appear in its Field Settings & Mapping related list.

Create a field setting for an AI Search indexed source

Define an indexed source field setting to configure AI Search content indexing behavior for a specific field on source table records.

Before you begin
Role required: ais_admin

About this task
For details on available field settings and values, see List of AI Search indexed source field settings.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source that you want to define a field setting for.
3. In the Field Settings & Mapping related list, select **New**.
4. On the Field Setting form, fill in the fields.
5. Select **Submit**.

Result
The new field setting appears in the Field Settings & Mapping related list.

What to do next
To make the new field setting take effect, perform a full table reindex for the indexed source. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source.

Enable indexing of referenced table fields for an AI Search indexed source

Configure an indexed source to index field values from tables referenced by fields in the source table. You can index these field values for use in filters and EVAM search result configurations, index them for search, or both.

Before you begin
You must have an indexed source configured for the source table. For details on creating an indexed source for a table, see Create an indexed source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: ais_admin

About this task

When an indexed source table includes a reference field, AI Search defaults to indexing values for the reference field but not for other fields on the table that it references. To index values from these referenced table fields, you can create *dot_walk_fields* and *searchable_dot_walk_fields* field settings on your indexed source table.

- To use field values from referenced tables in search source filters, facet filters, and EVAM search result configurations, create a *dot_walk_fields* field setting.
- To make field values from referenced tables searchable, create a *searchable_dot_walk_fields* field setting.

As the value for either of these field settings, list the names of the referenced table fields you want to index, separated by commas. For example, to index the **name** and **city** fields from the table referenced by the **company** field on the indexed source table, select the **company** field and enter value `name,city`.

To dot-walk across multiple tables, you can enter field name values with dot-separated reference field prefixes. For example, enter value `company.contact.name` to index the **name** field in the table referenced by the **contact** field on the table referenced by the indexed source table's **company** reference field.

Note: Each dot-walk reference level imposes a performance impact on indexing. Avoid using multi-level references unless necessary.

You can create both *dot_walk_fields* and *searchable_dot_walk_fields* field settings for the same reference field.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. In the Field Settings & Mapping related list, select **New**.
3. On the Field Setting form, enter the field values shown for your use-case.
   - To index field values from referenced tables for use in search source filters, facet filters, and EVAM search result configurations, enter the following field values.

Field	Value
Attribute	dot_walk_fields
Field	<name of indexed source table reference field that you want to use to dot-walk to another table>
Value	<comma-separated list of names for fields that you want to index from the referenced table>

   - To index field values from referenced tables as searchable text, enter the following field values.

Field	Value
Attribute	searchable_dot_walk_fields

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Field	<name of indexed source table reference field that you want to use to dot-walk to another table>
Value	<comma-separated list of names for fields that you want to index from the referenced table>

Note: If the *dot_walk_fields* and *searchable_dot_walk_fields* attributes don't appear in the **Attribute** selection list, ensure that your **Field** selection is a reference field.

4. Select **Submit**.
   The attribute and value appear in the Field Settings & Mapping related list.

List of AI Search indexed source field settings

You can adjust indexing behavior for source record fields in an AI Search indexed source by configuring field setting attributes and values.

For more information on creating field settings, see Create a field setting for an AI Search indexed source.

Attribute	Description
dot_walk_fields	Index reference and display values from fields on the selected reference field's source table for use in search source filters, facet filters, and EVAM search result configurations. AI Search automatically updates the indexed field values to reflect changes made to the referenced table's field values. For more information about search source filters, see Search sources in AI Search. For details on facet filters, see Create a facet in an AI Search application configuration. • Field: Name of the reference field on your indexed source table. As an example, if your indexed source table contains a **company** reference field that references the Company [core_company] table, and you want to index field values from that table's **name** and **city** fields, you'd set `company` as the field. • Type: string • Value: Comma-separated list of referenced table fields to index values from. As an example, if your indexed source table contains a **company** reference field that references the Company [core_company] table, and you want to index field values from that table's **name** and **city** fields, you'd set `name,city` as the value. **Note:** You can't search field values indexed with this field setting. To index field values from referenced tables for search, create a *searchable_dot_walk_fields* field setting. You can create both *dot_walk_fields* and *searchable_dot_walk_fields* field settings for the same reference field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
	If you change the value of this setting for an indexed source's field, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
index_calculated_field	Option to enable indexing of searchable content from calculated field values. If your indexed source contains a calculated field, set this field setting to *true* for that field to correctly index its values. With a field setting value of *false* or no value, AI Search ignores values from the calculated field when indexing content. • Field: Name of a calculated field from the indexed source table. (If you specify a non-calculated field, the system rejects the field setting submission and displays a warning message.) • Type: true | false • Supported values: ○ *true*: Apply special handling to correctly index calculated field values from the selected field. ○ *false*: Don't apply special handling when indexing field values from the selected field. Calculated field values aren't indexed. If you change the value of this setting for an indexed source's field, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
map_to	Map the selected field from the indexed source table to an AI Search index field. When indexing records from the source table, AI Search populates the specified index field with the value of the selected source field. For example, the base system's Knowledge Table indexed source maps the **kb_knowledge.short_description** source field to the **title** index field. When AI Search indexes a record from the Knowledge [kb_knowledge] table, it populates the indexed record's searchable title with the value from the source record's **short_description** field. • Field: Name of a field from the indexed source table. • Type: string • Value: Name of the AI Search field that you want to map the selected field's display values to. For details on AI Search index fields, see AI Search index fields. **Note:** You can only define one **map_to** field setting for an indexed source field. If you try to define multiple **map_to** settings for the same field, the system displays an error message. If you change the value of this setting for an indexed source's field, the change doesn't take effect until you reindex content

© 2026 ServiceNow, Inc. All rights reserved.

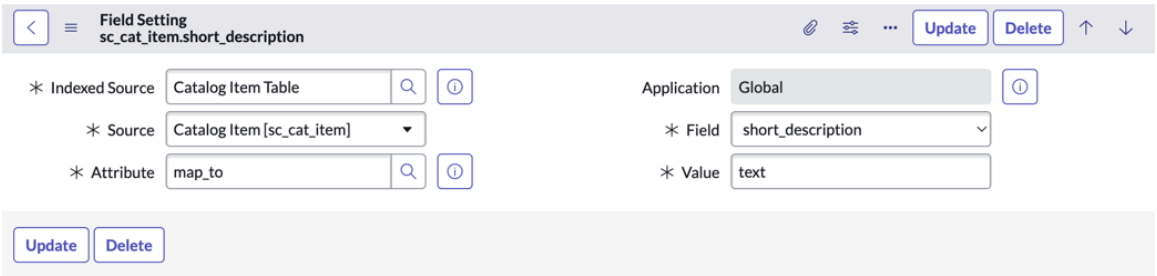
Attribute	Description
	from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
no_text_index	Option to disable indexing of searchable content from the selected field on records from the indexed source. • Field: Name of a field from the indexed source table. • Type: true | false • Supported values: ○ *true*: Disable searchable content indexing for the selected field. Search and filters can't match the field's value. AI Search doesn't generate an index event when the field is updated. ○ *false*: Enable searchable content indexing for the selected field. Search and filters can match the field's value. AI Search generates an index event when the field is updated, adding the affected record to its indexing queue. • Default value: *false* If you change the value of this setting for an indexed source's field, the new value immediately affects index event generation for updates to that field, but it doesn't affect searches or filters for previously indexed records until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source. ⚠ **Warning:** Don't set this option to *true* for the sys_updated_on field on the Task [task] table, tables that extend Task, or any other tables that you've configured retention policies for. The retention policies for these tables rely on indexing of sys_updated_on field values. For more information on retention policies, see Indexed source retention policies and filter conditions. For Customer Service and Support guidelines on setting the **no_text_index** option for different field types, see KB0859922 on the Now Support site.
not_searchable	Option to disable search matching for content indexed from the selected field. • Field: Name of a field from the indexed source table. • Type: true | false • Supported values: ○ *true*: Disable search matching for content indexed from the selected field. Search can't match the field's value. Filters (such as those for content security, source facet buckets, and facets) can still match the field's value. ○ *false*: Enable search matching for content indexed from the selected field. Search and filters can match the field's value. • Default value: *false*



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute	Description
	If you change the value of this setting for an indexed source's field, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.
searchable_dot_walk_fields	Index reference and display values from fields on the selected reference field's source table as searchable text. AI Search doesn't automatically update the indexed field values to reflect changes made to the referenced table's field values. To update the indexed field values, you must reindex the indexed source. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source. • Field: Name of the reference field on your indexed source table. As an example, if your indexed source table contains a **company** reference field that references the Company [core_company] table, and you want to index searchable text from that table's **name** and **city** fields, you'd set `company` as the field. • Type: string • Value: Comma-separated list of referenced table fields to index as searchable content. As an example, if your indexed source table contains a **company** reference field that references the Company [core_company] table, and you want to index searchable text from that table's **name** and **city** fields, you'd set `name,city` as the value. **Note:** You can't use field values indexed with this field setting in search source filters. To index field values from referenced tables for use in search source filters, create a *dot_walk_fields* field setting. You can create both *dot_walk_fields* and *searchable_dot_walk_fields* field settings for the same reference field. If you change the value of this setting for an indexed source's field, the change doesn't take effect until you reindex content from the indexed source. For reindexing steps, see Perform a full table index or reindex for a single AI Search indexed source.

Note: Field settings are records on the AI Search Configuration Attribute [ais_configuration_attribute] table that have Column as their **Applies To** field value. Records on this table that have Table as their **Applies To** field value are Indexed source attributes for AI Search.

This example shows how the base system's Catalog Item Table indexed source maps **short_description** field values from the Catalog Item [sc_cat_item] table to the AI Search index's **text** field for indexed records.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security for searchable referenced table field values in AI Search

When a user searches referenced table field values that you have indexed for search with the *searchable_dot_walk_fields* field setting, only field values that the user can view appear in the search results. The system uses a field value's role-based access control list rules (ACLs) to determine whether the search user can view that field value.

Searchable referenced table field values that have condition-based or script-based ACLs or user criteria don't appear in search results.

For searchable field values indexed through multiple dot-walk reference levels, the system only considers role-based ACLs on the final field value. As an example, if you index `company.contact.name` referenced table field values for search, user access to **name** field values isn't affected by role-based ACLs on **contact** field values.

To bypass all ACLs and allow users to search for all searchable referenced table field values, you can set the *glide.ais.query.allow_indexlookup_for_dotwalk* system property to true. This bypasses ACL evaluation for field values indexed via the *dot_walk_fields* and *searchable_dot_walk_fields* field settings.

For more details on ACL types and configuration, see Access control list rules.

Indexing content from AI Search indexed sources

AI Search indexes records on indexed source tables to make their content searchable.

After you define an indexed source, AI Search begins automatically indexing to reflect changes to records in the selected source table and its specified child tables. The results of all record create, update, and delete operations in these tables are reflected in the search index. AI Search doesn't index content from unmodified records in these tables until you perform a full table index.

Indexing content from referenced tables

When an indexed source table includes a reference field that stores a reference to another table, AI Search defaults to indexing values for the reference field but not for other fields on the referenced table. For example, the User [sys_user] table includes a **company** reference field that stores a reference to the Company [core_company] table. When indexing records from the User table, AI Search indexes values for the **company** reference field, but doesn't index values for other Company table fields such as **city** or **website**.

To index additional fields from referenced tables, you can configure *dot_walk_fields* and *searchable_dot_walk_fields* field settings for reference fields on your indexed source table.

- To use field values from referenced tables in search source filters, facet filters, and EVAM search result configurations, create a *dot_walk_fields* field setting.
- To make field values from referenced tables searchable, create a *searchable_dot_walk_fields* field setting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create both *dot_walk_fields* and *searchable_dot_walk_fields* field settings for the same reference field.

For instructions on configuring *dot_walk_fields* and *searchable_dot_walk_fields* field settings, see Enable indexing of referenced table fields for an AI Search indexed source. For more information on field settings, see Field settings for AI Search. To learn about search source filters, see Search sources in AI Search. For details on facet filters, see Create a facet in an AI Search application configuration. To understand EVAM configurations, see Entity View Action Mapping.

Indexing content from source record attachments

By default, AI Search indexes searchable content and metadata (such as file size and date) for attachments found on source table records. Indexing supports the following attachment file formats:

- Active Server Page Extended (`.aspx`)
- Email Message (`.eml`, `.msg`)
- Extensible Markup Language (`.xml`)
- Hypertext Markup Language (`.html`, `.htm`)
- Microsoft Excel (`.xls`, `.xlsx`)
- Microsoft PowerPoint (`.pot`, `.potx`, `.ppt`, `.pptm`, `.pptx`)
- Microsoft Word (`.doc`, `.docx`, `.dot`, `.dotx`)
- Plain Text (`.txt`)
- Portable Document Format (`.pdf`) with searchable text

Note: The maximum file size for binary files is 25 MB. Keyword indexing processes up to the first 1MB of text. Use semantic search to index data containing between 1MB and 25 MB of text.

AI Search provides limited support for encrypted record attachments:

- When indexing an encrypted attachment, AI Search extracts metadata such as file size and date, but doesn't extract searchable content.
- The encrypted attachment's MIME type is detected as `application/octet-stream`.
- No feedback for the encrypted attachment appears in ingestion log messages.

Attachment indexing is controlled by an indexed source's *index_attachments* attribute. To verify that attachment indexing is enabled for an indexed source, see Enable indexing of attachments for an AI Search indexed source.

Indexing content from source record tags

AI Search can index tags found on source table records. Search results display indexed tags based on the visibility of the result record instead of the visibility of the tag.

By default, indexing ignores tags from source records. You can enable indexing of tags for each indexed source. Choose whether to index all shared and globally visible tags or just globally visible tags.

For details on enabling tag indexing for an indexed source, see Enable indexing of tags for an AI Search indexed source.

Indexing content from the Task table and its child tables

When defining an indexed source that indexes records from the Task table or any of its child tables, you must specify a retention policy. For details on retention policies, see Indexed source retention policies and filter conditions.

Reindexing content

You must perform a full table reindex for an indexed source under the following circumstances:

- After you add, modify, or delete an indexed source attribute or a field setting for the indexed source.
- To update indexed values for fields on tables referenced by source table records. As an example, the **company** field on the User [sys_user] table stores a reference to the Company [core_company] table. If you configure indexing for values for fields on the referenced Company table, such as **city** or **website**, you must reindex the User table to update those indexed Company table field values. For details on configuring indexing of referenced table fields, see Enable indexing of referenced table fields for an AI Search indexed source.

Perform a full table index or reindex for a single AI Search indexed source

Make content from an internal indexed source searchable by performing a full table index. This procedure indexes existing records from the source table and any child tables configured for indexing. You can manually reindex content from an internal indexed source by repeating this procedure.

Before you begin

Your indexed source must be active and internal (referring to a ServiceNow AI Platform® table). To index content from an indexed source for external documents, see Indexing and searching external content in AI Search.

Role required: ais_admin

About this task

After you define an indexed source, AI Search begins automatically indexing to reflect changes to records in the selected source table and its specified child tables. The results of all record create, update, and delete operations in these tables are reflected in the search index. AI Search doesn't index content from unmodified records in these tables until you perform a full table index.

Use this procedure to index searchable content from existing records in an indexed source, or to manually reindex existing content for an indexed source that has already been indexed.

If an indexed source contains unindexed records, the Indexed Sources list displays an informational message and marks the new source with an alert triangle icon ⚠. A similar informational message appears on the Indexed Source form. Make sure to perform a full table index for each indexed source that displays the alert triangle icon.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source with content that you want to make searchable.
3. Select **Index All Tables**.
   The Generate Text Index dialog box appears.
4. **Optional:** If you want AI Search to allow indexing of updates to individual records in the source table while the table indexing event is running, select the **Non blocking index** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: With this option deselected, AI Search defers indexing of updates to individual records in the source table until after the table indexing event finishes. The index may not reflect the latest contents for updated records until the deferred record indexing events finish.

5. Select **OK**.
   The Indexed Source History page appears. A message reports that AI Search has queued an indexing task for the indexed source.
6. **Optional:** To monitor the progress of the indexing task, refresh the Indexed Source History form page.
   When the task completes, the **Ingestion State** field shows *indexed*.
7. To return to the list of indexed sources, select the back icon .

Result

AI Search indexes content from existing records in the indexed source. Indexing continues on a scheduled basis. You don't need to repeat this task for the indexed source unless you want to reindex its content before the next scheduled indexing run.

What to do next

Define search sources to make searchable content from the indexed source available in user search experiences. For details on creating search sources, see Create a search source for AI Search.

Perform a full table index or reindex for multiple AI Search indexed sources

Make content from multiple internal indexed sources searchable by performing a full table index. This procedure indexes existing records from the source tables and any child tables configured for indexing. You can manually reindex content from internal indexed sources by repeating this procedure.

Before you begin

Your indexed sources must be active and internal (referring to ServiceNow AI Platform® tables). To index content from indexed sources for external documents, see Indexing and searching external content in AI Search.

Role required: ais_admin

About this task

After you define an indexed source, AI Search begins automatically indexing to reflect changes to records in the selected source table and its specified child tables. The results of all record create, update, and delete operations in these tables are reflected in the search index. AI Search doesn't index content from unmodified records in these tables until you perform a full table index.

Use this procedure to index searchable content from existing records in indexed sources, or to manually reindex content for indexed sources that have already been indexed.

If an indexed source contains unindexed records, the Indexed Sources list displays an informational message and marks the new source with an alert triangle icon ⚠. A similar informational message appears on the Indexed Source form. Make sure to perform a full table index for each indexed source that displays the alert triangle icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Select the indexed sources with content that you want to make searchable.
   To select all indexed sources on the page, follow the instructions for your list version in Perform actions on selected items in a list.
3. In the **Actions on selected rows...** menu, select **Index All Tables**.
   The Indexed Source History page for the last selected index appears. A message reports that AI Search has queued an indexing task for the indexed source.
4. **Optional:** Refresh the Indexed Source History form page to monitor the progress of the indexing task.
   When the task completes, the **Ingestion State** field shows *indexed*.
5. To return to the list of indexed sources, select the back icon.

Result

AI Search indexes content from existing records in the indexed sources. Indexing continues on a scheduled basis. You don't need to repeat this task for the indexed sources unless you want to reindex their content before the next scheduled indexing run.

What to do next

Define search sources to make searchable content from indexed sources available in user search experiences. For details on creating search sources, see Create a search source for AI Search.

Search sources in AI Search

Define search sources to make your searchable content available in search experiences. Choose an indexed source and configure optional filter conditions to limit the content that users can search.

Search source structure

A search source includes two elements:

- A reference to an indexed source. By default, search queries using the search source can return all records from the referenced indexed source. For more information on indexed sources, see Indexed sources in AI Search.
- An optional set of filter conditions applied to the indexed source's records. Indexed source records must pass all of these filter conditions to be returned as search results for queries using the search source.

You can define multiple search sources that reference the same indexed source, specifying distinct filter conditions for each.

Filter conditions

To limit the set of indexed source table records that AI Search returns as search results, you can apply filter conditions to your search source.

Note: Search source filter conditions can only operate on source record fields that are indexed. Fields on referenced records aren't indexed by default. To use a referenced record field in a search source filter condition, you must first configure indexing for the field in the indexed source. For details on this procedure, see Enable indexing of referenced table fields for an AI Search indexed source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use static and dynamic filter conditions to filter search source records. As an example, you could apply a dynamic **[Assigned to] [is (dynamic)] [Me]** user filter to your search source. With this filter applied, the search source only returns search results for indexed source table records that are assigned to the search user.

Search sources don't support any of the following filter options:

- Filters that reference fields from child tables of the indexed source table. As an example, suppose you create an indexed source for the Task [task] table. Search sources for that indexed source can't use filters to reference fields from the Incident [incident] table because the Incident table is a child of the Task table.
- Dynamic filters with scripts that use the *current* keyword or global variable
- Dynamic filters with scripts that reference any global business rules
- Dynamic filters with scripts that use script includes

For more information on filter conditions, see Filters. To learn about relationships between parent and child tables, see Table extension and classes. For details on dynamic filter options and their associated scripts, see Create a dynamic filter option.

Linking search sources to search profiles

To make your search source's content available to users, link it to one or more search profiles. You can link multiple search sources to a single search profile.

For more information, see Link a search source to a search profile.

Unlinking search sources from search profiles

If you delete a search source that's linked to one or more search profiles, it's not automatically unlinked from those search profiles. You must manually unlink the search source from each search profile that it's linked to. For details on this procedure, see Unlink a search source from a search profile.

Viewing search sources

You can view or edit search sources from any of the following application modules:

- To view all defined search sources, navigate to **All** > *AI Search* > **Search Experience** > **Search Sources**.
- To view search sources that reference a particular indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. Open the indexed source and select its Search Source Mappings related list.
- To view search sources linked to a particular search profile, navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**. Open the search profile and select its Search Sources related list.

Create a search source for AI Search

Make searchable content from an indexed source available in user search experiences by defining a search source.

Before you begin

You must have an indexed source defined. For more details on setting up indexed sources, see Create an indexed source.

Role required: ais_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Define at least one search source for each of your indexed sources. You can define multiple search sources that reference the same indexed source, specifying distinct filter conditions for each.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. In the Search Source Mappings related list, select **New**.
3. On the Search Source form, fill in the fields.
   For a description of the field values, see Search Source form.
4. Select **Submit**.
   The new search source appears in the Search Sources related list.

Preview matching records for an AI Search search source

View the ServiceNow AI Platform® table records that match a search source's indexed source table and filter conditions.

Before you begin

Role required: ais_admin

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Sources**.
2. Open the search source that you want to preview matching records for.
3. On the Search Source form, select the **preview** link in the informational message that reports the number of matching records.
   For a description of the field values, see Search Source form.

Result

The ServiceNow AI Platform table specified in the search source's indexed source appears, with filter conditions applied to match conditions from the search source. This filtered view displays all records that are searchable through the search source.

Note: Preview uses the saved conditions from the search source. If you change a search source's conditions, preview doesn't reflect your changes until you save them.

Search profiles in AI Search

Search profiles contain settings for a search experience, including synonyms, stop words, typo handling, Genius Results, and result improvement rules. Define a search profile for each unique search experience that you want to offer in a ServiceNow AI Platform® application. Publish search profiles to make them available in your search applications.

A search profile contains settings that determine how AI Search generates search results for a given search experience. Publishing a search profile makes it available so you can link it to one or more search application configurations.

A search application configuration specifies a search profile to use, and also determines how generated search results are displayed in the application. To learn about search application configuration display settings, see Search application configurations.

The following table describes the search experience settings that you can configure in a search profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search profile settings

Setting	Description
Search sources	Link one or more search sources to a search profile. Search sources give administrators precise control over the searchable content available to users.
Synonyms	Define language-specific dictionaries of terms that AI Search treats as equivalent in search queries. Synonyms improve search recall and provide a more natural search experience for users.
Stop words	Define language-specific dictionaries of common terms for AI Search to remove from search queries. Stop words improve search precision and result relevancy by discarding irrelevant matches.
Typo handling	Configure settings for derivation of auto-correction terms from search source indexed content. AI Search replaces misspelled search query terms with auto-correction terms.
Genius Results	Analyze search query intent and display the best answers as Genius Result answer cards. Genius Results enable users to act directly on their search results.
Result improvement rules	Define rules with configurable triggers to modify search results for specific search queries. Result improvement rules enable administrators to boost, block, or promote records in a search query's result set.

Publishing search profile settings

To make a search profile's settings active in search queries, you must publish it. Publishing propagates the following settings to search application configurations that reference the search profile.

- The set of synonym and stop word dictionaries linked to the search profile
- Settings, blocked terms, and derived auto-correction terms for typo handling dictionaries linked to the search profile
- Result improvement rules and actions defined in the search profile

A search profile can have one of these states:

- **New**: The search profile has never been published.
- **Draft**: The search profile is saved with unpublished changes.
- **Published**: The search profile is saved with all changes published.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the **All** > *AI Search* > **Search Experience** > **Search Profiles** list, search profiles with the *New* state display an alert triangle icon ⚠. An informational message notifies you to publish these search profiles.

Create a search profile

Create a new search profile to store search experience settings for a search application.

Before you begin
Role required: ais_admin

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Select **New**.
3. On the Search Profile form, fill in the fields.
   For a description of the field values, see Search Profile form.
4. Select **Submit**.

Result
The new search profile appears in the AI Search Search Profiles list with **State** set to *New*. An informational message and an alert triangle icon ⚠ indicate that the new search profile has never been published.

What to do next
To make content searchable using your new search profile, link one or more search sources to it. For instructions on linking search sources, see Link a search source to a search profile.

Your new search profile includes sample synonym and stop word dictionaries and a default typo handling dictionary. For more details on configuring and populating these dictionaries, see Synonyms, Stop words, and Typo handling.

Clone a search profile

Create a copy of an existing search profile. The cloned search profile retains search sources, stop word and synonym dictionaries, Genius Result configurations, and result improvement rules from the original search profile.

Before you begin
Role required: ais_admin

About this task
Multiple search applications can link to the same search profile. For example, in the base system, Service Portal and Virtual Agent both link to the **Service Portal search profile** record.

As a search administrator, you may wish to configure separate search profiles for two applications that share a search profile. Cloning the existing search profile enables you to create a new record with the same search sources, stop word and synonym dictionaries, Genius Result configurations, and result improvement rules. This approach saves time if you want the two applications to use similar or identical search experience settings.

Note: Cloning a search profile doesn't preserve its existing typo handling dictionary settings or blocked terms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Select the record for the search profile that you want to clone.
   If the system prompts you to change the application scope so that you can edit the record, select the provided link.
3. Select **Clone**.
4. In the Set Profile Label dialog box, enter a label for your new search profile record, then select **OK**.
5. **Optional:** Make changes to the cloned search profile's settings.
   For details on search profile settings, see Create a search profile, Synonyms, Stop words, Typo handling, Genius Results, and Result improvement rules.
6. Publish your cloned search profile by selecting **Publish**.
   For more information on the effects of publishing a search profile, see Publish an AI Search search profile.

Result
Your cloned search profile record appears in the Search Profile table.

What to do next
Edit the search application configuration record of your choice and link it to your cloned search profile. For details on search application configurations, see Search application configurations.

Publish an AI Search search profile

Publish a search profile to make pending changes to its settings take effect in linked search applications.

Before you begin
Role required: ais_admin

About this task
To make a search profile's settings active in search queries, you must publish it. Publishing propagates the following settings to search application configurations that reference the search profile.

- The set of synonym and stop word dictionaries linked to the search profile
- Settings, blocked terms, and derived auto-correction terms for typo handling dictionaries linked to the search profile
- Result improvement rules and actions defined in the search profile

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.

   Note: Search profiles with the *New* state display an alert triangle icon ⚠. An informational message notifies you to publish these search profiles.

2. Open the search profile that you want to publish.
3. Select **Publish**.

Result
The search profile appears in the AI Search Search Profiles list with **State** set to *Published*.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Link a search source to a search profile

Link search sources to a search profile to specify the content users can search through that profile.

Before you begin
You must have already created at least one search source. For instructions on creating search sources, see Create a search source for AI Search.

Role required: ais_admin

About this task
Linking a search source to a search profile makes its filtered content available for searches using that search profile. AI Search only uses content from the search profile's linked search sources when finding and generating standard search results and Genius Result answers.

When linking a search source to a search profile, you can specify options that control how the search source's content is accessed for searches using that search profile. You can exclude the search source's content from being considered when finding standard search results, or prevent it from being considered during Genius Result answer generation. For a search source that includes internal content (from a ServiceNow AI Platform® table), you can also exclude indexed attachment content from being considered during Genius Result answer generation.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to link the search source to.
3. In the Search Sources related list, select **Link Existing**.
4. On the Search Profile - Search Source Mapping form, fill in the fields.
   For a description of the field values, see Search Profile - Search Source Mapping form.
5. Select **Submit**.

Result
The new search source appears in the Search Sources related list. Search query results immediately reflect changes to the set of records searchable through the search profile.

What to do next
Derived auto-correction term lists for the search profile's typo handling dictionary don't automatically update to reflect changes to the set of searchable records. To update these auto-correction term lists, publish the search profile you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Unlink a search source from a search profile

Unlink search sources from a search profile to prevent their content from being searchable through that profile. Deleted search sources aren't automatically unlinked from search profiles.

Before you begin
Role required: ais_admin

About this task
Unlinking a search source from a search profile prevents its filtered content from being searchable through that search profile.

When you delete a search source, the system doesn't automatically unlink it from search profiles. In this case, you must manually unlink the search source from each search profile it's linked to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to unlink the search source from.
3. In the Search Sources related list, select the search source that you want to unlink from the search profile.
4. Select **Unlink Selected**.

Result

The search source no longer appears in the Search Sources related list.

What to do next

To make the search source change take effect, publish the search profile you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Synonyms

Synonyms expand search queries to include additional terms with equivalent meaning or usage. Improve search recall by configuring synonym dictionaries and defining synonyms.

To define synonyms, modify the default synonym dictionary for a search profile or create a new synonym dictionary linked to one or more search profiles. Create and publish synonyms for each dictionary. Publish the dictionary to make your synonyms take effect for searches that use linked search profiles.

You can delete synonym dictionaries that aren't linked to any search profiles.

Synonym usage in search

When a search query includes a term defined in a synonym, AI Search expands the search to include all equivalent terms defined in the synonym.

For example, a synonym might expand the search query term `vacation` to `vacation OR holiday OR pto`. The expanded query returns records that contain any of the three equivalent terms.

Conditions for synonym eligibility

To be eligible for expanding a search query's terms, a synonym must satisfy the following conditions:

- It must be active.
- The synonym dictionary that includes it must be published.
- Its length doesn't exceed the dictionary term-length limit.

The system locates eligible synonyms in synonym dictionaries as follows:

Condition	Result
The search profile specified for the search query links to a published synonym dictionary for the search query's language.	The system only considers synonyms from the linked synonym dictionary. As an example, suppose a search application's search profile links to a French synonym dictionary. When a user searches in French in this application, only synonyms from the linked

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Condition	Result
	French synonym dictionary are eligible to expand search query terms.
The search profile specified for the search query doesn't link to a published synonym dictionary for the search query's language.	The system only considers synonyms from the default (English) synonym dictionary. As an example, suppose a search application's search profile has no linked Spanish synonym dictionary. When a user searches in Spanish in this application, only synonyms from the default (English) synonym dictionary are eligible to expand search query terms.

For more details on language support in synonym dictionaries, see Language dependence.

Synonym terms and payloads

Each synonym includes two or more equivalent terms, defined in two fields. The **Term** field contains one term designated as the synonym's label. The **Payload** field contains the remaining equivalent terms, formatted as a JSON array.

Synonym term expansion is bidirectional. AI Search treats all terms defined in the **Term** and **Payload** fields as equivalent, as illustrated in the following table.

Use case	Synonym expansion behavior
Search query term matches the term from a synonym's **Term** field	AI Search expands the search query term to match all equivalent terms from the **Payload** field.
Search query term matches a term from the **Payload** field	AI Search expands the search query term to match the term from the **Term** field and all remaining equivalent terms from the **Payload** field.

Dictionary term-length limit

By default, AI Search ignores synonym terms that exceed 256 characters in length. You can override this default limit by adding the *`query.maxDictionaryTermLength`* system property. The integer value of this system property indicates the maximum allowable character length for stop word and synonym dictionary terms.

For information on adding a system property, see Add a system property.

⚠ **Warning:** Exercise caution when increasing the dictionary term-length limit beyond its default value. Processing long dictionary terms increases AI Search's memory usage, and in some cases search queries may fail with out-of-memory errors.

Multi-word phrases

A synonym term can include either a single word or a multi-word phrase. AI Search expands multi-word phrases when the search query terms exactly match the order and proximity of the phrased words in the synonym definition. If a user searches with these words in a different arrangement, no expansion occurs.

For example, the following table describes AI Search expansion behavior for a synonym that includes the single word `401k` and the multi-word phrase `retirement account`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search query terms	Synonym expansion behavior
401k	AI Search expands the search query to match either `401k` or `retirement account`.
retirement account	AI Search expands the search query to match either `401k` or `retirement account`.
retirement account bank	AI Search expands the search query to match either `401k` or `retirement account` in addition to `bank`.
account retirement	AI Search doesn't expand the search query terms.
retirement bank account	AI Search doesn't expand the search query terms.

When search query terms match a multi-term synonym, AI Search treats those terms as a quoted phrase. For example, if you define `401k` and `retirement account` as synonyms and a user searches for the unquoted terms `retirement account`, AI Search returns results that match the quoted phrase `"retirement account"`.

Case sensitivity

By default, synonym expansion ignores letter case when comparing synonyms with search query terms. You can enable case sensitivity for a synonym dictionary. This option affects all synonyms defined in the dictionary.

When case sensitivity is enabled, synonyms in the dictionary only match search query terms or phrases that include the same combination of uppercase and lowercase letters.

For example, if you define a synonym including the word CASE and the phrase `Computer-Aided Software Engineering`, AI Search expands searches for CASE but not searches for `case`.

Punctuation sensitivity

By default, synonym expansion ignores punctuation when comparing synonyms with search query terms. You can enable punctuation sensitivity for a synonym dictionary. This option affects all synonyms defined in the dictionary.

When punctuation sensitivity is enabled, synonyms in the dictionary only match search query terms or phrases that include the same punctuation.

For example, suppose you define a synonym equating `U-S-A` with `University of South Australia` and another synonym equating `U.S.A.` with `United States of America`. Without punctuation sensitivity enabled, a search for `U.S.A.` expands to match both `University of South Australia` and `United States of America`. When punctuation sensitivity is enabled, the same search only expands to match `United States of America`.

Language dependence

Synonym expansion is language-dependent. You specify a language for each synonym dictionary, and this language applies to all synonyms defined in the dictionary. Synonyms from dictionaries with the same language as the search query are eligible for expansion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the search profile specified for a search query has no linked synonym dictionary for the search query language, AI Search uses the default (English) synonym dictionary as a fallback.

AI Search supports synonym dictionaries for all languages activated in your instance. For the list of languages you can activate, see Activate a language.

Interaction with other search features

The following table describes interactions between synonyms and other search features.

Feature	Interaction with synonyms
Genius Results	Synonym expansion terms can't trigger Genius Result configurations with Term trigger conditions. When computing Q&A Genius Results for a search query, AI Search expands synonyms in the query.
Lemma and Unicode normalization	If a search query term is defined as a synonym, AI Search doesn't normalize it.
Result improvement rules	By default, a synonym expansion term can activate a result improvement rule if it matches the rule's Query trigger. You can prevent synonym expansion terms from activating a rule with a Query trigger by clearing the **Expand Synonyms For Query Conditions** option that appears when you define the Query trigger. **Note:** Starting with the Xanadu release, AI Search uses synonyms to expand user context field values when applying boost actions from result improvement rules. As an example, if the user context location is `Paris` and you define a synonym that defines `Paris` and `France` as equivalent, your result improvement rule boosts documents containing `France` as well as those containing `Paris`. For more details on boost actions, see Boost search results using a result improvement rule.
Stop words	If a synonym definition includes a term defined as a stop word, AI Search retains that term when checking whether the synonym expands a search query. For example, suppose you define `as` and `a` as stop words and SAAS↔`#software as a service` as a synonym. • If you search for `saas`, AI Search retains the `as` and `a` terms in the synonym expansion. As a result, the search query matches the following records: ○ records that contain the original search query term `saas` ○ records that contain the synonym expansion phrase `software as a service` • If you search for `software as a service`, AI Search retains the `as` and `a` query terms when checking for synonym expansions. As a result, the search query matches the following records: ○ records that contain the phrase `software as a service` ○ records that contain the synonym expansion term `saas`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Interaction with synonyms
Typo handling	If a misspelled search query term is defined as a synonym, AI Search expands that synonym without auto-correcting it.

Publishing synonym dictionaries

Publishing a synonym dictionary makes its settings and active synonyms take effect in all linked search profiles.

Publishing a search profile updates the profile's synonym dictionary links but doesn't update the dictionary's settings or active synonyms in AI Search.

Create a synonym dictionary linked to a search profile

Define a new synonym dictionary and link it to a search profile.

Before you begin
Role required: ais_admin

About this task
To make a synonym dictionary affect search behavior, you must link it to a search profile, either at creation time or afterward. To learn about linking a saved dictionary to a search profile, see Link a synonym dictionary to a search profile.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to link the new synonym dictionary to.
3. In the Synonyms related list, select **Create and Link**.
4. On the Dictionary form, fill in the fields.
   For a description of the field values, see Dictionary form.
5. Select **Submit**.

Result
The new synonym dictionary appears in the Synonyms related list.

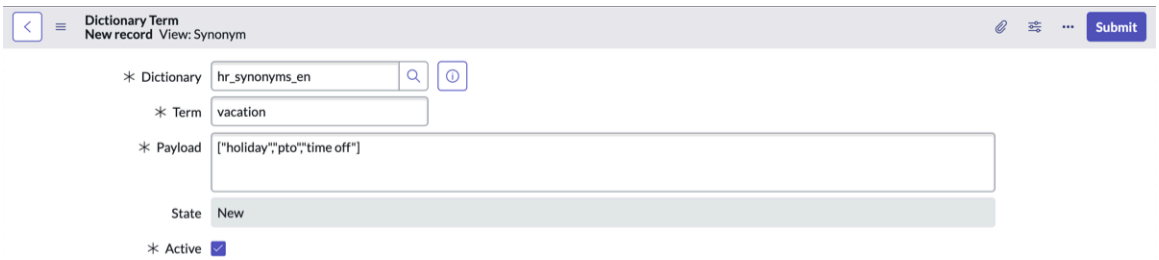
What to do next
To make new or updated synonym dictionary settings take effect, publish the search profile that you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Create synonyms

Define terms to treat as equivalent in search queries.

Before you begin
Role required: ais_admin

About this task
You must have already created a synonym dictionary. For information on creating synonym dictionaries, see Create a synonym dictionary linked to a search profile.



Procedure
1. Navigate to **All** > *AI Search* > *AI Search* **Engine** > **Dictionaries**.
2. Open the synonym dictionary that you want to add the new synonym to.
3. In the AI Search Dictionary Terms related list, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Dictionary Term form, fill in the fields.
   For a description of the field values, see Dictionary Term form.
5. Select **Submit**.
   The new synonym appears in the AI Search Dictionary Terms related list.
6. **Optional:** Repeat the preceding steps for each additional synonym that you want to create.
7. Choose one of the following actions.
   - To save the modified dictionary and refresh its active synonyms in all linked search profiles, select **Publish**.
   - To save the modified dictionary without refreshing its active synonyms in all linked search profiles, select **Update**.

Example: Define a synonym with equivalent words and phrases

This example shows a synonym defining `vacation`, `holiday`, PTO, and the phrase `time off` as equivalent.

Clone a synonym dictionary

Create a copy of an existing synonym dictionary.

Before you begin
Role required: ais_admin

About this task
Cloning a synonym dictionary copies the source dictionary's settings and all of its defined synonym terms. This process can save you time when you need multiple synonym dictionaries that have many synonym terms in common.

Procedure

1. Navigate to **All** > *AI Search* > **Search Query Settings** > **Dictionaries**.
2. Expand the Synonym record group if necessary and open the synonym dictionary that you want to clone.
3. Select **Clone**.
4. In the Set Dictionary Label dialog box, enter a label for the new synonym dictionary in the **Cloned dictionary label** field and select **OK**.

Result
The new synonym dictionary form opens. All synonym terms defined in the source dictionary appear in the AI Search Dictionary Terms related list.

Link a synonym dictionary to a search profile

Link an existing synonym dictionary to one or more search profiles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: ais_admin

About this task
You can link a single synonym dictionary to multiple search profiles.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to link the synonym dictionary to.
3. In the Synonyms related list, select **Link Existing**.
4. On the Search Profile - Dictionary Mapping form, select the synonym dictionary and search profile to link.
   a. Select the reference lookup icon for the **Dictionary** field.
   b. Select the synonym dictionary that you want to link to the search profile.
   c. Select **Submit**.
   For a description of the field values, see Search Profile - Dictionary Mapping form.

Result
The selected synonym dictionary appears in the search profile's Synonyms related list.

What to do next
To make the new synonym dictionary linking take effect, publish the search profile. For more information on publishing a search profile, see Publish an AI Search search profile.

Unlink a synonym dictionary from a search profile

Remove a synonym dictionary from a search profile.

Before you begin
Role required: ais_admin

About this task
Unlinking a synonym dictionary from a search profile doesn't delete the dictionary. To delete a synonym dictionary, you must first unlink it from all search profiles. For steps to delete a synonym dictionary, see Delete a synonym dictionary.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to unlink the synonym dictionary from.
3. In the Synonyms related list, select the option for the synonym dictionary that you want to unlink from the search profile.
4. Select **Unlink Selected**.

Result
The selected synonym dictionary disappears from the search profile's Synonyms related list.

What to do next
To make the change in synonym dictionary linking take effect, publish the search profile. For more information on publishing a search profile, see Publish an AI Search search profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete a synonym dictionary

Remove a synonym dictionary that isn't linked from any search profile.

Before you begin

Role required: ais_admin

Procedure

1. Navigate to **All** > *AI Search* > **Search Query Settings** > **Dictionaries**.
   The AI Search Dictionaries list appears with a **[Type] [!=] [Spell Check]** filter condition applied and records grouped by dictionary type.
2. Expand the Synonym record group if necessary and open the synonym dictionary that you want to delete.
3. Select **Delete**.

> **Note:** If the synonym dictionary is still linked to any search profiles, deletion fails and an error message lists the linked profiles. Unlink the dictionary from these search profiles, then repeat the preceding steps. For details on unlinking a synonym dictionary from a search profile, see Unlink a synonym dictionary from a search profile.

Result

The selected synonym dictionary disappears from the AI Search Dictionaries list.

Stop words

Stop words remove search query terms that don't produce meaningful results. Improve search precision and relevancy by configuring stop word dictionaries and defining stop words.

Stop words are common terms that appear on a large proportion of indexed records. Examples of such terms can include articles, conjunctions, personal pronouns, and prepositions. By defining these terms as stop words, you can improve search precision and result relevancy for users.

You can define stop words in the default stop word dictionary for a search profile, or create your own stop word dictionaries linked to search profiles. Create and publish stop words for each dictionary. Publish the dictionary to make your stop words take effect for searches that use linked search profiles.

You can delete stop word dictionaries that aren't linked to any search profiles.

Stop word usage in search

When a search query includes a term defined as a stop word, AI Search removes the term from the search query.

For example, a stop word might remove the term `my` from a search query for `upgrade my laptop`. This modified search query only matches records containing the more relevant terms `upgrade` and `laptop`.

Conditions for stop word eligibility

To be eligible for removal from a search query's terms, a stop word must satisfy the following conditions:

- It must be active.
- The stop word dictionary that includes it must be published.
- Its length doesn't exceed the dictionary term-length limit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system locates eligible stop words in stop word dictionaries as follows:

Condition	Result
The search profile specified for the search query links to a published stop word dictionary for the search query's language.	The system only considers stop words from the linked stop word dictionary. As an example, suppose a search application's search profile links to a French stop word dictionary. When a user searches in French in this application, only stop words from the linked French stop word dictionary are eligible for removal from the search query terms.
The search profile specified for the search query doesn't link to a published stop word dictionary for the search query's language.	The system only considers stop words from the default (English) stop word dictionary. As an example, suppose a search application's search profile has no linked Spanish stop word dictionary. When a user searches in Spanish in this application, only stop words from the default (English) stop word dictionary are eligible for removal from the search query terms.

For more details on language support in stop word dictionaries, see Language dependence.

Dictionary term-length limit

By default, AI Search ignores stop word terms that exceed 256 characters in length. You can override this default limit by adding the *`query.maxDictionaryTermLength`* system property. The integer value of this system property indicates the maximum allowable character length for stop word and synonym dictionary terms.

For information on adding a system property, see Add a system property.

⚠ **Warning:** Exercise caution when increasing the dictionary term-length limit beyond its default value. Processing long dictionary terms increases AI Search's memory usage, and in some cases search queries may fail with out-of-memory errors.

Multi-word phrases

A stop word can include either a single word or a multi-word phrase. AI Search removes multi-word phrases from the search query when the query terms exactly match the order and proximity of the phrased words in the stop word definition. If a user searches with these words in a different arrangement, no term removal occurs.

For example, the following table describes AI Search stop word removal behavior for a stop word that includes the multi-word phrase `retirement account`.

Search query terms	Stop word removal behavior
my retirement account	AI Search removes the terms `retirement account` from the search query.
my bank retirement account	AI Search removes the terms `retirement account` from the search query.
my account retirement	AI Search doesn't remove any terms from the search query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search query terms	Stop word removal behavior
my retirement bank account	AI Search doesn't remove any terms from the search query.

Case sensitivity

By default, AI Search ignores letter case when comparing stop words with search query terms. You can enable case sensitivity for a stop word dictionary. This option affects all stop words defined in the dictionary.

When case sensitivity is enabled, stop words in the dictionary only match search query terms or phrases that include the same combination of uppercase and lowercase letters.

For example, if you define a `RAID` stop word in a dictionary with case sensitivity enabled, AI Search ignores the search query term `RAID` but treats the search query term `raid` normally.

Punctuation sensitivity

By default, AI Search ignores punctuation when comparing stop words with search query terms. You can enable punctuation sensitivity for a stop word dictionary. This option affects all stop words defined in the dictionary.

When punctuation sensitivity is enabled, stop words in the dictionary only match search query terms or phrases that include the same punctuation.

For example, if you define a `one-half` stop word in a dictionary with punctuation sensitivity enabled, AI Search removes the search query term `one-half` but doesn't remove the search query term `one half`.

Language dependence

Stop word removal is language-dependent. You specify a language for each stop word dictionary, and this language applies to all stop words defined in the dictionary. Stop words from dictionaries with the same language as the search query are eligible for removal.

Note: If the search profile specified for a search query has no linked stop word dictionary for the search query language, AI Search uses the default (English) stop word dictionary as a fallback.

AI Search supports stop word dictionaries for all languages activated in your instance. For the list of languages you can activate, see Activate a language.

You can only link one stop word dictionary per language to a given search profile.

Interaction with other search features

The following table describes interactions between stop words and other search features.

Feature	Interaction with stop words
Genius Results	If a search query term that matches a Genius Result configuration's Term trigger is defined as a stop word, AI Search evaluates the trigger before removing that stop word from the search query. When computing Q&A Genius Results for a search query, AI Search ignores stop words in the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Interaction with stop words
Lemma and Unicode normalization	If a search query term is defined as a stop word, AI Search removes that term without normalizing it.
Result improvement rules	If a search query term that matches a result improvement rule's Query trigger is defined as a stop word, AI Search evaluates the rule trigger before removing the stop word from the search query.
Synonyms	If a synonym definition includes a term defined as a stop word, AI Search retains that term when checking whether the synonym expands a search query. For example, suppose you define `as` and `a` as stop words and SAAS↔`#software as a service` as a synonym. • If you search for `saas`, AI Search retains the `as` and `a` terms in the synonym expansion. As a result, the search query matches the following records: ○ records that contain the original search query term `saas` ○ records that contain the synonym expansion phrase `software as a service` • If you search for `software as a service`, AI Search retains the `as` and `a` query terms when checking for synonym expansions. As a result, the search query matches the following records: ○ records that contain the phrase `software as a service` ○ records that contain the synonym expansion term `saas`
Typo handling	If a misspelled search query term is defined as a stop word, AI Search auto-corrects that term normally instead of removing it. AI Search ignores terms defined as stop words when determining an auto-correction for a misspelled search query term. For example, if you define `email` as a stop word, AI Search doesn't offer `email` as an auto-correction when you search for `emial`.
Wildcard operators	When expanding search terms that contain `%` or `*` wildcard operators, AI Search ignores terms defined as stop words. For example, suppose you define `the` and `their` as stop words. A search for `the*` won't expand to match `the` or `their`, but will still match non-stop word terms such as `there` and `these`.

Publishing stop word dictionaries

Publishing a stop word dictionary makes its settings and active stop words take effect in all linked search profiles.

Publishing a search profile updates the profile's stop word dictionary links but doesn't update the dictionary's settings or active stop words in AI Search.

Create a stop word dictionary linked to a search profile

Define a new stop word dictionary and link it to a search profile.

Before you begin
Role required: ais_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To make a stop word dictionary affect search behavior, you must link it to a search profile, either at creation time or afterward. You can only link one stop word dictionary per language to a given search profile. To learn about linking a saved stop word dictionary to a search profile, see Link a stop word dictionary to a search profile.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to link the new stop word dictionary to.
3. In the Stop Words related list, select **Create and Link**.
4. On the Dictionary form, fill in the fields.
   For a description of the field values, see Dictionary form.
5. To save the new stop word dictionary and link it to the specified search profile, select **Submit.**

Result

The new stop word dictionary appears in the Stop Words related list.

What to do next

To make new or updated stop word dictionary settings take effect, publish the search profile that you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Create stop words

Define terms to remove from search queries.

Before you begin

Role required: ais_admin

About this task

You must have already created a stop word dictionary. For information on creating stop word dictionaries, see Create a stop word dictionary linked to a search profile.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Engine** > **Dictionaries**.
2. Open the stop word dictionary that you want to add the new stop word to.
3. In the AI Search Dictionary Terms related list, select **New**.
4. On the Dictionary Term form, fill in the fields.
   For a description of the field values, see Dictionary Term form.
5. Select **Submit**.
   The new stop word appears in the AI Search Dictionary Terms related list.
6. **Optional:** Repeat the preceding steps for each additional stop word that you want to create.
7. Choose one of the following actions.
   - To save the modified dictionary and refresh its active stop words in all linked search profiles, select **Publish**.
   - To save the modified dictionary without refreshing its active stop words in all linked search profiles, select **Update**.

Clone a stop word dictionary

Create a copy of an existing stop word dictionary.

Before you begin
Role required: ais_admin

About this task
Cloning a stop word dictionary copies the source dictionary's settings and all of its defined stop word terms. This process can save you time when you need multiple stop word dictionaries that have many stop word terms in common.

Procedure
1. Navigate to **All** > *AI Search* > **Search Query Settings** > **Dictionaries**.
2. Expand the Stop Word record group if necessary and open the stop word dictionary that you want to clone.
3. Select **Clone**.
4. In the Set Dictionary Label dialog box, enter a label for the new stop word dictionary in the **Cloned dictionary label** field and select **OK**.

Result
The new stop word dictionary form opens. All stop word terms defined in the source dictionary appear in the AI Search Dictionary Terms related list.

Link a stop word dictionary to a search profile

Link an existing stop word dictionary to one or more search profiles.

Before you begin
Role required: ais_admin

About this task
You can link a single stop word dictionary to multiple search profiles. You can only link one stop word dictionary per language to a given search profile.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to link the stop word dictionary to.
3. In the Stop Words related list, select **Link Existing**.
4. On the Search Profile - Dictionary Mapping form, select the stop word dictionary and search profile to link.
   a. Select the reference lookup icon  for the **Dictionary** field.
   b. Select the stop word dictionary that you want to link to the search profile.
   c. Select **Submit**.
   For a description of the field values, see Search Profile - Dictionary Mapping form.

Result
The selected stop word dictionary appears in the search profile's Stop Words related list.

What to do next
To make the new stop word dictionary linking take effect, publish the search profile. For more information on publishing a search profile, see Publish an AI Search search profile.

Unlink a stop word dictionary from a search profile

Remove a stop word dictionary that isn't linked from any search profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: ais_admin

About this task
Unlinking a stop word dictionary from a search profile doesn't delete the dictionary. To delete a stop word dictionary, you must first unlink it from all search profiles. For steps to delete a stop word dictionary, see Delete a stop word dictionary.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to unlink the stop word dictionary from.
3. In the Stop Words related list, select the option for the stop word dictionary that you want to unlink from the search profile.
4. Select **Unlink Selected**.

Result
The selected stop word dictionary disappears from the search profile's Stop Words related list.

What to do next
To make the change in stop word dictionary linking take effect, publish the search profile. For more information on publishing a search profile, see Publish an AI Search search profile.

Delete a stop word dictionary

Remove a stop word dictionary that isn't linked from any search profile.

Before you begin
Role required: ais_admin

Procedure
1. Navigate to **All** > *AI Search* > **Search Query Settings** > **Dictionaries**.
   The AI Search Dictionaries list appears with a **[Type] [!=] [Spell Check]** filter condition applied and records grouped by dictionary type.
2. Expand the Stop Word record group if necessary and open the stop word dictionary that you want to delete.
3. Select **Delete**.

> **Note:** If the stop word dictionary is still linked to any search profiles, deletion fails and an error message lists the linked profiles. Unlink the dictionary from these search profiles, then repeat the preceding steps. For details on unlinking a stop word dictionary from a search profile, see Unlink a synonym dictionary from a search profile.

Result
The selected stop word dictionary disappears from the AI Search Dictionaries list.

Typo handling

AI Search replaces misspelled search query terms with auto-correction terms derived from indexed content. Configure typo handling dictionary settings to control derivation of auto-correction terms.

To define auto-correction terms for a search profile, modify settings in the profile's linked typo handling dictionary. The typo handling dictionary derives a list of auto-correction terms from indexed content found in search sources linked to its search profile. Update the typo handling

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

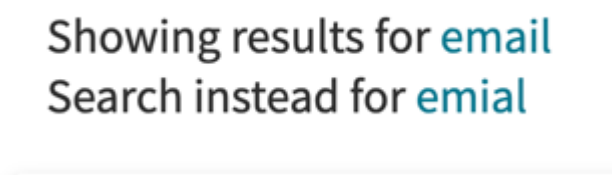
dictionary to save its settings. Publish the linked search profile to make auto-correction terms available for searches that use the profile.

AI Search automatically creates a typo handling dictionary for a search profile when you link search sources to that profile. You can't delete a typo handling dictionary, unlink it from its search profile, or link it to any other search profile.

To disable typo handling auto-correction for a search application, deselect the **Enable Typo Handling** option in the search application configuration. For more details on search application configuration settings, see Create a search application configuration for AI Search.

Conditions for auto-correction term eligibility

When deriving its list of auto-correction terms, the typo handling dictionary only considers indexed terms that satisfy the following conditions:



- The term includes at least 3 characters and no more than 255 characters.
- The term appears at least once in indexed records from the search profile's linked search sources.

Auto-correction of search query terms

When a search query includes a term not present in the typo handling dictionary, AI Search looks for terms in the dictionary with similar spelling. If it finds a good match, it automatically replaces the original search query term with the dictionary term.

For example, a search for `emial`, which isn't present on any indexed record, might auto-correct to the similarly spelled term `email` which exists on multiple indexed records and thus appears in the typo handling dictionary.

A notification message displays the auto-corrected term. Users can select the link in this message to repeat their search with the original query term.

Terms excluded from auto-correction

Auto-correction ignores search query terms that satisfy any of the following conditions:

Condition	Description
Search query term includes only 1 or 2 characters	Auto-correction ignores search query terms below 3 characters in length. For example, AI Search doesn't auto-correct the search query term `gi`.
Search query term includes only uppercase letters	To enable search for abbreviations, auto-correction ignores search query terms that contain only uppercase letters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Condition	Description
	For example, AI Search doesn't auto-correct the search query term `PINN`, even if it auto-corrects the lowercase form `pinn` to `pin`.
Search query term includes one or more numeric digits	To enable search for numbers and alphanumeric identifiers, auto-correction ignores search query terms that include numeric digits. For example, AI Search doesn't auto-correct the search query term `402K`.
Search query term excluded from typo handling dictionary	Auto-correction ignores search query terms excluded from the typo handling dictionary. For instructions on excluding terms from a typo handling dictionary, see Exclude a term from a typo handling dictionary.

Automatic refresh of auto-correction term lists

Each typo handling dictionary automatically refreshes its list of auto-correction terms after a set interval. The refresh operation has the same effect as republishing the dictionary's linked search profile.

By default, typo handling dictionaries refresh every 24 hours. If you want the term list refreshed less frequently, you can increase this interval in the dictionary settings.

Language dependence

Typo handling is language-dependent. AI Search derives a separate list of auto-correction terms for each supported language found in the search sources' indexed content.

AI Search supports derivation of auto-correction terms for Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French - Canada, French, German, Hebrew, Hungarian, Italian, Norwegian (Bokmål), Polish, Portuguese, Russian, Spanish, Swedish, and Turkish. Typo handling auto-correction term derivation isn't supported for Japanese, Korean, Simplified Chinese, or Traditional Chinese.

Interaction with other search features

The following table describes interactions between typo handling and other search features.

Feature	Interaction with typo handling
Genius Results	Auto-corrected search query terms can't trigger Genius Result configurations with Term trigger conditions. When computing Q&A Genius Results for a search query, AI Search corrects terms in the query.
Lemma and Unicode normalization	AI Search performs lemma and Unicode normalization on auto-corrected search query terms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Interaction with typo handling
Result improvement rules	An auto-corrected search query term can trigger a result improvement rule if it matches the rule's Query trigger.
Stop words	If a misspelled search query term is defined as a stop word, AI Search auto-corrects that term normally instead of removing it. AI Search ignores terms defined as stop words when determining an auto-correction for a misspelled search query term. For example, if you define `email` as a stop word, AI Search doesn't offer `email` as an auto-correction when you search for `emial`.
Synonyms	If a misspelled search query term is defined as a synonym, AI Search expands that synonym without auto-correcting it.

Modify settings for a typo handling dictionary

Modify typo handling dictionary settings for a search profile.

Before you begin

Role required: ais_admin

About this task

Each typo handling dictionary is linked to a search profile. For more information about search profiles, see Search profiles in AI Search.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that contains the typo handling dictionary that you want to modify.
3. In the Typo Handling related list, open the record for the typo handling dictionary.
4. On the AI Search Dictionary form, update the fields.
   For a description of the field values, see Dictionary form.
5. Select **Update**.

What to do next

To make updated settings for a typo handling dictionary take effect, publish the search profile linked to the dictionary. For details on publishing a search profile, see Publish an AI Search search profile.

Exclude a term from a typo handling dictionary

Prevent AI Search from auto-correcting a term in user search queries by excluding the term from a typo handling dictionary.

Before you begin

You must have already defined a search profile with one or more linked search sources.

Role required: ais_admin

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to exclude a typo handling term for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Typo Handling related list, open the typo handling dictionary.
4. In the AI Search Dictionary Terms related list, select **New**.
5. On the Dictionary Term form, fill in the fields.
   For a description of the field values, see Dictionary Term form.
6. Select **Submit**.
   The new term appears in the AI Search Dictionary Terms related list with the **State** set to *New*.
7. **Optional:** Repeat the preceding steps for each additional term that you want to exclude.
8. Select **Publish**.
   The typo handling dictionary appears in the Typo Handling related list with the **State** set to *Published*.

What to do next

To make updated typo handling settings take effect, publish the search profile that you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Genius Results

Optionally display the best answers for a search query as actionable Genius Result cards included with search results.

A Genius Result configuration includes a trigger condition and logic for creating answers. The trigger condition determines whether the Genius Result configuration activates for a search query. When activated, the configuration checks for search results with extremely high relevancy. If it finds any, its answer logic populates one or more Genius Result cards with information and actions derived from these results. The Genius Result cards appear alongside normal search results, giving the user immediate access to the most relevant answers and actions.

To use a Genius Result configuration in searches, link it to one or more of your search profiles. For details on this procedure, see Link a Genius Result configuration to a search profile.

Genius Result evaluation order and result limit

AI Search evaluates active Genius Result configurations for a search profile in an order determined by their numeric **Order** field values, as defined in the search profile's Genius Results related list. Genius Result configurations with lower **Order** field values are evaluated before those with higher field values. As an example, a Genius Result configuration with **Order** 100 is evaluated before one with **Order** 200. To learn how to change the evaluation order, see Set the evaluation order for Genius Result configurations in a search profile.

> **Note:** **Order** field values for linked Genius Result configurations are set separately for each search profile. A Genius Result configuration that's linked to multiple search profiles can have a different **Order** field value in each profile. For instance, you might set an **Order** value of 100 for the Q&A Genius Result configuration in one search profile but set a value of 750 for the same Genius Result configuration in a second search profile that it's linked to.

A search application configuration's **Genius Results Limit** field value specifies the maximum number of Genius Result cards the application can display. For more details on search application configuration settings, see Search Application Configuration form.

Genius Result trigger conditions

You can select any one of the following trigger conditions for a Genius Result configuration:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *Always*: The Genius Result configuration activates for all search queries.
- *NLU*: The Genius Result configuration activates when the search query's detected intent matches a specified Natural Language Understanding (NLU) model intent. For more information on NLU models and intents, see Natural Language Understanding.
- *Term*: The Genius Result configuration activates when the search query consists of a single specified term or phrase.

Note: A Genius Result configuration can trigger and still not return answers. Genius Result answers only display when AI Search has extremely high confidence that there's a correct response for the search query. You should typically expect to see Genius Result answers for a small percentage of search queries.

Genius Result answer types

A Genius Result configuration can include either of the following answer types:

- *Search*: When triggered, displays Genius Result cards for results from a search query. The search query must be defined in a server-side script included in the Genius Result configuration. Each search result displays as a separate Genius Result card, to a maximum of three cards. If the search query returns no results, no Genius Result card is displayed.
- *Script*: When triggered, displays a Genius Result card containing key-value pairs. The object containing these key-value pairs must be defined in a server-side script included in the Genius Result configuration. The script can use methods from any ServiceNow AI Platform® public API to construct this object.

Language support

In the base system, Genius Results only support English search queries.

Table record limit for Genius Result configurations with NLU trigger conditions

If an NLU model includes a table vocabulary source that references a table containing more than 100,000 records, sync fails for the vocabulary source. When sync fails, the model can't be successfully trained, and Genius Result configurations that use the model in their NLU trigger conditions don't operate correctly.

Warning: Don't activate the People Genius Result configuration if your instance has more than 100,000 records in any of the following tables:

- Catalog Item [sc_cat_item]
- Department [cmn_department]
- Location [cmn_location]
- User [sys_user]

These tables are configured as vocabulary sources in the Default AI Search Genius Results Model specified in the People configuration's NLU trigger condition. If your instance has more than 100,000 records in any of the listed tables, training will fail for the NLU model and the People Genius Result configuration won't operate correctly.

For more information on NLU vocabulary sources, see NLU vocabulary.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Genius Result review feedback

You can review individual Genius Result answers and provide feedback about their accuracy. To provide review feedback on a Genius Result answer, select one of the thumb icons shown on the answer card:

- If the answer answers your question accurately, select the thumbs up icon  .
- If the answer answers your question inaccurately, select the thumbs down icon  .

Your feedback helps ServiceNow improve future versions of Genius Result configurations.

Interaction with other search features

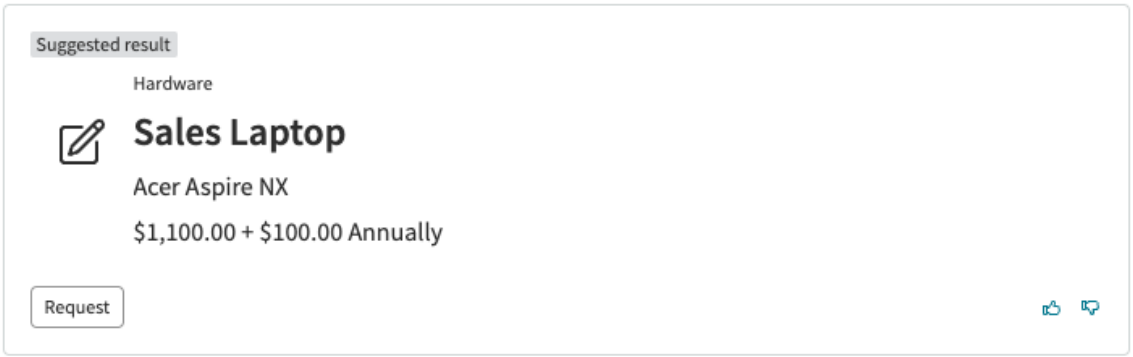
The following table describes interactions between Genius Results and other search features.

Feature	Interaction with Genius Results
Lemma and Unicode normalization	Search query terms added by lemma or Unicode normalization can't trigger Genius Result configurations with Term trigger conditions.
Stop words	If a search query term that matches a Genius Result configuration's Term trigger is defined as a stop word, AI Search evaluates the trigger before removing that stop word from the search query.
Synonyms	Synonym expansion terms can't trigger Genius Result configurations with Term trigger conditions.
Typo handling	Auto-corrected search query terms can't trigger Genius Result configurations with Term trigger conditions.

Genius Result configurations in the base system

Preconfigured AI Search Genius Result configurations display concise, actionable answers derived from high-relevancy search results. These configurations return Genius Result answers for Catalog Items, tables, users, and Knowledge articles that match your search.

The base system includes multiple Genius Result configurations.



Note: You can link the base system's Genius Result configurations to your own search profiles. You can't modify these Genius Result configurations, but you can clone them and modify the cloned configurations.

Catalog Item Genius Results

Catalog Item Genius Results display top search results from the Catalog Item [sc_cat_item] table. Each answer card shows a single Catalog Item record. You can create a request for the Catalog Item directly from the answer card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample Catalog Item Genius Result answer card

Select **Request** to create a new request for the specified Catalog Item.

Catalog Item Genius Results only support English searches.

NLQ Genius Results

NLQ (Natural Language Query) Genius Results use NLQ processing to surface relevant results from tables that match your search query. Each NLQ Genius Result answer card displays a preview of records from matching tables. You can navigate to a matching table's list view or the CMDB workspace directly from the Genius Result answer card.

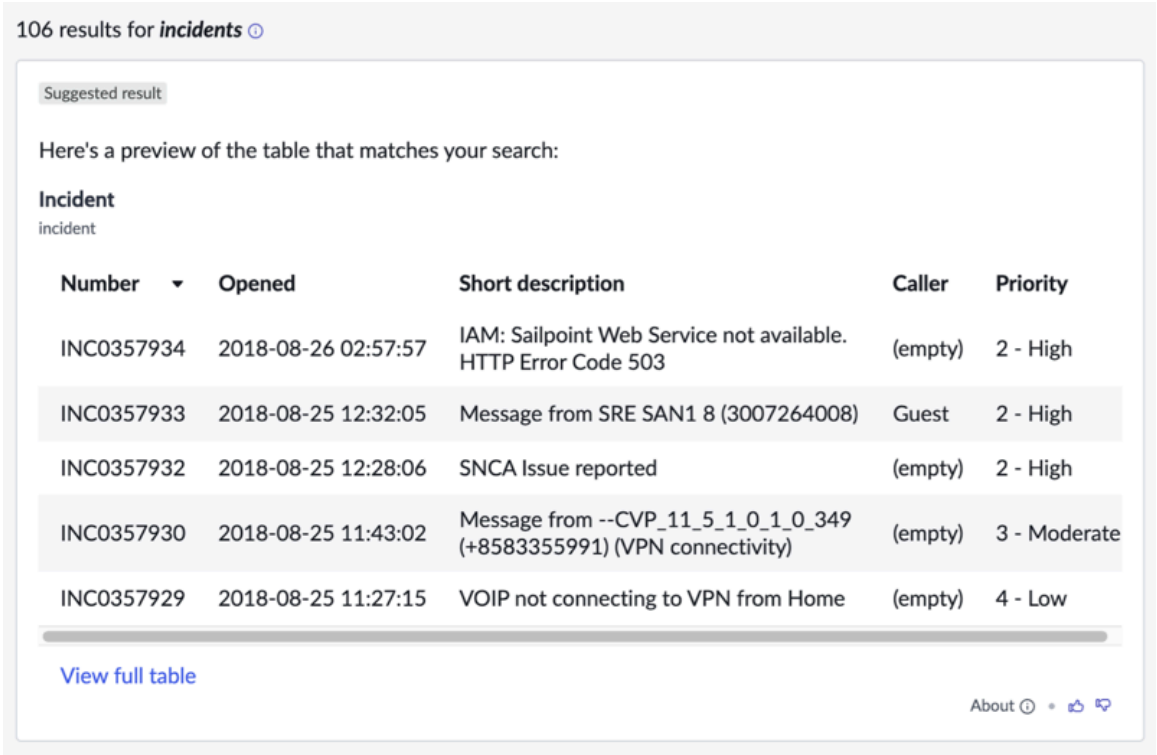
NLQ Genius Results don't use indexed sources when finding tables that match your query. You don't need to define a table as an indexed source to make it eligible to appear in NLQ Genius Result answers.

When computing NLQ Genius Result answers, AI Search identifies tables that match your search using the following NLQ query types:

- Natural language queries similar to the ones made using Analytics Overview. To learn more about Analytics Overview table query capabilities, see Platform Analytics overview.
- Natural language queries similar to the ones made using the Configuration Management Database (CMDB). These CMDB queries only match tables that aren't defined as indexed sources. For more information about CMDB table query capabilities, see Configuration Management.

AI Search combines the results from these query types when creating NLQ Genius Result answer cards. A single NLQ Genius Result answer card may contain tables returned by Analytics Overview queries, CMDB queries, or both.

For more information about NLQ processing, see Natural Language Query.



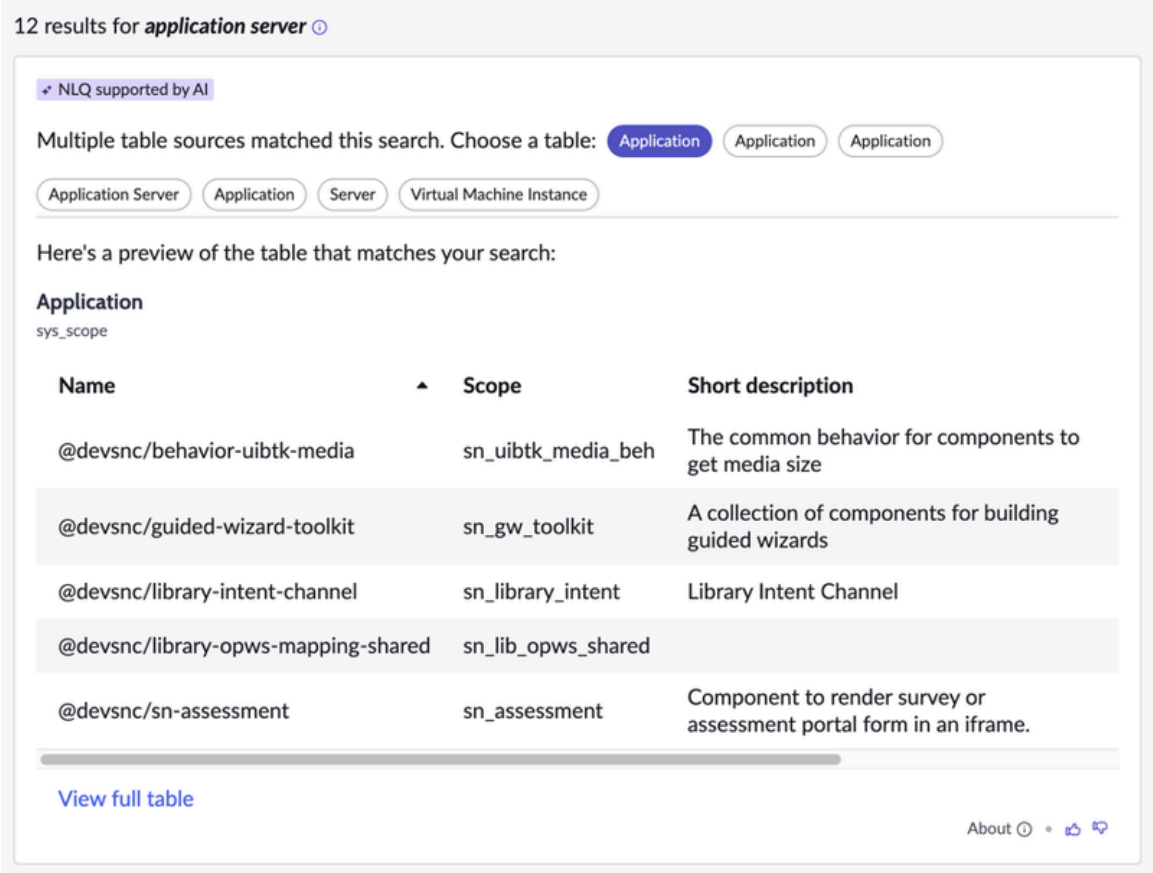
Answer card format

The NLQ Genius Result answer card shows different results depending on how many tables your search matched.

Search matches a single table

When your search only matches one table, the answer card's preview list displays up to five records from that table. To see more records from the table, select **View full table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

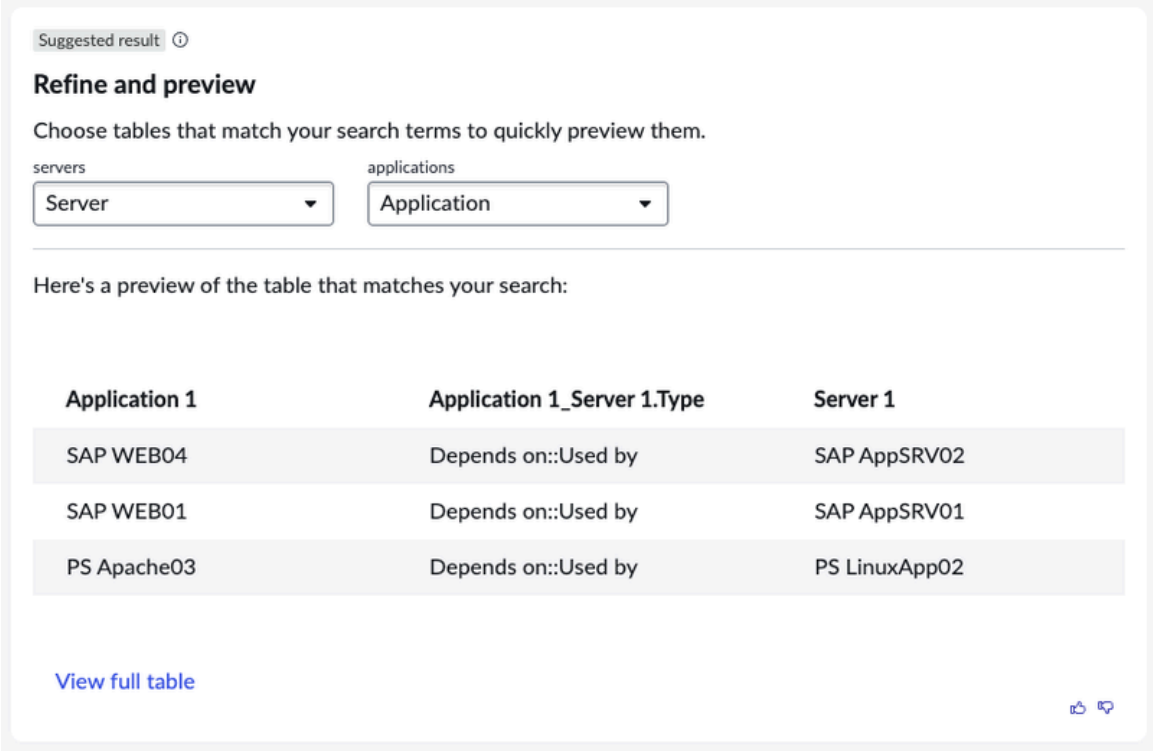


Search matches multiple tables

When your search matches multiple tables, the answer card displays the matching tables as pills or as entries in a drop-down list. You can select any of the matching tables to preview.

The preview list displays up to five records from the selected table. To see more records from the table, select **View full table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Multiple search terms match CMDB tables

When multiple terms in your search match CMDB tables, the answer card displays **Refine and preview** controls. A drop-down list appears for each search term that matches one or more CMDB tables. Use the drop-down lists to refine your results by selecting a CMDB table for each matching search term.

The preview list displays records from a CMDB workspace smart search for the selected tables, including their connecting relationships. To see more records from the chosen tables, select **View full table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing full tables

When you select **View full table** in an NLQ Genius Result answer card, the action performed depends on how the matching table was found. The default actions are as follows.

- If the table was found by an Analytics Overview table query, the system displays it in list view.
- If the table was found by a CMDB table query, the system displays it in the CMDB Workspace.

Search administrators can customize these actions. For more information, see the Configure navigation actions for NLQ Genius Result answer cards section.

Review feedback

Some NLQ Genius Result answers show *NLQ supported by AI* as their answer type, indicating that they used artificial intelligence to help find tables that matched your search query. Because these answers are automatically generated, you should review them for accuracy.

To provide review feedback on an NLQ Genius Result answer, select one of the thumb icons shown on the answer card. If the answer's information is accurate, select the thumbs up icon. If the answer's information isn't accurate, select the thumbs down icon.

Your feedback helps ServiceNow improve future versions of this Genius Result configuration.

Limitations

Like the other base system Genius Result configurations, NLQ Genius Results only support searches in English.

NLQ Genius Results rely on Natural Language Query processing, which can increase the time required to return results on the first search for a given set of terms. Consider this performance impact before enabling NLQ Genius Results in any of your AI Search applications.

NLQ Genius Results don't support the following table query options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Grouping of table query results
- Rendering of table query results as pie charts or bar charts
- Trend and single score visualizations
- Keywords that return results in non-list formats, such as `total`, `count`, or `average`

Display NLQ Genius Result answers in Service Portal search applications

Configure the system to display search result preview lists for NLQ Genius Result answers in Service Portal search applications.

Before you begin

Only perform this task if you want to use NLQ Genius Results in your Service Portal search applications. If you only use NLQ Genius Results in Next Experience search applications, you don't need to perform this task.

Role required: admin

About this task

The *glide.service_portal.ais_nlq_enabled* system property determines whether the system displays search result preview lists for NLQ Genius Result answers in Service Portal search applications.

Administrators should set this system property's value to *true* if the NLQ Genius Result configuration is active in any Service Portal application.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Select **New**.
3. On the System Property form, enter these values.

Field	Value
Name	glide.service_portal.ais_nlq_enabled
Type	true | false
Value	true

   For details on this system property's values, see the System properties for NLQ Genius Results section.

4. Press **Submit**.
   The new *glide.service_portal.ais_nlq_enabled* record appears in the System Property [sys_properties] table list view.

Configure navigation actions for NLQ Genius Result answer cards

Configure the navigation actions that trigger when a user selects **View full table** on an NLQ Genius Result action card. Each navigation action includes a redirection payload and can optionally include filters for a table's name, the NLQ source that returned the table, or the search profile used by the search application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: ais_admin

About this task
When you select **View full table** on an NLQ Genius Result answer card, the action performed depends on how the matching table was found. The default actions are as follows.

- For a table found by an Analytics Overview table query, the table displays in list view.
- For a table found by a CMDB table query, the CMDB workspace opens.

As a search administrator, you can customize the actions available for NLQ Genius Result answer cards.

Procedure
1. Navigate to the AI Search NLQ Navigation [ais_nlq_navigation] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `ais_nlq_navigation.list`.
   c. Press Enter.
2. Edit an existing navigation record or create a new one by selecting **New**.
3. On the AI Search NLQ Navigation form, fill in the fields for your navigation action.

Field	Description
Source	Optional NLQ source filter for the navigation action. The action only operates for tables that satisfy this source filter. When this field is left empty, the navigation action operates for tables from any NLQ source that isn't specified in another navigation action's **Source** field. As an example, suppose you have two navigation actions: one with **Source** set to `CMDB_WS` and a second one with no **Source** field value. ○ When an NLQ Genius Result answer card previews a table returned by the CMDB NLQ source, selecting **View full table** triggers the first navigation action because the table name satisfies the action's NLQ source filter. ○ When an NLQ Genius Result answer card previews a table from the Analytics Overview NLQ source, selecting **View full table** instead triggers the second navigation action because the table's NLQ source doesn't satisfy the first action's NLQ source filter. ○ Type: string ○ Default value: none. ○ Supported values: ▪ *AC*: The navigation action only operates for tables returned by the Analytics Overview NLQ source. ▪ *CMDB_WS*: The navigation action only operates for tables returned by the CMDB NLQ source.
Action Payload	JSON payload for the navigation action. This field's value determines where AI Search redirects when you select **View full table** on an NLQ Genius Result answer card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	When submitting the JSON payload for redirection, AI Search replaces the following references with relevant values: ○ *${logID}*: Replaced with the NLQ transaction's ID as shown in system logs. ○ *${query}*: Replaced with the query filter from the original search query that triggered the NLQ Genius Result. ○ *${table}*: Replaced with the name of the table previewed on the NLQ Genius Result answer card. ○ *${utterance}*: Replaced with the original search query that triggered the NLQ Genius Result. As an example, the default navigation action that opens a table in the CMDB workspace specifies this action payload that makes use of all four references: `{ "external": { "url": "now/cmdb/home/sub/smart-search-results/${table}/${utterance}/params/encoded-query/${query}/nlq-query-log/${logID}", "target": "_self" } }` ○ Type: JSON ○ Default value: none
Profile	Optional reference to a search profile record. The navigation action only operates in search applications that use the referenced search profile. When this field is left empty, the navigation action operates for any search application that doesn't use a search profile referenced in another navigation action's **Profile** field. As an example, suppose you have two navigation actions: one with **Profile** referencing the `Service Portal Default Search Profile` record and a second one with no **Profile** reference field value. ○ When you search in an application that uses the Service Portal Default Service Profile, selecting **View full table** on an NLQ Genius Result answer card triggers the first navigation action because the search profile in use is the one referenced in the action. ○ When you search in any other search application, selecting **View full table** instead triggers the second navigation action because the search profile in use isn't referenced in the first navigation action. ○ Type: reference ○ Default value: none
Action	Name for the navigation action. ○ Type: string ○ Default value: none
Table	Optional table filter for the navigation action. The action only operates for the table whose name matches this filter. When this field is left empty, the navigation action operates for any table that doesn't have its name specified in another navigation action's **Table** field.

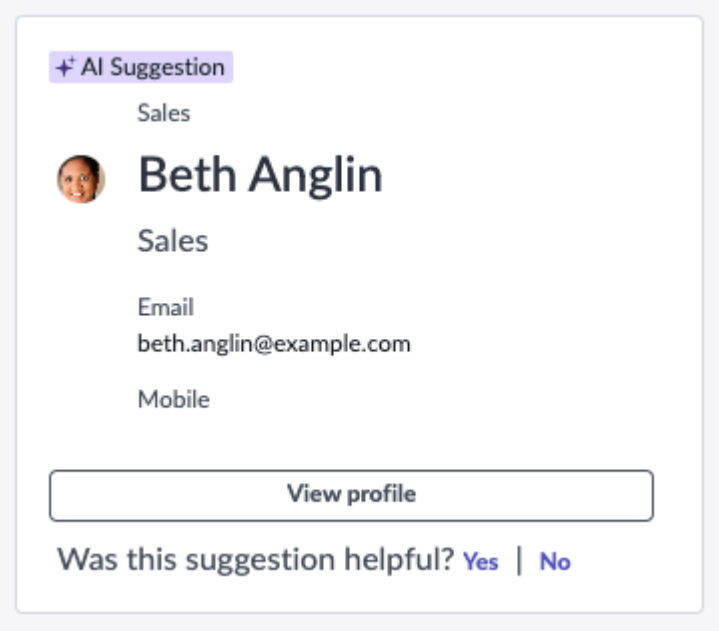
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	As an example, suppose you have two navigation actions: one with **Table** set to `my_custom_table` and a second one with no **Table** field value. ○ When an NLQ Genius Result answer card previews your custom table, selecting **View full table** triggers the first navigation action because the table name satisfies the action's table filter. ○ When an NLQ Genius Result answer card previews any other table, selecting **View full table** instead triggers the second navigation action because the table name doesn't satisfy the first action's table filter. ○ Type: table_name ○ Default value: none

4. Select **Update** if you're editing an existing navigation action record, or **Submit** if you're creating a new one.

System properties for NLQ Genius Results

A system property determines whether the system displays search result preview lists for NLQ Genius Result answers in Service Portal search applications.



Property	Description
glide.service_portal.ais_nlq_enabled	Specifies whether the system displays search result preview lists for NLQ Genius Result answers in Service Portal search applications. If you activate the NLQ Genius Result configuration in any Service Portal search application, set this system property's value to *true*. • Type: true | false • Default value: false • Location: System Property [sys_properties] table • Supported values: ○ *true*: The system displays search result preview lists for NLQ Genius Result answers in Service Portal search applications. ○ *false*: The system doesn't display search result preview lists for NLQ Genius Result answers in Service Portal search applications. ⚠ **Warning:** This value prevents NLQ Genius Result answers from displaying in Service Portal search applications.

People Genius Results

People Genius Results display top search results from the User [sys_user] table. Each People Genius Result answer card shows a single user record. You can view the user's full profile directly from the answer card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample People Genius Result answer card

Select **View profile** to see the user's profile.

People Genius Results only support English searches.

The People Genius Result configuration is inactive in the base system. To learn how to activate it, see Activate People Genius Results.

Warning: Don't activate the People Genius Result configuration if your instance has more than 100,000 records in any of the following tables:

- Catalog Item [sc_cat_item]
- Department [cmn_department]
- Location [cmn_location]
- User [sys_user]

These tables are configured as vocabulary sources in the Default AI Search Genius Results Model specified in the People configuration's NLU trigger condition. If your instance has more than 100,000 records in any of the listed tables, training will fail for the NLU model and the People Genius Result configuration won't operate correctly.

Activate People Genius Results

Enable AI Search's People default Genius Result configuration for use in your search profiles.

Before you begin
Role required: ais_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning: Don't activate the People Genius Result configuration if your instance has more than 100,000 records in any of the following tables:

- Catalog Item [sc_cat_item]
- Department [cmn_department]
- Location [cmn_location]
- User [sys_user]

These tables are configured as vocabulary sources in the Default AI Search Genius Results Model specified in the People configuration's NLU trigger condition. If your instance has more than 100,000 records in any of the listed tables, training will fail for the NLU model and the People Genius Result configuration won't operate correctly.

About this task

The People default Genius Result configuration is inactive in the base system. To use this Genius Result configuration in your search profiles, you must activate it.

Note: If you upgraded from the Quebec release, this Genius Result configuration is already activated. You don't need to perform the steps from this task.

As part of activation, you need to run a scheduled job that trains and publishes the Default AI Search Genius Results Model. This *NLU* model contains intents used by the People configuration's *NLU* trigger.

For more information on the People default Genius Result configuration, see People Genius Results.

Procedure

1. Train and publish the Default AI Search Genius Results Model.
   a. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
   b. Open the *AI Search* **Create Train Model** job.
   c. Select **Execute Now**.
   d. Check the publication status of the NLU model by navigating to **All** > *AI Search* > **Search Query Settings** > **Search Intents**.
   When a **Last Published** field value is displayed, the NLU model is trained and published. You can now activate the People default Genius Result configuration.
2. Activate the People default Genius Result configuration.
   a. Navigate to **All** > *AI Search* > **Search Query Settings** > **Genius Results**.
   b. Open the People Genius Result configuration.
   c. On the AI Search Genius Result Configuration form, select **Change Active State**.
   For a description of the field values, see AI Search Genius Result Configuration form.
   The Genius Result configuration's **Active** field value changes to *true*.

Result

The People Genius Result configuration is available for use in search profiles.

Q&A Genius Results

Q&A Genius Results display top search results extracted from HTML fields of records on the Knowledge [kb_knowledge] table and tables that extend it. Each Q&A Genius Result answer card shows a topic snippet and an answer snippet extracted from a single Knowledge article. You can view the full article directly from the answer card.

A snippet is a short, typically paragraph-length, section of text that contains useful and relevant information. A Genius Result answer's topic snippet indicates the subject for the answer, while the answer snippet provides details on that subject.

Sample Q&A Genius Result answer card

Select **View Article** to view the full Knowledge article.

Note: Knowledge search property settings don't affect Q&A Genius Results. For more information on these settings, see Knowledge search properties.

Q&A Genius Results only support English searches.

Because the Q&A implementation is based on deep neural networks that are continually improving, Q&A results for specific queries may vary from release to release. Articles boosted or promoted by result improvement rules are more likely to appear as Q&A Genius Results, but aren't guaranteed to appear.

Topic and answer snippet extraction for Q&A Genius Results

By default, AI Search automatically determines which elements of a Knowledge article's HTML field values to extract as the Q&A topic and answer snippets. You can't configure the criteria for this extraction behavior.

Topic and answer snippet extraction behavior varies depending on the source table for the Knowledge article:

Knowledge article source	Q&A topic and answer snippet extraction
FAQ [kb_template_faq] table	AI Search extracts the Q&A topic snippet from the Knowledge article record's **Question** HTML field. It extracts the Q&A

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge article source	Q&A topic and answer snippet extraction
Note: This table is enabled when you activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced). For more information, see Activate the Knowledge Management Advanced plugin	answer snippet from the record's **Answer** HTML field.
Knowledge [kb_knowledge] table and all other tables that extend it	AI Search extracts the Q&A topic and answer snippets from the Knowledge article record's HTML fields.

Because the default extraction behavior favors search precision, it may not extract all desired Q&A topic and answer snippets. You can override the extraction behavior for a Knowledge article by manually designating topic and answer snippets in that article's HTML fields. Manually designating snippets increases the likelihood that they will appear as Q&A results, but doesn't guarantee that they will.

To manually designate snippets for an article, set the following HTML classes on elements in the article's HTML fields.

HTML Class	Description
`class="sn_snippet_topic"`	Set this class on the HTML field element that contains text that you want to designate as the Q&A Genius Result topic snippet for the Knowledge article.
`class="sn_snippet_answer"`	Set this class on the HTML element that contains text that you want to designate as the Q&A Genius Result answer snippet for the Knowledge article. **Note:** Answer snippets should be from 250 to 300 characters in length. Longer answer snippets may be cut off when displayed on the Q&A Genius Results card.

Machine reading comprehension model

AI Search uses a machine reading comprehension (MRC) model to validate extracted answer snippets. The MRC model analyzes each extracted snippet to determine whether it answers your question. An answer snippet must pass this validation filter step before it can be displayed as a Q&A Genius Result answer.

When you enable factoid extraction for Q&A Genius Results, the MRC model also finds the exact span of text within the extracted snippet that represents the answer to your question.

You can't configure settings for MRC models or choose which model to use for Q&A Genius Results. AI Search performs A/B testing with different search query parameter values to automatically select the best MRC model for you. For more details on this A/B testing process, see Search query parameter evaluation framework.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge Management and Q&A Genius Results

When you activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced), Q&A Genius Results can return answers from records on the FAQ [kb_template_faq] table as well as records on the Knowledge [kb_knowledge] table and its child tables.

Additionally, if a search query satisfies one of the following conditions, AI Search bypasses the usual Q&A routines and returns the FAQ record's **Answer** field value as a Q&A Genius Result answer:

- The user's search query exactly matches the **Question** field value from the FAQ record.
- A result improvement rule promotes the FAQ record to be the first result for the user's search

As an example, suppose you create an FAQ record with **Question** `How do I reset my password?`. When a user searches for `how do I reset my password`, AI Search returns a Q&A Genius Result card with an answer snippet extracted from the FAQ record's **Answer** field value.

Interaction with other search features for Q&A Genius Results

The following table describes interactions between Q&A Genius Results and other search features.

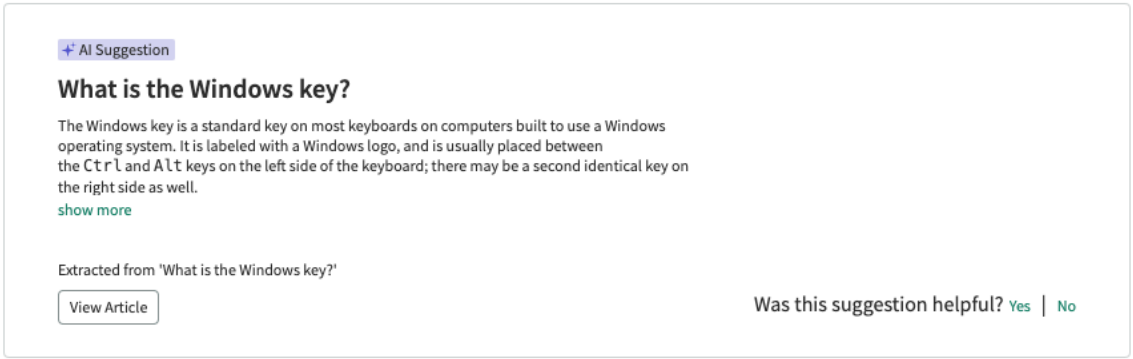
Feature	Interaction with Q&A Genius Results
Result improvement rules with block actions	When computing Q&A Genius Results for a search query, AI Search ignores blocked search results.
Stop words	When computing Q&A Genius Results for a search query, AI Search ignores stop words in the query.
Synonyms	When computing Q&A Genius Results for a search query, AI Search expands synonyms in the query.
Typo handling	When computing Q&A Genius Results for a search query, AI Search corrects terms in the query.

Factoid extraction for Q&A Genius Results

Factoid extraction uses the machine reading comprehension (MRC) model to find the exact span of text within a longer extracted snippet that represents the answer to your question.

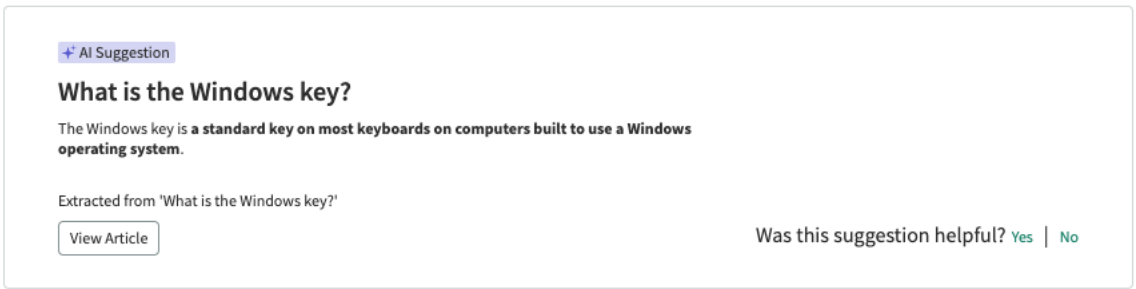
Enabling factoid extraction

To enable factoid extraction for Q&A Genius Results, set the *`glide.ais.genius_result.qna_mode`* system property to **sentence** or **snippet**.



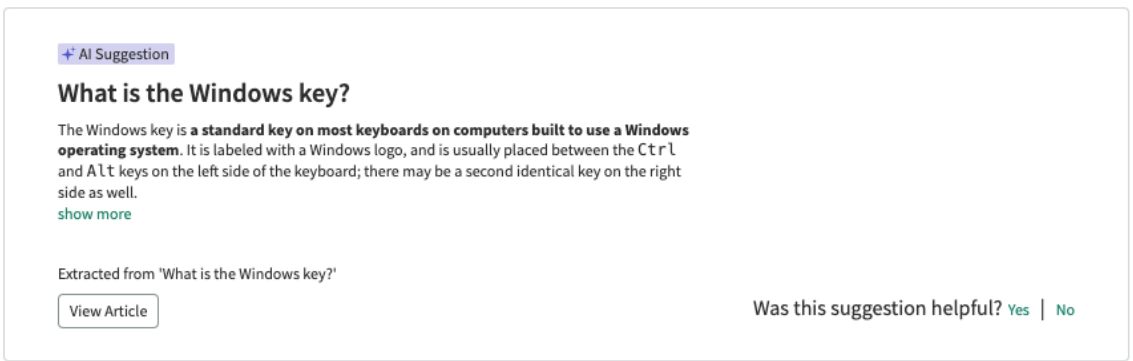
For details on setting this system property, see the Set the factoid extraction mode for Q&A Genius Results section. To learn about the effects of this system property's values, see the System properties for factoid extraction in Q&A Genius Results section.

Examples of factoid extraction



The following images illustrate how the *`glide.ais.genius_result.qna_mode`* system property setting affects the display of Q&A Genius Result answer cards for a sample `What is the Windows key?` search in Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- With the system property set to *none*, the Q&A Genius Result answer card displays the full extracted text snippet with no highlighting:

- With the system property set to *sentence*, the Q&A Genius Result answer card displays only the sentence containing the factoid, and highlights the factoid:

- With the system property set to *snippet*, the Q&A Genius Result answer card displays the full extracted text snippet and highlights the factoid:

Set the factoid extraction mode for Q&A Genius Results

Specify how you want factoid extraction to display and highlight answers for Q&A Genius Results.

Before you begin

Role required: ais_admin

About this task

As a search administrator, you can specify the factoid extraction mode for Q&A Genius Results by setting the value of the *glide.ais.genius_result.qna_mode* system property. This system property does not exist in the base system, so you may have to add it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search for a system property record with name *`glide.ais.genius_result.qna_mode`*.
   - If a system property record with this name exists, open the record by selecting it.
   - If no system property record with this name exists, select **New**, then enter `glide.ais.genius_result.qna_mode` in the System Property form's **Name** field.
3. In the System Property form's **Value** field, enter one of the following values:
   - *`none`* to disable factoid extraction and highlighting for Q&A Genius Results.
   - *`sentence`* to make Q&A Genius Result answer cards display only the sentence containing the factoid (and to highlight the factoid).
   - *`snippet`* to make Q&A Genius Result answer cards display the full extracted text snippet containing the factoid (and to highlight the factoid).

   For details on these system property values, see the System properties for factoid extraction in Q&A Genius Results section.
4. Save the modified System Property record by selecting **Submit** or **Update**.

System properties for factoid extraction in Q&A Genius Results

A system property determines how the system extracts factoids from knowledge articles when computing Q&A Genius Results.

Property	Description
glide.ais.genius_result.qna_mode	Specifies the factoid extraction mode that you want Q&A Genius Results to use. For more information on factoid extraction, see the Factoid extraction for Q&A Genius Results section. • Type: string • Default value: *`none`* • Location: System Property [sys_properties] table • Supported values: ○ *`none`*: Q&A Genius Result answer cards display the full extracted snippet from the source HTML article without highlighting. ○ *`sentence`*: Q&A Genius Result answer cards display the sentence from the source HTML article that contains the factoid, with the factoid highlighted if possible. ○ *`snippet`*: Q&A Genius Result answer cards display the full extracted snippet from the source HTML article, with the factoid highlighted if possible.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Link a Genius Result configuration to a search profile

Link a Genius Result configuration to one or more search profiles.

Before you begin
Role required: ais_admin

About this task
To use a Genius Result configuration, link it to a search profile. AI Search evaluates the Genius Result configuration for all searches made with the search profile.

You can link a single Genius Result configuration to multiple search profiles. A search profile can include multiple Genius Result configuration links.

AI Search evaluates active Genius Result configurations for a search profile in an order determined by their numeric **Order** field values, as defined in the search profile's Genius Results related list. Genius Result configurations with lower **Order** field values are evaluated before those with higher field values. As an example, a Genius Result configuration with **Order** 100 is evaluated before one with **Order** 200.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to link the Genius Result configuration to.
3. In the Genius Results related list, select **Link Existing**.
4. On the Search Profile - Genius Result Mapping form, fill in the fields.
   For a description of the field values, see Search Profile - Genius Result Mapping form.
5. Select **Submit**.

Result
The new Genius Result configuration link appears in the search profile's Genius Results related list.

Set the evaluation order for Genius Result configurations in a search profile

Change the order in which AI Search evaluates Genius Result configurations linked to a search profile.

Before you begin
Role required: ais_admin

About this task
AI Search evaluates active Genius Result configurations for a search profile in an order determined by their numeric **Order** field values, as defined in the search profile's Genius Results related list. Genius Result configurations with lower **Order** field values are evaluated before those with higher field values. As an example, a Genius Result configuration with **Order** 100 is evaluated before one with **Order** 200.

> **Note:** **Order** field values for linked Genius Result configurations are set separately for each search profile. A Genius Result configuration that's linked to multiple search profiles can have a different **Order** field value in each profile. For instance, you might set an **Order** value of 100 for the Q&A Genius Result configuration in one search profile but set a value of 750 for the same Genius Result configuration in a second search profile that it's linked to.

A search application configuration's **Genius Results Limit** field value specifies the maximum number of Genius Result cards the application can display. For more details on search application configuration settings, see Search Application Configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to set the Genius Result configuration evaluation order for.
3. In the Genius Results related list, edit the **Order** field values for Genius Result configurations linked to the search profile.
   For details on editing field values in the related list, see Use the list editor.

What to do next

To make changes in the **Order** field values take effect, publish the search profile. For more information on publishing a search profile, see Publish an AI Search search profile.

Create a Genius Result configuration

Create a Genius Result configuration, set its trigger condition, and configure the results displayed on its answer card.

Before you begin

Role required: ais_admin

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to link the new Genius Result configuration to.
3. In the Genius Results related list, select **Create and Link**.
4. On the AI Search Genius Result Configuration form, fill in the fields.
   For a description of the field values, see AI Search Genius Result Configuration form.
5. Select **Submit**.
   The new Genius Result configuration appears in the Genius Results related list.
6. **Optional:** Open the **Order** for the new Genius Result configuration to control its display order for the search profile.

What to do next

Changes to Genius Result configurations take effect in search as soon as you save them. You don't need to publish the linked search profile to make the new configuration take effect.

If you selected an *NLU* trigger condition, you must link an NLU model and its intents to your Genius Result configuration. For instructions, see Link an NLU model and intents to a Genius Result configuration.

Link an NLU model and intents to a Genius Result configuration

Specify the NLU model and intents to use for a Genius Result configuration with an NLU trigger condition.

Before you begin

Role required: ais_admin

Procedure

1. Navigate to **All** > *AI Search* > **Search Query Settings** > **Genius Results**.
2. Open the Genius Result configuration that you want to link an NLU model to.
3. In the NLU Model related list, select **Link Existing**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the AI Search Genius Result Configuration NLU Model Mapping form, fill in the fields.
5. Select **Submit**.

Result
The NLU model and its selected intents appear in the NLU Models related list.

What to do next
For an NLU trigger condition to function, the NLU model must be published. You can verify NLU model status by navigating to **All** > *AI Search* > **Search Query Settings** > **Search Intents**.

Result improvement rules

Define rules with configurable trigger conditions to boost, block, or promote search results for specific searches. You can also boost search results for documents matching elements of the user context, such as a user's country, OS, or device type.

Result improvement rules with boost actions override the default search result order produced by the AI Search machine learning relevancy feature. Rules with block or promote actions override the default result set for a search query.

Rule structure

A result improvement rule consists of these parts:

- A set of conditions that determine when the rule activates.
- A set of boost, block, or promote actions that determine how the rule modifies the search query's results when activated. The rule can only include actions of a single type, but can include multiple actions of that type.

Rule conditions include the following:

- A date range bounded by start and end dates. The rule can only activate during the specified date range.
- A language. The rule can only activate if this language matches the search query's language.
- Optionally, a set of one or more trigger conditions. Triggers can operate on individual search query keywords, the full search query, or elements of the search user's context such as their department, language, or browser version. The rule can only activate if all of its trigger conditions are met.

Rule actions include the following types:

- *Boost*: Increase the relevancy scores for search results from an indexed source that satisfy your specified conditions. You can select any of the following options:
  - Boost relevancy for all search results from the indexed source.
  - Boost relevancy for search results from the indexed source that include field values matching a dynamically populated value from the user context.
  - Boost relevancy for search results from the indexed source that include field values matching a static string value that you specify.
  - Boost relevancy for search results from the indexed source that include field values matching synonyms from one of your synonym dictionaries.
- *Block*: Exclude specific results from the search query's results list.
- *Promote*: Display specific results at the start of the search query's results list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each result improvement rule can only perform actions of a single type when activated. You can define multiple actions of the same type for a rule.

Block actions take precedence over other actions. For example, if two result improvement rules block and promote the same search result, AI Search excludes the search result from the search query's results list.

Language dependence

Result improvement rule activation is language-dependent. You specify a language for each result improvement rule.

AI Search supports result improvement rules for all languages activated in your instance. For the list of languages you can activate, see Activate a language.

Interaction with other search features

The following table describes interactions between result improvement rules with Query triggers and other search features.

Feature	Interaction with result improvement rules
Lemma and Unicode normalization	A search query term added by lemma or Unicode normalization can trigger a result improvement rule if it matches the rule's Query trigger.
Stop words	If a search query term that matches a result improvement rule's Query trigger is defined as a stop word, AI Search evaluates the rule trigger before removing the stop word from the search query.
Synonyms	By default, a synonym expansion term can activate a result improvement rule if it matches the rule's Query trigger. You can prevent synonym expansion terms from activating a rule with a Query trigger by clearing the **Expand Synonyms For Query Conditions** option that appears when you define the Query trigger.
Typo handling	An auto-corrected search query term can trigger a result improvement rule if it matches the rule's Query trigger.

Create a result improvement rule

Create a rule to boost, block, or promote search results or to block Genius Results. Specify the conditions that activate your rule and choose the action it performs when activated.

Before you begin
Role required: ais_admin

About this task
You can configure activation conditions and triggers for a result improvement rule. Additional topics cover steps for configuring boost, block, or promote actions for your rule.

Note: Each result improvement rule can only perform actions of a single type when activated. You can define multiple actions of the same type for a rule.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the search profile that you want to add the result improvement rule to.
3. In the Result Improvement Rules related list, select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the AI Search Results Improvement Rule form, fill in the fields.
   For a description of the field values, see AI Search Results Improvement Rule form.
5. Select **Submit**.
   The Actions related list appears.
6. Choose the action that you want the result improvement rule to perform when activated, and see the appropriate topic for configuration steps:
   - To increase the relevancy scores of search result records that include specific field values, see Boost search results using a result improvement rule.
   - To prevent specific records from appearing in the search results, see Block search results and Genius Results using a result improvement rule.
   - To make specific records appear first in the search results, see Promote search results using a result improvement rule.

What to do next

To make new or updated result improvement rule settings take effect, publish the search profile that you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Boost search results using a result improvement rule

Increase the relevancy scores for search results that satisfy a custom set of conditions.

Before you begin

Create your result improvement rule first to define your trigger conditions. For steps to create a result improvement rule, see Create a result improvement rule.

Role required: ais_admin

About this task

Boost actions define relevancy changes applied by result improvement rules. When a result improvement rule with a boost action activates, AI Search modifies the relevancy scores for search results from an indexed source specified in the action. You can choose one of these boost types:

- Boost all search results from the specified indexed source.
- Boost only search results from the specified indexed source with a field value that matches a dynamically populated field value from the searcher's user context.
- Boost only search results from the specified indexed source with a field value that matches a static string value specified in the action.
- Boost only search results from the specified indexed source with a field value that matches a synonym defined in a synonym dictionary.

You can specify a boost weight for each boost action. This is an integer value that AI Search uses to alter the relevancy scores for search results affected by your boost action. Boost weights can be positive or negative.

Positive boost weights increase the relevancy scores for boosted search results. Each boost weight of 1 increases a boosted search result's relevancy score by 0.1% of its original value. For example, if you set a boost weight of 100, you increase each boosted search result's relevancy by +10%, so a search result with an original relevancy score of 60 gets a final relevancy score of 66. Setting a boost weight of 1000 adds +100%, doubling the relevancy scores for boosted search results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Negative boost weights reduce the relevancy scores for boosted search results. Each boost weight of –1 reduces a boosted result's relevancy score by 0.1% of its original value. As an example, if you set a boost weight of –150, you reduce a boosted search result's relevancy by 15%, so a search result with an original relevancy score of 100 gets a final relevancy score of 85. Any boost weight of –1000 or lower reduces a boosted search result's relevancy score to 0, causing it to appear at the end of the search result list.

When a single search result is affected by multiple boost actions, AI Search adds the individual boost weights together to determine the total relevancy score modifier. For example, a search result boosted by three rules with boost weights 100, 150, and –25 has a total boost weight of 225, increasing its final relevancy score by 22.5% of its original value.

Note: Boost actions don't change the set of results returned for your search, so you can't boost a record that doesn't match your search. If you want to add a search result into your results whether or not it matches your search, try using a promote action instead. For details on this action, see Promote search results using a result improvement rule.

Procedure

1. In the Actions related list, select **Create Boost Action**.
2. On the Rule - Action Mapping form, set the boost weight and fill in the other fields.
3. Select **Submit**.
4. **Optional:** Edit the **Order** values for the result improvement rule's boost actions.

What to do next

To make new or updated result improvement rule settings take effect, publish the search profile you edited. For details on publishing a search profile, see Publish an AI Search search profile.

List of result improvement rule boost types

This list describes the types of search result relevancy boost that you can apply using a result improvement rule.

Boost action types

Type	Description
Boost All Documents In Indexed Source	Applies relevancy boost to every search result from the selected indexed source. As an example, you might boost all results from the Knowledge Table indexed source.
Boost By User Context (dynamic)	Applies relevancy boost to search results from the selected indexed source if they include a value for the selected field that matches a field value specified in the dynamically populated user context. As an example, you might boost all results from the Knowledge Table indexed source with Short description field values that contain matches for the city specified in the current search user's location, as set in their user context. This configuration could end up boosting different records when you search from Paris than when you search from New York City.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Boost action types (continued)

Type	Description
	Note: Starting with the Xanadu release, AI Search expands user context field values using published, active synonyms defined in dictionaries linked to the current search profile. As an example, if the user context location is `Paris` and you define a synonym that defines `Paris` and `France` as equivalent, your result improvement rule boosts documents containing `France` as well as those containing `Paris`. For more details on synonym expansion, see Synonyms.
Boost By Field Match (static)	Applies relevancy boost to search results from the selected indexed source if they include a value for the selected field that matches a specified static value. As an example, you might boost all results from the Knowledge Table indexed source that have Short description field values matching the static value `Dealing with Spyware and Viruses`.
Boost By Synonym Dictionary	Applies relevancy boost to search results from the selected indexed source if they include a value for the selected field that matches any synonym defined in a selected synonym dictionary. As an example, you might create a custom synonym dictionary named Boost Synonyms. You could then configure a result improvement rule to boost all results from the Knowledge Table indexed source which have Short description field values containing matches for synonyms in that dictionary. If the dictionary includes a synonym that defines `laptop` and `computer` as equivalent, this result improvement rule boosts knowledge article search results with short descriptions that include `laptop` or `computer` (or both). The selected synonym dictionary must be published, active, and linked to the current search profile. AI Search only checks for matches against published and active synonyms in the dictionary. For more details on synonyms and synonym dictionaries, see Synonyms.

Block search results and Genius Results using a result improvement rule

Configure a result improvement rule to prevent specific documents from appearing as Genius Results or search results.

Before you begin

Create your result improvement rule first to define your trigger conditions. For steps to create a result improvement rule, see Create a result improvement rule.

Role required: ais_admin

About this task

Block actions hide selected search results from the result set. When a result improvement rule with a block action activates, its effect depends on the result improvement rule's **Apply only to Genius Results** option setting:

- If this option is selected, the block action prevents selected documents from appearing as Genius Result answers. Selected documents can still appear as search results.
- If this option is cleared, the block action prevents the selected documents from appearing as Genius Result answers or search results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Actions related list, select **Block Documents**.
2. In the Select Documents To Block dialog box, search for results that you want to block.
3. To add a search result to the selected results pane, select the plus sign next to it.
4. After selecting all the results that you want to block, select **Add Documents and Close**.
5. **Optional:** Edit the **Order** values for the result improvement rule's block actions.

What to do next

To make new or updated result improvement rule settings take effect, publish the search profile that you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Promote search results using a result improvement rule

Configure a result improvement rule to make specific records appear first in results for a search.

Before you begin

Create your result improvement rule first to define your trigger conditions. For steps to create a result improvement rule, see Create a result improvement rule.

Role required: ais_admin

About this task

Promote actions define search results to spotlight in the result set. When a result improvement rule with a promote action activates, it displays search results specified in the action ahead of other results for the search query.

Note: Promote actions can spotlight results that wouldn't otherwise match your search. Spotlighted results are added to the search results set if they're not already present in it.

Procedure

1. In the Actions related list, select **Promote Documents**.
2. In the Select Documents To Promote dialog box, search for the results that you want to promote.
3. To add a search result to the selected results pane, select the plus sign next to it.
4. After selecting all the results that you want to promote, select **Add Documents and Close**.
5. **Optional:** Edit the **Order** values for the result improvement rule's promote actions.
   The **Order** field only accepts integer values. AI Search evaluates promote actions with lower **Order** values before promote actions with higher values. As an example, a promote action with **Order** 150 is evaluated before one with **Order** 200.

What to do next

To make new or updated result improvement rule settings take effect, publish the search profile that you edited. For details on publishing a search profile, see Publish an AI Search search profile.

Share result improvement rules between search profiles

Make your search experiences more consistent by configuring a search profile to mirror result improvement rules from other search profiles.

Before you begin

You must have ServiceNow Otto for AI Search installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: ais_admin

About this task

Result improvement rules are specific to the search profile they're created in, and can't be copied between search profiles. As a search administrator, however, you can configure a search profile to use the set of result improvement rules defined in another search profile. This approach lets you define your result improvement rules in one place while making them available in multiple different search experiences.

This procedure is called mirroring, since your affected search profile reflects result improvement rules defined in another search profile. The search profile that includes your result improvement rules is called the mirror source, and the search profile that uses those rules is called the mirror target.

Note: You can link multiple mirror source search profiles to a single mirror target search profile. Similarly, you can link a single mirror source search profile to multiple mirror target search profiles.

When you modify result improvement rules in a mirror source search profile and then publish that search profile, AI Search checks all mirror target search profiles that link to that mirror source.

- If the mirror target search profile is published, AI Search republishes it so that it reflects your result improvement rule changes.
- If the mirror target search profile isn't published, an informational message reminds you to publish it so that it can reflect your result improvement rule changes.

This check keeps result improvement rule changes in sync across your search profiles.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the record for the mirror target search profile.
   As an example, if you've defined result improvement rules in the Service Portal Default Search Profile and now want to mirror those rules in the ESC Portal Default Search Profile, open the ESC Portal Default Search Profile record.
3. To add another search profile as a mirror source for result improvement rules, create a link to it.
   a. In the Mirrored Result Improvement Rules related list, select **Link Search Profile**.
   b. On the Mirrored Result Improvement Rule form, in the **Mirror Source** field, enter the name of the search profile that you want to mirror result improvement rules from, or use the Lookup using list icon to populate the field.
   c. Select **Submit**.
   The new mirror source search profile appears in the Mirrored Result Improvement Rules related list.
   d. **Optional:** Repeat the linking procedure for each additional search profile you want to add as a mirror source.
4. To remove one or more search profiles as mirror sources for result improvement rules, unlink them:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Mirrored Result Improvement Rules related list, select the row checkbox for each mirror source that you want to remove.

b. Select **Unlink Selected**.
The selected mirror source search profiles are removed from the Mirrored Result Improvement Rules related list.

5. To make your mirror source changes take effect, publish your modified mirror target search profile.
For details on publishing a search profile, see Publish an AI Search search profile.

Search application configurations

A search application configuration specifies the search engine and settings to use for search in a ServiceNow AI Platform® application. When you choose AI Search as an application's search engine, you can select a search profile for the application and configure its search result display and refinement settings.

A search application configuration contains a reference to a search profile, along with settings that affect how search results are displayed to users of the application. The search profile specifies settings that determine how AI Search generates search results for a given search. To learn more about search profile configuration settings, see Search profiles in AI Search.

Some ServiceNow AI Platform applications install their own AI Search application configurations when you activate them. For example, activating the Customer Service Management (CSM) application installs AI Search application configurations for the Customer Service Portal and Consumer Service Portal.

AI Search includes search application configurations for use in the following ServiceNow AI Platform applications:

- Employee Center
- Virtual Agent
- Service Portal

You can modify existing search application configurations, or create and configure your own search application configurations with AI Search specified as the search engine.

For details on enabling AI Search and specifying search application configurations in supported applications, see Enabling and configuring AI Search in ServiceNow AI Platform applications.

Note: When you view or edit search application configuration records, the system may display a warning message telling you to reindex one or more indexed sources. This reindexing process (a one-time process for each indexed source listed) is required to correctly populate search-based auto-complete suggestions. For more details on auto-complete suggestions, see Auto-complete suggestions in AI Search applications.

Create a search application configuration for AI Search

Create a search application configuration to specify AI Search as the search engine for a ServiceNow AI Platform® application. Select a search profile for the application to use. Configure the application's settings for refinement and display of search results.

Before you begin

Role required: search_application_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Select **New**.
3. On the Search Application Configuration form, fill in the fields.
   For a description of the field values, see Search Application Configuration form.
4. Select **Submit**.

Result

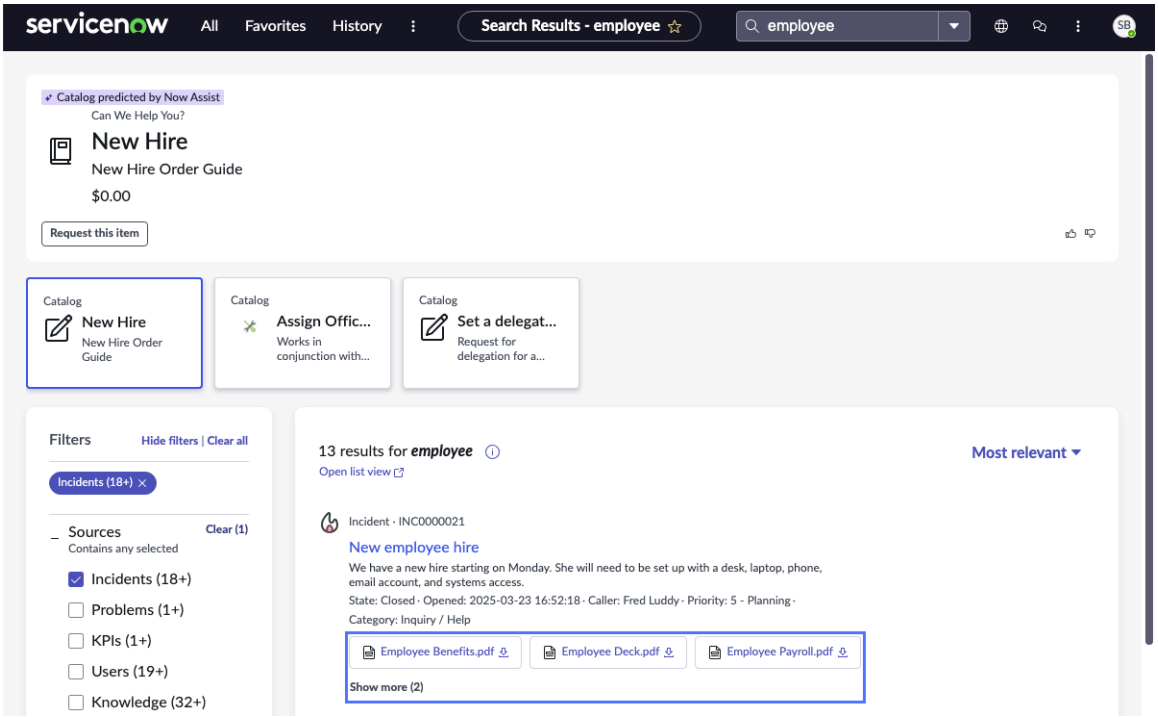
The new search application configuration record appears in the Search Application Configurations list.

What to do next

To use your new search application configuration, select it in the configuration for a ServiceNow AI Platform application that supports AI Search. For more information on these ServiceNow AI Platform applications, see Enabling and configuring AI Search in ServiceNow AI Platform applications.

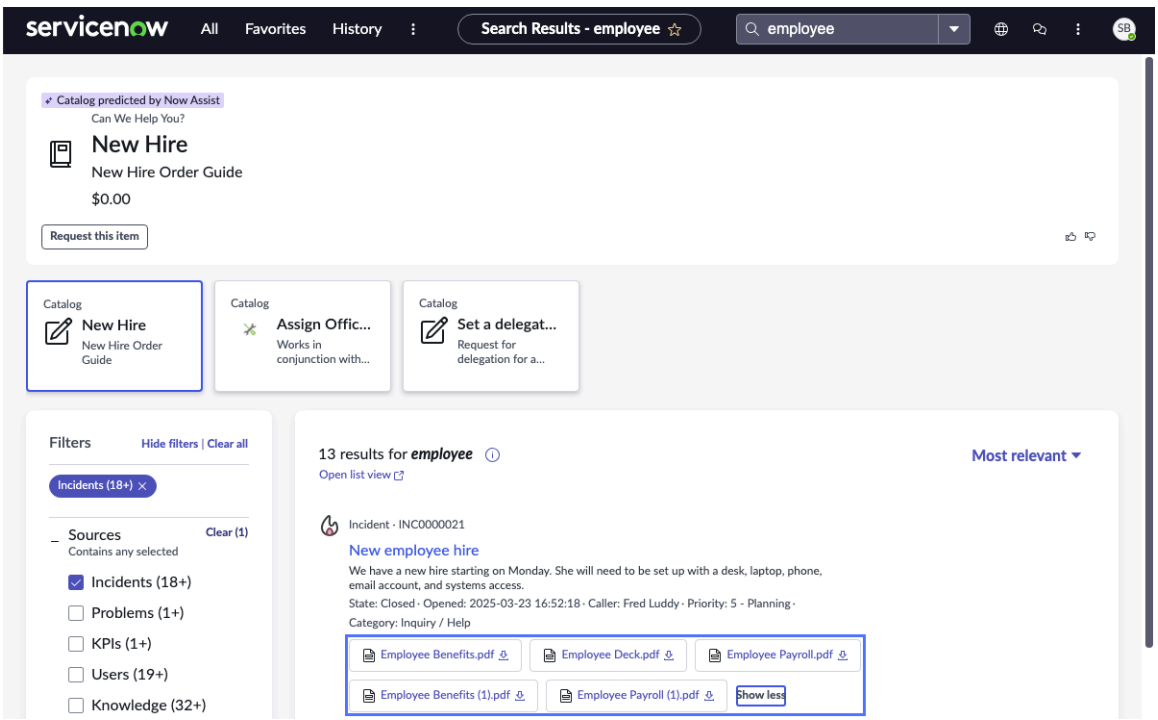
Grouping attachment search results with their parent search results

Search application administrators can control whether attachment search results appear grouped with their parent search results or whether they display on their own. By default, AI Search displays attachments grouped with their parent search results.



By default, AI Search displays separate search results for the parent record and each of its attachments that matches the user's search. Search administrators can enable grouping of attachment search results with the results for their parent records. With this option enabled, search results for attachments that match a user's search display inline with the search results for their parent record.

The maximum number of attachments per parent search result is set by the **Attachment Limit** field in the search application's configuration record. For details on this field, see Search Application Configuration form.



Grouped attachments in the search results UI

If the parent record itself or any of its attachments matches the user's search, the parent record appears in the search result list. Grouped attachments that match the search appear in collapsed form, in descending relevancy order within the search result for their parent record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, a parent search result shows up to three attachments in collapsed format. If it has more than three attachments, a **Show more** link appears, with a number indicating how many attachments are hidden in the current view. When you select this link, the hidden attachments appear and the link name changes to **Show less**. Selecting this link hides the overflow attachments again.

Viewing or downloading attachment search results

Selecting an attachment search result downloads the original attachment to your web client, or opens the original attachment in Document Viewer if all of these conditions are met:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Document Viewer is active on your instance.
- Document Viewer is enabled for the attachment's source table.
- The *useAttachmentViewer* EVAM property is set to *true* for the parent search result.

For details on activating and enabling Document Viewer, see Enable Document Viewer.
To learn more about EVAM property settings for search results, see Configure EVAM display settings for search results in AI Search applications.

Relevancy and click rank for grouped attachment search results

When attachment grouping is in use, AI Search computes relevancy scores for the parent record and each of its grouped attachments. The final relevancy score of the grouped search result is the highest of these individual relevancy scores.

Note: When you select a grouped attachment search result, AI Search logs click rank signal data for the parent record search result. All other search signal data is specific to the selected attachment record. For more details on search signal logging, see Search signal tables.

Group attachment search results with their parent results

Configure your AI Search applications to display attachment search results grouped with the results for their parent records.

Before you begin

The **index_attachments** attribute can't be set to **false** for any indexed source used in the AI Search application. For details on creating and editing attributes for indexed sources, see Indexed source attributes for AI Search.

Note: If you remove a **index_attachments** attribute value of **false** from an indexed source, perform a full reindex for the indexed source before continuing with this procedure. To learn how to reindex content for an indexed source, see Perform a full table index or reindex for a single AI Search indexed source.

Role required: search_application_admin

About this task

Attachment grouping is enabled by default for new search application configuration records. You only need to perform this procedure to enable attachment grouping for existing search application configuration records after upgrading from a previous release.

For details on how attachment grouping appears in the search results list and how you can interact with grouped attachment search results, see Grouping attachment search results with their parent search results.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Select the record for the AI Search application that you want to enable attachment grouping for.
3. Select the **Show parent for results that are attachments** option.
4. Select **Update**.
   If any indexed source used in the search application doesn't have the **index_attachments** attribute set to **true**, the system displays a warning message. For each affected indexed source, set the **index_attachments** attribute to **true**, then perform a full reindex.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
AI Search groups matching attachment search results with their parent record results on the search application results page.

Create a facet in an AI Search application configuration

Define facets to refine your searches using categories dynamically generated from the current search results.

Before you begin
Role required: search_application_admin

About this task
Create a facet to populate a refinement filter for search results based on indexed source field values. The facet initially displays filter options for all field values found in the current search result set. Selecting a field value refines the search result set, displaying only those results that satisfy the filter logic for the facet.

Note: If AI Search applies late binding security to any results from an indexed source used by a facet, the list of available filter selections for the facet changes. When this happens, the facet only displays field values found in the current page of search results. For more information on late binding security, see Content security in AI Search.

Facets can have any one of the following types. Each facet type has its own filter logic.

Single Select

In a Single Select facet, you can only select a single field value as a facet refinement filter.

When you select a field value from a Single Select, AI Search filters the search results list, displaying only results that contain your chosen field value.

A Single Select facet only allows you to select field values that are found in the current result set.

Multi Select And

In a Multi Select And facet, you can select multiple field values as facet refinement filters.

When you select a field value from a Multi Select And facet, AI Search filters the search results list, displaying only results that contain all of the field values you've selected from the facet.

A Multi Select And facet only allows you to select field values that are found in the current result set.

Multi Select Or

In a Multi Select Or facet, you can select multiple field values as facet refinement filters.

When you select a field value from a Multi Select Or facet, AI Search filters the search results list, displaying only results that contain any of the field values you've selected from the facet.

A Multi Select Or facet initially only allows you to select field values that are found in the current result set. All field values that are available when you make your first selection remain available for selection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, suppose you have a Multi Select Or facet for a custom **Color** field with blue, green, and red field values. If your search returns only green and red results, the **Color** facet only displays **green** and **red** field values. When you select the **red** field value, AI Search keeps the **green** field value available for selection because it was available before you made any **Color** selection.

Warning: Applying multiple filters from a Multi Select And or Multi Select Or facet makes your search query URL longer. Test your multi-select facet configurations to ensure that search query URLs with facet filters don't exceed the maximum URL length limit for your web browser. (Different web browsers have different URL length limits.)

Facets work best when created from fields of the following types with relatively few unique values:

- Choice
- Reference
- String
- String (Full UTF-8)
- True/False

When sorting facet refinement filters by name, AI Search uses collation-based sort following the rules for the ServiceNow AI Platform® session language.

For tables other than Knowledge [kb_knowledge], facets display appropriate field translations for the current user session. Facets don't display translated versions of kb_knowledge translated fields.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that you want to configure a facet for.
3. In the Facets related list, select **New**.
4. On the Facet form, fill in the fields.
   For a description of the field values, see Facet form.
5. Select **Submit**.

Result

The new facet appears in the Facets related list.

Show search result counts for facets on the results page for a search application

Display search result counts for facets on the results page for AI Search applications that use Seismic components. Search result counts for facets show the number of matching search results for each source facet bucket.

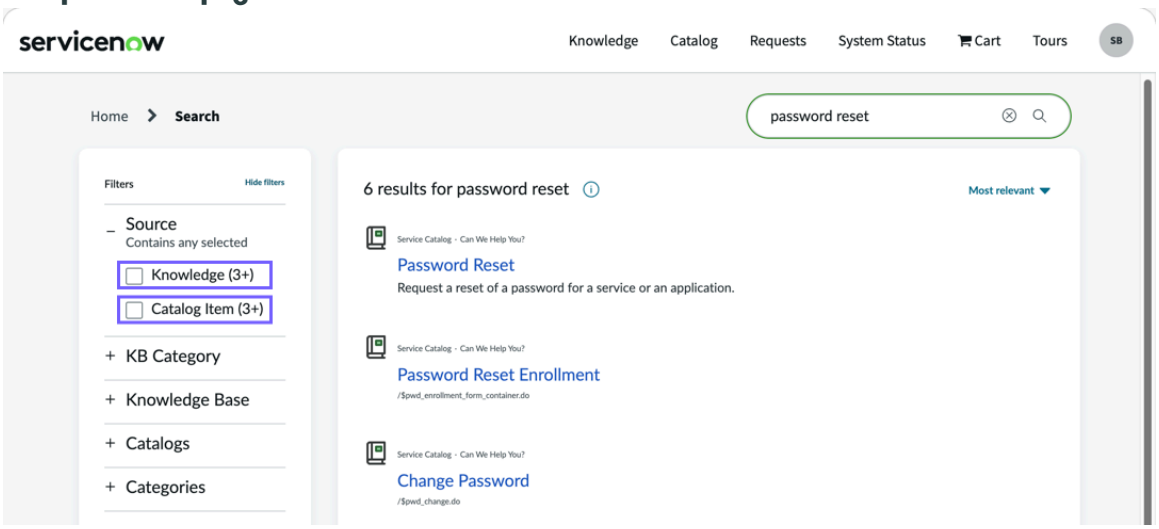
Before you begin

The search application configuration must not have hybrid search enabled. When hybrid search is activated in a search application configuration, search result counts for facets aren't displayed in that search application configuration. For more information on hybrid search, see Hybrid search in AI Search.

Role required: search_application_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task



Search administrators can enable display of search result counts for facets in AI Search applications that use Seismic components. With this option enabled, the results page for the search application shows the number of matching search results for each search source displayed as a source facet bucket.

Because the late binding security implementation may have removed some search results that aren't accessible, search result counts are shown as a minimum value. As an example, a count of 6+ on a source facet bucket means that there are at least six search results from the specified source, but that there may be more.

Note: Source facet buckets with 1,000 or more matching search results display **1000+** as their result count. When search result counts for facets are enabled, source facet buckets with 0 matching search results aren't shown on the search results page.

To learn more about content security in AI Search and how the late binding security implementation can affect search result counts, see Content security in AI Search.

Sample results page with results counts

Note: Search result counts for facets indicate the number of results that matched the user's search. Late binding security can remove results after they're counted, causing the actual number of displayed results to be lower than the count. For more information on late binding security, see Content security in AI Search.

Search result counts for facets are supported in search applications that use Seismic components. You can display search result counts for facets in these search applications:

- Service Portal
- Employee Service Center (ESC)
- AI Search for Next Experience global and workspace search
- Custom UI Builder applications that use Seismic UI components

Other search applications, such as Virtual Agent and Now Mobile, don't use Seismic components and so don't support display of search result counts for facets. For best results, don't enable search result counts for facets in these search applications.

Search result counts for facets are enabled by default for new search application configuration records. You only need to perform this procedure to enable search result counts for facets in existing search application configuration records after upgrading from a previous release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Select the record for the AI Search application that you want to display result counts for.
3. Select the **Show counts for facets** option.
4. Select **Update**.

Result

AI Search displays source facet bucket result counts on the results page for the selected search application.

Clear facet filters when selecting a new source facet bucket

Specify whether AI Search applications should preserve existing facet filters when you select a new source facet bucket.

Before you begin

Role required: admin

About this task

By default, AI Search preserves your facet filter selections when you select a new source facet bucket. As an example, suppose that you narrow your search results by selecting the Email field value from the **KB Category** facet displayed on the **All** source facet bucket. If you then select the **Knowledge** source facet bucket, the **KB Category** facet retains your Email selection and still filters your search results accordingly.

Administrators can override this default behavior by setting the value of the *glide.ais.facets.cross_tab_persistence* system property. When this system property value is set to **false**, selecting a new source facet bucket removes all facet filters. In the preceding example, selecting the **Knowledge** source facet bucket would remove your **KB Category** facet filter.

This option is global and applies to all AI Search applications on your instance.

Note: If an existing facet filter cannot be applied to search results from a selected source facet bucket, AI Search ignores the facet filter. This behavior only occurs in search applications where you've disabled search result counts for facets. For more details on search result counts for facets, see Show search result counts for facets on the results page for a search application.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Open the record for the *glide.ais.facets.cross_tab_persistence* system property.
3. Enter the system property value according to the behavior that you want:
   - To preserve existing facet filters when a new source facet bucket is selected, set the system property value to **true**.
   - To remove all facet filters when a new source facet bucket is selected, set the system property value to **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default property value is **true**.

4. Select **Update**.

Result
All AI Search applications preserve or discard existing facet filters when a new source facet bucket is selected.

Configure source facet buckets in an AI Search application configuration

Define settings for source facet buckets in a search application configuration. Users of the application can select source facet buckets to refine their search query results by search source.

Before you begin
Role required: search_application_admin

About this task
AI Search automatically defines source facet buckets for search application configurations. Each bucket is tied to a search source linked to the search application configuration's search profile. You can't create or delete these source facet buckets.

Use this procedure to configure display settings for source facet buckets in your search application configuration.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that you want to configure source facet buckets for.
3. In the Source Facet Buckets related list, open the source facet bucket that you want to configure.
4. On the Source Facet Bucket form, fill in the fields.
   For a description of the field values, see Source Facet Bucket form.
5. Select **Update**.

Result
The source facet bucket appears with updated settings in the Source Facet Buckets related list.

Auto-complete suggestions in AI Search applications

Automatically display intelligent suggestions in your search application's input field, helping users formulate their searches or jump directly to relevant results. Suggestions can include relevant search results, popular queries, recent queries from the user's personal history, and popular search results.

When you create a search application configuration, AI Search automatically populates it with auto-complete suggestion types. The settings for these suggestion types control the appearance of auto-complete suggestions when users interact with its input field.

Each auto-complete suggestion type includes default settings that you can configure to suit your application's needs. It also includes one or more search suggestion readers, which generate search query and search result suggestions.

You can remove an unwanted suggestion type from your search application configuration. If you want to restore a removed suggestion type, you can relink it to your search application configuration. You can only link one auto-complete suggestion source of each type to any given search application configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-complete suggestions are generated by the Search Suggestions application. For full details on configuration and use of the Search Suggestions application, see Search Suggestions.

AI Search uses a dedicated relevancy model to rank records for display as auto-complete suggestions in the search field. This relevancy model scores records based on their freshness and on search query term matches in their **title** fields. The system doesn't train this auto-complete suggestion relevancy model. For more details on relevancy models, see Machine learning relevancy in AI Search.

List of auto-complete suggestion types for AI Search applications

AI Search provides multiple types of auto-complete suggestions that you can configure for display to users in the search field.

The following auto-complete suggestion types are available for linking to search application configurations that specify AI Search as their search engine.

Note: Not all auto-complete suggestion types are available for the search application configurations included in the base system.

Auto-complete suggestion type	Description
Popular Search Reader Group for <application name>	Displays search query suggestions based on searches submitted by all users of the search application. When you create a search application configuration, this suggestion reader group isn't linked to it by default. Default section header: `Popular searches` Readers: Popular Query Reader
Recent Search Reader Group for <application name>	Displays search query suggestions based on the user's previous searches. Default section header: `Recent searches` Included readers: User History Reader
Search-based Suggested Results Reader Group for <application name>	Displays titles and tables for search result suggestions based on a search for the terms entered in the search field. This search applies search source filters, stop word and synonym dictionaries, and result improvement rules from the search application's linked search profile. AI Search treats the last term in the search field specially, as follows: • If the last term in the search field is followed by a space, AI Search treats it as a literal search term. As an example, `act` followed by a space matches results containing the term `act`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-complete suggestion type	Description
	• If the last term in the search field isn't followed by a space, AI Search treats it as a wildcard search prefix. For example, `act` without following space matches results containing the terms `act`, `action`, `activated`, `actuated`, and so on. Selecting a suggested search result opens it as follows: • Catalog Item results open in Service Catalog. • Knowledge article results open in Knowledge. • Other results open in form view. **Note:** If the suggested search result is an attachment, selecting it opens its parent record in form view. Default section header: `Suggested` Included readers: Search Based Suggestion Reader
Suggested Query Reader Group for <application name>	Displays a mix of search query suggestions (based on the user's previous searches) and search result suggestions (based on results the user selected for previous searches). Default section header: none Included readers: Popular Query Reader, User History Reader, User Search Term Reader
Suggested Result Reader Group for <application name>	Displays search result suggestions based on results the user selected for previous searches. When you create a search application configuration, this suggestion reader group isn't linked to it by default. Default section header: `Suggested results` Included readers: Personal Click Reader
User History Reader Group for <application name>	Displays the user's current search query, plus search query and result suggestions from the user's previous search activity that match the current input. When you create a search application configuration, this suggestion reader group isn't linked to it by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-complete suggestion type	Description
	Default section header: `Recently viewed` Included readers: User History and Click Reader, User Search Term Reader

Note: A search application configuration can't link to multiple search suggestion types that include the same reader and have the same click-in mode. If you try to link a second suggestion type with the same reader and click-in mode to a search application configuration, the system displays an error message.

Configure an auto-complete suggestion type in an AI Search application configuration

Modify default settings for display of auto-complete suggestions of a selected type in your search application's input field.

Before you begin
Role required: search_application_admin

About this task
When you define a new search application configuration, AI Search automatically populates it with auto-complete suggestion types. You can alter the default settings for these auto-complete suggestion types.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that contains the auto-complete suggestion type that you want to modify.
3. In the Autocomplete Suggestions related list, open the auto-complete suggestion type that you want to modify settings for.
4. On the Suggestion Reader Group form, fill in the fields.
   For a description of the field values, see Suggestion Reader Group form.
5. Select **Update**.

Result
The updated settings for the auto-complete suggestion type appear in the search application configuration's Autocomplete Suggestions related list.

Remove an auto-complete suggestion type from an AI Search application configuration

Disable the display of auto-complete suggestions of a selected type in your search application's input field.

Before you begin
Role required: search_application_admin

About this task
When you define a search application configuration, AI Search automatically populates it with auto-complete suggestion types. You can remove unwanted auto-complete suggestion types from the search application configuration.

Note: Removing an auto-complete suggestion type from your search application configuration doesn't delete it. To relink the removed suggestion type to your search application configuration, see Relink an auto-complete suggestion type to an AI Search application configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that contains the auto-complete suggestion type you want to remove.
3. In the Autocomplete Suggestions related list, open the auto-complete suggestion type that you want to remove.
4. On the Suggestion Reader Group form, select **Remove from Search Application**.
   For a description of the field values, see Suggestion Reader Group form.

Result

The selected auto-complete suggestion type no longer appears in the search application configuration's Autocomplete Suggestions related list.

Relink an auto-complete suggestion type to an AI Search application configuration

Re-enable the display of auto-complete suggestions of a selected type in your search application's input field.

Before you begin

Role required: search_application_admin

About this task

When you define a search application configuration, AI Search automatically populates it with auto-complete suggestion types. If you removed one of these auto-complete suggestion types from the search application configuration, you can relink it.

Note: A search application configuration can't link to multiple search suggestion types that include the same reader and have the same click-in mode. If you try to link a second suggestion type with the same reader and click-in mode to a search application configuration, the system displays an error message.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that you want to relink the auto-complete suggestion type to.
3. In the Autocomplete Suggestions related list, select **Add Existing**.
4. In the Suggestion Reader Groups list, open the auto-complete suggestion type that you want to relink to your search application configuration.
5. On the Suggestion Reader Group form, enter or look up the search application configuration by name in the **Search Application** field.
   For a description of the field values, see Suggestion Reader Group form.
6. Select **Update**.

Result

The selected auto-complete suggestion type appears in the search application configuration's Autocomplete Suggestions related list.

Using search scripted post-processors in AI Search application configurations

Use scripted post-processors to modify search result records for display in a search application.

For example, a search scripted post-processor can modify search result date or currency field values to display in the user's regional formats.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a search scripted post-processor

Define a script to post-process AI Search search results before displaying them to the user.

Before you begin

Role required: search_application_admin

Procedure

1. **Optional:** Copy code from an existing post-processor script to use as a starting point for your own script.
   a. Select **All**.
   b. In the Filter field, enter `sys_search_scripted_processor.list`.
   c. Press Enter.
   d. Open a post-processor script of your choice.
   e. Copy the code from the **Post processing script** field.
2. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
3. Open the search application configuration that you want to configure a scripted post-processor for.
4. In the Search Scripted Post-processors related list, select **New**.
5. On the Search Scripted Post-processors form, fill in the fields.
   For a description of the field values, see Search Scripted Post-processors form. If you copied code from an existing post-processor script in step 1.e, paste it into the new script's **Post processing script** field and modify it as needed.
6. Select **Submit**.

Result

The new search scripted post-processor appears in the search application configuration's Search Scripted Post-processors related list.

What to do next

To make your new search scripted post-processor take effect, link it to the search application configuration for the application whose results you want to post-process.

Link a search scripted post-processor to an AI Search application configuration

Link a search scripted post-processor to an AI Search search application configuration. The search application executes the linked script for each search result before displaying it to the user.

Before you begin

Role required: search_application_admin

You must have already created the search script post-processor that you want to link to the search application configuration.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that you want to link a search scripted post-processor to.
3. In the Search Scripted Post-processors related list, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Search Scripted Post-processors form, select the reference lookup icon for the **Search scripted processor** field and select the search scripted post-processor that you want to link to the search application configuration.
   For a description of the field values, see Search Scripted Post-processors form.
5. Select **Submit**.

Result
The new search scripted post-processor appears in the Search Scripted Post-processors related list.

Search result sort options in AI Search application configurations

A search result sort option enables users to display search results in an order determined by their field values. Applying a search result sort option overrides the default AI Search relevancy-based result order. You can define custom search result sort options for your AI Search applications.

When sorting search results on a string field, AI Search uses collation-based sort following the rules for the ServiceNow AI Platform® session language.

For details on how users apply search result sort options, see Change the sort order for your search results.

Create a search result sort option in an AI Search application configuration

Define a sort option to enable users of an AI Search application to order their search results using field values.

Before you begin
Role required: search_application_admin

About this task
A search result sort option enables users to sort their search results on a field, overriding the default AI Search relevancy-based result order. Each search result sort option specifies a field to sort results on, and a sort order (ascending or descending) order for the sort.

The sort menu in an AI Search application displays all active search result sort option defined for that application, plus the default **Most relevant** option.

Note: If no search result sort options are active for an AI Search application, the sort menu doesn't display for users of that application and results are automatically sorted by relevance.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that you want to create a search result sort option for.
3. In the Sort Options related list, select **New**.
4. On the Sort Option form, fill in the fields.
   For a description of the field values, see Sort Option form.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The new search result sort option appears in the search application's Sort Options related list, and its title displays in the sort menu for users of the search application. Users can select the new option from the sort menu to apply the defined sort to their search results.

Remove a search result sort option from an AI Search application configuration

Remove a search result sort option from the sort menu in an AI Search application. The removal of the search result sort option prevents users of the application from selecting that option to reorder their search results with.

Before you begin
Role required: search_application_admin

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**.
2. Open the search application configuration that you want to disable a search result sort option for.
3. In the Sort Options related list, open the search result sort option that you want to disable.
4. On the Sort Option form, clear the **Active** option and select **Update**.
   For a description of the field values, see Sort Option form.

Result
The selected search result sort option no longer appears in the search application's sort menu.

Note: If no search result sort options are active for an AI Search application, the sort menu no longer displays for users of that application and results are automatically sorted by relevance.

Activate fuzzy numeric search in AI Search

Activate fuzzy numeric search to let users find indexed records by their Number field values without needing to enter alphabetic prefixes or leading zeroes.

Before you begin
Role required: admin

About this task
This task is optional. You only need to perform it if you need to activate the fuzzy numeric search feature in AI Search.

Fuzzy numeric search allows numerical search terms to match indexed ServiceNow AI Platform® records by their Number field values. The fuzzy matching compares the numeric search term with each indexed record's Number, ignoring its alphabetical prefix and any leading zeroes. As an example, if you index knowledge article and problem records, a search for `23583` might return knowledge article KB00023583 and problem PRB00023583 as search results.

When fuzzy numeric search is activated, AI Search checks all-numeric search terms for fuzzy numeric matches when you search and when computing auto-complete suggestions for your search terms. For details on implementing and using auto-complete suggestions, see Auto-complete suggestions in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Fuzzy numeric search only searches records from numbered tables. These are tables with Number fields that have prefixes defined in the Number [sys_number] table. To learn about record numbering and the Number table, see Record numbering.

Child tables that inherit the Number field from their parent table can't be searched using fuzzy numeric search. Only tables that have their own Number field defined work with this feature.

Fuzzy numeric search only finds numeric field values in predefined fields named **number**. It doesn't search custom fields or predefined fields with other names.

To learn more about searching with fuzzy numeric search, see Fuzzy numeric search in AI Search.

Fuzzy numeric search includes an indexing component which is activated by default and a query-time component which is deactivated by default. Admins can activate the query-time component by changing the value of the *glide.ais.query.enable_fuzzy_number_match* system property.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search for a system property record with name *glide.ais.query.enable_fuzzy_number_match*.
   - If a system property record with this name exists, open the record by selecting it.
   - If no system property record with this name exists, select **New**, then enter `glide.ais.query.enable_fuzzy_number_match` as the new system property's **Name** and select `true | false` as its **Type**.
3. In the System Property form's **Value** field, enter *true*.
4. Save the modified System Property record by selecting **Submit** or **Update**.

Result

Fuzzy numeric search is activated for users in all of your instance's AI Search applications.

Configure EVAM display settings for search results in AI Search applications

Customize display settings for Search Result EVAM (Entity View Action Mapping) cards in portal and non-portal AI Search applications.

Before you begin

Role required: evam_admin

About this task

EVAM administrators can modify settings on Search Result EVAM cards to customize the appearance and layout of search results in AI Search applications.

String fields on Search Result EVAM cards can be populated with literal text or with values from AI Search indexed fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the EVAM Definition record associated with your chosen AI Search application.
   - For portal applications, navigate to **All** > **Service Portal** > **Portals**, select the search application's portal record from the list, then use the Preview this record icon to preview and open the portal record's linked Search Results Configuration record.
   - For non-portal applications, navigate to **All** > *AI Search* > **Search Experience** > **Search Applications**, select the search application's configuration record from the list, then use the Preview this record icon to preview and open the search application configuration record's linked EVAM Definition record.
2. In the EVAM View Config Bundle M2Ms related list, select the record for the EVAM definition's config bundle.
3. In the EVAM View Configs list, select the record for the specific Search Result category that you want to customize.
   The record name should include `Search Result`. Don't select a record with `Genius Result` in its name, as Genius Results have different display settings than standard search results do.
4. Use the Preview this record icon to preview and open the EVAM View Config record's linked View Template record.
5. In the Template field, edit the JSON for the Search Result card properties you want to customize.
   For details on available properties and their supported values, see List of Search Result EVAM card properties.
6. Select **Update**.

Result

Changes made to Search Result EVAM card settings take effect immediately in AI Search applications.

List of Search Result EVAM card properties

You can customize the appearance of standard search results in your AI Search application by changing these properties in the application's Search Result EVAM (Entity View Action Mapping) cards.

To learn about configuring properties for Search Result EVAM cards, see Configure EVAM display settings for search results in AI Search applications.

Note: The following properties are only supported for EVAM cards with `component` property value `sn-search-result-evam-card`. Don't set these properties for EVAM cards with any other `component` value.

Property	Description
avatarURL	Defines the URL for the image you want to show on the Search Result card when **imageType** is set to **avatar**. • Type: string • Default value: (no value)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Note: To specify literal text for this property, include the property in the `staticValues` object and specify the text as its `key` value. To populate this property with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields.
customIcon	Specifies the name of an image from the Images [db_image] table that you want to show as a custom icon for the Search Result card. If specified, this property overrides the icon setting from the **icon** property. **Note:** This property only has an effect if **imageType** is set to *icon*. If **imageType** is set to any other value, the **customIcon** setting is ignored. Custom icon images should be either 24 × 24 pixels or 32 × 32 pixels in size. • Type: string • Default value: (no value)
customIconSize	Specifies the size of the image specified as the **customIcon** property. The specified size should match the size of the custom icon image in the Images [db_image] table. • Type: string • Default value: 24px • Supported values: ○ *24px*: Render the custom icon image as 24 × 24 pixels in size. ○ *32px*: Render the custom icon image as 32 × 32 pixels in size.
detailLabelOne, detailLabelTwo, detailLabelThree, detailLabelFour, detailLabelFive, detailLabelSix, detailLabelSeven, detailLabelEight, detailLabelNine, and detailLabelTen	Defines label content for the Search Result card's detail label-value pairs. You can show up to 10 label-value pairs on the Search Result card. • Type: string • Default value: (no value) **Note:** To specify literal text for one of these properties, include the property in the `staticValues` object and specify the text as its `key` value. To populate one of these properties with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields. To define value content for these label-value pairs, see **detailValueOne** through **detailValueTen**. **detailValueOne** sets the value for **detailLabelOne**, **detailValueTwo** sets the value for **detailLabelTwo**, and so on up through **detailValueTen** and **detailLabelTen**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	For additional configuration of how a search result's details are shown on the Search Results card, see **detailLabelType**, **detailLabelSeparator**, and **detailPosition**.
detailLabelSeparator	Defines the character used to separate inline label-value pairs. Only applies when **detailLabelType** is set to **inline**. • Type: string • Default value: (no value) **Note:** To specify literal text for this property, include the property in the `staticValues` object and specify the text as its `key` value. To populate this property with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields.
detailLabelType	Defines how to render label-value pairs on the Search Result card. • Type: choice list • Default value: inline • Supported values: ○ *`inline`*: Render label-value pairs using the Label-value component, with each label appearing on the same line as its value string. ○ *`stacked`*: Render label-value pairs using the Label value stacked component, with each label appearing on a separate line from its value string.
detailPosition	Defines where search result detail label-value pairs are shown relative to the Search Result card's summary field. • Type: choice list • Default value: below • Supported values: ○ *`above`*: Search result details are shown above the summary field. ○ *`below`*: Search result details are shown below the summary field.
detailValueOne, detailValueTwo, detailValueThree, detailValueFour, detailValueFive, detailValueSix, detailValueSeven, detailValueEight,	Defines value content for the Search Result card's detail label-value pairs. You can show up to 10 label-value pairs on the Search Result card. • Type: string • Default value: (no value)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
detailValueNine, and detailValueTen	**Note:** To specify literal text for one of these properties, include the property in the `staticValues` object and specify the text as its `key` value. To populate one of these properties with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields. To define label content for these label-value pairs, see **detailLabelOne** through **detailLabelTen**. **detailLabelOne** sets the label for **detailValueOne**, **detailLabelTwo** sets the label for **detailValueTwo**, and so on up through **detailLabelTen** and **detailValueTen** For additional configuration of how a search result's details are shown on the Search Results card, see **detailLabelType**, **detailLabelSeparator**, and **detailPosition**.
forceNewTab	Defines whether you want the search result to open in a new browser tab or the current browser tab when you select the link in the Search Result card. • Type: true | false • Default value: true • Supported values: ○ *`false`*: Open the search result in the current browser tab when you select the link in the Search Result card. ○ *`true`*: Open the search result in a new browser tab when you select the link in the Search Result card.
hideIcon	Defines whether you want to show or hide the icon on the Search Result card. • Type: true | false • Default value: false • Supported values: ○ *`false`*: Show the configured icon on the Search Result card. ○ *`true`*: Don't show an icon on the Search Result card.
icon	Defines the icon you want to show on the Search Result card when **imageType** is set to **icon**. This icon is also shown as a fallback when **imageType** is set to **image** but no **imageURL** value is provided. • Type: string • Default value: (no value)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Note: To specify literal text for this property, include the property in the `staticValues` object and specify the text as its `key` value. To populate this property with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields. For the set of available icon names, see the Icon Gallery in the Next Experience reference section on the ServiceNow® Developer Site.
iconSize	Defines the size of the icon or avatar image shown on the Search Result card. • Type: choice list • Default value: xl (if **imageType** is set to **icon**) or md (if **imageType** is set to **avatar**) • Supported values: ○ *sm*: Show a small icon or avatar image on the Search Result card. ○ *md*: Show a medium-sized icon or avatar image on the Search Result card. ○ *lg*: Show a large icon or avatar image on the Search Result card. ○ *xl*: Show an extra-large icon or avatar image on the Search Result card.
imageType	Defines the type of marker you want to show on the Search Result card. Supported values: • avatar • icon • image
imageURL	Defines the URL for the image you want to show on the Search Result card when **imageType** is set to **image**. • Type: string • Default value: (no value) **Note:** To specify literal text for this property, include the property in the `staticValues` object and specify the text as its `key` value. To populate this property with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields.
summary	Defines the content of the Search Result card's summary field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• Type: string • Default value: (no value) **Note:** To specify literal text for this property, include the property in the `staticValues` object and specify the text as its `key` value. To populate this property with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields.
summaryFontSize	Defines the font size for the Search Result card's summary field. • Type: choice list • Default value: sm • Supported values: ○ *sm*: Show the Search Result card's summary field in small font size. ○ *md*: Show the Search Result card's summary field in medium font size. ○ *lg*: Show the Search Result card's summary field in large font size. ○ *xl*: Show the Search Result card's title summary in extra-large font size.
textHeaderLabelOne, textHeaderLabelTwo, and textHeaderLabelThree	Defines the content of the Search Result card's text header labels. If you specify multiple text header labels, they appear separated by a pipe | character. • Type: string • Default value: (no value) **Note:** To specify literal text for one of these properties, include the property in the `staticValues` object and specify the text as its `key` value. To populate one of these properties with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields.
titleFontSize	Defines the font size for the Search Result card's title field. • Type: choice list • Default value: lg • Supported values: ○ *sm*: Show the Search Result card's title field in small font size. ○ *md*: Show the Search Result card's title field in medium font size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	○ *lg*: Show the Search Result card's title field in large font size. ○ *xl*: Show the Search Result card's title field in extra-large font size.
titleLabel	Defines the content of the Search Result card's title field. • Type: string • Default value: (no value) **Note:** To specify literal text for this property, include the property in the `staticValues` object and specify the text as its `key` value. To populate this property with the current search result's value from an AI Search indexed field, include the property in the `mappings` object with the field name as its value. For a list of AI Search indexed field names, see AI Search index fields.
useAttachmentViewer	Option to use Document Viewer to display grouped attachments shown on the Search Result card in collapsed format. To learn more about Document Viewer, see Enable Document Viewer. For more information on grouped attachments and how they're shown on the Search Result card, see Grouping attachment search results with their parent search results. • Type: true | false • Default value: false • Supported values: ○ *true*: Use Document Viewer to display attachments selected from the Search Result card. **Note:** If Document Viewer is not active on your instance, or not enabled for the search result's source table, selecting an attachment from the Search Result card shows a message indicating that the attachment can't be viewed. ○ *false*: Download attachments selected from the Search Result card.

Show borders between search result cards

Display borders between search result cards in portal search and in global and workspace search.

Before you begin
Role required: admin

About this task
By default, AI Search doesn't show borders between search result cards. You can configure AI Search to display borders between search result cards by creating a *glide.search.show_result_card_border* system property with value **true**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This system property controls search result card borders in portal search and in global and workspace search.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Select **New**.
3. On the System Property form, fill in the fields.

Field	Value
Name	glide.search.show_result_card_border
Type	true | false
Value	true

4. Select **Submit**.

Result

AI Search shows borders between search result cards in portal search and in global and workspace search.

Enabling and configuring AI Search in ServiceNow AI Platform® applications

Configure and use the AI Search engine in the Customer Service Management, Now Mobile, Service Portal, and Virtual Agent applications.

For each supported ServiceNow AI Platform application that you want to use AI Search in, define a search application configuration and specify AI Search as the search engine. To learn more about search application configurations, see Search application configurations.

Some applications support additional configuration for AI Search, as described in the following sections.

Customer Service Management (CSM)

Customer Service Management enables you to provide service and support for external customers through communication channels such as web, email, chat, telephone, and social media. The CSM application includes Customer and Consumer Service Portals that support AI Search.

For details on configuring the Customer and Consumer Service Portals to use AI Search, see Configure AI Search for the Customer and Consumer Service Portals. To activate AI Search widgets so that guest users on these portals can use AI Search, see Enabling AI Search in the Customer and Consumer Service Portals for unauthenticated users.

Now Mobile

Enable your users to submit incidents and requests, manage tasks, and access company resources from anywhere using the Now Mobile app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on configuring and using AI Search as the Now Mobile search engine, see AI Search in mobile.

Service Portal

Service Portal is a portal framework that enables administrators to build a mobile-friendly self-service experience for users. It interacts with parts of the ServiceNow AI Platform, so users can access specific platform features using Service Portal.

For details on enabling and using AI Search as the Service Portal search engine, see Enable and configure AI Search in Service Portal.

Virtual Agent

Virtual Agent is a platform for providing user assistance through conversations within a messaging interface. Use Virtual Agent to design and build automated conversations that help your users quickly obtain information, make decisions, and perform common work tasks.

For information on how Virtual Agent uses AI Search, see Improving the user experience with AI Search.

AI Search for Next Experience

The AI Search for Next Experience ServiceNow® Store application enables administrators to configure AI Search as the search engine for Unified Navigation searches in Next Experience, including global search and configurable workspace search.

For more information on how you can configure and use AI Search for Next Experience in global search and configurable workspace search, see AI Search for Next Experience.

Create a custom search matcher for global search

Customize the global search experience to return exact match search results from a specified table and column (field). You can configure custom search matchers for search terms with prefixes followed by numbers, such as `INT470271`, or for numeric search terms with delimiter characters, such as `525-326-3827` or `2016/01/08`.

Before you begin

You must have Next Experience enabled.

AI Search must be configured as the search engine for global search. For details on configuring AI Search as the search engine for global search, see AI Search for Next Experience.

Note: If your instance was originally created running Utah or a later family release, AI Search is automatically configured as the search engine for global search.

Role required: ais_admin

About this task

To customize exact-matching behavior in global search, you can define a custom search matcher. The matcher specifies a Java regular expression pattern that AI Search compares search queries to, plus a table and a column (field) from that table. When a search query exactly matches the regular expression pattern, the custom matcher triggers and global search only returns exact-match results from the specified table and column.

Custom search matchers take precedence over the default AI Search exact match functionality for tables with prefixes defined in the Number [sys_number] table. If a global search query doesn't match any custom search matcher's regular expression pattern, AI Search falls back to evaluating the query for exact matches in tables with defined prefixes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Users with the admin role can disable this fallback behavior by setting the value of the *glide.ais.custom_matcher.legacy_fallback_enabled* system property to *false*. With this value set, if a search query doesn't match any custom search matcher's regular expression patterns, AI Search treats it as a normal full-text search, ignoring exact matches in tables with defined prefixes.

To learn how AI Search evaluates global search queries for exact matches, see Using global search with AI Search for Next Experience.

Procedure

1. Navigate to *AI Search* > **Search Experience** > **Global Search Custom Matchers**.
2. Select **New**.
3. On the Custom Matcher form, fill in the **Name**, **Table**, and **Column** fields.
   For a description of the field values, see Custom Matcher form.
4. Populate the form's **Regex** field.
   a. Select **Generate Regex**.
   b. In the pop-up window, select the option that more closely matches the values you expect to see in the specified **Column**.
   c. When prompted, enter the value prefix or select the value numeric delimiter.
   d. Close the pop-up window by selecting **Submit**.
5. Select **Submit.**
6. Navigate to the Custom matchers for Search Applications table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `m2m_search_context_config_custom_matcher.list`.
   c. Press Enter.
   The Custom matchers for Search Application [m2m_search_context_config_custom_matcher] table opens in list view.
7. For each search application that you want to use your custom matcher with, including global search, link the matcher to the application.
   a. Select **New**.
   b. On the Custom matchers for Search Application form, fill in the fields.

Field	Description
Custom matcher	The name of your custom search matcher.
Order	Evaluation order for your custom search matcher in the context of the specified AI Search application. Matchers with lower **Order** values are evaluated first.
Search context config	The name of the search application configuration record for the AI Search application that you want to link your custom search matcher to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For global search, select the **[AIS] Next Experience Search Configuration** record.

c. Select **Submit**.
A linkage record for your custom search matcher and the selected AI Search application appears in the Custom matchers for Search Application [m2m_search_context_config_custom_matcher] table.

Result

Global searches performed with AI Search use your new custom search matcher. When a search query exactly matches the specified regular expression pattern, the custom matcher triggers and the search only returns exact-match results from the specified table and column.

Domain separation and AI Search

Domain separation is unsupported for the AI Search application tables, but user search queries respect domain restrictions from indexed ServiceNow AI Platform® table records. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Note: Refer to the Overview and following sections for details on how AI Search search queries respect domain settings from indexed records.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

AI Search domain separation overview

AI Search enables users to index and search content from records in ServiceNow AI Platform tables. The AI Search application tables and properties don't support domain separation, but user search queries respect domain settings from indexed content as described in the following sections.

Domain separation in indexed content and search queries

When indexing searchable content from a ServiceNow AI Platform table, AI Search stores the sys_domain field values for records on the source table and referenced tables.

If domain separation is enabled, AI Search applies a filter for the current session domain to every search query. This filter excludes records that aren't visible in the session domain. Only records visible in the session domain appear as search query results.

For child tables that have the *domain_master* attribute set, both indexing and search use the appropriate reference field to derive the child record domain from a referenced parent record.

Restrictions apply to referenced records in search queries, as summarized in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Condition	Behavior
Referenced record isn't visible in current session domain	• Search queries don't match content from the referenced record • Filtering on the reference field has no effect on search results • Faceting on the reference field has no effect
Referenced record domain differs from parent record domain	Search result records don't display the reference field

Indexing changes to record domains

AI Search automatically updates indexed domains for records in tables configured as indexed sources.

AI Search doesn't automatically update indexed domains for referenced tables. You can update the indexed domain for a referenced table in either of the following ways.

Use case	Action
Perform a one-time update of domain field values for a referenced table	Perform a full table reindex for the indexed source that includes the affected table. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source.
Enable automatic updating of domain field values for a referenced table	Create a *dot_walk_fields* field setting for the reference field, specifying the `sys_domain,sys_domain_path` domain fields as the attribute value. For full steps for this task, see Enable automatic domain updates for a referenced table.

Related topics

Domain separation for service providers

Enable automatic domain updates for a referenced table

Configure a field setting to automatically index domain field value updates for records from a referenced table.

Before you begin

Role required: ais_admin

About this task

This topic provides steps for configuring a *dot_walk_fields* field setting to enable automatic indexing of domain field values for records in referenced tables. For more general instructions on defining field settings, see Create a field setting for an AI Search indexed source.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source that you want to define a field setting for.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Field Settings & Mapping related list, select **New**.
4. On the Field Setting form, enter the following field values.

Field	Value
Attribute	dot_walk_fields
Field	<reference field>
Value	sys_domain,sys_domain_path

For a description of the field values, see Field Setting form.

5. Select **Submit**.

Result
The new *dot_walk_fields* field setting appears in the Field Settings & Mapping related list.

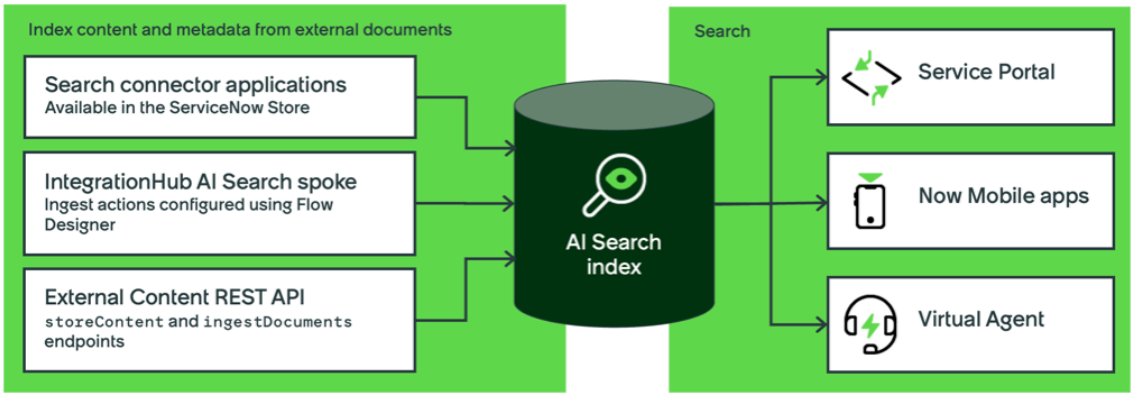
What to do next
To make the new *dot_walk_fields* attribute take effect, perform a full table reindex for the indexed source. For details on this procedure, see Perform a full table index or reindex for a single AI Search indexed source.

Indexing and searching external content in AI Search

With a subscription for the External Content for AI Search plugin, you can enable AI Search users to search content and metadata from documents in external repositories and remote tables.

The External Content for AI Search plugin enables you to index documents located outside of your ServiceNow AI Platform® instance, such as those stored in SharePoint collections, Confluence sites, and remote tables. Indexing these documents makes their content and metadata searchable in AI Search.

AI Search displays search results for indexed external documents just as it does for indexed ServiceNow AI Platform records. Users don't need to perform any special searches to match content and metadata from external documents.



Indexing doesn't duplicate external documents as records in your ServiceNow AI Platform instance. When a user selects an external document search result, they are directed to the source document in its original location.

External content indexing tools

The following diagram illustrates how AI Search provides indexing and search for external document content and metadata:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search external content architecture diagram

As shown in the architecture diagram, you can index content and metadata from external documents using any or all of the following tools:

External content indexing tool	Description
Search connector applications	Search connector applications available in the ServiceNow Store provide simple tools for indexing content and metadata from documents in supported external sources. They handle some of the configuration work, such as creation of external content schema tables, for you. Each search connector application supports a specific external document source (or set of sources). For example, the SharePoint Online Search Connector only supports documents in SharePoint collections, while the Raytion Connector Hub for AI Search supports multiple document sources. If no search connector application is available for your external document source, you must use the Integration Hub AI Search spoke or the External Content REST API to index content and metadata for documents from that source. Search connector applications provide the most straightforward way to index document content and metadata from supported external sources.
Integration Hub AI Search spoke	The Integration Hub AI Search spoke provides Workflow Studio actions that you can use to ingest external documents for indexing: • *`Ingest Document`*: Define property name-value pairs for an external document and submit the document to AI Search for indexing. • *`Ingest Document Using Download URL`*: Specify an external document's URL and have AI Search download it for indexing. You can specify security principal access permissions for documents ingested using these actions. To learn more about access permissions and security for external document content, see External content security for AI Search. For the full list of Workflow Studio actions provided by the AI Search spoke, see AI Search spoke. The Integration Hub AI Search spoke combines flexible configuration and handling with the simple drag-and-drop Workflow Studio interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External content indexing tool	Description
External Content REST API	The External Content REST API provides endpoints that you can use to index content and metadata from external documents: • Send external document text content and metadata to AI Search for indexing using the `ingestDocuments` API endpoint. • Upload external document binary content to AI Search using the `storeContent` API endpoint. You can associate the stored binary content with a document fed using the `ingestDocuments` endpoint. **Note:** To access the External Content REST API endpoints, you need either the ais_external_content role or the admin role. You can specify security principal access permissions for documents ingested using the `ingestDocuments` endpoint. To learn more about access permissions and security for external document content, see External content security for AI Search. For full descriptions of the External Content REST API endpoints, see External Content Ingestion REST API. The External Content REST API is the most complex tool for indexing content and metadata from your external documents, but it offers the most flexibility.

External content search prerequisites

Before you can index external document content and metadata for search in AI Search, you must satisfy the following requirements. Except as noted in the table, these requirements apply regardless of which external content indexing tools you use.

Requirement	Description
Have an active subscription for the External Content for AI Search plugin (com.glide.ais.external_content)	The External Content for AI Search plugin provides functionality for indexing content from external data sources. For instructions on purchasing a subscription for the plugin and activating it, see Request the External Content for AI Search plugin.
Define an external content schema table for the external document source	An external content schema table doesn't store external document content in the database. Instead, its columns serve as a map of AI Search index fields to populate when you index content from external data sources. For instructions on creating a new external content schema table, see Create an external content schema table. When documents from multiple external data sources share the same set of fields and have unique document identifiers, you can use a single external content schema table for all of them. To avoid data loss, the external data sources must satisfy these conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirement	Description
	• All documents in the external data sources must include the same fields, matching the columns defined in the content schema table. • Every document in the external data sources must have a unique identifier so that documents don't overwrite one another in the AI Search index. If the external data sources can't satisfy these conditions, create a separate external content schema table for each data source. **Note:** Search connector applications from the ServiceNow Store automatically create external content schema tables as needed. You only need to create your own external content schema tables when indexing external documents using the Integration Hub AI Search spoke or the External Content REST API.
Create an indexed source with your external content schema table specified as the table to index	The indexed source sends external documents' content and metadata to the AI Search index. For instructions on creating an indexed source, see Create an indexed source.
Create one or more search sources for the indexed source	Each search source specifies a subset of external documents from the indexed source whose content you want to make searchable in AI Search. For instructions on creating search sources, see Create a search source for AI Search.

Request the External Content for AI Search plugin

Request activation of the External Content for AI Search plugin (com.glide.ais.external_content) to enable indexing of searchable content and metadata from records in external data sources.

Before you begin

You must purchase a paid subscription before requesting activation of the plugin. For details on purchasing a paid subscription for a plugin, see ServiceNow plugins.

Role required: admin

About this task

You can't activate the External Content for AI Search plugin from your instance or the ServiceNow Store. Use this procedure to submit a Now Support request for activation of the plugin for your instance.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Create an external content schema table

Define a schema table with columns corresponding to fields on records from an external data source. AI Search uses the schema when indexing content from the external data source.

Before you begin

Role required: ais_admin

About this task

An external content schema table doesn't store data in the database. Instead, its columns serve as a map of AI Search index fields to populate when you index content from external data sources.

When you index or delete records associated with this content schema using endpoints from the External Content Ingestion REST API, you must specify the schema table name as a path parameter.

Procedure

1. Navigate to **All** > *AI Search* > **External Content** > **Create Schema**.
2. Enter a name for your new external source schema table.
3. Select **Submit**.
   The new external content schema table opens in list view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** If you need to define additional field mappings for records from the external data source, add a new column for each field.

   a. In the Columns related list, select **New**.

   b. On the Dictionary Entry form, fill in the fields.
   For descriptions of these form fields, see Dictionary Entry form.

   > **Note:** When filling in the **Type** field, select **String**, **Date**, **Date/Time**, or **Integer**. AI Search doesn't support other column types on external content schema tables.

   c. Select **Submit**.

5. If you modified the default column set, select **Update** to save your changes.

What to do next

Create a new indexed source with your external content schema table defined as its source. For instructions on creating an indexed source, see Create an indexed source

External content security for AI Search

AI Search preserves user and group security access permissions specified for documents indexed from external sources. You can control access to external content search results by mapping these externally defined users and groups to ServiceNow AI Platform® users.

For an overview of AI Search content security, see Content security in AI Search.

Requirements

To use external content security, include the following two steps in your ingestion and indexing process for external documents:

Step	Description
Specify access permissions on each external document fed for ingestion	Access permissions for an external document can allow or deny access to the document globally (for all users), or can include lists of specific externally defined users and groups who are allowed or denied access to the document. AI Search preserves the external document's security access permissions during indexing. Additional information: • For an overview of specifying access permissions on external documents, see Defining access permissions for external documents. • To learn about the set of access permissions supported for external content security, see External content access permissions. • For details on special access permissions granted by certain user roles, see Special external content access permissions by role. • To learn how to reverse the default precedence of *`users.read`* and *`groups.deny`* access permissions for an external content indexed source, see Change the precedence of user read and group deny permissions for an external content indexed source.
Define user mappings in	A user mapping specifies externally defined user and group aliases for a ServiceNow AI Platform user. Link these user mappings to indexed sources

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Description
tables linked to external content indexed sources	for external content. AI Search uses an indexed source's user mappings in conjunction with indexed records' access permissions to determine ServiceNow AI Platform user access for search results from the indexed source. Additional information: • For an overview of user mappings, see Mapping external users and groups to ServiceNow AI Platform users. • To learn about the set of externally defined security principal types supported in user mappings, see External user mapping security principal types. • For instructions on creating a table to store your user mappings, see Create a user mapping table. • For instructions on linking your user mapping tables to external content indexed sources, see Link a user mapping table to an external content indexed source. • To learn about importing user mappings via the AI Search External User Mapping API, see Importing user mappings. • For instructions on viewing user mapping import history records to confirm that user mappings imported correctly, see View history records for user mapping import operations.

Security implementation for search queries

When a user's search query matches an indexed record created from an external document, AI Search performs these steps:

1. Examines the user mappings linked to the record's indexed source and retrieves the set of all externally defined users and groups aliased to the current ServiceNow AI Platform user's account.
2. Compares the mapped set of externally defined user and group aliases with the access permissions on the indexed search result record to see whether the ServiceNow AI Platform user should be allowed to view the search result.

Defining access permissions for external documents

You can specify access permissions for externally defined users and groups when ingesting external documents. AI Search preserves these permissions during indexing so that user content security filters can operate on them at search time.

For details on including access permissions for externally defined users and groups in ingested external documents, see the `POST /ais/external_content/ingestDocument/{schema_table_name}` endpoint of the External Content Ingestion API.

External content access permissions

External content security includes permissions that describe user and group access for an external document. When indexing an external document, AI Search stores these permissions so that content security filters can limit user access to the indexed search result.

Access permissions

AI Search supports the following access permissions on ingested external documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security principal	Description
everyone	Boolean option that indicates whether access to the external document is allowed for all users. AI Search applies this global access permission to the indexed record created from the document. Set this permission for an ingested document via the `[array].principals.everyone` request body parameter in a request to the `POST /ais/external_content/ingestDocument/{schema_table_name}` endpoint of the External Content Ingestion API. When set to **true**, this permission overrides all **groups** and **users** permissions. This permission is mutually exclusive with **none**. Only one of these two permissions can be set to **true** for any external document.
groups.deny	List of externally defined groups that are denied access to the external document. ServiceNow AI Platform® users mapped to any of these external groups can't view the indexed search result record created from the document. Set this permission for an ingested document via the `[array].principals.groups.deny` request body parameter in a request to the `POST /ais/external_content/ingestDocument/{schema_table_name}` endpoint of the External Content Ingestion API. This permission takes precedence over **groups.read**. If the same group has both read and deny access permissions for a document, AI Search denies members of the group access to the indexed record. By default, **users.read** takes precedence over this permission. To reverse this precedence order for an indexed source, see Change the precedence of user read and group deny permissions for an external content indexed source.
groups.read	List of externally defined groups that are allowed access to the external document. ServiceNow AI Platform users mapped to any of these external groups can view the indexed search result record created from the document. Set this permission for an ingested document via the `[array].principals.groups.read` request body parameter in a request to the `POST /ais/external_content/ingestDocument/{schema_table_name}` endpoint of the External Content Ingestion API. **groups.deny** permission takes precedence over this permission. If the same group has both read and deny access permissions for a document, AI Search denies members of the group access to the indexed record.
none	Boolean option indicating whether access to the external document is denied for all users. AI Search applies this global denial permission to the indexed record created from the document. Set this permission for an ingested document via the `[array].principals.none` request body parameter in a request to the `POST /ais/external_content/ingestDocument/{schema_table_name}` endpoint of the External Content Ingestion API. When set to **true**, this permission overrides all **groups** and **users** permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security principal	Description
	This permission is mutually exclusive with **everyone**. Only one of these two permissions can be set to **true** for any external document.
users.deny	List of externally defined users that are denied access to the external document. ServiceNow AI Platform users mapped to any of these external users can't view the indexed search result record created from the document. Set this permission for an ingested document via the *[array].principals.users.deny* request body parameter in a request to the *POST /ais/external_content/ingestDocument/{schema_table_name}* endpoint of the External Content Ingestion API. This permission takes precedence over **users.read**. If the same user has both read and deny access permissions for a document, AI Search denies that user access to the indexed record.
users.read	List of externally defined users that are allowed access to the external document. ServiceNow AI Platform users mapped to any of these external users can view the indexed search result record created from the document. Set this permission for an ingested document via the *[array].principals.users.read* request body parameter in a request to the *POST /ais/external_content/ingestDocument/{schema_table_name}* endpoint of the External Content Ingestion API. **users.deny** takes precedence over this permission. If the same user has both read and deny access permissions for a document, AI Search denies that user access to the indexed record. By default, this permission takes precedence over **groups.deny**. To reverse this precedence order for an indexed source, see Change the precedence of user read and group deny permissions for an external content indexed source.

Precedence order for principal permissions

The precedence order for *[array].principals* permissions on an ingested external document depends on the value of the *user_read_takes_precedence_over_group_deny* attribute for the document's indexed source.

Attribute value	Precedence order for principal permissions
true	From highest precedence to lowest: **1.** *everyone* and *none* **2.** *users.deny* **3.** *users.read* **4.** *groups.deny* **5.** *groups.read*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attribute value	Precedence order for principal permissions
	Note: This is the default attribute value for external content indexed sources.
false	From highest precedence to lowest: **1.** *everyone* and *none* **2.** *users.deny* and *groups.deny* **3.** *users.read* and *groups.read* **Note:** For instructions on setting this attribute value, see Change the precedence of user read and group deny permissions for an external content indexed source.

For details on how content security permissions from certain user roles interact with these external content security principals, see Special external content access permissions by role.

Special external content access permissions by role

Certain user roles provide special access permissions for external content indexed records.

Role	Permissions
AI Search administrator [ais_admin]	An AI Search administrator can access all external content indexed records in a search application. **Note:** To bypass all search source and content security filtering in the Search Preview UI, you also need the impersonator and AI Search high security administrator [ais_high_security_admin] roles. For details on this procedure, see Diagnose search result access issues using the Search Preview UI.
Guest user [public]	Non-authenticated guest users can only access external content indexed records that have the *everyone* permission set to *true*.
Self-registered external user [snc_external]	Self-registered external users that belong to groups can access external content indexed records based on their group memberships. External users that don't belong to any group can only access external content indexed records that have the *everyone* permission set to *true*. For more details on self-registered external users, see Self-register to ServiceNow instance.

Change the precedence of user read and group deny permissions for an external content indexed source

Make external group deny access permissions take precedence over external user read access permissions for all external documents ingested through an indexed source.

Before you begin

The External Content for AI Search plugin (com.glide.ais.external_content) must be activated in your instance.

The source table for the indexed source must be an external content schema table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: ais_admin

About this task

By default, external user read access permissions (*users.read*) on an external document take precedence over external group deny access permissions (*groups.deny*) on the same document.

For example, suppose you ingest external content through an indexed source with a user mapping that maps ServiceNow AI Platform® user *beth.anglin@example.com* to external user *ad|beth-anglin* and external group *report-users*. If an external document grants read access to *ad|beth-anglin* and denies access to *report-users*, AI Search allows *beth.anglin@example.com* to view the indexed search result record for the external document.

To reverse this default behavior for an indexed source, making external group deny permissions take precedence over external user read permissions for all of its indexed records, change the value of the indexed source's *user_read_takes_precedence_over_group_deny* attribute. In the preceding example, making this change would prevent *beth.anglin@example.com* from viewing the indexed search result record for the external document.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Edit the record for the indexed source you want to change the permissions precedence for.
3. In the Advanced Configuration related list, select **New**.
4. On the Indexed Source Attribute form, enter the following field values.

Field	Value
Attribute	user_read_takes_precedence_over_group_deny
Value	false

   For a description of the field values, see Indexed Source Attribute form.

5. Select **Submit**.
   The attribute and value appear in the Advanced Configuration related list.

Result

The change in permission preference takes effect for search results from the external content indexed source.

Mapping external users and groups to ServiceNow AI Platform® users

AI Search external user mappings enable you to configure externally defined user and group aliases for ServiceNow AI Platform users. AI Search uses these aliased security principals to apply content security filters that control user access to search results indexed from external documents.

You can use mapped external user and group names when defining access permissions for external documents that you ingest for indexing via the External Content Ingestion API.

External content security user mapping overview

To configure user mappings for external content security, you must perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create one or more user mapping tables. For instructions on this procedure, see Create a user mapping table.
2. Link a user mapping table to each of your external content indexed sources. For details on this task, see Link a user mapping table to an external content indexed source.

   Note: If no mapping is found for the current ServiceNow AI Platform user, AI Search only allows the user to view search results for external documents that have the *everyone* permission set to **true**. This can occur if no user mapping table is linked to a search result's indexed source, or if no mapping for the current ServiceNow AI Platform user exists in the indexed source's linked user mapping table.

3. Import user mappings into your user mapping tables with the AI Search External User Mapping API.

Users with the ais_high_security_admin role can review history records for import operations to verify that user mappings imported correctly. For instructions on this procedure, see View history records for user mapping import operations.

External user mapping security principal types

AI Search user mapping aliases can include externally defined group and user security principals.

Mapped security principal type	Description
Externally defined group	The ServiceNow AI Platform® user specified in the user mapping inherits group-level access permissions for all aliased external groups. For example, if you define external group *report-users* as an alias for ServiceNow AI Platform user *beth.anglin@example.com*, AI Search allows *beth.anglin@example.com* to view indexed search results for external documents that include read access permission for *report-users*.
Externally defined user	The ServiceNow AI Platform user specified in the user mapping inherits user-level access permissions for all aliased external users. For example, if you define external user *ad|abel-tuter* as an alias for ServiceNow AI Platform user *abel.tuter@example.com*, AI Search allows *abel.tuter@example.com* to view indexed search results for external documents that include read access permission for *ad|abel-tuter*.

Create a user mapping table

Define a table to store externally defined user and group aliases for ServiceNow AI Platform® users.

Before you begin

The External Content for AI Search plugin (com.glide.ais.external_content) must be activated in your instance.

Role required: ais_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

User mapping tables store user mappings for use with external documents that have access permissions. Each mapping specifies externally defined user and group aliases for an individual ServiceNow AI Platform user. AI Search uses the mappings linked to an external document's indexed source to determine whether a ServiceNow AI Platform user can view the indexed record for the document.

All user mapping tables extend the AI Search External Search User Mapping Base [ais_external_search_user_mapping] table.

Procedure

1. Navigate to **All** > *AI Search* > **External Content** > **Create User Mapping**.
2. Enter a name for your user mapping table.
3. Select **Submit**.
   The dictionary form for your new user mapping table appears.

What to do next

Import user mappings into your new user mapping table. For an overview of this process, see Importing user mappings. For details on the relevant API endpoint, see AI Search External User Mapping API.

Link a user mapping table to an external content indexed source

Specify the user mapping table you want AI Search to use for external documents ingested through an indexed source.

Before you begin

The External Content for AI Search plugin (com.glide.ais.external_content) must be activated in your instance.

The source table for the indexed source must be an external content schema table.

Role required: ais_admin

About this task

A user mapping table linked to an indexed source defines external user and group aliases for ServiceNow AI Platform® users. AI Search uses these aliases to determine a user's effective access permissions when their search matches a record from the indexed source.

A user mapping table can be linked to any number of indexed sources.

Note: If no mapping is found for the current ServiceNow AI Platform user, AI Search only allows the user to view search results for external documents that have the *everyone* permission set to **true**. This can occur if no user mapping table is linked to a search result's indexed source, or if no mapping for the current ServiceNow AI Platform user exists in the indexed source's linked user mapping table.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source record that you want to link a user mapping to.
3. In the AI Search External Search User Mapping Table Data Source Relationships related list, create a new relationship record for the user mapping table that you want to link to the indexed source:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New**.

b. On the AI Search External Search User Mapping Table Data Source Relationship form, fill in the fields.

c. Select **Submit**.
The user mapping table's name appears in the related list.

Importing user mappings

You can use the AI Search External User Mapping API to import mappings between ServiceNow AI Platform® users and externally defined users and groups.

To define a user mapping for import, you need the following information:

- The email address that uniquely identifies a ServiceNow AI Platform user in the User [sys_user] table.
- The list of externally defined groups that you want to alias to the ServiceNow AI Platform user. This list can be empty.
- The list of externally defined users that you want to alias to the ServiceNow AI Platform user. This list can be empty.

For more information on importing user mappings, see AI Search External User Mapping API.

View history records for user mapping import operations

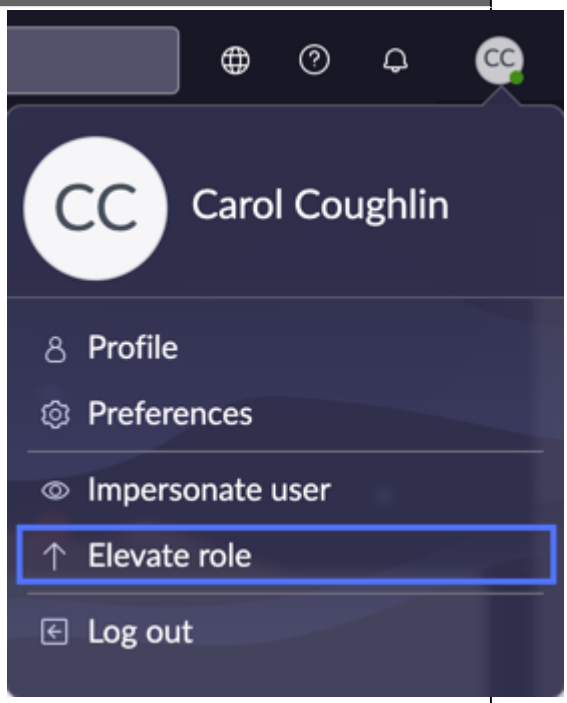
Review the results for your user mapping import operations, including data, log messages, and any errors. Use this procedure to verify that your user mappings are imported correctly.

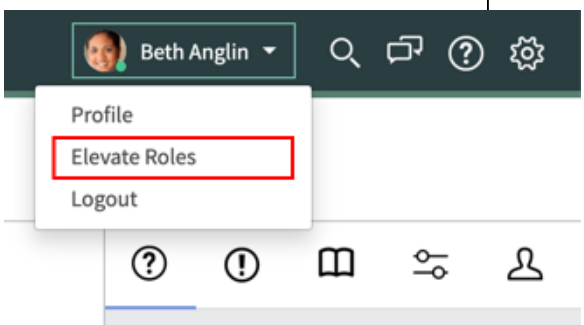
Before you begin

Role required: ais_admin, ais_high_security_admin, and import_transformer.

About this task

AI Search creates an import set for each batch of user mappings that you import via the AI Search External User Mapping API. The transform histories for these import sets provide insight into the results of your user mapping import operations.

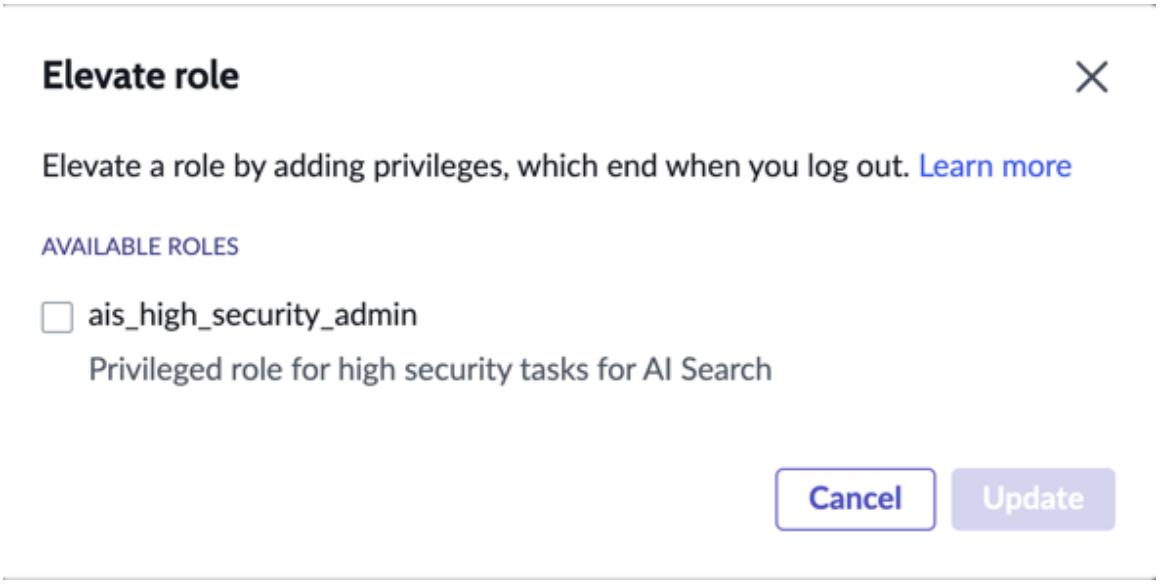




Procedure

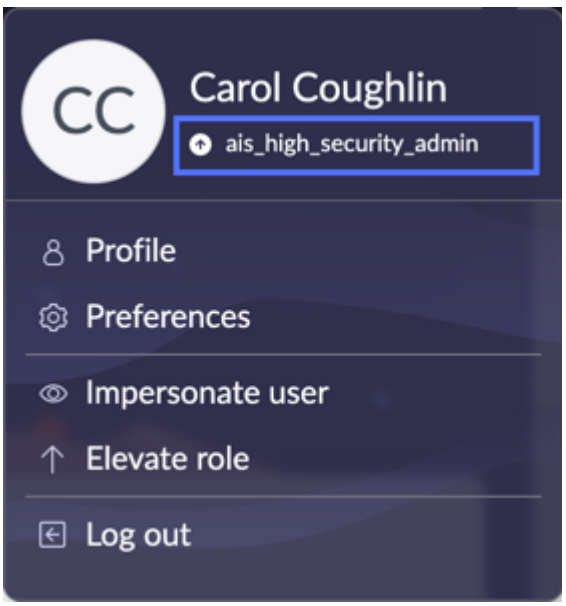
1. Elevate to the ais_high_security_admin role:

   a. Perform the appropriate action for your version of the UI:



UI version	Action
Next Experience UI	In the banner frame, select the icon for your account to open the user menu, then select **Elevate role**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



UI version	Action
	
Core UI	In the banner frame, select your name to open the user menu, then select **Elevate Roles**. 

A dialog box appears, displaying a checklist of your available privileged roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. In the dialog box, select the **ais_high_security_admin** option, then select **Update** (in Next Experience UI) or **OK**.
The page reloads and an elevated role indicator appears next to your user name in the user menu. In Next Experience UI, this indicator displays the names of the active privileged roles.
In Core UI, the indicator displays the elevated role icon .

Note: When the page reloads, any unsaved edits are lost.

2. Navigate to **All** > *AI Search* > **External Content** > **User mapping import history**.

3. Review each user mapping import history record that you're interested in.

a. Open the user mapping import history record.

b. On the AI Search External Content User Mapping History Record form, select the **Show Transform History** related link.
The Transform History [sys_import_set_run] table opens, with a filter applied for the import set from the selected user mapping import history record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Open the transform history record.

d. Review import set results on the form, errors in the Import Set Row Errors related list, and log messages in the Import Log related list.

Components installed with External Content for AI Search

When you activate the External Content for AI Search plugin (com.glide.ais.external_content), the system creates a new virtual table.

Tables installed

Table	Description
AI Search External Search Content [v_ais_external_search_content]	Stores the base set of field mapping columns for inclusion in external content schema tables. **Note:** All user-created external content schema tables extend this table.
AI Search External Search User Mapping Table Data Source Relationship [ais_external_search_user_mapping_data_source_m2m]	Stores links between user mapping tables and indexed sources.

Integrating AI Search into other ServiceNow AI Platform® applications

AI Search integrates with other ServiceNow AI Platform applications. Populate your UI Builder pages with search components and customize display of search results and Genius Results with EVAM definitions. Improve incident deflection in Service Portal by configuring AI Search Assist for record producers.

UI Builder search components

AI Search provides components for search input, search results, search facets, and source facet bucket filters. You can add these components to your pages in UI Builder.

The AI Search components are described in detail on the Developer Site:

- Search facets
- Search input
- Search results
- Tab filter

For details on adding components to your pages in UI Builder, see Add and configure components.

Entity View Action Mapping (EVAM) definitions

Entity View Action Mapping (EVAM) is a ServiceNow AI Platform application that standardizes how different data sources display records in cards and lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search provides EVAM configurations that you can use to customize display of search results and Genius Results in Service Portal and your UI Builder pages.

You can customize EVAM settings to display AI Search results as a card grid view or as a list view. Users can page through large data sets of search results and see different views based on filtering.

For details on EVAM definitions, configurations, templates, and configuration bundles, see Entity View Action Mapping (EVAM).

Service Portal record producer integration

AI Search Assist is a Service Portal widget that uses AI Search to improve incident deflection by displaying the most relevant set of related search results within a record producer. You can use AI Search Assist instead of Contextual Search.

For more details on the AI Search Assist widget, see AI Search Assist record producer integration for Service Portal.

AI Search Assist record producer integration for Service Portal

AI Search Assist is a Service Portal widget that uses AI Search to improve incident deflection by displaying the most relevant set of related Catalog Item and knowledge article search results within a record producer. You can use AI Search Assist instead of Contextual Search.

AI Search Assist overview

AI Search Assist can help a user find the most relevant Catalog Items and knowledge articles in a search on your portal. For example, a user who creates an Incident via the Service Portal can see related Catalog Items that they can order. The user can also view related knowledge articles to assist them to resolve the issue on their own without involving the service desk.

AI Search Assist helps with incident deflection for incident record producers, deflecting incidents by helping end users resolve issues before they raise an incident.

AI Search Assist supports ServiceNow mobile.

Note: AI Search Assist doesn't support external users. If an external user tries to use an Assist UI action, the system returns an error.

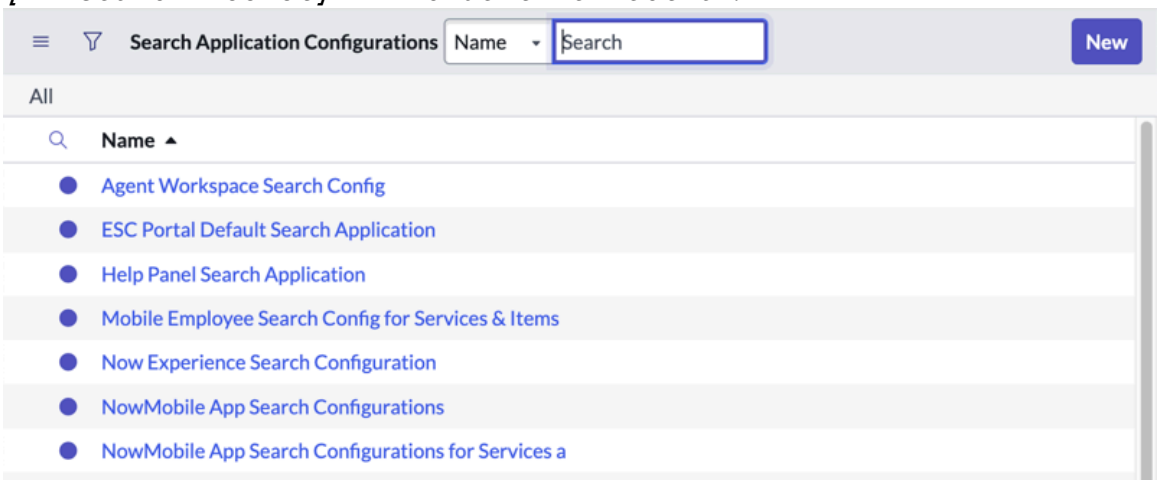
Activation information

The AI Search Assist plugin (com.snc.ai_search_assist) is a ServiceNow AI Platform® application that is activated by default when AI Search is active.

Configure AI Search Assist for a record producer

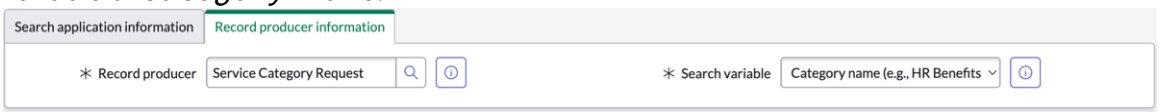
Configure AI Search Assist settings for a record producer to help users view related Catalog Item and knowledge article search results.

Before you begin
Role required: aisa_admin or admin



About this task
AI Search Assist is a Service Portal widget that displays relevant Catalog Item and knowledge article search results within a record producer configuration.

Note: If both AI Search Assist and Contextual Search are configured for the same record producer, see *Results* at the end of this task for how to control which one is displayed.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Assist** > **Record Producer Configuration**.
2. Select **New** and fill in the form to create a configuration for Catalog Item and knowledge article search results.
3. On the **Search application information** tab, select a Search application configuration.
   You can choose from a list of pre-defined configurations for specific features. For example, *[AI Search Assist] - Incident Deflection*.

4. On the **Record producer information** tab, select a Record producer and Search variable.
   For example, *Service Category Request* as a record producer can have a search variable of *Category name*.

5. **Optional:** To adjust the visibility of your card or detail view, select **Show UI Actions** under the new Record Producer Configuration record's related links.
   AI Search Assist *UI actions* can hide from view using a simple condition or advanced condition via a script.
6. Select **Submit**.

Result

AI Search Assist is active.

Note: AI Search Assist doesn't support external users. If an external user tries to use an Assist UI action, the system returns an error.

If Contextual Search has been configured for the same record producer, and is showing results instead of AI Search Assist, check the following conditions:

- The *Enable AI Search* flag on the Portal (sp_portal) is active
- The AI Search Assist record configuration is active
- The AI Search Profile is active and published
- The record producer variable for AI Search Assist is created for the associated record producer and the variable is active

If these conditions aren't all met, then Contextual Search is the fallback for the same record producer to make sure you see related search results.

AI Search Assist roles

AI Search Assist includes the following roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

AI Search Assist administrator [aisa_admin]

Configure and manage AI Search Assist settings.

- Manages AI Search Assist on record producers, including the associated UI actions
- Adds variables to a record producer
- Administers AI Search Assist capability

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note: Avoid granting an admin role when more specialized roles are available.

AI Search Assist properties

The AI Search Assist properties determine when searching begins based on characters entered and the time that has elapsed. These properties reduce the impact of searches for systems with many Catalog Items or Knowledge articles.

AI Search Assist properties

Property	Description
com.snc.ai_search_assist.min_length	The minimum number of characters entered before a search initiates. The default is 3.
com.snc.ai_search_assist.wait_time	The time elapsed after the user finishes entering characters in the search field before the search begins. **Note:** If you set the time to '-1', the search begins when the user leaves the search field. This behavior is known as 'Search on tab'.

Domain separation and AI Search Assist

Domain separation is supported for AI Search Assist. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search Assist overview

The goal of AI Search Assist is to give a Service Portal record producer AI Search capabilities, which improve search results over time. Domain separation is enabled in AI Search Assist.

How domain separation works in AI Search Assist

Domain separation for AI Search Assist is set in the record producer configuration. A related link for each record producer configuration enables you to expand or collapse the domain scope. If you expand the domain scope, any child domain record producer configurations can override a global or parent domain record configuration.

Domain separation for service providers

Searching in AI Search

See how AI Search displays search results, refinement filter options, and Genius Result answers. Learn how to search using the AI Search query language. Understand when and how AI Search automatically resubmits queries.

Note: For more details on using AI Search features in global and workspace search, see Using global search with AI Search for Next Experience.

AI Search query language

Learn how to construct search queries using terms, phrases, and AI Search query operators.

Search query terms and phrases

Specify terms and quoted phrases in the search query to find records that contain the same terms or phrases.

Search query terms	Description
`conference`	Single-term search. Finds records that contain the term `conference`. **Note:** Search terms don't match substrings of indexed terms. As an example, searching for `exam` finds records that contain the term `exam`, but not records that contain the term `example`. To search for substring matches, you can use the `%` or `*` wildcard matching operators.
`conference room`	Conjunctive multi-term search. Finds records that contain both of the terms `conference` and `room` (an intersection of sets). The search terms can appear in any order or proximity in the record and may appear in different fields. **Note:** If you set the **Boolean search operator to use when a search query includes multiple terms** (*`glide.ais.query.search_operator`*) system property to *`OR query`*, this search finds records that contain either of the terms `conference` or `room` (a union of sets).
`"conference room"`	Quoted phrase search. Finds records that contain the term `conference` followed immediately by the term `room`. The search terms must appear in this order and in the same field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search query terms	Description
	Note: Quoting a phrase doesn't disable linguistic features (such as normalization, synonym expansion, and stop word removal) or wildcard operators. For example, a search for the quoted phrase `"email acc*"` expands the wildcard operator normally to find records that contain `email account` and `email access`.

AI Search ignores letter case for search query terms and phrases. For example, searching for `PIN` finds records containing `PIN` and `pin`.

Note: When processing search query terms, AI Search automatically strips out HTML and XML content by removing strings that start with < and end with >. As an example, if you enter `user <beth.anglin@example.com>` as your search terms, AI Search only searches for `user`. If you search for `<abel.tuter@example.com>`, AI Search treats the search as empty and returns no results. This behavior isn't configurable.

Boolean search operators

Separate query terms and phrases with Boolean operators to override the default matching logic for the search query.

Operator	Description
`OR`	Boolean disjunction operator. Finds records that contain any of the terms or phrases separated by `OR`. For example, searching for `"conference room" OR suite` finds records that contain the phrase `conference room` and records that contain the term `suite`. **Note:** If you set the **Boolean search operator to use when a search query includes multiple terms** (*`glide.ais.query.search_operator`*) system property to *`OR query`*, this operator has no effect because search already treats all query terms and phrases as though separated by the `OR` operator.
hyphen (`-`)	Boolean negation operator. Excludes records containing the term or phrase that immediately follows the hyphen. For example, searching for `email -"email signature"` finds records that contain the term `email` but don't contain the phrase `email signature`.

Wildcard matching operators

Use wildcard operators to find records that contain indexed terms matching a wildcard pattern.

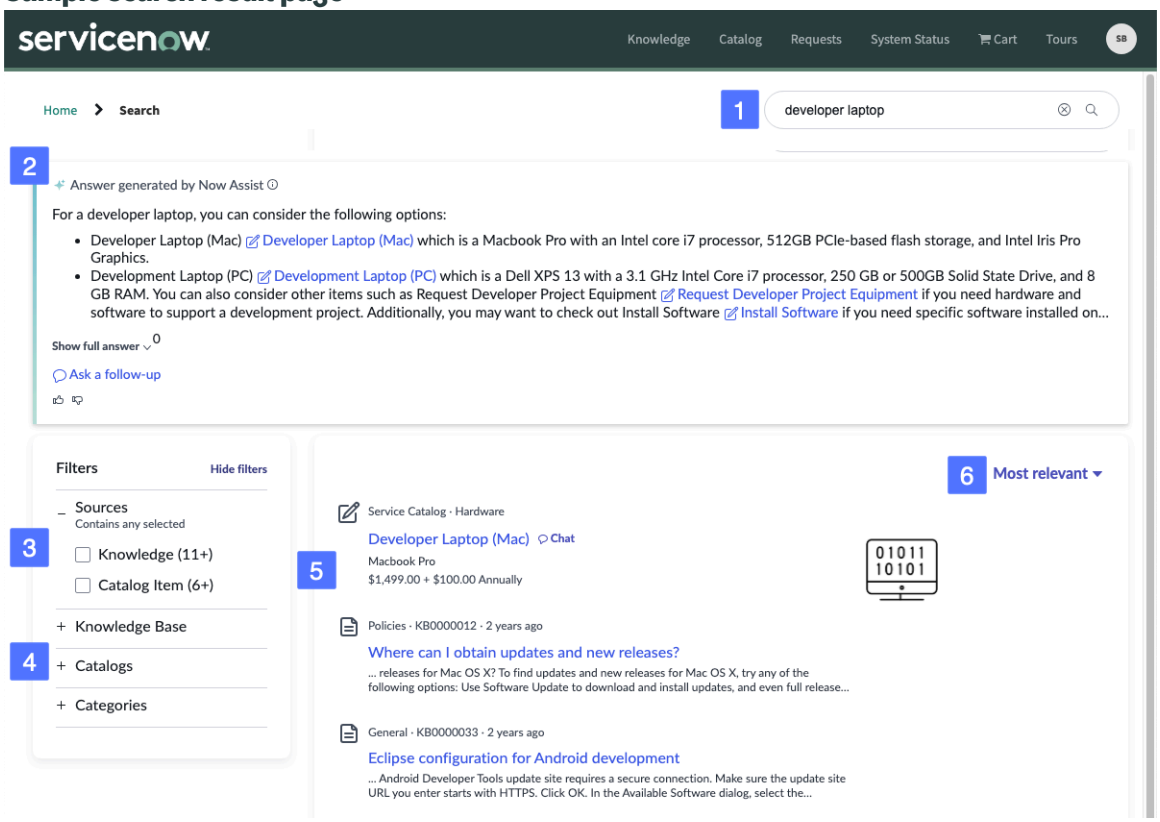
Operator	Description
`%`	Single-character wildcard operator. Include `%` in a search query term to match any one character in an indexed term. As an example, searching for `the%e` finds results containing wildcard matches such as `theme`, `there`, or `these`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operator	Description
	AI Search also evaluates the search with the wildcard operator ignored, to look for literal matches. The non-wildcard operator parts of the search term are treated as a phrase, meaning that they must appear in the same order in the result as they do in the search. As an example, a search for `5000%000` returns results that contain `5000` followed by `000` as well as results that contain wildcard matches like `50007000`. **Note:** The `%` operator must follow a string of three or more non-wildcard characters. For search query terms that don't satisfy this condition, AI Search only returns literal matches. As an example, if you search for `99%`, with only two non-wildcard characters preceding the `%` operator, AI Search only returns results with literal matches for `99`.
`*`	String wildcard operator. Include `*` in a search query term to match any string of zero or more characters in an indexed term. As an example, searching for `acc*` finds results containing wildcard matches such as `access`, `account`, `accrue`, `accumulate`, and `accuracy`. AI Search also evaluates the search with the wildcard operator ignored, to look for literal matches. The non-wildcard operator parts of the search term are treated as a phrase, meaning that they must appear in the same order in the result as they do in the search. As an example, a search for `753*268` returns results that contain `753` followed by `268` as well as results that contain wildcard matches like `7539268`. **Note:** The `*` operator must follow a string of three or more non-wildcard characters. For search query terms that don't satisfy this condition, AI Search only returns literal matches. As an example, if you search for `ad*`, with only two non-wildcard characters preceding the `*` wildcard operator, AI Search only returns results with literal matches for `ad`.
`***`	Universal wildcard operator. Specify `***` as a search query to find all indexed terms and thus all records. **Note:** AI Search doesn't apply relevancy ranking to `***` queries. Results from `***` queries appear in an unspecified order.

Note: When expanding search terms that contain `%` or `*` wildcard operators, AI Search ignores terms defined as stop words. For example, suppose you define `the` and `their` as stop words. A search for `the*` won't expand to match `the` or `their`, but will still match non-stop word terms such as `there` and `these`.

Viewing search results in AI Search



Learn about the components that AI Search uses to display results for search queries.

Search result page elements

The layout and appearance of AI Search UI elements varies from application to application. This example shows the elements as they might appear on a Service Portal search results page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample search result page

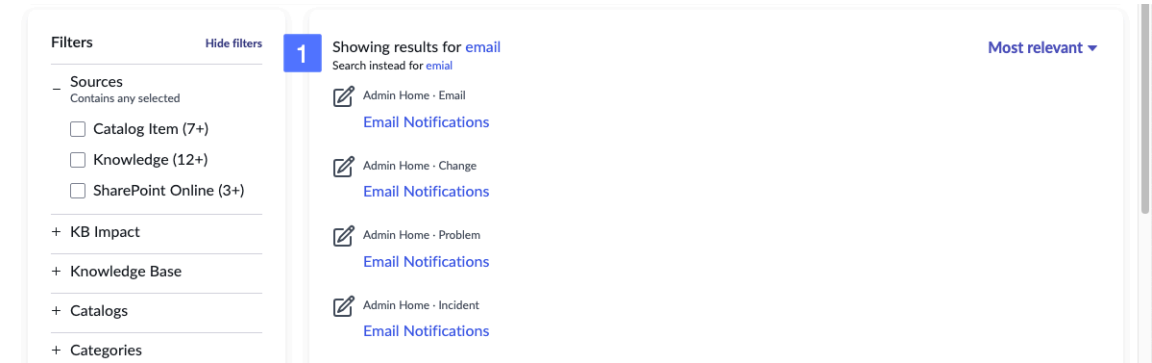
Search result page elements

Element	Description
1. Search input field	Displays the search query that produced the listed search results. You can modify this search query and search again to view different results.
2. Genius Result answer cards	Display the best answers for your search query along with actions you can take directly from each card. **Note:** Genius Result answer cards may not appear for all search queries. You may see your regular search results appear before AI Search finishes computing Genius Result answers for your search. An animated message lets you know if Genius Result answer computation is still ongoing when your regular search results appear. When a search returns multiple Genius Result answers, the answer cards display in a carousel. You can scroll the carousel and select the answer card you want to take action from. To provide feedback relating to a Genius Result answer, select one of its **Was this suggestion helpful?** links. If the answer is relevant to your search, select **Yes**; otherwise, select **No**.
3. Source facet buckets	Displays static filter options for refining search results by search source. To view only results from a single search source, select the option for that search source. To remove the filter, clear the search source option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search result page elements (continued)

Element	Description
	Source names in source facet buckets display as options instead of links, and include a label showing how multiple selections are applied when filtering your search results. Labels include: • *`Contains all selected`*: Displays only search results that include all of the selected sources. This label indicates the Multi Select And facet type. • *`Contains any selected`*: Displays search results that include any one of the selected sources. This label indicates the Multi Select Or facet type.
4. Facet filters	Displays dynamic filter options for refining search results by field value. To expand or collapse a facet, select the **+** (plus) or **-** (minus) symbol by its name. To view only search results that contain a specific field value, select the field value option in the facet. Clear the field value option to remove the facet filter. **Note:** When faceting on a date field, the facet options are precomputed date ranges, such as `Past 3 months`, rather than exact date field values. Selecting an option displays only results that have date field values in the specified range. You can select and clear these date range options in the same way that you select and clear field value options for non-date facets. Some facets allow you to select multiple field values. Field values in multi select facets display as options instead of links, and include a label showing how multiple selections are applied when filtering your search results. Labels include: • *`Contains all selected`*: Displays only search results that include all of the selected field values. This label indicates the Multi Select And facet type. • *`Contains any selected`*: Displays search results that include any one of the selected field values. This label indicates the Multi Select Or facet type. If your facet filter cannot be applied to search results from the source facet bucket you've selected, AI Search ignores the facet filter.
5. Search results	Displays the icon, summary field values, title, and text snippet for each search result. Select a result to view its source record in a new browser tab, preserving the state of your search in the current tab. The display settings for search results may be customized by modifying their EVAM properties. As an example, search results for Service Catalog items might be customized to display item images along with icons and field values. To learn about customizing search result display settings, see Configure EVAM display settings for search results in AI Search applications. Search results for attachments may be displayed separately or may appear grouped with their parent search results. Each grouped attachment displays an icon indicating the attachment file type. For more details on how grouped attachments appear in the search results list, see Group attachment search results with their parent results. **Note:** When you select an attachment search result, the system may display the attachment in a new browser tab or may prompt you to download the attachment.
6. Search	Displays the currently selected sort order for search results.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search result page elements (continued)

Element	Description
result sort order	By default, AI Search displays the most relevant results first. To apply an alternative sort order, open this list and select one of the available search result sort options. **Note:** If no search result sort options are available, the sort menu doesn't display and results are automatically sorted by relevance.

Auto-correction message

When AI Search auto-corrects a misspelled search query term, a `Showing results for <corrected_term>` message appears above the search results list.

Auto-correction message elements

Element	Description
1. Typo handling auto-correction message and link to original search term	Displays the auto-corrected query term used for the search. To repeat the search using your original search query term, select the link in the **Search instead for <original_term>** line of the message.

Change the sort order for your search results

Choose the order in which AI Search displays results for your search. By default, the most relevant search results appear first. You can override this behavior and view search results ordered by their field values.

Before you begin

Role required: none

About this task

Sorting enables you to view your search results in an order based on their field values. You can select any of the sort options available in the search application.

Note: If your search administrator has deactivated sort options globally or for the search application, the sort menu doesn't appear and you can only see your search results in the default relevancy order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the results page for your search, access the sort menu.
   - In Now Mobile, select **Filter**, and then select **Sort by**.
   - In other applications, select **Most relevant**.

   The sort menu shows the list of available sort options.
2. Select the sort option that you want to apply to your current search result set.

   Example
   As an example, to show the most recently updated search results first, select **Most recent**. The search results page refreshes to display your results in the preferred order.

> **Note:** The new sort order persists when you select facets or navigation filters. It resets to the default relevancy order when you start a new search by modifying the search query terms.

Automatic search query resubmission

When a search query returns too few results, AI Search automatically modifies and resubmits it with the goal of returning at least the desired number of results.

Search administrators configure the minimum number of desired results per search query using the **Search Results Limit** field in search application configurations. For more details, see Create a search application configuration for AI Search.

AND-to-OR search query resubmission

When a search query with conjunctive terms or phrases returns insufficient results, AI Search resubmits it with the default Boolean operator changed from AND to OR and displays results for the modified query.

For example, if a query for `hotel "conference room" suite` matches no results, AI Search resubmits it as `hotel OR "conference room" OR suite`. This less-restrictive query may match more results than the original query.

> **Note:** If you set the **Boolean search operator to use when a search query includes multiple terms** (*`glide.ais.query.search_operator`*) system property to *`OR query`*, AI Search doesn't resubmit search queries in this way because the initial search already treats all query terms and phrases as though separated by the `OR` operator.

When automatically resubmitting a search query in this way, AI Search adds a minimum match count restriction to the OR expression. The modified query only returns results that match at least half (rounded up) of the terms separated by OR operators. This restriction improves query performance and provides more relevant results.

For example, suppose a search query for `laptop can't access wi-fi network` returns no results. AI Search automatically resubmits the query as `laptop OR can't OR access OR wi-fi OR network`. Only records that match at least three of the five query terms appear as results for the resubmitted search.

Conditions for automatic search query resubmission

Automatic search query resubmission ignores search queries that meet any of the following conditions.

- The original search query only includes a single term.
- The original search query includes 8 or more terms and returns at least one search result.

Fuzzy numeric search in AI Search

Fuzzy numeric search lets you find indexed records by their Number field values without needing to enter alphabetic prefixes or leading zeroes.

Fuzzy numeric search overview

Fuzzy numeric search in AI Search allows your numerical search terms to match indexed ServiceNow AI Platform® records by their Number field values. The fuzzy matching compares the numeric search term with each indexed record's Number, ignoring its alphabetical prefix and any leading zeroes. As an example, if you index knowledge article and problem records, a search for `23583` might return knowledge article KB00023583 and problem PRB00023583 as search results.

When fuzzy numeric search is activated, AI Search checks all-numeric search terms for fuzzy numeric matches when you search and when computing auto-complete suggestions for your search terms.

Important:

Fuzzy numeric search only searches records from numbered tables. These are tables with Number fields that have prefixes defined in the Number [sys_number] table. To learn about record numbering and the Number table, see Record numbering.

Child tables that inherit the Number field from their parent table can't be searched using fuzzy numeric search. Only tables that have their own Number field defined work with this feature.

Fuzzy numeric search only finds numeric field values in predefined fields named **number**. It doesn't search custom fields or predefined fields with other names.

Fuzzy numeric matching behavior

The following table provides additional details on how fuzzy numeric matching operates.

Fuzzy numeric matching behavior	Description
AI Search only checks all-numeric search terms for fuzzy matches	A search for `KB52578` doesn't match knowledge article KB00052578 because the search term includes non-numeric characters. If you search for `16867 test`, your all-numeric `16867` search term is checked for fuzzy numeric matches, but your non-numeric `test` search term isn't.
Fuzzy numeric matching ignores leading zeroes in all-numeric search terms	A search for `07295` returns the same fuzzy numeric matches as a search for `7295` (without the leading zero) does.
Fuzzy numeric search only matches Number field values from indexed records	A search for `28761` matches the knowledge article with Number field value KB00028761, but it doesn't match the term `KB00028761` if it occurs in the text of other knowledge articles.
Fuzzy numeric matching only ignores alphabetical prefixes and leading zeroes in record Number field values	A search for `729` matches knowledge article KB00000729, but doesn't match article KB00003729 because its Number field value has a non-zero digit before the matching substring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fuzzy numeric matching behavior	Description
To be a fuzzy match, a numeric substring must match the final digits of a record's Number field value	A search for 1164 matches knowledge article KB00001164, but doesn't match article KB00116497 because its Number field value includes digits after the matching substring.

Examples of fuzzy numeric search

The following table includes examples to illustrate how fuzzy numeric searches match search results. These examples assume that records are indexed from the Knowledge [kb_knowledge] and Problem [problem] tables.

Search	Search results
73492	Search matches these results: • Knowledge article with Number KB00073492 • Problem with Number PRB00073492 • Any indexed record or document that includes 73492 as a whole term (not a substring)
05638	Search matches these results: • Knowledge article with Number KB0005638 • Problem with Number PRB0005638 • Any indexed record or document that includes 05638 as a whole term (not a substring)
2541 828	Search matches these results when using the AND (conjunctive) operator: • Knowledge article with Number KB0002541 and text including 828 as a whole term (not a substring) • Knowledge article with Number KB0000828 and text including 2541 as a whole term (not a substring) • Problem with Number PRB0002541 and text including 828 as a whole term (not a substring) • Problem with Number PRB0000828 and text including 2541 as a whole term (not a substring) • Any indexed record or document that includes 2541 and 828 as whole terms (not substrings) Search matches these results when using the OR (disjunctive) operator: • Knowledge article with Number KB0002541 • Knowledge article with Number KB0000828 • Problem with Number PRB0002541 • Problem with Number PRB0000828

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search	Search results
	• Any indexed record or document that includes `2541` as a whole term (not a substring) • Any indexed record or document that includes `828` as a whole term (not a substring) **Note:** For more details on the AND and OR operators, see the description of the *`glide.ais.query.search_operator`* system property in AI Search system properties.
model 9433	Search matches these results when using the AND (conjunctive) operator: • Knowledge article with Number KB0009433 and text including `model` as a whole term (not a substring) • Problem with Number PRB0009433 and text including `model` as a whole term (not a substring) • Any indexed record or document that includes `model` and `9433` as whole terms (not substrings) Search matches these results when using the OR (disjunctive) operator: • Knowledge article with Number KB0009433 • Problem with Number PRB0009433 • Any indexed record or document that includes `model` as a whole term (not a substring) • Any indexed record or document that includes `9433` as a whole term (not a substring) **Note:** For more details on the AND and OR operators, see the description of the *`glide.ais.query.search_operator`* system property in AI Search system properties.

Fuzzy numeric search availability

Fuzzy numeric search is deactivated by default. It's only available at search time if your ServiceNow AI Platform® admin has activated it. To view activation steps for this feature, see Activate fuzzy numeric search in AI Search.

Provide feedback on Genius Results

Users can submit feedback for each Genius Result answer card, specifying whether it was helpful for their search or not. For cards from default Genius Result configurations, users can also select the reason they found an answer unhelpful. AI Search records feedback responses as search signals that you can use to assess the relevancy of your Genius Result configurations.

Before you begin

You must have performed a search that returned one or more Genius Result answer cards.

Role required: none

About this task

You can provide feedback for each Genius Result answer card in your search result set, marking it as helpful or unhelpful for your search. If you mark an answer card produced by a default Genius Result configuration as unhelpful, you can also select the reason it was unhelpful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search stores user feedback for Genius Result answers as signals in the Genius Result Event Action [sys_search_genius_result_event_action] table. For more information on this table, see Search signal tables.

Procedure

1. On the Genius Result answer card that you want to provide feedback for, find the **Helpful?** section.
2. Choose one of the following:
   - If you found the Genius Result answer helpful for your search, select **Yes**.
   - If you found the Genius Result answer unhelpful for your search, select **No**.
3. If you selected **No** on an answer card produced by a default Genius Result configuration, choose one of the following:
   - To indicate why you found the Genius Result answer unhelpful, select a reason from the list in the dialog box, then select **Submit feedback**.
   - To submit your feedback without a reason, select anywhere outside the dialog box.

Result

AI Search submits your feedback as a search signal.

Administering AI Search

Learn how AI Search features and behavior affect indexing and search. Gain insight into AI Search behavior by reviewing log messages, ingestion history for indexed sources, and session debugging messages.

AI Search and performance testing

Understand how the AI Search topology affects performance testing on instances created with System Clone.

> **⚠ Warning:**
>
> Be careful when testing AI Search performance in cloned non-production instances. The same dedicated AI Search nodes handle search query traffic from all of your instances. Search queries on non-production instances can impact search query performance in your production instance.

Lemma and Unicode normalization

AI Search normalizes inflected words and Unicode glyphs during indexing and at search query time. Normalization improves search recall and enables users to find content with variant forms of their search query terms.

Normalization features are automatically enabled and aren't configurable.

Lemma normalization

Many languages include inflected forms of terms, such as plural nouns or verb tenses. AI Search normalizes inflected terms found in indexed content and search queries. Normalization enables matching based on a root form, such as the singular for a plural noun or the base form for a conjugated verb. This root form is called a lemma, and this process is referred to as lemma normalization.

For example, when a source record includes the conjugated verb `selling`, AI Search expands the indexed term to include the lemma form `sell` in addition to `selling`. When a user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

searches for the past-tense conjugated form `sold`, AI Search expands the search query term to include the lemma form `sell` as well as `sold`. Because the indexed term and the search query term include matching forms, the user's search returns the `selling` record as a result.

AI Search supports language-specific lemma normalization for Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish.

Decompounding

In addition to normalizing lemmas for Danish, Finnish, German, Hungarian, Korean, Norwegian (Bokmål), and Swedish, AI Search indexes compound words and their individual component words. For example, when indexing a German record that contains the compound word `Humanressourcen`, AI Search indexes the component terms `Human` and `ressourcen` in addition to the compound term.

Unicode normalization

AI Search performs Unicode normalization on indexed terms and search query terms. This normalization makes alphabetical Unicode glyphs searchable using their nearest equivalent characters.

For example, when indexing a record containing the term `resumé`, AI Search expands the term to also include the non-accented form `resume`. This record appears as a search result when users search for either `resume` or `resumé`.

Unicode normalization includes NFKD (compatibility decomposition) and NFKC (compatibility composition) stages. For more information on these normalization forms, see the Unicode Standard Annex #15, https://www.unicode.org/reports/tr15/ .

Interaction with other search features

The following table describes interactions between normalization and other search features.

Feature	Interaction with lemma and Unicode normalization
Genius Results	Search query terms added by lemma or Unicode normalization can't trigger Genius Result configurations with Term trigger conditions.
Result improvement rules	A search query term added by lemma or Unicode normalization can trigger a result improvement rule if it matches the rule's Query trigger.
Stop words	If a search query term is defined as a stop word, AI Search removes that term without normalizing it.
Synonyms	If a search query term is defined as a synonym, AI Search doesn't normalize it.
Typo handling	AI Search performs lemma and Unicode normalization on auto-corrected search query terms.

Internationalization support for AI Search

AI Search supports indexing and search in all languages offered by the ServiceNow AI Platform®. Search linguistic features are supported in Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Internationalization support is automatically enabled and isn't configurable.

To view the full list of languages offered as ServiceNow AI Platform plugins and supported in AI Search, see Activate a language.

Note: After you activate a new language plugin, you must reindex all indexed source content that you want to make searchable in the new language. For details on reindexing, see Perform a full table index or reindex for a single AI Search indexed source.

Language settings determine how AI Search separates the text of indexed content and search queries into individual terms. This process, called tokenization, is handled differently for each supported language, using language-specific settings. For example, most languages use spaces and punctuation to separate words and sentences, but when tokenizing Chinese or Japanese text, AI Search instead uses contextual interpretation to correctly identify word and sentence breaks. When tokenizing Japanese text, AI Search additionally recognizes the nakaguro (middle dot) as a word separator.

Note: If you indexed content in any of the following languages before the specified date, reindex that content to benefit from improved tokenization and feature support added in the AI Search back end.

Languages requiring reindexing

Date	Languages to reindex
August 2024	Brazilian Portuguese, Dutch, Italian, Japanese, Korean, Portuguese, Swedish
August 2025	Finnish
December 2025	Polish
June 2026	Arabic, Czech, Danish, Hebrew, Hungarian, Norwegian (Bokmål), Russian, Turkish
September 2026	Finnish

Indexing behavior in supported languages

When indexing content and metadata from a ServiceNow AI Platform source record or an external document, AI Search uses tokenization settings for the language of the record or document, as shown in the following table.

Indexing behavior by source

Record or document	Tokenization settings
Source record from the Task [task] table	AI Search performs language identification and uses tokenization settings for the detected language to index the record's content and metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indexing behavior by source (continued)

Record or document	Tokenization settings
or one of its child tables	**Note:** Language identification only identifies Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish. Content in other languages is identified and treated as English.
Source record from a non-Task table	AI Search uses tokenization settings for the record's language to index its content and metadata. If the record has no language specified, the ServiceNow AI Platform treats it as being in the instance's default language. In an English instance, for example, AI Search indexes records without specified languages using tokenization settings for English.
External document	AI Search performs language identification and uses tokenization settings for the detected language to index the document's content and metadata. **Note:** Language identification only identifies Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish. Content in other languages is identified and treated as English.

Note: When indexing content and metadata, AI Search recognizes regions of Japanese, Simplified Chinese, and Traditional Chinese text embedded within text in other languages. These text regions are indexed with the appropriate language tokenization settings regardless of the surrounding text's language. As an example, suppose you index an English-language knowledge article that includes a paragraph of Simplified Chinese. AI Search indexes this paragraph's content as Simplified Chinese and the rest of the record's content as English.

Search query behavior in supported languages

When processing search query text, AI Search uses tokenization settings for the language of the current user's ServiceNow AI Platform session.

Note: AI Search recognizes Japanese, Simplified Chinese, and Traditional Chinese terms in search queries. These terms are processed with the appropriate language tokenization settings regardless of the user session's language. As an example, if a user in a French user session searches for `remplacement ordinateur 笔#本##`, AI Search applies Simplified Chinese settings for the `笔#本##` term and French settings for the other search terms.

AI Search compares your search query terms with terms from indexed content and metadata, returning search results for indexed records or documents that contain matches. When your search terms are in the same language as the indexed terms, AI Search processes both sets of terms with the same tokenization settings, producing predictable matches and search results. If your search terms aren't in the same language as the indexed terms, AI Search processes the two sets of terms with different tokenization settings and matching may be unpredictable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Language dependence for search features

The following search features are language-dependent and supported only for the listed languages.

Search feature language dependence

Feature	Language dependence and supported languages
Genius Results	AI Search only evaluates Genius Result configurations with NLU triggers if the linked NLU model has the same language as the search query. Genius Result configurations that use an LLM or a heuristic model, such as Summary or Q&A, are limited to languages supported by the model. Supported languages: Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish.
Language identification and tokenization	During indexing, AI Search identifies supported languages in Task table records and external documents. Text processing for the indexed content uses tokenization settings for the identified language. Supported languages: Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish.
Lemma and Unicode normalization	AI Search performs language-specific lemma normalization for terms in indexed content and search queries. Supported languages: Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French, French - Canada, German, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian (Bokmål), Polish, Portuguese, Russian, Simplified Chinese, Spanish, Swedish, Traditional Chinese, and Turkish. **Note:** For Danish, Finnish, German, Hungarian, Korean, Norwegian (Bokmål), and Swedish, AI Search performs term decompounding in addition to lemma normalization. AI Search performs Unicode normalization for all terms in indexed content and search queries. For more information on normalization of lemmas and Unicode forms in indexed content and search queries, see Lemma and Unicode normalization.
Result improvement rules	AI Search only evaluates activation for result improvement rules that have the same language as the search query or that have **All Languages** specified. Supported languages: All languages activated in your instance. For the list of languages you can activate, see Activate a language.
Stop words	AI Search only considers stop words from dictionaries that have the same language as the search query. Supported languages: All languages activated in your instance. For the list of languages you can activate, see Activate a language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search feature language dependence (continued)

Feature	Language dependence and supported languages
Synonyms	AI Search only considers synonyms from dictionaries that have the same language as the search query. Supported languages: All languages activated in your instance. For the list of languages you can activate, see Activate a language.
Typo handling	AI Search derives a separate list of auto-correction terms for each supported language found in search source indexed content. Auto-correction only replaces search query terms with terms from the list that has the same language as the search query. Supported languages: Arabic, Brazilian Portuguese, Czech, Danish, Dutch, English, Finnish, French - Canada, French, German, Hebrew, Hungarian, Italian, Norwegian (Bokmål), Polish, Portuguese, Russian, Spanish, Swedish, and Turkish. Typo handling isn't supported for Japanese, Korean, Simplified Chinese, or Traditional Chinese.

Searching translated content

Understand how AI Search searches translated fields and documents.

The ServiceNow AI Platform® includes two categories of translated content:

1. Translated fields, such as translations of Catalog Item record fields.
2. Translated documents (long text and HTML values), such as translations of knowledge article records.

The default AI Search matching behavior differs for these two types of content.

Translated fields

When you search content that includes translated fields, AI Search matches and displays field translations in your ServiceNow AI Platform session language. If a field lacks a translation in the session language, AI Search instead falls back to matching against the English-language field value. For example, if your session language is Japanese, AI Search returns Japanese field translations where present on a Catalog Item record, but returns English values for Catalog Item fields that have no Japanese translation.

To learn more about how the ServiceNow AI Platform handles translated fields, see Translating individual UI strings.

If you insert or update field translation records in the Translated Text [sys_translated_text] table, reindex content from the relevant indexed source to make AI Search use the new translations. For details on reindexing content, see Perform a full table index or reindex for a single AI Search indexed source and Perform a full table index or reindex for multiple AI Search indexed sources.

Note: AI Search doesn't support translated fields on the Knowledge [kb_knowledge] table. This behavior has the following effects.

- Search queries don't match translated versions of kb_knowledge translated fields.
- Search results don't display translated versions of kb_knowledge translated fields.
- Search application facets don't display translated versions of kb_knowledge translated fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translated documents

When searching content with translated documents, by default AI Search only matches documents in the user's ServiceNow AI Platform session language. For example, a Japanese user search only matches knowledge articles in Japanese, excluding all knowledge articles in other languages.

Starting with the Utah release, you can configure a filter condition for globally searchable knowledge articles. Articles that satisfy this condition can be matched by searches in any language. For information on this setting, see Configure globally searchable knowledge articles.

Starting with the Tokyo release, you can set a fallback language for each language enabled in your ServiceNow AI Platform instance. When a fallback language is configured for the user's session language, AI Search returns search results in both languages. For more details, see AI Search interaction with fallback languages.

You can configure a global fallback locale to make AI Search match documents in the instance locale's language as well as the user's session language. This configuration works best when you need to make all English-language documents globally searchable. To learn more about configuring a global fallback locale, see Enable a global fallback locale for translated content.

Assign Knowledge article search languages by country

Improve multilingual search recall by defining a set of Knowledge article search languages for each user country. User searches can match Knowledge articles in any of the search languages specified for their country as well as in the language associated with their ServiceNow AI Platform® session.

Before you begin

Role required: ais_admin

About this task

By default, user searches only match Knowledge articles in the language associated with the user's ServiceNow AI Platform session. As an example, a user searching from a Japanese session only sees search results for Japanese-language Knowledge articles.

Search administrators can expand the recall of Knowledge article searches for a country's users by specifying additional Knowledge article search languages for that country. For example, suppose you specify the Knowledge article search languages English and French for the country of Japan. With these country-to-language mappings in place, a user searching from a Japanese session can see search results for Knowledge articles in English and French as well as for articles in Japanese.

Procedure

1. Navigate to the AI Search Country To Search Language [ais_country_to_search_language] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `ais_country_to_search_language.list`.
   c. Press Enter.
2. For each Knowledge article search language that you want to map to a country, create a new record in the table.
   a. Select **New**.
   b. On the AI Search Country To Search Language form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see AI Search Country To Search Language form.

c. Select **Submit**.

Note: You can define multiple AI Search Country To Search Language records for the same country, as long as each one has a different Knowledge article search language. If you attempt to create multiple records with the same country and the same Knowledge article search language, the system displays a warning message and the record insert operation fails.

Result

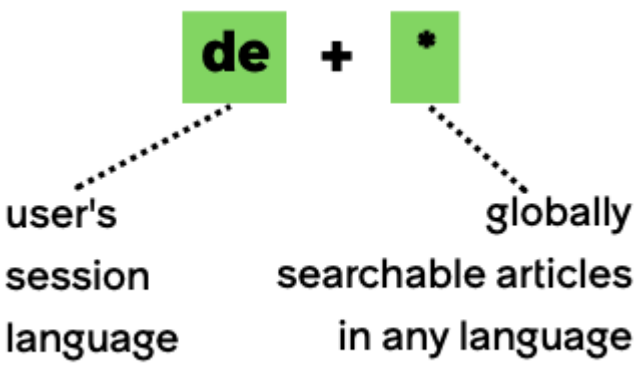
When users in a country with one or more Knowledge article search languages defined perform a search, they can match Knowledge articles in those search languages as well in the language associated with their ServiceNow AI Platform session.

Configure globally searchable knowledge articles

Define an encoded query for knowledge articles that you want to make searchable in any language.

Before you begin

Role required: ais_admin



About this task

By default, AI Search only matches translated content records, such as knowledge articles, that are in the user's ServiceNow AI Platform® session language. For example, a user searching from a Spanish user session only matches Spanish knowledge articles. For full details on this restriction, see Searching translated content.

Note: If you've configured a global fallback locale, search can match translated content records in that locale's language as well as in the user's session language. For more details on this approach, see Enable a global fallback locale for translated content.

To enable users to search for knowledge articles in any language, you can define an encoded query as the value of the *glide.ais.global_searchable_filter.kb_knowledge* system property. Records that match this query are globally searchable, meaning they bypass the normal language filters and can be matched regardless of the search's language. As an example, a user searching from a German user session can match English or Japanese knowledge articles as long as they match the encoded query.

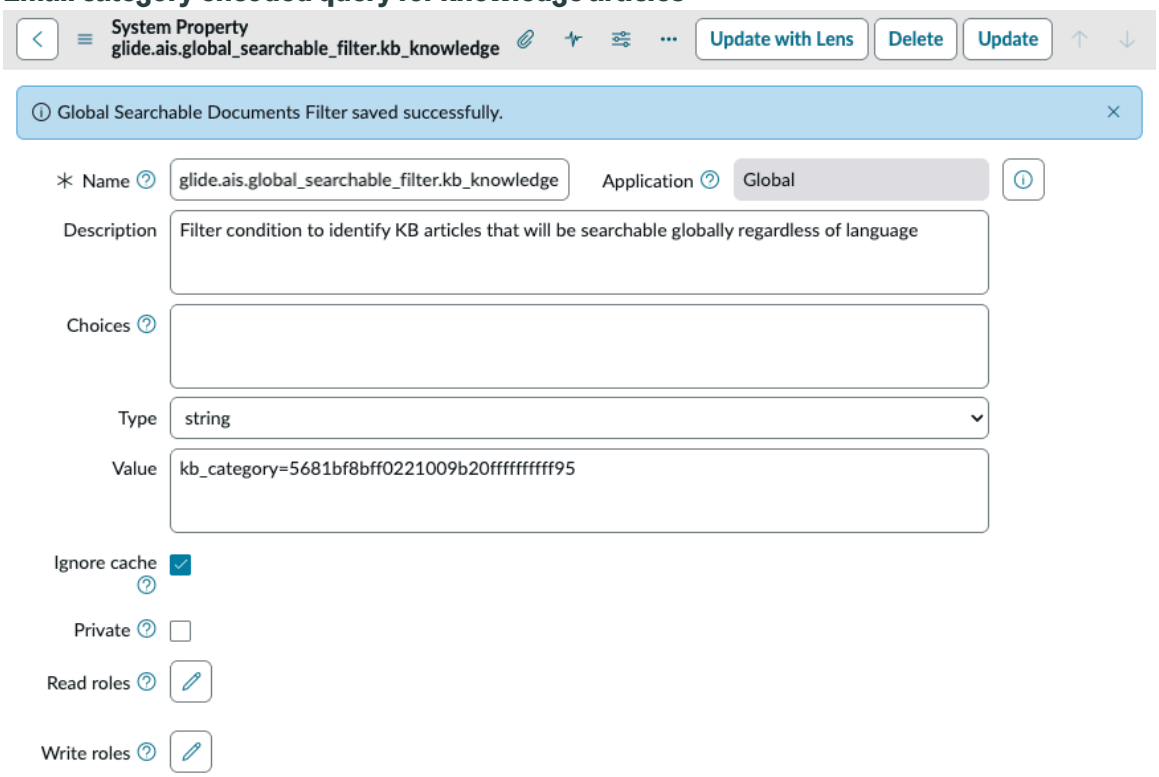
Search result languages with globally searchable articles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To generate knowledge article query strings for your encoded query, you can navigate to **All** > *Knowledge* > **Articles** > **All** and follow the steps found in Generate an encoded query string through a filter. For descriptions of encoded query syntax and operators, see Encoded query strings and Operators available for filters and queries.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Open the *glide.ais.global_searchable_filter.kb_knowledge* system property record.
3. In the **Value** field, enter a filter expression specifying the knowledge articles that you want to make globally searchable.
4. Select **Update**.



Result

Knowledge articles that match your encoded query can be returned as results for user searches in any language.

Example: Make knowledge articles in the Email category globally searchable

Here is an example that defines the encoded query `kb_category=5681bf8bff0221009b20ffffffffff95` to make knowledge articles in the Email category globally searchable.

Email category encoded query for knowledge articles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure translation for knowledge article reference field values in facets

Specify whether facets should display knowledge article reference field values in the search user's session language. If you disable translation, facets display knowledge article reference field values in your instance's default language.

Before you begin

Role required: ais_admin

About this task

By default, the search results page displays facets for knowledge article reference fields using translated field values in the search user's session language. If no translated field value is available for the search user's session language, the knowledge article facet instead displays the field value in your instance's default language.

As an example, if you search from a Japanese session on an English-language instance, the KB Category facet displays field values in Japanese using Japanese translated field values. If a field value has no Japanese translation, the KB Category facet falls back to displaying that field value in English.

Search administrators can disable this translation behavior for knowledge article reference fields. With translation disabled, search users will see knowledge article facet field values in the instance's default language instead of in their session language.

To learn more about facets, see Create a facet in an AI Search application configuration. For details on translated field values, see System Localization.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the Knowledge Table indexed source record in form view by selecting its name.
3. In the Advanced Configuration related list, select **New**.
4. On the Indexed Source Attribute form, fill in the fields.

Field	Value
Name	index_translated_reference_fields
Value	false

Note: To re-enable translation for facets, so that knowledge article reference field values appear in the user's session language when translated field values are available, set the index_translated_reference_fields attribute's value back to *true*, its default value. For more information on the index_translated_reference_fields attribute, see Indexed source attributes for AI Search.

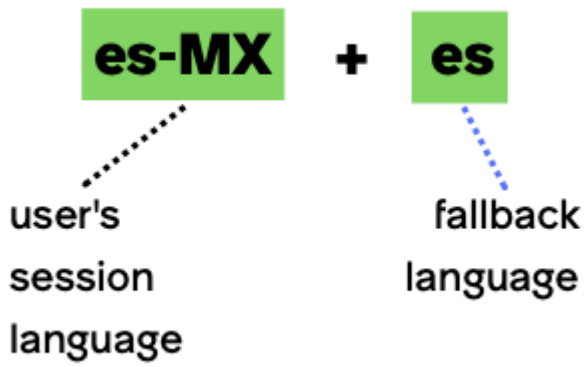
5. Select **Submit**.
   The updated attribute value appears in the indexed source's Advanced Configuration related list. If you changed the index_translated_reference_fields attribute's value, a `Re-index is needed for configuration change to take effect` informational message appears.
6. If you changed the index_translated_reference_fields attribute's value, select **Index All Tables** to reindex content for the Knowledge Table indexed source.
   For more details on reindexing, see Perform a full table index or reindex for a single AI Search indexed source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Facets for knowledge article reference fields display field value translations in the user's session language.

> **Note:** If you set the index_translated_reference_fields attribute's value back to `true` and see knowledge article reference field values displayed in the instance's default language in facets, check whether translations of these field values exist for the user's session language.

AI Search interaction with fallback languages

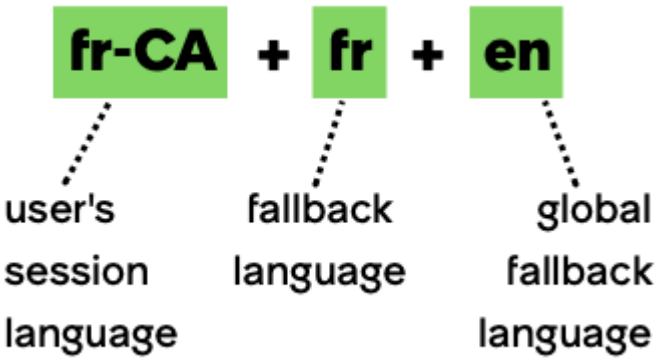


When a fallback language is configured for the user's session language, AI Search searches translated documents in both languages. Search uses the appropriate stop word, synonym, and typo handling dictionaries for the fallback language.

Starting with the Tokyo release, you can set a fallback language for each language enabled in your instance. The system uses this fallback language for elements of user interface text that aren't translated in the specified language. For details on configuring fallback languages, see Set a fallback language.

If you set a fallback language for the user's ServiceNow AI Platform® session language, AI Search returns results for translated content, such as knowledge articles, in both the session language and your configured fallback language. When searching content in the fallback language, AI Search uses the stop word, synonym, and typo handling dictionaries for the fallback language.

As an example, suppose you configure Spanish as the fallback language for Mexican Spanish. With this configuration, users searching in Mexican Spanish sessions can find knowledge articles in both Mexican Spanish and Spanish. AI Search uses the Mexican Spanish and Spanish dictionaries and result improvement rules when matching articles in Mexican Spanish. It uses the Spanish dictionaries and result improvement rules when matching articles in Spanish.



Search result languages with a fallback language

If you configure a global fallback locale in addition to a fallback language, AI Search returns matching results for translated content in the user's session language, the fallback language, and the global fallback locale's language. As an example, suppose you configure French as the fallback language for Canadian French, and also configure English as the global fallback locale. Users searching in Canadian French sessions can search knowledge articles in Canadian French, French, and English.

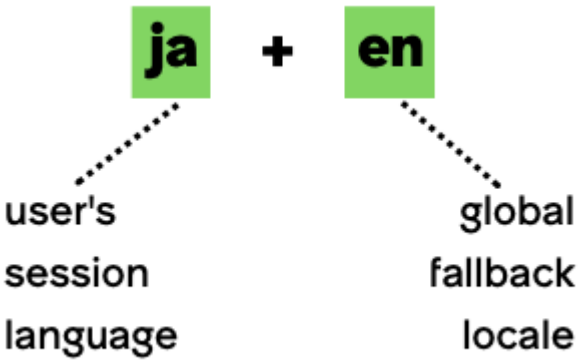
Search result languages with a fallback language and a global fallback locale

For details on configuring a global fallback locale, see Enable a global fallback locale for translated content.

Enable a global fallback locale for translated content

Configure AI Search to match translated documents in a global fallback locale's language as well as the user's session language.

Before you begin



Role required: ais_admin

About this task

By default, when searching content with translated documents, AI Search only matches indexed records in the user's ServiceNow AI Platform® session language. For example, a search in a Japanese user session only matches knowledge articles in Japanese, excluding all articles in other languages.

You can configure AI Search to apply a global fallback locale to user searches. When you enable this option, AI Search matches records in the language from the ServiceNow AI Platform instance's locale (or another locale that you specify) as well as matching records in the user's session language. As an example, if you set English as the global fallback locale, users searching in Japanese sessions can see knowledge article results in both Japanese and English.

Search result languages with a global fallback locale

Note: The global fallback locale works best when you need to make all English-language records globally searchable. To make other sets of records globally searchable, see Configure globally searchable knowledge articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you enable the global fallback locale option for search, AI Search determines the global fallback locale as follows:

1. If the value of the *glide.ais.translate.global_fallback_locale* system property is a valid locale identifier string, such as *en*, *en-US*, or *fr*, AI Search uses the matching locale as the global fallback locale.
2. Otherwise, AI Search uses the ServiceNow AI Platform instance's locale, as specified by the value of the *glide.system.locale* system property, as the global fallback locale.
3. If the *glide.system.locale* system property's value isn't a valid locale, AI Search uses English as the global fallback locale.

For more details on ServiceNow AI Platform locales and their associated languages, see Configuring locales.

Procedure

1. Navigate to **All** > **System Properties** > *AI Search*.
2. Select the option for the **Enable global language fallback** (*glide.ais.translate.enable_global_language_fallback*) system property.
3. Select **Save**.
4. **Optional:** Add the *glide.ais.translate.global_fallback_locale* system property and set its value to the locale that you want AI Search to use as the global fallback locale.
   For instructions on adding this system property, see Add a system property.

Result

AI Search searches translated document content in the global fallback locale's language as well as the user's session language.

Note: When searching the Catalog Item table, AI Search ignores the instance locale. Catalog searches only match documents in the user's ServiceNow AI Platform session language.

Language filtering for external content

AI Search filters search results from external content connectors, showing only results in the user's session language, fallback language, and global fallback locale language.

When you have the External Content Connectors application installed, AI Search applies language-based filtering to search results retrieved by your external content connectors. For an external content search result to be displayed, it must include content in one of the following languages:

- The search user's ServiceNow AI Platform® session language
- The fallback language for the search user's ServiceNow AI Platform session language (if configured)
- The language for the global fallback locale (if configured)

As an example, if the session language is Canadian French, with French configured as the fallback language and English configured as the global fallback locale language, searches only return external content results that contain Canadian French, French, and English content. External content search results which only contain content in other languages don't appear in the search results list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: AI Search can detect multiple languages when indexing content from external source system documents, so a single external content search result may be tagged with multiple languages. As an example, a document in Japanese that contains a section in English might be tagged as including both Japanese and English content. This document would appear in the search results from the previous example because it contains content in English. For more information on language detection at indexing time, see Internationalization support for AI Search.

To learn about configuring and using connectors to make content from external source systems searchable, see External Content Connectors. For details on fallback languages and the global fallback locale, see AI Search interaction with fallback languages and Enable a global fallback locale for translated content.

Machine learning relevancy in AI Search

AI Search displays the most relevant search results for a query first. Machine learning automatically tunes search result relevancy scoring for search experiences based on aggregated user interactions.

Machine learning relevancy is automatically enabled and isn't configurable.

Relevancy models and scoring

AI Search uses a relevancy model to compute a relevancy score for each result returned by a search. Documents with higher relevancy scores appear first in the result set. A result's relevancy score is specific to the particular document, search terms, and user associated with the query.

Each search profile includes its own relevancy model. You can't view, modify, or delete this relevancy model.

Note: AI Search doesn't apply relevancy ranking to `***` universal wildcard queries. Results from `***` queries appear in an unspecified order.

Search signals and machine learning relevancy tuning

AI Search UX components record signals associated with user searches. These search signals include data on how search users interact with the search input field, auto-complete suggestions, facet and source facet bucket filters, Genius Result answer cards, and search results. To learn more about how search signals are recorded and stored, see Search signals.

Machine learning relevancy uses data from these search signals to intelligently tune relevancy models on a continual basis. Every 30 days, AI Search computes a new version of each relevancy model, iteratively modifying its parameters and regression testing it against aggregated search signal data for the search profile. When this tuning process is complete, AI Search compares the existing and new relevancy models to see which one produces better matches for user search behavior as recorded in the historical signal data.

If the new relevancy model produces better results with the signal data, AI Search uses its modified parameter values to perform A/B testing evaluations of live search traffic for the search profile. These evaluations test individual parameter changes to verify that they produce better search relevancy.

Note: For details on the search query parameter evaluation framework used to perform A/B testing evaluations, see Search query parameter evaluation framework.

If the new model outperforms the original model in both the historical search-match comparison and the A/B testing, AI Search sets it as the active relevancy model for the search profile, overwriting the existing relevancy model. The updated relevancy model remains in use until the next tuning cycle begins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These relevancy model tuning processes occur separately for each search profile. Changes made to the relevancy model in one search profile don't affect relevancy models in other search profiles.

Note: When you upgrade to Brazil from a previous release, the default relevancy scores for your search results may change. Relevancy models trained in the previous release should continue to produce the same result ordering. Models trained more than one release ago may revert to the default relevancy model.

Successful relevancy tuning requires at least 10,000 stored search event signals for a search profile. If the search profile has fewer than 10,000 signals stored, relevancy tuning fails with an error message and AI Search continues to use the original relevancy model for that search profile.

Relevancy model for auto-complete suggestions

AI Search uses a dedicated relevancy model to rank records for display as auto-complete suggestions in the search field. This relevancy model scores records based on their freshness and on search query term matches in their **title** fields. The system doesn't train this auto-complete suggestion relevancy model. For details on configuring auto-complete suggestions, see Auto-complete suggestions in AI Search applications.

Viewing relevancy scores for search results

Search administrators can view the scores for search results in the Search Preview UI from the Advanced AI Search Management Tools ServiceNow® Store application. For details on using this feature to investigate search behavior, see Search Preview UI for AI Search.

Content security in AI Search

AI Search filters search query results and displays only records that the currently logged in user can access.

Content security is automatically enabled and isn't configurable.

Indexed security features

When indexing records from ServiceNow AI Platform® tables, AI Search preserves the following access control settings:

- Role-based field-level access control list rules (ACLs)
- Non-scripted conditional ACLs
- Scripted table-level ACLs
- Before Query business rules
- Domain separation
- User criteria for records indexed from the Knowledge [kb_knowledge] and Catalog Item [sc_cat_item] tables

AI Search doesn't support scripted field-level ACLs or conditional field-level ACLs.

Early and late binding security implementations for search queries

At query time, AI Search filters search results by evaluating user access to indexed tables and records. The filtering implementation used depends on the security features present on tables and records that match the search query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content security implementation	Description
Early binding	Default content security implementation that incorporates security filters into the search query. The system adds relevant security filters for the user to each search query. To appear in the search results, records must match the search query and pass all security filters. Early binding security supports non-scripted ACLs, Before Query business rules, and domain separation, plus user criteria for records indexed from the kb_knowledge and sc_cat_item tables. If a search matches records that have table-level scripted ACLs, the search query automatically falls back to use late binding security. **Note:** If an early binding filter produces an error, the search query automatically falls back to use late binding security.
Late binding	More computationally expensive alternate content security implementation that post-filters search query results. The system applies security filters to the search query just as early binding security does. After retrieving records that match the filtered query, it invokes the *GlideRecord.canRead()* method for each record. To appear in the search results, records must match the search query, pass all security filters, and return *true* for the API method. Late binding security supports all indexed security features. By default, late binding security serves as a fallback mechanism for early binding security. You can override this default behavior in the following ways: • To make AI Search use late binding security for all results from an indexed source, set the value of that indexed source's **Force Late Binding** field to *true*. • To make AI Search use late binding security for all search results, set the value of the **Force *AI Search* to use late binding for ACL evaluation** (*glide.ais.security.force_late_binding*) system property to *true*. If AI Search applies late binding security to any results from an indexed source used by a facet, the list of available filter selections for the facet changes. When this happens, the facet only displays field values found in the current page of search results. For details on facets, see Create a facet in an AI Search application configuration. When you enable search result counts for facets in a search application, the counts indicate the number of results that matched the user's search. Late binding security can remove results after they're counted, causing the actual number of displayed results to be lower than the count. For more information on search result counts for facets, see Show search result counts for facets on the results page for a search application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content security for external content

AI Search preserves access permissions when ingesting external documents. You can alias ServiceNow AI Platform users to the externally defined users and groups specified in these access permissions. AI Search constructs content security filters for external document records from these permissions and aliases.

To learn about using AI Search with external data sources, see Indexing and searching external content in AI Search. For full details on external content security, see External content security for AI Search.

Encrypted fields in AI Search

AI Search excludes source record fields encrypted with Encryption Support or Edge Encryption.

When dealing with an encrypted source record field, AI Search has the following limitations:

- Content indexing excludes the encrypted field. This exclusion means that search query terms won't match terms from the encrypted field's content.
- You can't create a facet using the encrypted field.
- If a search query attempts to filter on the encrypted field, such as when applying an access control list (ACL) filter, the search query fails. An `Encrypted Field is not supported` error message is logged.

For detailed descriptions of the encryption options available for source records, see Encryption.

Semantic vector search in AI Search

Semantic vector search enables the Now LLM Service to find results based on how similar they are in meaning to your search terms. Knowledge base articles Genius Results and ServiceNow® Otto for Virtual Agent use semantic vector search to improve recall with natural language interpretation of search queries.

By default, AI Search uses keyword search, meaning that it finds results for records that contain the best matches for the keywords (terms) in your search query. Term matching doesn't account for the context or meaning of your search terms.

Starting with the Vancouver Patch 4 release, AI Search includes an alternate search mode called semantic vector search that's used in features which work with the Now LLM Service. Examples of such features include ServiceNow® Otto for Virtual Agent chats, Summary Genius Results, and Actions Genius Results.

Semantic vector search analyzes the meanings and context of your search terms and uses that information to find results with similar meanings. It improves search recall by interpreting natural language to more accurately reflect the intent of your search.

As an example, suppose you index a source record including text `how to prevent phishing` and search for `avoiding scams`.

- In keyword search mode, AI Search returns no result for this record because your search query terms aren't literal matches for the terms included in the indexed content.
- In semantic vector search mode, however, AI Search might return a result for the record based on the following context-aware analysis:
  - Your search term `avoiding` is contextually similar in meaning to `prevent`
  - Your search term `scams` has meaning that overlaps with the meaning of `phishing`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search orders results from semantic vector search based on how similar they are to your search. In the example, suppose you had a second indexed record including text `how to prevent scams`. This record would be more similar to the `avoiding scams` search and its search result would appear before the `how to prevent phishing` result.

Unlike the default keyword-based search mode, semantic vector search doesn't rely on your synonym dictionaries to find term equivalences. AI Search identifies term similarities automatically when indexing source content and metadata for semantic vector search.

Semantic vector search is enabled automatically and has no configurable settings.

Benefits of semantic vector search

Compared to the default keyword search mode, semantic vector search provides the following benefits:

- Helps improve recall for knowledge article, Catalog Item, and topic retrieval searches by matching results based on the underlying meaning of your search rather than matching on keywords.
- Provides a more natural and consistent search experience by returning similar results for varied search queries with the same underlying meaning.
- Reduces the need to create and maintain synonym dictionaries to anticipate similarities in searches.

Semantic vector search output

Semantic vector search overrides the normal AI Search term matching and relevancy ranking mechanisms. Results are ordered based on their computed similarity to your search query terms, with the most similar results appearing first.

Availability of semantic vector search

Semantic vector search is available in the following contexts.

- ServiceNow Otto for Virtual Agent uses semantic vector search for Catalog Item retrieval and live agent topic retrieval. For more details, see .
- Knowledge base articles Genius Results use semantic vector search along with legacy keyword search when looking for knowledge articles that match your search query. They also use semantic vector search when looking for cached answers that match your query in the second-level cache. For more details, see Knowledge base articles Genius Results and Caching for Knowledge base articles Genius Results.
- Actions Genius Results use semantic vector search along with legacy keyword search when looking for Catalog Items that match your search query. For more details, see Actions Genius Results.
- All connectors from the External Content Connectors application support semantic vector indexing when retrieving document content from external source systems. Only features which use semantic vector search with the Now LLM Service can take advantage of this support. For more information on external content connector configuration and usage, see External Content Connectors.

AI Search logging and debugging

Review AI Search logs and history to analyze performance and diagnose issues. View log messages and ingestion history, or use session debugging to capture detailed messages for a user session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View AI Search ingestion log messages

Review AI Search ingestion and indexing events by viewing log messages.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Logs** > **Ingestion Warnings & Errors**.
   The Log [syslog] table appears with a **[Source] [starts with] [AIS-Datasource]** filter condition applied.
2. Use the list search, sort, filter, and group functions to locate messages of interest.

View all AI Search log messages

Review AI Search events by viewing log messages.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Logs** > **All**.
   The Log [syslog] table appears with a **[Message] [contains] [ais]** filter condition applied.
2. Use the list search, sort, filter, and group functions to locate messages of interest.

Review ingestion history for an indexed source

View processing results and performance statistics associated with an ingestion event for an indexed source.

Before you begin
Role required: ais_admin

About this task
The AI Search Indexed Source History [ais_ingest_datasource_stats] table contains records for indexed source ingestion events. Each record includes performance statistics and processing results for the ingestion event. You can review the ingestion event history record to analyze ingestion performance and diagnose issues.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Open the indexed source whose indexing history you want to review.
3. In the Indexing History related list, open the ingestion event record that you want to review.
4. On the Indexed Source History form, review the fields for the selected ingestion event.
   For a description of the field values, see Indexed Source History form.

Enable session debugging for AI Search

Capture and review detailed AI Search log messages for a user session.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you enable session debugging for AI Search in a user session, the system records debug log messages for that session. These messages include:

- Messages illustrating how AI Search interprets a user's search query
- Messages specifying the search source filters and content security filters applied to a search query
- Messages containing search query request and response objects in human-readable format

You can review these debug log messages to diagnose search issues or configure optimal search performance settings.

After enabled, session debugging remains active for the user session until you disable it. For more information on session debugging, see Session debug.

Procedure

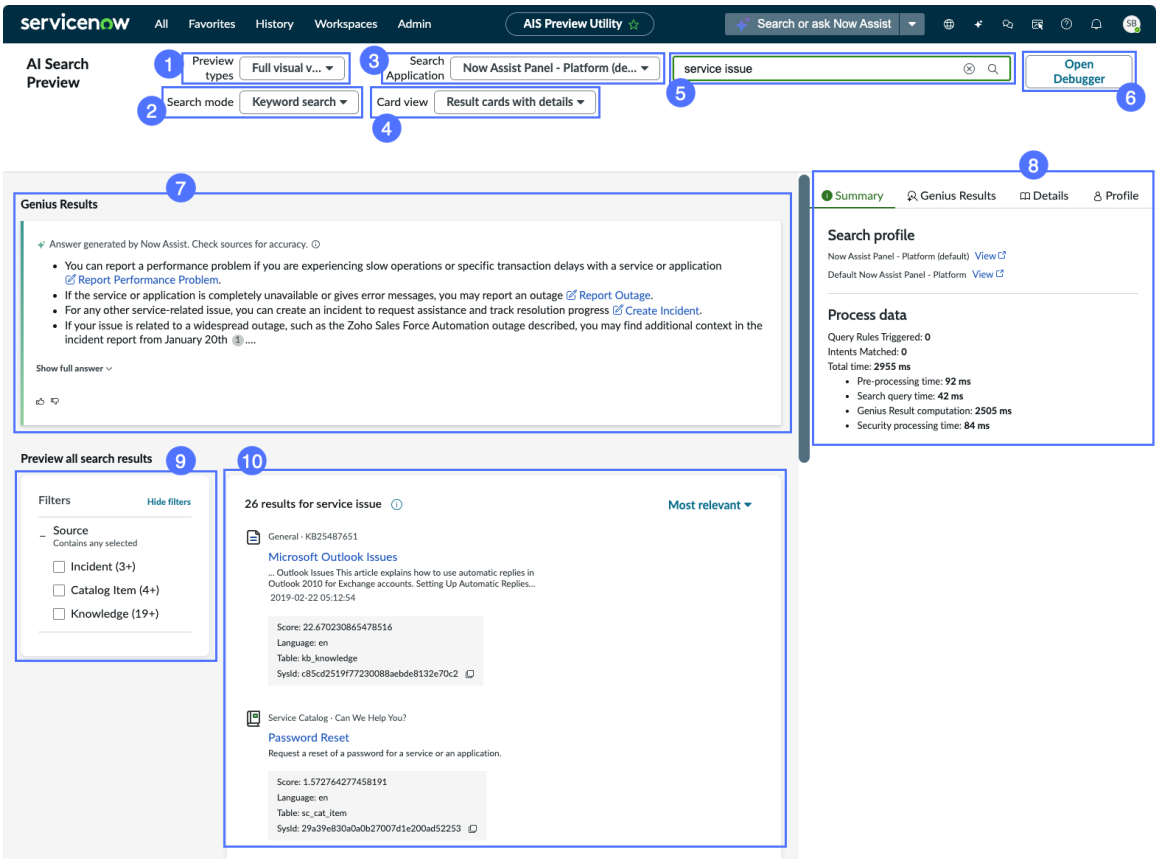
1. To enable debugging, navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug** *AI Search*.
   A message reports completion of the Debug AI Search session debug script.
2. To review debug logs, navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug Log**.
   Debug log messages appear in the **Session Log** window.
3. To disable debugging, navigate to **All** > **System Diagnostics** > **Session Debug** > **Disable All**.
   A message reports completion of the Disable All session debug script.

Search Preview UI for AI Search

The Search Preview UI enables you to test AI Search queries using settings from a selected search application configuration or search profile. Administrator tools help you review search query performance data and feedback, debug queries, and override default query settings for testing purposes.

Note: The new Search Preview UI feature is included with AI Search. It replaces the legacy Search Preview UI that's included with Advanced AI Search Management Tools. The new version provides additional functionality when compared with the legacy version, and offers a revised and cleaner interface.

Access the new Search Preview UI by navigating to *AI Search* > **Preview** > **Search Preview (New)**.



Required ServiceNow AI Platform® roles

- The ais_admin role is required to view and use the Search Preview UI.
- The impersonator role is required for some AI Search administrator tools.
- The ais_high_security_admin role is required to bypass search source and content security filtering. For details on this procedure, see Diagnose search result access issues using the Search Preview UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Preview UI components

Search Preview UI

Search Preview UI components

Component	Description
1. Preview types list	Select the type of preview you want to view. • *`Full visual view`*: preview search query results using the search profile and display settings defined for the search application configuration record selected in the **Search Application** list. • *`Text view`*: preview search query results using a search profile selected in the **Search Profile** list. When previewing in text view, features from search application configurations, such as auto-complete suggestions, aren't available.
2. Search mode list	Select the search mode you want to use for your search query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Preview UI components (continued)

Component	Description
	• *Keyword search*: Use the legacy keyword search mode to find the best matches for your search query terms. • *Hybrid search*: Use the hybrid search mode, blending keyword search and semantic vector search to find the best combination of search precision and contextual relevance for your search query. **Note:** Hybrid search applies to any indexed source that's included in the semantic index. By default, the following indexed sources ship with preconfigured semantic indexing and work with hybrid search: ○ Knowledge Table indexed source [kb_knowledge table] ○ Catalog Item Table indexed source [sc_cat_item table] ○ Skills indexed source [sys_gen_ai_skill table] ○ All External Content Connectors indexed sources [connector-specific tables] You can manually configure additional indexed sources to be included in the semantic index, extending hybrid search to those sources as well. For details on this procedure, see Configure semantic indexing settings for an indexed source.
3. Search Application / Search Profile list	Select the search application configuration or search profile that you want to apply when previewing search queries. When you select full visual view as the preview type, the name of this list is **Search Application** and it includes all available search application configurations that have published search profiles with one or more linked search sources. When you select text view as the preview type, the name of this list is **Search Profile** and it includes all published search profiles with one or more linked search sources. **Note:** If a search profile has unpublished changes, its entry in the list displays a warning icon and shows [DRAFT] after the profile's name. Publish the search profile to see the changes reflected in the Search Preview UI results.
4. Card view list	Select how you want to display the results from your search query: • *Result cards with details*: Display search results using EVAM result cards, with a text box for each result showing key details like its relevancy score, language, source table, and source record system_id. • *Result cards*: Display search results using EVAM result cards, as they appear in search portals and applications. • *Raw output*: Display the search query response object in JSON format. Individual search results appear in this document as objects in the response object's `searchResults` array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Preview UI components (continued)

Component	Description
5. Search input field	Enter search query terms and operators in this field. To preview the query's results using settings from the selected search application configuration or search profile, press Enter or select the Submit search icon. To clear the search input field, select the Clear search term icon. For details on search query syntax and operators, see AI Search query language. When you select full visual view as the preview type, this field displays auto-complete suggestions from your selected search application configuration. When you select text view as the preview type, this field doesn't display auto-complete suggestions.
6. Open Debugger button	Select this icon to enable session debugging for AI Search and launch the Script Debugger in a new browser tab. To learn about session debugging and using the Script Debugger, see Enable session debugging for AI Search and Script Debugger and Session Log.
7. Genius Result answers	Review the Genius Result answers the search query produces when executed with the selected search application configuration or search profile. **Note:** Genius Result answers may not appear for all search queries. If multiple Genius Result answers are produced for the search query, they appear in a carousel, with the currently selected answer displayed.
8. AI Search administrator tools	Select the icon for the administrator tool that you want to use: **Summary** View links to the search query's search profile (and search application configuration, in full visual view). Review overview data on the processing of the search query. **Genius Results** View the Genius Result configurations activated for the search query, with those that generated Genius Result answers indicated. Review the set of search results that were sent to the LLM for Genius Result answer generation. **Details** View summaries of how stop word, typo handling, and synonym dictionaries affected processing of the search query. Review the list of fields and values from the search query object, filtering to focus on areas of interest. **Profile** Set a user or locale for the search query to test user access to results or view translated documents. Specify user context field values for the search query to test result improvement rule triggers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Preview UI components (continued)

Component	Description
	For more details on each administrator tool's output, controls, and fields, see Search Preview admin tools.
9. Filters	View facet filters applicable to your current search results. To filter the query results, select a facet bucket. To remove the filter, clear the facet bucket selection, select **Clear** at the facet level, or select **Clear all**. You can hide the filter list by selecting **Hide filters** and display it again by selecting **Show filters**. The filter list contents depend on whether you're previewing results for a search application configuration or a search profile. • *`Search application configuration`*: The filter list displays facet filters for the facets defined in the search application configuration. • *`Search profile`*: The filter list displays a facet filter for the source table field. To learn more about facet filters, see Create a facet in an AI Search application configuration.
10. Search query results	View the results the search query produces when executed with the selected search application configuration or search profile. When viewing result cards, you can page through results by selecting **Next** or **Previous**, and use the Sort search results list to choose a sort order for the displayed search results. When viewing raw output, this section displays the search query response object in JSON format. Select the Search icon to search for a term in the response. Open the More options menu to activate or deactivate syntax highlighting, show or hide the navigation minimap of the full JSON response, or enable or disable word wrap.

Search Preview admin tools

Learn about the output, controls, and fields provided by admin tools in the new Search Preview UI.

In all of the admin tools, the active search profile is the search profile currently selected for previewed search queries.

- If you select the **Full visual view** preview type, the active search profile is the one linked to the search application configuration selected in the **Search Application** field.
- If you select the **Text only view** preview type, the active search profile is the one selected in the **Search Profile** field.

Summary tool

The Summary tool displays these sections:

Search profile

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In full visual view, this section provides links to the selected search application configuration and the active search profile that's linked to it. In text only view, it provides a link to the active search profile.

Process data

This section provides an overview of how the previewed search query behaved, with details as given in the following table.

Entry	Description
Query Rules Triggered	Count and names of result improvement rules triggered by the search query.
Intents Matched	Count and names of NLU model intents detected in the search query.
Total time	Total time the AI Search back end spent processing the search query. This time includes the pre-processing time, search query time, Genius Result computation time, and security processing time values that are reported separately. It doesn't include time spent sending the search query results across the network to the user's browser.
Pre-processing time	Time spent preparing the search query for execution. Includes time spent looking up the user's access permissions for content security.
Search query time	Time spent retrieving records that match the search query and generating the result set.
Genius Result computation	Time spent computing Genius Result answers for the search query.
Security processing time	Time spent filtering inaccessible records out of the search query's result set based on the user's access permissions.

Genius Results tool

The Genius Results tool displays these sections:

Genius Result status

In full result view, this section shows a list of Genius Result configurations activated in the active search profile. A checkmark and status text indicate whether or not each Genius Result configuration generated an answer for the search query.

LLM Context

This section shows a list of all the search results that were sent to the LLM for Genius Result answer generation, along with indicators of how well each sent result matched the context of the search query.

Details tool

The Details tool displays these sections:

Dictionary

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This section shows how the stop word, typo handling, and synonym dictionaries defined in the active search profile affected the previewed search query.

Entry	Description
Stopwords	Summary of stop word removal operations performed while processing the search query.
Spellcheck	Summary of typo handling auto-correction operations performed while processing the search query.
Synonyms	Summary of synonym expansion operations performed while processing the search query.

Query

List of fields and values from the search query object. Select **Filters** to refine this list by field category. You can select multiple categories at a time to view just the fields you're interested in.

Profile tool

The Profile tool displays these sections:

User

This section provides fields you can use to search as a specific user or in a specific supported language. Use these fields to see how search results differ from user to user and language to language.

Field	Description
Search as user	To submit search preview queries as another user, enter the user's name from the User [sys_users] table. You must have the impersonator role. Use this control to see how content security affects search query results for specific user accounts. Searches performed while impersonating another user don't affect the **Search users** metric, trend, and report on the AI Search Analytics dashboard. **Note:** Changing the value of this field terminates elevated privileges for the ais_high_security_admin role. To bypass filters after changing this field's value, you must re-elevate to the ais_high_security_admin role.
Query locale	To submit search preview queries using a specific supported language, select the language from the list. Use this control to observe differences in search query results for different languages.

Context settings

This section provides the following groups of user context fields you can use to specify user context values. Use these fields when testing user context triggers for your result improvement rules.

Location and language

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
User language	To set a language in the user context for search preview, select it from the list of supported languages.
User groups	To set a user group in the user context for search preview, enter the name of a group from the Group [sys_user_group] table.
User title	To set a title in the user context for search preview, select it from the list. This list includes all Title values found in the User [sys_user] table.
User department	To set a department in the user context for search preview, enter the name of a department from the Department [cmn_department] table.
User location	To set a location in the user context for search preview, enter the name of a location from the Location [cmn_location] table.
User country	To set a country in the user context for search preview, select it from the list. This list includes all countries found in user locations from the User [sys_user] table.
User office	To set an office in the user context for search preview, enter the name of a building from the Building [cmn_building] table.
User office city	To set an office city in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User office state	To set an office state in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User office country	To set an office country in the user context for search preview, select it from the list. This list includes all countries found in user locations from the User [sys_user] table.

User access

Field	Description
User company	To set a company in the user context for search preview, enter the name of a company from the Company [core_company] table.
User roles	To set a role in the user context for search preview, enter the name of a role from the Role [sys_user_role] table and press Enter. You can set multiple roles for a single search query. Each selected role appears as a pill. To remove a role, select the Remove icon × for its pill.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Environment

Field	Description
User OS	To set an operating system in the user context for search preview, enter its name in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User OS version	To set an operating system version in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User agent	To set a web browser's user-agent string in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User browser agent	To set a browser name in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User device form	To set a device form in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User device type	To set a user device type in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.

Diagnose search result access issues using the Search Preview UI

Use the Search Preview UI and the AI Search High Security administrator elevated privilege role to determine whether filters prevent a search user from viewing a specific search result in the AI Search index.

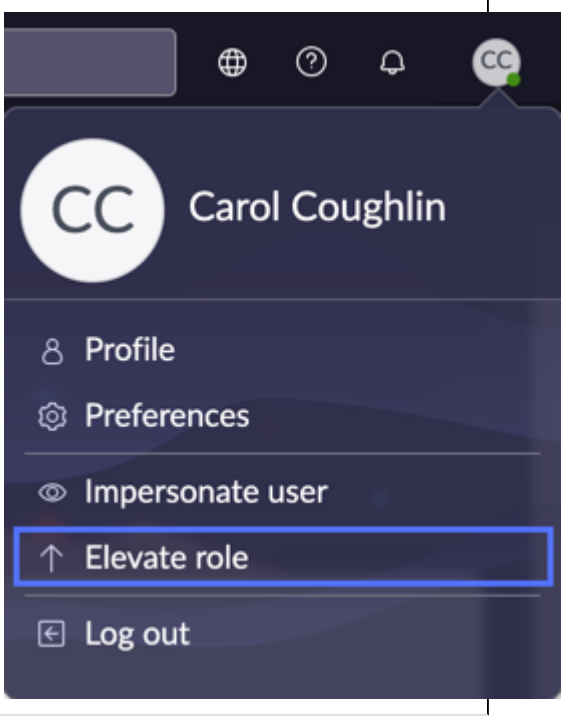
Before you begin

Role required: ais_admin, ais_high_security_admin, and impersonator.

About this task

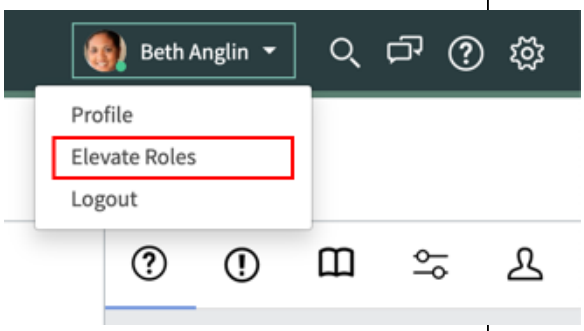
Use the Search Preview UI to diagnose filter configurations that prevent a search user from seeing a specific search result in the AI Search index. First, search as the affected user in the Search Preview UI to confirm that the search result in question isn't returned for them. Next, end impersonation and repeat the search after elevating to the ais_high_security_admin role to bypass all search source and content security filters. If the desired search result appears in your elevated search, examine its search source and content security filter settings to determine why the affected user can't view it.

Note: Changing the value of the **Search as User** field in the Search Preview UI's User tool terminates elevated privileges for the ais_high_security_admin role. To bypass filters after changing this field's value, you must re-elevate to the ais_high_security_admin role, as directed in the following procedure.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



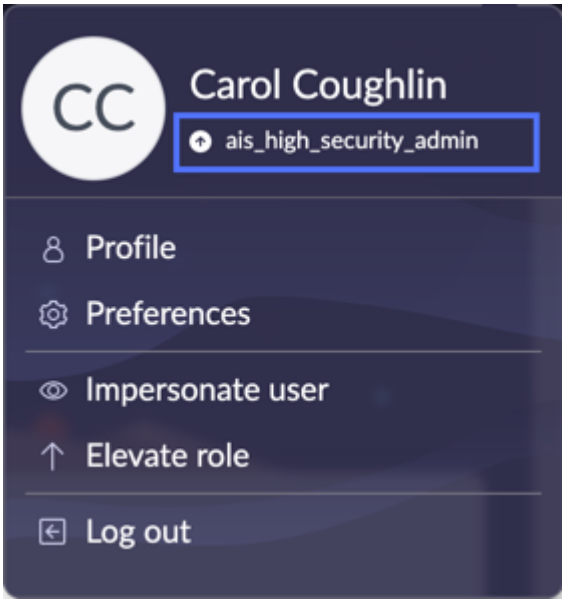
1. Navigate to *AI Search* > **Preview** > **Search Preview (New)**.
2. Select the Search Preview UI's Profile tool and enter the affected user's name into the **Search as user** field.

   Note: For more details on the **Search as user** field, see Search Preview admin tools.
3. In the Preview types list, select **Full visual view**.
4. In the Search mode list, select the mode used by the search application configuration for the portal or search application where the affected user is unable to see the search result in question.
5. In the Search Application list, select the search application configuration for the portal or search application where the affected user is unable to see the search result in question.
6. In the Card view list, select **Result cards with details**.
7. Enter the search query of interest into the search input field and press Enter or select the Submit search icon to search as the affected user.
   Search results appear, matching those seen by the affected user for the search query of interest in the selected portal or search application. Some results that match your search terms may be hidden by search source or content security filters.
8. Elevate to the ais_high_security_admin role:

   a. Perform the appropriate action for your version of the UI:

UI version	Action
Next Experience UI	In the banner frame, select the icon for your account to open the user menu, then select **Elevate role**. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



UI version	Action
Core UI	In the banner frame, select your name to open the user menu, then select **Elevate Roles**. 

A dialog box appears, displaying a checklist of your available privileged roles.

b. In the dialog box, select the **ais_high_security_admin** option, then select **Update** (in Next Experience UI) or **OK**.
The page reloads and an elevated role indicator appears next to your user name in the user menu. In Next Experience UI, this indicator displays the names of the active privileged roles.
In Core UI, the indicator displays the elevated role icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When the page reloads, any unsaved edits are lost.

9. Repeat the search of interest without impersonating the affected user.
   Search results appear with no search source or content security filters applied.

What to do next

Compare the two search result sets. If the search result in question appears only in the elevated search, a search source or content security filter prevents the affected user from viewing that result. If the search result doesn't appear in either search, it's not present in the AI Search index.

If the search result in question is indexed from an external document, you can debug the external content security access permission filter for the affected user to see whether it prevents access to the search result. For details on this procedure, see Debug external content security filters for a ServiceNow AI Platform user.

Debug search source and content security filters

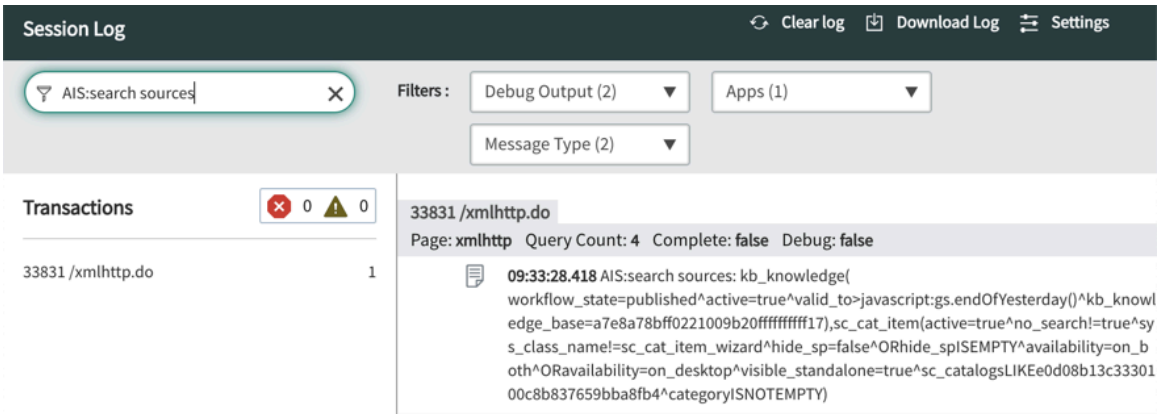
Use the Session Log to view search source and content security filters applied to results for a search query. Administrators can use this approach to verify search source filters and content security settings.

Before you begin

Role required: admin

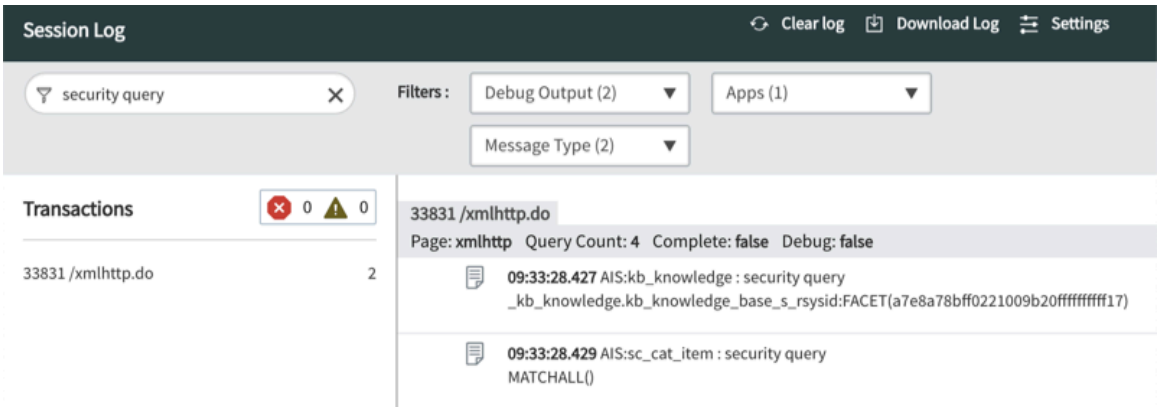
About this task

Enable session debugging for AI Search to view debug log messages for search source and content security filters. Each debug log message shows the filters that AI Search applies to determine which records appear in a search query's results.



Procedure

1. To enable session debugging for AI Search, navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug** *`AI Search`*.
2. Navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug Log**.
   The Session Log opens.
3. Use the Search Preview UI for AI Search to submit the search query of interest.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To debug content security filters for another user, specify their name in the Search Preview UI's user impersonation tool.

4. To see the search source filters applied for your search queries, filter the Session Log entries for `AIS : search sources`.

5. To see the content security filters applied when evaluating access to search results for the current (or impersonated) ServiceNow AI Platform® user, filter the Session Log entries for `security query`.

What to do next

If a search source's filters exclude records that should be searchable, modify those filters. For details, see Create a search source for AI Search.

If content security filters prevent the user from seeing search results that should be accessible, correct the access control settings for the affected source records and then reindex content for the relevant indexed source. For details on content security settings, see Content security in AI Search. To reindex content, follow the steps from Perform a full table index or reindex for a single AI Search indexed source.

Debug external content security filters for a ServiceNow AI Platform® user

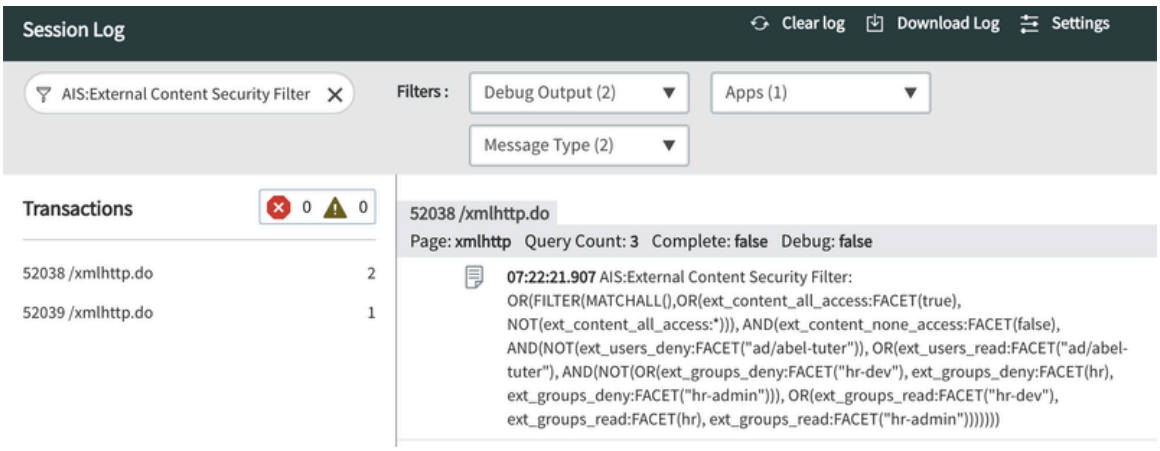
Use the Session Log to view the set of externally defined user and group access permission filters associated with the current ServiceNow AI Platform user. Administrators can use this approach to verify that the proper user mappings exist for the current user.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task



Enable session debugging for AI Search to view debug log messages for external content security. Each debug log message shows the external content security filter that AI Search applies to determine whether the current ServiceNow AI Platform user can see a search result for an external document.

Procedure

1. To enable session debugging for AI Search, navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug** *`AI Search`*.
2. Navigate to **All** > **System Diagnostics** > **Session Debug** > **Debug Log**.
   The Session Log opens.
3. Use the Search Preview UI for AI Search to submit the external content search query of interest.

   Note: To debug external content security access permissions for another user, specify their name in the Search Preview UI's user impersonation tool.

4. In the Session Log, filter for `AIS:External Content Security Filter` to see the external content security filters applied when evaluating access to an external document search result for the current (or impersonated) ServiceNow AI Platform user.

What to do next

If the external content security filters don't include the desired external user or group access permissions, a search administrator can import an updated and corrected user mapping for the relevant ServiceNow AI Platform user. For more details on defining and importing user mappings, see Mapping external users and groups to ServiceNow AI Platform users.

Review record counts for indexed sources

Understand where your indexed content originates by viewing record counts for your indexed sources in the AI Search Indexed Source Statistics table.

Before you begin

Role required: ais_admin

About this task

The AI Search Indexed Source Statistics [ais_datasource_stats] table contains entries showing the indexed record counts for each of your indexed sources. These entries are logged every 24 hours by the **AIS Collect Ingestion Stats** scheduled job. You can review the statistics entries to see how many records each indexed source contributes to the AI Search index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the AI Search Indexed Source Statistic [ais_datasource_stats] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `ais_datasource_stats.list`.
   c. Press Enter.
2. If the Updated field doesn't appear, add it to the list view.
   a. Select the Personalize List icon .
   b. In the Personalize List Columns dialog box, find the Updated field in the Available list and use the Add icon to move it to the Selected list.
   c. Select **OK**.
3. To display the most recent indexed record-count entries first, select the Updated field's column options icon in Next Experience UI or , then select **Sort (z to a)**.
4. Review the indexed record-count entries for each of your indexed sources.

> **Note:** The entry for an indexed source indicates the number of indexed records from that source when the **AIS Collect Ingestion Stats** scheduled job ran at the time listed in the Updated field.

Search query parameter evaluation framework

AI Search performs A/B test evaluations that compare result relevancy for alternate sets of search query parameter values. These evaluations determine the models that AI Search uses for machine learning relevancy and for Q&A Genius Results.

The search query parameter evaluation framework enables A/B relevancy testing on live search traffic. AI Search considers results from this live testing along with its offline evaluation of aggregated search signal data when making the following determinations:

- Determining which relevancy model to publish for a search profile. For details on generation and publication of relevancy models, see Machine learning relevancy in AI Search.
- Determining which machine reading comprehension (MRC) model to use when validating potential Q&A Genius Result answers. For more information on the MRC model used for Q&A Genius Results, see Q&A Genius Results.

AI Search computes A/B testing evaluation results on a nightly basis.

> **Note:** The search query parameter evaluation framework doesn't support user configured A/B testing. All A/B testing is automatically performed by AI Search as part of its evaluation of machine learning relevancy models.

The search query parameter evaluation framework is part of the Adaptive Telemetry suite of features.

Search query parameter evaluation framework tables

The search query parameter evaluation framework for AI Search uses tables to store results and metrics from A/B testing of live search traffic. AI Search uses the stored data when determining which relevancy model and Q&A Genius Result answer validation model to publish for a search application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A/B Testing Evaluation table

The A/B Testing Evaluation [evaluation] table stores details for A/B testing evaluations performed on live search traffic.

Note: The system automatically cleans this table, removing records for inactive evaluations that are more than two years old.

evaluation

Column	Description
Number	Autogenerated number to identify the evaluation.
Name	Name and description for the evaluation.
Source	Name of the table containing records to run the evaluation for.
Testing Scope	Scope of the evaluation. • Supported values: ○ *ALL*: Run the evaluation against all records in the table specified by **Source**. ○ *SELECTED*: Only run the evaluation against records specified in the **Selected Artifacts** field value. • Default value: *ALL*
Artifact Provider	List of artifact filtering classes that provide records for testing.
Selected Artifacts	Comma-separated list of record sys_id values. When **Testing Scope** is set to **SELECTED**, the evaluation only runs against records with sys_id values specified in this list.
Minimum Signals for Evaluation	Minimum number of search signals the evaluation should collect before ending. • Type: integer • Default value: *0* (no minimum) • Maximum value: *30000* For details on how this condition interacts with the **Minimum Days for Evaluation** condition, see **End Criteria Operator**.
Minimum Days for Evaluation	Minimum number of days the evaluation should be active before ending. • Type: integer • Default value: *0* (no minimum) • Maximum value: *180* For details on how this condition interacts with the **Minimum Signals for Evaluation** condition, see **End Criteria Operator**.
End Criteria Operator	Logical operator to use for evaluation end conditions when both **Minimum Signals for Evaluation** and **Minimum Days for Evaluation** conditions exist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

evaluation (continued)

Column	Description
	• Supported values: ○ *AND*: The evaluation remains active until the **Minimum Signals for Evaluation** and **Minimum Days for Evaluation** conditions are both satisfied. ○ *OR*: The evaluation remains active until either of the **Minimum Signals for Evaluation** or **Minimum Days for Evaluation** conditions is satisfied. • Default value: *OR*

A/B Testing Evaluation Execution table

The A/B Testing Evaluation Execution [evaluation_execution] table stores details of individual operations executed as part of A/B testing evaluations for live search traffic.

evaluation_execution

Column	Description
Number	Autogenerated number to identify the evaluation operation.
Evaluation	Reference to the record for the evaluation on the A/B Testing Evaluation [evaluation] table.
Artifact ID	Sys_id for the record analyzed by this evaluation operation.
State	State for the record evaluation execution. • Supported values: ○ *Queued*: The evaluation operation is queued for execution. ○ *In Progress*: The evaluation operation is underway. ○ *Scoring*: The evaluation operation is in the scoring phase. ○ *Complete*: The evaluation operation completed successfully. ○ *Errored*: The evaluation operation failed with an error. ○ *Canceled*: The evaluation operation was canceled by the system. ○ *Suspended*: The evaluation operation was suspended by the system. • Default value: *Queued*
Start Date	Date and time when the evaluation operation started.
End Date	Date and time when the evaluation operation ended.

A/B Testing Evaluation Parameter table

The A/B Testing Evaluation Parameter [evaluation_parameter] table stores details of individual search query parameters considered in A/B testing evaluations for live search traffic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

evaluation_parameter

Column	Description
Evaluation	Reference to the record for the evaluation on the A/B Testing Evaluation [evaluation] table.
Name	Name and description for the evaluation parameter.
Use Artifact's Assigned Parameter	• Type: true | false • Supported values: ○ *true*: Compare the specified *Parameter Values* to the currently assigned search query parameter value on the provided artifact. ○ *false*: Don't compare the specified *Parameter Values* to the currently assigned search query parameter value on the provided artifact • Default value: *true*
Parameter Values Traffic Percentage	Percentage of search queries to apply the specified *Parameter Values* to during the A/B evaluation. • Type: integer • Default value: *0* • Maximum value: *100*
Parameter Values	JSON list of values to compare to the current search query parameter value when *Use Artifact's Assigned Parameter* is true.
Parameter Type	Type for the search query parameter. The selected value determines how the *Parameter Values* are used during and after an A/B evaluation. Supported values: • *Search Context Parameters*: Merge and override search profile context parameters with the *Parameter Values* for search query requests. When the evaluation ends, use the search query context parameter value set with the winning score to override or merge the relevant search profile context parameters. • *Search QnA Genius Result Configuration*: Apply the *Parameter Values* to Q&A Genius Result configurations used in search query requests. When the evaluation ends, update the relevant search profile to include the Genius Result configuration parameter value with the winning score. • *Search QnA Model*: Apply the *Parameter Values* to Q&A Genius Result models used in search query requests. When the evaluation ends, update the relevant search profile to include the Q&A Genius Result model parameter value with the winning score. • *Search Relevancy Model*: Apply the *Parameter Values* as search relevancy models to use in search query requests. When the evaluation ends, update the relevant search profile to include the relevancy model parameter value with the winning score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

evaluation_parameter (continued)

Column	Description
	• *Search REST Parameters*: Merge and override search profile query parameters with the *Parameter Values* for search query requests. When the evaluation ends, use the search query parameter value set with the winning score to override or merge the relevant search profile parameters.
Score Calculation Type	Form of calculation used to compute search query parameter value scores and find the best value. Supported values: • *Average Click Position*: The best search query parameter value is the one with the lowest average click position score. **Note:** AI Search computes the average click position score by dividing the sum of all selected search result ranks by the number of searches. The highest-ranked search result has rank 1, the next-highest has rank 2, and so on. As an example, if you perform two searches, selecting the first result in one case and the second result in the other, your average click position score is (1 + 2) / 2 = 1.5. • *Genius Result Helpfulness*: The best search query parameter value is the one with the highest helpfulness score. This calculation takes into account whether a relevant Genius Result answer appeared in your search results. **Note:** The helpfulness score is a metric that indicates whether Genius Result answers were helpful in the context of your search. • *Helpfulness*: The best search query parameter value is the one with the highest helpfulness score. Unlike *Genius Result Helpfulness*, this calculation doesn't take into account whether a relevant Genius Result answer appeared in your search results.
Signal Provider	The provider for search signals needed to score the search query parameter. *Search Event Signal Provider* is the only supported value.

A/B Testing Evaluation Parameter Result table

The A/B Testing Evaluation Parameter Result [evaluation_parameter_result] table stores calculation results for individual search query parameters considered in A/B testing evaluations for live search traffic.

evaluation_parameter_result

Column	Description
Evaluation Execution	Reference to the record for the evaluation execution on the A/B Testing Evaluation Execution [evaluation_execution] table.
Parameter Evaluation	Reference to the record for the search query parameter on the A/B Testing Evaluation Parameter [evaluation_parameter] table.
Best Value	Best value for the search query parameter, as determined by the *Winning Score*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

evaluation_parameter_result (continued)

Column	Description
Winning Score	Numeric score for the search query parameter, determined using the *Score Calculation Type*.
Score Metadata	Metadata from the score computation for the search query parameter.

Exclude a search profile from the search query parameter evaluation framework

Exclude a search profile from A/B testing evaluations of live AI Search traffic. This procedure prevents AI Search from using A/B testing evaluation results when publishing the search profile's search result relevancy model and its Q&A Genius Result answer validation model.

Before you begin
Role required: ais_admin

About this task
The search query parameter evaluation framework performs A/B testing evaluations of search configuration settings using live search traffic. By default, AI Search evaluates configuration settings for all search profiles.

Search administrators can exclude individual search profiles from the search query parameter evaluation framework. Excluding a search profile from the framework prevents AI Search from performing A/B testing evaluations for live search traffic that uses the excluded search profile.

Note: When you exclude a search profile from evaluations, AI Search no longer considers evaluation results when updating the machine learning relevancy and machine reading comprehension (MRC) models for that search profile. As a result, relevancy scoring settings and Q&A Genius Result answer filtering settings for the search profile may be less reflective of your search traffic. For more information on how AI Search uses A/B evaluation testing results when publishing these models, see Machine learning relevancy in AI Search and Q&A Genius Results.

Procedure
1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the record for the search profile that you want to exclude from A/B testing evaluations of live search traffic.
3. If the Search Profile form doesn't already display the **Exclude from evaluation** field, configure the form layout to make the field visible.
   For details on configuring a form layout to make fields visible, see Configuring the form layout.
4. Select the **Exclude from evaluation** option.
5. Select **Update**.

Result
AI Search no longer performs A/B testing evaluations for traffic that uses the excluded search profile. Machine learning relevancy no longer updates the relevancy model for the search profile.

AI Search reference

These reference topics provide additional information about AI Search installed components, system properties, features, and forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins installed with AI Search

AI Search adds the following plugin.

AI Search plugins

Plugin	Description
AI Search plugin (com.glide.ais)	Enables core functionality for AI Search. Installed in the base system. **Note:** This plugin isn't visible in the **All** > **System Applications** > **All Available Applications** > **All** and **All** > **System Definition** > **Plugins** listings. To verify that AI Search is installed and provisioned for use on your instance, navigate to **All** > *AI Search* > *AI Search* **Status**.

Components installed with AI Search

Several types of components are installed with activation of the AI Search plugin, including scheduled jobs, tables, and user roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

Scheduled job	Description
Aggregate Health Data for AIS Partition	Collects health check data for AI Search query nodes connected to your instance.
AI Search Expire Rules	Marks result improvement rules as expired when their end date is in the past.
AI Search Relevancy Data Processor	Processes search signal data as part of search profile relevancy model tuning by the machine learning relevancy feature.
AIS Collect Ingestion Stats	Collects ingestion history statistics for indexed sources.
AIS Derived Dictionary Auto Refresh	Refreshes derived typo handling dictionaries when their refresh interval has elapsed.
AIS Index Event Processor	Processes indexing events for indexed sources.
AIS Index Event Queue Size Monitor	Monitors the size of the indexing queue during indexing of source records.
AIS Index Purge Stale Document	Optimizes the search index by deleting stale documents.
AIS Validate Publish ID and Auto Publish	Publishes search profiles and typo handling, stop word, and synonym dictionaries.
ML Trigger for AIS Search Relevancy	Triggers automatic tuning of search profile relevancy models by the machine learning relevancy feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Table	Description
AI Search ACL Overrides [ais_acl_overrides]	List of rules used by content security.
AI Search Active Table Ingestion Tracker [ais_active_table_ingestion_tracker]	List of active content ingestion events for indexed source tables.
AI Search Child Table [ais_child_table]	List of child tables defined for indexed sources.
AI Search Configuration Attribute [ais_configuration_attribute]	List of indexed source attributes available for use in indexed sources.
AI Search Connection [ais_connection]	List of AI Search query nodes connected to your instance.
AI Search Dictionary [ais_dictionary]	List of typo handling, stop word, and synonym dictionaries.
AI Search Dictionary Term [ais_dictionary_term]	List of terms defined in typo handling, stop word, and synonym dictionaries.
AI Search External Content User Mapping Base [ais_external_search_user_mapping]	Empty list of external content user mappings. All custom external content user mapping tables extend this table. **Note:** This table is only installed after activation of the External Content for AI Search plugin (com.glide.ais.external_content).
AI Search External Content User Mapping History Record [ais_external_content_user_mapping_history]	List of import history events for external content user mapping tables. **Note:** This table is only installed after activation of the External Content for AI Search plugin (com.glide.ais.external_content).
AI Search External Content User Mapping Table Data Source Relationship [ais_external_search_user_mapping_data_source_m2m]	List of mappings between external content user mapping tables and indexed sources. **Note:** This table is only installed after activation of the External Content for AI Search plugin (com.glide.ais.external_content).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
AI Search Genius Result Configuration [ais_genius_result_configuration]	List of Genius Result configurations.
AI Search Genius Result Configuration NLU Model Mapping [ais_genius_result_configuration_sys_nlu_model_m2m]	List of mappings between NLU models and Genius Result configurations.
AI Search Index Events stats [ais_index_queue_stats]	List of statistics entries for indexing events.
AI Search Indexed Batch History [ais_ingest_batch_stats]	List of ingestion history events for indexing batches.
AI Search Indexed Event History [ais_ingest_event_stats]	List of ingestion history events for indexer events
AI Search Indexed Retry History [ais_ingest_retry_stats]	List of ingestion history events produced when retrying indexing for a source table record.
AI Search Indexed Source [ais_datasource]	List of indexed sources.
AI Search Indexed Source Attribute [ais_datasource_attribute]	List of indexed source attributes configured for indexed sources.
AI Search Indexed Source Field Attribute [ais_datasource_field_attribute]	List of field settings configured for indexed sources.
AI Search Indexed Source History [ais_ingest_datasource_stats]	List of ingestion history events for indexed sources.
AI Search Indexed Source Statistics [ais_datasource_stats]	List of entries showing indexed record counts for indexed sources. For more information on these entries, see Review record counts for indexed sources.
AI Search Indexed Table History [ais_ingest_table_stats]	List of ingestion history events for individual source tables defined in indexed sources.
AI Search Ingestion Trigger Checkin [ais_ingestion_trigger_checkin]	List of ingestion trigger check-in times for AI Search nodes.
AI Search Partition Health [ais_partition_health]	List of health check events for AI Search query nodes connected to your instance.
AI Search Partition Health Response [ais_partition_health_response]	List of health check response events for AI Search query nodes connected to your instance.
AI Search Publish History [ais_publish_history]	List of publication history events for search profiles and typo handling, stop word, and synonym dictionaries.
AI Search Relevancy Auto Train Solution [ais_relevancy_autotrain_solution]	List of relevancy model tuning records used by machine learning relevancy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
AI Search Relevancy Solution Definition [ais_relevancy_solution_definition]	List of search profiles with relevancy models tuned by machine learning relevancy.
AI Search Relevancy Training Execution [ais_relevancy_training_execution]	List of relevancy model tuning tasks performed by machine learning relevancy.
AI Search Relevancy Training Staging [ais_relevancy_training_staging]	List of relevancy model staging tasks performed by machine learning relevancy.
AI Search Results Improvement Rule [ais_rule]	List of result improvement rules.
AI Search Results Improvement Rule Action [ais_rule_action]	List of actions defined for use in result improvement rules.
AI Search Results Improvement Rule Condition Builder Values [v_ais_result_improvement_rule_condition_builder_values]	List of static values defined for use in result improvement rule actions.
AI Search Retention Policy [ais_retention_policy]	List of retention policies available for use in indexed sources.
AI Search Search Profile [ais_search_profile]	List of search profiles.
AI Search Search Profile Dictionary Mapping [ais_search_profile_ais_dictionary_m2m]	List of mappings between search profiles and typo handling, stop word, and synonym dictionaries.
AI Search Search Profile Genius Result Configuration Mapping [ais_search_profile_ais_genius_result_configuration_m2m]	List of mappings between search profiles and Genius Result configurations.
AI Search Search Profile Relevancy Model [ais_search_profile_relevancy_model]	List of relevancy models created by machine learning relevancy.
AI Search Search Profile Search Source Mapping [ais_search_profile_ais_search_source_m2m]	List of mappings between search profiles and search sources.
AI Search Search Source [ais_search_source]	List of search sources.
AI Search Updatable Field Event [ais_updatable_field_event]	List of events for updatable fields on indexed records.
Raw User Mapping for External Content [ais_external_content_raw_external_user_mapping]	List of imported user mapping table entries. **Note:** This table is only installed after activation of the External Content for AI Search plugin (com.glide.ais.external_content).

Roles installed

AI Search includes the following roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search administrator [ais_admin]

Manage configuration settings for the AI Search application.

- Creates, reads, updates, and deletes indexed sources
- Creates, reads, updates, and deletes search sources
- Creates and deletes mappings between search sources and search profiles
- Creates, reads, updates, and deletes search profiles
- Creates, reads, updates, and deletes synonym and stop word dictionaries
- Creates and deletes mappings between dictionaries and search profiles
- Reads and updates typo handling auto-correction dictionaries linked to search profiles
- Creates, reads, updates, and deletes Genius Result configurations
- Creates and deletes mappings between Genius Result configurations and search profiles
- Creates, reads, updates, and deletes result improvement rules
- Creates and deletes mappings between result improvement rules and search profiles

Contains roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note: Avoid granting an admin role when more specialized roles are available.

External Content for AI Search roles

External Content for AI Search includes the following roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

AI Search external content API user [ais_external_content]

Access endpoints for AI Search external content APIs.

- Feeds external documents for AI Search to index as search results, or deletes records for external documents from the index, using the External Content Ingestion API.
- Imports user mappings for external content security using the AI Search External User Mapping API.

Contains Roles

List of roles contained within the role.

None.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Assign this role to non-interactive users and integration users who require access to external content API endpoints. For more information on non-interactive users, see Non-interactive sessions. For details on integration users, see Mark service accounts as internal integration users.

Users with the admin role don't need this role to access external content API endpoints.

AI Search high security administrator [ais_high_security_admin]

Access High Security settings for AI Search.

- Bypasses all search filters from search sources and content security in the Search Preview UI, viewing all search query results available in the AI Search index
- Reads external content user mapping import history records
- Reads indexed content item records in the index inspector tool for External Content Connectors

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

This is an elevated privilege role. Elevated privilege roles aren't assigned to users or groups, and must be used by elevation. For more information on elevated privilege roles, see Elevated privilege roles. To learn about elevation, see Elevate to a privileged role.

The Instance Security Center **Users with High Privilege Roles** user metric displays the count of users assigned this role. For more details, see .

AI Search system properties

Users with the admin role can configure the following system properties for AI Search by navigating to **All** > **System Properties** > *AI Search*.

AI Search system properties

Property
Enable automatic switch over to a healthy *AI Search* **node in the near datacenter** (*glide.ais.ha.auto*)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
Enable automatic failover to an alternate *AI Search* **node when the active node becomes unhealthy** (*glide.ais.ha.enable_auto_failover*)
Ingestion batcher queue memory size in MB (*glide.ais.ingestion.batcher_queue_memory_siz*
Ingestion batcher queue length (records) (*glide.ais.ingestion.batcher_queue_size*)
glide.ais.ingestion.catalog_variables_filter_query

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
Ingestion dictionary batcher queue length (records) (*glide.ais.ingestion.dictionary_term_bat*
Ingestion failure retry timeout in seconds (*glide.ais.ingestion.failure_retry_timeout*)
Ingestion feedback logger for error messages (*glide.ais.ingestion.feedback_logger_error*)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
Ingestion feedback logger for informational messages (*glide.ais.ingestion.feedback_logger_i*
Ingestion feedback logger for minor error messages (*glide.ais.ingestion.feedback_logger_mir*
Ingestion feedback logger for warning messages (*glide.ais.ingestion.feedback_logger_warn*)
glide.ais.ingestion.ignore_catalog_variables_read_roles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
glide.ais.ingestion.index_catalog_variables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
Interval in seconds between AI Search node health status check requests (*glide.ais.monitor.health_status_check_interval*)
Timeout period in seconds for AI Search node health status check request (*glide.ais.monitor.health_status_check_timeout*)
Inclusive lower bound for GREEN (healthy) range of AI Search node health scores (*glide.ais.monitor.health_threshold_green*)
Inclusive lower bound for YELLOW range of AI Search node health scores (*glide.ais.monitor.healt*
Maximum request count per search query for AI Search node (*glide.ais.query.max_request_coun*
Search query result count multiplier for AI Search node (*glide.ais.query.requested_rows_multi*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
Boolean search operator to use when a search query includes multiple terms (*glide.ais.query.searc*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
Force *AI Search* **to use late binding for ACL evaluation** (*glide.ais.security.force_late_bindi*
Enable global language fallback (*glide.ais.translate.enable_global_language_fallback*)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search system properties (continued)

Property
glide.mlpredictor.ml_x_snc_global_global_6eedb38234bf5010f877396127c8ffee.pr
query.maxDictionaryTermLength

ServiceNow AI Platform® tables excluded from AI Search indexing

AI Search excludes the following ServiceNow AI Platform tables when indexing content. You can't configure these tables, or tables derived from them, as AI Search indexed sources.

- AI Search External Search User Mapping Base [ais_external_search_user_mapping]
- Base Configuration Item [cmdb]
- Email [sys_email]
- Event [sysevent]
- Import Set Row [sys_import_set_row]
- Log [syslog]
- Queue [ecc_queue]
- Replicated Operation [sys_replication_queue]
- Sys Audit [sys_audit]

Variable types supported by AI Search indexing

AI Search can index searchable content and metadata from multiple variable types found on indexed source records.

Variable types indexed from variables column

When indexing records from any source table, AI Search retrieves searchable content from supported variable types when they're present in a source record column that has name **variables** and type *Variables*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported variable types include:

- Email
- Multi-line text
- Single-line text
- URL
- Wide single-line text

Service Catalog variable types indexed from Catalog Items

When indexing records from the Catalog Item [sc_cat_item] table and tables that extend it, AI Search can retrieve searchable content from these Service Catalog variable types:

- Multiple choice
- Select box

Other variable types aren't supported for catalog variable indexing.

Catalog variable indexing is not active in the base system, but it's activated if you have the ServiceNow® Otto for AI Search application installed. To learn how to activate and configure catalog variable indexing, see Activate indexing of catalog variable content on Catalog Item records. For details on the ServiceNow Otto for AI Search application, see ServiceNow Otto for AI Search.

For the full list of available Service Catalog variable types, see Types of Service Catalog variables.

AI Search index fields

List of fields available on records in the AI Search index. AI Search populates these fields with values from source record fields during indexing.

AI Search index fields

Field	Description
ai_search_parent_title	Title of the indexed record's parent record, if it has one. This field is automatically generated by AI Search from the parent record's **title** field value.
ai_search_teaser_text	Searchable text of the indexed record, displayed in search results. This field is automatically generated by AI Search from the indexed record's **text** field value.
ai_search_teaser_title	Title of the indexed record, displayed in search results. This field is automatically generated by AI Search from the indexed record's **title** field value.
datasource_id	Name of the indexed source that added the record to the AI Search index.
ext_record_id	Unique identifier for the external content source record that corresponds to the indexed record. Only populated for records from external content sources.
ext_groups_deny	Names of security principal groups that can't read the record. Only populated for records from external content sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search index fields (continued)

Field	Description
	Note: Deny entries take precedence over read entries. If a group appears in this field and in *ext_groups_read*, members of that group can't read the record.
ext_groups_read	Names of security principal groups that can read the record. Only populated for records from external content sources. **Note:** Deny entries take precedence over read entries. If a group appears in this field and in *ext_groups_deny*, members of that group can't read the record.
ext_users_deny	Names of security principal users that can't read the record. Only populated for records from external content sources. **Note:** Deny entries take precedence over read entries. If a user appears in this field and in *ext_users_read*, that user can't read the record.
ext_users_read	Names of security principal users that can read the record. Only populated for records from external content sources. **Note:** Deny entries take precedence over read entries. If a user appears in this field and in *ext_users_deny*, that user can't read the record.
index_event_id	Sys_id of the indexing event that added the record to the AI Search index.
language	Language of the indexed record. AI Search uses the language specified for the record in the source table. If no language is specified in the source table, AI Search automatically detects the record's language.
record_class_name	The hierarchical class used to render the source record.
sys_id	Sys_id of the source record.
table	Name of the indexed record's source table. For records from external content sources, this index field indicates the name of the content schema table specified during document ingestion.
text	Searchable text for the indexed record. This index field may be populated directly from a source record field, such as **Description**, or may be extracted from binary content.
title	Title for the indexed record. This index field may be populated directly from a source record field, such as **Short description**, or may be extracted from binary content.
url	URL for the source record's form view. When you select the indexed record from a search result list, the system redirects you to this URL so you can view the source record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search index fields (continued)

Field	Description
	Note: AI Search automatically populates this index field from the source record. You cannot override the index field value using *map_to* field settings.

Common index fields

The following AI Search index fields appear on all records indexed from ServiceNow AI Platform® source tables:

- ai_search_parent_title
- ai_search_teaser_text
- ai_search_teaser_title
- record_class_name
- sys_id
- table

AI Search Country To Search Language form

The AI Search Country To Search Language form enables you to define a knowledge article search language for a country.

For details on defining knowledge article search languages for a country, see Assign Knowledge article search languages by country.

AI Search Country To Search Language form

Field	Description
Country	Reference to the country from the Country [core_country] table that you want to define an additional knowledge article search language for.
Search language	Reference to a language from the Language [sys_language] table that you want AI Search to use for knowledge article searches by users in the selected country.

Note: You can define multiple AI Search Country To Search Language records for the same country, as long as each one has a different knowledge article search language. If you attempt to create multiple records with the same country and the same knowledge article search language, the system displays a warning message and the record insert operation fails.

AI Search External Search User Mapping Table Data Source Relationship form

The AI Search External Search User Mapping Table Data Source Relationship form enables you to link a user mapping table to an indexed source for external content in AI Search.

For details on linking a user mapping table to an indexed source for external content, see Mapping external users and groups to ServiceNow AI Platform users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search External Search User Mapping Table Data Source Relationship form

Field	Description
User Mapping Child Table	The name of the user mapping table that you want to link to the external content indexed source.
Index Source	The name of the external content indexed source that you want to link the user mapping table to.

AI Search Genius Result Configuration form

The AI Search Genius Result Configuration form enables you to create a Genius Result configuration for use in your AI Search search profiles.

For details on creating or editing a Genius Result configuration, see Create a Genius Result configuration.

AI Search Genius Result Configuration form

Field	Description
Name	Name for the Genius Result configuration.
Trigger condition	Condition that triggers evaluation of the Genius Result configuration. Supported values: • *Always*: The Genius Result configuration triggers for every search query. • **NLU**: The Genius Result configuration triggers when the search query's detected intent matches an NLU model intent. To use this trigger condition, you must link the NLU model and one or more of its intents to your Genius Result configuration. For instructions, see Link an NLU model and intents to a Genius Result configuration. **Note:** For an NLU trigger condition to function, the NLU model must be published. You can verify NLU model status by navigating to **All** > *AI Search* > **Search Query Settings** > **Search Intents**. • *Term*: The Genius Result configuration triggers when the search query exactly matches a specified set of query terms. **Note:** Exact matching means that the search query must contain only the specified terms in the specified order. For example, if you define `conference room` as the trigger term, a search for `conference room` triggers the Genius Result condition but searches for `hotel conference room` or `room conference` don't trigger it.
Term	Term that triggers the Genius Result configuration when it exactly matches the search query. This field appears only when you select **Term** from the **Trigger condition** field.
Application	Application scope for the Genius Result configuration. This field is automatically set.
Active	Option to activate the Genius Result configuration. Inactive Genius Result configurations never trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search Genius Result Configuration form (continued)

Field	Description
Processor script template	Sample server-side script function. Use the code displayed in this field as a basis for your *AI Search* **request processor** and *AI Search* **response processor** scripts. This field is automatically set.
AI Search request processor	Server-side script function that takes a `GeniusResultContext` object as its parameter. The function must return a `GeniusResultAnswer` object that contains a search query. Up to three results from this search query display as Genius Result answer cards. **Note:** This field is required if **AI Search response processor** isn't populated. You can copy the code from the **Processor script template** to use as a starting point for your script function. When a search query triggers the Genius Result configuration, the system executes this script and then sends both the triggering search query and the scripted search query to the AI Search back end for computation of search results. To define a search query, use the `GeniusResultAnswer.setTable()`, `GeniusResultAnswer.addSearchPhrases()`, and `GeniusResultAnswer.setSearchPhrase()` API methods. For details of API methods usable in this script function, including examples of use, see the GeniusResultAnswer and GeniusResultContext scoped JavaScript API descriptions. **Note:** The `GeniusResultContext.getMatchingDocuments()` API method returns no results when invoked in an **AI Search request processor** script, since the script is executed before AI Search computes results for the triggering search query. Don't use this method in your request processor scripts.
AI Search response processor	Server-side script function that takes a `GeniusResultContext` object as its parameter. The function must return a `GeniusResultAnswer` object that defines one or more maps of key-value pairs. You can display these key-value pairs on the Genius Result answer card by specifying them as **Return fields**. **Note:** This field is required if **AI Search request processor** isn't populated. You can copy the code from the **Processor script template** to use as a starting point for your script function. When a search query triggers the Genius Result configuration, the system executes this script after AI Search computes search results. To define your map of key-value pairs, use the `GeniusResultAnswer.addDataMap()` API method. Each key-value pair represents a field name and value that you can display on the Genius Result answer card using the **Return fields** list. For details of API methods usable in this script function, including examples of use, see the GeniusResultAnswer and GeniusResultContext scoped JavaScript API descriptions.
Return fields	Comma-separated list of fields to display on the Genius Result answer card. This field is required if **AI Search response processor** is populated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search Genius Result Configuration form (continued)

Field	Description
	Behavior depends on which processor script field is populated: • If **AI Search response processor** is populated, you must use this field to specify the names of fields defined in your `GeniusResultAnswer` response object that you want to display on the Genius Result answer card. • If **AI Search response processor** isn't populated, the Genius Result answer card automatically displays the common AI Search index fields: ○ ai_search_parent_title ○ ai_search_teaser_text ○ ai_search_teaser_title ○ record_class_name ○ sys_id ○ table You can optionally use this field to specify any additional AI Search index fields that you want to display for search results shown on the Genius Result answer cards. To view the list of AI Search index fields, see AI Search index fields.

AI Search Genius Result Configuration NLU Model Mapping form

The AI Search Genius Result Configuration NLU Model Mapping form enables you to link a Genius Result configuration to an NLU model.

For details on linking Genius Result configurations to NLU models, see Link an NLU model and intents to a Genius Result configuration.

AI Search Genius Result Configuration NLU Model Mapping form

Field	Description
Genius Result Configuration	The Genius Result configuration to link the NLU model to. This field is automatically set to the selected Genius Result configuration.
NLU Model	Existing NLU model to use for the Genius Result configuration's NLU trigger condition.
State	Current state of the selected NLU model. This field is automatically set.
Intents	List of intents from the NLU model that can trigger the Genius Result configuration when detected in the search query.
Order	Order of evaluation for the NLU model in the context of the Genius Result configuration.
Application	Application scope for the NLU model link. This field is automatically set.

AI Search Results Improvement Rule form

The AI Search Results Improvement Rule form enables you to create a result improvement rule in an AI Search search profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on creating or editing result improvement rules, see Create a result improvement rule.

AI Search Results Improvement Rule form

Field	Description
Label	Unique label for the result improvement rule.
Start Date	System time for the first date when the result improvement rule can activate. If left empty, this field is automatically set to the current date.
End Date	System time for last date when the result improvement rule can activate. After this date, the rule state changes to *Expired*. If left empty, this field is automatically set to 30 days from the **Start Date**.
Activate on all queries	Option to make the result improvement rule activate for every search query.
Language	Language for the result improvement rule. AI Search only evaluates activation for result improvement rules that have the same language as the search query or that have **All Languages** specified for this field.
State	Current state for the result improvement rule. • **New**: The rule has never been published. • **Draft**: The rule is saved with unpublished changes. • **Published**: The rule is saved with all changes published. • **Expired**: The rule can't activate because its **End Date** is in the past. Publishing a search profile doesn't publish expired rules.
Marked for Deletion	Option indicating whether AI Search will delete the result improvement rule the next time you publish the search profile.
Apply only to Genius Results	Option to make the result improvement rule only operate on Genius Result answers when activated. **Note:** When this option is selected, the result improvement rule can only contain block actions.
Triggers	
Expand Synonyms For Query Conditions	Option for enabling synonym expansion for Query condition arguments. This field disappears if you select **Activate on all queries**. When expanding Query conditions, AI Search only considers active synonyms that are defined in the same search profile and that have a language matching the language of the result improvement rule.
Triggers	List of conditions that must be met for the result improvement rule to activate. This field disappears if you select **Activate on all queries**. Select one of the following fields as the subject for your condition:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search Results Improvement Rule form (continued)

Field	Description
	• *Keywords*: Operates on one or more keywords found in the user's search query. For example, a **[Keywords] [are] [password]** condition is satisfied by searches for `How do I change my password` or `password reset`. • *Query*: Operates on the user's full search query. As an example, a **[Query] [is] [password reset]** condition is satisfied by a search for `password reset`, but not by a search for `password reset steps`. • *User Context*: Operates on a user context element from the search user's ServiceNow AI Platform® session. The system displays the source table and field after the user context element name. As an example, a **[User Context - Country (sys_user.country)] [is] [Japan]** condition is satisfied when the search user's User [sys_user] record has **country** set to Japan.

Child Table form

The Child Table form enables you to enable AI Search content indexing for a child table that extends an indexed source table.

For details on creating or modifying an indexed source child table, see Create an indexed source.

Child Table form

Field	Description
Indexed Source	Reference to the indexed source. This field is automatically set.
Table	Label and name for the child table that you want to enable content indexing for. You can only select from tables that extend the indexed source table.
Active	Option to activate indexing for the child table.
Application	Application scope for the child table indexing configuration. This field is automatically set.

Custom Matcher form

The Custom Matcher form enables you to create a global search custom matcher.

For details on creating a global search custom matcher, see Create a custom search matcher for global search.

Custom Matcher form

Field	Description
Name	Unique name for the custom matcher.
Regex	Java regular expression pattern that AI Search compares search queries to. When a search query matches this regular expression pattern, the custom matcher triggers and the search only returns results from the specified **Table** and **Column**. This field is automatically set when you select **Generate Regex**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom Matcher form (continued)

Field	Description
	Note: For details on Java regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.
Table name	Table that you want to restrict search matches to when a user search satisfies the custom matcher's **Regex** regular expression pattern.
Application	Application scope for the custom matcher. This field is automatically set.
Column	Field from the specified **Table** that you want to restrict search matches to when a user search satisfies the custom matcher's **Regex** regular expression pattern.
Active	Option to activate the custom matcher. To deactivate the matcher, clear the **Active** option.

Dictionary form

The Dictionary form enables you to create a typo handling, stop word, or synonym dictionary for use in your AI Search search profiles.

For details on creating and modifying dictionaries, see Modify settings for a typo handling dictionary, Create a stop word dictionary linked to a search profile, and Create a synonym dictionary linked to a search profile.

Note: When creating a typo handling dictionary, the name of the form is shown as AI Search Dictionary instead of Dictionary.

Dictionary and AI Search Dictionary forms

Field	Description
Label	Unique label for the dictionary.
Dictionary name	Name for the dictionary. This field is automatically set based on the **Label** field value.
Language	Language for all terms defined in the dictionary. This field only displays when editing a stop word or synonym dictionary. AI Search automatically sets the language for typo handling dictionaries. **Note:** You can only link one stop word dictionary with a given language to a search profile.
Type	Dictionary type. This field is automatically set to *`Spell Check`*, *`Stop Word`*, or *`Synonym`*.
State	Current state of the dictionary. • **New**: The dictionary has never been published. • **Draft**: The dictionary is saved with unpublished changes. • **Published**: The dictionary is saved with all changes published.
Case sensitive	Option to enable case sensitivity for all terms in the dictionary. For more details on case sensitivity, see Typo handling, Stop words, or Synonyms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary and AI Search Dictionary forms (continued)

Field	Description
Punctuation sensitive	Option to enable punctuation sensitivity for all terms in the dictionary. For more details on punctuation sensitivity, see Typo handling, Stop words, or Synonyms.
Derived	Option to derive dictionary entries from indexed content. This field and the **Derive Settings** section only display when editing a typo handling dictionary.
Derive Settings	
Indexed sources	List of indexed sources. The dictionary derives auto-correction terms from content indexed for these sources. This field only displays when editing a typo handling dictionary. For more information on indexed sources, see Indexed sources in AI Search.
Auto refresh	Interval, in hours, after which derived typo handling entries automatically refresh. The minimum value is 24 hours. This field only displays when editing a typo handling dictionary.
Blocked Fields	Comma-separated list of fields. The dictionary excludes terms found in these fields when deriving typo handling auto-correction terms from indexed source records. This field only displays when editing a typo handling dictionary. You can specify fields using the following formats: • *** (asterisk): Exclude terms found in all fields. This value disables derivation of typo-handling auto-corrections for the dictionary. • *`fieldname`*: Exclude terms found in the specified AI Search index field, such as **title** or **text**. For details on AI Search index fields, see AI Search index fields. • *`tablename.fieldname`*: Exclude terms found in the specified field on the specified ServiceNow AI Platform® table. • *`tablename.*`*: Exclude terms found in all fields in the specified ServiceNow AI Platform table.

Dictionary Term form

The Dictionary Term form enables you to create a typo handling entry, a stop word, or a synonym in a dictionary linked to an AI Search search profile.

For more details on creating or modifying dictionary terms, see Exclude a term from a typo handling dictionary, Create stop words, and Create synonyms.

Dictionary Term form

Field	Description
Dictionary	Name of the dictionary that includes the typo handling, stop word, or synonym term. This field is automatically set based on the dictionary that you selected.
Term	The term or phrase to include in the typo handling, stop word, or synonym dictionary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary Term form (continued)

Field	Description
Payload	List of equivalent terms or phrases in JSON array format. For example, `["wireless network", "WLANS"]`. This field only displays when editing a synonym term.
State	Current state for the dictionary term. • **New**: The dictionary term has never been published. • **Draft**: The dictionary term is saved with unpublished changes. • **Published**: The dictionary term is saved with all changes published. This field only displays when editing a synonym term.
Active	Option to activate the term for use in the dictionary. To deactivate the term, clear the **Active** option.
Marked for Deletion	Option indicating that AI Search will delete the term the next time you publish the search profile linked to the selected dictionary. This field only displays when editing a typo handling or stop word term, and is automatically set.
Application	Application scope for the dictionary term. This field only displays when editing a typo handling or stop word term, and is automatically set.

Facet form

The Facet form enables you to create a facet refinement filter in the search application configuration for an AI Search application.

For details on creating or modifying a facet, see Create a facet in an AI Search application configuration.

Facet form

Field	Description
Name	Unique name for the facet.
Label	Label to display for the facet in the search application.
Facet Field	Comma-separated list of field names from AI Search indexed source tables. The facet displays search result refinement filters for values from one or more specified fields that are present in the current search result set. When you select a refinement filter after searching, AI Search restricts the search result set to show only results that contain the specified field value. **Note:** When you save or update a facet, AI Search verifies each facet field. To pass verification, the field must exist on at least one record that exists in a search source used by the search application. If a field doesn't satisfy this condition, the system displays an error message. Supports the following formats: **Table-specific field list** Enter a comma-separated list of qualified `[indexed_source_table_name].[field_name]` entries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Facet form (continued)

Field	Description
	AI Search displays search result refinement filters for values from the superset of the specified indexed source table fields. For example, enter `kb_knowledge.author` to display search result refinement filters for **Author** field values from the Knowledge [kb_knowledge] indexed source table. Or enter `kb_knowledge.author, sc_cat_item.owner, custom_table.author_field` to display search result refinement filters for values from all of the three specified indexed source table fields. **Note:** All fields specified in a facet field list must be of the same type. The `[indexed_source_table_name]` qualifier must be the name of a table specified in an indexed source. Don't specify indexed source child table names for this qualifier. **Cross-table field** Enter an unqualified `[field_name]` entry. AI Search displays search result refinement filters for values from the specified cross-table field. For example, enter `language` to display search result refinement filters for **Language** field values from any indexed source table. **Note:** This format only supports the `language` and `tags` cross-table fields. Special cases include: **Faceting on parent table fields** If you specify an indexed source parent table field as a facet field, AI Search includes values from the same field on child tables from the indexed source. As an example, suppose you create an indexed source for a custom Parent [u_parent] table, which is extended by a custom Child [u_child] table. If you specify `u_parent.author` as a facet field, AI Search displays search result refinement filters for both `u_parent.author` and `u_child.author` field values. **Faceting on child table fields** You can specify a field that's unique to an indexed source child table as a facet. Continuing the previous example, if your Child [u_child] table includes an **Editor** field that's not present on the Parent [u_parent] table, you can specify `u_parent.editor` as a facet to display search result refinement filters for **Editor** field values. **Note:** Be sure to specify the parent table name as the qualifier, not the child table name. **Faceting on dot-walk fields from referenced tables**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Facet form (continued)

Field	Description
	If your indexed source includes a *dot_walk_fields* field setting for a dot-walk referenced table field, you can specify that field in a facet field entry using dot-separated reference field qualifiers. Add these qualifiers between the indexed source table name and the referenced table field name. For example, to facet knowledge article search results based on the Department field values for their authors, you can define `author.department` as a *dot_walk_fields* field setting for the indexed source for the Knowledge [kb_knowledge] table and then specify `kb_knowledge.author.department` in your facet field entry. If you define `company.contact.department` as a *dot_walk_fields* field setting for the indexed source for the User [sys_user] table, you can specify `sys_user.company.contact.department` in your facet field entry. **Note:** Each dot-walk reference level imposes a performance impact on indexing. Avoid using multi-level references unless necessary. To learn about *dot_walk_fields* field settings, see Enable indexing of referenced table fields for an AI Search indexed source. Facets work best when created from fields of the following types with relatively few unique values: • Choice • Reference • String • String (Full UTF-8) • True/False
Type	Type of the facet. The facet type determines how many field values you can select as facet refinement filters and the filter logic used by the facet. Supports the following values: **Single Select** In a Single Select facet, you can only select a single field value as a facet refinement filter. When you select a field value from a Single Select, AI Search filters the search results list, displaying only results that contain your chosen field value. A Single Select facet only allows you to select field values that are found in the current result set. **Multi Select And** In a Multi Select And facet, you can select multiple field values as facet refinement filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Facet form (continued)

Field	Description
	When you select a field value from a Multi Select And facet, AI Search filters the search results list, displaying only results that contain all of the field values you've selected from the facet. A Multi Select And facet only allows you to select field values that are found in the current result set. **Multi Select Or** In a Multi Select Or facet, you can select multiple field values as facet refinement filters. When you select a field value from a Multi Select Or facet, AI Search filters the search results list, displaying only results that contain any of the field values you've selected from the facet. A Multi Select Or facet initially only allows you to select field values that are found in the current result set. All field values that are available when you make your first selection remain available for selection. As an example, suppose you have a Multi Select Or facet for a custom **Color** field with blue, green, and red field values. If your search returns only green and red results, the **Color** facet only displays **green** and **red** field values. When you select the **red** field value, AI Search keeps the **green** field value available for selection because it was available before you made any **Color** selection. ⚠ **Warning:** Applying multiple filters from a Multi Select And or Multi Select Or facet makes your search query URL longer. Test your multi-select facet configurations to ensure that search query URLs with facet filters don't exceed the maximum URL length limit for your web browser. (Different web browsers have different URL length limits.)
Facet Value Limit	Maximum number of distinct field values to display for the facet.
Order	Order of appearance for the facet in the context of the search application configuration.
Active	Option to activate the facet for the application.
Sort by	Order in which to display the facet's buckets in the search results UI. Type: Choice list Default value: Count Supported values: • *Count*: Sort facet buckets by their search result counts, going from highest count to lowest. • *Value*: Sort facet buckets by their labels in alphabetical order.

Field Setting form

The Field Setting form enables you to create a field setting for an indexed source in AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on creating or editing field settings for indexed sources, see Field settings for AI Search.

Field Setting form

Field	Description
Indexed Source	Indexed source that the field setting applies to.
Source	Specific table from the indexed source that the field setting applies to.
Attribute	Field setting to apply for the selected field on all records indexed from the selected source table. For the full set of available field settings, see List of AI Search indexed source field settings.
Application	Application scope for the field setting. This field is automatically set.
Field	Record field that the field setting operates on.
Value	Value for the specified field setting. For details on the values supported for each field setting, see List of AI Search indexed source field settings.

Indexed Source form

The Indexed Source form enables you to create an indexed source for use in AI Search.

For details on creating or modifying an indexed source, see Create an indexed source.

Indexed Source form

Title	Description
Name	Unique name for the indexed source.
Source	The ServiceNow AI Platform® table to index. AI Search excludes some ServiceNow AI Platform tables from indexing. You can't define indexed sources for these excluded tables or their derived tables. For a list of excluded tables, see ServiceNow AI Platform tables excluded from AI Search indexing. To index content from a remote table, create an external indexed source. For more details on configuring indexed sources for external content, see Indexing and searching external content in AI Search. Plugins and applications can define multiple indexed sources for the same ServiceNow AI Platform table, but only one of them can be active at a time. For more details, see *Active*.
Active	Option to activate the indexed source. AI Search only indexes content and metadata from active indexed sources. **Note:** Only one indexed source can be active at a time for a given ServiceNow AI Platform table. The system makes duplicate indexed sources for a table inactive by default. Before you can make one of these duplicate sources active, you must edit the currently active source and make it inactive. AI Search only indexes content and metadata from active indexed sources.

Indexed Source form (continued)

Title	Description
Application	Application scope for the indexed source. This field is automatically set.
Retention Policy	Policy specifying a retention time limit for records from the source table. AI Search only indexes source records that were last updated within the specified time period, and purges records from the index when their time since last update exceeds the limit. If this field is empty, AI Search indexes source records regardless of their last updated date and retains them in the index indefinitely. **Note:** This field is required when **Source** is set to the Task [task] table or any table that extends it.
Force Late Binding	Option to make AI Search use late binding security for all search results from the indexed source. This field isn't shown in the default Indexed Source form view. For instructions on configuring the form layout to show the field, see Configuring the form layout. For an explanation of late binding security and its effects on search, see Content security in AI Search.
Condition	
Filter	Optional filter conditions limiting the set of records to index from the source table. AI Search only indexes records that satisfy all defined filter conditions, and purges records from the index if they no longer satisfy these conditions.

Indexed Source Attribute form

The Indexed Source Attribute form enables you to create an indexed source attribute for an indexed source in AI Search.

For details on creating or editing indexed source attributes, see Indexed source attributes for AI Search.

Indexed Source Attribute form

Field	Description
Indexed Source	Indexed source the attribute applies to.
Attribute	Attribute to set for all records indexed from the selected source table. For the full set of indexed source attributes, see List of AI Search indexed source attributes.
Application	Application scope for the indexed source attribute. This field is automatically set.
Source	Specific table from the indexed source that the attribute applies to.
Value	Value for the specified attribute.

Indexed Source History form

The Indexed Source History form enables you to review details from the ingestion history for an AI Search indexed source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To learn how to review the ingestion history for an indexed source, see Review ingestion history for an indexed source.

Indexed Source History form

Field	Description
Indexed Source	Reference to the indexed source from which AI Search ingested records for indexing.
Ingestion Event ID	Sys_id of the ingestion event.
Partial Ingestion	Option indicating whether AI Search ingested all parent and child tables defined in the indexed source. Valid values: • *false*: AI Search ingested records from the indexed source table and all child tables configured for indexing. • *true*: AI Search only ingested records from a subset of the indexed source tables configured for indexing.
Number of Errors	Count of error messages logged for the ingestion event.
Number of Minor Errors	Count of minor error messages logged for the ingestion event.
Number of Warnings	Count of warning messages logged for the ingestion event.
Ingestion State	State for the ingestion event. Valid values: • *cancelled*: Ingestion and indexing didn't complete successfully. • *indexed*: Ingestion and indexing completed successfully. • *indexing*: Ingestion and indexing are ongoing. • *not_started*: Ingestion and indexing are pending.
Start Time	System time at which the ingestion event began.
End Time	System time at which the ingestion event completed.
Content Preparation Duration	Total time that the ServiceNow AI Platform® spent retrieving source records for the ingestion event.
Indexing Duration	Total time that AI Search spent indexing source records for the ingestion event.
Records Processed	Count of source records processed for the ingestion event.
Attachments Processed	Count of source record attachments processed for the ingestion event.
Documents Processed per Second (DPS)	Average number of source records and attachments processed per second for the ingestion event.

Source Facet Bucket form

The Source Facet Bucket form enables you to configure display settings for a source facet bucket in the search application configuration for an AI Search application.

For information on configuring source facet bucket display settings for an AI Search application, see Configure source facet buckets in an AI Search application configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source Facet Bucket form

Field	Description
Name	Name for the source facet bucket. This field is set by default to the name of the originating search source. Changing the name doesn't affect the source facet bucket's filtering behavior.
Active	Option to enable the source facet bucket. Inactive source facet buckets aren't displayed in the search application.
Order	Order of appearance for the source facet bucket in the context of the search application configuration.
Label	Label to display for the source facet bucket in the search application.
Search Context Config	Search application configuration for the source facet bucket.

Record Producer Configuration form

The Record Producer Configuration form enables you to create an AI Search Assist record producer configuration.

Record Producer Configuration form

Field	Description
Title	Title of the record producer configuration. For example, `Search Results`.
Results per page	Number of search results to display per page.
Allow expand/ collapse	Option to allow users to expand or collapse search results in this record producer configuration.
Active	Option to make this record producer configuration active for your instance.
Application	Application scope for this record producer configuration.

Rule - Action Mapping form

The Rule - Action Mapping form enables you to link a boost action to a result improvement rule in an AI Search search profile.

For information on configuring boost actions in result improvement rules, see Boost search results using a result improvement rule.

Rule - Action Mapping form

Field	Description
Label	Unique label for the boost action.
Type	Action type. This field is automatically set to **Boost Action**.
Application	Application scope for the boost action. This field is automatically set to the name of the current application.
Order	Order of evaluation for the boost action in the context of the result improvement rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rule - Action Mapping form (continued)

Field	Description
Boost Action	
Boost Type	Type of boost the action applies to search results from the selected indexed source. Supported types include: • *Boost All Documents In Indexed Source*: Applies relevancy boost to every search result from the indexed source. • *Boost By User Context (dynamic)*: Applies relevancy boost to search results from the indexed source if they include a value for the selected field that matches a field value specified in the dynamically populated user context. • *Boost By Field Match (static)*: Applies relevancy boost to search results from the indexed source if they include a value for the selected field that matches a specified static value. • *Boost By Synonym Dictionary*: Applies relevancy boost to search results from the indexed source if they include a value for the selected field that matches any synonym defined in a synonym dictionary.
Indexed Source	Reference to an indexed source. The boost action only applies to search results for records from this indexed source.
Boost Weight	Integer value that AI Search uses to alter the relevancy scores for search results affected by the boost action. Boost weights can be positive or negative. Positive boost weights increase the relevancy scores for boosted search results. Each boost weight of 1 increases a boosted search result's relevancy score by 0.1% of its original value. For example, if you set a boost weight of 100, you increase each boosted search result's relevancy by +10%, so a search result with an original relevancy score of 60 gets a final relevancy score of 66. Setting a boost weight of 1000 adds +100%, doubling the relevancy scores for boosted search results. Negative boost weights reduce the relevancy scores for boosted search results. Each boost weight of –1 reduces a boosted result's relevancy score by 0.1% of its original value. As an example, if you set a boost weight of –150, you reduce a boosted search result's relevancy by 15%, so a search result with an original relevancy score of 100 gets a final relevancy score of 85. Any boost weight of –1000 or lower reduces a boosted search result's relevancy score to 0, causing it to appear at the end of the search result list. When a single search result is affected by multiple boost actions, AI Search adds the individual boost weights together to determine the total relevancy score modifier. For example, a search result boosted by three rules with boost weights 100, 150, and –25 has a total boost weight of 225, increasing its final relevancy score by 22.5% of its original value.
When	Name of a field from the selected indexed source. This field appears only when you select **Boost By User Context (dynamic)**, **Boost By Field Match (static)**, or **Boost By Synonym Dictionary** as the boost type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rule - Action Mapping form (continued)

Field	Description
Matches the Searcher's	Dynamically populated user context element to compare with a search result's value for the field selected in the **When** field. This field appears only when you select **Boost By User Context (dynamic)** as the boost type. The choice list displays the source table and field for each user context element. As an example, the **Language** user context element is populated using the User [sys_user] table's **language** field value for the search user.
Contains	Static value to compare with a search result's value for the field selected in the **When** field. This field appears only when you select **Boost By Field Match (static)** as the boost type.
Matches A Synonym Dictionary	Synonym dictionary to check for synonyms that match a search result's value for the field selected in the **When** field. This field appears only when you select **Boost By Synonym Dictionary** as the boost type.

Search Application Configuration form

The Search Application Configuration form enables you to create a search application configuration for an AI Search application.

For details on creating or modifying a search application configuration for use with AI Search, see Create a search application configuration for AI Search.

Search Application Configuration form

Field	Description
Name	Name for the search application configuration. Type: string
Search Engine	Search engine to use in the ServiceNow AI Platform® search application that links to the search ap Type: choice list Default value: AI Search Supported values: • *AI Search*: Use AI Search as the search engine for the application. Select this search engine application has the **Enable** *AI Search* option enabled. • *Zing*: Use the Zing text indexing and search engine as the search engine for the application. Se search application has the **Enable AI Search** option disabled, or if it lacks this option. **Note:** If your search engine selection conflicts with your search application's **Enable** *AI Se* system displays an error message. Before changing search engines, first make sure that your the proper **Enable** *AI Search* setting.
Search Profile	Search profile to use for searches in the application. This field appears only when you select **AI Se** application's search engine. Type: reference to a record from the Search Profile [ais_search_profile] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Application Configuration form (continued)

Field	Description
Search Results Limit	Maximum number of search results the application should display on each search results page. This limit also specifies the minimum number of search results each query should return. When a s less than this number of results, AI Search attempts to broaden the result set by automatically resu modified parameters. For more details on query resubmission, see Automatic search query resubr Type: integer Default value: 10 Supported values: 0 or positive
Genius Results Limit	Maximum number of Genius Result answer cards the application should display on the search res appears only when you select **AI Search** as the application's search engine. Type: integer Supported values: 0 or positive When **Genius Results Limit** is set to 2 or greater and a search returns multiple Genius Result answ display in a carousel. You can scroll the carousel and select the answer card you want to take actio **Note:** Search applications display a maximum of 10 answer cards per search query. If you se the search application still displays a maximum of 10 answer cards. Starting with version 6 of ServiceNow Otto for AI Search, installing ServiceNow® Otto for AI Search field default to 10 instead of 1 when you create a search application configuration or edit an existin
Attachment Limit	Maximum number of grouped attachments to display by default on a parent search result when at specified in **Show parent for results that are attachments**. Attachments beyond this limit are hidden by default and only shown when you select **Show more** result's attachments list. Type: integer Default value: 5 Supported values: 0 or positive
Enable Typo Handling	Option to auto-correct search query terms to match terms found in the search profile's typo handli appears only when you select **AI Search** as the application's search engine. For more details on typo handling auto-correction configuration and behavior, see Typo handling. Type: true | false Supported values: • *true*: Auto-correct search query terms in the search application. • *false*: Don't auto-correct search query terms in the search application.
Enable Exact Match	Option to use exact matching in the search application. When this option is selected, if a search result's **Number** field exactly matches the search, the app record or document associated with that search result, bypassing the search results page. Exact m any custom matchers defined for the search application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Application Configuration form (continued)

Field	Description
	Important: Exact match is not supported in portals. If you enable this option for a portal, us portal may experience navigation issues. Exact match behavior is controlled by the *com.snc.agent_workspace.global_search.typeahead.exact_match_reques* system property. This property's value is a Java regular expression pattern. Only search queries th expression pattern are evaluated as possible exact record matches. For details on Java regular ex see the Javadoc for the java.regex.util.Pattern class. Type: true | false Default value: true Supported values: • *true*: Use exact matching in the search application. • *false*: Don't use exact matching in the search application.
Show parent for results that are attachments	Option to display attachment search results inline with their parent results on the search applicati cleared, attachment search results display separately from their parent results. For more details on the effects of attachment grouping, see Grouping attachment search results w results. Type: true | false Default value: true Supported values: • *true*: Group attachment search results inline with their parent results in the search application • *false*: Display attachment search results separately from their parent results in the search app
Filter Genius Results by tab	Option to filter Genius Result searches based on the selected source facet bucket. In a search application that has this option enabled, when you select a source from the applicatio Result searches honor the source filter and so can only return results from the selected source. Th Genius Result configurations that include information from the selected source can generate Geni the search application. Genius Result configurations that don't include information from the select any search results and thus can't generate Genius Result answers. As an example, suppose you select the Knowledge source facet bucket in a search application tha selected. With that Knowledge source selection applied, Q&A Genius Results, which include infor Knowledge source, can still find search results and generate Genius Result answers. But Catalog I which include information from the Catalog Item source which isn't selected, can't find search resu generate Genius Result answers. **Note:** The Summary Genius Results configuration (from the ServiceNow Otto for AI Search S application) includes information from multiple sources, so it can generate Genius Result answ source is selected. To learn more about Summary Genius Results, see Summary Genius Resu
Show Search Results Count	Option to display search result counts for facets on the search application's results page. For more details on this option, see Show search result counts for facets on the results page for a Type: true | false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Application Configuration form (continued)

Field	Description
	Default value: true Supported values: • *true*: Display search result counts for facets on the search application's results page. • *false*: Don't display search result counts for facets on the search application's results page.

Search Profile form

The Search Profile form enables you to create a search profile for use in AI Search applications.

For details on creating or editing search profiles, see Create a search profile.

Search Profile form

Field	Description
Label	Label for the search profile.
Description	Text description for the search profile.
Application	Application scope for the search profile. This field is automatically set.
Updated	Last update date for the search profile. This field is automatically set.
Updated by	User who most recently updated the search profile. This field is automatically set.
Active	Option to activate the search profile.
State	State of the search profile. • **New**: The search profile has never been published. • **Draft**: The search profile is saved with unpublished changes. • **Published**: The search profile is saved with all changes published.

Search Profile - Dictionary Mapping form

The Search Profile - Dictionary Mapping form enables you to link a stop word or synonym dictionary to a search profile in AI Search.

For details on linking stop word and synonym dictionaries to your search profiles, see Link a stop word dictionary to a search profile and Link a synonym dictionary to a search profile.

AI Search Profile Dictionary M2M form

Field	Description
Dictionary	The stop word or synonym dictionary that you want to link to the selected search profile.
Application	Application scope for the dictionary mapping record. This field is automatically set.
Profile	The search profile that you want to link the selected stop word or synonym dictionary to. This field is automatically set to the profile that you edited.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Profile - Genius Result Mapping form

The Search Profile - Genius Result Mapping form enables you to link a Genius Result configuration to a search profile in AI Search.

For details on linking Genius Result configurations to your search profiles, see Link a Genius Result configuration to a search profile.

Search Profile - Genius Result Mapping form

Field	Description
Profile	The search profile to link the Genius Result configuration to. This field is automatically set to the profile that you edited.
Genius Result Configuration	The Genius Result configuration to link to the specified search profile.
Order	Order of evaluation for the Genius Result configuration in the context of the search profile.
Application	Application scope for the Genius Result configuration mapping record. This field is automatically set.

Search Profile - Search Source Mapping form

The Search Profile - Search Source Mapping form enables you to link a search source to a search profile in AI Search.

For details on linking search sources to your search profiles, see Link a search source to a search profile.

Search Profile - Search Source Mapping form

Field	Description
Profile	The search profile that you want to link the search source to. This field is automatically set to the profile that you edited.
Search source	The search source that you want to link to the specified search profile.
Exclude in Regular Search	Option to exclude content from this search source when generating standard search results for searches that use the selected search profile.
Application	Application scope for the search source mapping record. This field is automatically set.
Exclude in Now Assist Genius Results	Option to exclude content from this search source when generating Genius Result answers for searches that use the selected search profile. This option applies to all Genius Results, not just ServiceNow Otto Genius Results.
Exclude Attachments in Now Assist Genius Results	Option to exclude attachments from this search source when generating Genius Result answers for searches that use the selected search profile. If *`Exclude in ServiceNow Otto Genius Results`* is not selected, selecting this option has no effect. This option applies to all Genius Results, not just ServiceNow Otto Genius Results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Profile - Search Source Mapping form (continued)

Field	Description
	Note: Selecting this option has no effect on search sources created from external indexed sources (those that index external content). It only affects search sources created from internal indexed sources (those that index content from ServiceNow AI Platform® tables).

Search Scripted Post-processors form

The Search Scripted Post-processors form enables you to create a search scripted post-processor in the search application configuration for an AI Search application.

For details on creating or editing search scripted post-processors, see Using search scripted post-processors in AI Search application configurations.

Search Scripted Post-processors form

Field	Description
Active	Option to activate the search script post-processor.
Name	Name for the search script post-processor.
Application	Application scope for the search script post-processor. This field is automatically set.
Type	Type of record the search script post-processor operates on. Valid values: • *Genius Result*: Script operates on a Genius Result answer record. • *Search Result*: Script operates on a search result record.

Post processing script	Server-side script function that takes a record object as its parameter. When the search scripted post-processor is linked to a search application configuration, search results reflect changes made to the record object in this script function.
	As an example, this post-processing script function operates on search results from the kb_knowledge table, transforming sys_updated_on date field values into a human-readable format:
	`function process(record) {`
	`  var transformableTables = ['kb_knowledge'];`
	`  var transformableDateFields = ['sys_updated_on'];`
	`  var table = record.getTable();`
	`  // Terminate early if possible, to avoid unnecessary overhead`
	`  if (transformableTables.indexOf(table) === -1)`
	`  return;`
	`  function transformToHumanFriendlyDate(rawDate) {`
	`  // Time gaps in ms`
	`  var MINUTE_GAP = 60000;`
	`  var HOUR_GAP = 3600000;`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Scripted Post-processors form (continued)

Field	Description

```
        var DAY_GAP = 86400000;
        var WEEK_GAP = 604800000;
        var MONTH_GAP = 2592000000;
        var YEAR_GAP = 31536000000;

        var gap = new Date().getTime() - rawDate;
        if (gap < MINUTE_GAP) {
            return gs.getMessage('Just Now');
        } else if (gap > MINUTE_GAP && gap < 2 *
MINUTE_GAP) {
            return gs.getMessage('1 minute ago');
        } else if (gap < HOUR_GAP) {
            return gs.getMessage('{0} minutes ago', ''
+ Math.floor(gap / MINUTE_GAP));
        } else if (gap > HOUR_GAP && gap < 2 *
HOUR_GAP) {
            return gs.getMessage('1 hour ago');
        } else if (gap < DAY_GAP) {
            return gs.getMessage('{0} hours ago', '' +
Math.floor(gap / HOUR_GAP));
        } else if (gap > DAY_GAP && gap < 2 * DAY_GAP)
{
            return gs.getMessage('1 day ago');
        } else if (gap < WEEK_GAP) {
            return gs.getMessage('{0} days ago', '' +
Math.floor(gap / DAY_GAP));
        } else if (gap > WEEK_GAP && gap < 2 *
WEEK_GAP) {
            return gs.getMessage('1 week ago');
        } else if (gap < MONTH_GAP) {
            return gs.getMessage('{0} weeks ago', '' +
Math.floor(gap / WEEK_GAP));
        } else if (gap > MONTH_GAP && gap < 2 *
MONTH_GAP) {
            return gs.getMessage('1 month ago');
        } else if (gap < YEAR_GAP) {
            return gs.getMessage('{0} months ago', ''
+ Math.floor(gap / MONTH_GAP));
        } else if (gap > YEAR_GAP && gap < 2 *
YEAR_GAP) {
            return gs.getMessage('1 year ago');
        } else {
            return gs.getMessage('{0} years ago', '' +
Math.floor(gap / YEAR_GAP));
        }
    }

    for (var i = 0; i <
transformableDateFields.length; i++) {
        var fieldName = transformableDateFields[i];
        var updatedDateField =
record.getField(fieldName);
        if (updatedDateField !== null) {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Scripted Post-processors form (continued)

Field	Description

	``
	            var updatedDateRaw =
	updatedDateField.getValue();
	            if (updatedDateRaw != null) {
	                var humanFriendlyDate =
	transformToHumanFriendlyDate(updatedDateRaw);
	
	updatedDateField.setDisplayValue(humanFriendlyDate);
	            }
	        }
	    }
	}
	``
	
	Note: The UI displays an overview of API methods usable in the post-processing script function.
	
	You can copy code from an existing post-processor script to use as a starting point for your own script function. To access existing post-processor scripts, open the Search Scripted Post-processors [sys_search_scripted_processor] table in list view by following these steps:
	
	1. Select **All**.
	
	2. In the Filter field, enter `sys_search_scripted_processor.list`.
	
	3. Press Enter.

Search Source form

The Search Source form enables you to create a search source that you can make available in AI Search user search experiences.

For details on creating or editing search sources, see Create a search source for AI Search.

AI Search Source form

Field	Description
Name	Name for the search source.
Indexed source	Reference to an indexed source. For more details on indexed sources, see Indexed sources in AI Search.
Conditions	Set of filter conditions that documents from the indexed source must meet to be included in the search source. For more details on filter conditions, see Filters.

Semantic Index Configuration form

The Semantic Index Configuration form enables you to define semantic indexing settings for an AI Search indexed source.

For details on defining and modifying semantic indexing settings for an indexed source, see Configure semantic indexing settings for an indexed source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This form is only available when the AI Search Semantic Controller plugin (com.glide.ais.semantic_search) is active on your instance. To activate this plugin, your instance must have at least one ServiceNow Otto® application installed.

Semantic Index Configuration form

Field	Description
Name	Unique name for the semantic index generated by this semantic index configuration. As an example, if you're creating a semantic index configuration for the Knowledge Table indexed source, you might name it `Knowledge-Table-semantic-index`. **Note:** The semantic index's name can't contain special characters, underscores, or whitespace.
Embedding Models	List of embedding models to use for the semantic index configuration. • Default value: *`ServiceNow Embedding (E5)`* • Supported values: ○ *`ServiceNow Embedding (E5)`*: Use the E5 fine-tuned embedding model for content in the semantic index. The embedding model's encoder limit is 512 terms. ○ Azure OpenAI Embedding: Use the Azure OpenAI fine-tuned embedding model for content in the semantic index. For more information, see Configuring your embedding model. ○ Google Gemini Embedding: Use the Google Gemini fine-tuned embedding model for content in the semantic index. For more information, see Configuring your embedding model. ○ Custom Embedding: Use the custom fine-tuned embedding model for content in the semantic index. For more information, see Configuring bring your own model (BYOM).
Active	Option to make the semantic index configuration active for your instance. AI Search ignores inactive semantic index configurations when indexing content from the specified index source.
Indexed Source	Reference to the AI Search indexed source that you want to apply this semantic index configuration to. This field is automatically set. For more details on indexed sources, see Indexed sources in AI Search.
Application	Application scope for the semantic index configuration record. This field is automatically set.
Chunking Configuration For Embedding	
Chunking Strategy	Strategy to use when chunking semantically indexed text for the embedding model. • Default value: *`Passage`* • Supported values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Semantic Index Configuration form (continued)

Field	Description
	○ *Passage*: Chunking strategy for longer text field values. Index text from semantic field values in chunks. Each chunk contains a maximum number of words or sentences determined by your *Chunk Unit* and *Chunk Size* selections. ○ *Truncate*: Chunking strategy for short text field values. Concatenate all semantic index field values, then perform semantic indexing for terms up to the *Maximum Total Words* limit. ○ *Full Text*: Chunking strategy for short text field values. Concatenate all semantic index fields, then perform semantic indexing for all terms up to the embedding model's encoder limit. • Type: choice list
Overlap Sentences	Number of sentences to overlap between chunks when indexing text from semantic index field values. Higher overlap values increase recall for semantic vector search at the expense of performance. This field appears only when *Passage* is selected from *Chunking Strategy*. • Default value: 5 • Supported values: Any non-negative integer • Type: integer
Chunk Unit	Textual unit to use as the basis for chunk size when indexing semantic field values for semantic vector search. This field appears only when *Passage* is selected from *Chunking Strategy*. • Default value: *Words* • Supported values: ○ *Words*: Use words as the textual unit by which semantic index field values are chunked. Each chunk can include up to *Chunk Size* words. ○ *Sentences*: Use sentences as the textual unit by which semantic index field values are chunked. Each chunk can include up to *Chunk Size* sentences. • Type: choice list
Chunk Size	Maximum number of words or sentences (depending on your *Chunk Unit* selection) to include in a chunk when indexing semantic field values for semantic vector search. This field appears only when *Passage* is selected from *Chunking Strategy*. • Default value: 250 when *Words* is selected from *Chunk Unit*, or 15 when *Sentences* is selected from *Chunk Unit* • Supported values: Any non-negative integer • Type: integer
Maximum Total Words	Maximum number of words to index for semantic vector search from the concatenated values of all semantic index fields.

Semantic Index Configuration form (continued)

Field	Description
	This field appears only when *Truncate* is selected from *Chunking Strategy*. • Default value: 500 • Supported values: Any non-negative integer • Type: integer

Semantic Index Field form

The Semantic Index Field form enables you to define a semantic index field for use in an AI Search semantic index configuration.

To learn about defining and modifying semantic indexing settings for an indexed source, see Configure semantic indexing settings for an indexed source. For details on semantic index configuration fields, see Semantic Index Configuration form.

Note: This form is only available when the AI Search Semantic Controller plugin (com.glide.ais.semantic_search) is active on your instance. To activate this plugin, your instance must have at least one ServiceNow Otto® application installed.

Semantic Index Field form

Field	Description
Semantic Index Name	The name of the semantic index defined in the semantic index field's parent semantic index configuration. This field is automatically set.
Source	ServiceNow AI Platform® source table whose value you want to include in the semantic index.
Type	Type of object to index for semantic vector search. • Default value: *Field* • Supported values: ○ *Field*: Field from the ServiceNow AI Platform source table specified by your *Source* selection. ○ *Attachment*: Attachments from the ServiceNow AI Platform source table specified by your *Source* selection. • Type: choice list
Application	Application scope for the semantic index field record. This field is automatically set.
Order	Order of concatenation for this field's value relative to the values of other semantic index fields defined in the same semantic index configuration. Fields with lower values appear first in the concatenation. This field's value is only meaningful when *Truncate* or *Full Text* is selected from *Chunking Strategy* for the semantic index field's parent semantic index configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Semantic Index Field form (continued)

Field	Description
	• Supported values: Any positive integer • Type: integer
Field	Name of the source table field to include in the semantic index. This field's value will be handled according to the parent semantic index configuration's specified *Chunking configuration for embedding* settings. This field is automatically set to *attachment_body* when *Attachment* is selected from *Type*.

Sort Option form

The Sort Option form enables you to create a search result sort option in the search application configuration for an AI Search application.

For details on creating or editing search result sort options, see Search result sort options in AI Search application configurations.

Sort Option form

Field	Description
Label	Label displayed for the search result sort option in the search application's sort menu.
Sort Field	Name of a source table field or common index field that the sort option uses to sort search results. The sort field can be a date, number, or string field. **Note:** If you specify a sort field of an unsupported type, an error message appears when you attempt to save the sort option. Supports the following formats: **Qualified `[indexed_source_table_name].[field_name]` entry** Sort search results on their values from the specified table's field. For example, enter `kb_knowledge.author` to sort search results by their Author field values. **Note:** The parent search application configuration's linked search profile must include a search source derived from the specified indexed source table. If this condition isn't met, an error message appears when you attempt to save the sort option. **Unqualified common index field name** Sort search results on their values from the specified common AI Search index field. For example, enter `title` to sort search results based on their titles, or `language` to sort search results based on their language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sort Option form (continued)

Field	Description
	The `[indexed_source_table_name]` qualifier must be the name of a table specified in an indexed source. Don't specify indexed source child table names for this qualifier. Special cases include: **Sorting on parent table fields** If you specify an indexed source parent table's field in a sort option, AI Search includes values from the same field on child tables from the indexed source. For example, suppose you create an indexed source for custom table Parent [u_parent] which is extended by custom table Child [u_child], and then specify `u_parent.author` as the field for a sort option. When a user applies the sort option, AI Search uses both `u_parent.author` and `u_child.author` field values to sort the search result list. **Sorting on child table fields** You can specify a field that's unique to an indexed source's child table as a sort option field. Continuing the previous example, if your Child [u_child] table includes an **Editor** field that's not present on the Parent [u_parent] table, you can define `u_parent.editor` as a sort option field to sort search result s using this field's values. **Note:** Be sure to specify the parent table's name as the qualifier, not the child table's name.
Application	Application scope for the search result sort option. This field is automatically set.
Ascending	Option to make the search result sort option display results in ascending order (a to z). Clear this option to make the search result sort option display results in descending order (z to a).
Active	Option to activate the search result sort option for use in the search application.

Suggestion Reader Group form

The Suggestion Reader Group form enables you to modify settings for an auto-complete suggestion type in the search application configuration for an AI Search application.

For details on configuring auto-complete suggestions in AI Search applications, see Auto-complete suggestions in AI Search applications.

Suggestion Reader Group form

Field	Description
Suggestion Type	Application-specific name for the auto-complete suggestion type. This field is automatically set.
Section Header	Header displayed in the application search field for auto-complete suggestions of this type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Suggestion Reader Group form (continued)

Field	Description
Application	Application scope for the auto-complete suggestion type. This field is automatically set.
Order	Order of appearance in the application search field for the section containing auto-complete suggestions of this type. The system uses this field to determine display order when a search application configuration includes multiple suggestion types with the same **Click-in Mode** setting.
Suggestion Limit	Maximum number of auto-complete suggestions of this type that the application should display in the search field.
Click-in Mode	Option to control the display of the section containing auto-complete suggestions of this type. • If selected, auto-complete suggestions of this type are displayed when the user first selects the empty application search field. • If deselected, auto-complete suggestions of this type are displayed as the user enters search query terms into the application search field. **Note:** A search application configuration can't link to multiple search suggestion types that include the same reader and have the same click-in mode. If you try to link a second suggestion type with the same reader and click-in mode to a search application configuration, the system displays an error message.

Extending AI Search with ServiceNow Store applications and integrations

Applications and integrations from the ServiceNow® Store extend AI Search functionality and provide insight into search usage and behavior.

AI Search spoke

This Integration Hub spoke enables storage of document data from third-party applications in the AI Search index using Workflow Studio. Users can access the indexed data through portals that have AI Search enabled.

Platform Analytics Solution for Advanced AI Search Management Tools

This Platform Analytics Solution helps AI Search administrators analyze search query traffic trends, review indexed record and configuration settings, and preview search query results.

AI Search for Next Experience

The AI Search for Next Experience ServiceNow® Store application enables administrators to configure AI Search as the search engine for Unified Navigation searches in Next Experience, including global search and configurable workspace search.

ServiceNow Otto for AI Search

The ServiceNow Otto for AI Search ServiceNow® Store application combines the power of search with a large language model (LLM) to answer questions in user searches with actionable AI-generated summaries of relevant knowledge articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search for Next Experience

This ServiceNow® Store application enables administrators to configure AI Search as the search engine for Unified Navigation searches in Next Experience, including global search and configurable workspace search.

AI Search for Next Experience is automatically installed and enabled in the Brazil release, so you don't need to perform the initial migration and enablement configuration steps. To add new Unified Navigation workspace search configurations later, see Add a new Unified Navigation workspace search configuration to AI Search for Next Experience.

To learn about how global search and configurable workspace search work when AI Search for Next Experience is enabled, see Using global search with AI Search for Next Experience.

Install AI Search for Next Experience

Install the AI Search for Next Experience application from the ServiceNow® Store.

Before you begin

If your instance was zBooted in Brazil, the AI Search for Next Experience application is already installed. You only need to install the application if you upgraded your instance from Tokyo or a previous release.

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AI Search for Next Experience application (sn_aisearch_global) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. Select **Install**.

What to do next

With the plugin installed, you can walk through Guided Setup tasks to enable AI Search as the search engine for the Unified Navigation search field in Next Experience. To get started with Guided Setup, see Verify that your instance meets the prerequisites for AI Search for Next Experience.

Configuring AI Search for Next Experience

Use a Guided Setup module to step through configuration of search application settings and enablement of AI Search for Next Experience on your instance.

The *Guided Setup* **for Zing to** *AI Search* **Migration** module walks you through the following configuration steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Verifying that your instance satisfies the prerequisites for AI Search for Next Experience.
2. Migrating your existing Zing search application configurations for use with AI Search.
3. Enabling AI Search for Next Experience on your instance. This step makes AI Search the search engine for global and workspace searches in the Unified Navigation search field.

After you've enabled AI Search for Next Experience, you can use the Guided Setup module at any time to perform either of these tasks:

- Enable AI Search for a newly installed workspace by adding its search application configuration into AI Search for Next Experience.
- Revert to using Zing as the search engine for the Unified Navigation search field by disabling AI Search for Next Experience.

Verify that your instance meets the prerequisites for AI Search for Next Experience

Walk through Guided Setup tasks to confirm that your instance meets the requirements for AI Search for Next Experience.

Before you begin

The AI Search for Next Experience ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install AI Search for Next Experience.

Role required: ais_admin

About this task

The **Prerequisites** Guided Setup tasks walk you through verifying that your instance can use AI Search for Next Experience. Complete these tasks before you begin migrating your Zing search application configurations.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **for** *Next Experience* > *Guided Setup* **for Zing to** *AI Search* **Migration**.
2. Select **Get Started**.
3. In the **Prerequisites** category, select **Get Started**.
4. Confirm that AI Search is provisioned and enabled on your instance.

   a. In the **Confirm that** *AI Search* **is enabled** task, select **Configure**.
   A modal window reports whether AI Search is provisioned and enabled on your instance.

   b. If the window reports *AI Search* **is ready**, select **Close**, then select **Mark as Complete** for the **Confirm that** *AI Search* **is enabled** task.

   c. If the window reports any other status, select **Close**, then repeat this task after AI Search is provisioned and enabled on your instance.

5. Confirm that Next Experience is enabled on your instance.

   a. In the **Confirm that** *Next Experience* **is Enabled** task, select **Configure**.
   A modal window reports whether Next Experience is enabled on your instance.

   b. If the system reports *Next Experience* **is enabled**, select **Close**, then select **Mark as Complete** for the **Confirm that** *Next Experience* **is Enabled** task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. If the system reports any other enablement status, ask your administrator to enable Next Experience on your instance, then repeat this task after it's enabled.

   For details on enabling Next Experience, see Enable Next Experience.

6. Index content and metadata for AI Search indexed sources used in global search.

   a. In the **Index searchable content and metadata for global search sources** task, select **Configure**.
   The AI Search Indexed Sources list opens in a new browser tab.

   b. Select all indexed sources marked with the alert triangle icon ⚠, then index their content by selecting **Actions on selected rows...** > **Index All Tables**.

   For more information on indexing tables from multiple indexed sources, see Perform a full table index or reindex for multiple AI Search indexed sources.

   c. When indexing is complete, close the browser tab and return to the **Prerequisites** Guided Setup category tab.

   d. Select **Mark as Complete** for the **Index searchable content and metadata for global search sources** task.

7. When all three **Prerequisites** tasks are marked as complete, select the Back icon < to return to the top-level *Guided Setup* **for Zing to** *AI Search* **Migration** page.

What to do next

Now that you've satisfied the prerequisites, it's time to migrate your existing Zing search application configurations for use with AI Search. For details on this procedure, see Migrate Zing search application configurations to AI Search.

Migrate Zing search application configurations to AI Search

Walk through a Guided Setup task to migrate your existing Zing search application configurations to AI Search application configurations.

Before you begin

The AI Search for Next Experience ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install AI Search for Next Experience.

You must have already completed the **Prerequisites** Guided Setup tasks. For details on completing these tasks, see Verify that your instance meets the prerequisites for AI Search for Next Experience.

Role required: ais_admin

About this task

The base system includes Zing search application configurations for global search and some workspaces. To use AI Search for Next Experience, you need AI Search configurations for these search applications.

You can create the new AI Search application configurations you need by migrating settings from your existing Zing search application configurations. The **Convert Zing search applications** Guided Setup task walks you through this procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When you migrate a Zing search application configuration, the system creates a new search application configuration for use with AI Search. This procedure doesn't delete or change your original Zing search application configuration.

Migration of a Zing search application configuration to AI Search includes these steps:

1. The migration tool analyzes your selected Zing search application configuration and determines what record changes in ServiceNow AI Platform® tables are needed to replicate its settings in a new AI Search application configuration.
2. You accept the proposed migration changes for review, and then commit them to make the required record changes in ServiceNow AI Platform tables.
3. You index content and metadata from any new indexed sources that the migration job created.

For more information on AI Search application configurations, see Search application configurations. To learn more about indexing content and metadata from AI Search indexed sources, see Indexed sources in AI Search.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **for** *Next Experience* > *Guided Setup* **for Zing to** *AI Search* **Migration**.
2. In the **Convert Zing search applications** category, select **Get Started**.
3. In the **Migrate settings for a** *Next Experience* **search application** task, open the Zing to AI Search Migration Job form by selecting **Configure**.
   A modal window shows a list of Zing search application configurations and their migration status. Custom search application names are only translated to your session language if you've created appropriate Message [sys_ui_message] table records for them. For details on translating message strings by creating Message table records, see Translate a client script message.
4. Close the modal list of Zing search application configurations.

   Note: You can reopen the list of Zing search application configurations at any time by selecting the **View Search Application Migration Status** related link.

5. For each Zing search application configuration with **Needs migration** status, migrate the search application configuration to AI Search.

   a. In the **Search Application Configuration** field, use the Lookup using list icon to select the Zing search application configuration that you want to migrate to AI Search.

      Note: Only Zing search application configurations with **Needs migration** status are available for selection. Application configurations with **Migrated** status already have corresponding AI Search application configurations.

   b. **Optional:** To have the system send email notifications to users when indexing of content for the migration job starts and completes, add those users to the watch list.

      Note: The system automatically adds the current user to the watch list when a migration job is created or updated.

   c. Select **Start Migration**.
      The migration tool converts the Zing search application configuration for use with AI Search, and the migration job's state changes from **Pending Conversion** to **Configuration Converted**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Accept All Changes**.
The system displays proposed changes to system tables in the Changes to Review related list.

e. Select **Commit Changes**.
The system commits the changes to system tables shown in the Changes to Review related list, and the migration job's state changes to **Configuration Committed**.

f. Select **Index Searchable Content**.
AI Search indexes content and metadata for new indexed sources created by the migration job. When indexing completes, the job's state changes to **Indexing Complete** and the modal window with the list of Zing search application configurations reopens.

6. When all Zing search application configurations in the modal list show **Migrated** status, close the browser tab and return to the **Convert Zing search applications** Guided Setup category tab, then select the Back icon < to return to the top-level *Guided Setup* **for Zing to** *AI Search* **Migration** page.

What to do next

Now that you've got AI Search application configurations for global search and your workspaces, it's time to enable AI Search for Next Experience on your instance. For details on this procedure, see Enable AI Search for Next Experience.

Enable AI Search for Next Experience

Walk through a Guided Setup task to configure AI Search as the search engine for global and workspace searches from the Unified Navigation search field.

Before you begin

The AI Search for Next Experience ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install AI Search for Next Experience.

You must have already completed the **Convert Zing search applications** Guided Setup task. For details on completing this task, see Migrate Zing search application configurations to AI Search.

Role required: ais_admin

About this task

The **Activate** *AI Search* **for all** *Next Experience* **search applications** Guided Setup task walks you through enabling the AI Search for Next Experience application.

After you enable the application, Next Experience search applications use AI Search instead of Zing. Each search application uses the specific settings defined in its search application configuration.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **for** *Next Experience* > *Guided Setup* **for Zing to** *AI Search* **Migration**.
2. In the **Complete migration to** *AI Search* category, select **Get Started**.
3. In the **Activate** *AI Search* **for all** *Next Experience* **search applications** task, select **Configure**.
A modal window reports whether AI Search for Next Experience is enabled on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If the system reports *AI Search* **for** *Next Experience* **is disabled**, select **Enable** *AI Search* **for** *Next Experience*.

   Note: If AI Search for Next Experience is already enabled, ensure that all migrated search application configurations are activated by disabling the application and then re-enabling it.

5. When the system reports *AI Search* **for** *Next Experience* **is enabled**, select **Close**, then select **Mark as Complete** for the **Activate** *AI Search* **for all** *Next Experience* **search applications** task.

Result
The system uses AI Search as the search engine for global search and Next Experience workspace application searches issued from the Unified Navigation search field.

What to do next
Notify all users of your instance about the following details.

- Users need to log out and back in before they can use AI Search for Next Experience.
- After you enable AI Search for Next Experience, only workspace applications that use AI Search as their search engine appear in the Unified Navigation search context menu. To search from workspace applications that use the Zing text indexing and search engine, you must navigate to the workspace instead of using the Unified Navigation search context menu.

Add a new Unified Navigation workspace search configuration to AI Search for Next Experience

Enable Unified Navigation search for newly installed workspaces in AI Search for Next Experience.

Before you begin
The AI Search for Next Experience ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install AI Search for Next Experience.

You must have already enabled AI Search for Next Experience on your instance. For details on this procedure, see Enable AI Search for Next Experience.

Role required: ais_admin

About this task
When a new workspace application that includes a search application configuration is installed on your instance, you can enable search for the workspace in AI Search for Next Experience by following this procedure.

Procedure
1. Navigate to **All** > *AI Search* > *AI Search* **for** *Next Experience* > *Guided Setup* **for Zing to** *AI Search* **Migration**.
2. In the **Post-Migration Actions** category, select **Get Started**.
3. In the **When a new** *Next Experience* **workspace has been added to your instance** task, open the Zing to AI Search Migration Job form by selecting the **migration tool** link.
   A modal window shows a list of Zing search application configurations and their migration status.
4. If the new workspace's search application configuration shows **Migrated** status, reindex its associated content and publish its search profiles and dictionaries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Repeat the **Index searchable content and metadata for global search sources** task in the **Prerequisites** Guided Setup category.
For details on this procedure, see Verify that your instance meets the prerequisites for AI Search for Next Experience.

b. Publish all search profiles and dictionaries provided by the new workspace.
To learn how to publish search profiles, see Publish an AI Search search profile. For details on publishing stop word and synonym dictionaries, see Create stop words and Create synonyms.

5. If the new workspace's search application configuration shows **Needs migration** status, migrate it for use with AI Search.

a. Close the modal window.

> **Note:** You can reopen the list of Zing search application configurations at any time by selecting the **View Search Application Migration Status** related link.

b. In the **Search Application Configuration** field, use the Lookup using list icon to select the new Zing search application configuration.

> **Note:** Only Zing search application configurations with **Needs migration** status are available for selection. Application configurations with **Migrated** status already have corresponding AI Search application configurations.

c. **Optional:** To have the system send email notifications to users when indexing of content for the migration job starts and completes, add those users to the watch list.

> **Note:** The system automatically adds the current user to the watch list when a migration job is created or updated.

d. Select **Start Migration**.
The migration tool converts the Zing search application configuration for use with AI Search, and the migration job's state changes from **Pending Conversion** to **Configuration Converted**.

e. Select **Accept All Changes**.
The system displays proposed changes to system tables in the Changes to Review related list.

f. Select **Commit Changes**.
The system commits the changes to system tables shown in the Changes to Review related list, and the migration job's state changes to **Configuration Committed**.

g. Select **Index Searchable Content**.
AI Search indexes content and metadata for new indexed sources created by the migration job. When indexing completes, the job's state changes to **Indexing Complete** and the modal window with the list of Zing search application configurations reopens.

6. Refresh the list of search application configurations included in AI Search for Next Experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > *AI Search* > *AI Search* **for** *Next Experience* > *Guided Setup* **for Zing to** *AI Search* **Migration**.

b. In the **Complete migration to** *AI Search* category, select **Edit**.

c. In the **Activate** *AI Search* **for all** *Next Experience* **search applications** task, select **Configure**.
A modal window reports whether AI Search for Next Experience is enabled on your instance.

d. Select **Refresh** *AI Search* **for** *Next Experience*.

Result
AI Search for Next Experience updates to include the new workspace application's search application configurations. The system uses AI Search as the search engine for workspace searches from the Unified Navigation search field.

What to do next
Notify all users of your instance that they need to log out and back in before they can use the new workspace search in AI Search for Next Experience.

Revert to Zing as the Unified Navigation search engine

Revert to using Zing text indexing and search engine for the Unified Navigation search field in Next Experience.

Before you begin
The AI Search for Next Experience ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install AI Search for Next Experience.

Role required: ais_admin

About this task
You can undo the configuration changes you made to enable AI Search for Next Experience. This may be for either of the following reasons:

- You prefer to use Zing text indexing and search engine for Unified Navigation in Next Experience.
- You plan to disable Next Experience and revert to the legacy UI. (The legacy UI only supports the Zing engine for global search and workspace search.)

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **for** *Next Experience* > *Guided Setup* **for Zing to** *AI Search* **Migration**.
2. In the **Complete migration to** *AI Search* category, select **Edit**.
3. In the **Activate** *AI Search* **for all** *Next Experience* **search applications** task, select **Configure**.
   A modal window reports the enablement status of AI Search for Next Experience on your instance.
4. If the system reports *AI Search* **for** *Next Experience* **is enabled**, select **Disable** *AI Search* **for** *Next Experience*.
5. When the system reports *AI Search* **for** *Next Experience* **is disabled**, select **Close**, then select **Mark as Incomplete** for the **Activate** *AI Search* **for all** *Next Experience* **search applications** task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The system reverts to using Zing as the search engine for global search and Next Experience workspace application searches issued from the Unified Navigation search field.

What to do next
Notify all users of your instance that they need to log out and back in before they can use Zing search in the Unified Navigation search field.

Repair AI Search for Next Experience after activating a new ServiceNow AI Platform® language

Install translated search UI element labels for a newly activated ServiceNow AI Platform language by repairing the AI Search for Next Experience application.

Before you begin
You must have activated a new ServiceNow AI Platform language plugin after AI Search for Next Experience was installed in your instance. For details on activating language plugins, see Activate a language.

Role required: admin

About this task
At installation time, the AI Search for Next Experience application includes search UI element translations for all languages currently active in your ServiceNow AI Platform instance. These translations include language-specific labels for the Unified Navigation search field, source facet buckets, and other elements of the global search and configurable workspace search user interfaces.

If you activate a new ServiceNow AI Platform language plugin in an instance that already has AI Search for Next Experience installed, the application doesn't automatically update to include UI element translations for the newly added language. To install these translations, you can repair the AI Search for Next Experience application.

For more details on repairing applications, see Repair a ServiceNow application.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Locate the AI Search for Next Experience and select its menu icon ⋮.
3. In the Activate Plugin dialog box, select **Repair**.

Result
The AI Search for Next Experience application and its dependencies are reinstalled. After reinstallation, the application includes search UI element translations for all languages activated in your ServiceNow AI Platform instance.

Enable search-based auto-complete suggestions in AI Search for Next Experience

Run a scheduled job to make search-based auto-complete suggestions available in AI Search for Next Experience.

Before you begin
The AI Search for Next Experience ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install AI Search for Next Experience.

Only perform this task if you installed AI Search for Next Experience 3.x on a San Diego instance that you then upgraded to Tokyo or a later release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

If you install AI Search for Next Experience 3.x on a San Diego instance and then upgrade to Tokyo or a later release, the new search-based auto-complete suggestion types introduced in Tokyo aren't automatically enabled in the **[AIS]** *Next Experience* **Search Configuration** search application configuration used by global search.

To enable the new search-based auto-complete suggestion types in AI Search for Next Experience and remove the legacy suggestion types that they replace, administrators can run a scheduled job.

Running the scheduled job adds these auto-complete suggestion types to the **[AIS]** *Next Experience* **Search Configuration** search application configuration, making them available for global search:

- Search-based Suggested Results Reader Group for [AIS] Next Experience Search Configuration
- User History Reader Group for [AIS] Next Experience Search Configuration

The scheduled job removes these two legacy auto-complete suggestion types from the **[AIS]** *Next Experience* **Search Configuration** search application configuration, making them unavailable for global search:

- Suggested Query Reader Group for [AIS] Next Experience Search Configuration
- Suggested Result Reader Group for [AIS] Next Experience Search Configuration

To learn more about auto-complete suggestion types in AIS applications, see Auto-complete suggestions in AI Search applications.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the **Enable search-based suggestions** scheduled job record.
3. Select **Execute Now**.

Result

The scheduled job adds these auto-complete suggestion types to the **[AIS]** *Next Experience* **Search Configuration** search application configuration:

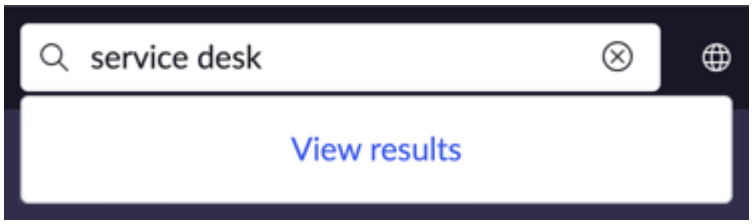
- Search-based Suggested Results Reader Group for [AIS] Next Experience Search Configuration
- User History Reader Group for [AIS] Next Experience Search Configuration

The scheduled job removes these auto-complete suggestion types from the **[AIS]** *Next Experience* **Search Configuration** search application configuration:

- Suggested Query Reader Group for [AIS] Next Experience Search Configuration
- Suggested Result Reader Group for [AIS] Next Experience Search Configuration

Global search uses the updated set of auto-complete suggestion types.

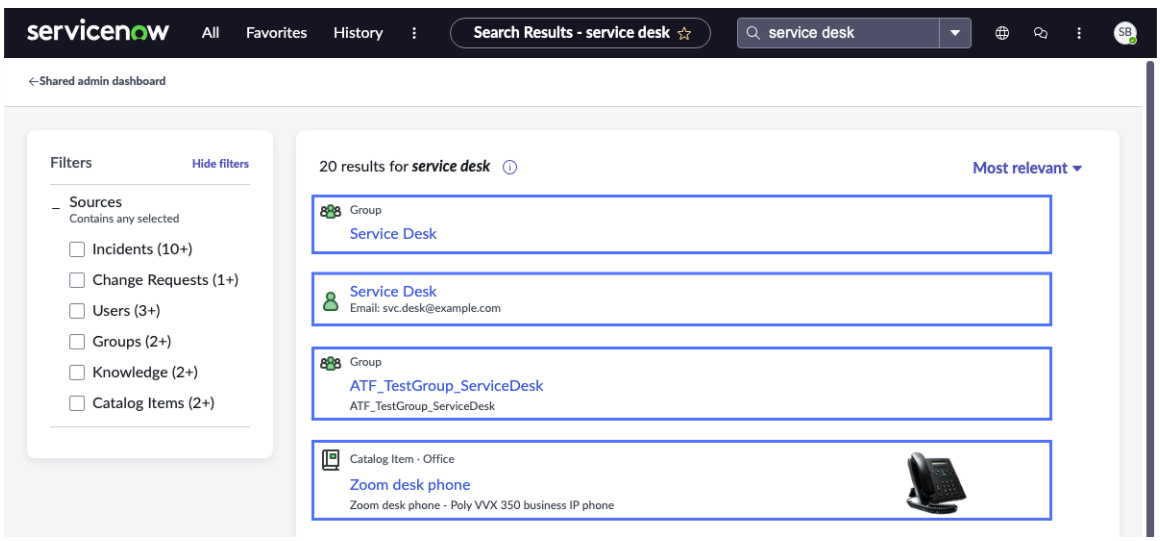
Using global search with AI Search for Next Experience



Global search enables you to search multiple record types at once from the Next Experience Unified Navigation search field. You can switch between global search results and results from workspace applications that you have access to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

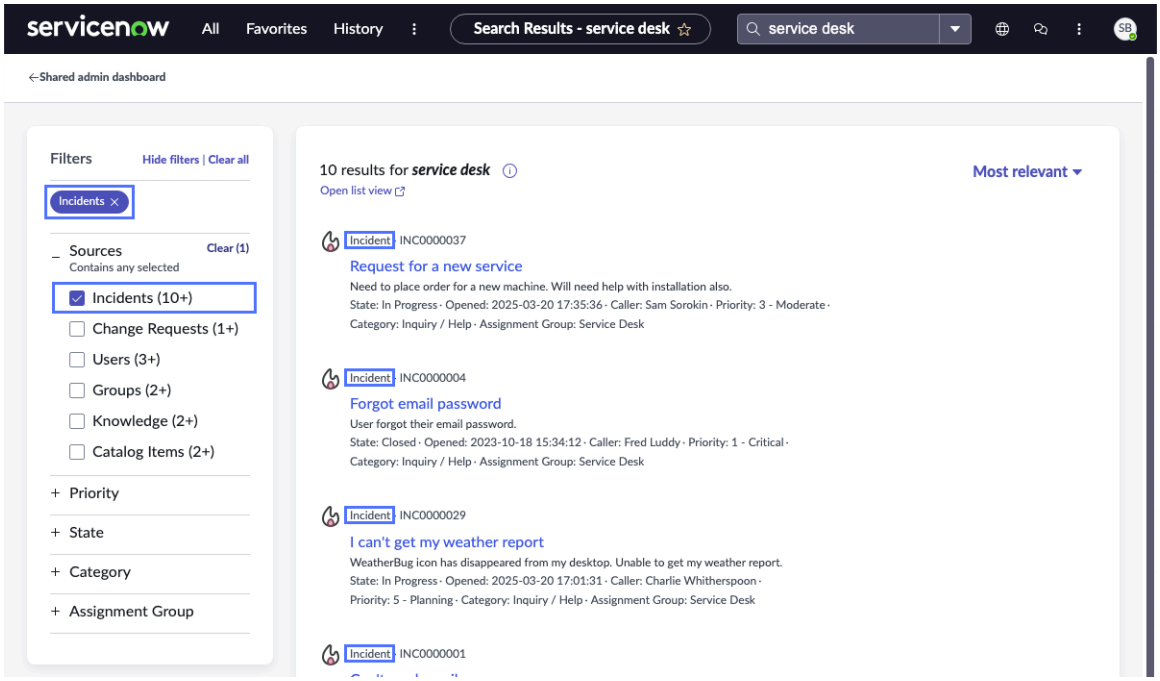
Search in the Unified Navigation search field



To use global search, enter your search query in the Unified Navigation search field, then select **View all results for "<search-query>"** or press Enter.

The search results page displays a list of previews for records that match your search query. You can open any search result record in a new browser tab by selecting its preview in the list. Your search remains open in your original browser tab, so you can return to it and refine it.

Note: AI Search administrators can configure search results to open in the same browser tab as the search. To make this change, edit the EVAM configuration bundle from the EVAM definition for the **[AIS] Next Experience Search Configuration** search application, setting the **forceNewTab** property to false in the relevant Search Result card EVAM view configurations. For more details on editing EVAM display settings for search results, see Configure EVAM display settings for search results in AI Search applications and List of Search Result EVAM card properties.



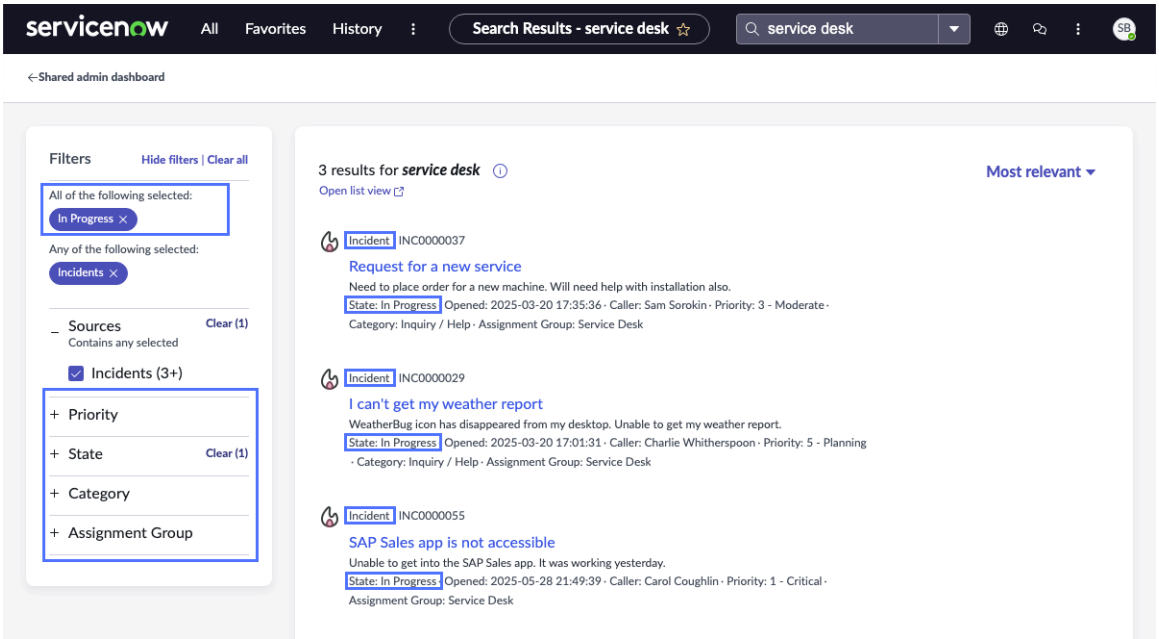
Note: When you search with a search query, the system only displays results for records included in the AI Search index. Search queries won't match records that have never been indexed or records that have been purged from the index by a retention policy. AI Search administrators can configure indexing and retention policy settings. For details on these settings, see Indexing content from AI Search indexed sources and Indexed source retention policies and filter conditions.

AI Search administrators can customize the index fields displayed on search result previews. For details, see the customization section found in this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Narrow your search by source on the search results page

You can narrow your search to display only results from a particular search source. When you select one or more of the search results page's source facet bucket options, the page shows only those matching records that come from the selected sources. To return to viewing matching records from all sources, clear the selected source facet bucket options or select **Clear** in the Sources list.



AI Search administrators can configure display settings for source facet buckets. For details, see Configure source facet buckets in an AI Search application configuration.

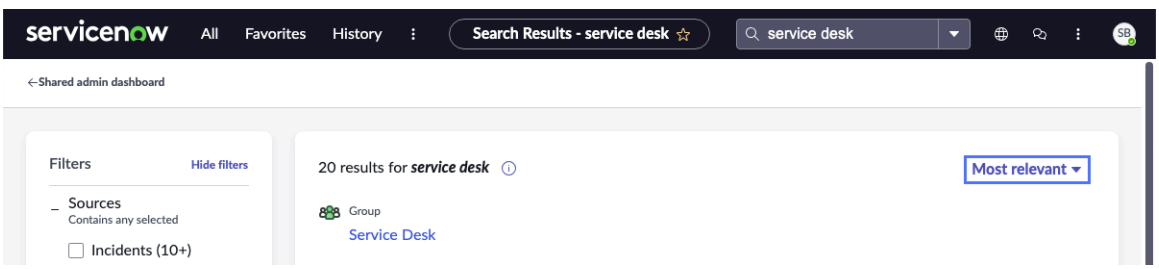
Narrow your search by field value on the search results page

After you select one or more source facet buckets, you may see a Filters list. Each facet filter in this list indicates a field from your selected search source(s). The filter displays the field's values that are found on one or more of your currently displayed search result records. When you select a facet filter value, your search narrows to show only those matching records that include the specified field value.

For example, suppose you select the **Incident** source facet bucket to view only Incident records that match your search query. The Filters list appears, displaying facet filters for Incident fields such as **Priority**, **State**, **Category**, and **Assignment Group**. Selecting the **In Progress** value from the **State** facet filter narrows your search to show only matching records for Incidents that are in progress.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To remove an applied facet filter, select **Clear** by the facet field name, or **Clear all** to remove all applied filters at once. You can hide the Filters list by selecting **Hide filters**.



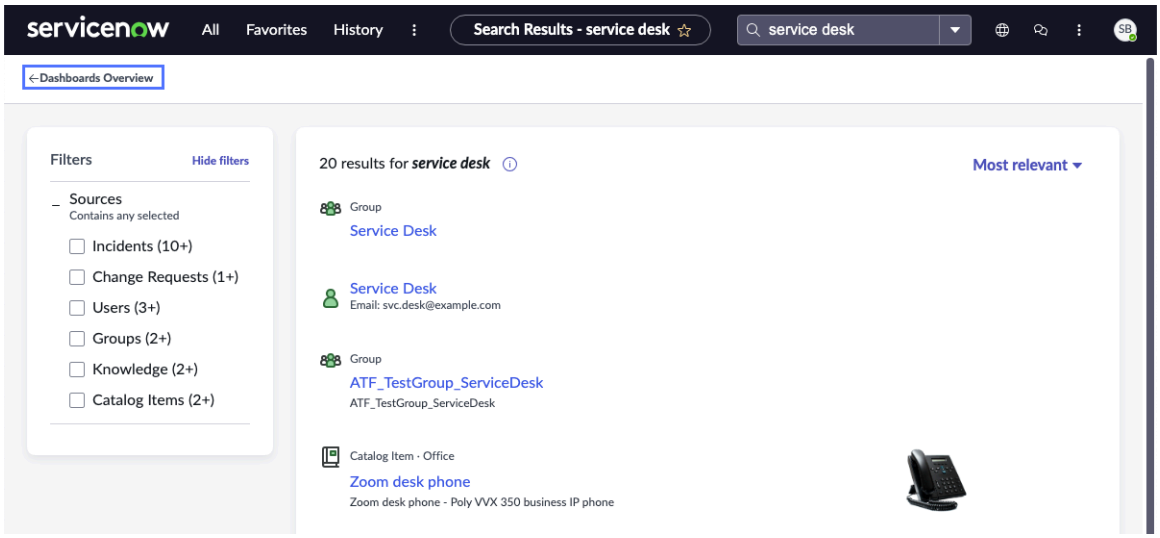
AI Search administrators can define facets in search application configurations. For details, see Create a facet in an AI Search application configuration.

In the base system, facets don't appear in the Filters list until you've selected a source facet bucket. Administrators can override this behavior and show all available facets in the Filters list by creating a *glide.ui.ais.show_all_facets* system property record and setting its value to *true*. For more details on this system property, see AI Search for Next Experience properties.

The Filters list defaults to displaying a count of matching search results for each facet bucket. Search administrators can configure this behavior in search application configurations. To learn more about result counts for facets, see Show search result counts for facets on the results page for a search application.

Sort your search results

By default, AI Search displays the most relevant search results first. To change the display order for records on the search results page, select a sort option from the sort menu.

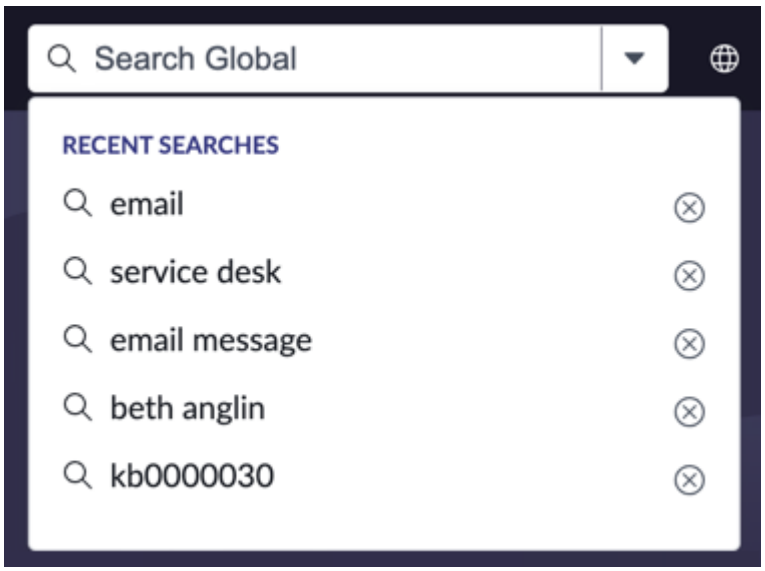


AI Search administrators can configure search result sort options. For details, see Search result sort options in AI Search application configurations.

Return to your starting point from the search results page

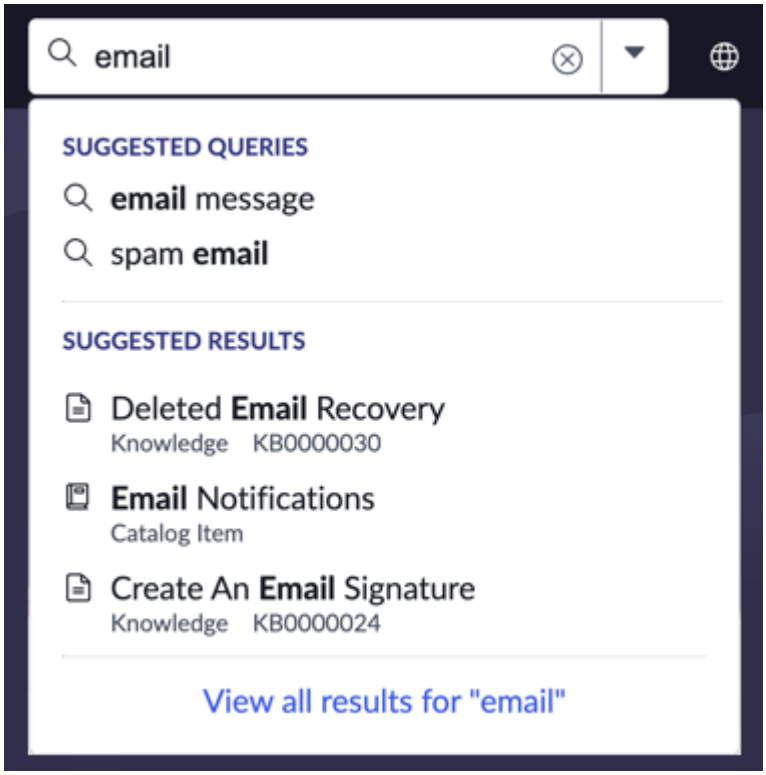
To return to the page where you initiated your search, select the link with a left arrow that appears above the source facet buckets on the search results page. The title of this link indicates the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



page it returns you to. For example, if you searched from the Home page, the link text would be **Home**, but if you searched from the Dashboards page, the link text would be **Dashboards Overview**.

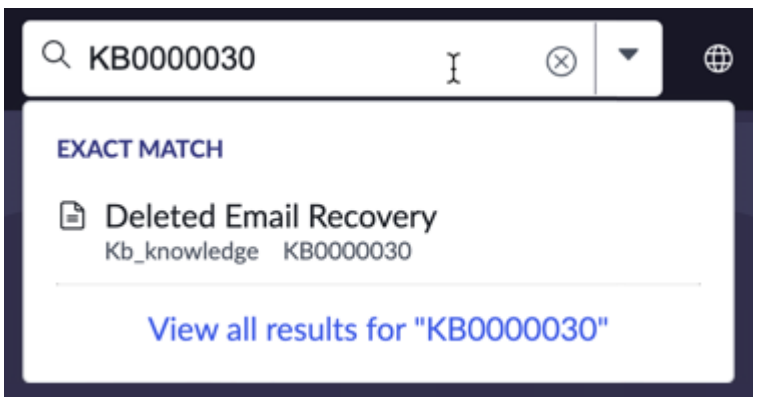
Search suggestions in the Unified Navigation search field



AI Search displays auto-complete suggestions to help you get directly to the results you need. Suggestions may include recent search queries, recently viewed search results, or search queries or results that match the terms you're typing into the search field.

Some suggestion types appear when you initially select the search field.

Other suggestion types appear when you begin typing your search query into the search field.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search administrators can configure auto-complete suggestions. For details, see Auto-complete suggestions in AI Search applications.

Search for a specific record using Exact Match

Enter a record number into the Unified Navigation search field but don't press Enter or select **View results**. The search field displays a preview of the record with an **Exact Match** tag. Select the preview to go directly to the matching record, bypassing the search results page.

Note: When you search for a record by number, the system displays the matching record regardless of whether it's included in the AI Search index or not.

Exact matching returns results from tables with a prefix defined in the Number [sys_number] table. If the search includes a single term that starts with the table's prefix, AI Search returns an exact match result from the table if one exists. As an example, searching for the single term `INC3263827` returns an exact match from the Incident [incident] table because the search term starts with the INC prefix defined for that table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If more than one record has a **Number** field value that exactly matches your search, AI Search displays the first exact match. An informational message reports the total number of exact matches and provides links to the other exact matches.

Search administrators can override the default exact match behavior by configuring custom search matchers. For details on this procedure, see Create a custom search matcher for global search.

View results for your search in an available workspace application

If you have access to search in workspace applications, an arrow appears at the right of the Unified Navigation search field after you search that enables you to switch between the results in global search and in your workspace applications.

For example, if the context menu in the illustration was available after you performed a global search, you could select **CSM/FSM Configurable Workspace** from the context menu to view results for the search in CSM/FSM Configurable Workspace.

Exact matches open in the selected workspace application. For example, if you selected **CSM/FSM Configurable Workspace**, entered a record number, and selected the record preview in the search results, the record would open in CSM/FSM Configurable Workspace.

Customize display fields for your search result previews

Search result previews display a default set of AI Search index fields. If you have the ais_admin role, you can customize the set of index fields a search result preview displays by modifying its EVAM view configuration. For information on EVAM view configurations, see Entity View Action Mapping.

When customizing a search result preview's EVAM view configuration, you can reference the AI Search index fields that exist on the previewed search result. To add a new AI Search index field to search results from an indexed source, define a *map_to* field setting. This field setting populates the index field on each affected search result with the value of a field you specify from the search result's source record or document. For an overview of mapping source fields to AI Search index fields, see Field settings for AI Search. To create a new *map_to* field setting for one of your indexed sources, see Create a field setting for an AI Search indexed source.

ServiceNow Otto® for Virtual Agent enhanced chat entry point

If ServiceNow Otto for Virtual Agent enhanced chat is activated in the ServiceNow Otto panel, the search field in global and workspace search displays a search icon and `Search or ask` ServiceNow Otto® placeholder text. When you enter search terms, the search field displays ServiceNow Otto suggestions. Selecting a ServiceNow Otto suggestion takes you to enhanced chat in the dynamic window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

To see this enhanced chat entry point behavior, your instance must satisfy all of the following conditions:

- ServiceNow Otto for AI Search is installed.
- is installed.
- Enhanced chat is activated via the ServiceNow Otto panel. For details on activating enhanced chat, see Activate ServiceNow Otto panel enhanced chat.

If these conditions aren't satisfied, the search field in global and workspace search doesn't display the icon and placeholder text or show ServiceNow Otto suggestions.

To learn about ServiceNow Otto for Virtual Agent enhanced chat, see Enhanced chat.

Entity View Action Mapper (EVAM) templates installed with AI Search for Next Experience

Template	Description
AI Search Global | Catalog Genius Results Template	Contains component, static value, field mapping, and action mapping settings for the Catalog Item Genius Result configuration in AI Search for Next Experience. To learn more about this Genius Result configuration, see Catalog Item Genius Results. • Application scope: AI Search For Next Experience • Location: **All** > **Entity View Action Mapper (*EVAM*)** > **View Definitions** > **View Templates**
AI Search Global | Q&A Genius Result Template	Contains component, static value, field mapping, and action mapping settings for the Q&A Genius Result configuration in AI Search for Next Experience. To learn more about this Genius Result configuration, see Q&A Genius Results. • Application scope: AI Search For Next Experience • Location: **All** > **Entity View Action Mapper (*EVAM*)** > **View Definitions** > **View Templates**
AI Search Global | User Genius Results Template	Contains component, static value, field mapping, and action mapping settings for the People Genius Result configuration in AI Search for Next Experience. To learn more about this Genius Result configuration, see People Genius Results. • Application scope: AI Search For Next Experience • Location: **All** > **Entity View Action Mapper (*EVAM*)** > **View Definitions** > **View Templates**

List of all components installed with AI Search for Next Experience

To view the complete list of components installed with AI Search for Next Experience, follow the steps described in Find components installed with an application. The application's package name is *`AI Search`* **For** *`Next Experience`*.

AI Search for Next Experience properties

A system property allows you to control whether facets are shown when no source is selected in global search and workspace search results pages.

This property is available for AI Search for Next Experience.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for AI Search for Next Experience

Property	Description
glide.ui.ais.show_all_facets	• Type: true | false • Default value: *false* • Supported values: ○ *true*: Show facets from all sources in the Filters list on global and workspace search results pages, even when no source is selected. ○ *false*: Only show facets from selected sources in the Filters list on global and workspace search results pages. • Location: System Property [sys_properties] table (record not present by default)

AI Search for Next Experience default source facet buckets for global search

List of source facet buckets that appear by default in AI Search for Next Experience global search results.

When you activate AI Search for Next Experience, global search results display in source facet buckets. Each source facet bucket represents a search source that's linked to the Next Experience Search Configuration search profile. This search profile is the one used by the [AIS] Next Experience Search Configuration search application.

The following table lists the source facet buckets that appear by default when you activate AI Search for Next Experience.

Source facet bucket	Description
All	Global search results from all search sources linked to the Next Experience Search Configuration search profile.
Incidents	Global search results from the Tasks - Incidents search source. • Indexed source: Incident • Source table: Incident [incident] Incident [incident]
Change Requests	Global search results from the Tasks - Change Requests search source. • Indexed source: Change • Source table: Change Request [change_request]
Change Tasks	Global search results from the Tasks - Change Tasks search source. • Indexed source: Change Task • Source table: Change Task [change_task]
Problems	Global search results from the Tasks - Problems search source.

Source facet bucket	Description
	• Indexed source: Problem • Source table: Problem [problem]
Requests	Global search results from the Tasks - Requests search source. • Indexed source: Request • Source table: Request [sc_request]
Dashboards	Global search results from the Dashboards search source. • Indexed source: Dashboards • Source table: PAR Dashboard [par_dashboards]
Data Visualizations	Global search results from the Data visualizations search source. • Indexed source: Data visualizations • Source table: PAR Visualization [par_visualization]
KPIs	Global search results from the KPIs search source. • Indexed source: KPIs • Source table: Indicator [pa_indicators]
Catalog Tasks	Global search results from the Tasks - Catalog Tasks search source. • Indexed source: Catalog Task • Source table: Catalog Task [sc_task]
Users	Global search results from the People - Users search source. • Indexed source: User table • Source table: User [sys_user]
Requested Items	Global search results from the Tasks - Requested Items search source. • Indexed source: Requested Item • Source table: Requested Item [sc_req_item]
Groups	Global search results from the People - Groups search source. • Indexed source: Group • Source table: Group [sys_user_group]
Knowledge	Global search results from the Knowledge & Catalog - Knowledge search source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Source facet bucket	Description
	• Indexed source: Knowledge Table • Source table: Knowledge [kb_knowledge]
Catalog Items	Global search results from the Knowledge & Catalog - Catalog Items search source. • Indexed source: Catalog Item Table • Source table: Catalog Item [sc_cat_item]
Companies	Global search results from the People - Companies search source. • Indexed source: Company • Source table: Company [core_company]

You can change the search sources linked to the Next Experience Search Configuration search profile. To learn more about creating search sources and linking them to search profiles, see Search sources in AI Search.

For details on configuring labels and display order for source facet buckets, see Configure source facet buckets in an AI Search application configuration.

ServiceNow Otto for AI Search

The ServiceNow Otto for AI Search application combines the power of search with a large language model (LLM) to provide actionable AI-generated or AI-selected answers in user searches. By constraining the context passed to the LLM, ServiceNow Otto for AI Search can increase the likelihood that LLM responses are grounded in indexed content.

ServiceNow Otto for AI Search overview

In Service Portal, Virtual Agent, Employee Center, and global searches, ServiceNow Otto for AI Search includes the following AI Genius Result configurations:

Summary Genius Results

Summary Genius Results use your chosen LLM to generate actionable Genius Result answers synthesized from a variety of content sources. Answers can include content from knowledge articles, Service Catalog items, Knowledge Graph schema nodes, enhanced chat searches and conversations, and external content documents and attachments.

Knowledge base articles Genius Results

Knowledge base articles Genius Results use the LLM to generate actionable Genius Result answers from the most relevant knowledge article results.

External Content Q&A Genius Results

External Content Q&A Genius Results generate actionable Q&A Genius Result answers from documents in your Microsoft SharePoint Online instance.

Actions Genius Results

Actions Genius Results use the Now LLM Service to select, filter, and display the most relevant Catalog Item and Virtual Agent topic results as answers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a search is broad or unclear, ServiceNow Otto for AI Search may ask follow-up questions before answering. This disambiguation step helps clarify what the user is looking for and is configurable. For configuration details, see .

AI Genius Result answers enhance search results with actionable answer cards. Each answer card includes links to its source records or external documents.

Important:

- Not all model providers are available for customers with in-country SKUs, and some AI products/features are currently unavailable for in-country customers. For more information, see the KB1584492 article in the Now Support Knowledge Base. Be sure to check for model provider availability updates in future releases.
- Some AI products/features are currently unavailable for customers in the FedRAMP, NSC DOD IL5, or Australia IRAP-Protected data centers, self-hosted customers, or in other restricted environments. For more information, see the KB0743854 article in the Now Support Knowledge Base. Be sure to check for availability updates in future releases.
- Some AI products/features are currently available only for customers in some regions. Be sure to check for availability updates in future releases.
- Some AI products and skills are not available in Regulated Markets. For more information, see KB2593939: Regulated Markets AI Products/Skills Not Available. Be sure to check for availability updates in future releases.

Language support

ServiceNow Otto for AI Search natively supports searches, content, and answers in English. Additional languages are supported through Dynamic Translation. For details on translation functionality and supported languages, see Dynamic Translation for Knowledge base articles Genius Results.

Domain support

By default, all skills exist in the global domain. When you use AI in a domain-separated environment, users are only able to access data in their domain. For example, if a user uses the summarization skill, AI only uses material that exists in the user's domain when generating that summary. Additionally, there is no co-mingling of data for domain-separated instances when using generative AI skills. The data resides only on the instance, and the shared services used

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

for generative AI do not persist any requests (prompts) and responses. For more information, see Domain separation in the AI Admin Hub console. (Note that global domain is not the same as global scope. For more information, see Exploring Next Experience pickers.)

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Install ServiceNow Otto for AI Search

As an administrator, you can install the ServiceNow® Otto for AI Search application (sn_ais_assist) from the AI Admin Hub module.

Before you begin

Role required: admin

About this task

The ServiceNow Otto for AI Search plugin is automatically installed as a dependency when you install a ServiceNow Otto plugin in ServiceNow Otto Admin. ServiceNow Otto for AI Search is included in Now Assist suites.

Note: When you upgrade to the latest version of ServiceNow Otto for AI Search, the system reindexes content from the Catalog Item Table and Knowledge Table indexed sources. While these reindexing tasks are ongoing, searches may not return Catalog and Q&A Genius Result answers. After reindexing completes, Catalog and Q&A Genius Result answers should appear normally.

Procedure

1. In ServiceNow Otto Admin, install one or more ServiceNow Otto plugins.
   To review the instructions for ServiceNow Otto feature plugin installation, see Install plugins for ServiceNow Otto. As part of the procedure, you may need to request a license for the plugin from the ServiceNow Store.
2. Verify that ServiceNow Otto for AI Search is installed:
   a. Navigate to **All** > *AI Admin Hub* > **Skills**.
   b. In the workflow list, select **Platform**.
   c. Verify that the **Conversational experience** feature card displays, and that the **Knowledge base articles Genius Results** and **Actions** skills appear in the **All Conversational experience skills** listing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

With the plugin installed, search administrators can enable Genius Results in the following contexts.

- Enable all available Genius Result configurations in individual AI Search portals. For details, see Enable ServiceNow Otto for AI Search Genius Results in AI Search portals and mobile applications.
- Enable Q&A Genius Results in search profiles for AI Search applications. For steps, see Enabling Knowledge base articles Genius Results.
- Enable Q&A Genius Results in global search using the AI Search for Next Experience application. For steps, see Enabling Knowledge base articles Genius Results.

To learn more about configuration settings for the plugin, see Configuring ServiceNow Otto for AI Search.

Review available versions of ServiceNow Otto for AI Search

View all versions of the ServiceNow® Otto for AI Search application on the ServiceNow Store. Use this information to find the latest version of the application that's compatible with your instance's current ServiceNow AI Platform® family release.

Before you begin

You need access to the ServiceNow Store site.

Role required: none

Procedure

1. In a web browser, navigate to the ServiceNow Store site: https://store.servicenow.com/sn_appstore_store.do#!/store/home
2. Use search or navigation to find the listing for a ServiceNow Otto plugin.
3. Open the application listing.
   The listing shows the **Product Details** view for the selected application.
4. Select the **Dependencies** tab, then select *`ServiceNow Otto for AI Search`* from the **App Dependency** listing.
   The listing shows the **Product Details** view for the ServiceNow Otto for AI Search application.
5. In the **Version** section, select **Other App Versions**.
   The Version History window shows the list of all available versions of the ServiceNow Otto for AI Search application. Each entry shows a version's number, family release compatibility, release type, and release date.
6. To view the listing for another version of the ServiceNow Otto for AI Search application, expand the entry for that version by selecting its arrow icon , then select **View Details**.
   The listing shows the **Product Details** view for the selected version of the ServiceNow Otto for AI Search application.

Configuring ServiceNow Otto for AI Search

As an administrator or search administrator, you can configure settings to control the behavior of ServiceNow® Otto for AI Search.

Enable ServiceNow Otto for AI Search Genius Results in AI Search portals and mobile applications

Specify the ServiceNow Otto for AI Search Genius Result types you want to make available in each of your AI Search portals and mobile applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.

Role required: ais_admin

About this task

ServiceNow Otto for AI Search provides multiple AI-powered Genius Result configurations. As a search administrator, you can enable individual Genius Result configurations in AI Search portal and mobile applications.

To learn more about how Genius Results work, see Genius Results. For details on the Genius Result configurations, see Knowledge base articles Genius Results and Actions Genius Results.

Procedure

1. Navigate to **All** > *AI Search* > *Now Assist* **in** *AI Search* **Setup**.
   The Set up ServiceNow Otto for AI Search panel displays a list of search profiles associated with AI Search portals and mobile applications and a Prerequisites section for each Genius Result configuration.
2. **Optional:** If a Genius Result enablement option isn't selectable, follow the guidance in its Prerequisites entry to make it selectable.

   Note: After following the Prerequisites guidance, you may need to refresh the Set up panel to make the Genius Result enablement option selectable.

3. In each search profile row, select the options for the individual Genius Results you want to enable for the associated AI Search portal or mobile application.

   As an example, to enable Q&A Genius Results in Service Portal, select the **Knowledge base articles** option in the **Service Portal Default Search Profile** row.

   Note: You can disable a Genius Result for an AI Search portal or mobile application by clearing its option.

4. Select **Apply Changes**.

Result

AI Search enables your selected Genius Result configurations for all users of the specified AI Search portals and mobile applications.

Summary Genius Results

Summary Genius Results use an LLM to generate search and chat responses that synthesize information from knowledge articles, Service Catalog items, and other available content types.

Summary Genius Results overview

Summary Genius Results is a Now Assist skill in the Platform workflow. It's included in the Conversational experience skill group.

You can use this skill in portal search and in global/workspace search in place of the legacy Knowledge base articles Genius Results and Actions Genius Results configurations. It improves on those legacy Genius Result configurations in multiple ways:

Broader source information

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary Genius Results use an improved LLM pipeline to display synthesized responses that can include information drawn from knowledge articles, Service Catalog items, Knowledge Graph schema node content, enhanced chat conversation and search results, and external content documents and attachments. Answers include citations to help users view the search results cited in the synthesized response.

By comparison, Knowledge base articles Genius Results can only display answers generated from knowledge articles using a legacy LLM pipeline, while Actions Genius Results can only display Catalog Items and Virtual Agent topics as answers.

More extensive and authoritative answers

A Summary Genius Result synthesized response can combine information from different search results to answer multiple aspects of a user's question.

By comparison, each Knowledge base articles Genius Result answer can only include information generated from a single knowledge article, and each Actions Genius Result can only include a single Catalog Item or Virtual Agent topic.

Support for follow-up questions

Users can ask follow-up questions directly from Summary Genius Result answers.

Content types included in synthesized responses

When a Summary Genius Result answer card appears in your conversation or search results, it displays a sentence or paragraph generated by the LLM. As part of this sentence or paragraph, the card displays citations for the content elements that were used to synthesize the response.

Citations for synthesized responses may include any or all of these content types:

Content type	Description
Knowledge articles	ServiceNow AI Platform® records indexed from the Knowledge [kb_knowledge] table.
Service Catalog items	ServiceNow AI Platform records indexed from the Catalog Item [sc_cat_item] table.
Content types from Knowledge Graph	
Records from tables configured as Knowledge Graph schema nodes	ServiceNow AI Platform records from tables configured as Knowledge Graph schema nodes. **Note:** Content from Knowledge Graph schema nodes is only available in synthesized responses if you've installed the Knowledge Graph ServiceNow® Store application. To learn about installing this application and configuring nodes in Knowledge Graph schemas, see Knowledge Graph.
Content types from enhanced chat experiences in Now Assist in Virtual Agent	
Enhanced chat results	Results from enhanced chat conversations and searches, such as Virtual Agent topics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content type	Description
	Note: Enhanced chat results are only available in synthesized responses when Summary Genius Result answers are generated in a Now Assist in Virtual Agent experience. To learn more about how these results appear in enhanced chat conversations and searches, see Enhanced chat. For more details on Now Assist in Virtual Agent, see .
Content types from External Content Connectors	
External content documents and attachments	Documents and attachments retrieved from external source systems such as Atlassian Confluence Cloud or Microsoft SharePoint Online. **Note:** Documents and attachments from external source systems are only available in synthesized responses if you've installed the External Content Connectors ServiceNow Store application and then indexed them from your source systems using the appropriate external content connectors. For more details on installing, configuring, and using this application, see External Content Connectors.

Citations

Selecting a citation from a Summary Genius Result answer typically displays a link to the source content so you can verify the synthesized response.

In global and workspace search, when a Virtual Agent topic is cited as a source for a Summary Genius Result answer, its citation displays a chat icon followed by the topic name. Selecting this topic citation opens the selected topic in the ServiceNow Otto panel, allowing the user to continue their conversation on that topic.

Note: To open topic citations in the ServiceNow Otto panel from global or workspace search, the following requirements must be met:

- The panel must be activated.
- A search source derived from the Skill (topics) indexed source must be linked to the search profile used for global search or the workspace search.

If these requirements aren't met, topic citations from global or workspace search display a link to the source content, just as occurs for other citations.

Asking follow-up questions

In portal search, workspace search, and Now Assist in Virtual Agent enhanced chat, Summary Genius Result answer cards display an **Ask a follow-up** link after the synthesized response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting this link opens the ServiceNow Otto panel so you can ask follow-up questions in the context of the Genius Result answer.

To learn about using the panel conversational interface, see ServiceNow Otto panel.

Activating Summary Genius Results

When you use Guided Setup to activate the ServiceNow Otto panel, Summary Genius Results are automatically activated for search profiles that satisfy these conditions:

- The search profile is linked to a search application configuration record for global search or for a workspace that uses AI Search.
- The search profile includes one or more search sources containing indexed records from the Catalog Item Table or Knowledge Table indexed sources.

Users with the ais_admin role can add Summary Genius Results to search profiles and then link those search profiles to AI Search portals in the AI Search Admin console. For details on configuring search application settings in the AI Search Admin console, see Configure and manage AI Search in search applications.

Note: When you activate Summary Genius Results in a search application, they're available to all users who search using that application.

For details on activating Summary Genius Results in global and workspace search, see Configure and manage AI Search in search applications

Note: When you activate Summary Genius Results in the search profiles for global or workspace search, they override all other Genius Result configurations activated for those search profiles. This means that global and workspace searches ignore other Genius Result answers and only display Summary Genius Result answers.

.

Large language model (LLM) providers

By default, Summary Genius Results use the Azure OpenAI model as the AI service provider. The Now LLM Service is used as a fallback AI service provider.

With the admin role, you can use AI Admin Hub to select a different LLM to use as the AI service provider for Summary Genius Results. For details on selecting the LLM for Platform workflow Now Assist skills, see Manage AI models.

As a Now Assist skill, Summary Genius Results supports these LLMs:

- AWS Anthropic
- Azure OpenAI
- Google Gemini
- Now LLM Service

Knowledge base articles Genius Results

Knowledge base articles Genius Results use the LLM to generate concise, actionable answers from knowledge article results in Service Portal, Virtual Agent, Employee Center, and global searches.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Starting with the Now Assist in AI Search 11 release, the Knowledge base articles Genius Results feature is in maintenance mode. This feature will remain available but will not be updated or supported. Similar and improved functionality is available in the newer Summary Genius Results feature. For more details on this feature, see Summary Genius Results.

Knowledge base articles Genius Results overview

Knowledge base articles Genius Results send the most relevant knowledge articles from your search to the LLM, which generates answer snippets from the articles' HTML fields.

Each Knowledge base articles Genius Result answer card displays up to three generated answer snippets. For reference, the answer card also includes a link you can select to view the source knowledge articles.

The Knowledge base articles Genius Result answer card contains a snippet that summarizes a knowledge article. Select the answer card's **View article** action link to view the full knowledge article.

Note: Because the Knowledge base articles Genius Result answer is automatically generated, it's a good idea to review it for accuracy. You can provide feedback on the answer by selecting the thumbs-up icon if the generated answer is accurate, or the thumbs-down icon if it's not. Your feedback helps ServiceNow improve future versions of this Genius Result configuration.

Knowledge base articles Genius Results use semantic vector search and legacy keyword search to find knowledge articles that best match the meaning and intent of your search query. For more details on semantic vector search, see Semantic vector search in AI Search.

The Knowledge base articles Genius Result configuration replaces the original Q&A Genius Result configuration from the base system. The base system's configuration extracts answers from knowledge articles using internal routines instead of using the LLM. To learn more about the base system's Q&A Genius Result configuration, see Q&A Genius Results.

Enabling Knowledge base articles Genius Results

You can enable Knowledge base articles Genius Results in your AI Search portals and mobile applications using the ServiceNow® Otto for AI Search Setup module. For details on this procedure, see Enable ServiceNow Otto for AI Search Genius Results in AI Search portals and mobile applications.

To use Knowledge base articles Genius Results in global search, you can enable the configuration in the AI Search for Next Experience application. For details on this procedure, see Enabling Knowledge base articles Genius Results.

Note: When you activate Knowledge base articles Genius Results in a search application, they're available to all users who search using that application.

Limitations

By default, Knowledge base articles Genius Results only support English-language searches. Administrators can enable support for other languages by activating Dynamic Translation. To learn more about how content and answers are translated, see Dynamic Translation for Knowledge base articles Genius Results. For more details on Dynamic Translation, see Dynamic Translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Knowledge articles that are boosted or promoted by result improvement rules are more likely to appear as Knowledge base articles Genius Results, but aren't guaranteed to appear.

Note: The Knowledge search property settings don't affect Knowledge base articles Genius Results. For more information on these settings, see Knowledge search properties.

If you have the External Content Connectors ServiceNow® Store application installed, Knowledge base articles Genius Results exclude search results retrieved from external content source systems when generating answers.

Answer snippet creation for Knowledge base articles Genius Results

AI Search uses the LLM to create each Knowledge base articles answer snippet from a knowledge article record's HTML fields. Each answer card can include up to three snippets. These snippets may all be generated from the same source article or from different source articles.

LLM automatically determines which elements of a knowledge article's text to include in an answer snippet. You can't configure the criteria for this behavior.

The LLM summarizes and abstracts content from the knowledge articles' text fields. Answer snippets displayed on Knowledge base articles Genius Result answer cards may not exist word for word in the source records.

Both AI Search content retrieval and the LLM are continually improving, so Knowledge base articles results for specific queries may vary over time. Because results from the LLM are non-deterministic, you should expect a higher answer variability compared to the base system's Q&A Genius Results.

Interaction with other search features

The following table describes the interactions between Knowledge base articles Genius Results and other search features.

Feature	Interaction with Knowledge base articles Genius Results
Result improvement rules	When computing Knowledge base articles Genius Result answers for a search query, AI Search applies result improvement rules normally. The effects depend on the result improvement rule's action, as follows: • *block*: Knowledge base articles Genius Results don't generate answers from blocked records. • *boost* or *promote*: Boosted and promoted records are more likely to be used when generating Knowledge base articles Genius Result answers.
Stop words	Knowledge base articles Genius Results use a blend of semantic vector search, which doesn't support stop words, and keyword-based search. AI Search only removes stop

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Interaction with Knowledge base articles Genius Results
	words from keyword-based searches, so answers may not reflect your stop words settings.
Synonyms	Knowledge base articles Genius Results use a blend of semantic vector search, which doesn't support synonyms, and keyword-based search. AI Search expands synonyms in keyword-based searches, so your synonyms are likely to improve the relevancy of Genius answers.
Typo handling	When computing Knowledge base articles Genius Result answers for a search query, AI Search corrects misspelled terms in the query.

Enabling Knowledge base articles Genius Results

As a search administrator, you can use the Knowledge base articles Genius Results skill in AI Search portals and mobile applications by enabling the skill in search profiles. You can also use the skill in global search by enabling Knowledge base articles Genius Results in the AI Search for Next Experience application.

Enable Knowledge base articles Genius Results in AI Search portals and mobile applications

For details on how to enable Knowledge base articles Genius Results and other Genius Results in your AI Search portals and mobile applications, see Enable ServiceNow Otto for AI Search Genius Results in AI Search portals and mobile applications.

Enable Knowledge base articles Genius Results in global search

Enable Knowledge base articles Genius Results in global search using the AI Search for Next Experience application.

Before you begin

The Next Experience UI must be activated on your instance. To learn about activating Next Experience UI, see Considerations for activating Next Experience.

The AI Search for Next Experience application must be installed and enabled on your instance. For more information about the application, see AI Search for Next Experience.

The Now Assist for Search application must be installed on your instance. For details on installing this application from the AI Admin Hub console, see Install ServiceNow Otto for AI Search.

Role required: ais_admin

About this task

As a search administrator, you can enable agentic AI model answer generation for Knowledge article results in global searches by adding the Knowledge base articles Genius Result configuration to the Next Experience Search Configuration search profile used by AI Search for Next Experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Linking the Knowledge base articles Genius Result configuration to the Next Experience Search Configuration search profile changes the status of the Knowledge base articles Genius Results skill to **Active** in the AI Admin Hub console. The skill remains active as long as any search profile includes a link to the Knowledge base articles Genius Result configuration.

When you enable Knowledge base articles Genius Results in global search, it is enabled for all users.

Procedure

1. In the Unified Navigation, select the application scope and update set icon  , and then set the application scope to *AI Search* **for** *Next Experience*.
2. If you have version 1.x or 2.x of the AI Search for Next Experience application installed on a Tokyo or Utah instance, add the Genius Result data source to the AI Search For Next Search EVAM definition.
   If you have version 3.x or a later version of the AI Search for Next Experience installed, or are on Vancouver or a later release, go to the next step.
   a. Navigate to **All** > **Entity View Action Mapper (***EVAM***)** > *EVAM* **Definitions**.
   b. Open the AI Search For Next Search definition record by selecting it from the list.
   c. In the EVAM Datasource M2Ms related list, select **Link Existing**.
   d. On the EVAM Datasource M2M form, populate the **Datasource** field with a reference to the Genius Result Data Source record from the EVAM Datasources table by using the Lookup using list icon  .
   e. Select **Submit**.
   The Genius Result Data Source reference appears in the EVAM Datasource M2Ms related list.
3. Add the Knowledge base articles Genius Result configuration to the search profile used by AI Search for Next Experience.
   a. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
   b. Open the Next Experience Search Configuration search profile record by selecting it from the list.
   c. In the Genius Results related list, select **Link Existing**.
   d. On the Search Profile - Genius Result Mapping form, fill in the following field values.

Field	Value
Genius Result Configuration	Enter or select **Knowledge base articles**.
Order	Specify the evaluation order for the Knowledge base articles Genius Result configuration in the search profile. AI Search evaluates active Genius Result

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	configurations for a search profile in order, from lowest **Order** field value to highest. For more details on the evaluation order for Genius Results, see Set the evaluation order for Genius Result configurations in a search profile.

e. Select **Submit**.

4. Select the existing related list row for the Knowledge base articles Genius Result configuration, and then select **Unlink Selected**.
The configuration supersedes the original Knowledge base articles Genius Result configuration. You don't need both configurations in the same search profile.

Result
The Knowledge base articles Genius Result configuration is enabled for global searches.

In the AI Admin Hub console, the status for the Knowledge base articles Genius Results skill is **Active**.

Define a query filter for Knowledge base articles Genius Results

Define a Java regular expression pattern that a search must match to be eligible for triggering Knowledge base articles Genius Results. Searches that don't match this pattern don't return Genius Result answers from Knowledge base articles Genius Results.

Before you begin
The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.

Make sure that you're familiar with Java's regular expression pattern syntax. To learn about the regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

Role required: admin

About this task
Knowledge base articles Genius Results send eligible knowledge article search results to the LLM for answer generation.

By default, the system only sends knowledge article results to the LLM when the search satisfies all of these conditions.

- The search application is Service Portal, Virtual Agent, Employee Center, or global search.
- The user's session language is English.
- The search contains two or more terms.
- The search matches the Java regular expression pattern defined by the *sn_ais_assist.u_question_regex* system property's value. This system property has no value set in the base system, so by default all search queries satisfy this condition.

You can customize the pattern match condition by defining your own Java regular expression pattern for use by Knowledge base articles Genius Result configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Open the record for the *`sn_ais_assist.u_question_regex`* system property by selecting it from the list.
   If the system prompts you to change the application scope so that you can edit the record, select the provided link.
3. In the system property's **Value** field, enter a Java regular expression pattern that you want Knowledge base articles search queries to match.
   The Java regular expression match is case-insensitive. As an example, to restrict Knowledge base articles answer expansion to search queries that start with a question keyword, you can set the property's value to `^(what|where|when|why|who|whom|which|how)\b`.
4. Select **Update**.

Result

Knowledge base articles Genius Results don't send knowledge article search results to the LLM for Knowledge base articles answer generation unless the search query matches your Java regular expression pattern.

Change the minimum search term count for Knowledge base articles Genius Results

Specify the minimum number of terms that a search must contain to be eligible for triggering Knowledge base articles Genius Results. Searches with fewer terms don't return Knowledge base articles Genius Result answers.

Before you begin

The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.

Role required: ais_admin

About this task

Knowledge base articles Genius Results send eligible knowledge article search results to the LLM for answer generation.

By default, the system only sends knowledge article results to the LLM when the search satisfies all of these conditions.

- The search application is Service Portal, Virtual Agent, Employee Center, or global search.
- The user's session language is English.
- The search contains two or more terms.
- The search matches the Java regular expression pattern defined by the *`sn_ais_assist.u_question_regex`* system property's value. This system property has no value set in the base system, so by default all search queries satisfy this condition.

You can customize the term count condition by altering the minimum term count required by Knowledge base articles Genius Result configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *AI Search* > **Search Query Settings** > **Genius Results**.
2. Open the record for the Knowledge base articles Genius Result configuration by selecting it from the list.
3. In the *AI Search* **response processor** field, locate the following code block:

```
var searchPhrase = context.getOriginalSearchPhrase();
if (searchPhrase.split(" ").length < 2) {
    return answer;
}
```

4. Change the inequality statement's numeric argument from 2 to another positive integer. As an example, if you only want the Genius Result configuration to operate on searches with three or more search terms, change 2 to 3. If you want the Genius Result configuration to operate on searches with any number of search terms, change 2 to `1`.
5. Select **Update**.

Result

The modified Genius Result configuration doesn't send knowledge article search results to the LLM for Knowledge base articles answer generation unless the search query has enough search terms to satisfy your chosen limit.

Dynamic Translation for Knowledge base articles Genius Results

Dynamic Translation improves the international search experience for knowledge article content. When Dynamic Translation is activated, AI Search can generate Knowledge base articles Genius Result answers from non-English knowledge articles. Dynamic Translation also enables AI Search to translate Knowledge base articles Genius Result answers into the search user's language.

When computing Knowledge base articles Genius Result answers, the Now LLM Service only accepts English-language knowledge article content and only generates answers in English.

Dynamic Translation expands the range of languages supported by Knowledge base articles Genius Results by adding the following features:

Feature	Description
Content translation	The Now LLM Service automatically translates knowledge article content from non-English languages into English before using that content to generate Knowledge base articles Genius Result answers. **Note:** Translation is based on the language specified for the knowledge article record. If the record has no language specified, the Now LLM Service analyzes the record's content to determine its language.
Answer translation	When you search in a non-English language, the Now LLM Service automatically translates answers generated by Knowledge base

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Description
	articles Genius Results from English into your search language.

To read more about the capabilities of Dynamic Translation and learn how to activate it, see Dynamic Translation.

Languages supported

Dynamic Translation works with all languages supported by the ServiceNow AI Platform®.

Interaction with Knowledge base articles Genius Result cache

The query-time caches for Knowledge base articles Genius Results only support English-language searches, articles, and answers. When searching in a non-English language or matching a non-English knowledge article, Knowledge base articles Genius Result behavior depends on the cache mode:

Cache mode	Description
on or *online*	AI Search bypasses the caches and queries the Now LLM Service to generate an answer for the Knowledge base articles Genius Result.
offline	AI Search bypasses the caches and returns no answer for the Knowledge base articles Genius Result.

For more details on the query-time caches for Knowledge base articles Genius Results, see Caching for Knowledge base articles Genius Results.

Caching for Knowledge base articles Genius Results

AI Search provides two query-time caches to improve search performance for Knowledge base articles Genius Results. Caching enables AI Search to return previously generated answers without submitting knowledge articles to the Now LLM Service for answer generation.

Knowledge base articles Genius Results caching overview

When a search query triggers a Knowledge base articles Genius Result configuration, AI Search uses the search query and the sys_id of the search's top-ranked knowledge article search result to look for cached article summaries. If no article summary is found in the active caches, AI Search submits the search query and article sys_id to the Now LLM Service for answer generation.

Note: By default, AI Search only uses the first-level cache and the Now LLM Service when finding Knowledge base articles Genius Result answers. To enable the second-level cache or disable use of the Now LLM Service, administrators can change the operational mode for the caches as described in this topic.

The query-time caches only support English-language searches, knowledge articles, and answers.

Cache levels

The cache includes two levels which work in different ways to improve search performance for Knowledge base articles Genius Results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

First-level cache

The first-level cache comprises a list of key-value pairs stored in memory for fast access. Each cache entry has a key that includes a search query and the sys_id of a knowledge article returned by that query. The cache entry's value includes the summary generated by the Now LLM Service for the specified search query and knowledge article.

When checking the first-level cache, AI Search compares your search query and the sys_id of your knowledge article search result to the cache entry keys. If it finds a matching key, it returns the article summary from the corresponding cache entry value. Otherwise, it goes on to check the second-level cache.

Note: The first-level cache only yields a result when your search query is an exact keyword match for the cached search query. For example, if you search for `avoiding scams` you won't get a result for a cached entry with search query `how to prevent scams` because the two search queries don't contain the same terms.

Second-level cache

The second-level cache comprises a table that is configured as an AI Search indexed source. Each record on this table is a cache entry, and includes a search query, the sys_id for an associated knowledge article search result, the summary generated for that query and knowledge article, and other fields such as pinned, sys_updated_on, and run_as. AI Search updates the index for this table whenever its records are created, updated, or deleted. This index update operation can take up to a minute.

When checking the second-level cache, AI Search queries the indexed table, looking for an entry that matches your search query and the sys_id of your knowledge article search result. If it finds a matching entry, it returns the article summary stored in the indexed table. Otherwise, it goes on to submit your search query and knowledge article search result to the Now LLM Service.

Note: Unlike the first-level cache, the second-level cache compares search query meanings using semantic vector search, so you may get a cache result even if your search query isn't an exact keyword match for the cached search query. For example, if you search for `avoiding scams` you might get the result for a cached entry with search query `how to prevent scams` because the meanings of the two search queries are similar. For more information on semantic vector search, see Semantic vector search in AI Search.

Benefits of caching

Caching for Knowledge base articles Genius Results provides the following benefits:

- Decreases average response time for common Knowledge base articles Genius Result answers
- Lowers Now Assist entitlement consumption by reducing the number of search query results sent to the Now LLM Service for Knowledge base articles answer extraction
- Increases the likelihood of returning a Knowledge base articles Genius Result answer
- Improves search consistency by returning the same Knowledge base articles Genius Result answer for similar searches

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content Security for cached queries

Because AI Search applies Content Security restrictions to your search before it matches knowledge articles and checks the caches, neither cache returns hits for knowledge articles that you don't have access to. For full details on AI Search's Content Security model, see Content security in AI Search.

Cache modes

The Knowledge base articles Genius Result answer caches support the following operational modes:

- *off*: Use the first-level cache and the Now LLM Service to find Knowledge base articles Genius Result answers.

  AI Search looks in the first-level cache for Knowledge base articles Genius Result answers that exactly match your search query and knowledge article result. If it doesn't find a matching answer, it sends your query and Knowledge article sys_id to the Now LLM Service for answer generation.

  Knowledge base articles Genius Result answers generated by the Now LLM Service populate the first-level cache.

  When using Dynamic Translation, AI Search bypasses the caches and queries the Now LLM Service to generate an answer for the Knowledge base articles Genius Result.

- *offline*: Use the first-level and second-level caches to find Knowledge base articles Genius Result answers. Don't submit queries to the Now LLM Service.

  AI Search looks in the first-level cache for Knowledge base articles Genius Result answers that exactly match your search query and knowledge article result. If it doesn't find a matching answer, it uses semantic vector search to look for answers that match the meaning of your query in the second-level cache. If no cached answers match your query and knowledge article result, AI Search returns no answer for the Knowledge base articles Genius Result.

  Knowledge base articles Genius Result answers found in the second-level cache populate the first-level cache.

  When using Dynamic Translation, AI Search bypasses the caches and returns no answer for the Knowledge base articles Genius Result.

- *online*: Use the first-level and second-level caches and the Now LLM Service to find Knowledge base articles Genius Result answers.

  AI Search looks in the first-level cache for Knowledge base articles Genius Result answers that exactly match your search query and knowledge article result. If it doesn't find a matching answer, it uses semantic vector search to look for answers that match the meaning of your query in the second-level cache. If no cached answers match your query and knowledge article result, AI Search submits the query and article sys_id to the Now LLM Service for answer generation.

  Knowledge base articles Genius Result answers generated by the Now LLM Service populate the first-level and second-level caches.

  When using Dynamic Translation, AI Search bypasses the caches and queries the Now LLM Service to generate an answer for the Knowledge base articles Genius Result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default operational mode is *off*.

Administrators can change the operational mode for the Knowledge base articles Genius Result answer caches by setting the value for the *sn_ais_assist.semantic_cache_mode* system property to *off*, *offline*, or *online*. For details on system property settings, see Add a system property.

For more details on using Dynamic Translation with ServiceNow Otto for AI Search Genius Results, see Dynamic Translation for Knowledge base articles Genius Results.

Scheduled job for cache management

The *Update Semantic Cache* scheduled job runs daily to perform the following tasks:

- Populate the second-level cache with results for the most frequently submitted queries found in the Search Event [sys_search_event] search signal table. For more information on this table, see Search signal tables.
- Purge all unpinned second-level cache entries that haven't been used in the past seven days. Search administrators can pin results in the second-level cache table to prevent them from being purged. For more details on this procedure, see Pin cached answers for Knowledge base articles Genius Results.

Pin cached answers for Knowledge base articles Genius Results

Improve performance for Knowledge base articles Genius Results by pinning frequently used answers in the second-level cache. Pinning an answer exempts it from the cache's purge mechanism.

Before you begin

The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.

Role required: ais_admin

About this task

Search administrators can pin entries in the second-level cache for Knowledge base articles Genius Result answers. The *Update Semantic Cache* scheduled job ignores pinned entries when purging the second-level cache.

Pinning frequently used entries helps improve search performance by enabling AI Search to return previously generated Knowledge base articles Genius Result answers without submitting knowledge articles to the Now LLM Service for answer generation.

To learn more about the second-level Knowledge base articles Genius Result answer cache and its usage, see Caching for Knowledge base articles Genius Results.

Procedure

1. Navigate to the ServiceNow Otto for AI Search Semantic Cache [sn_ais_assist_semantic_cache] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sn_ais_assist_semantic_cache.list`.
   c. Press **Enter**.
   Each record in this table represents a second-level cache entry. The table is populated with Knowledge base articles Genius Result answers previously generated by the Now LLM Service.
2. Update each cache entry record that you want to pin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the cache entry record by selecting it from the list view.

b. Set the value of the record's **Pinned** field to **true**.

c. Select **Update**.

Result
The *Update Semantic Cache* scheduled job ignores your pinned entries when purging the second-level cache.

External Content Q&A Genius Results

External Content Q&A Genius Results display concise, actionable AI-generated answers derived from documents in your Microsoft SharePoint Online instance.

Important: Starting with the Now Assist in AI Search 10 release, the External Content Q&A Genius Results feature is being prepared for future deprecation. This feature is no longer installed on new instances and is removed from instances where it's not in use, but will continue to be supported on instances where it's in use. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

External Content Q&A Genius Results overview

The External Content Q&A Genius Result configuration searches for documents relevant to your search using an Integration Hub subflow. If it finds sufficiently relevant documents, it sends them to the Now LLM Service, which generates answers from their content and metadata.

Each External Content Q&A Genius Result answer card includes a generated answer. For reference, the answer card also includes a link you can select to download the source documents.

Note: Because the External Content Q&A Genius Result answer is automatically generated, it's a good idea to review it for accuracy. You can provide feedback on the answer by selecting the thumbs-up icon if the generated answer is accurate, or the thumbs-down icon if it's not. Your feedback helps ServiceNow improve future versions of this Genius Result configuration.

When searching for relevant documents, the system uses your Microsoft SharePoint Online credentials and user profile, so your searches generate External Content Q&A Genius Result answers from documents that you can access.

Enabling External Content Q&A Genius Results

To make External Content Q&A Genius Results available for use in AI Search applications, administrators first need to perform the following steps:

1. Verify that the ServiceNow IntegrationHub Enterprise Pack Installer [com.glide.hub.integrations.enterprise] plugin is installed on your instance. If this plugin isn't installed, you can request it. For details on requesting IntegrationHub plugins, see Request an Integration Hub plugin.
2. Create and configure an OAuth application in the Microsoft Azure portal to verify and authorize connection requests from your ServiceNow AI Platform® instance. To learn about this procedure, see Configure OAuth application in Microsoft Azure.
3. Add the AllSites.FullControl SharePoint delegated permission (and grant admin consent) to your new OAuth application in the Microsoft Azure portal. For details on this procedure, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure SharePoint API permissions for your External Content Q&A Genius Results OAuth 2.0 application.

4. Define OAuth configuration settings for External Content Q&A Genius Results. For full details on the required OAuth settings, see Configure OAuth settings for External Content Q&A Genius Results.

Next, search administrators need to enable External Content Q&A Genius Results in one or more AI Search portals. To learn about this procedure, see Enable ServiceNow Otto for AI Search Genius Results in AI Search portals and mobile applications.

After all these steps are completed, AI Search portal users can authorize External Content Q&A Genius Results for their searches by authenticating with Microsoft SharePoint Online. For details on this authentication procedure, see Sign in to Microsoft SharePoint Online to authorize External Content Q&A Genius Results.

Note: When you activate External Content Q&A Genius Results in a search application, they're available to all users with Microsoft SharePoint Online credentials who search using that application.

Limitations

By default, External Content Q&A Genius Results only support English-language searches. Administrators can enable support for other languages by activating Dynamic Translation. To learn more about how content and answers are translated, see Dynamic Translation for Knowledge base articles Genius Results. For more details on Dynamic Translation, see Dynamic Translation.

External Content Q&A Genius Results only generate answers from documents found in your Microsoft SharePoint Online instance. They don't generate answers from sites found in your instance.

Interaction with other search features

The following table describes the interactions between External Content Q&A Genius Results and other search features.

Feature	Interaction with External Content Q&A Genius Results Genius Results
Result improvement rules	When computing External Content Q&A Genius Result answers, AI Search doesn't apply your result improvement rules because they don't operate on documents from your Microsoft SharePoint Online instance.
Stop words	When computing External Content Q&A Genius Result answers, AI Search doesn't remove stop words from your search.
Synonyms	When computing External Content Q&A Genius Result answers, AI Search doesn't expand synonyms found in your search.
Typo handling	When computing External Content Q&A Genius Result answers, AI Search doesn't correct misspelled search terms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure SharePoint API permissions for your External Content Q&A Genius Results OAuth 2.0 application

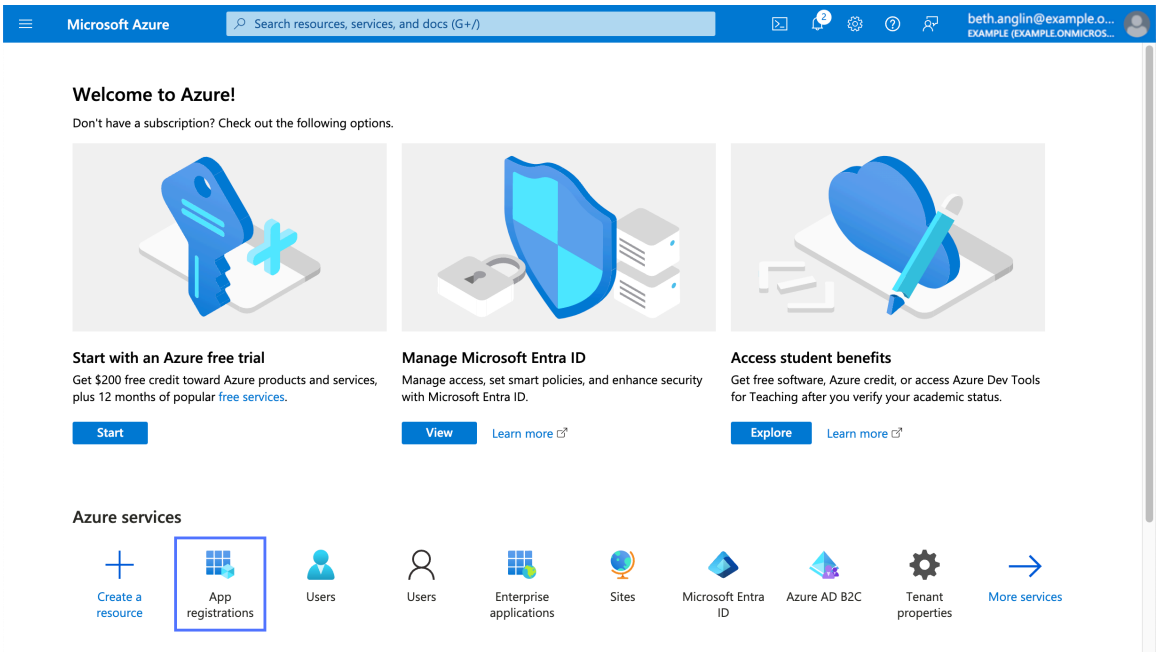
Add the AllSites.FullControl SharePoint API delegated permission to your External Q&A Genius Results OAuth 2.0 application in Microsoft Azure portal and grant admin consent to allow the application to access this permission. The OAuth 2.0 application for External Q&A Genius Results requires the delegated permission to search your Microsoft SharePoint Online sites.

Before you begin

The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.

You need to have an OAuth 2.0 application configured in Microsoft Azure portal for External Content Q&A Genius Results. For details on this procedure, see Configure OAuth application in Microsoft Azure.

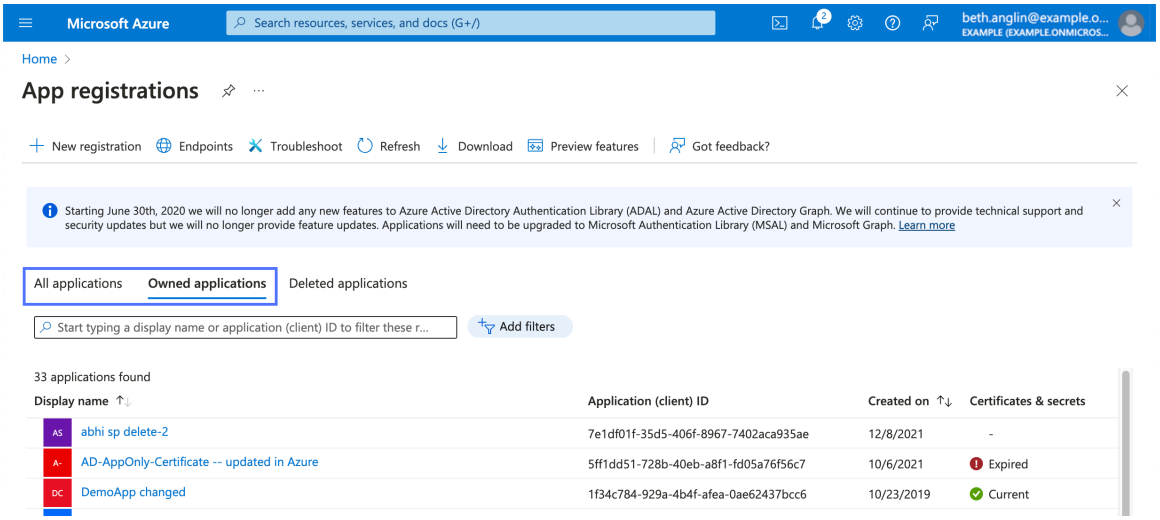
You must have permissions to change the OAuth 2.0 application's settings in Microsoft Azure portal.



Role required: admin

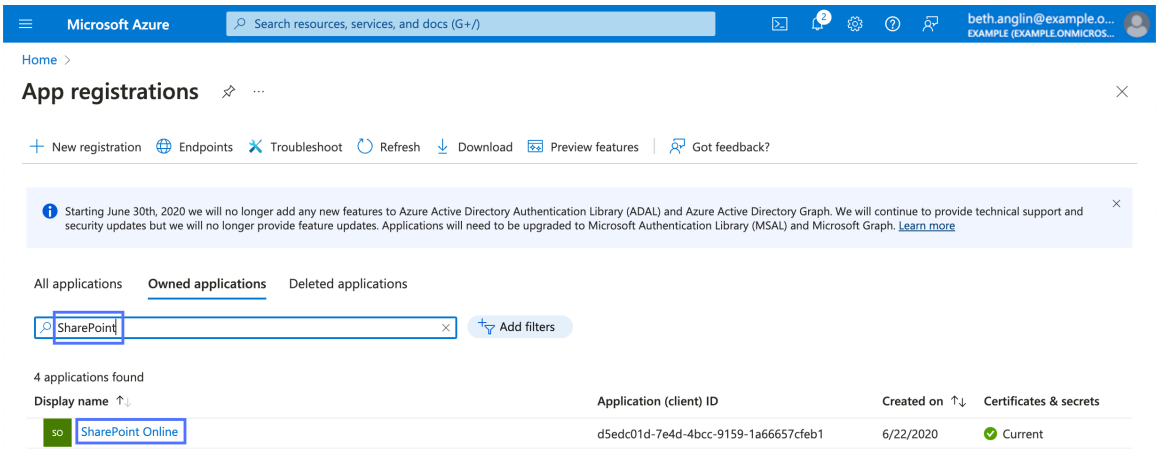
Procedure

1. Access your OAuth 2.0 application's settings in Microsoft Azure portal.



a. Log in to https://portal.azure.com/.

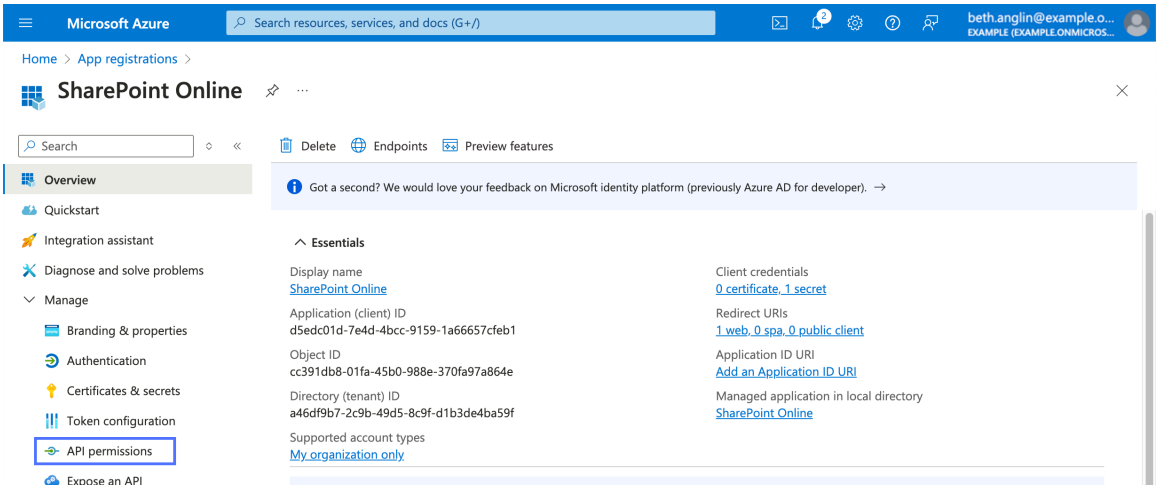
b. In the **Azure services** section, select **App registrations**.



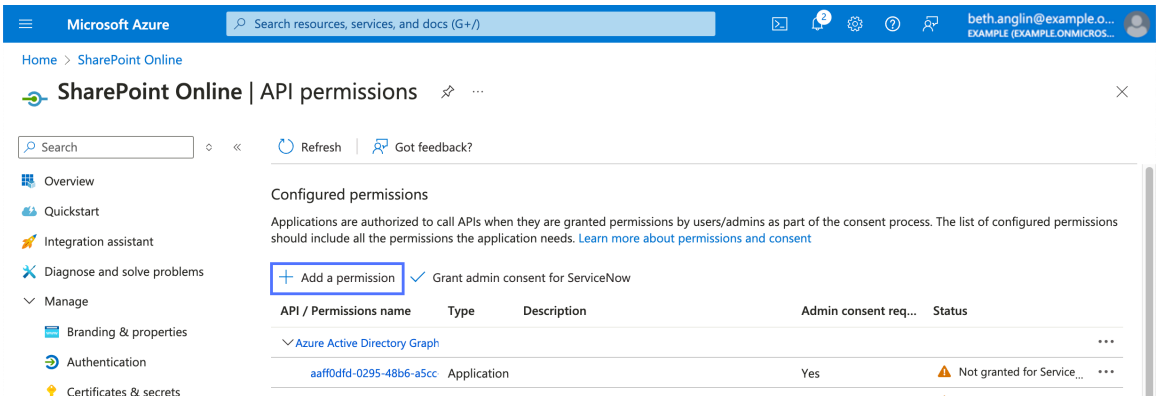
c. Select **All applications** or **Owned applications**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the search field, enter the name or application (client) ID of the OAuth 2.0 application you created for External Content Q&A Genius Results, then select that application's display name from the list of results.

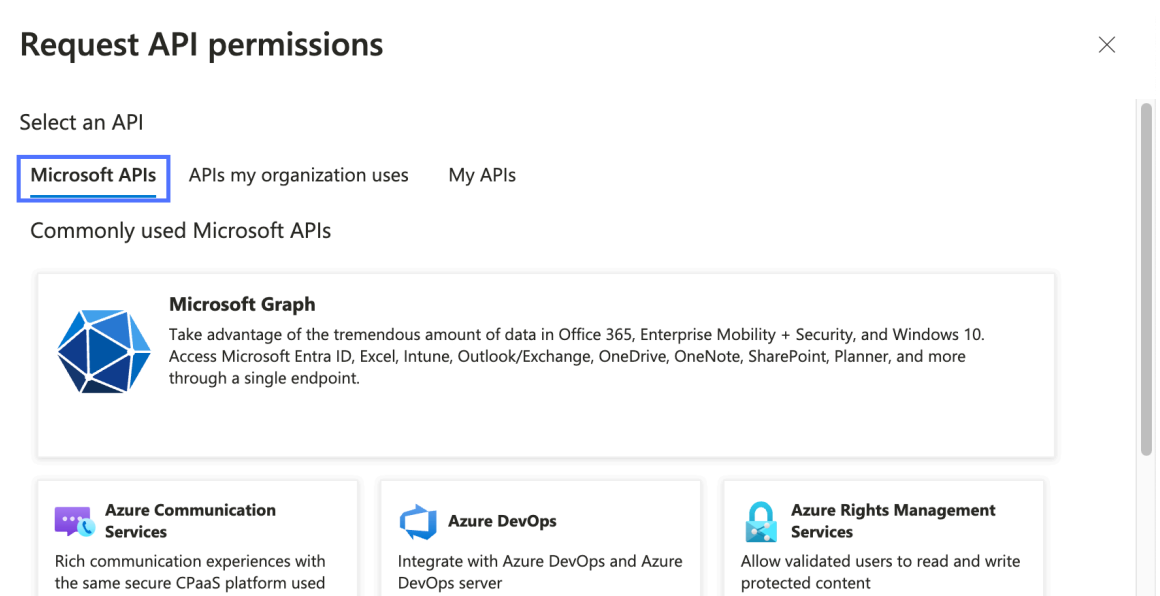


To learn how to configure an OAuth 2.0 application for External Content Q&A Genius Results, see Configure OAuth application in Microsoft Azure.

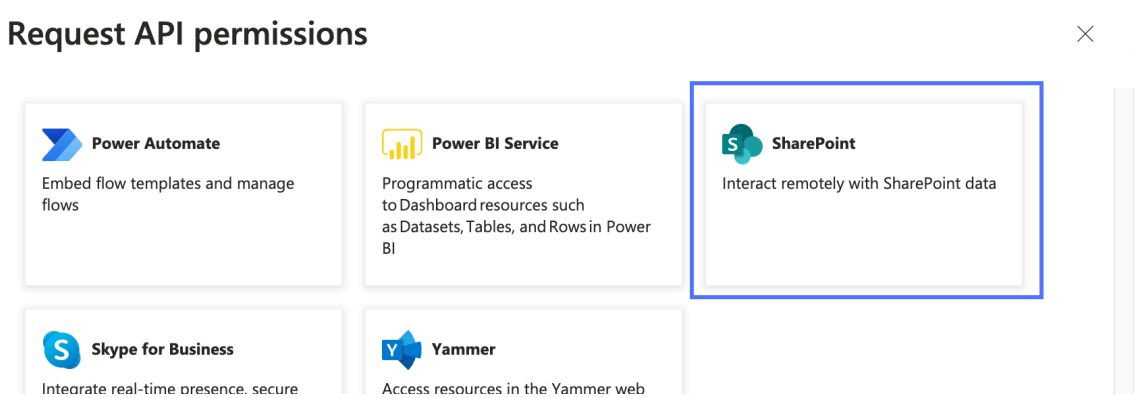


2. Add an AllSites.FullControl SharePoint API delegated permission to your OAuth 2.0 application.

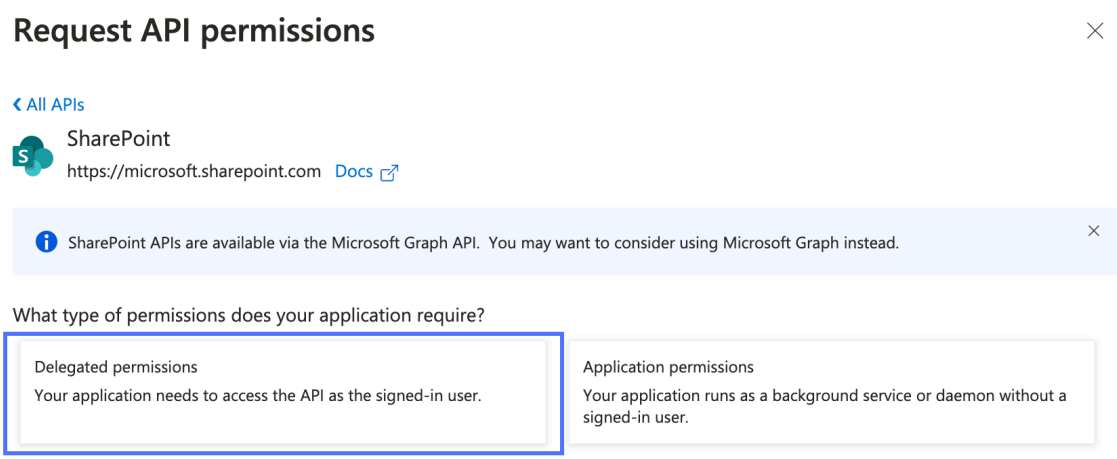
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. In the menu, select **Manage** > **API permissions**.

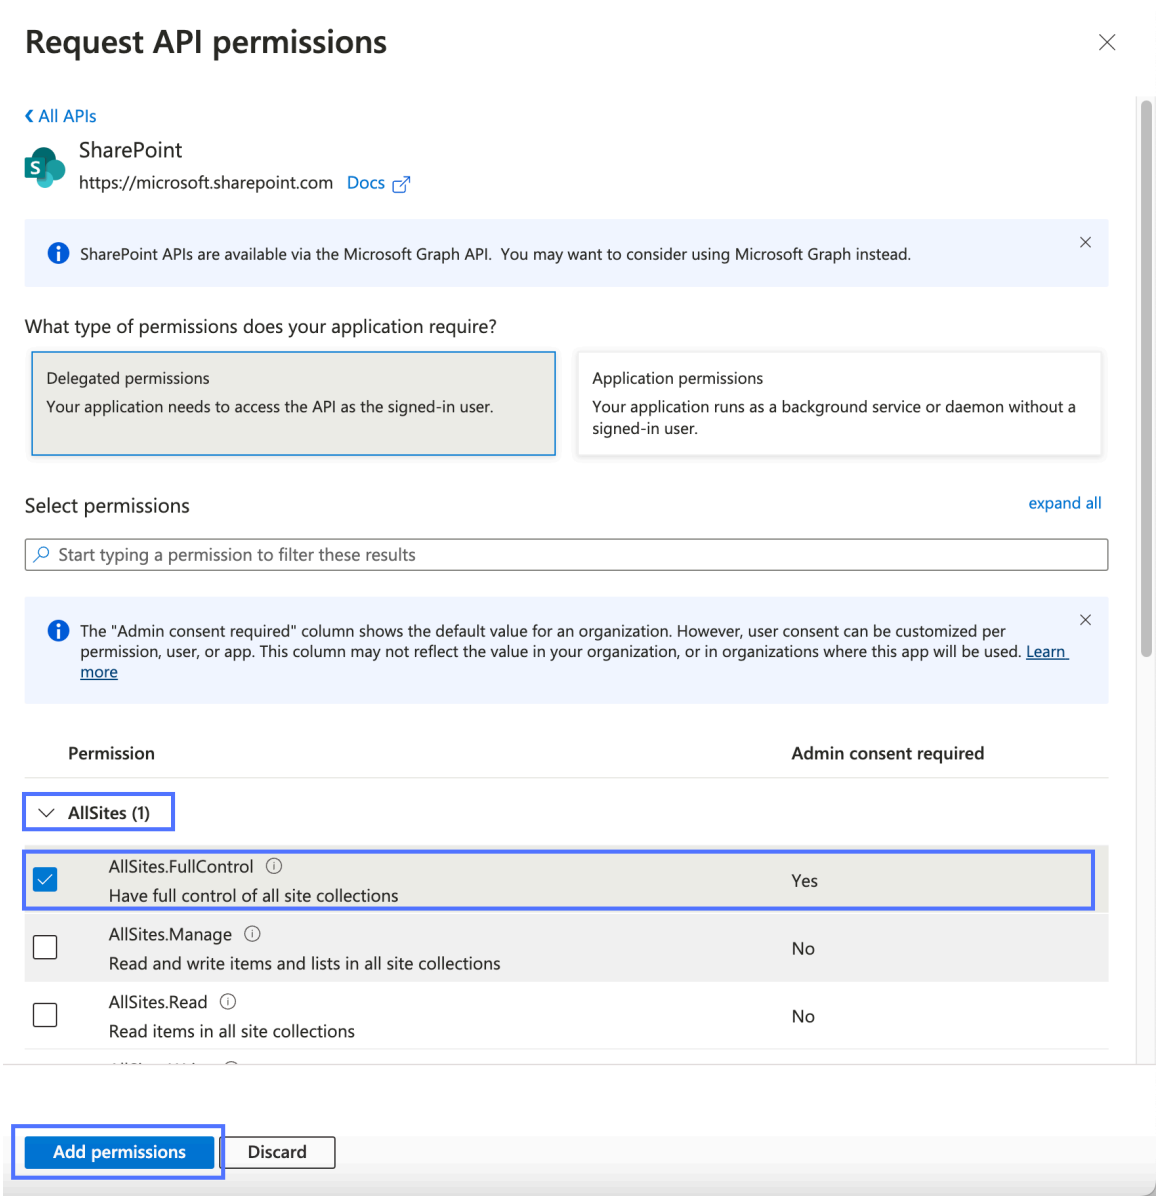


b. Under the **Configured permissions** heading, select **Add a permission**.

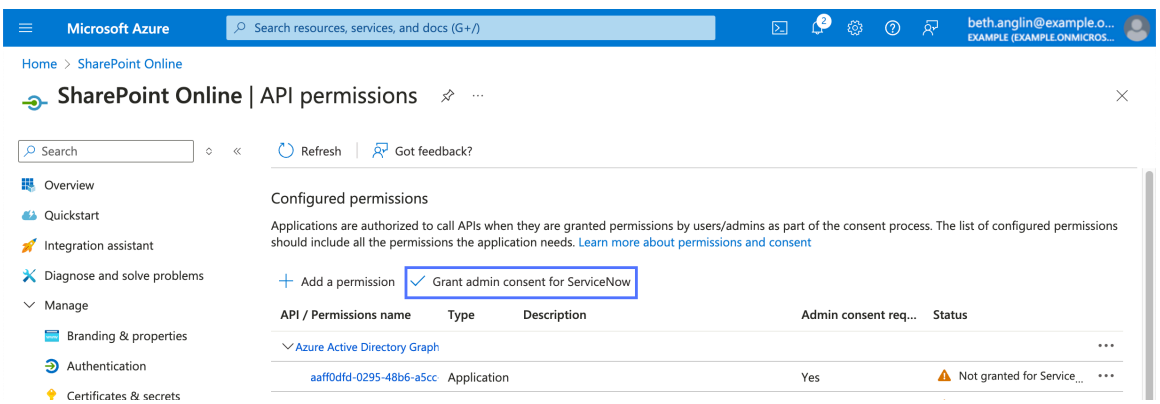


c. In the **Request API permissions** window's **Select an API** section, select **Microsoft APIs**, then select the **SharePoint** API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

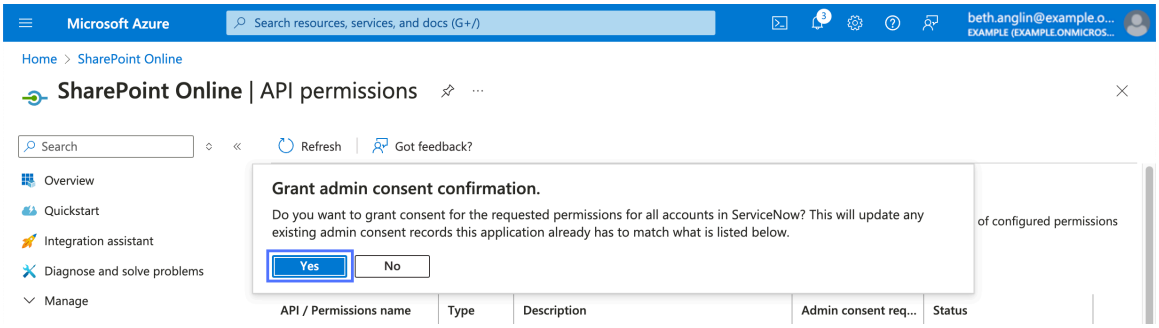


d. When prompted, select **Delegated permissions** as the type of permission to add.



e. In the **Select permissions** section, select **AllSites** > **AllSites.FullControl**, then select **Add permissions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The new AllSites.FullControl SharePoint API permission appears in the list of configured permissions with status `Not granted for` *`ServiceNow`*.

f. Under the **Configured permissions** heading, select **Grant admin consent for** *`ServiceNow`*.

g. In the **Grant admin consent confirmation** dialog box, select **Yes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The AllSites.FullControl SharePoint API permission's status changes to `Granted for` *`ServiceNow`*.

What to do next

Configure the OAuth 2.0 settings in your ServiceNow AI Platform® instance that are needed for External Content Q&A Genius Results. For details on this procedure, see Configure OAuth settings for External Content Q&A Genius Results.

Configure OAuth settings for External Content Q&A Genius Results

Configure the settings that External Content Q&A Genius Results need to interact with your Microsoft SharePoint Online instance.

Before you begin

The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.

You must have already completed the following tasks:

- Request installation of the ServiceNow IntegrationHub Enterprise Pack Installer [com.glide.hub.integrations.enterprise] plugin
- Configure OAuth application in Microsoft Azure

You will need read access to the following Microsoft Azure Portal configuration settings for your Microsoft SharePoint Online instance:

- Root site URL
- Client ID
- Client secret
- Tenant ID
- Authorization URL
- Token URL
- Token revocation URL
- Redirect URL

Role required: admin

About this task

Administrators need to perform this one-time procedure to enable External Content Q&A Genius Results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create an Application Registry record:

   a. Navigate to **All** > **System OAuth** > **Application Registry**.

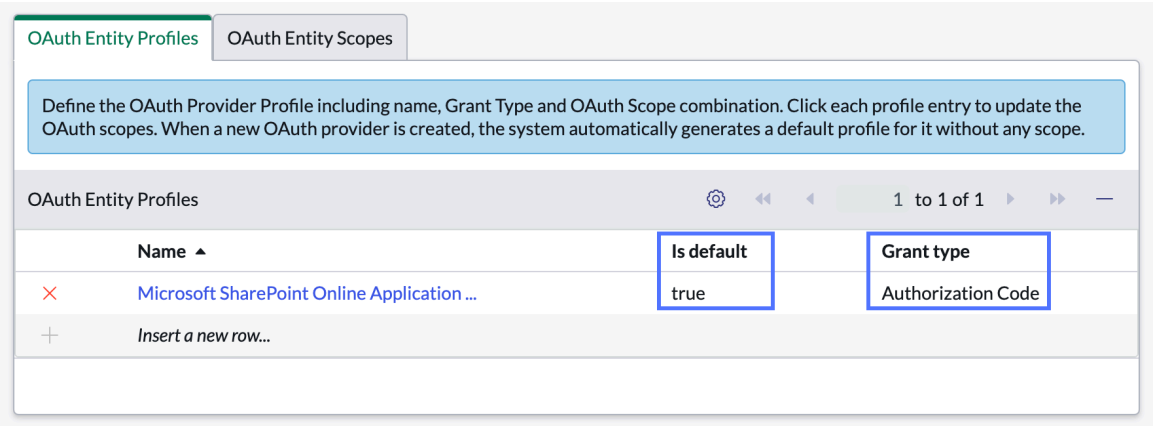
   b. Select **New**.

   c. Select **Connect to a third party OAuth Provider**.

   d. On the Application Registries form, fill in the fields:

Field	Value
Name	Enter a name of your choice for the Application Registry record.
Client ID	Enter the client ID value from your Microsoft SharePoint Online configuration on Microsoft Azure Portal.
Client Secret	Enter the client secret value from your Microsoft SharePoint Online configuration on Microsoft Azure Portal.
Default Grant type	Select *Authorization Code*.
Authorization URL	Enter the fully qualified authorization URL for your Microsoft SharePoint Online source system in this format: `https://login.microsoftonline.com/<tenant-id>/oauth2/v2.0/authorize`. Replace `<tenant-id>` with your Microsoft SharePoint Online tenant ID, as found in your Microsoft Azure Portal settings.
Token URL	Enter the fully qualified token URL for your Microsoft SharePoint Online source system in this format: `https://login.microsoftonline.com/<tenant-id>/oauth2/v2.0/token`. Replace `<tenant-id>` with your Microsoft SharePoint Online tenant ID, as found in your Microsoft Azure Portal settings.
Token Revocation URL	Enter the fully qualified token revocation URL for your Microsoft SharePoint Online source system in this format: `https://login.microsoftonline.com/<tenant-id>/oauth2/v2.0/token`. Replace `<tenant-id>` with your Microsoft SharePoint Online tenant ID, as found in your Microsoft Azure Portal settings.
Redirect URL	Enter the fully qualified redirect URL for the Integration Hub subflow in this format: `https://<instance-`

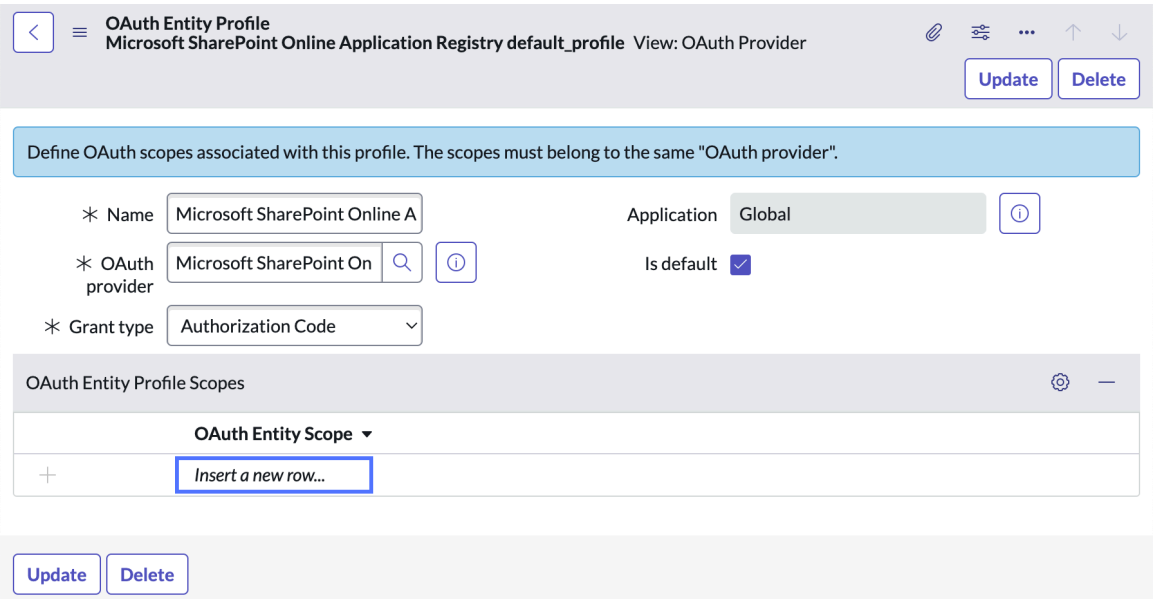
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Value
	`name>.service-now.com/oauth_redirect.do`. Replace `<instance-name>` with your ServiceNow AI Platform® instance name, as specified in your Microsoft Azure Portal settings.

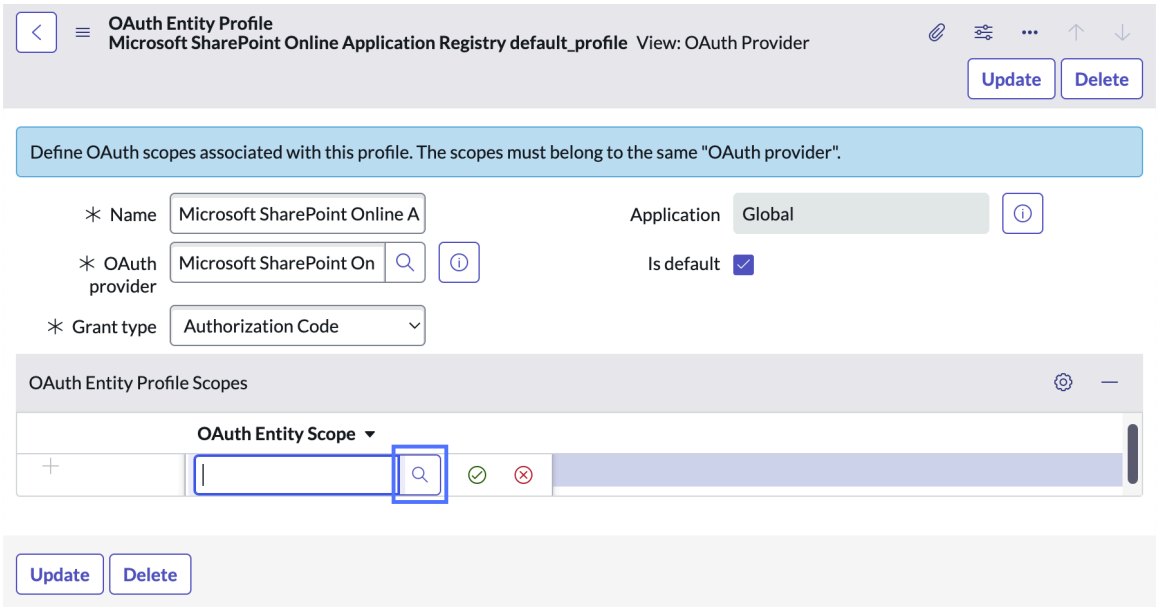
e. Select **Submit**.
The new Application Registry record appears in the table list view.

2. Define an OAuth entity scope for your new Application Registry record:

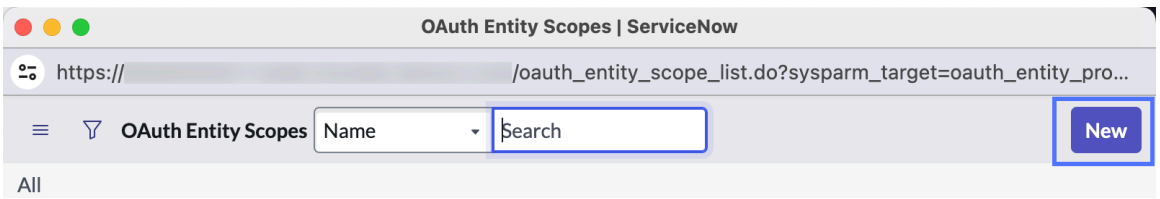


a. Open your new Application Registry record in form view by selecting it.

b. In the OAuth Entity Profiles related list, verify that an OAuth entity profile record appears with **Is default** set to *`true`* and **Grant type** set to *`Authorization Code`*.



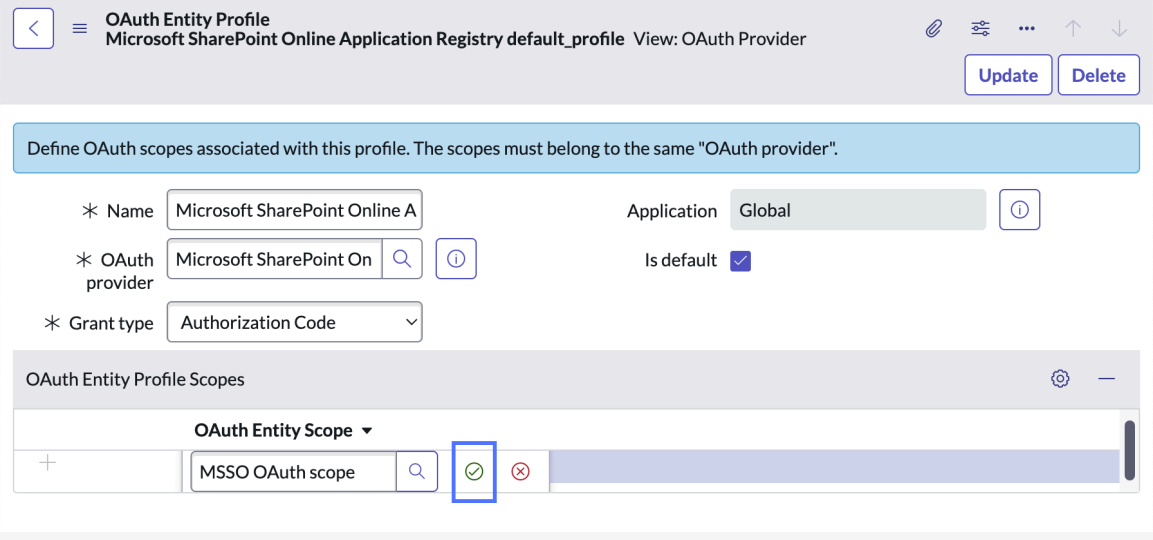
c. Open the new OAuth entity profile record in form view by selecting its name.



d. On the OAuth Entity Profile form, in the OAuth Entity Profile Scopes related list, double-click **Insert a new row**, then select the Lookup using list icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. On the OAuth Entity Scopes form, select **New**.



f. On the OAuth Entity Scope form, fill in the fields:

Field	Value
Name	Enter a name of your choice for the connection and credential alias.
OAuth provider	Select or enter the name of the Application Registry record that you created in step 1.e.
OAuth scope	Enter `offline_access https://<root-site>.sharepoint.com/.default`, replacing `<root-site>` with the name of your Microsoft SharePoint Online instance's root site. **Important:** Make sure to include the dot before `default`.

g. Select **Submit**.

h. In the OAuth Entity Profile Scopes related list, select the Save (Enter) icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The new OAuth entity scope record appears in the OAuth Entity Profile Scopes related list.

i. Select **Update**.

3. Define a connection and credential alias record for Microsoft SharePoint Online:

   a. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.

   b. Open the **MicrosoftSharePointOnlineforAISearch** alias record in form view by selecting it.

   c. In the Connections related list, select **New**.

   d. On the HTTP(s) Connection form, fill in the fields:

Field	Value
Name	Enter a name of your choice for the connection and credential alias.
Connection URL	Enter the fully qualified URL for your Microsoft SharePoint Online instance: `https://<root-site>.sharepoint.com`.

   e. To create your new connection record, select **Submit**.
   The new connection record appears in the Connections related list.

4. Define a new OAuth 2.0 credential associated with your Application Registry record:

   a. Navigate to **All** > **Connections & Credentials** > **Credentials**.

   b. Select **New**.

   c. Select **OAuth 2.0 Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. If the **Integration Type** field isn't visible on the OAuth 2.0 Credentials form, configure the form layout to make the field visible.
For details on configuring a form layout, see Configuring the form layout.

e. On the OAuth 2.0 Credentials form, fill in the fields:

Field	Value
Name	Enter a name of your choice for the OAuth 2.0 credential record.
OAuth Entity Profile	Select the new OAuth entity profile record associated with the Application Registry record that you created in step 1.e.
Integration Type	Select *Personal*.

f. Select **Submit**.
The new OAuth 2.0 credentials record appears in the Credentials [discovery_credentials] table list view.

5. Specify your new OAuth 2.0 credential as the one to use when connecting to Microsoft SharePoint Online:
   a. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
   b. Open the **MicrosoftSharePointOnlineforAISearch** alias record in form view by selecting it.
   c. In the Connections related list, select the connection record that you created in step 3.e.
   d. On the HTTP(s) Connection form, select the **Credential** field's Lookup using list icon, then select the credential that you defined in step 4.
   e. Select **Update**.

What to do next
You can optionally configure a Microsoft Keyword Query Language (KQL) query to restrict the set of Microsoft SharePoint Online sites that External Content Q&A Genius Results search for relevant documents. For details on defining this KQL query, see Restrict the Microsoft SharePoint Online sites that External Content Q&A Genius Results can search.

Restrict the Microsoft SharePoint Online sites that External Content Q&A Genius Results can search

Define a Microsoft Keyword Query Language (KQL) query to restrict the set of Microsoft SharePoint Online sites (paths) that External Content Q&A Genius Results can search for documents. Only documents that satisfy your query are eligible for External Content Q&A Genius Result answer generation.

Before you begin
The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.

Role required: admin

About this task
By default, External Content Q&A Genius Results search for relevant documents in all sites (paths) in your Microsoft SharePoint Online source system. You can restrict the set of sites

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

searched by specifying a Microsoft Keyword Query Language (KQL) property restriction query expression as the value for the *sn_ais_assist.sharepoint_search.query_filter* system property. Only documents from sites that satisfy your property restriction query are eligible for External Content Q&A Genius Result retrieval and answer generation.

To learn more about KQL property restriction queries and the operators they support, see https://learn.microsoft.com/en-us/sharepoint/dev/general-development/keyword-query-language-kql-syntax-reference.

Procedure

1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search the list for the *sn_ais_assist.sharepoint_search.query_filter* system property record.
   - If the system property record appears in the list, open it in form view by selecting it.
   - If the system property record doesn't appear in the list, add it, setting its **Type** to `string`. To learn how to add a new system property, see Add a system property.
3. In the system property record's **Value** field, enter a valid KQL property restriction query expression.
   As an example, suppose your Microsoft SharePoint Online source system is `https://example.sharepoint.com`.
   - To limit External Content Q&A Genius Result searches to documents in your Marketing and Sales sites, you might enter `path:"https://example.sharepoint.com/teams/Marketing/" path:"https://example.sharepoint.com/teams/Sales/"` as your property restriction query expression.
   - To prevent External Content Q&A Genius Results from searching documents in your Engineering and QA sites, you might enter `NOT (path:"https://example.sharepoint.com/teams/Engineering/" path:"https://example.sharepoint.com/teams/QA/")` as your query expression.

   Note: You can use KQL Boolean and inclusion/exclusion operators to combine multiple property restriction expressions into a complex query expression.
4. Select **Update**.

Result

When searching for documents in your Microsoft SharePoint Online source system, External Content Q&A Genius Results apply your property restriction KQL query as a filter. Only documents in sites that satisfy your query are eligible for retrieval and answer generation.

Sign in to Microsoft SharePoint Online to authorize External Content Q&A Genius Results

Obtain an OAuth 2.0 token from Microsoft SharePoint Online so that External Content Q&A Genius Results can find documents and generate answers when you search.

Before you begin

Only perform this task if your search results page displays this informational message: `To view results generated from SharePoint, you need to be signed in.`

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

External Content Q&A Genius Results use an OAuth 2.0 token to access your Microsoft SharePoint Online instance and search for relevant documents. The OAuth 2.0 token is specific to your Microsoft SharePoint Online user account, so your search only returns documents that you can access.

Perform this task to generate a valid OAuth 2.0 token in Microsoft SharePoint Online and authorize External Content Q&A Genius Results for your searches.

Note: How often you need to sign in depends on your Microsoft SharePoint Online instance's settings. Ask your Microsoft SharePoint Online administrator about the OAuth 2.0 token's lifespan.

Procedure

1. Select the **Sign in** link in the informational message on your search results page.
2. When prompted, enter your Microsoft SharePoint Online credentials to authenticate with Microsoft.

   Note: This login step submits your credentials directly to Microsoft. If you're unable to authenticate, ask your Microsoft SharePoint Online administrator for assistance.

3. After you're authenticated, repeat your previous search.

   Note: External Content Q&A Genius Results respect your Microsoft SharePoint Online user profile security settings. If you're not seeing an expected Genius Result answer, it's a good idea to check with your Microsoft SharePoint Online administrator to make sure you have access to the appropriate source documents.

Actions Genius Results

Genius Results display actionable answers showing Catalog Items and Virtual Agent topics that match your search query. AI Search matches records based on their similarity to your search's intent and meaning instead of looking for exact term matches.

Important: Starting with the Now Assist in AI Search 11 release, the Actions Genius Results feature is in maintenance mode. This feature will have no new enhancements but will have continued support. Similar and improved functionality is available in the newer Summary Genius Results feature. For more details on this feature, see Summary Genius Results.

Genius Results send content from your search's most relevant Catalog Item records and Virtual Agent topic records to the LLM. The LLM ranks and filters the selected records' content for display.

A Genius Result answer card can display content from up to three records. AI Search uses semantic vector search and legacy keyword search to select records that best match the meaning and intent of your search query. For more details on semantic vector search, see Semantic vector search in AI Search.

Supported record types

In Service Portal, Genius Results only operate on Catalog Items. In Virtual Agent, Genius Results operate on Virtual Agent topics as well as on Catalog Items. To learn more about Virtual Agent topics, see Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In Virtual Agent, Genius Results rank Catalog Item and Virtual Agent topic records using a unified relevancy scoring scheme. As a result, Genius Result answers may display records of either type in any order.

Activating Actions Genius Results

To enable the skill in an AI Search application, you can link the Genius Result configuration to your search profile for the search application. For details on this procedure, see Link a Genius Result configuration to a search profile.

For AI Search portal applications, you can enable ServiceNow Otto® Genius Results using the Now Assist in AI Search Setup page. For more information on this approach, see Enable ServiceNow Otto for AI Search Genius Results in AI Search portals and mobile applications.

Note: When you activate Actions Genius Results in a search application, they're available to all users who search using that application.

Limitations

Genius Results are only supported in Service Portal and Virtual Agent.

By default, Genius Results only support English-language searches. Administrators can enable support for other languages by activating Dynamic Translation. To learn more about how answers are translated, see Dynamic Translation for Actions Genius Results. For more details on Dynamic Translation, see Dynamic Translation.

If you have the External Content Connectors ServiceNow® Store application installed, Genius Results exclude search results retrieved from external content source systems when generating answers.

Interaction with other search features

The following table describes the interactions between Genius Results and other search features.

Feature	Interaction with Genius Results
Result improvement rules	When computing Genius Result answers for a search query, AI Search applies result improvement rules normally. The effects depend on the result improvement rule's action, as follows: • *block*: Genius Results don't return blocked records as answers. • *boost* or *promote*: Boosted and promoted records are more likely to be returned as Genius Result answers.
Stop words	Genius Results use a blend of semantic vector search, which doesn't support stop words, and keyword-based search. AI Search only removes stop words from keyword-based searches, so Genius Result answers may not reflect your stop words settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Interaction with Genius Results
Synonyms	Genius Results use a blend of semantic vector search, which doesn't support synonyms, and keyword-based search. AI Search expands synonyms in keyword-based searches, so your synonyms are likely to improve the relevancy of Genius Result answers.
Typo handling	When computing Genius Result answers for a search query, AI Search corrects misspelled terms in the query.

Dynamic Translation for Actions Genius Results

Dynamic Translation improves the international search experience for Catalog Items and Virtual Agent topics. When Dynamic Translation is activated, AI Search can translate searches into English before matching Catalog Items and Virtual Agent topics for inclusion in Genius Result answers, and can translate generated answers into the search user's language.

When computing Genius Result answers, the Now LLM Service only supports English-language searches for Catalog Items and Virtual Agent topics.

Dynamic Translation expands the range of languages supported by Genius Results by adding the following features:

Feature	Description
Search translation	The Now LLM Service automatically translates non-English searches into English and uses the translated search to find Catalog Items and Virtual Agent topics for inclusion in Genius Result answers.
Answer translation	When you search in a non-English language, the Now LLM Service automatically translates Genius Result answers into your search language. The Genius Result answer card displays the translated text.

To read more about the capabilities of Dynamic Translation and learn how to activate it, see Dynamic Translation.

Languages supported

Dynamic Translation works with all languages supported by the ServiceNow AI Platform®.

Configure AI Search as the source for Ask ServiceNow Otto suggestions

Enable term highlighting in enhanced chat's Ask ServiceNow Otto suggestions by configuring AI Search as the source for those suggestions.

Before you begin
You must have at least Now Assist in AI Search 15 installed.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, Ask ServiceNow Otto suggestions are generated using a prefix-based GlideAggregate query against the Utterance Suggestion [sys_suggested_utterance] table.

Admins can configure the system to use AI Search as the source for Ask ServiceNow Otto suggestions in enhanced chat. Making this change activates suggestion term highlighting in Ask ServiceNow Otto and provides improvements such as wildcard searching and lemmatization for suggestions.

For more information on Ask ServiceNow Otto suggestions in enhanced chat, see Enhanced chat.

Procedure

1. Index all content for the Ask ServiceNow Otto Suggestions indexed source.
   a. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
   b. Open the record for the Ask ServiceNow Otto Suggestions indexed source.
   c. Select **Index All Tables**.
2. Publish the Ask ServiceNow Otto Suggestions search profile.
   a. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
   b. Open the record for the Ask ServiceNow Otto Suggestions search profile.
   c. Select **Publish**.
3. Navigate to the list view for the System Property [sys_properties] table.
   a. Navigate to **All**.
   b. In the **Filter** field, enter `sys_properties.list`, then press Enter.
4. Search for the *glide.search.suggestions.utterance.use_ais* system property record and perform the appropriate steps depending on whether it exists or not.
   - If the *glide.search.suggestions.utterance.use_ais* record already exists in the System Property table, open it.
   - If no record with the name *glide.search.suggestions.utterance.use_ais* exists in the System Property table, select **New**, then enter `glide.search.suggestions.utterance.use_ais` as the name for your new system property and select *true / false* as its type.
5. On the System Property form, set the system property's value to *true*, then select **Update**.

Hybrid search in AI Search

In hybrid search mode, AI Search blends keyword search and semantic vector search to find results that best match the terms and meaning of your search. Hybrid search is usable for any indexed source that has semantic vector search enabled.

Overview of hybrid search

In older releases, AI Search performs all searches in keyword search mode. This mode looks for the best matches for your search terms, but doesn't take the context or meaning of those terms into account. The keyword search relevance score for a search result indicates how well the indexed terms in that search result match your search terms.

Starting with the Yokohama Patch 11 release, AI Search includes an alternate semantic vector search mode in features which work with the Now LLM Service. Semantic vector search analyzes the meanings and context of your search terms and uses that information to find results with

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

similar meanings. It improves search recall by interpreting natural language to more accurately reflect your search's intent. The semantic vector search relevance score for a search result indicates how closely the search result matches the meaning of your search.

Note: To learn more about semantic vector search mode and how it differs from keyword search mode, see Semantic vector search in AI Search.

Installation of ServiceNow Otto for AI Search offers a new hybrid search mode. This mode combines keyword relevance scores and semantic similarity scores into a single result ranking using Reciprocal Rank Fusion (RRF). By blending keyword and semantic vector search modes, AI Search offers the best of both worlds, providing users with both search precision and contextual relevance.

Hybrid search is automatically activated for all search application configurations (SACs) when you install ServiceNow Otto for AI Search for the first time. Upgrading an existing installation doesn't change current hybrid search settings. Users with the admin role can deactivate hybrid search for individual SACs after installation.

Note: Hybrid search applies to any indexed source that's included in the semantic index. By default, the following indexed sources ship with preconfigured semantic indexing and work with hybrid search:

- Knowledge Table indexed source [kb_knowledge table]
- Catalog Item Table indexed source [sc_cat_item table]
- Skills indexed source [sys_gen_ai_skill table]
- All External Content Connectors indexed sources [connector-specific tables]

You can manually configure additional indexed sources to be included in the semantic index, extending hybrid search to those sources as well. For details on this procedure, see Configure semantic indexing settings for an indexed source.

In portal search, hybrid search queries the default semantic field names, **title** and **body**. These default field names are specified by the value of the *glide.ais.query.default_hybrid_semantic_fields* system property. If your indexed source's semantic configuration uses non-default semantic field names, you can set the value of the *glide.ais.query.use_default_hybrid_semantic_fields* system property to **false**. With this value set, hybrid search resolves each indexed source's own semantic field mappings instead of using the default field names.

Benefits of hybrid search

Hybrid search offers these benefits when compared with keyword search.

Improved search quality and recall

Hybrid search combines keyword and semantic matching, increasing the chances of retrieving relevant results, even when users phrase their queries differently.

More relevant top-ranked search results

Understanding the intent of your search, along with matching the words you use, helps find results that match what you mean.

Fewer zero-result searches

Hybrid search can return useful results even for vague or misspelled queries because it uses semantic matching to understand meaning beyond exact keywords. This reduces the number of searches that return no results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Availability of hybrid search

Hybrid search requires installation of the ServiceNow Otto for AI Search application. This feature is available beginning in ServiceNow Otto for AI Search 15.

If you install ServiceNow Otto for AI Search without having any previous version installed, hybrid search is automatically activated for your search application configurations that use AI Search as their search engine.

Note: Search application configurations that use the legacy Zing text indexing and search engine don't support hybrid search.

If you upgrade to ServiceNow Otto for AI Search from a previous version, hybrid search isn't automatically activated for your search application configurations that use AI Search as their search engine. To learn how to manually activate hybrid search for these search application configurations in the AI Search Admin console, see Manage hybrid search in search applications.

Interactions with other features

Activating hybrid search in a search application configuration disables search result counts for facets in that search application configuration. For more information on search result counts for facets, see Show search result counts for facets on the results page for a search application.

When you activate hybrid search in a search application configuration, the behavior of the **Most recent** search result sort option changes for the specified search application. Instead of sorting the entire list of search results by last modification date, AI Search first retrieves keyword search results and the most relevant semantic vector search results, then merges those results and sorts them by last modification date. To learn about sorting search results based on recency, see Change the sort order for your search results.

Provide feedback on Summary Genius Result answers

Provide positive or negative feedback on Summary Genius Result answers.

Before you begin

You can perform this task when viewing a Summary Genius Result answer in a search portal that uses the faceted search widget.

Role required: none

About this task

Use the thumb-up and thumb-down icons in a Summary Genius Result answer to submit positive or negative feedback on the answer. Positive feedback indicates that the answer provided you with the information you were looking for. Negative feedback indicates that the answer didn't help you with your question.

Note: You can only submit feedback once per Summary Genius Result answer.

Feedback for Summary Genius Result answers is stored in the Generative AI Log [sys_generative_ai_log] and Genius Result Event Actions [sys_search_genius_result_event_action] tables. Users with the admin role can view answer feedback metadata in the Gen AI Log Metadata [sys_gen_ai_log_metadata] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Summary Genius Result answer, select the thumb icon that matches your desired feedback type.
   - If the answer provided the information you wanted, provide positive feedback by selecting the thumb-up icon .
   - If the answer did not address your question, provide negative feedback by selecting the thumb-down icon .
2. If you chose negative feedback, select the option that best explains why the answer didn't help you.
   If none of the predefined options explains why the answer didn't help you, select **Other**, then enter your own explanation into the text field.
3. Select **Submit feedback**.

Result

Your feedback is submitted for the Genius Result answer. The thumb-up and thumb-down icons for the answer become inactive, indicating that you've already submitted feedback for the answer.

ServiceNow Otto for AI Search reference

Reference information for the ServiceNow® Otto for AI Search application.

Components installed with ServiceNow Otto for AI Search

The ServiceNow® Otto for AI Search application installs new system components including scheduled jobs and Entity View Action Mapping (EVAM) configurations and templates.

Scheduled jobs installed with ServiceNow Otto for AI Search

Scheduled job	Description
Update Semantic Cache	• Populate the second-level Q&A Genius Results cache with results for the most frequently submitted queries found in the Search Event [sys_search_event] search signal table. For more information on this table, see Search signal tables. • Purge all unpinned entries in the Q&A Genius Results second-level cache that haven't been used in the past seven days. Search administrators can pin results in the second-level cache table to prevent them from being purged. For more details on this procedure, see Pin cached answers for Knowledge base articles Genius Results.

Entity View Action Mapper (EVAM) configurations installed with ServiceNow Otto for AI Search

Configuration	Description
AI Search Global - Q&A Genius Result	Contains the view configuration settings for the Q&A Genius Result configuration in AI Search for Next Experience global search.

Property	Description
	• Type: true | false • Default value: false • Location: Not present in the System Property [sys_properties] table by default. To override the default value, add this property by following the steps in Add a system property.

Auto-complete suggestion types included with ServiceNow Otto for AI Search

ServiceNow® Otto for AI Search includes an auto-complete suggestion type that displays suggested ServiceNow® Otto for Virtual Agent conversational prompts.

To learn more about how this auto-complete suggestion type appears to search and chat users, see Enhanced chat. For details on configuring and using auto-complete suggestion types in your search application configurations, see Auto-complete suggestions in AI Search applications.

Auto-complete suggestion type	Description
Now Assist Suggested Query Reader Group for <application name>	Displays Virtual Agent conversational prompts based on previous user searches (utterances) that produced synthesized Genius Result responses. Selecting a suggested prompt opens a Virtual Agent conversation within the enhanced chat window or full-page experience. ServiceNow Otto for AI Search scores conversational prompt suggestions based on how search users have interacted with and rated their synthesized Genius Result responses. Suggestions with higher scores are preferentially displayed when searching. User queries from Virtual Agent conversations are stored as suggestions in the Utterance Suggestions [sys_suggested_utterance] table. The system prunes this table and automatically removes conversational prompt suggestions that meet any of these conditions: • The conversational prompt suggestion's query and result combination haven't been used in a search within the last 180 days. • The conversational prompt suggestion refers to a record (such as a Catalog Item or a knowledge article) that has been deleted or deactivated. New conversational prompt suggestions are disabled if they match any exclusion rule entry from the Search Suggestion Exclusion List

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

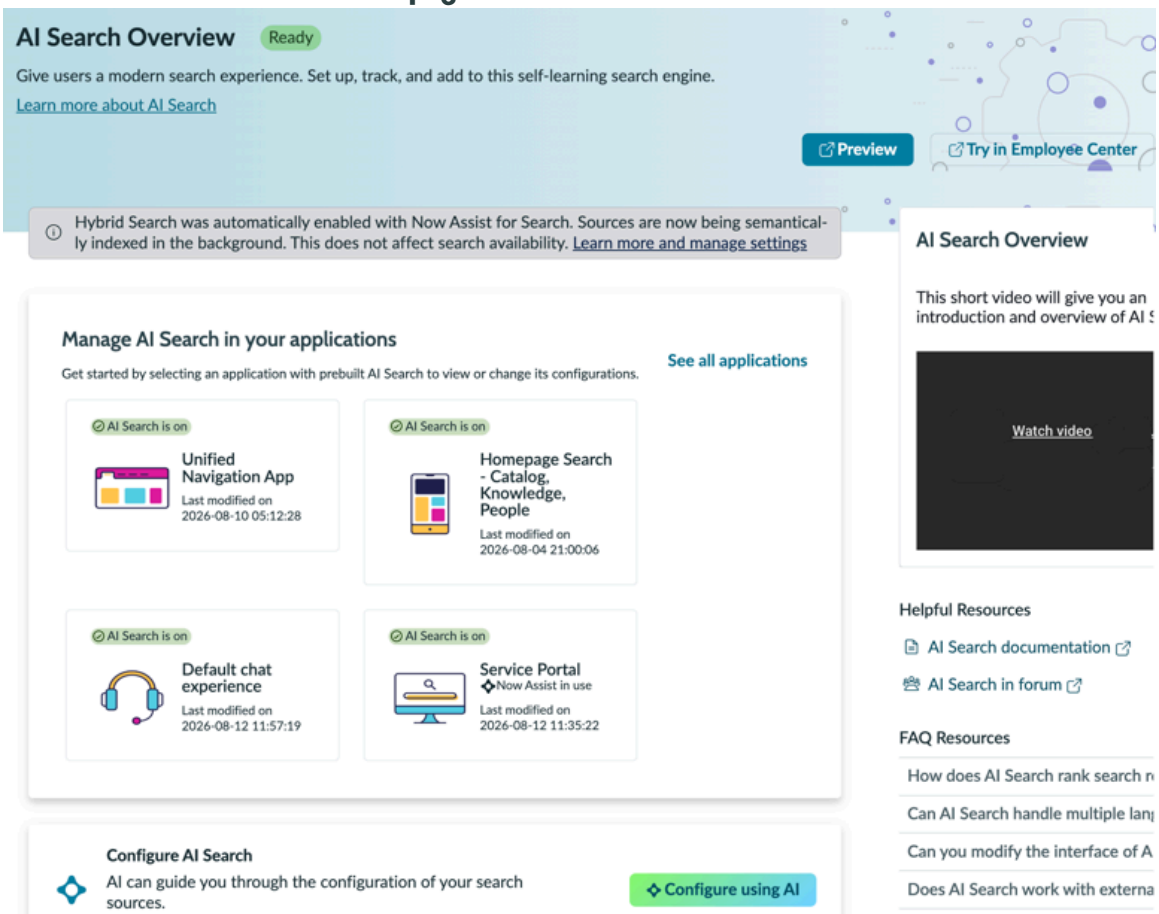
Auto-complete suggestion type	Description
	[sys_search_suggestion_blacklist] table. When a new exclusion rule is added to the Search Suggestion Exclusion List table, existing conversational prompt suggestions that match it are disabled. For details on the Search Suggestion Exclusion List table, see Prevent the creation of suggestions in special cases. Conversational prompt suggestions are only returned from the search user's domain. Only search users with the global domain can see utterance suggestions from the global domain. When you create a new search application configuration, this suggestion reader group isn't linked to it by default. If you enable enhanced chat in a search portal, this suggestion reader group is linked to the search application configuration record shared between the portal and Virtual Agent. Conversational prompt suggestions are displayed in search portals by default. To make conversational prompt suggestions available in global and workspace search, you must enable ServiceNow Otto panel enhanced chat. For details on this procedure, see Activate ServiceNow Otto panel enhanced chat. Default section header: `Ask` *`ServiceNow Otto`* Readers: ServiceNow Otto Suggested Utterance Reader **Note:** This suggestion reader group is only supported in search application configurations for applications that support the enhanced chat experience, such as the *`ServiceNow Otto`* **in VA** search application configuration.

AI Search Admin console

The AI Search Admin console application provides AI Search administrators with a no-code management tool to configure, test, and activate AI Search solutions across different types of search applications.

https://player.vimeo.com/video/1101270095?h=055f3e232d&badge=0&autopause=0&player_id=0&app_id=58479

AI Search Admin console overview



The AI Search Admin console is a central hub for managing and monitoring AI Search capabilities across search applications. It provides a streamlined experience for setting up, tracking, and enhancing AI Search configurations. This console supports both AI Search and ServiceNow® Otto for AI Search, which makes it easy to integrate advanced AI Search features.

The home page has the following sections that help search administrators understand how AI Search works and how to manage it by using the AI Search Admin console:

Manage AI Search in your applications

View and configure AI Search for supported applications. Select an application to access its settings or explore all available applications.

Indexed sources

Create, view, or edit index sources to define which data is included in the search indexes. This helps to decide which content appears in search results.

Track AI Search activity

Monitor key metrics, such as indexed documents and search queries. Refresh views or access the full dashboard for deeper insights.

AI Search with additional features

Discover and install applications and plugins to expand the AI Search capabilities in your search application.

For more information about the home page and its controls, see AI Search Admin console Home page.

AI Search Admin console benefits

- Prebuilt AI Search configurations for Service Portal, Now Mobile, Virtual Agent, and other applications that support AI Search.
- Step-by-step assistance to activate Genius Results.
- Easy access to pages that have various configuration settings.
- Performance Analytics indicators to track and monitor the search applications.

Install AI Search Admin console

The AI Search Admin console application (sn_ai_search_admin) is available from the ServiceNow® Store.

Before you begin

- Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

About this task

Installing the AI Search Admin Admin console makes the application available to users with the ais_admin or admin roles. For more information, see AI Search Admin console roles.

For information on the tasks that users can perform in the application, see Using AI Search Admin console.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AI Search Admin console (sn_ai_search_admin) application using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the application by its name or ID. If you can't find an application, you may have to request it from the ServiceNow Store.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. Select **Install**.

What to do next

Access the AI Search Admin console application by navigating to **All** > *AI Search* **Admin** > *AI Search* **Admin Home**.

Components installed with AI Search Admin console

Using AI Search Admin console

If you have the ais_admin role, you can use the AI Search Admin console to set up and manage AI Search in search applications, track AI Search activity, add features to AI Search, or access AI Search resources.

With the AI Search Admin console, you can manage advanced AI Search configurations.

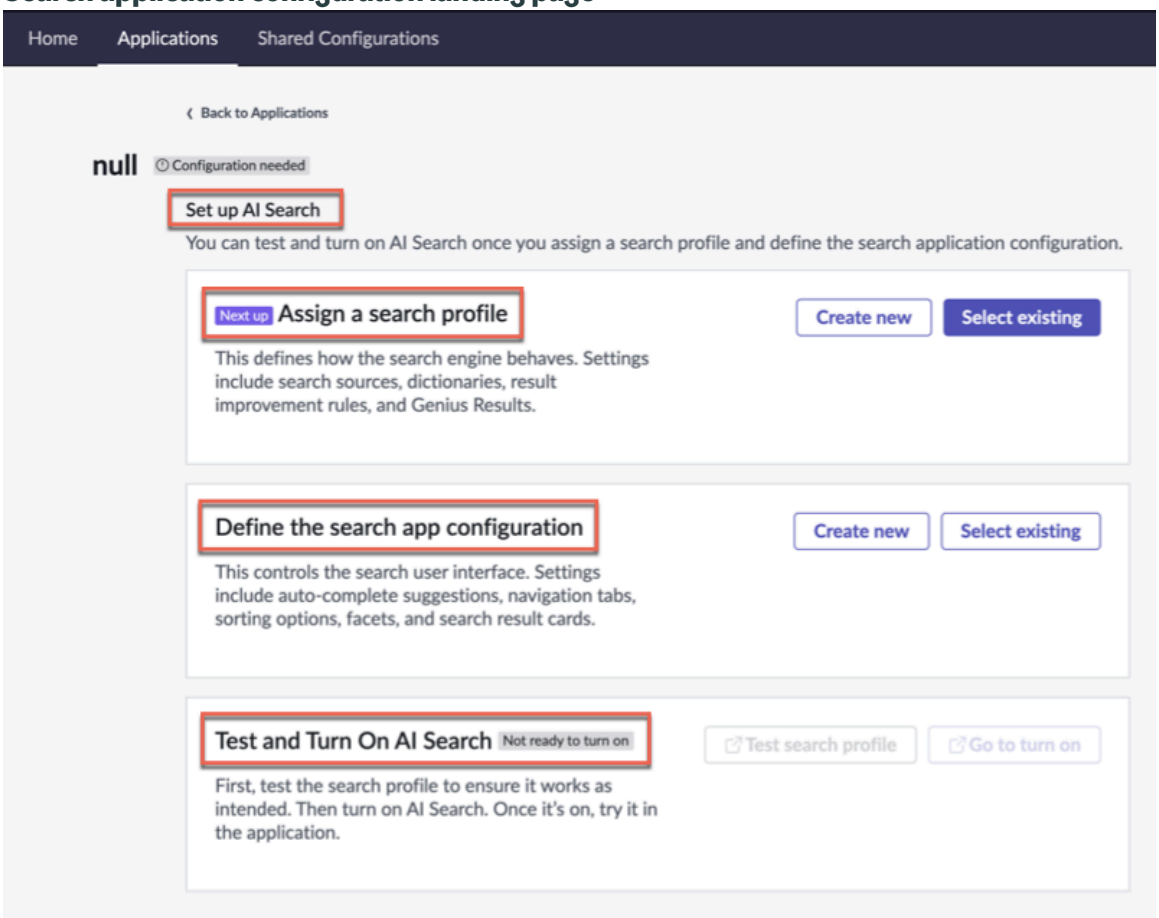
- Set up AI Search configurations to customize the search experience of your application to your needs.
- Track and monitor the usage of AI Search in the search applications.
- Adding extra features to improve the search engine functionality of your search application.
- Customize the result-card interface of search application by using Entity View Action Mapper (EVAM).
- Configure Indexed sources to make the content searchable and improves the search performance of AI Search.

Configure and manage AI Search in search applications

Configure and manage the AI Search settings for search applications that support the AI Search engine.

Before you begin

Role required: ais_admin



About this task

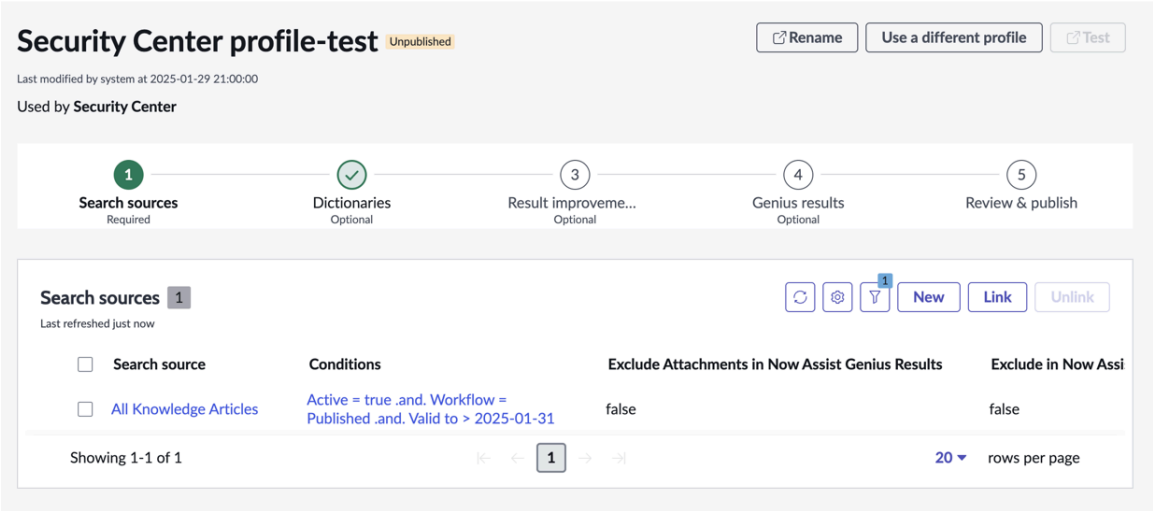
You can modify existing search application configurations, or create and configure your own search application configurations with AI Search when you specify it as the search engine. By configuring the AI Search settings for a search application, you can customize the search experience for your specific needs. To set up the AI Search configuration, you do the following tasks from the search application configuration landing page:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Assign a search profile. Create a search profile and set the search sources as a priority to define the behavior of your search application. For more information, see Search profiles in AI Search.
2. Define the search application configuration. Configure the search profile to customize the user interface of your search application. For more information, see Search application configurations.
3. Test and turn on AI Search. Display the options to test and verify AI Search in your search profile, turn on, or turn off AI Search based on its configuration status. For more information, see AI Search Admin console Applications page.

Search application configuration landing page

Procedure



1. Navigate to **All** > *AI Search* **Admin** > *AI Search* **Admin Home**.
2. In the Set up and Manage *AI Search* in your applications section, select a supported search application that you want to configure the *AI Search* settings for.
3. In the application configuration landing page, assign a search profile.

Option	Procedure
Create a new search profile	Select **Create new**. A new search profile is created automatically. You can rename it or use a different search profile. For more information about the search profile controls, see AI Search Admin console Applications page. For a description of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
	search profile field values, see Search Profile form.
Link an existing search profile	**a.** Select **Select existing**. **b.** Select a profile from the list of existing search profiles. **c.** Select **Link to application name**.

Each search profile contains the settings that determine how *AI Search* generates the search results for a search. The search profile settings include Search sources, Dictionaries, Result improvement rules, Genius results, and Review & publish.

a. Add Search sources to a search profile to make your searchable content available for your users.

- Create a search source:
  - **i.** On the **Search sources** tab, select **New**.
  - **ii.** On the form, fill in the fields.

    For a description of the field values, see Search Source form.
  - **iii.** Select **Submit**.
- Link an existing AI Search search source:
  - **i.** On the **Search sources** tab, select **Link**.
  - **ii.** From the list of existing AI Search search sources, select one or more search sources.
  - **iii.** Select **Link**.

For more information, see Search sources in AI Search.

b. Define the language-specific dictionaries of terms, such as equivalent terms (synonyms), common terms, and spell check.

- Create a AI Search term:
  - **i.** On the **Dictionaries** tab, select **New**.
  - **ii.** On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see Dictionary form.

iii. Select **Submit**.

- Link an existing AI Search term:

  i. On the **Dictionaries** tab, select **Link**.

  ii. From the list of existing AI Search dictionaries, select one or more dictionaries.

  iii. Select **Link**.

  For more information, see Search profiles in AI Search.

c. Define the Result improvement rules to boost, block, or promote the search results for specific search queries.

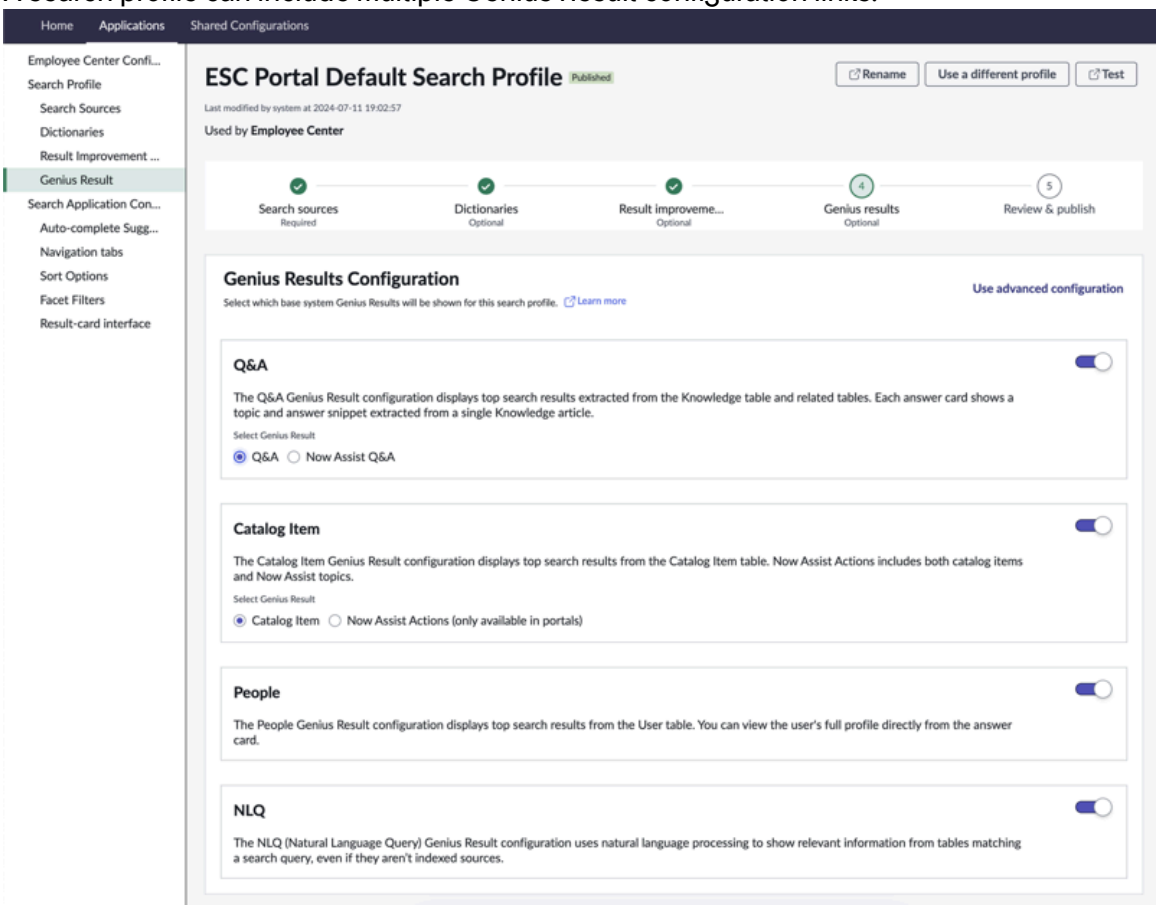
i. On the **Result improvement rules** tab, select **New**.

ii. On the form, fill in the fields.

For a description of the field values, see AI Search Results Improvement Rule form.

iii. Select **Submit**.

iv. From the Actions related list, create boost action, block, or promote documents to appear as search results.



v. Select **Update**.

For more information, see Result improvement rules.

d. Populate one or more Genius Result cards with concise, actionable answers that are derived from the relevant search results by linking AI Search Genius results configurations to your search profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A search profile can include multiple Genius Result configuration links.

i. On the **Genius Results Configuration** tab, enable base system genius results for your search profile from the list of genius result configuration options.

ii. Select **Save**.

For more information, see Genius Result configurations in the base system.

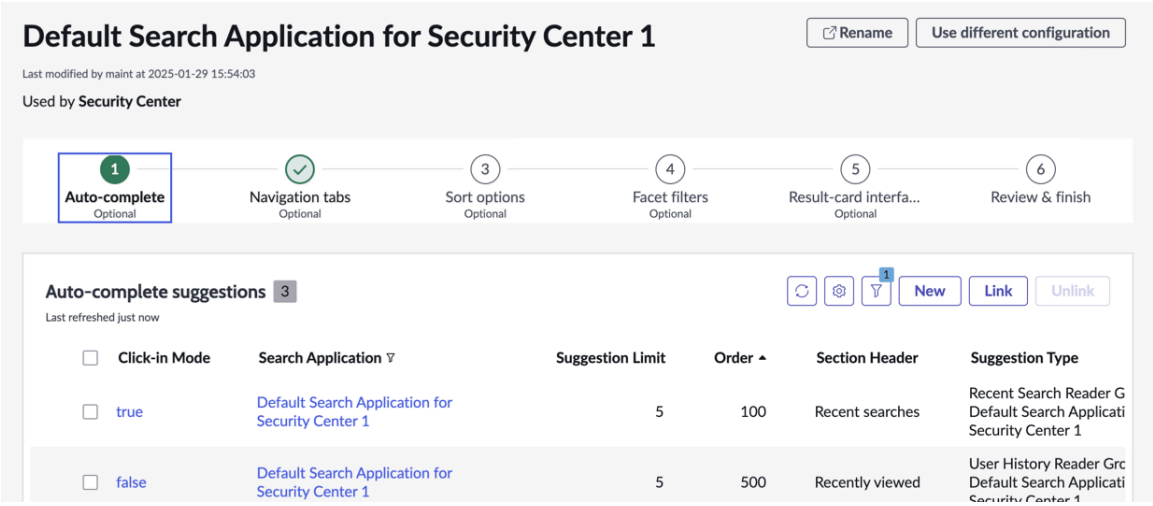
e. Review and publish the search profile to make the profile's settings active in the linked search applications.

i. On the **Review & publish** tab, review the summary of your search profile.

ii. If all configurations look correct, select **Publish Profile**.

iii. Select **Finish**.

The search profile is published and assigned to the search application.



4. Define the search application configuration.

Option	Procedure
Create a new search application configuration	Select **Create new**. A new search application configuration is created automatically. You can rename it or use a different configuration. For more information about the search application configuration controls, see AI Search Admin console Applications page. For a description of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
	search application configuration field values, see Search Application Configuration form.
Link an existing search application configuration	**a.** Select **Select existing**. **b.** Select an application from the list of existing search application configurations. **c.** Select **Link to application name**.

Each search application configuration contains the settings that determine how search results are displayed to users of the application. The search application configuration settings include Auto-complete, Navigation tabs, Sort options, Facet filters, Result-card interface, and Review & finish.

a. Display the intelligent suggestions in your search application's input field by adding auto-complete suggestions to the search application configuration.

- Create a suggestion:
  - **i.** On the **Auto-complete suggestions** tab, select **New**.
  - **ii.** On the form, fill in the fields.

    For a description of the field values, see Suggestion Reader Group form.
  - **iii.** Select **Submit**.
- Link an existing suggestion to the search application:
  - **i.** On the **Auto-complete suggestions** tab, select **Link**.
  - **ii.** From the list of existing suggestions, select one or more search application.
  - **iii.** Select **Link**.

For more information, see Auto-complete suggestions in AI Search applications.

b. Edit the display settings for navigation tabs to help users navigate within the search application to access and manage information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. On the **Navigation tabs** tab, select the **Navigation tabs List Actions icon** > **Edit columns**.

ii. On the form, fill in the fields.

For a description of the field values, see Source Facet Bucket form.

Note: AI Search automatically defines the navigation tabs for search application configurations. You can't create or delete these navigation tabs.

c. Display the search results in a specific order by defining the Sort options for your AI Search application (such as sorting the search results based on the date).

i. On the **Sort Options** tab, select **New**.

ii. On the form, fill in the fields.

For a description of the field values, see Sort Option form.

iii. Select **Submit**.

d. Define the facets to filter your searches.

Use categories that are dynamically generated from the current search results, such as filtering the search results based on the dates or keywords.

i. On the Facet filters page, select **New**.

ii. On the form, fill in the fields.

For a description of the field values, see Facet form.

iii. Select **Submit**.

e. Select the result-card interface of your AI Search application to customize the appearance and layout of search results in AI Search applications.

i. On the Result-card interface page, select **Choose**.

ii. Create or update the result-card interface for the AI Search application.

Option	Procedure
Select from the existing result-card interfaces for your search application.	1. Select **Use an existing result-card interface**. 2. From the Result card interface list, select an option.
Add a new result-card interface for your search application	1. Select **Create new interface**. 2. In the **Configuration name** field, enter the name.

iii. Select **Save**.

For more information, see Create or edit an EVAM view definition.

f. Review the search application configurations of your AI Search application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Go back to the application configuration landing page and select **Test search profile** to verify that the search application works as intended.
6. Enable AI Search in the search application by selecting **Go to turn on**.

Result
The AI Search engine is ready to use AI Search in the search application.

Add features to AI Search

Improve AI Search functionality by adding extra features through supported applications. Install the applications to expand AI Search capabilities.

Before you begin
Role required: ais_admin

About this task
Expand AI Search functionality by installing the AI Search Integration Hub spoke and the AI Search Data Labeling and AI Search for Next Experience applications. If any of these apps are installed, their card doesn't show up. If all three apps are installed, the entire section doesn't appear.

Procedure

1. Navigate to **All** > *AI Search* **Admin** > *AI Search* **Admin Home**.
2. In the Add features to *AI Search* section, select Install for the application you want to add to *AI Search*.

Access AI Search resources

Review the AI Search introductory video, follow links to the AI Search documentation and ServiceNow Community forum, or view answers to commonly asked questions about AI Search.

Before you begin
Role required: ais_admin

Procedure

Navigate to **All** > *AI Search* **Admin** > *AI Search* **Admin Home**.

Customizing the result-card interface of an AI Search application by using EVAM

You can customize the appearance and layout of the result-card interface in AI Search applications by accessing Entity View Action Mapper (EVAM) configurations from the AI Search Admin console. This helps to enhance usability, clarity of search results, making them easier to read and navigate.

Using EVAM to modify the Result-card interface overview

AI Search Admin console provides a unified platform that enables you to manage the search result interface of your AI Search application with EVAM configurations. EVAM standardizes how different data sources are displayed in cards and lists. You can create, edit, copy, view usage, activate, deactivate, or delete EVAM view configurations, and even create EVAM definitions as needed all from the AI Search Admin console. To learn more about EVAM, see Exploring Entity View Action Mapper.

The Result-card interface in AI Search applications displays a search result in clear, visual format. It includes key details, such as title, a brief description, relevant icons, and other important information. This helps users quickly understand each search result and decide which one to explore further.

The following table describes the tasks that you can do to set up the search result interface by using EVAM.

Task	Description
Map fields to display in search results	Define which fields from your data should be shown in the search results to help ensure that the most relevant information is presented to users. For more information, see View config details fields.
Configure icons for search results	Assign specific icons to different types of search results to make them visually distinct and easier to identify at a glance. For more information, see Card image fields.
Configure navigation actions	Set up actions that users can take directly from the search results, such as navigating to a related page. For more information, see Card details field.

Create or edit an EVAM view definition

Create or edit an Entity View Action Mapper (EVAM) view definition in the AI Search Admin console to customize how your AI Search results appear in the portal or workspace.

Before you begin

Role required: admin or ais_admin

About this task

An EVAM is a data source type tool that helps standardize how data appears in lists and cards. An EVAM lets you combine data from multiple sources, set up views for each source, and browse large data sets more easily. When you create or edit an EVAM definition, you can define which

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

conditions, fields, and declarative actions to use and pair them with a view template. This setup lets you customize the result-card interface to your needs.

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Applications** tab, select the application card that you want to create or edit the EVAM configurations for.
3. In the left pane, select **Result-card Interface**.
   The result-card Interface shows the configured EVAM definition. You can modify the existing EVAM definition or if you're configuring your application for the first time, you can add an EVAM definition. For more information, see step 4.
4. **Optional:** Update an existing EVAM definition or add a definition.
   - To update the existing EVAM definition for the result-card interface, select **Change**.
   - To add an EVAM definition and configure the result-card interface for the first time, select **Choose**.

   a. Create or update an EVAM definition for the result-card interface.

Option	Procedure
Select from the existing result-card interfaces for your search application	i. Select **Use an existing result-card interface**. ii. From the Result card interface list, select an option.
Add a new result-card interface for your search application	i. Select **Create new interface**. ii. In the **Configuration name** field, enter the name.

   b. Select **Save**.

5. From the Select a bundle to edit list, select an EVAM configuration bundle.
   You can link more bundles to the selected EVAM definition by selecting **Advanced configuration**. For more information, see Create an EVAM definition.
   The list of view configurations that are associated with the selected bundle are displayed.
6. Manage the EVAM view configuration.

Option	Procedure
Create an EVAM view configuration	a. Select **Create New**. b. In the Create new view config dialog box, re view the auto-populated values, and then select **Create**.
Edit the existing EVAM view configuration	a. From the View configs list, identify an EVAM view configuration that you want to edit. b. Select the **More Actions icon** > **Edit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Changes made to search result EVAM cards take effect immediately in AI Search applications.

What to do next
After creating a view configuration, you must activate it. For more information, see Activate or deactivate an EVAM view configuration.

Create a copy of an EVAM view configuration

Modify the search results of your AI Search application by creating a copy of an existing Entity View Action Mapper (EVAM) view and then changing the copy. This process is efficient, especially when the changes are minimal.

Before you begin
Role required: ais_admin

About this task
If the view configuration is shared and you need to change the result-card interface without impacting other shared instances, create a copy of the view configuration. You can verify if the view configuration is shared. For more information, see Track how your EVAM view configurations are used.

Procedure
1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Applications** tab, select the application card that you want to copy.
3. In the left pane, select **Result-card Interface**.
4. From the Select a bundle to edit list, select an EVAM configuration bundle.
   The list of view configurations that are associated with the selected bundle are displayed.
5. Hover over the desired view configuration and select the **More Actions icon** > **Create a copy**.
6. In the Copy view config dialog box, review the auto-populated values and then select **Copy**.

Result
A copy of the view configuration is added to the list.

What to do next
After copying a view configuration, you can modify it based on your requirements, such as updating the EVAM definition for the result-card interface. For more information, see Create or edit an EVAM view definition.

Track how your EVAM view configurations are used

Track where Entity View Action Mapper (EVAM) view configurations are being used in the AI Search application. EVAM helps you understand search result layouts, identify shared settings, and make adjustments for better search results.

Before you begin
Role required: admin or ais_admin

About this task
Tracking where a view configuration is used helps you:

- Understand the overall structure of the view configuration and open each component directly from the ServiceNow AI Platform record page.
- Check whether the view configuration is shared across search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Applications** tab, select the application card that you want track the usage of.
3. In the left pane, select **Result-card Interface**.
4. From the Select a bundle to edit list, select an EVAM configuration bundle.
   A list of view configurations linked to the selected bundle appears.
5. Hover over the view configuration and select **More Actions (** ⋮ **)** > **View usage**.
6. In the View usage dialog box, review the values.
7. Select **Close**.

Activate or deactivate an EVAM view configuration

Activating or deactivating the Entity View Action Mapper (EVAM) view configurations in the AI Search application helps you to control which view configurations are in use.

Before you begin
Role required: admin or ais_admin

About this task
When you configure a new EVAM view configuration for your AI Search application, you must manually activate it before it can be used.

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Applications** tab, select the application card that you want to activate or deactivate.
3. In the left pane, select **Result-card Interface**.
4. From the Select a bundle to edit list, select an EVAM configuration bundle.
   A list of view configurations associated with the selected bundle appears.
5. Hover over the view configuration that you want to activate or deactivate and then select **More Actions (** ⋮ **)** > **Activate or deactivate**.

Result
The selected view configuration is activated or deactivated.

Delete an EVAM view configuration

Delete unnecessary Entity View Action Mapper (EVAM) view configuration from your AI Search application at any time to keep the application clean and organized

Before you begin
Role required: admin or ais_admin

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Applications** tab, select the application card that you want to delete.
3. In the left pane, select **Result-card Interface**.
4. From the Select a bundle to edit list, select an EVAM configuration bundle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The list of view configurations that are associated with the selected bundle are displayed.

5. Select the **More Actions icon** > **Delete** at the end of the view configuration row that you want to delete.

Result
The selected view configuration is permanently deleted.

Manage hybrid search in search applications

Control hybrid search settings in AI Search applications to optimize search performance. Activate hybrid search to create context-aware results that provide both search precision and contextual relevance. Deactivating hybrid search generates results that rely solely on keyword-based queries.

Before you begin

- Starting with ServiceNow Otto for AI Search version 15.0.
- Must have at least one indexed source with semantic fields and semantic indexing configured.

Role required: ais-admin

About this task
Hybrid search helps users find relevant content more easily, even when they don't use the exact words in the content. For most experiences, it improves the relevance of results, especially when users search with questions or descriptive phrases. If users typically search for exact values, such as record numbers, IDs, or codes, keyword search may provide more predictable results. For more information, see Hybrid search in AI Search.

Upgrading an existing installation doesn't change current hybrid search settings. Users with the admin role can activate or deactivate hybrid search for individual SACs after installation.

Procedure

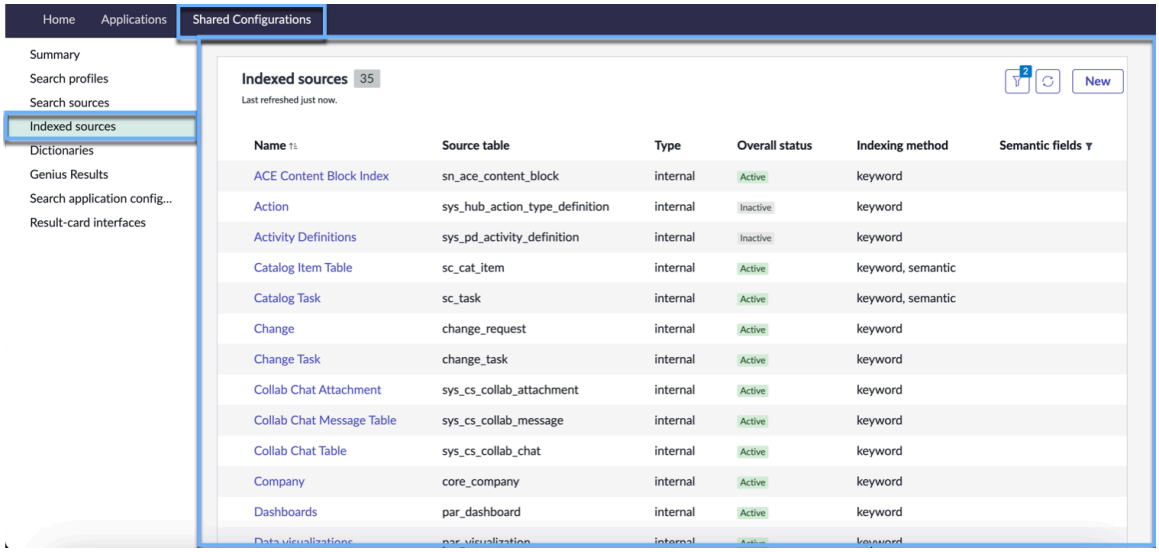
1. Navigate to **All** > *AI Search* **Admin** > *AI Search* **Admin Home**.
2. From , select the search application.
3. Manage the hybrid search mode.
   - Enable the **Hybrid search** toggle to switch on the hybrid search mode.
   - Disable the **Hybrid search** toggle to switch off the hybrid search mode.

Result
Hybrid search mode is updated for the selected application.

What to do next

Managing indexed sources from the AI Search Admin console

If you have the ais_admin role, you can create, view, or edit indexed sources directly from the AI Search Admin console.



Indexed sources overview

Indexed sources are ServiceNow AI Platform® tables and external documents that you want to make searchable. AI Search then adds the content from these sources to its search index. The configuration for the indexed sources is shared by AI Search and other applications. For more information, see Indexed sources in AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indexed sources table

The following example shows the indexed sources configuration table in the Shared Configuration tab of the AI Search Admin console. From here, you can view, edit, or create indexed sources.

Indexed sources table

The Indexed sources configuration table displays key details of existing indexed source, such as name, source table, type, status, and more.

Indexed sources table

Field	Description
Name	Unique name of the indexed source.
Source table	ServiceNow AI Platform table to index.
Type	Type of the source table selected for indexing. It can be either an internal ServiceNow AI Platform table or an external document.
Overall status	Status of the indexed source: **Inactive** The indexed source isn't searchable and overrides other statuses. **Never indexed** The indexed source is active, but it has never been full indexed. This status can be combined with the **Reindex required** status. **Index in progress** The indexed source is being indexed manually. **Reindex required**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indexed sources table (continued)

Field	Description
	The indexed source configuration is updated and the source must be indexed again. **Active** The index is active and no changes have been made to the configuration since the last full index.
Indexing method	Methods used in information retrieval systems, such as AI Search to organize and retrieve text-based data by selecting either keyword or semantic: **Keyword** Helps to identify and index-specific keywords or phrases from the text. **Semantic** An advanced semantic vector search that goes beyond keywords. This method helps to understand the meaning or context of words within a document.
Semantic fields	Name of the fields that are configured to index for a semantic vector search.

Create an indexed source from the AI Search Admin console

Define an indexed source to make content and metadata from ServiceNow AI Platform table records searchable by using AI Search.

Before you begin

Role required: admin or ais_admin

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Shared Configurations** tab, select the **Indexed Sources** tab.
3. Select **New**.
4. On the form, fill in the fields.
   For a description of the field values, see Indexed Source form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You may see more field values on the form that aren't visible on your user interface. Make sure that you fill in all the required fields and ignore the extra fields.
- You can't create more than one indexed source for a single ServiceNow AI Platform table.

5. Select **Save**.

What to do next

To control how your new indexed source processes source records and fields during indexing, configure its indexed source attributes and field settings. For more information, see Set up a field configuration for an indexed source.

To make content from internal indexed sources and source records searchable, perform a full table index for your new indexed source. For more information, see Index the content from an indexed source for searchability.

Define the semantic indexing configuration for an indexed source

Define the semantic indexing configuration for your indexed sources so that AI Search can analyze and understand your content accurately. By doing this process, you can help to ensure that you get more relevant search results.

Before you begin

Role required: ais_admin

About this task

AI Search indexes content from the indexed source for use with a semantic vector search. The group of semantic indexing settings for a particular indexed source is called a semantic index configuration. For more information, see Semantic index configuration for indexed sources.

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Shared Configurations** tab, select the **Indexed Sources** table.
3. Select the indexed source that you want to configure the semantic indexing settings for.
   The selected indexed source opens in the Configuration form view.
4. In the Semantic indexing configurations section, select **Edit**.
5. On the Semantic Indexing form, select **Create**.
6. On the form, fill in the fields.
   For a description of the field values, see Semantic Index Configuration form.
7. Select **Save**.

   The Semantic indexing configuration form reloads and displays your selected field values and the Semantic fields section.

8. In the Semantic fields section, follow these steps for each field that contains the content you want to include in the semantic index for the specified indexed source.

   a. Select **Add**.

   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see Semantic Index Field form.

c. Select **Add**.

The new semantic field configuration appears in the Semantic fields section.

What to do next

After updating the semantic index configuration settings for an indexed source, you must index or reindex the content from that indexed source. For more information, see Index the content from an indexed source for searchability.

Index the content from an indexed source for searchability

Enable AI Search to index the records from your source tables to make the content searchable.

Before you begin

Role required: ais_admin

About this task

You can index the existing records in the source table and any child tables that you set up for indexing. If you add, change, or remove an indexed source attribute, or update indexed values for fields on referenced tables, you must reindex the content from an internal source. You can do it manually by following the steps given in the procedure again. For more information, see Indexing content from AI Search indexed sources.

You can also index the content from an indexed source for external documents. For more information, see Indexing and searching external content in AI Search.

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Shared Configurations** tab, select **Indexed Sources** .
3. Select the indexed source that you want to index.
   The selected indexed source opens in the Configuration form view.
4. Select **Start index job**.
5. Start indexing.

Option	Procedure
Enable AI Search indexing content from internal indexed sources, including both parent table and its child tables	**a.** Select **Full index**. **b.** Select **Start**.
Enable AI Search indexing content from the source tables, including only the selected child tables	**a.** Select **Select source tables to index**. **b.** Select the source tables that are defined in the indexed source from the **Tables** field. **c.** Select **Start**.

   The AI Search Indexed Source History page appears.
6. **Optional:** To monitor the progress of the indexing task, refresh the AI Search Indexed Source History form page.
   When the task completes, the **Ingestion State** field of the indexed source shows its status as indexed.
7. Return to the list of indexed sources by selecting the back icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
AI Search indexes content from existing records in the indexed source. Indexing continues on a scheduled basis. You must repeat this task for the indexed sources if you want to reindex their content before the next scheduled indexing run.

What to do next
Define search sources to make searchable content from the indexed source available in user search experiences. For details on creating search sources, see Create or edit an EVAM view definition.

Set up a field configuration for an indexed source

Set up indexed source field configurations to control how AI Search indexes content for a specific field in your source table records.

Before you begin
Role required: ais_admin

About this task
A field setting controls the indexing behavior for a specified field (column) on all records from an indexed source. For more information, see Field settings for AI Search.

Procedure
1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Shared Configurations** tab, select **Indexed Sources**.
3. Select the indexed source that you want to configure the fields for.
   The selected indexed source opens in the Configuration form view.
4. In the Field configurations section, select **Edit**.
5. Select **Create**.
6. On the form, fill in the fields.

Create field configuration form

Field	Description
Field configuration	Options to adjust the indexing behavior for source record fields in anAI Search indexed source. You can select a field setting from the following list of options: • **Exclude field from index**: Option to exclude content from a specific field in your records from being searchable in AI Search. • **Exclude field from search**: Option to disable search matching for content that is indexed from the selected field. • **Include calculated field in index**: Option to enable indexing of searchable content from the calculated field values. • **Include dot-walk fields in index**: Index reference and display values from the reference field's source table for use in search filters and result configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Remap AI Search fields**: Option to map the selected field from the indexed source table to an AI Search index field. AI Search fills the index field with the value from the source field when indexing records.
Source	Specific table from the indexed source that the field setting applies to.
Field	Record field that the field setting operates on. The name of this field changes based on the selected field configuration. • If you have selected any of the exclude options, the field name is **Field to exclude**. • If you have selected the **Include calculated field in index** option, the field name changes to **Calculated field**. • If you have selected the **Include dot-walk fields in index** option, the field name changes to **Reference field**.
Add dot walk fields	Option to add a dot walk field. This field appears only if the **Include dot-walk fields in index** option is selected in the field configuration.
Searchable	Option to enable the field keyword searchable. This field appears only if the **Include dot-walk fields in index** option is selected in the field configuration.
Map to AI Search field	AI Search index field to match the specific field from your indexed source table.
Map as raw value	Option to map to the underlying sys_id for a reference field.

7. Select **Save**.

Result
The new field setting appears in the Field configurations section.

What to do next
To make the new field configurations take effect, perform a full table reindex for the indexed source. For more information, Index the content from an indexed source for searchability see

Set up an indexed source attribute for indexing the search content

Set up an indexed source attribute to control how AI Search indexes content for all records in a source table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: ais_admin

About this task
An indexed source attribute defines how records from an indexed source table are indexed in AI Search. For example, with indexed source attributes, you can control which records to index, how to handle specific data types, such as attachments or tags, and whether to include translated fields in the index. These attributes help customize the indexing process to your needs. For more information, see Indexed source attributes for AI Search.

Procedure
1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. On the **Shared Configurations** tab, select **Indexed Sources**.
3. Select the indexed source that you want to configure the attributes for.
   The selected indexed source opens in the Configuration form view.
4. In the Advanced configurations section, select **Edit**.
5. Select **Create**.
6. On the form, fill in the fields.

Create field configuration form

Field	Description
Attribute	Options to adjust indexing settings for an AI Search indexed source. You can select an attribute from the following list of options: • **Index tags**: Control indexing of tags from indexed records. • **Translated fields**: Control indexing of translated fields from indexed records. • **Translated reference fields**: Control the indexing of translated reference fields from the indexed records. • **Attachments**: Control the indexing of attachments from indexed records.
Source	Specific table from the indexed source that the attribute applies to.
Which tags should be indexed	Type of tags to be indexed. You can select either option, shared tags and globally visible tags, or only globally visible tags, This field appears only if the Index tags option is selected in the attribute field.
Action	Option to enable or disable the indexing of a selected attribute. This field appears for all attributes except the Index tags.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.

Result
The new indexed source attribute is added in the Advanced configurations form.

Configure multimodal captioning for AI Search

Use the AI Search Admin console to select the visual language model (VLM) provider and model for multimodal captioning.

Before you begin

- The Platform Multimodal Service plugin (com.glide.platform_mm_service) must be installed on your instance. If the plugin is not installed, multimodal captioning options will not appear in the AI Search Admin console. For more information, see Activate the Platform Multimodal Service plugin.
- Role required: ais_admin

About this task
When multimodal captioning is activated, attachments retrieved from supported sources are automatically analyzed and given descriptive captions, making visual content, such as images, discoverable through text-based search. You can specify the VLM provider and model to use when generating captions.

Procedure

1. Navigate to **All** > *AI Search* **Admin** > *AI Search* **Admin Home**.
2. Select **System Properties**.
3. In the Multimodal captioning section, select a **Provider** from the drop-down list.
   A provider is the VLM you want to use for captioning.

   Note: If your preferred provider is not listed, use the AI Control Tower (AICT) to configure approved third-party LLMs. For more information, see Configure third-party LLMs using AI Control Tower. NowLLM doesn't support this feature.

   The corresponding **Model** options appear.
4. Select a **Model** from the drop-down list.
   A model is a specific version of AI offered by the provider.
5. Select **Save**.

Result
Changes to the provider and model take effect immediately for multimodal captioning.

What to do next
AI Search administrators have additional configuration options available, as follows:

- AI Search administrators can activate multimodal captioning for individual AI Search indexed sources. For details on this procedure, see Activate multimodal captioning for attachments from an indexed source.
- Connector administrators can activate multimodal captioning in the crawl settings for an external content connector. To learn about configuring crawl settings for external content connectors, see Configuring crawl settings for external content connectors.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure multi-content synthesized sources

Configure indexed sources so that AI Search includes content from multiple sources when generating responses. When you configure a source for synthesis, the large language model draws from that source alongside others to produce more complete, contextually relevant answers.

Before you begin

This task assumes you have completed the ServiceNow Otto for AI Search setup and are ready to activate sources for AI-generated responses.

- The ServiceNow Otto for AI Search ServiceNow® Store application must be installed on your instance. For details on installing this application, see Install ServiceNow Otto for AI Search.
- The source must be added to the search profile as a search source. For more information, see Create a search source for AI Search.
- The source must be configured as a hybrid source with semantic fields and semantic indexing configured. For more information, see Manage hybrid search in search applications.

Role required: admin

Procedure

1. Navigate to **All** > *AI Search* **Admin** > *AI Search* **Admin Home**.
2. Select **Application** > **Service Portal** > **Search Sources**.
3. Select the **Include in AI responses** toggle next to the source you want to activate.

   Sources that aren't configured as hybrid sources with semantic indexing can't be activated for synthesis and won't display the toggle.

   Selecting the toggle triggers a confirmation dialog to complete the activation.
4. Select **Submit**.

Result

The toggle now shows as activated and results from this source are now included in AI-generated responses. Citations for the additional sources appear as references within the synthesized answer. Select a citation to view the original record.

What to do next

After activating sources, run a test search to confirm AI-generated responses include content from this source. If results from this source don't appear in AI-generated responses, verify that the source still shows as a hybrid source with semantic indexing active and rerun the steps. Configuration changes after initial setup can affect synthesis eligibility.

For more information about multi-content synthesized sources, see Generate multi-content synthesized responses.

AI Search Admin console reference

Reference information for the AI Search Admin console application.

Components installed with AI Search Admin console

The AI Search Admin console application installs new system components.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

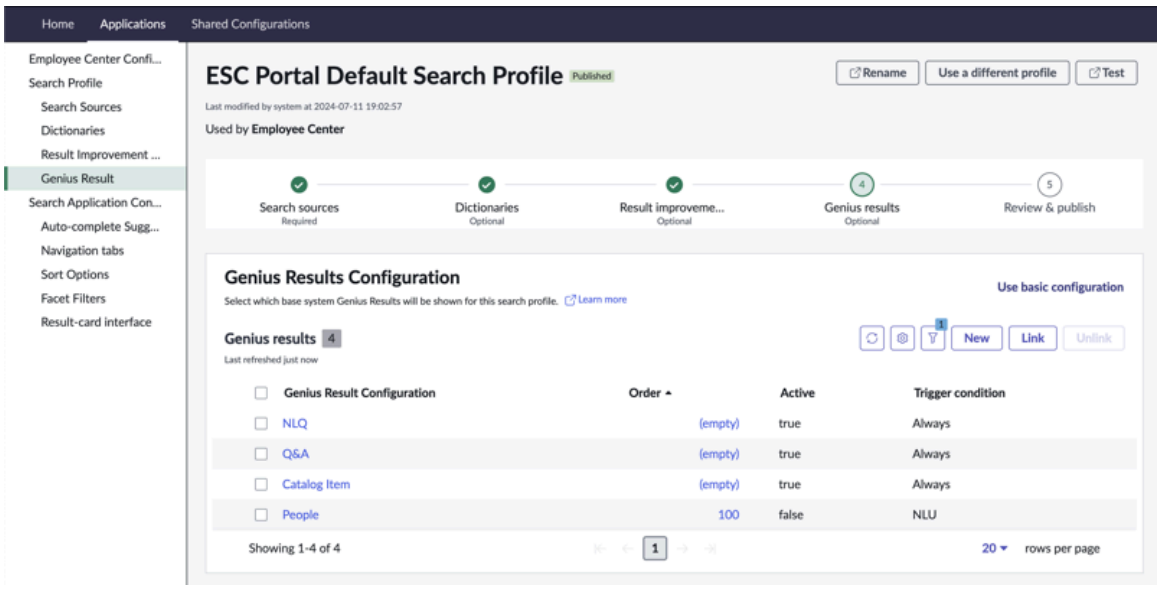
Genius Results

Genius Results are an optional part of your Search Profile that displays the best results for search queries. You can view Genius Results configuration in basic and advanced configuration. For more information, see Genius Results and Create a Genius Result configuration.



Genius Results basic configuration controls

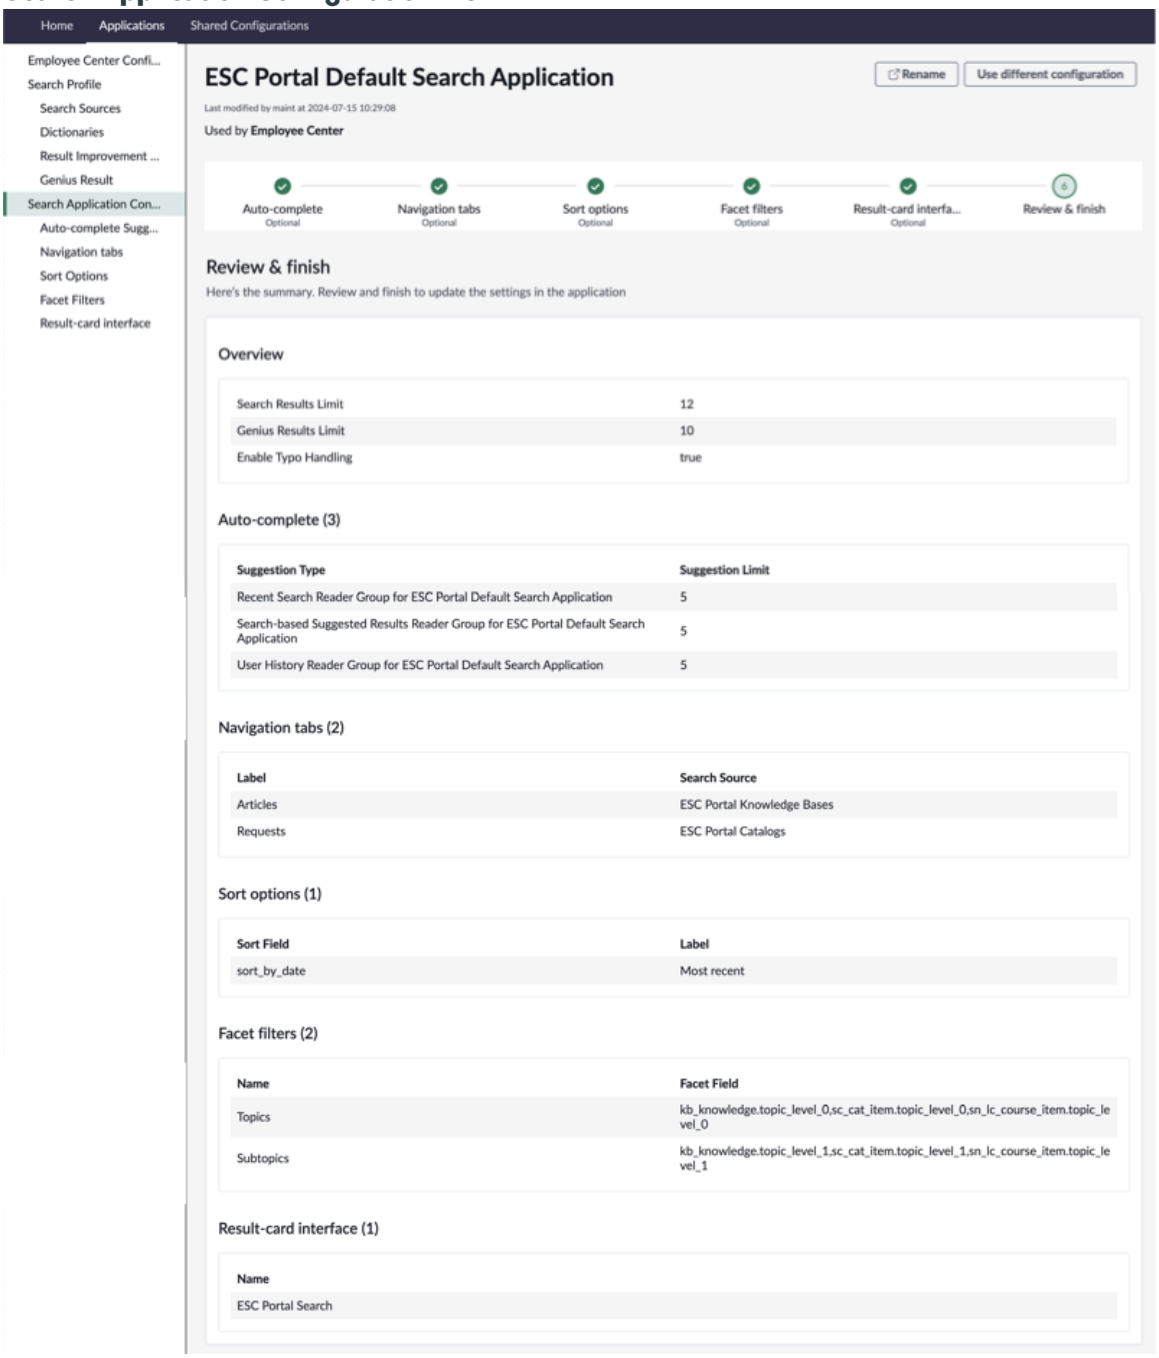
Field	Description
Use advanced configuration	Select to switch to advanced configuration.
Q&A	Toggle to display top search results from the Knowledge table and related tables. Select from two options: • Q&A • Knowledge base articles **Note:** If you activate Q&A, the selected Genius Result is set with the default order. You can change the order by going to the advanced configuration. Knowledge base articles and Actions are only available to select if you have a Pro Plus license, otherwise they are greyed out.
Catalog Item	Toggle to display top search results from the Catalog Item table. Select from two options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Genius Results basic configuration controls (continued)

Field	Description
	• Catalog Item • Actions (only available in portals)
People	Toggle to display top search results from the User table.
NLQ	Toggle to use natural language processing to show information from tables, including non-indexed tables, that match a search query.

Genius Results advanced configuration controls



Field	Description
Use basic configuration	Select to switch to basic configuration.
Refresh list	Button to refresh list of Genius Results.
List Actions	Button to open list actions. Select **Edit columns** to add or remove columns from the table. Select **Reset widths** if you have adjusted any column widths.
Show/Hide Filter panel	Button to open filter conditions panel. Select the clear input icon ✕ next to any defined conditions to remove them. Select **Restore defaults** to reset default filters, or **Advanced view** to define filter conditions. For more information, see Set filter conditions.
New	Button to create a Genius Result.
Link	Button to select a Genius Result to add to the list.
Unlink	Button to unlink a Genius Result from the list. Select one or more Genius Results from the list before selecting **Unlink**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shared Configurations tables

Sample Shared Configuration Table

All Shared Configurations tables use the same controls to manage their entries.

Shared Configurations table controls

Field	Description
Refresh list	Button to refresh list of table entries.
List Actions	Button to open list actions. Select **Edit columns** to add or remove columns from the table. Select **Reset widths** if you have adjusted any column widths.
Show/ Hide Filter panel	Button to open filter conditions panel. Select the clear input icon next to any defined conditions to remove them. Select **Restore defaults** to reset default filters, or **Advanced view** to define filter conditions. For more information, see Set filter conditions.
New	Button to create a record.
Delete	Button to delete records. Select one or more entries before selecting **Delete**

For further information on using these tables, see Create an AI Search configuration.

Create an AI Search configuration

Create search profiles, search sources, and other configurations for any of your applications that use AI Search.

Before you begin

Role required: admin or ais_admin

Procedure

1. Navigate to **All** > **AI Search Admin** > **AI Search Admin Home**.
2. Select the Shared Configurations tab.
3. Select the table tab where you want to create the configuration.
4. Select **New**.
5. Fill in the form fields, depending on your preferred configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Form
Search profiles	Search Profile form
Search sources	Search Source form
Search indexes	Indexed Source form
Dictionaries	Dictionary form
Genius Results	AI Search Genius Result Configuration form
Search application configurations	Search Application Configuration form
Result-card interfaces	

6. Select **Save**.

Edit view config form

The Edit view config form contains information about Entity View Action Mapper (EVAM) view configurations defined for search application configurations in AI Search. Use this form when creating or modifying a view configuration.

For details on creating or modifying a view configuration, see Create or edit an EVAM view definition.

Edit view config form

View config details fields

Field	Description
Name	Unique name for the EVAM view configuration.
Order	Order of appearance for a view configuration in the context of the search application configuration.
Table	Table to associate with the EVAM view configuration.
Condition	Conditions for when to use the EVAM view configuration.
View Template	Template to associate with the EVAM view configuration.

Main content fields

Field	Description
Component	Name of the component to be added to the EVAM view configuration.
Title label	Title of the EVAM view result card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Main content fields (continued)

Field	Description
Type	Determines how title is handled within the EVAM view, select either Model Field or Static Value. **Static Value** A fixed or constant value that you manually enter. **Table Field** Dynamically generated value based on a specific columns from the selected table. **Custom Field** Specific information that is returned as part of the search results. By default, there are four custom fields available: • ai_search_teaser_title • ai_search_teaser_text • document_index • navigation_url **Note:** This field appears multiple times throughout the form. Choose its value according to the configuration of the preceding field.
Title font size	The font size for the title text in an EVAM view to control the visual appearance of the title.
Translatable	Option to translate the text based on the preferred language of a user. **Note:** This field appears multiple times throughout the form.
Summary	Additional information to display in the result card after the title.
Summary font size	The font size for the text in an EVAM view result card to control the visual appearance of the information.

Card header fields

Field	Description
Text header label one	Unique title one for a specific EVAM view that communicates the purpose or content of the view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card header fields (continued)

Field	Description
Text header label two	Unique title two for a specific EVAM view that communicates the purpose or content of the view.
Text header label three	Unique title three for a specific EVAM view that communicates the purpose or content of the view.

Card image fields

Field	Description
Image type	Determine the format or type of an image you want to display, such as icon, image, or avatar.
Image URL	Determine the web address (URL) of an image that you want to display within a particular component or element of your application.
Avatar URL	Determine the web address (URL) of an avatar image. Avatars are typically used to represent users, characters, or entities within an application.
Avatar name	Name given to the avatar.
Icon	Represents a visual symbol that displays in the EVAM view result card interface. /The icon to display next to the breakdown-related field on the form.
Icon size	Determines the size of the icon
Hide icon	An option to hide icon in the EVAM view result card interface.

Card details fields

Field	Description
Aria label	An attribute that enhances web accessibility by supplying titles for screen readers.
Detail label type	Specifies how the details are displayed on the EVAM view result card, either inline or stacked.
Detail position	Specifies where the details are displayed on the EVAM view result card, either above the summary text or below.
Detail label separator	Specifies the character or string used to separate labels on the EVAM view result card.
Detail label	Describes each detail displayed on the EVAM view result card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card details fields (continued)

Field	Description
Detail value	Specifies the information that is displayed for each detail on the EVAM view result card.
Open in new tab	An option to display and enable the Open in New Tab icon on the EVAM view result card.
Is global	Indicates whether the view configuration is for a portal.

Platform Analytics Solution for Advanced AI Search Management Tools

ServiceNow® Platform Analytics Solutions contain prepackaged Performance Analytics and Reporting content for use with other ServiceNow AI Platform® products. This Platform Analytics Solution helps AI Search administrators analyze search query traffic trends, review indexed record and configuration settings, and preview search query results.

Required roles

The following roles are associated with this solution:

- ServiceNow AI Platform administrator (admin): Install and activate this Platform Analytics Solution and make any necessary changes to system properties.
- AI Search administrator (ais_admin): Review the AI Search dashboards. Share the dashboards with appropriate stakeholders. Test search queries using the Search Preview UI module.
- Usage Insights administrator (analytics_admin), Usage Insights viewer (analytics_viewer), User Portal Analytics administrator (portal_analytics_admin), Portal Analytics viewer(portal_analytics_viewer), Web Analytics administrator (web_analytics_admin), or Web Analytics viewer(web_analytics_viewer): View the AI Search Analytics dashboard metrics and reports.
- Impersonator (impersonator): View NLU intents detected in queries, enable debugging, or search as another user in the Search Preview UI module.

Related topics

Platform Analytics solutions

Activate the Platform Analytics Solution for Advanced AI Search Management Tools

Activate the content pack ServiceNow® Store application for the Platform Analytics Solution.

Before you begin

The Usage Insights API application from the ServiceNow Store must be activated in your instance.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **Available To Obtain From Store**.
2. Browse for Advanced AI Search Management Tools and verify that you have the necessary valid entitlements.

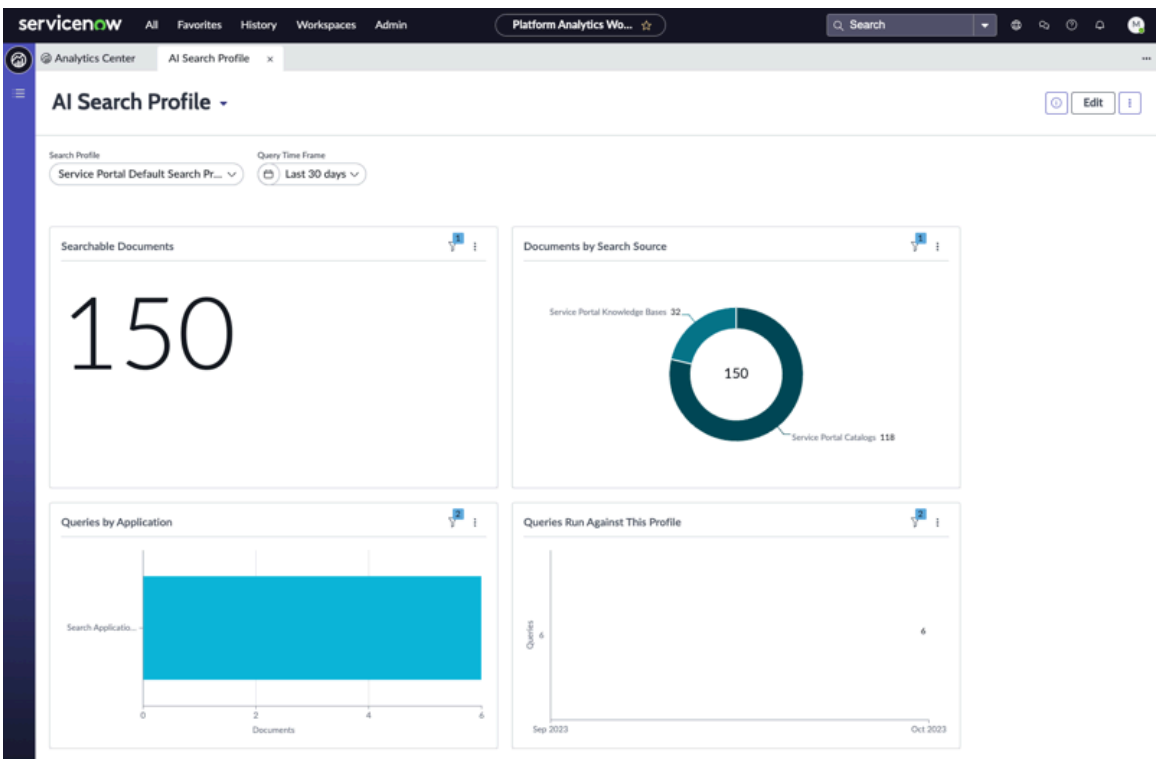
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You need a Now Support account and permission to request applications for the instances under consideration. The Now Support account and the instance must be part of the same company. For more information, see Install a ServiceNow Product on the ServiceNow Store.

3. Search for `Advanced AI Search Management Tools`.
4. Install the application.

Result

The following application menus and modules appear in the application navigator:



Application	Application navigator path
AI Search Profile dashboard	*AI Search* > *AI Search* **Analytics** > **Search Profile Analytics**
AI Search dashboard	*AI Search* > *AI Search* **Analytics** > **Search Index Analytics**
Search preview UI	*AI Search* > **Preview** > **Search Preview**

Note: Immediately after installation, the AI Search dashboards will be empty. The dashboards may take up to an hour to populate with results.

AI Search Profile dashboard

The AI Search Profile dashboard summarizes indexed record counts and search query traffic associated with a search profile defined in AI Search. Interactive filters enable users to choose a search profile and select the time frame for analysis of search query traffic.

AI Search Profile dashboard

To access the dashboard, navigate to **All** > *AI Search* > *AI Search* **Analytics** > **Search Profile Analytics**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the dashboard displays a `Read operation on table '<name>' from scope 'Advanced AI Search Management Tools' was denied` informational message, ask your administrator to perform the steps described in Create a cross-scope access privilege for the AI Search dashboards for the listed table.

Required ServiceNow AI Platform® roles

To view or edit the dashboard, you must have the ais_admin role.

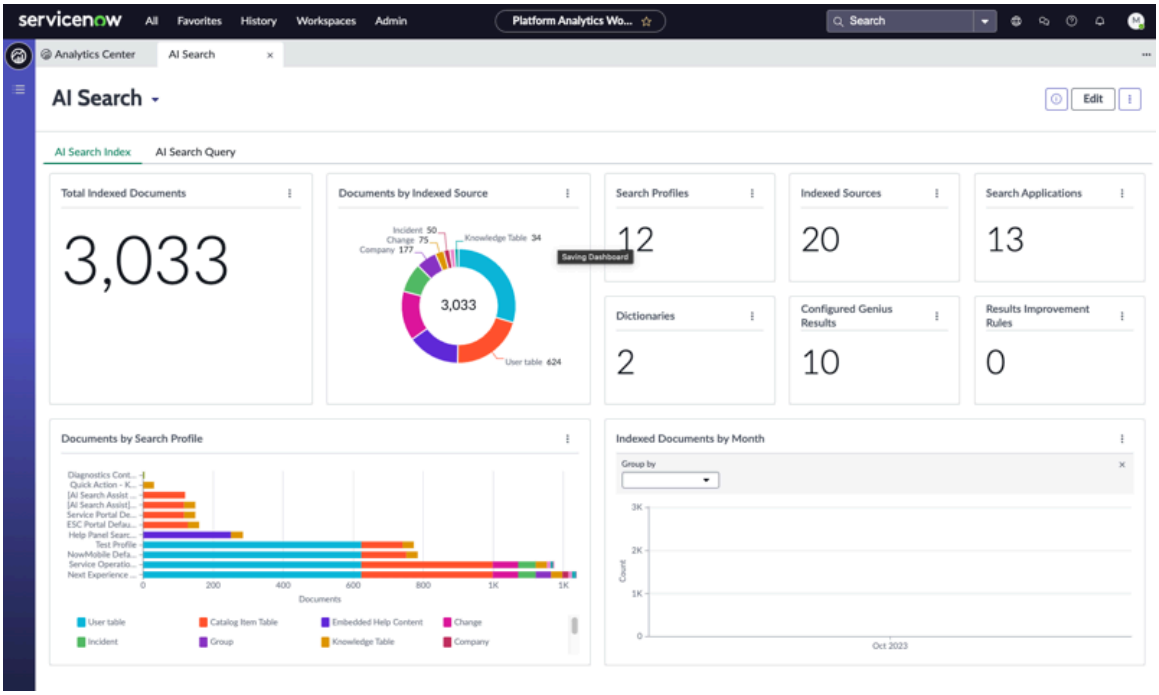
You may need additional roles to view and select search profiles for some AI Search applications or portals. For example, the **ESC Portal Default Search Profile** for the ESC portal is only visible in the search profile list if you have Employee Center administrator [sn_hr_sp.esc_admin] role.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

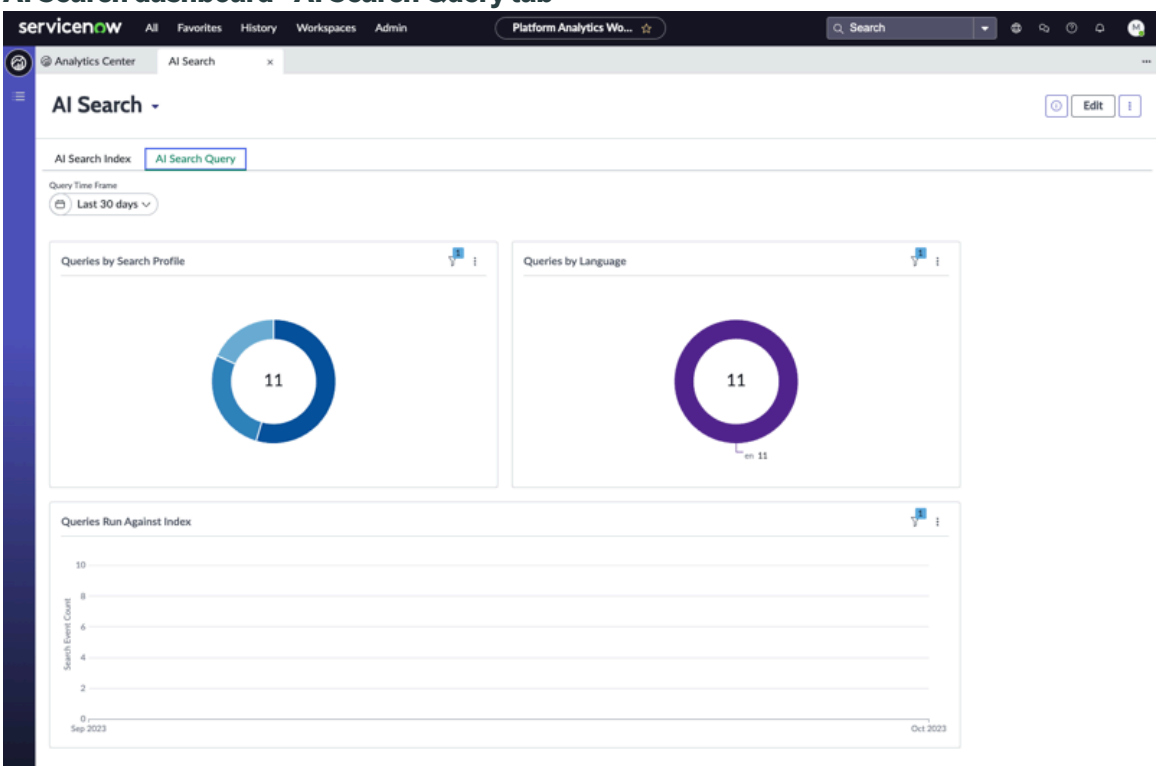
User	Dashboard use
AI Search administrator	Reviews indexed record counts and follows search query traffic trends for search profiles defined in AI Search.

Data visualizations



Title	Type	Source table	Description
Queries by Application	Bar	sys_search_event	Shows the number of search queries that used the selected search profile in the selected query time frame, grouped by search application.
Queries Run Against This Profile	Line	sys_search_event	Shows the number of search queries that used the selected search profile in the selected query time frame, grouped by month.

AI Search dashboard



The AI Search dashboard summarizes AI Search indexed documents, configuration settings in use, and search query traffic. An interactive filter enables users to select the time frame for analysis of search query traffic.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI Search Query tab

Title	Type	Source table	Description
Queries by Search Profile	Donut	sys_search_event	Shows the number of search queries in the selected time frame, grouped by search profile used.
Queries by Language	Donut	sys_search_event	Shows the number of search queries in the selected time frame, grouped by query language (ServiceNow AI Platform language context).
Queries Run Against Index	Line	sys_search_event	Shows the number of search queries in the selected time frame, grouped by month.

Create a cross-scope access privilege for the AI Search dashboards

Enable the AI Search dashboards to read records from tables that cannot be accessed from the Advanced AI Search Management Tools application scope.

Before you begin

The Platform Analytics Solution for Advanced AI Search Management Tools must be activated on your instance. For details on activating this solution, see Activate the Platform Analytics Solution for Advanced AI Search Management Tools.

Role required: admin

About this task

The AI Search Profile and AI Search dashboards belong to the Advanced AI Search Management Tools application scope.

If an indexed source or search source table can't be accessed from this scope, the dashboards display the following informational message:

```
Read operation on table '<name>' from scope 'Advanced AI Search Management Tools' was denied. The application 'Advanced AI Search Management Tools' must declare a cross scope access privilege. Please contact the application author to update their privilege requests.
```

To resolve this issue, define a cross-scope table access privilege for the Advanced AI Search Management Tools application.

For more information on cross-scope privileges, see Cross-scope privilege record.

Procedure

1. Set your current application scope context to Advanced AI Search Management Tools using the application picker.
2. Navigate to **All** > **System Applications** > **Application Cross-Scope Access**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **New**.
4. On the Cross scope privilege form, enter the following field values.

Field	Value
Target Scope	<table scope>
Target Name	<table name>
Target Type	Table
Operation	Read
Status	Allowed

5. Select **Submit**.

Result
The new cross-scope privilege appears in the Cross scope privilege table.

AI Search analytics dashboard

The AI Search analytics dashboard displays key performance metrics, trends, and reports for AI Search usage. Analysts can apply interactive filters to view performance analytics for individual search applications and to select the time frame to analyze.

To access the AI Search analytics dashboard, navigate to **All** > *Usage Insights*, select an application's **Launch Dashboard** link, then select the Search Analytics icon  or link in the modules menu. To learn more about the Usage Insights dashboard, see Overview of the dashboard.

Note: If the dashboard doesn't load, follow the steps from Configure Service Portal to send analytics data to enable it.

In the **Queries** section of the dashboard, you can view the query lists on their own page by selecting **View all**. To return to the main dashboard from the sub-page, select **AI Search Analytics**.

You can improve the visual experience by using the dark theme. For more information, see Working with themes in Next Experience.

Required ServiceNow AI Platform roles

To view the AI Search analytics dashboard, you must have the ais_admin role and one of the following roles:

- analytics_admin
- analytics_viewer
- portal_analytics_admin
- portal_analytics_viewer
- web_analytics_admin
- web_analytics_viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
Any of the following: • Service Portal Analytics administrator or viewer • Usage Insights administrator or viewer • Web Analytics administrator or viewer	• View and monitor search usage and search performance for a specified search application and date range • Review search trends to better understand the needs of search application end users • Gain insights on how to improve search experience and knowledge coverage by identifying common search queries that yield no results or low-quality results

Interactive filters

Filter	Description
Search application	Specifies the search application configuration for which you want to see search analytics metrics, trends, and reports. You can search for a search application configuration or select its name in the list. Select **Apply** to make your filter selection take effect. **Note:** You can only select a single search application configuration in this filter. The filter list includes search application configurations that are configured to use AI Search and that are used in any of the following contexts: • A service portal • A Next Experience workspace search • Next Experience global search • Mobile Platform search • Now Assist in Virtual Agent enhanced chat • Recommended Actions The dashboard reports metrics for all search queries in the selected search application configuration that satisfy your **Date range** constraint. These may include user searches submitted directly to a search application that uses the configuration and searches submitted through interaction with other

Filter	Description
	ServiceNow AI Platform features, such as Virtual Agent.
Date range	Specifies the range of dates for which you want to see search analytics metrics, trends, and reports. By default, the dashboard displays data from the last 30 days. You can choose one of the preset date ranges or set your own start and end dates. Select **Apply** to make your filter selection take effect. The dashboard retains data from the last 180 days. If you select a date from outside of this range, the system displays an error message and the dashboard reverts to the last valid date range selection. If you haven't selected any valid date range, the dashboard reverts to its default date range. **Note:** When you select a custom date range, the dashboard may take longer to load than when you select a preset date range. The dashboard reports metrics for all search queries in the selected date range that satisfy your **Search application** constraint. These may include user searches submitted directly to the search application and searches submitted through interaction with other ServiceNow AI Platform features, such as Virtual Agent.

Metrics, trends, and reports

The dashboard includes a main page and a Queries sub-page accessible from the **View all** link in the **Queries** section. The **View all** link in the **Search queries** section opens the Search Events [sys_search_event] table in list view.

Note: To improve performance, the AI Search analytics dashboard caches results from its source tables for 60 minutes. As a result, you may not see search queries from the last 60 minutes reflected in the dashboard's metrics, trends, and visualizations.

Overview section

Title	Description
Search users	This numeric metric shows the total number of unique users who submitted search queries. The trend describes how the number of unique search users has changed since the start of your selected date range.

Customize the banner logo for the AI Search Analytics dashboard

Add your own logo to the banner for the AI Search Analytics dashboard.

Before you begin

The Platform Analytics Solution for Advanced AI Search Management Tools must be activated on your instance. For details on activating this solution, see Activate the Platform Analytics Solution for Advanced AI Search Management Tools.

Role required: admin

About this task

The AI Search Analytics dashboard displays the ServiceNow logo in the banner. You can modify the UX theme assets for the dashboard to display your own logo instead.

Procedure

1. Switch to the Advanced AI Search Management Tools application.
   For details on switching applications, see Switch between applications.
2. To replace the default **header_for_dashboard** UX theme asset with a version containing your logo, perform the following steps.
   a. Navigate to the UX Theme Asset [sys_ux_theme_asset] table's list view by selecting **All**, entering `sys_ux_theme_asset.list` in the **Filter** field, and pressing Enter.
   b. Open the **header_for_dashboard** record.
   c. Select **Delete**.
   d. Select **New**.
   e. On the UX Theme Asset form, enter the following field values.

Field	Value
Category	Image
Name	header_for_dashboard

   f. In the form header, select the Manage Attachments icon and attach your logo image to the new record.
   To learn more about managing record attachments, see Manage attachments.
   g. Select **Submit**.
3. To link your new UX theme asset to the banner for the AI Search Analytics dashboard, perform the following steps.
   a. Navigate to the UX Theme [sys_ux_theme] table's list view by selecting **All**, entering `sys_ux_theme.list` in the **Filter** field, and pressing Enter.
   b. Open the **SearchAnalytics Dashboard Theme** record.
   c. Select the **Legacy: Experience Theme** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the UX Theme Assets list, edit the existing asset record.

> **Note:** If you don't see the UX Theme Assets list, configure the form layout, adding **UX Theme Assets->Theme** to the list of selected fields. When prompted, switch to editing the form section in the Global application. For details on this procedure, see Configuring the form layout.

e. On the UX Theme Assets form, in the **Asset** field, enter the value `header_for_dashboard`.

f. Select **Update**.

Result
Your custom logo image appears in the banner for the AI Search Analytics dashboard.

Configure Service Portal to send analytics data

Enable loading of the AI Search Analytics dashboard by configuring Service Portal to send analytics data.

Before you begin
The Platform Analytics Solution for Advanced AI Search Management Tools must be activated on your instance. For details on activating this solution, see Activate the Platform Analytics Solution for Advanced AI Search Management Tools.

Role required: admin

About this task
If the AI Search Analytics dashboard doesn't load, you must configure tracking of Usage Insights data in the Service Portal. This configuration is a prerequisite for the dashboard.

Procedure
1. Navigate to **All** > **Service Portal** > **Portals**.
2. Edit the **Service Portal** record.
3. Select **Create Analytics Settings**.
4. On the Usage Insights Settings form, select the **Enable Unauthenticated User Tracking** option, then select **Update**.

Result
The AI Search Analytics dashboard should now load correctly.

Search Preview UI for AI Search

The Search Preview UI enables you to test AI Search queries using settings from a selected search profile. Administrator tools help you review search query performance data and feedback, debug queries, and override default query settings for testing purposes.

Access the Search Preview UI by navigating to *AI Search* > **Preview** > **Search Preview**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform® roles

- The ais_admin role is required to view and use the Search Preview UI.
- The impersonator role is required for some AI Search administrator tools.
- The ais_high_security_admin role is required to bypass search source and content security filtering. For details on this procedure, see Diagnose search result access issues using the Search Preview UI.

Search Preview UI components

Search Preview UI

Search Preview UI components

Component	Description
1. Search profile list	Select the search profile to apply when previewing search queries. The list only includes published search profiles that have one or more linked search sources. **Note:** If a search profile has unpublished changes, the list displays a warning icon and shows [DRAFT] after the profile's name. Publish the search profile to see these changes reflected in the search query preview.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search Preview UI components (continued)

Component	Description
2. Search input field	Enter search query terms and operators in this field. To preview the query's results using settings from the selected search profile, select **Search**.
3. Table facet filter	View the distribution of search query results by source table. To filter the query results by table, select a table's name. To remove the table facet filter, select **All**.
4. Genius Result answers	Review the key-value pairs for each Genius Result answer the search query produces when executed with the selected search profile. **Note:** Genius Result answers may not appear for all search queries.
5. Search query results	Review the results the search query produces when executed with the selected search profile. To page through results, select **Next** or **Previous**.
6. AI Search administrator tools	Select the icon for the administrator tool that you want to use: • Process data tool: View summary information on the search query's triggered result improvement rules, matched NLU model intents, and processing time. • Alerts tool: Review alert feedback messages produced during processing of the search query. • Dictionary and query feedback tool: Review dictionary and query feedback messages and NLU model intent data for the search query. Enable debugging. • Context settings tool: Specify user context values for the search query to trigger result improvement rules. • User impersonation tool: Change the search query's user or locale to test access settings and view translated documents. For more detailed descriptions of each administrator tool's output, controls, and fields, see the following reference section.

Search preview admin tools

Understand the output, controls, and fields provided by admin tools in the search preview UI.

Process data tool

Entry	Description
Query Rules Triggered	Count of result improvement rules triggered by the search query.
Intents Matched	Count and names of NLU model intents detected in the search query.
Total time	Total time spent processing the search query. Includes pre-processing, search query, Genius Result computation, and security processing times.
Pre-processing time	Time spent preparing the search query for execution. Includes time spent looking up the user's access permissions for content security.
Search query time	Time spent retrieving records that match the search query and generating the result set.
Genius Result computation	Time spent computing Genius Result answers for the search query.
Security processing time	Time spent filtering inaccessible records out of the search query's result set based on the user's access permissions.

Alerts tool

This tool displays a list of alert feedback messages produced while processing the search query.

If the search query produced no alert feedback messages, the tool instead displays `No Alert Feedback`.

Dictionary and query feedback tool

This tool displays separate panes for dictionary feedback entries and query feedback controls.

Dictionary feedback

Entry	Description
Stop words	List of feedback messages relating to stop word removal for the search query.
Spellcheck	List of feedback messages relating to typo handling auto-correction for the search query.
Synonyms	List of feedback messages relating to synonym expansion for the search query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query feedback

Control	Description
Show all feedback	Display a JSON array of feedback messages produced for the search query.
Show all intent data	Display a JSON array of NLU model intents detected in the search query. **Note:** To use this tool, you must have the impersonator role.
Debug	Enable this option to set *sysparm_debug* to *true* when submitting search preview queries. **Note:** To use this tool, you must have the impersonator role.

Context settings tool

With these tools, you can specify user context values to test user context triggers for result improvement rules.

Field	Description
User Domain	To set a domain in the user context for search preview, enter the name of a group from the Group [sys_user_group] table.
User Company	To set a company in the user context for search preview, enter the name of a company from the Company [core_company] table.
User Office	To set an office in the user context for search preview, enter the name of a building from the Building [cmn_building] table.
User Department	To set a department in the user context for search preview, enter the name of a department from the Department [cmn_department] table.
User Title	To set a title in the user context for search preview, select it from the list. This list includes all Title values found in the User [sys_user] table.
User Location	To set a location in the user context for search preview, enter the name of a location from the Location [cmn_location] table.
User Role	To set a role in the user context for search preview, enter the name of a role from the Role [sys_user_role] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
User Country	To set a country in the user context for search preview, select it from the list. This list includes all countries found in user locations from the User [sys_user] table.
User Language	To set a language in the user context for search preview, select it from the list of supported languages.
User Office Country	To set an office country in the user context for search preview, select it from the list. This list includes all countries found in user locations from the User [sys_user] table.
User Office City	To set an office city in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User Office State	To set an office state in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User OS	To set an operating system in the user context for search preview, enter its name in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User Device Type	To set a user device type in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User OS Version Type	To set an operating system version type in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User Browser Agent	To set a browser agent string in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User Browser	To set a browser name in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to review values submitted for this user context field in user queries.
User Device Form	To set a device form in the user context for search preview, enter it in this field. You can enable session debugging for AI Search to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	review values submitted for this user context field in user queries.

User impersonation tool

Field	Description
Search as	To submit search preview queries as another user, enter the user's name from the User [sys_users] table. You must have the impersonator role. Use this control to see how content security affects search query results for specific user accounts. Searches performed while impersonating another user don't affect the **Search users** metric, trend, and report on the AI Search Analytics dashboard. **Note:** Changing the value of this field terminates elevated privileges for the ais_high_security_admin role. To bypass filters after changing this field's value, you must re-elevate to the ais_high_security_admin role.
Query Locale	To submit search preview queries using a specific supported language, select the language from the list. Use this control to observe differences in search query results for different languages.

Advanced AI Search Management Tools reference

This reference topic describes system components installed with the Advanced AI Search Management Tools application.

Plugins installed with Advanced AI Search Management Tools

Plugin	Description
Advanced AI Search Management Tools (sn_ais_admin_tools)	Includes AI Search dashboards and Search Preview tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed with Advanced AI Search Management Tools

Scheduled job	Description
Load AI Search Dashboard Documents by Month	Populates the Indexed Documents by Month data visualization on the AI Search dashboard. Runs every minute.
Load AI Search Dashboard Documents by Profile	Populates the Documents by Search Profile data visualization on the AI Search dashboard. Runs every hour.
Load AI Search Dashboard Total Indexed Documents	Populates the Total Indexed Documents data visualization on the AI Search dashboard. Runs every hour.
Update Search Analytics Data	Pre-calculates metrics to improve load time for the AI Search Analytics dashboard. Runs every hour. **Note:** If you pause or disable this scheduled job, the AI Search Analytics dashboard takes longer to load and displays the metrics calculated by the last scheduled job run. You can specify a new date range for the dashboard to force recalculation of metrics.

List of all components installed with Advanced AI Search Management Tools

To view the complete list of components installed with Advanced AI Search Management Tools, follow the steps described in Find components installed with an application. The application's package name is **Advanced** *AI Search* **Management Tools**.

External Content Connectors

The External Content Connectors ServiceNow® Store application enables AI Search applications to search content and metadata from supported external source systems, such as Atlassian Confluence Cloud and Microsoft SharePoint Online.

Exploring External Content Connectors

Using External Content Connectors, AI Search applications can search content and metadata from external content repositories such as Atlassian Confluence Cloud and Microsoft SharePoint Online. Expanding search recall to include external content helps search users locate the information they need.

External Content Connectors overview

The External Content Connectors application adds support for indexing content and metadata from external source systems to make those systems searchable in AI Search applications. Indexing preserves the content's original user access permissions from the source system using AI Search's content security model.

This release includes the following external content connectors:

- Adobe Acrobat Sign external content connector
- Adobe Experience Manager as a Cloud Service external content connector
- Aha! Roadmaps external content connector
- Amazon S3 external content connector
- Asana external content connector
- Atlassian Confluence Cloud external content connector
- Atlassian Jira Cloud external content connector
- Box external content connector
- Cornerstone external content connector
- Docusign external content connector
- Fluid Topics external content connector
- Dropbox external content connector
- GitHub Enterprise Cloud external content connector
- GitLab external content connector
- Google Drive external content connector
- HubSpot external content connector
- Lucidchart external content connector
- ManageEngine external content connector

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Microsoft OneDrive external content connector
- Microsoft SharePoint Online external content connector
- Microsoft Teams external content connector
- Microsoft Viva Engage external content connector
- Miro external content connector
- monday.com external content connector
- Notion external content connector
- SAP DMS external content connector
- SAP SuccessFactors external content connector
- ServiceNow documentation external content connector
- ServiceNow instance external content connector
- Slack external content connector
- Smartsheet external content connector
- Trello external content connector
- Webcrawler external content connector
- WordPress external content connector
- Workday external content connector
- Workvivo external content connector
- Zendesk Guide external content connector
- Zoom external content connector

Connector administrators can schedule content and user permission crawls to suit your indexing requirements. If the need arises, connector administrators can also run either type of crawl on demand.

Important: The External Content Connectors application consumes Integration Hub transactions when feeding crawled content to AI Search. You can monitor available and used transactions for your Integration Hub subscription packages in the Integration Hub Usage Dashboard. For details on transaction monitoring, see Transaction reports in Integration Hub Usage Dashboard.

All external content connectors support semantic vector indexing of content retrieved from crawled source systems. Only features which use semantic vector search with the Now LLM Service can take advantage of this support. For details on semantic vector indexing and search, see Semantic vector search in AI Search.

External Content Connectors indexed sources and search sources

Each external content connector has its own indexed source for crawled content. It also has a default search source that specifies no filter conditions and so includes all items from its indexed source. To apply filter conditions to an external content connector's indexed content, create your own search sources for that connector's indexed source.

To make a connector's content searchable in an AI Search application, include one of its search sources in the search profile used for that application. For more information about creating and using indexed sources and search sources, see Indexed sources in AI Search and Search sources in AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External Content Connectors availability

The External Content Connectors application is only supported on cloud-hosted ServiceNow AI Platform® instances. It's not supported on on-premise (self-hosted) instances.

External Content Connectors workflow

The following illustration shows a sample workflow of how users in an organization interact with External Content Connectors to enable indexing and search of content and metadata from supported external sources.

Configuring and using External Content Connectors

In this External Content Connectors workflow:

1. Connector administrators configure connection settings for external content connectors. They configure crawl start points and inclusion/exclusion filters to define the scope of connector crawls. They define schedules that specify when crawls run.
2. The system runs connectors at their scheduled times or when connector administrators start one-time crawls. When crawling, connectors retrieve searchable content and security principals from their source systems and feed them to AI Search for indexing.
3. Search users are presented with content and metadata from external content source systems when interacting with AI Search applications. AI Search's content security model retains user and group access permissions set in the source system, so users can only view content that they have permission to access.
4. Connector administrators review and analyze crawl metrics, crawl histories, and user permission data. They use this information to understand how external data is crawled and indexed, allowing for more effective tuning of crawl settings for their external content connectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

External Content Connectors benefits

Benefit	Feature	Users
Configure source systems for external content indexing	Configuring source systems for external content indexing	Source system administrators
Create connectors to retrieve searchable content and metadata and user permissions from supported external data source systems	Creating external content connectors	Connector administrators
Control the scope of external content connector crawls by specifying source system locations to crawl and content types to feed to AI Search for indexing	Configuring crawl settings for external content connectors	Connector administrators
Update searchable content and metadata from source systems on demand or on a scheduled recurring basis	Create a content crawl for an external content connector	Connector administrators
Update user and group access permissions from source systems on demand or on a scheduled recurring basis	Create a user permission crawl for an external content connector	Connector administrators
Review metrics for source system items retrieved by content crawls	Review crawl history for an external content connector	Connector administrators
Review user and group access permissions retrieved by user permission crawls	Review user permissions for an external content connector	Search high security administrators
Search content and metadata indexed from external data source systems	Searching in AI Search	AI Search users

Interaction with ServiceNow Otto® Genius Results

If you have the ServiceNow Otto for AI Search and ServiceNow Otto for Virtual Agent ServiceNow Store applications installed, external content search results are eligible for inclusion in Summary Genius Result answers. This includes answers generated in ServiceNow Otto for Virtual Agent chats.

External content search results are ignored when generating answers for Knowledge base articles Genius Results and Actions Genius Results.

Estimating document volume for source systems

Source system tools enable you to estimate the number of documents available for retrieval by external content connectors. By estimating the available document count for a source system, you can determine whether you need to apply crawl scope restrictions when configuring an external content connector for that source system.

Configuring source systems for external content indexing

Source system administrators configure settings to allow external content connectors to index your documents and security settings for search. These settings must be configured for a source system before you create an external content connector to crawl that source system.

Each external content connector has its own source system configuration requirements, as shown in the following topics.

Note: The following external content connectors don't require any source system configuration.

- ServiceNow® documentation external content connector
- Webcrawler external content connector

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

same source system. Connectors that crawl the same source system can include overlapping crawl locations.

Supported configurations

The system supports these configurations for multiple external content connectors of the same type running on the same ServiceNow AI Platform instance.

Multiple external content connectors of the same type that crawl different source systems

For example, one Microsoft SharePoint Online external content connector crawls sites 1A and 1B in source system 1, while a second Microsoft SharePoint Online external content connector crawls sites 2A and 2B in source system 2. The two external content connectors have no sites in common, so there's no duplication of retrieved content.

Multiple external content connectors of the same type that crawl the same source system with distinct crawl scopes

For example, one Microsoft SharePoint Online external content connector crawls sites 1A and 1B in source system 1, while a second Microsoft SharePoint Online external content connector crawls sites 1C and 1D in source system 1. The two external content connectors have no sites in common, so there's no duplication of retrieved content.

Multiple external content connectors of the same type that crawl the same source system with overlapping crawl scopes

For example, one Microsoft SharePoint Online external content connector crawls sites 1A and 1B in source system 1, while a second Microsoft SharePoint Online external content connector crawls sites 1B and 1C in source system 1. The two external content connectors have site 1B in common, so content from that site may be retrieved by both connectors. There's no duplication of retrieved content from the other sites.

Behavior notes

When you create multiple external content connectors of the same type on the same ServiceNow AI Platform instance, they behave as described in the following list.

All external content connectors of the same type feed their retrieved content to the same indexed source

In the previous examples, all content retrieved by either of the two Microsoft SharePoint Online external content connectors would be fed to the SharePoint Online indexed source.

During indexing of crawled content, retrieved items are deduplicated across all external content connectors of the same type

As an example, if two different Microsoft SharePoint Online external content connectors both retrieve the same file from the same site, only one copy of the retrieved file is indexed and appears in your search results.

User permissions are specific to an individual external content connector, not shared between all external content connectors of the same type

Admins need to run a separate user permission crawl for each external content connector of the same type. In the preceding examples, each Microsoft SharePoint Online external content connector requires its own user permission crawl. Running a user permission crawl for the first Microsoft SharePoint Online external content connector doesn't populate security principals for the second connector.

The system executes crawl jobs for external content connectors of the same type in parallel if sufficient resources are available

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If sufficient resources for parallel execution aren't available, the system executes the crawl jobs sequentially instead.

The crawl limit of one million items applies separately to each external content connector of the same type

In the preceding examples, each individual Microsoft SharePoint Online external content connector can crawl up to one million items.

Considerations for parallel execution

When creating multiple external content connectors of the same type on the same ServiceNow AI Platform instance, bear the following considerations in mind.

Increased request load on source system

Creating multiple external content connectors that crawl the same source system in parallel can increase the rate at which requests are made to the source system. This may trigger rate-limit issues on the source system.

Indexed source contention when running in parallel

Running crawl jobs for multiple external content connectors of the same type in parallel can cause contention when they send retrieved content to their shared indexed source. This contention may reduce the connectors' retrieval rate when their crawl jobs are run in parallel.

Configuring crawl settings for external content connectors

Connector administrators can configure crawl settings for each external content connector, such as which source system locations it crawls and which types of content it sends to AI Search for indexing.

Delta content crawls for external content connectors

Delta content crawls improve content crawl performance by only retrieving newly added, changed, or deleted items from an external content connector's source system.

Delta content crawls overview

By default, an external content connector's content crawl examines all content items from its source system to determine which ones to retrieve and index for search. If the source system contains many items, a full content crawl can take a long time to complete. This remains true even if the number of items with actual updates is fairly small.

Starting with External Content Connectors 9.0, the External Content Connectors application supports delta content crawl operations for some external content connectors. When running a delta content crawl, an external content connector only examines, retrieves, and indexes newly added, changed, or deleted items from its source system. By ignoring unchanged items, delta content crawling can significantly reduce the time taken to crawl content from the source system. This means you can refresh your searchable content more often by running delta content crawls between your scheduled full or partial content crawls.

Note: Delta content crawls don't replace full content crawls. They're supplemental crawls that enable you to refresh searchable content more frequently in between full content crawls.

By default, delta content crawls aren't active for any external content connector. Connector admins can activate or deactivate delta content crawls for individual connectors of supported types. To view the activation procedure, see Activate delta content crawling for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: In External Content Connectors 9.0, delta content crawls are only supported for the Google Drive external content connector.

Scheduling of delta content crawls

When you activate delta content crawling for an external content connector, the system begins scheduling delta content crawls for that connector after it completes a full content crawl. Until that full content crawl is completed, no delta content crawls will be scheduled.

Note: If you upgrade to a new External Content Connectors major release, run a full content crawl in the new version for each connector that has delta content crawling activated. Full content crawls run in a previous External Content Connectors release don't retrieve all of the metadata needed for delta content crawling. As an example, after upgrading from External Content Connectors version 8.0 to version 9.0, you must complete a full content crawl in version 9.0 for each connector that has delta content crawls activated. Until you complete that full content crawl, delta content crawls won't run for the connector.

The system automatically schedules delta content crawls for connectors that have them activated. You can't override the automatic scheduling.

Scheduled delta content crawls aren't guaranteed to run at any particular time. The system may pause, delay, or skip a scheduled delta content crawl. In particular, delta crawls won't run if a full or partial content crawl is already running for the external content connector.

Delta content crawls have a time limit. If a delta content crawl doesn't complete within its specified time, the next delta content crawl attempts to pick up where the previous one stopped. If delta content crawls are consistently unable to keep up with changes made in the connector's source system, you may need to run more frequent full content crawls to keep your searchable content up-to-date with the source data.

Interaction with other content crawls

Full, partial, and delta content crawls can't run in parallel. The system won't start a delta content crawl for a connector if it has a full or partial content crawl running.

If you try to start a one-time full or partial content crawl while a delta content crawl is running, the system offers you the following options:

- Queue the one-time full or partial content crawl so that it doesn't start until the current delta content crawl completes.
- Cancel the current delta content crawl and start the one-time full or partial content crawl immediately.

Delta content crawl history

In the connector editor's **Crawl history** tab, a summary of delta content crawl activity over the last 30 days appears in the **Delta content crawls** section. Delta content crawl history doesn't appear in the **Crawl history** listing.

Limitations of delta content crawls

Delta content crawls may not detect all relevant changes to items in the source system. As an example, a delta content crawl may not detect that a source system content item has been deleted. Other similar detection issues are specific to the connector type.

In all of these cases, running a new full connector content crawl detects the overlooked changes and brings your AI Search index up to date.

Domain separation and External Content Connectors

Domain separation is unsupported for External Content Connectors. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Overview of domain separation in External Content Connectors

The External Content Connectors ServiceNow® Store application enables you to make content from external source system documents searchable in AI Search applications. External content connectors don't support domain separation.

Note: The External Content Connectors application includes an External Content Connectors Service Account user that's assigned to the global domain by default. If your instance has domain separation configured, assigning this user to another domain can prevent user permission crawls from correctly mapping permissions to users in your instance. To correct this behavior, reassign the External Content Connectors Service Account user to the global domain. For details on this procedure, see Reassign the External Content Connectors Service Account user to the global domain.

Domain separation for service providers

Install External Content Connectors

Install the External Content Connectors applications from the ServiceNow® Store.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Your ServiceNow AI Platform® instance must be cloud-hosted. The External Content Connectors applications aren't supported on on-premise (self-hosted) instances.

Role required: admin

About this task

To make content from your external source systems accessible in AI Search, you must install the External Content Connectors Application Suite plugin from the ServiceNow Store.

When you install this plugin, it automatically installs plugins for the following applications:

- External Content Connectors
- External Content Connectors Admin
- All available External Content Connectors connector applications except for the following, which you must install separately if you want them:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ServiceNow product documentation external content connector
- Webcrawler external content connector

Your instance needs inbound mTLS support to run external content connector crawls. If inbound mTLS support isn't already activated for your instance, it should be automatically activated after you install the External Content Connectors Application Suite plugin.

Note: Automatic activation of inbound mTLS support on your instance may take up to 24 hours. To check the activation status for this feature, see Verify whether inbound mTLS support is activated for your instance.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the External Content Connectors Application Suite application (sn_ext_conn_suite) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. Select **Install**.
4. **Optional:** If you want to use the ServiceNow product documentation external content connector, repeat the preceding steps to find and install the External Content Connectors SN Docs (sn_ext_conn_sndocs) application.
   See the External Content Connectors SN Docs application on the ServiceNow Store.
5. **Optional:** If you want to use the Webcrawler external content connector, repeat the preceding steps to find and install the External Content Connectors Web Crawler (sn_ext_conn_wc) application.
   See the External Content Connectors Web Crawler application on the ServiceNow Store.

What to do next

With the External Content Connectors applications installed, connector admins can configure connectors to crawl content, metadata, users, and group memberships from supported external content repositories. They can also configure crawl settings and create and schedule crawls for those connectors. For details on external content connector configuration, see Configuring External Content Connectors.

Verify whether inbound mTLS support is activated for your instance

Check whether inbound mTLS support is activated for your ServiceNow AI Platform® instance. You need this feature activated to run crawls for external content connectors.

Before you begin

Role required: none

About this task

To run crawls for external content connectors, your ServiceNow AI Platform instance must have inbound mTLS support activated. You can check the activation status for this feature on your instance from a web browser or the curl command-line tool.

If inbound mTLS support isn't activated on your instance, you can open a service request case to ask Customer Service and Support to activate it for you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In a web browser, navigate to the `https://<instance-name>.service-now.com/adcv2/supports_tls` status page, where `<instance-name>` is the name of your ServiceNow AI Platform instance.
   You can also access this status page using the curl command-line tool, replacing `<instance-name>` with the name of your ServiceNow AI Platform instance:

   ```
   curl -k
    "https://<instance-name>.service-now.com/adcv2/supports_tls"
   ```

2. Check the response from the `adcv2/supports_tls` request.

What to do next

If the response from the `adcv2/supports_tls` request is `true`, inbound mTLS support is activated on your instance. You don't need to do anything else.

If the response from the `adcv2/supports_tls` request is anything other than `true`, inbound mTLS support isn't activated on your instance. Open a service request case at https://support.servicenow.com/now to ask Customer Service and Support to activate inbound mTLS support on your instance.

Configuring External Content Connectors

Plan and configure your External Content Connectors implementation.

External Content Connectors configuration overview

Configuring retrieval and indexing of content from your external content source systems requires the following steps:

Configuration step	Description
Source system administrator configures access settings for your external content source system	• Configure Adobe Acrobat Sign for external content indexing • Configure Adobe Experience Manager as a Cloud Service for external content indexing • Configure Aha! Roadmaps for external content indexing • Configure Amazon S3 for external content indexing • Configure Asana for external content indexing • Configure Atlassian Confluence Cloud for external content indexing • Configure a connector user in Atlassian Jira Cloud • Configure Atlassian Jira Cloud for external content indexing • Create a public/private key pair for the Box external content connector • Configure Cornerstone for external content indexing

Configuration step	Description
AI Search administrator creates (and optionally schedules) crawls for external content connectors	• Create a content crawl for an external content connector • Create a user permission crawl for an external content connector

Adobe Acrobat Sign external content connector

The Adobe Acrobat Sign external content connector retrieves documents from agreements in your Adobe Acrobat Sign source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Create a user permission crawl for an external content connector

Configure Adobe Acrobat Sign for external content indexing

Create and authorize an OAuth 2.0 application in Adobe Acrobat Sign to allow the Adobe Acrobat Sign external content connector to access your Adobe Acrobat Sign source system.

Before you begin

You need to be an administrator in Adobe Acrobat Sign.

Role required: none

About this task

The Adobe Acrobat Sign external content connector retrieves documents from agreements in your Adobe Acrobat Sign source system using the Adobe Acrobat Sign REST API.

To allow the connector to access your Adobe Acrobat Sign content via the REST API, you must configure and authorize an API application with OAuth 2.0 in Adobe Acrobat Sign. Your connector administrator can use settings copied from this application to configure the Adobe Acrobat Sign external content connector for proper connection to your source system.

Procedure

1. In Adobe Acrobat Sign, create a new API application for the Adobe Acrobat Sign external content connector.

   a. Navigate to your Adobe Acrobat Sign instance and log in with administrator credentials.

   b. In the application menu, select **API**.
   If the **API** menu item isn't visible, select **Account** instead.

   c. In the account menu, navigate to *Adobe* **Sign API** > **API Applications**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select the Create icon .

e. On the Create form, fill in the fields.

Field	Description
Name	Name for your API application. As an example, you might enter *ServiceNow* **external content connector**.
Display Name	Display name for your API application. As an example, you might enter *ServiceNow***external content connector**.
Domain	Domain for your API application. Select **CUSTOMER**.

f. Select **Save**.

Adobe Acrobat Sign creates your new API application.

2. Copy the application ID and secret for your new API application.

a. On the API Applications page, copy the application ID for your new API application and store it in a secure location.

> **Important:** Your external content connector administrator needs this application ID when configuring the Adobe Acrobat Sign external content connector.

b. Select the API Applications entry for your new API application.
The action menu for your new API application appears.

c. In the action menu, select **View/Edit**.

d. Copy the application secret for your new API application and store it in a secure location.

> **Important:** Your external content connector administrator needs this application secret when configuring the Adobe Acrobat Sign external content connector.

3. Configure OAuth 2.0 settings for your new API application.

a. On the API Applications page, select the entry for your new API application.
The action menu for your new API application appears.

b. In the action menu, select **Configure OAuth for Application**.

c. On the Configure OAuth form, fill in the fields.

Field	Description
Redirect URI	Enter `https://<instance-name>.service-now.com/oauth_redirect.do`, replacing `<instance-name>` with your ServiceNow AI Platform instance name.
Enabled Scopes	For each of the following scopes, select the **Enabled?** option and set the **Modifier** to **account**:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ user_read ▪ agreement_read

What to do next

Provide the following items to your connector administrator:

- The base URL for your Adobe Acrobat Sign instance. This URL is typically `https://<host>.<data-center>.adobesign.com/`, where `<host>` is `secure` or your organization name and `<data-center>` is the shard ID for your Adobe Acrobat Sign data center. For a list of Adobe Acrobat Sign data centers, see https://helpx.adobe.com/sign/using/adobesign-data-centers.html.
- The API application ID that you copied in step 2.a.
- The API application secret that you copied in step 2.d.

Your connector administrator needs these items to configure an Adobe Acrobat Sign external content connector to retrieve documents and security principals from your Adobe Acrobat Sign source system.

For details on creating and configuring a Adobe Acrobat Sign external content connector, see Create an Adobe Acrobat Sign external content connector.

Create an Adobe Acrobat Sign external content connector

Create an external content connector to retrieve searchable content and security principals from your Adobe Acrobat Sign source system.

Before you begin

A source system administrator must have already configured your Adobe Acrobat Sign source system to allow access by the Adobe Acrobat Sign external content connector. For the required source system configuration steps, see Configure Adobe Acrobat Sign for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Adobe Acrobat Sign* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Adobe Acrobat Sign external content connector.
Host URL	Base URL for your Adobe Acrobat Sign instance. This URL is typically `https://<host>.<data-center>.adobesign.com/`, where `<host>` is `secure` or your organization name and `<data-center>` is the shard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	ID for your Adobe Acrobat Sign data center. For a list of Adobe Acrobat Sign data centers, see https://helpx.adobe.com/sign/using/adobesign-data-centers.html. If you don't have the host URL, ask your *Adobe Acrobat Sign* administrator for it.
API application ID	Application ID for the API application that grants access to your *Adobe Acrobat Sign* content. If you don't have the client ID, ask your *Adobe Acrobat Sign* administrator for it.
API application secret	Application secret for the API application that grants access to your *Adobe Acrobat Sign* content. If you don't have the client secret, ask your *Adobe Acrobat Sign* administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Adobe Acrobat Sign external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for an Adobe Acrobat Sign external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for an Adobe Acrobat Sign external content connector

Specify the agreement documents you want your Adobe Acrobat Sign external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the Adobe Acrobat Sign external content connector that you want to configure crawl settings for. To learn about this procedure, see Create an Adobe Acrobat Sign external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Adobe Acrobat Sign external content connector crawls all agreements from its specified source system and sends all documents to AI Search for indexing. Only perform this task if you want the connector to use inclusion or exclusion filters for the agreements to crawl when running content crawls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Adobe Acrobat Sign external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. In the Agreements section, select one of the following agreement creation date filter options:
   - To crawl only agreements created in the last year, select **Created last year**.
   - To crawl only agreements created in the last quarter, select **Created last quarter**.
   - To crawl only agreements created in the last month, select **Created last month**.
   - To crawl only agreements created in the last week, select **Created last week**.
5. In the Agreements section, select one of the following status filter options:
   - To crawl agreements with all statuses from the source system, select **Crawl all statuses**.
   - To crawl only agreements with a specified set of statuses from the source system, select **Include only these statuses**, then use the **Statuses to include** field to enter statuses you want the connector to include when crawling.

     As an example, you might enter `Approved` to only retrieve searchable content from agreements with this status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl agreements with all but a specified set of statuses from the source system, select **Exclude only these statuses**, then use the **Statuses to exclude** field to enter statuses you want the connector to exclude when crawling.

  As an example, you might enter `Cancelled` to exclude searchable content from agreements with this status.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result

The Adobe Acrobat Sign external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Adobe Acrobat Sign source system using your modified crawl settings, create and run a one-time content crawl for your Adobe Acrobat Sign external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Adobe Experience Manager as a Cloud Service external content connector

The Adobe Experience Manager as a Cloud Service external content connector retrieves assets from nodes in your Adobe Experience Manager as a Cloud Service source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to update searchable content and metadata from your source system. Content crawls feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Limitations

The Adobe Experience Manager as a Cloud Service external content connector only crawls assets. It doesn't crawl web page content or social content such as reviews, blog posts, or comments. All asset content retrieved by the connector is treated as public, meaning that it's searchable by all users with access to your configured AI Search experience.

Configure Adobe Experience Manager as a Cloud Service for external content indexing

Create Service Credentials in Adobe Cloud Manager to allow the Adobe Experience Manager as a Cloud Service external content connector to access nodes and assets in your source system.

Before you begin

You need an Adobe Cloud Manager account with Adobe IMS Org administrator privileges. This account must be a member of the **AEM Administrators** IMS Product Profile on **AEM Author**. The **AEM Assets API Users service** option must be selected for the **AEM Administrators** IMS Product Profile.

Role required: none

About this task

The Adobe Experience Manager as a Cloud Service external content connector retrieves assets from nodes in your Adobe Experience Manager as a Cloud Service source system.

To allow the connector to access your Adobe Experience Manager as a Cloud Service source system, you must create a Technical Account in Adobe Cloud Manager. Your connector administrator can use the Service Credentials from this Technical Account to configure the Adobe Experience Manager as a Cloud Service external content connector for proper connection to your source system.

Procedure

1. Create a Technical Account in Adobe Cloud Manager.
   a. Log in to https://my.cloudmanager.adobe.com/ with your Adobe IMS Org administrator credentials.
   b. In the My Programs console, select the Program that contains the Adobe Experience Manager as a Cloud Service environment you want the connector to access.
   c. Navigate to **...** > **Developer Console**.
   d. Select the **Integrations** tab, then select the **Technical Accounts** tab.
   e. Select **Create new technical account**.
   Adobe Cloud Manager creates your new Technical Account and initializes its Service Credentials.
2. Download the Service Credentials for your new Technical Account as a JSON-format file.
   a. On the Technical Accounts tab, select the arrow icon to expand the private key entry for your new Technical Account.
   The private key name varies. As an example, the private key entry name for your new Technical Account might be `PRIVATE-KEY-1873000081275`.
   b. In the expanded private key entry, select the **...** > **View** link for the private key.
   Adobe Cloud Manager displays the Service Credentials JSON for your new Technical Account.
   c. In the displayed Service Credentials, select the download icon.
   d. When prompted, download the JSON-format Service Credentials file to a secure location.

> **Important:** Your external content connector administrator needs this JSON-format Service Credentials file when configuring the Adobe Experience Manager as a Cloud Service external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Provide the following items to your connector administrator:

- The hostname for your Adobe Experience Manager as a Cloud Service tenant.

  Note: As an example, if the URL for your tenant is `https://example.adobeaemcloud.com`, your tenant hostname is `example`.

- The JSON-format Service Credentials file that you copied in step 2.d.

Your connector administrator needs these items to configure an Adobe Experience Manager as a Cloud Service external content connector to retrieve assets from your Adobe Experience Manager as a Cloud Service source system.

For details on creating and configuring an Adobe Experience Manager as a Cloud Service external content connector, see Create an Adobe Experience Manager as a Cloud Service external content connector.

Create an Adobe Experience Manager as a Cloud Service external content connector

Create an external content connector to retrieve searchable content from your Adobe Experience Manager as a Cloud Service source system.

Before you begin

A source system administrator must have already configured your Adobe Experience Manager as a Cloud Service source system to allow access by the Adobe Experience Manager as a Cloud Service external content connector. For the required source system configuration steps, see Configure Adobe Experience Manager as a Cloud Service for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Adobe* **Experience Manager as a Cloud Service (AEM)** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Adobe Experience Manager as a Cloud Service external content connector.
Adobe AEM Tenant URL	URL for your Adobe Experience Manager as a Cloud Service tenant. This URL typically has the format `https://example.adobeaemcloud.com/`. If you don't know the tenant URL, ask your Adobe Experience Manager administrator for it.
Service Account JSON file	JSON-format file containing Service Credentials for a Technical Account created in Adobe Cloud Manager. The external content connector uses these Service Credentials to authenticate via the Technical Account when running crawls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	If you don't have this JSON-format Service Credentials file, ask your Adobe Experience Manager administrator for it.
I agree to the following disclaimer	Option acknowledging that the Adobe Experience Manager as a Cloud Service external content connector makes all crawled content accessible by all search users.

6. Save your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection setting entries fails, the system shows an error message. Verify your connection settings to ensure they're correct.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Adobe Experience Manager as a Cloud Service external content connector.
9. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
10. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for an Adobe Experience Manager as a Cloud Service external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for an Adobe Experience Manager as a Cloud Service external content connector

Specify the nodes you want your Adobe Experience Manager as a Cloud Service external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Adobe Experience Manager as a Cloud Service external content connector that you want to configure crawl settings for. To learn about this procedure, see Create an Adobe Experience Manager as a Cloud Service external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Adobe Experience Manager as a Cloud Service external content connector crawls all nodes located beneath the `/content/dam` node of its specified source system and sends assets with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the nodes to crawl when running content crawls
- Inclusion or exclusion filters for the file extensions of assets to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Adobe Experience Manager as a Cloud Service external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Nodes** options:
   - To crawl all nodes that descend from the specified start node, select **Crawl all nodes**.
   - To crawl only a specified set of nodes that descend from the specified start node, select **Include only these nodes**, then use the **Add node path to include** field and **Add** button to enter paths for nodes you want the connector to include when crawling.

     As an example, you might enter `/content/dam/en/documentation` to only retrieve searchable content from this descendant node.
   - To crawl all but a specified set of nodes that descend from the specified start node, select **Exclude only these nodes**, then use the **Add node path to exclude** field and **Add** button to enter paths for nodes you want the connector to exclude when crawling.

     As an example, you might enter `/content/dam/en/engineering-ui-assets` to exclude searchable content from this descendant node.
5. Select one of the following **Assets** options:
   - To retrieve all assets with supported file extensions from the source system, select **Crawl all assets**.
   - To retrieve only assets with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter asset file extensions you want the connector to include when crawling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `.pdf` to retrieve only assets with the Portable Document Format file type.

- To retrieve all assets except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter asset file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.csv` to exclude assets with the Comma-Separated Values (CSV) file format.

For details on the supported asset file extensions, see Binary file extensions supported in External Content Connectors.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result

The Adobe Experience Manager as a Cloud Service external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Adobe Experience Manager as a Cloud Service source system using your modified crawl settings, create and run a one-time content crawl for your Adobe Experience Manager as a Cloud Service external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Aha! Roadmaps external content connector

The Aha! Roadmaps external content connector retrieves Features, Goals, Ideas, Notes, and Releases from workspaces in your Aha! Roadmaps source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Aha! Roadmaps for external content indexing

Generate an API key in Aha! Roadmaps to allow the Aha! Roadmaps external content connector to access content from your workspaces.

Before you begin

Your organization must have already set up a custom Aha! domain.

Your Aha! Roadmaps account needs either the owner role for your organization's workspace or the account admin role. To learn about non-administrator and administrator roles in Aha! Roadmaps, see https://support.aha.io/aha-roadmaps/account/billing-and-users/user-permissions~7444657360296913475.

Role required: none

About this task

The Aha! Roadmaps external content connector retrieves Features, Goals, Ideas, Notes, and Releases from workspaces in your Aha! Roadmaps source system using the Aha! REST API.

To allow the connector to access your Aha! Roadmaps content via the REST API, you must generate an API key in Aha! Roadmaps. Your connector administrator can use this API key to configure the Aha! Roadmaps external content connector for proper connection to your source system.

Procedure

In Aha! Roadmaps, generate a new API key for use by the Aha! Roadmaps external content connector.

a. Navigate to https://secure.aha.io/settings/api_keys and log in with your administrator or workspace owner credentials when prompted.

b. Select **Generate API Key**.

c. Enter a name for your new API key, then select **Generate API Key**.

d. Copy your new API key and store it in a secure location.

> **Important:** Your external content connector administrator needs this API key when configuring the Aha! Roadmaps external content connector.

What to do next

Provide the following items to your connector administrator:

- The host URL for your Aha! Roadmaps instance. This is typically `https://<organization>.aha.io/`, where `<organization>` is the name of your organization.
- The API key value that you copied in step 1.d.

Your connector administrator needs these items to configure a Aha! Roadmaps external content connector to retrieve Features, Goals, Ideas, Notes, and Releases and security principals from your Aha! Roadmaps source system.

For details on creating and configuring a Aha! Roadmaps external content connector, see Create an Aha! Roadmaps external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an Aha! Roadmaps external content connector

Create an external content connector to retrieve searchable content and security principals from your Aha! Roadmaps source system.

Before you begin

A source system administrator must have already configured your Aha! Roadmaps source system to allow access by the Aha! Roadmaps external content connector. For the required source system configuration steps, see Configure Aha! Roadmaps for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Aha !* **Roadmaps** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Aha! Roadmaps external content connector.
Host URL	URL for your Aha! Roadmaps instance host. This is typically `https://<organization>.aha.io`, where `<organization>` is the name of your organization. If you don't have the host URL, ask your Aha! Roadmaps administrator for it.
API token	API key generated in Aha! Roadmaps. If you don't have the API token, ask your Aha! Roadmaps administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Aha! Roadmaps external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for an Aha! Roadmaps external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for an Aha! Roadmaps external content connector

Specify the products you want your Aha! Roadmaps external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Aha! Roadmaps external content connector that you want to configure crawl settings for. To learn about this procedure, see Create an Aha! Roadmaps external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Aha! Roadmaps external content connector crawls all products from its specified source system and sends all Features, Goals, Ideas, Notes, and Releases to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the products to crawl when running content crawls
- Inclusion or exclusion filters for the content types to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Aha! Roadmaps external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. In the Products section, select one of the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl content found in all products from the source system, select **Crawl all products**.

- To crawl only content found in a specified set of products from the source system, select **Include only these products**, then use the **Add products to include** field and **Add** button to enter URLs for products whose content you want the connector to include when crawling.

  As an example, you might enter `https://example.aha.io/future-innovations` and `https://example.aha.io/launchpad-initiatives` to only retrieve searchable content from the specified products.

- To crawl content found in all but a specified set of products from the source system, select **Exclude only these products**, then use the **Add products to exclude** field and **Add** button to enter URLs for products whose content you want the connector to exclude when crawling.

  As an example, you might enter `https://example.aha.io/internal` and `https://example.aha.io/test` to exclude searchable content from the specified products.

5. In the Crawl content types section, select the options for the Aha! Roadmaps content types (Features, Goals, Ideas, Notes, and Releases) that you want the connector to retrieve from products when running content crawls.
6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result

The Aha! Roadmaps external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Aha! Roadmaps source system using your modified crawl settings, create and run a one-time content crawl for your Aha! Roadmaps external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Amazon S3 external content connector

The Amazon S3 external content connector retrieves files from buckets in your Amazon S3 source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to update searchable content and metadata from your source system. Content crawls feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: All content the connector retrieves from your Amazon S3 buckets is treated as public content, searchable by everyone who has access to your configured AI Search experience.

Advanced connection settings

You can optionally specify the following connection settings for an Amazon S3 external content connector.

- The AWS region for the connector.

  Note: For regulatory market compliance, specify a regulated market AWS region, such as `us-gov-east-1` or `us-gov-west-1`.

- Automatic selection or manual specification of the Amazon S3 endpoint used for connection and authentication operations. For AWS regions that offer endpoints compliant with the Federal Information Processing Standards (FIPS), you can optionally restrict automatic selection to those endpoints.
- A list of Amazon S3 buckets that the connector can access content from. If you leave this list empty, the connector finds buckets using auto-discovery. If you populate this list, the connector only accesses content from the specified buckets.

For the full list of supported Amazon S3 endpoints and regions, see the Amazon Simple Storage Service endpoints and quotas Amazon documentation resource.

Create a content crawl for an external content connector

Configure Amazon S3 for external content indexing

Create an Identity and Access Management (IAM) user in the Amazon Web Services (AWS) Management Console. Define an access key for your new user to allow the Amazon S3 external content connector to access your Amazon S3 source system.

Before you begin

You need AWS Management Console credentials for your AWS account. You must have sufficient privileges to create an IAM user, define policy permissions for that user, and create an access key for that user. To learn more about these tasks, see the Amazon Web Services IAM users, Define custom IAM permissions with customer managed policies, Permissions required to access IAM resources, Manage access keys for IAM users, and Secure access keys resources.

Role required: none

About this task

The Amazon S3 external content connector retrieves content from buckets in your Amazon S3 source system using the Amazon Web Services (AWS) API. To access your Amazon S3 buckets, the connector uses an access key ID and secret access key that you define for a new Identity and Access Management (IAM) user. You specify bucket access permissions for this IAM user with an IAM policy.

Your ServiceNow AI Platform administrator needs this IAM user's access key ID and secret access key to configure the Amazon S3 external content connector for proper connection to your AWS account.

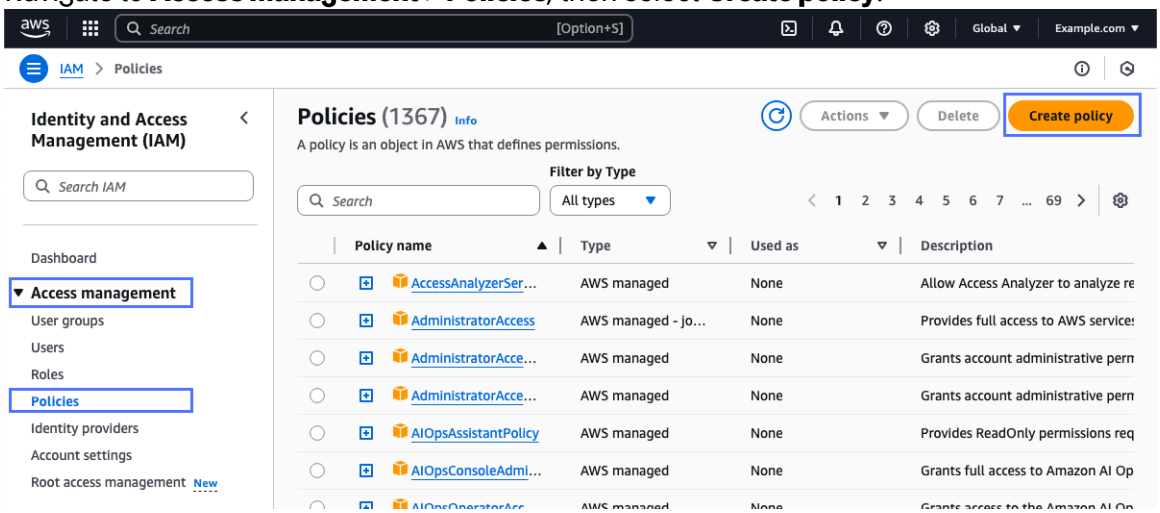
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Important: All content the connector retrieves from your Amazon S3 buckets is treated as public content, searchable by everyone who has access to your configured AI Search experience.

Procedure

1. Create a new IAM policy that defines permissions needed for the Amazon S3 external content connector user.

   a. Log in to the Identity and Access Management page of the AWS Management Console at https://console.aws.amazon.com/iam/.

   b. Navigate to **Access management** > **Policies**, then select **Create policy**.

   c. In the Policy editor, select **JSON**, then paste the following JSON-format policy description into the editor, replacing the default policy description:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "ListAllBuckets",
         "Effect": "Allow",
         "Action": [
            "s3:ListAllMyBuckets"
         ],
         "Resource": [
            "*"
         ]
      },
      {
         "Sid": "BucketCrawlPermissions",
         "Effect": "Allow",
         "Action": [
            "s3:ListBucket",
            "s3:GetBucketLocation"
         ],
         "Resource": [
            "arn:aws:s3:::example-bucket-1",
            "arn:aws:s3:::example-bucket-2"
         ]
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    },
    {
      "Sid": "ObjectCrawlPermissions",
      "Effect": "Allow",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::example-bucket-1/*",
        "arn:aws:s3:::example-bucket-2/*"
      ]
    }
  ]
}
```

d. In the Policy editor, update the `Resource` array for the `BucketCrawlPermissions` object to include Amazon Resource Names (ARNs) for all of the Amazon S3 buckets you want the external content connector to be able to crawl.
This array should only contain ARNs for the Amazon S3 bucket resource type. For details on ARNs, see https://docs.aws.amazon.com/IAM/latest/UserGuide/reference-arns.html. To learn more about resource types defined for Amazon S3, see https://docs.aws.amazon.com/service-authorization/latest/reference/list_amazons3.html#amazons3-resources-for-iam-policies. When granting access to your Amazon S3 buckets, remember that all content crawled by the connector is searchable by everyone who has access to your configured AI Search experience.

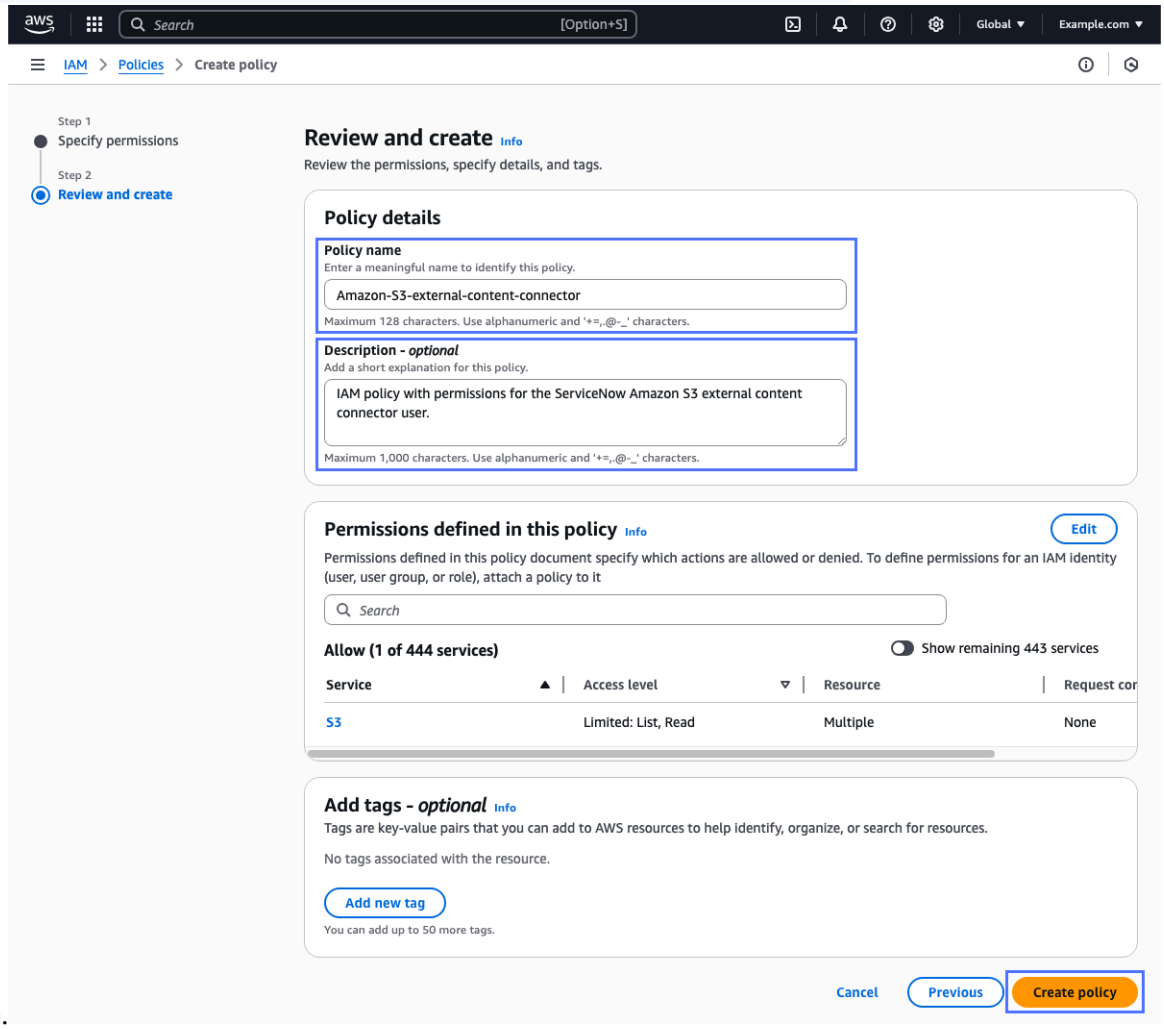
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

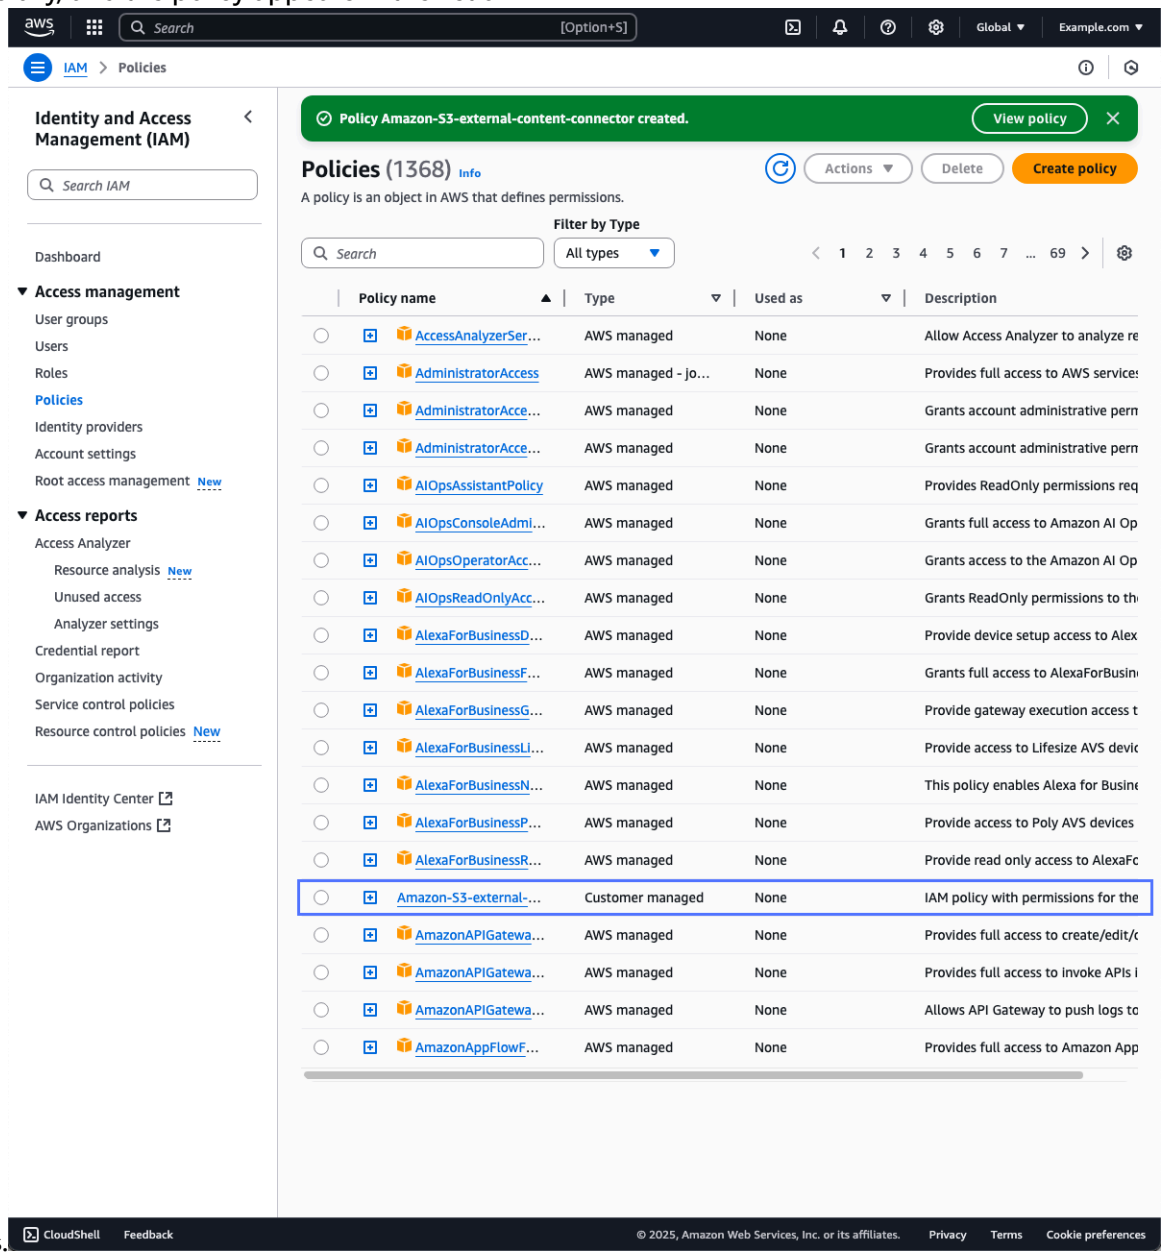
e. In the Policy editor, update the `Resource` array for the `ObjectCrawlPermissions` object to include ARNs for all of the Amazon S3 resources you want the external content connector to be able to retrieve.
This array should only contain ARNs for the Amazon S3 object resource type. You can use wildcards to grant access to all objects in a bucket, as shown in the example ARNs. For details on ARNs, see https://docs.aws.amazon.com/IAM/latest/UserGuide/reference-arns.html. To learn more about resource types defined for Amazon S3, see https://docs.aws.amazon.com/service-authorization/latest/reference/list_amazons3.html#amazons3-resources-for-iam-policies. When granting access to your Amazon S3 bucket resources, remember that all content crawled by the connector is searchable by everyone who has access to your configured AI Search experience.



```
{
  "Sid": "BucketCrawlPermissions",
  "Effect": "Allow",
  "Action": [
    "s3:ListBucket",
    "s3:GetBucketLocation"
  ],
  "Resource": [
    "arn:aws:s3:::example-bucket-1",
    "arn:aws:s3:::example-bucket-2"
  ]
},
{
  "Sid": "ObjectCrawlPermissions",
  "Effect": "Allow",
  "Action": [
    "s3:GetObject"
  ],
  "Resource": [
    "arn:aws:s3:::example-bucket-1/*",
    "arn:aws:s3:::example-bucket-2/*"
  ]
}
]
}
```

f. Select **Next**.

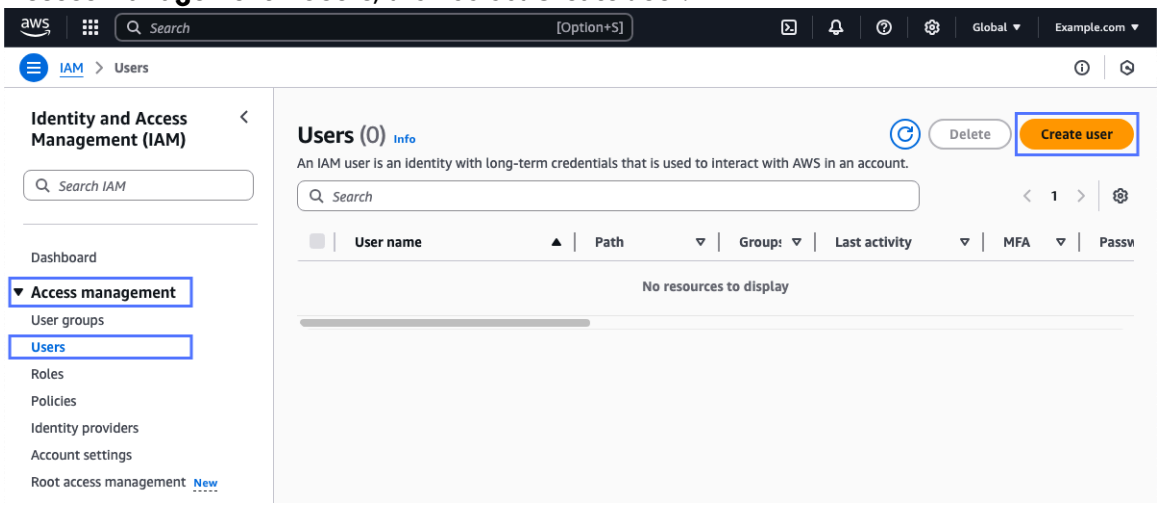
g. On the Review and create page, enter a **Policy name** and optionally a **Description** for your new policy, then select **Create policy**.



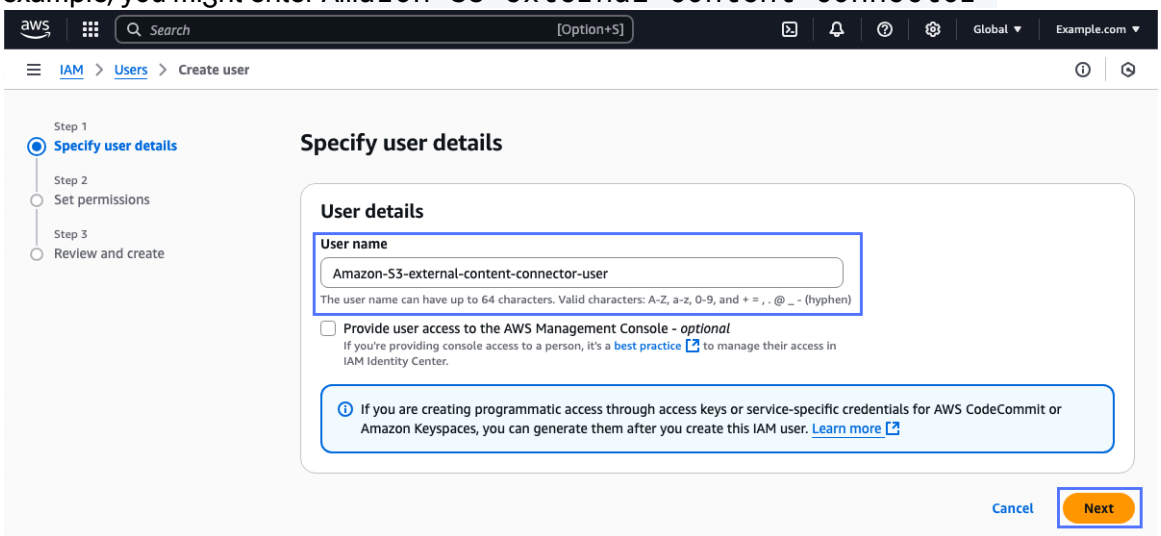
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `Amazon-S3-external-content-connector` as the policy name and `IAM policy with permissions for the ServiceNow Amazon S3 external content connector user.` as the definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



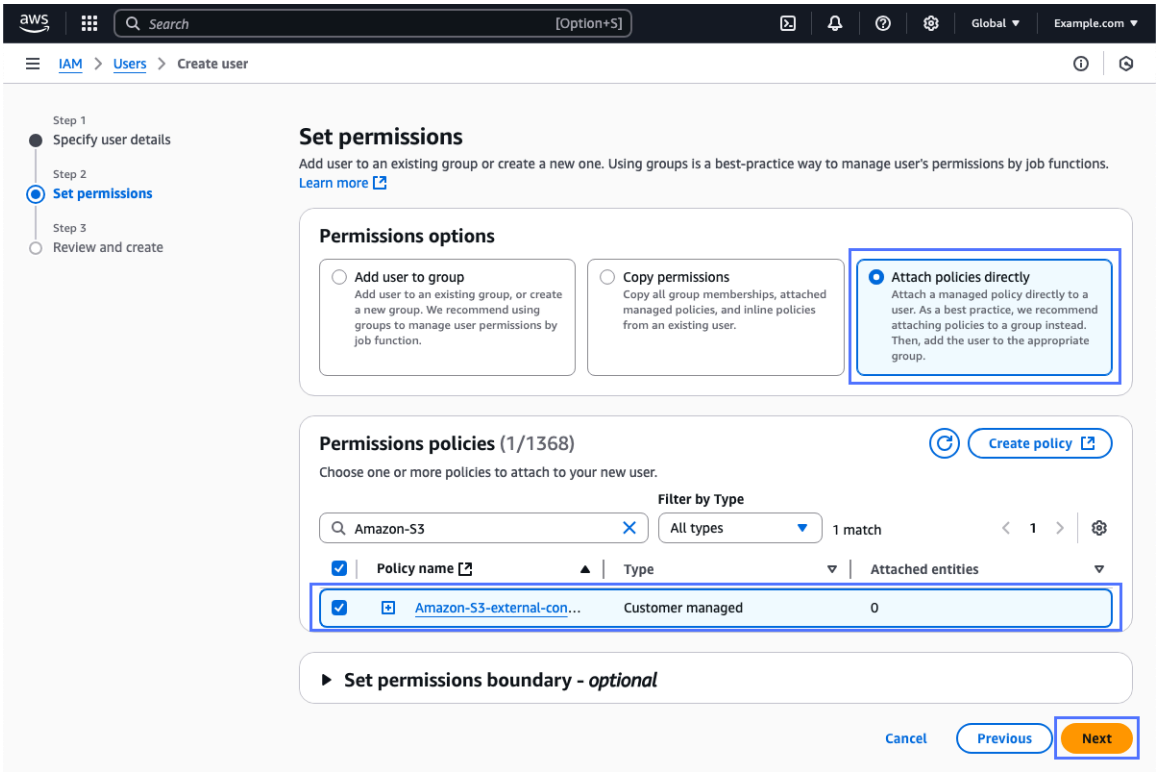
A message confirms that your new IAM policy was created successfully, and the policy appears in the list of IAM policies.



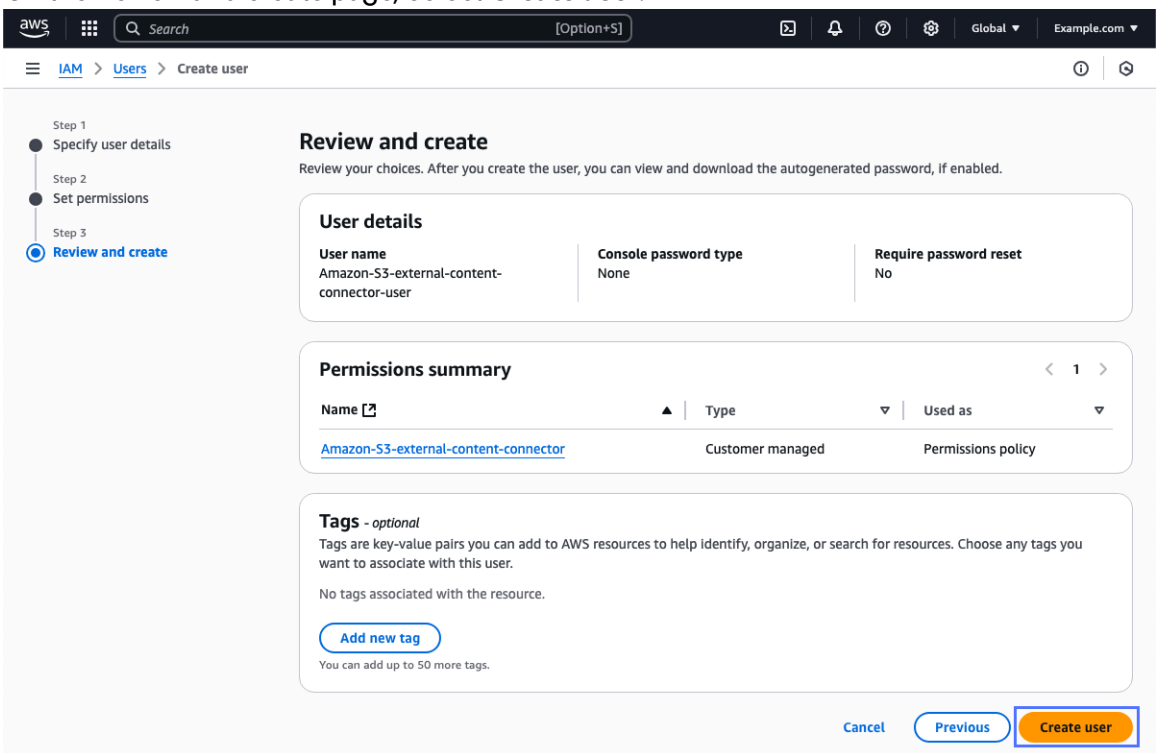
2. Create a new IAM user in your AWS account:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Identity and Access Management page of the AWS Management Console, navigate to **Access management** > **Users**, then select **Create user**.



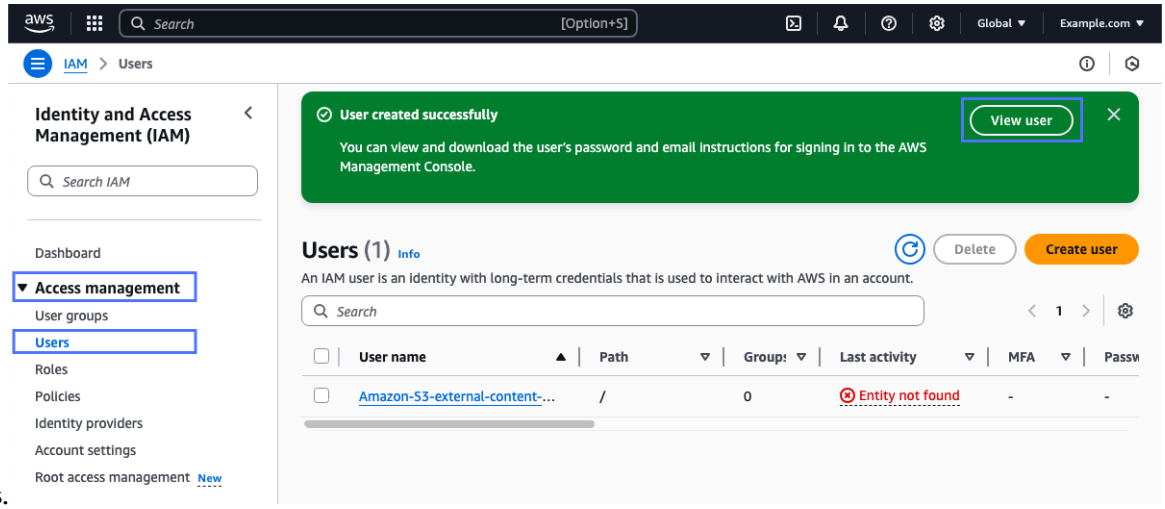
b. On the Specify user details page, enter a name for your new IAM user, then select **Next**. As an example, you might enter `Amazon-S3-external-content-connector-user`.



c. On the Set permissions page, select **Attach policies directly** in the Permissions options section.

d. In the Permissions policies list, select the option for the new IAM policy that you created in step 1, then select **Next**.

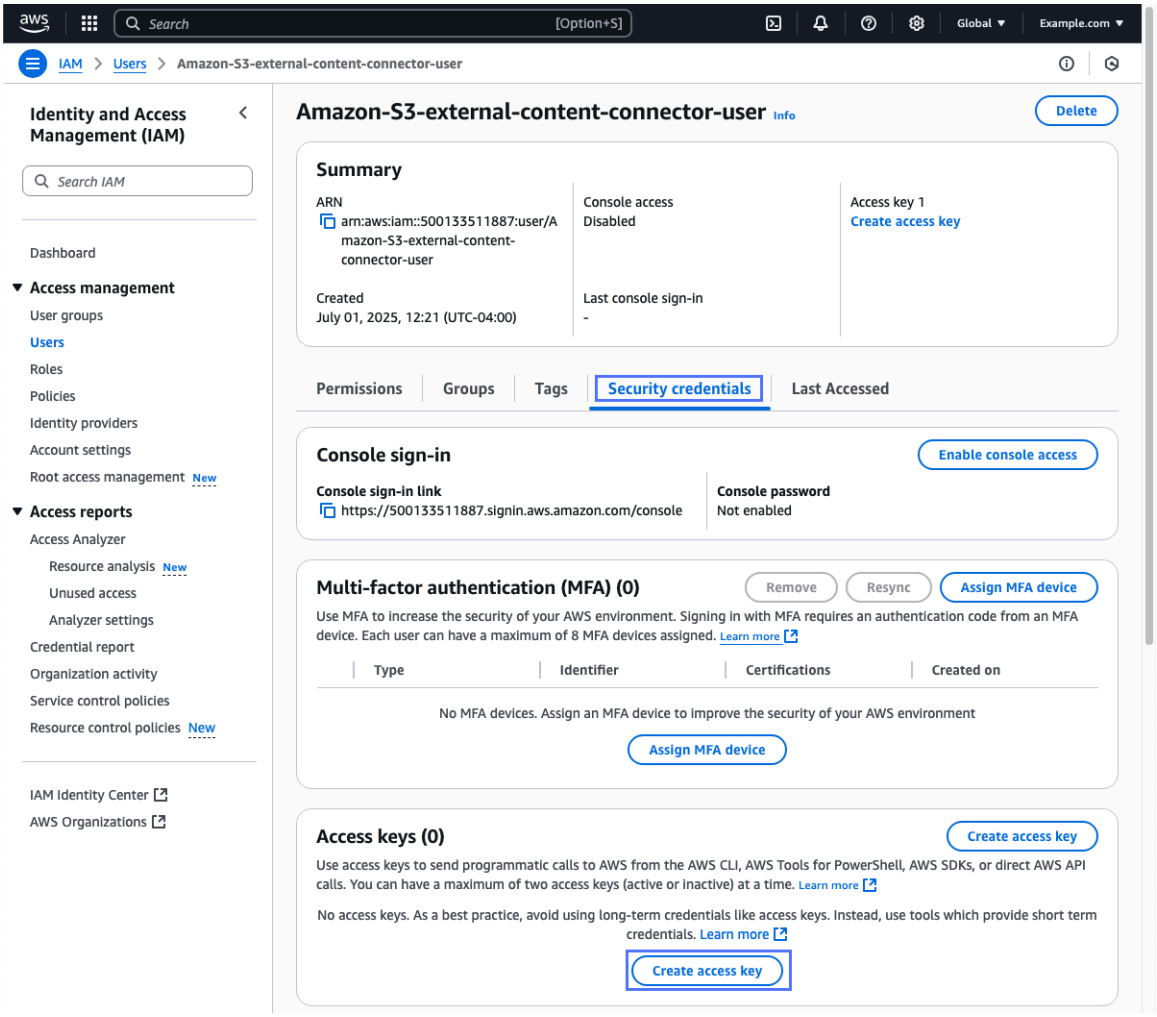
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. On the Review and create page, select **Create user**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A message confirms that your new IAM user was created successfully, and the user appears in the list of IAM users.

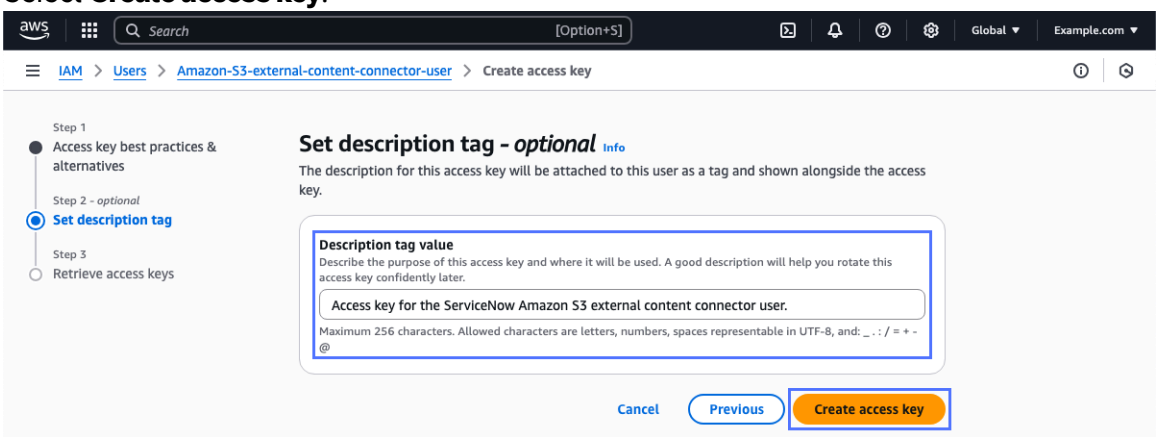


3. Create an access key for your new IAM user:

   a. Select **View user** in the message that appeared when you completed step 2.
   If the message and **View user** link are no longer visible, navigate to **Access management** > **Users** in the AWS Management Console, then select the user that you created in step 2.

   b. In the Security credentials tab, navigate to the Access keys section and select **Create access key**.

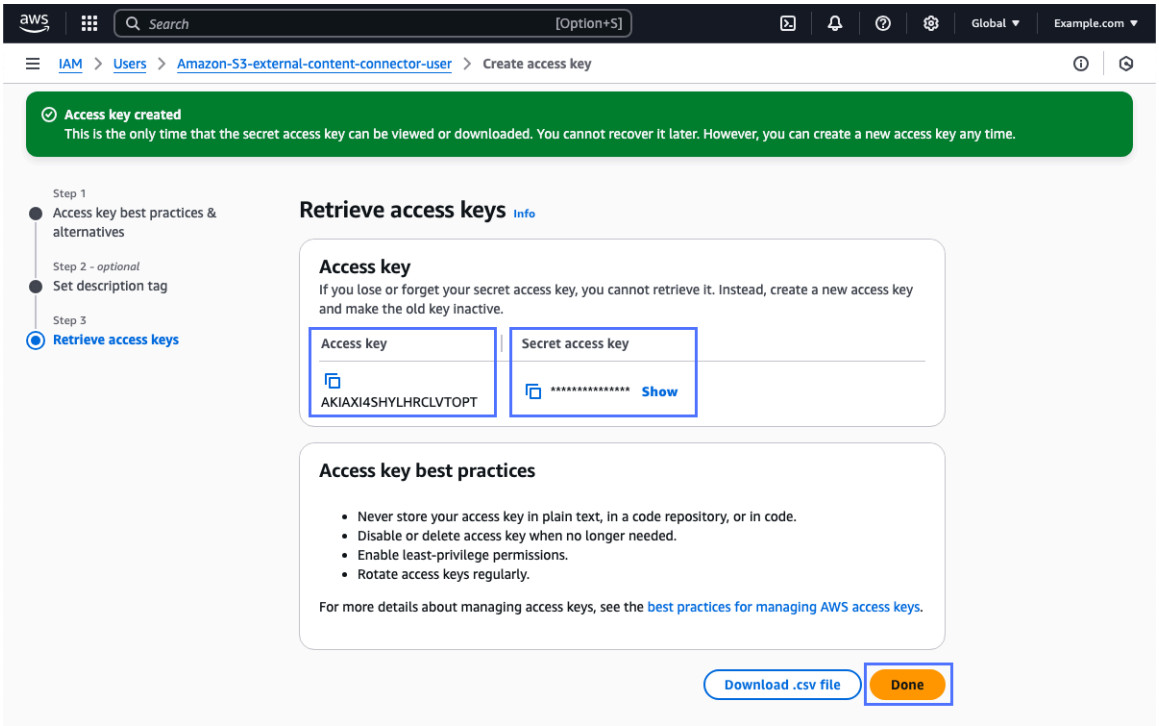
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. On the Access key best practices & alternatives page, select the **Application running outside AWS** use-case, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Enter a description tag value for your new access key.
As an example, you might enter `Access key for the ServiceNow Amazon S3 external content connector user.`



e. Select **Create access key**.

A message confirms that your new access key was created.

f. On the Retrieve access keys page, copy the new key's **Access key** and **Secret access key** values and store them in a secure location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Your connector administrator needs this access key and secret access key when configuring the Amazon S3 external content connector.

g. Select **Done**.

What to do next

Provide the IAM user access key and secret access key that you copied in step 3.f to your ServiceNow AI Platform admins. Your admin needs these items to configure an Amazon S3 external content connector to retrieve searchable content and security principals from your Amazon S3 buckets.

For details on creating and configuring an Amazon S3 external content connector, see Create an Amazon S3 external content connector.

Create an Amazon S3 external content connector

Create an external content connector to retrieve searchable content from your Amazon S3 source system.

Before you begin

A source system administrator must have already configured your Amazon S3 source system to allow access by the Amazon S3 external content connector. For the required source system configuration steps, see Configure Amazon S3 for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Amazon S3** tile, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Amazon S3 external content connector.
Access Key Id	Access key ID for the Amazon Web Services (AWS) IAM user account used by the Amazon S3 external content connector. If you don't have this access key ID, ask your AWS administrator for it.
Secret Access Key	Secret access key for the Amazon Web Services (AWS) IAM user account used by the Amazon S3 external content connector. If you don't have this secret access key, ask your AWS administrator for it.
I agree to the following legal disclaimer	Option acknowledging that the Amazon S3 external content connector makes all crawled content accessible by all search users. Amazon S3 content access permissions don't rely on users' email addresses, as retrieved in user permission crawls. As a result, user permission crawls aren't supported for the Amazon S3 external content connector.

6. **Optional:** Expand the **Advanced connection settings** section and fill in the fields.

Advanced connection settings

Connection setting	Description
Endpoint resolution	Selection mode for the AWS endpoint to use for connection and authentication. Supported values: ○ **Automatic**: The connector uses the AWS SDK and your *AWS* **region** and **Use FIPS compliant endpoints** settings to automatically select the AWS endpoint to use. ○ **Manual**: The connector uses the AWS endpoint and region that you specify in the **Endpoint** and *AWS* **region** fields.
Use FIPS compliant endpoints	Option to force connection and authentication operations to use an AWS endpoint host that conforms to the Federal Information Processing Standards. This option appears only when you set **Endpoint resolution** to *Automatic*. It's only accessible when the region specified in the *AWS* **region** field supports FIPS endpoints.
Endpoint	URL for the AWS endpoint host you want the connector to use for connection and authentication. As an example, to make the connector use the `s3.us-east-1.amazonaws.com` endpoint with the HTTPS protocol, you might enter `https://s3.us-east-1.amazonaws.com`. This field appears only when you set **Endpoint resolution** to *Manual*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	For the full list of supported endpoints, see the Amazon Simple Storage Service endpoints and quotas Amazon documentation resource. **Note:** The Amazon resource lists endpoint hostnames. This field's value must be a valid URL, with the HTTP or HTTPS protocol prefix included.
AWS region	AWS region containing your Amazon S3 buckets. As an example, you might specify `us-west-1`. When **Endpoint resolution** is set to *`Automatic`*, the connector uses this region and the **Use FIPS compliant endpoints** option to determine the correct AWS endpoint to use for connection and authentication. To view the list of AWS regions, see the Amazon Simple Storage Service endpoints and quotas Amazon documentation resource. **Note:** For regulatory market compliance, specify a regulated market AWS region, such as `us-gov-east-1` or `us-gov-west-1`.
Buckets	List of Amazon S3 buckets containing your content. Enter a bucket name and press **Add** to add it to the list. You must populate this field when using an AWS endpoint that doesn't support automatic bucket discovery, such as a FIPS endpoint or an Amazon S3 Outposts endpoint. For other endpoints, you can leave this field empty to enable auto-discovery of buckets. When this list is populated, the connector only retrieves searchable content and metadata from the specified Amazon S3 buckets.

7. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Atlassian Confluence Cloud external content connector.
9. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
10. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for an Amazon S3 external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

Important: All content the connector retrieves from your Amazon S3 buckets is treated as public content, searchable by everyone who has access to your configured AI Search experience.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for an Amazon S3 external content connector

Define inclusion and exclusion filters to specify the buckets and file types you want your Amazon S3 external content connector to retrieve when running content crawls.

Before you begin
A connector administrator must have already created the Amazon S3 external content connector that you want to configure crawl settings for. To learn about this procedure, see Create an Amazon S3 external content connector.

Role required: sn_ext_conn.xcc_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

This task is optional. By default, the Amazon S3 external content connector crawls all buckets and file types from its specified source system and sends files with all supported extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the buckets to crawl when running content crawls
- Inclusion or exclusion filters for the file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Amazon S3 external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all buckets from the source system, select **Crawl all content**.
   - To crawl only a specified set of buckets from the source system, select **Include only these buckets**, then use the **Add S3 bucket URLs to include** field and **Add** button to enter URLs for buckets you want the connector to include when crawling.

     As an example, you might enter `https://s3.amazonaws.com/published` to only include searchable content from a bucket with name `published`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all but a specified set of buckets from the source system, select **Exclude only these buckets**, then use the **Add S3 bucket URLs to exclude** field and **Add** button to enter URLs for buckets you want the connector to exclude when crawling.

  As an example, you might enter `https://s3.amazonaws.com/legacy_bucket` to exclude searchable content from a bucket with name `legacy_bucket`.

5. Select one of the following **Filetype filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result

The Amazon S3 external content connector is updated with your modified crawl settings.

> **Important:** All content the connector retrieves from your Amazon S3 buckets is treated as public content, searchable by everyone who has access to your configured AI Search experience.

What to do next

To retrieve content from your Amazon S3 source system using your modified crawl settings, create and run a one-time content crawl for your Amazon S3 external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Asana external content connector

The Asana external content connector retrieves projects, tasks, and comments from your Asana source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Asana for external content indexing

Create and authorize an OAuth 2.0 application in the Asana developer console to allow the Asana external content connector to access your Asana source system.

Before you begin

You need the super admin role for your organization's Asana instance. To learn about this role, see the Admin and super admin roles in Asana Asana help resource.

Role required: none

About this task

The Asana external content connector retrieves projects, tasks, and comments from your Asana source system using the Asana API.

To allow the connector to access your Asana source system via the Asana API, you must configure and authorize an OAuth 2.0 application in the Asana developer console. Your connector administrator can use settings copied from the OAuth 2.0 application to configure the Asana external content connector for proper connection to your source system.

Procedure

1. Log in to Asana and access the Asana developer console.
   a. Navigate to https://app.asana.com/ and log in with your super admin credentials.
   b. Select your user avatar, then select **Settings** from the context menu.
   c. In the Apps tab of the Settings modal window, find the Build new apps section and select **View developer console**.
   The Asana developer console opens.
2. In the Asana developer console, create a new OAuth 2.0 application for the Asana external content connector.
   a. Select **Create new app**.
   b. In the Create new app modal window, enter a name for your app.
   As an example, you might enter `Asana external content connector`.
   c. Select the **Integrate Asana and another tool** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select the **I agree to the Asana API Terms** option.

e. Select **Create app**.

The Basic information page for your new app appears.

3. On the Basic information page, record the client ID and client secret for your new OAuth 2.0 application.

a. In the Client ID field, select **Copy** to copy your new app's client ID, then record its value in a secure location.

> **Important:** Your external content connector administrator needs this client ID when configuring the Asana external content connector.

b. In the Client secret field, select **Copy** to copy your new app's client secret, then record its value in a secure location.

> **Important:** Your external content connector administrator needs this client secret when configuring the Asana external content connector.

4. Configure an OAuth redirect URL for your new app.

a. Navigate to **Configure** > **OAuth**.
The OAuth page for your new app appears.

b. In the Redirect URLs section, select **Add redirect URL**.

c. In the Add redirect URL modal window, enter `https://<instance-name>.service-now.com/oauth_redirect.do`, replacing `<instance-name>` with the name of your ServiceNow AI Platform® instance, then select **Add**.

The new redirect URL appears on the OAuth page.

5. Configure Asana API permission scopes for your new app.

a. On the OAuth page, in the Permission scopes section, select the options for all of the following permission scopes:

- Goals: Read (`goals:read`)
- Portfolios: Read (`portfolios:read`)
- Projects: Read (`projects:read`)
- Stories: Read (`stories:read`)
- Tasks: Read (`tasks:read`)
- Team memberships: Read (`team_memberships:read`)
- Teams: Read (`teams:read`)
- Users: Read (`users:read`)
- Workspaces: Read (`workspaces:read`)

b. Select **Save changes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Share your new app with your Asana workspaces.

   a. Navigate to **Test & distribute** > **Manage distribution**.
   The Manage distribution page for your new app appears.

   b. Select **Specific workspaces**.

   c. Select **Add workspace**, then choose the Asana workspace that you want to distribute the new app to and select **Add**.

   d. Repeat the preceding step if you want to distribute your new app to multiple Asana workspaces.

What to do next

Provide the following items to your connector administrator:

- The client ID for your new OAuth 2.0 application that you copied in step 3.a.
- The client secret for your new OAuth 2.0 application that you copied in step 3.b.

Your connector administrator needs these items to configure an Asana external content connector to retrieve projects, tasks, comments, and security principals from your Asana source system.

For details on creating and configuring an Asana external content connector, see Create an Asana external content connector.

Create an Asana external content connector

Create an external content connector to retrieve searchable content and security principals from your Asana source system.

Before you begin

A source system administrator must have already configured your Asana source system to allow access by the Asana external content connector. For the required source system configuration steps, see Configure Asana for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Asana** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Asana external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
Client ID	Client ID for the OAuth 2.0 Asana application that grants the connector access to your Asana content. If you don't have the client ID, ask your Asana administrator for it.
Client Secret	Client secret for the OAuth 2.0 Asana application that grants the connector access to your Asana content. If you don't have the client secret, ask your Asana administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Asana external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for an Asana external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for an Asana external content connector

Specify the projects you want your Asana external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Asana external content connector that you want to configure crawl settings for. To learn about this procedure, see Create an Asana external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Asana external content connector crawls all projects from its specified source system and sends documents with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the projects to crawl when running content crawls
- Inclusion or exclusion filters for the file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Asana external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content** options:
   - To crawl all projects from the source system, select **Crawl all content**.
   - To crawl only a specified set of projects from the source system, select **Include only these projects**, then use the **Add Projects** field and **Add** button to enter names for projects you want the connector to include when crawling.

     As an example, you might enter `Production` to only retrieve searchable content from the project with the specified name.
   - To crawl all but a specified set of projects from the source system, select **Exclude only these projects**, then use the **Add Projects** field and **Add** button to enter names for projects you want the connector to exclude when crawling.

     As an example, you might enter `Test` to exclude searchable content from the project with the specified name.
5. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

6. Select **Save and validate**.

Result
The Asana external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Asana source system using your modified crawl settings, create and run a one-time content crawl for your Asana external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Atlassian Confluence Cloud external content connector

The Atlassian Confluence Cloud external content connector retrieves pages and attachments from spaces in your Atlassian Confluence Cloud source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Note:

When running crawls for the Atlassian Confluence Cloud external content connector, run your content crawl first, before running a user permission crawl. If you run the user permission crawl before the content crawl completes, some Confluence Cloud content may not be searchable.

The connector automatically runs a user permission crawl after its first full content crawl completes. It also automatically runs a user permission crawl if you modify its connection settings and then run a complete full content crawl. In all other cases, you need to run or schedule the user permission crawl so that it starts after your latest content crawl has completed.

Role-Based Access Control (RBAC) beta support

The Atlassian Confluence Cloud external content connector only offers limited support for the Role-Based Access Control (RBAC) feature that's available in beta in Atlassian Confluence Cloud.

- The connector maps user and group read permissions assigned via RBAC roles just as it does for non-RBAC read permissions.
- The connector ignores user and group read permissions assigned via RBAC user classes. These include the anonymous permission assigned via the anonymous user class. If RBAC user class permissions are the only read permissions assigned on a page or attachment, the content from that page or attachment is not searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Atlassian recommends enabling the RBAC feature for testing in a non-production Atlassian Confluence Cloud environment. Connector admins should test the connector's behavior with RBAC in non-production ServiceNow AI Platform® instances before deploying to production.

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Estimate document volume for Atlassian Confluence Cloud

Estimate the number of documents included in your Atlassian Confluence Cloud source system. Use this information to determine crawl scope settings needed for your Atlassian Confluence Cloud external content connector.

Before you begin

You need the following credentials and permissions for your organization's Atlassian Confluence Cloud source system:

- Login credentials for an administrator account
- Permission to create reports

Role required: none

About this task

Before configuring an Atlassian Confluence Cloud external content connector, you may find it helpful to estimate the number of documents available in your Atlassian Confluence Cloud source system.

By estimating the count of available documents, you can determine whether you need to restrict the crawl scope for your Atlassian Confluence Cloud external content connector to avoid exceeding the indexed-document limit.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to your Atlassian Confluence Cloud administration console using administrator credentials.
   The URL for the Atlassian Confluence Cloud administration console is typically `https://<hostname>.atlassian.net/wiki/admin`, where `<hostname>` is your organization-specific hostname.
2. In the administration page's menu, navigate to **Settings** > **Data management** > **Space reports**.
3. Select **Create report** and wait for the new report's **Download** link to appear.
   The report may take a few minutes to generate.
4. Select the **Download** action for the new report, then save the space report CSV file to a convenient location when prompted.
5. Open the downloaded space report CSV file in a tool of your choice.
6. For each space listed in the space report CSV file, find the number of available documents in the space by adding its listed Content Count and Attachments figures.
   As an example, if a space's entry in the space report CSV file shows Content Count 3571 and Attachments 258, the total number of available documents for that space is 3,829.
7. Sum the available-document counts for all spaces to find the total number of available documents in your Atlassian Confluence Cloud source system.

> **Note:** The counts in the space report include all document and attachment types. Some of these may be types that aren't supported by the Atlassian Confluence Cloud external content connector, so the number of documents and attachments retrieved by the connector may be lower than the numbers in the report.

What to do next

If your Atlassian Confluence Cloud source system's total available document count exceeds the connector limit of one million (1,000,000) documents, you will need to limit the crawl scope for the Atlassian Confluence Cloud external content connector. Choose a set of spaces whose total document count is less than the connector limit, and inform your ServiceNow AI Platform admin so they can configure the external content connector's crawl settings to include only those spaces.

For details on configuring the Atlassian Confluence Cloud connector's crawl settings, see Configure crawl settings for an Atlassian Confluence Cloud external content connector.

Configure Atlassian Confluence Cloud for external content indexing

Register an OAuth 2.0 integration in the Atlassian Developer console and create an API key in Atlassian Administration to allow the Atlassian Confluence Cloud external content connector to crawl spaces and security principals in your Atlassian Confluence Cloud source system.

Before you begin

You need the following credentials and permissions for your organization's Atlassian management applications:

Atlassian portal	Required credentials and permissions
Atlassian Developer console (https://developer.atlassian.com/console/myapps/)	• Login credentials • Permission to view settings for registered applications • Permission to register a new application

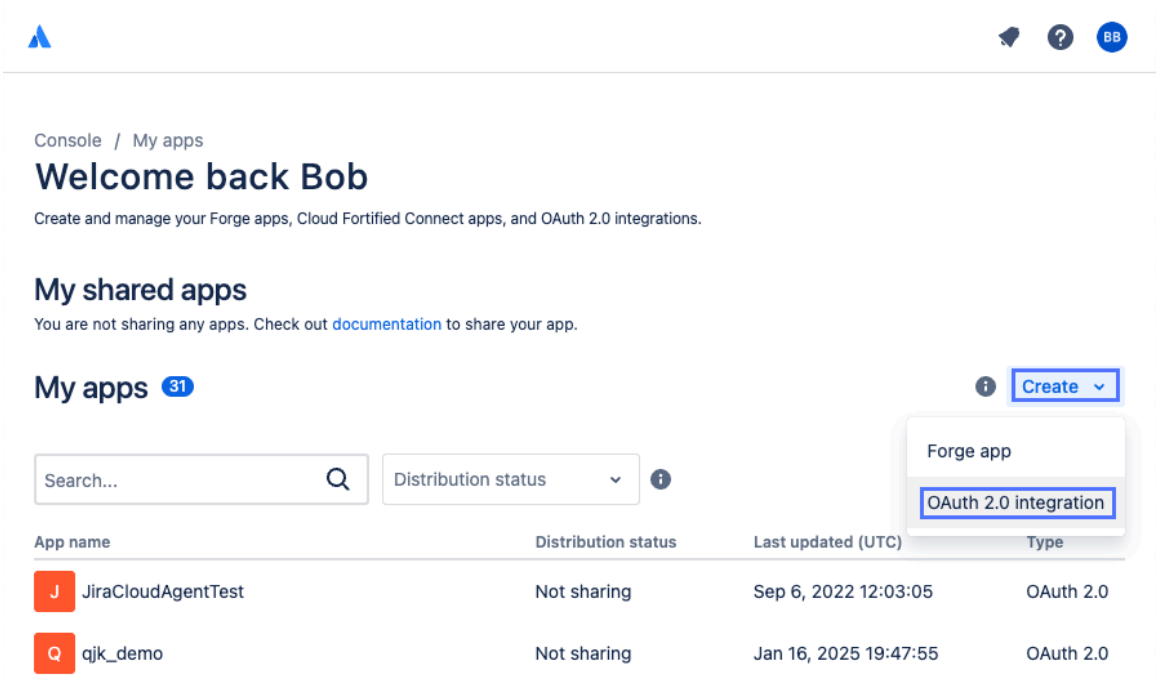
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Atlassian portal	Required credentials and permissions
	• Permission to set granular Confluence API scopes for an application • Permission to set the OAuth 2.0 callback URL for an application
Atlassian Administration (https://admin.atlassian.com/)	• Organization admin login credentials

Role required: none

About this task

The Atlassian Confluence Cloud external content connector retrieves content from your Atlassian Confluence Cloud source system using the Confluence Cloud API.



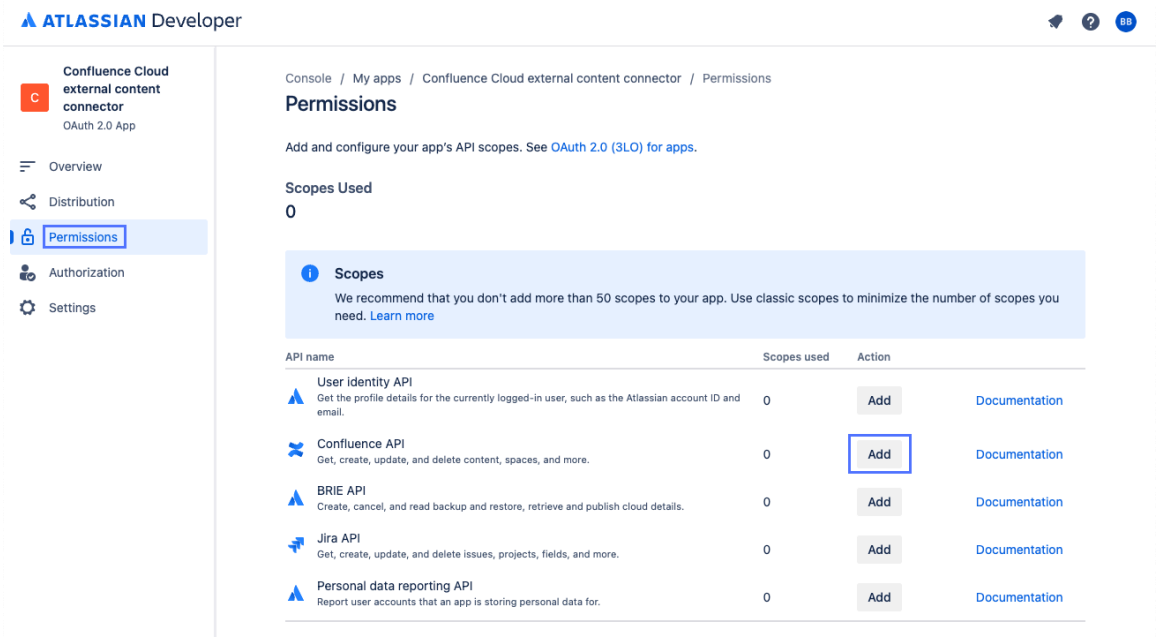
To allow the connector to access your Atlassian Confluence Cloud source system via the Confluence Cloud API, you must configure an OAuth 2.0 integration in the Atlassian Developer console and an API key in Atlassian Administration. Your connector administrator can use settings copied from the OAuth 2.0 integration and the API key to configure the Atlassian Confluence Cloud external content connector for proper connection to your Atlassian Confluence Cloud source system.

Procedure

1. In the Atlassian Developer console, register a new OAuth 2.0 integration for the Atlassian Confluence Cloud external content connector.

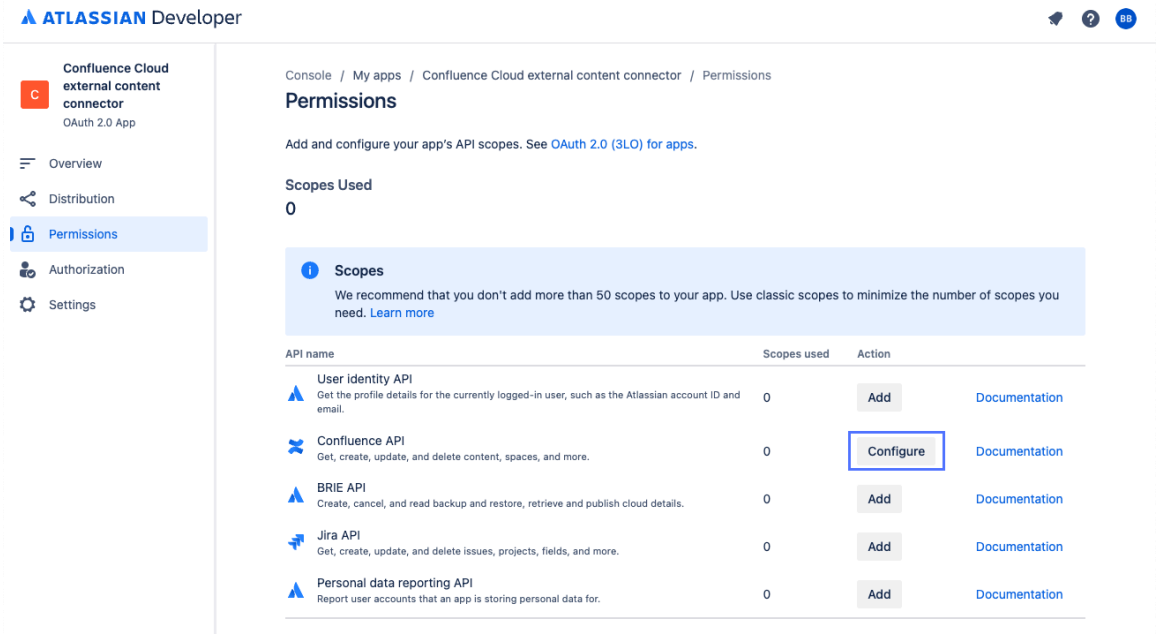
   a. Log in to the Atlassian Developer console at https://developer.atlassian.com/console/myapps/.

   b. In the My apps section, select **Create** > **OAuth 2.0 integration**.



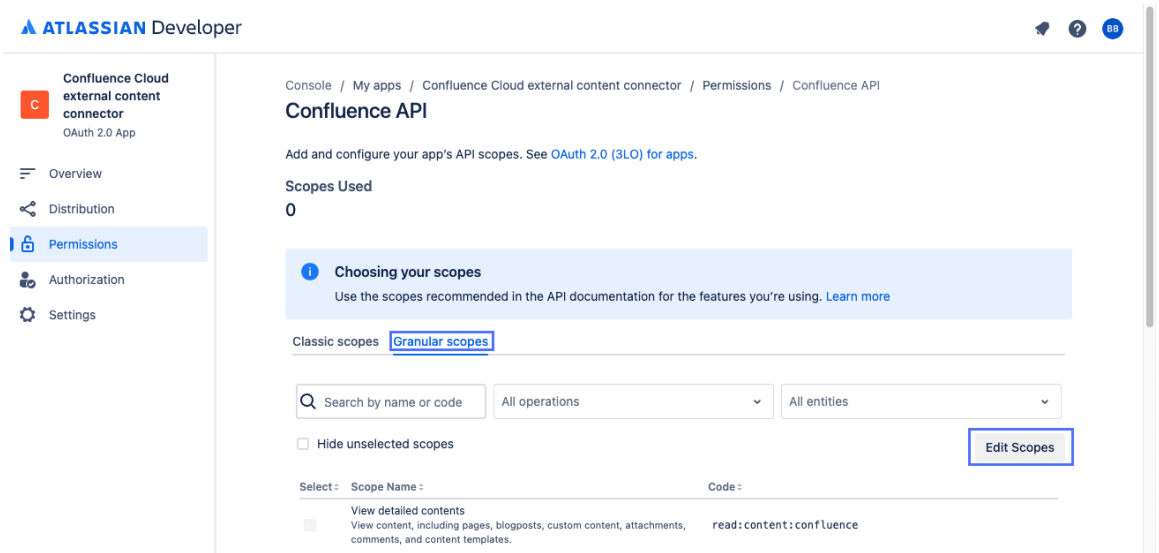
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Enter a name for your OAuth 2.0 integration, select the option to agree to Atlassian's developer terms, and select **Create**.



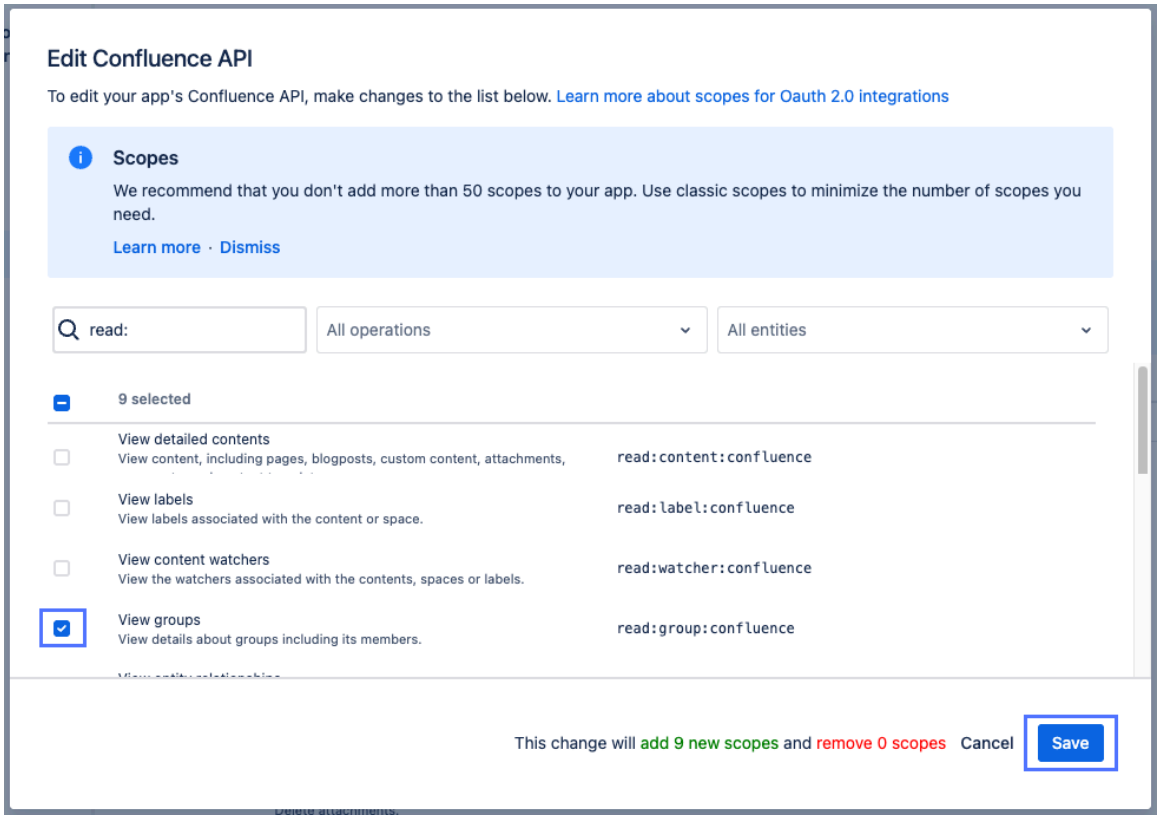
As an example, you might enter `Confluence Cloud external content connector` as the name for your OAuth 2.0 integration.

d. Navigate to the OAuth 2.0 integration's Permissions page, then select **Add** in the Confluence API row.



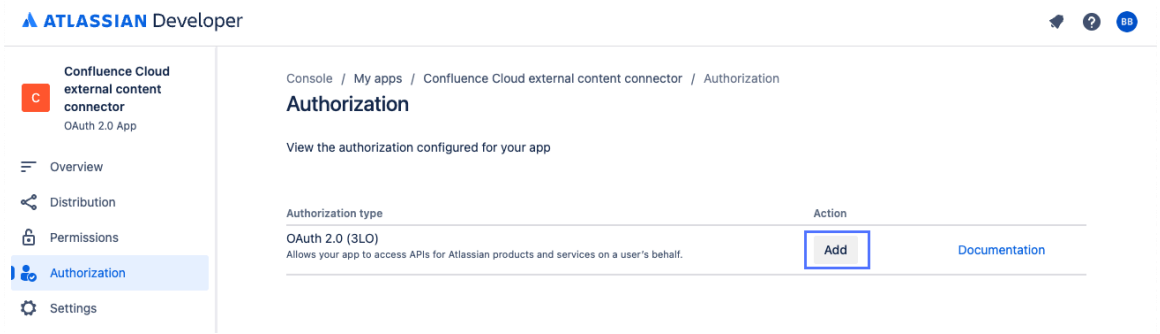
e. In the Confluence API row, select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

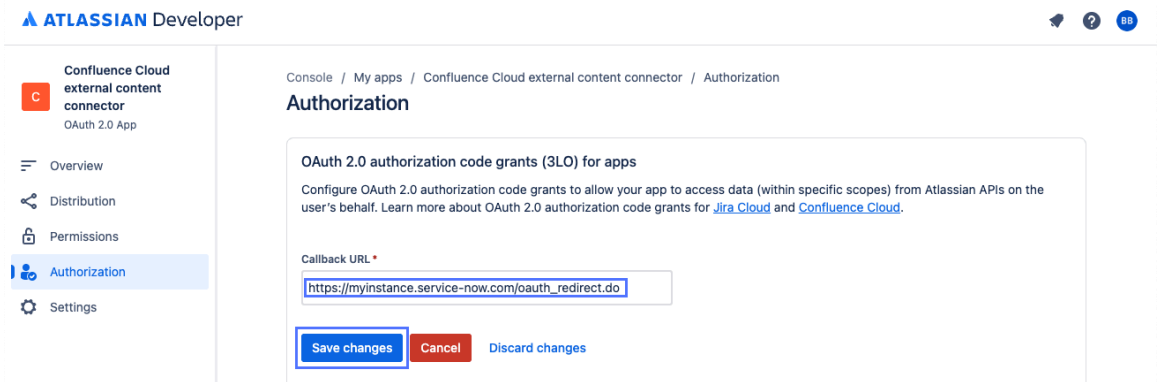


f. On the Granular scopes tab, select **Edit Scopes** and then select the options for each of the following scopes:

- read:attachment:confluence
- read:blogpost:confluence
- read:content-details:confluence
- read:content.metadata:confluence
- read:folder:confluence
- read:group:confluence
- read:page:confluence
- read:space:confluence
- read:user:confluence

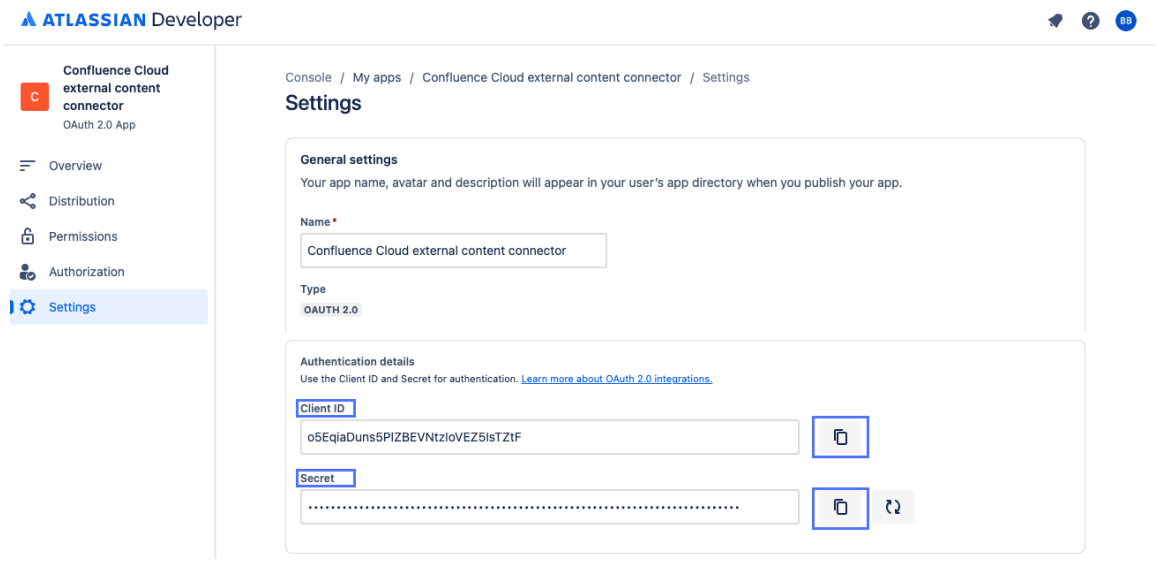


g. Select **Save**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. Navigate to the OAuth 2.0 integration's Authorization page, then select **Add** in the row for the OAuth 2.0 (3LO) authorization type.

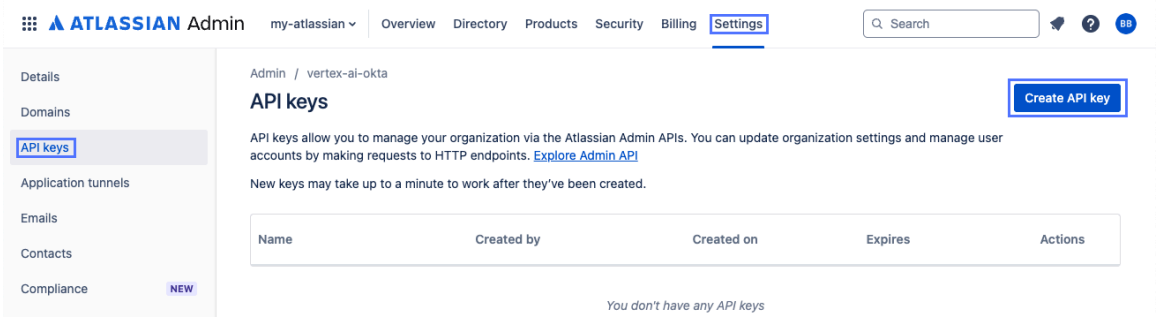


i. Enter `https://<instance-name>.service-now.com/oauth_redirect.do` as the callback URL, replacing `<instance-name>` with your ServiceNow AI Platform® instance name, then select **Save changes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

j. Navigate to the OAuth 2.0 integration's Settings page and record the Client ID and Secret values in a secure location.

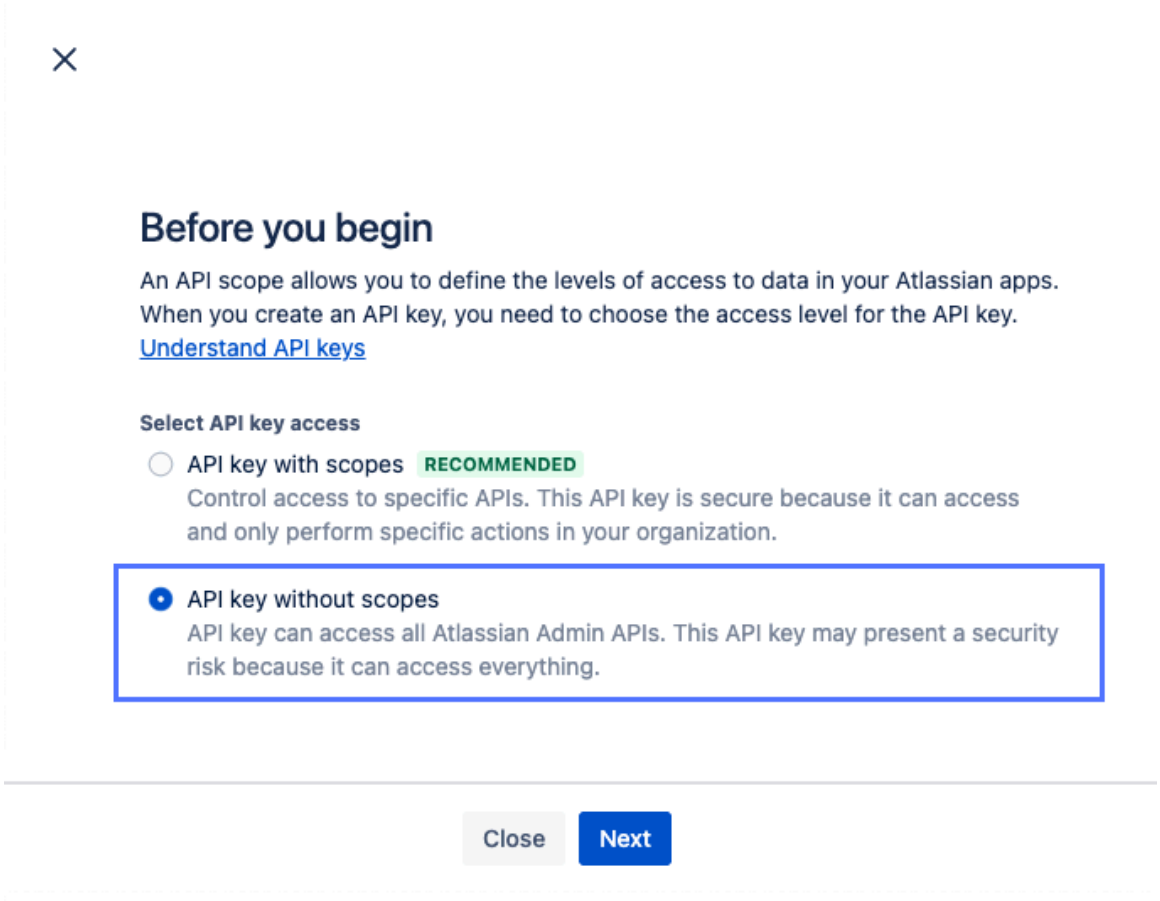
Important: Your connector administrator needs these Client ID and Secret values when configuring the Atlassian Confluence Cloud external content connector.



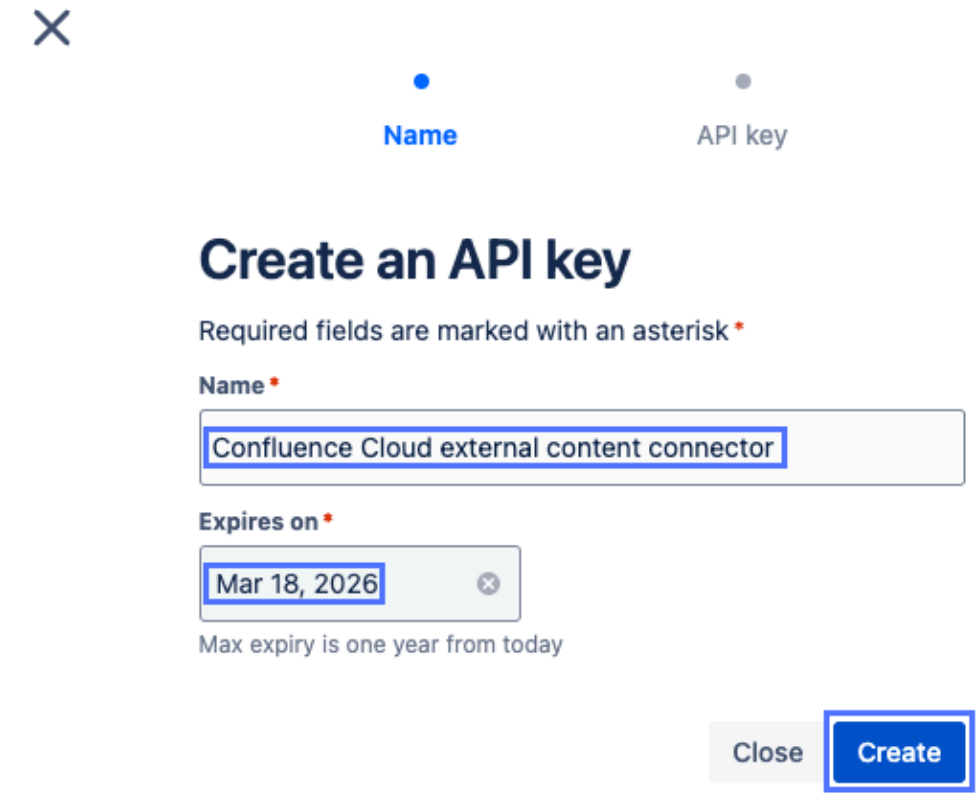
2. In Atlassian Administration, create a new admin API key.

a. Log in to Atlassian Administration at https://admin.atlassian.com/.

b. Select **Settings** in the tab list.



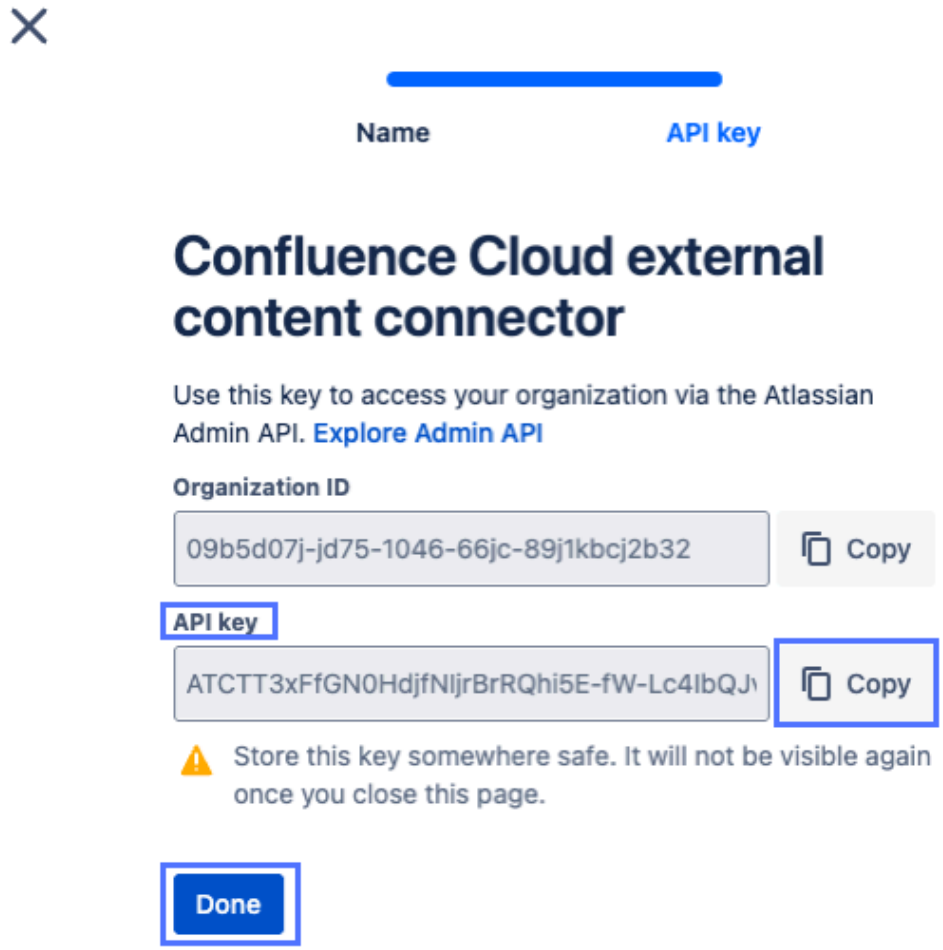
c. Select **API keys**, then select **Create API key**.



d. On the Before you begin page, select **API key without scopes**, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Enter a name and an expiration date for your new API key.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `Confluence Cloud external content connector` as the name for your API key and set its expiration date to be one year in the future.

f. Select **Create**.

g. Record the value of the API key in a secure location.

Important: Your connector administrator needs the API key's value when configuring the Atlassian Confluence Cloud external content connector.

h. Select **Done**.

What to do next

Provide the following items to your connector administrator:

- The OAuth 2.0 integration's Client ID and Secret values that you recorded in step 1.j.
- The API key's value that you recorded in step 2.g.

Your connector administrator needs these items to configure an Atlassian Confluence Cloud external content connector to retrieve searchable content and security principals from your Atlassian Confluence Cloud instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on creating and configuring an Atlassian Confluence Cloud external content connector, see Create an Atlassian Confluence Cloud external content connector.

Note: By default, the Atlassian Confluence Cloud external content connector only retrieves content access permissions for Confluence Cloud users who are managed by your organization. Other Confluence Cloud users can allow the connector to retrieve their content access permissions by setting their own email visibility to **Anyone** as explained in the https://support.atlassian.com/confluence-cloud/docs/configure-user-email-visibility/ Atlassian support resource.

Create an Atlassian Confluence Cloud external content connector

Create an external content connector to retrieve searchable content and security principals from your Atlassian Confluence Cloud source system.

Before you begin

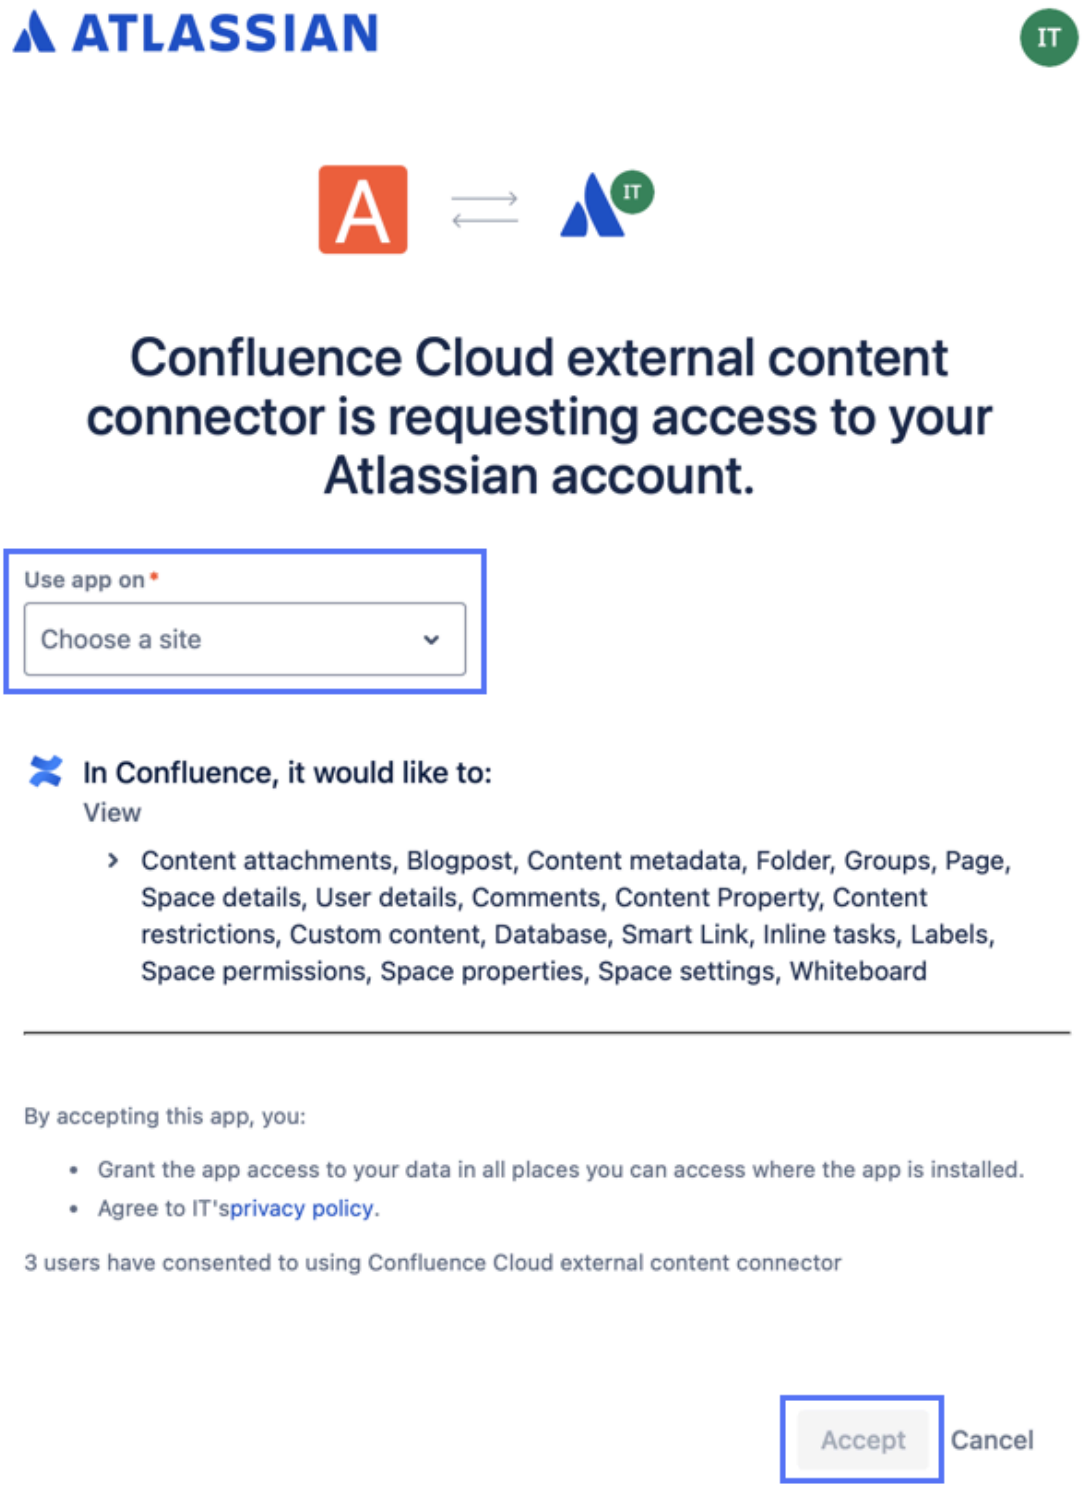
A source system administrator must have already configured your Atlassian Confluence Cloud source system to allow access by the Atlassian Confluence Cloud external content connector. For the required source system configuration steps, see Configure Atlassian Confluence Cloud for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Confluence Cloud** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings



Connection setting	Description
Connector name	Unique name for this Atlassian Confluence Cloud external content connector.
URL	URL for your Atlassian Confluence Cloud source system, in this format: `https://<your-instance-name>.atlassian.net`.
API Key	API key from your Atlassian Administration console. If you don't have this API key, ask your Atlassian administrator for it.
Client ID	Client identifier for the OAuth 2.0 Atlassian developer application that grants Confluence API access to your Atlassian Confluence Cloud source system. If you don't have this client identifier, ask your Atlassian administrator for it.
Client Secret	OAuth 2.0 client secret for the OAuth 2.0 Atlassian developer application that grants Confluence API access to your Atlassian Confluence Cloud source system. If you don't have this client secret, ask your Atlassian administrator for it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Save and validate your connection settings.

   a. Select **Validate Connection**.
   A pop-up window reports that the connector is requesting access to your Atlassian account.

   b. In the **Use app on** field of the pop-up window, select the site that you specified the URL for in step 5, then select **Accept**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Atlassian Confluence Cloud external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for an Atlassian Confluence Cloud external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for an Atlassian Confluence Cloud external content connector

Specify the spaces you want your Atlassian Confluence Cloud external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Atlassian Confluence Cloud external content connector that you want to configure crawl settings for. To learn about this procedure, see Create an Atlassian Confluence Cloud external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Atlassian Confluence Cloud external content connector crawls all spaces from its specified source system and sends documents with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the spaces to crawl when running content crawls
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Atlassian Confluence Cloud external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Spaces** options:
   - To crawl all spaces from the source system, select **Crawl all spaces**.
   - To crawl only a specified set of spaces from the source system, select **Include only these spaces**, then use the **Add URL** field and **Add** button to enter URLs for spaces that you want to include in the crawl.

     For example, you might enter `https://example.atlassian.net/wiki/spaces/Z6BU8S2J2LQRS` to include only searchable content from the specified space.
   - To crawl all except a specified set of spaces from the source system, select **Exclude only these spaces**, then use the **Add URL** field and **Add** button to enter URLs for spaces that you want to exclude from the crawl.

     For example, you might enter `https://example.atlassian.net/wiki/spaces/V3TXFZNUFD5YI` to exclude searchable content from the specified space.
5. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.

- To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save**.

Result

The Atlassian Confluence Cloud external content connector is updated with your crawl scope and file extension filter settings.

What to do next

To retrieve content from your Atlassian Confluence Cloud source system using your modified crawl settings, create and run a one-time content crawl for your Atlassian Confluence Cloud external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Atlassian Jira Cloud external content connector

The Atlassian Jira Cloud external content connector retrieves work items and attachments from projects in your Atlassian Jira Cloud source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure a connector user in Atlassian Jira Cloud

Create a user and group in your Atlassian Jira Cloud tenant with access and permissions required by the Atlassian Jira Cloud external content connector. The connector runs as this user when accessing data from your tenant.

Before you begin

You must have Jira administrator global permissions in your Atlassian Jira Cloud tenant.

To ensure that you grant the correct access to the connector user, you should be familiar with the project roles and issue security levels defined in your Atlassian Jira Cloud tenant.

Role required: none

About this task

When creating an Atlassian Jira Cloud external content connector, search administrators need to supply credentials for an Atlassian Jira Cloud user that can access all necessary data in the tenant.

Atlassian administrators need to create and configure this user as part of configuration for the Atlassian Jira Cloud source system.

Procedure

1. Log in to your Atlassian Jira Cloud tenant.
2. Create a new user for the Atlassian Jira Cloud external content connector.
   For information on creating a user, see the Create, edit, or remove a user Atlassian resource.
3. Create a new group that includes only the connector user.
   To learn about creating and populating groups, see the View, create, or delete a group and Modify group membership Atlassian resources.
4. Assign the new group access to all project roles needed to view issue comments and worklogs.
   For information on assigning group access to project roles, see the Assign group access to a project role and Managing project role membership Atlassian resources.
5. Add the **Jira administrators** and **Jira users** global permissions to the new group.
   To learn about adding global permissions to a group, see the Managing global permissions Atlassian resource.
6. Add the **Browse Projects** permission to the new group for each project that you want the external content connector to crawl.
   For information on adding project permissions to a group, see the Manage project permissions Atlassian resource.
7. Include the new group in all issue security levels defined for all your issue security schemes.
   To learn about including groups in issue security levels, see the Configuring issue-level security Atlassian resource.

What to do next

Provide the technical user credentials to your search administrators so they can use them when creating Atlassian Jira Cloud external content connectors.

Configure Atlassian Jira Cloud for external content indexing

Register an OAuth 2.0 integration in the Atlassian Developer console and create an API key in Atlassian Administration to allow the Atlassian Jira Cloud external content connector to crawl projects and security principals in your Atlassian Jira Cloud source system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

You need the following credentials and permissions for your organization's Atlassian management applications:

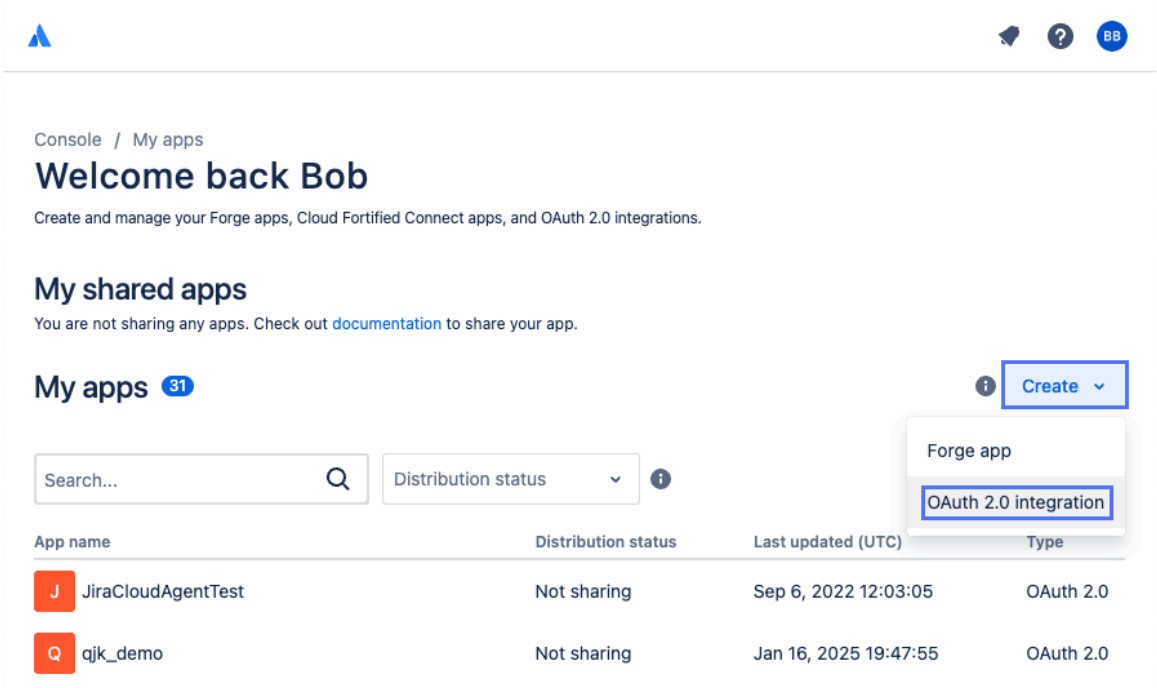
Atlassian portal	Required credentials and permissions
Atlassian Developer console (https://developer.atlassian.com/console/myapps/)	• Login credentials • Permission to view settings for registered applications • Permission to register a new application • Permission to set granular Jira API scopes for an application • Permission to set the OAuth 2.0 callback URL for an application
Atlassian Administration (https://admin.atlassian.com/)	• Login credentials • Permission to create a new admin API key

Role required: none

About this task

The Atlassian Jira Cloud external content connector retrieves content from your Atlassian Jira Cloud source system using the Jira API.

To allow the connector to access your Atlassian Jira Cloud source system via the Jira API, you must configure an OAuth 2.0 integration in the Atlassian Developer console and an API key in Atlassian Administration. Your connector administrator can use settings copied from the OAuth 2.0 integration and the API key to configure the Atlassian Jira Cloud external content connector for proper connection to your Atlassian Jira Cloud source system.



Procedure

1. In the Atlassian Developer console, register a new OAuth 2.0 integration for the Atlassian Jira Cloud external content connector.

   a. Log in to the Atlassian Developer console at https://developer.atlassian.com/console/myapps/.

   b. In the My apps section, select **Create** > **OAuth 2.0 integration**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Your connector administrator needs the API key's value when configuring the Atlassian Jira Cloud external content connector.

h. Select **Done**.

3. Configure a technical user in your Atlassian Jira Cloud tenant to allow access by the Atlassian Jira Cloud external content connector.
   For details on this procedure, see Configure a connector user in Atlassian Jira Cloud.

What to do next

Provide the following items to your connector administrator:

- The OAuth 2.0 integration's Client ID and Secret values that you recorded in step 1.j.
- The API key's value that you recorded in step 2.g.
- The credentials for the Atlassian Jira Cloud user that you created in step 3.

Your connector administrator needs these items to configure an Atlassian Jira Cloud external content connector to retrieve projects and security principals from your Atlassian Jira Cloud instance.

For details on creating and configuring an Atlassian Jira Cloud external content connector, see Create an Atlassian Jira Cloud external content connector.

© 2026 ServiceNow, Inc. All rights reserved.

Create an Atlassian Jira Cloud external content connector

Create an external content connector to retrieve searchable content and security principals from your Atlassian Jira Cloud source system.

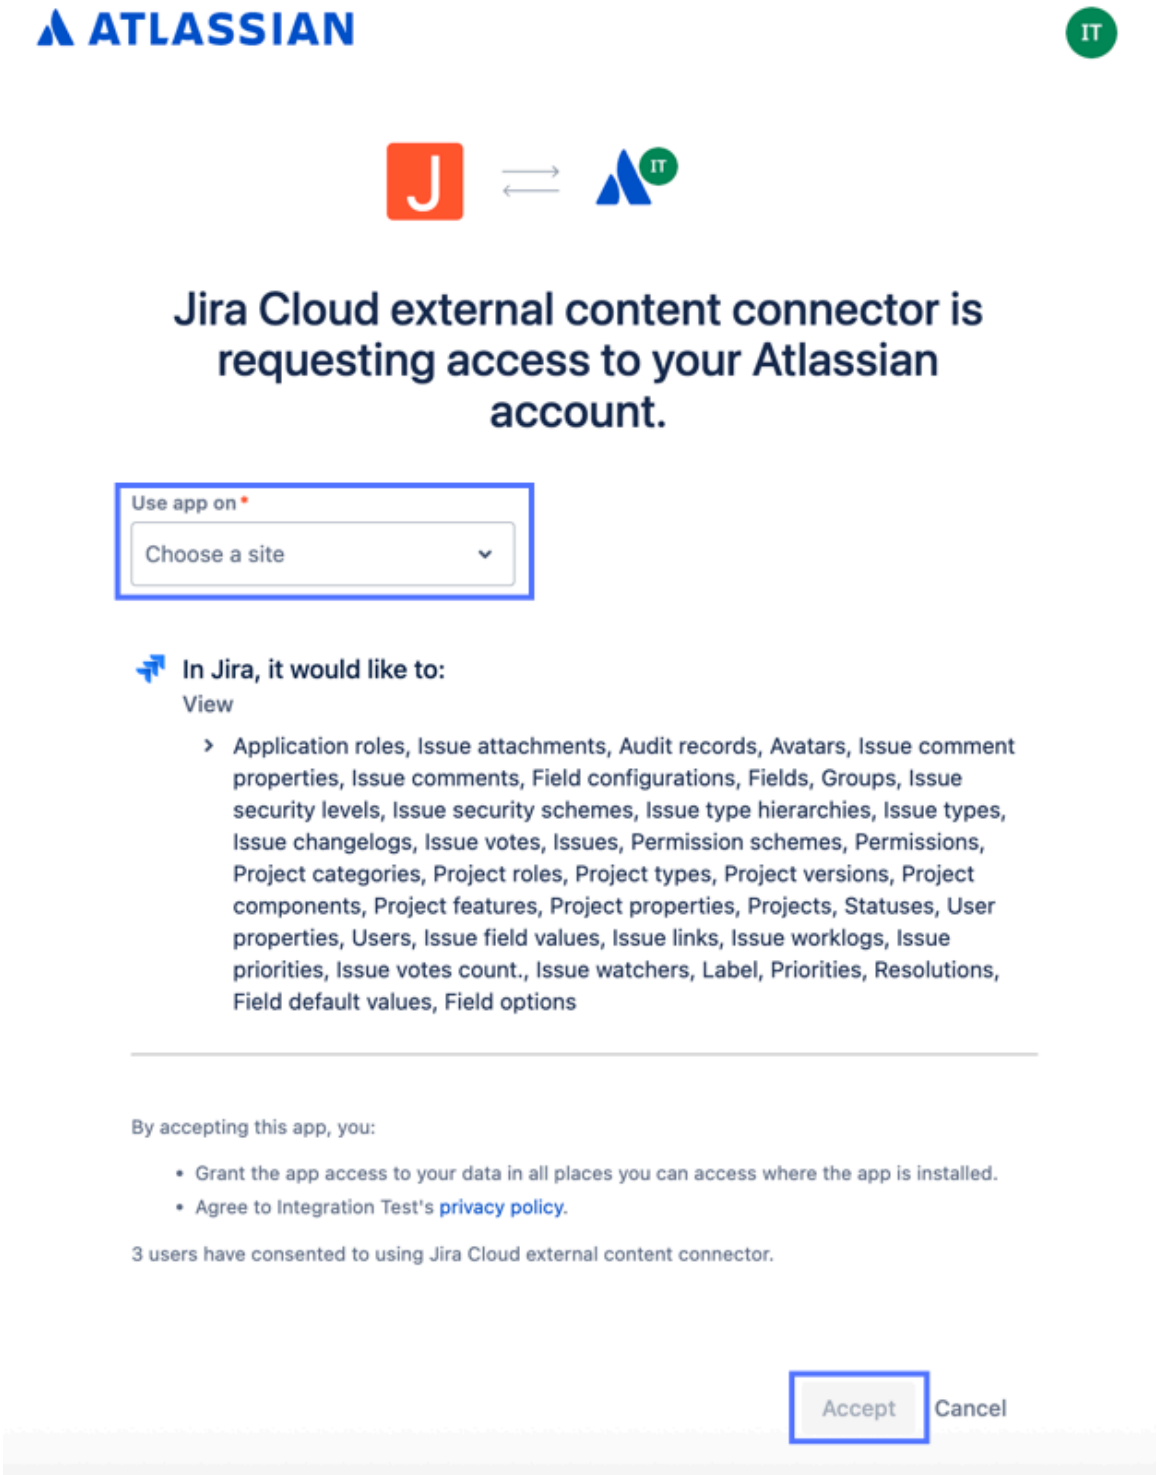
Before you begin

A source system administrator must have already configured your Atlassian Jira Cloud source system to allow access by the Atlassian Jira Cloud external content connector. For the required source system configuration steps, see Configure Atlassian Jira Cloud for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Jira Cloud** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.



Connection settings

Connection setting	Description
Connector name	Unique name for this Atlassian Jira Cloud external content connector.
URL	URL for your Atlassian Jira Cloud source system, in this format: `https://jira.example.com`.
API Key	API key from your Atlassian Administration console. If you're not sure how to find the API key in your Atlassian Administration console, ask your Atlassian administrator.
Client ID	Client identifier for the OAuth 2.0 Atlassian developer application that grants Confluence API access to your Atlassian Jira Cloud source system. If you're not sure how to find the Client ID for the OAuth 2.0 application in your Atlassian developer console, ask your Atlassian administrator.
Client Secret	OAuth 2.0 client secret for the OAuth 2.0 Atlassian developer application that grants Jira API access to your Atlassian Jira Cloud source system. If you're not sure how to find the Client Secret for the OAuth 2.0 application in your Atlassian developer console, ask your Atlassian administrator.

6. Save and validate your connection settings.
   a. Select **Validate Connection**.
      A pop-up window reports that the connector is requesting access to your Atlassian account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. In the **Use app on** field of the pop-up window, select the site that you specified the URL for in step 5, then select **Accept**.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Atlassian Jira Cloud external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for an Atlassian Jira Cloud external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for an Atlassian Jira Cloud external content connector

Specify the projects you want your Atlassian Jira Cloud external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Atlassian Jira Cloud external content connector that you want to configure crawl settings for. To learn about this procedure, see Create an Atlassian Jira Cloud external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Atlassian Jira Cloud external content connector crawls all projects from its specified source system and sends documents with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the projects to crawl when running content crawls
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Atlassian Jira Cloud external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all projects from the source system, select **Crawl all content**.
   - To crawl only a specified set of projects from the source system, select **Include only these projects**, then use the **Add URL** field and **Add** button to enter URLs for projects that you want to include in the crawl.

     For example, you might enter `https://example.atlassian.net/jira/core/projects/XJR` to include only searchable content from the specified project.
   - To crawl all except a specified set of projects from the source system, select **Exclude only these projects**, then use the **Add URL** field and **Add** button to enter URLs for projects that you want to exclude from the crawl.

     For example, you might enter `https://example.atlassian.net/jira/core/projects/QBY` to exclude searchable content from the specified project.
5. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

7. Select **Save**.

Result
The Atlassian Jira Cloud external content connector is updated with your crawl scope and file extension filter settings.

What to do next
To retrieve content from your Atlassian Jira Cloud source system using your modified crawl settings, create and run a one-time content crawl for your Atlassian Jira Cloud external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Box external content connector

The Box external content connector retrieves files and attachments from your Box source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Create a public/private key pair for the Box external content connector

Generate an encrypted private key and a public key for use by the Box external content connector.

Before you begin
You need access to the OpenSSL Library toolkit, version 3. If you don't have this toolkit available, you can install it as follows:

Linux

Install the latest available **openssl** package using your distribution's package manager. As an example, on Ubuntu or Debian, run `sudo apt install openssl`. On Red Hat Enterprise Linux, run `sudo dnf install openssl`.

macOS

macOS ships with a LibreSSL executable binary installed as `/usr/bin/openssl`, but one of the OpenSSL commands for this task requires options that LibreSSL doesn't support. Use Homebrew (https://brew.sh/) to install the **openssl@3** formula. For details on this formula, see https://formulae.brew.sh/formula/openssl@3.

Windows

Install OpenSSL binaries from https://github.com/openssl/openssl/wiki/Binaries.

For more information about the OpenSSL Library, see https://openssl-library.org/.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: none

About this task

You need to create your own private and public RSA keys for use with the Box external content connector. The keys that the Box developer console generates aren't secure enough to comply with the connector's security requirements.

To configure public/private key authentication for the connector, you need to create the following items:

1. A 4,096-bit RSA private key in encrypted PKCS#8 format.
   - Your connector administrator needs this encrypted private key file and its password when configuring settings for the Box external content connector.
   - When the Box external content connector runs a crawl, it presents the public key certificate from this encrypted private key file to authenticate itself as a valid client of the OAuth 2.0 app in the Box developer console.
2. A public key in PEM-encoded (Base64 ASCII) X.509 certificate format.
   - Your Box administrator needs to upload this certificate file in the Box OAuth 2.0 app that grants API access to the Box external content connector.
   - When the Box external content connector presents its public-key certificate for client authentication, Box uses this uploaded certificate to confirm that the connector is a valid client of the OAuth 2.0 app.

Procedure

1. Generate a 4,096-bit RSA private key in PEM-encoded X.509 certificate format by running this OpenSSL command:

```
openssl genpkey -algorithm RSA -out private_key.pem -pkeyopt
 rsa_keygen_bits:4096
```

2. Generate a secure password to use for the encrypted version of your new private key:

   a. Run this OpenSSL command:

```
openssl rand -base64 20
```

   Note: This command generates a 20-character password. If your organization's standards require longer passwords, replace 20 with the desired password length in characters. The password must have at least 112 bits of entropy.

   b. Copy the generated password and record it in a secure location.

   Important: Your connector administrator needs this password when configuring the Box external content connector.

3. Convert your new private key to the encrypted PKCS#8 format (with AES-256-CBC and PBKDF2):

   a. Run this OpenSSL command:

```
openssl pkcs8 -topk8 -in private_key.pem -out
 encrypted_key.pem -v2 aes-256-cbc -v2prf hmacWithSHA256
 -iter 10000 -saltlen 32
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. When prompted, enter the secure password you generated in step 2.

c. Store the generated `encrypted_key.pem` file in a secure location.

> **Important:** Your connector administrator needs this encrypted key file when configuring the Box external content connector.

4. Extract the public key for your new private key in PEM-encoded X.509 certificate format:

a. Run this OpenSSL command:

```
openssl pkey -in private_key.pem -pubout -out public_key.pem
```

b. View or edit the content of the `public_key.pem` file that you generated in step 2.

c. Copy the PEM-encoded X.509 public key certificate text and store it in a secure location.

The public key consists of all the text in the file, including the `-----BEGIN PUBLIC KEY-----` and `-----END PUBLIC KEY-----` markers.

> **Important:** Your Box admin needs this PEM-encoded X.509 public key certificate text when configuring the OAuth 2.0 application for Box external content connector in the Box developer console.

What to do next

Provide the following items to your Box admin and your connector administrator:

Item	Description
PEM-encoded X.509 public key certificate text	Provide this text to your Box administrator. They will need to upload the PEM-encoded X.509 public key certificate text to the Box developer console when configuring an OAuth 2.0 application for the Box external content connector.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
	For more information on configuring an OAuth 2.0 application in the Box developer console for the Box external content connector, see Configure Box for external content indexing.
Encrypted private key file and password	Provide this encrypted private key file and its password to your connector administrator. They will need the file and password when configuring the Box external content connector. For details on creating and configuring the Box external content connector, see Create a Box external content connector.

Configure Box for external content indexing

Create and authorize an OAuth 2.0 application in the Box developer console to allow the Box external content connector to access your Box source system.

Before you begin

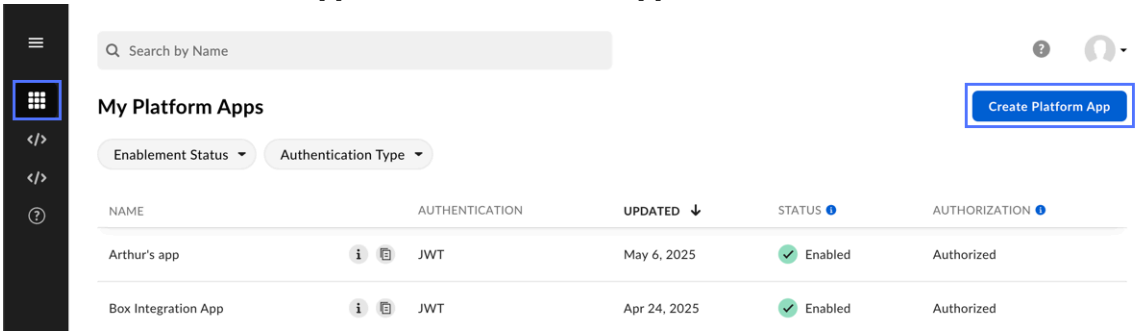
You need administrator access to the Box developer console and the Box Admin UI portal.

You must have created a private/public key pair for the Box external content connector and extracted the public key certificate in PEM-encoded (Base64 ASCII) X.509 format. For details on creating the public/private key pair and extracting the public key certificate, see Create a public/private key pair for the Box external content connector.

Role required: none

About this task

The Box external content connector retrieves documents and user permissions from your Box source system using the Box API.



To allow the connector to access your Box source system via the Box API, you must configure and authorize an OAuth 2.0 application in the Box developer console. Your connector administrator can use settings copied from the OAuth 2.0 application and its API key to configure the Box external content connector for proper connection to your source system.

Procedure

1. In the Box developer console, create a new OAuth 2.0 application for the Box external content connector.

   a. Navigate to https://app.box.com/developers/console and log in with administrator credentials.

   b. Select **Create Platform App**, then select **Custom App**.

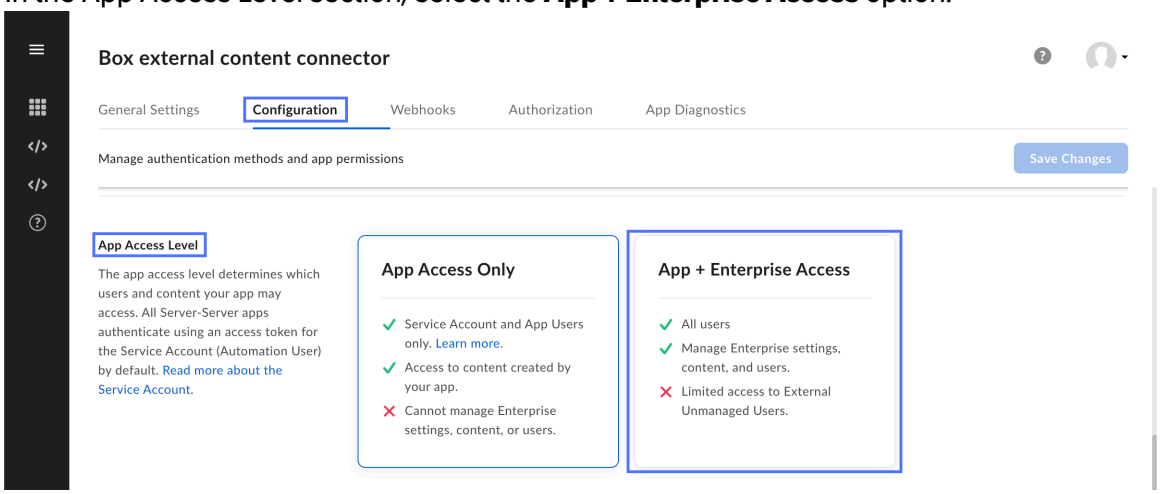
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

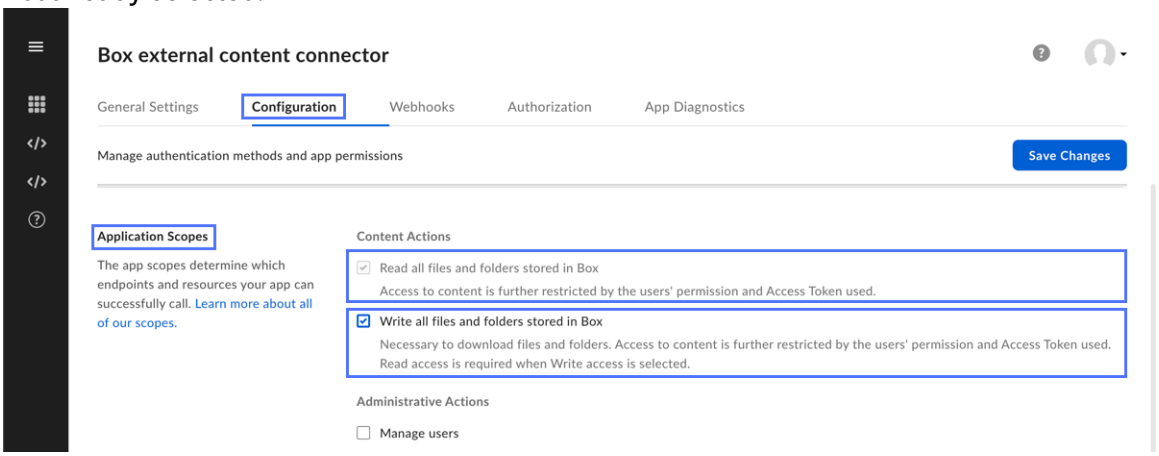
c. In the Create a Custom App window, enter a name for your app and specify its purpose, then select **Next**.

d. In the Create a Custom App windows, select **Server Authentication (with JWT)**, then select **Create App**.



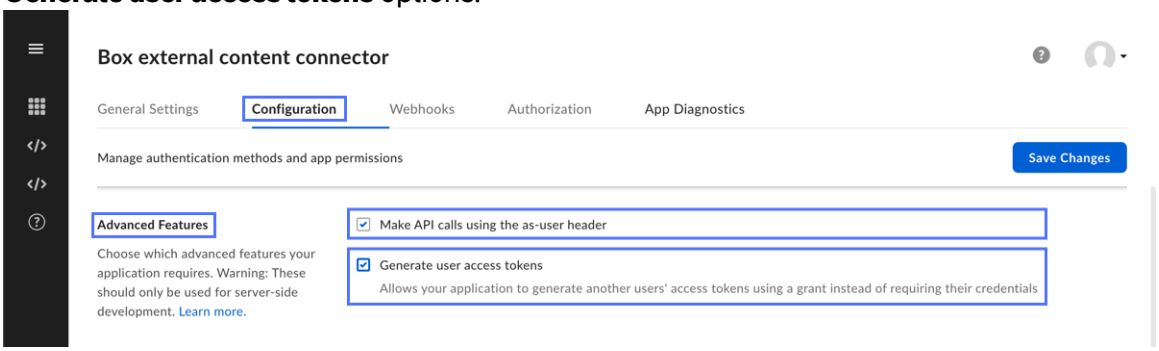
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Configuration** screen for your new OAuth 2.0 application appears.

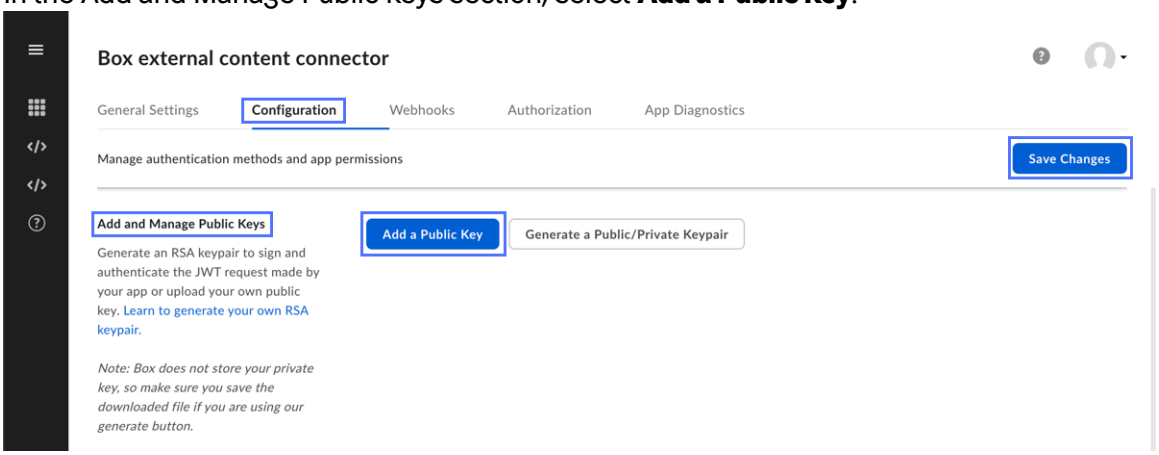


2. Configure your new OAuth 2.0 application with required settings and generate a public/private keypair for it.

   a. In the App Access Level section, select the **App + Enterprise Access** option.

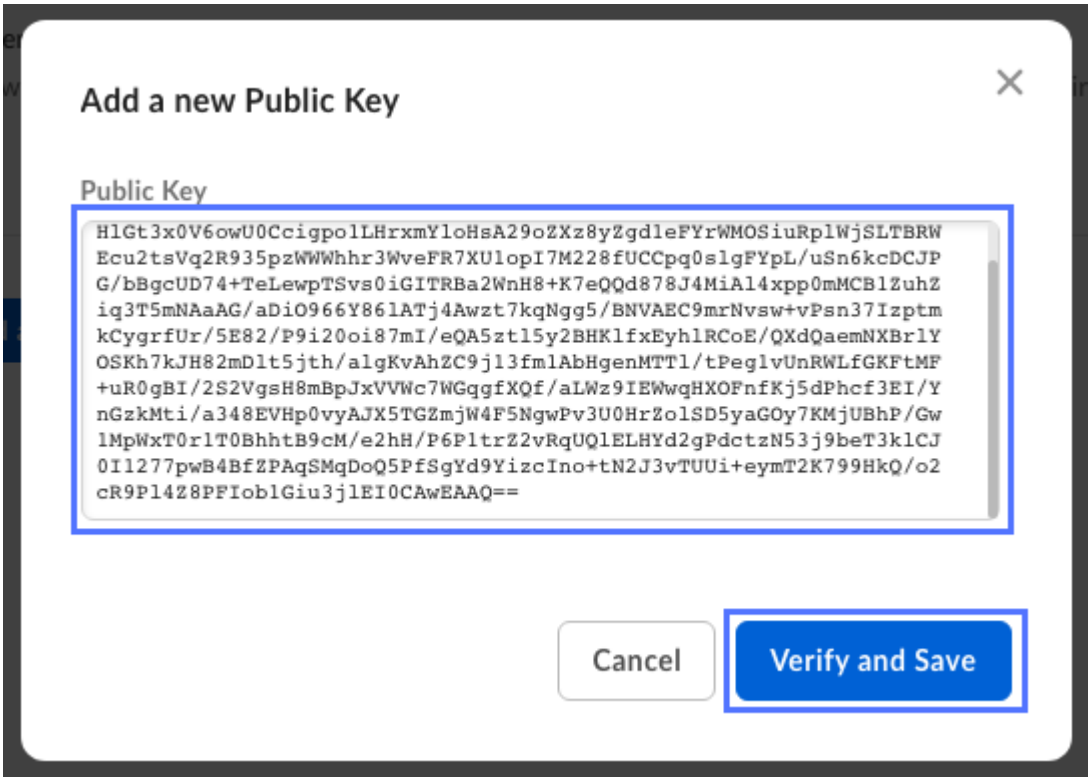


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

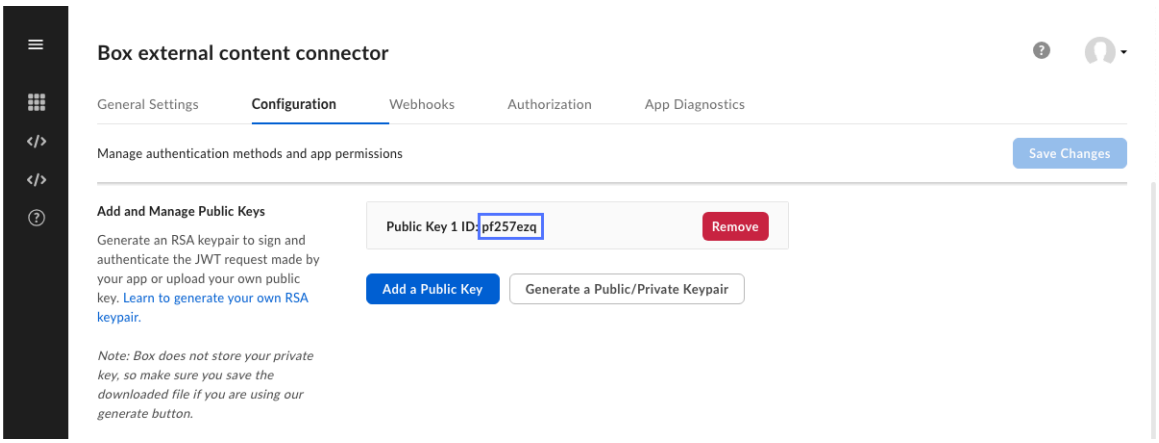


b. In the Application Scopes section, under the **Content Actions** heading, select the **Read all files and folders stored in Box** and **Write all files and folders stored in Box** options if they're not already selected.

c. In the Advanced Features section, select the **Make API calls using the as-is header** and **Generate user access tokens** options.



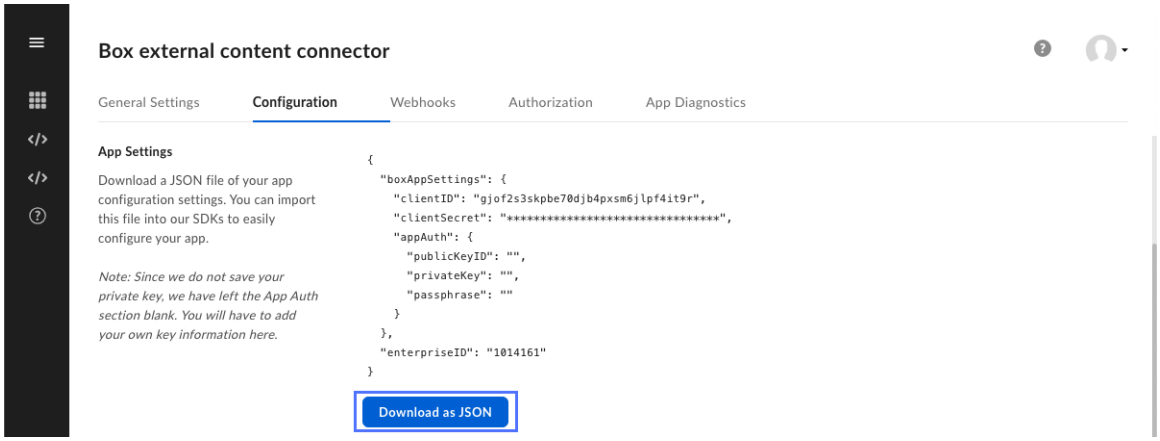
d. In the Add and Manage Public Keys section, select **Add a Public Key**.



The Add a new Public Key dialog box appears.

e. In the Add a new Public Key dialog box, paste the PEM-encoded public key text, including the `-----BEGIN PUBLIC KEY-----` and `-----END PUBLIC KEY-----` markers, into the **Public Key** field, then select **Verify and Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

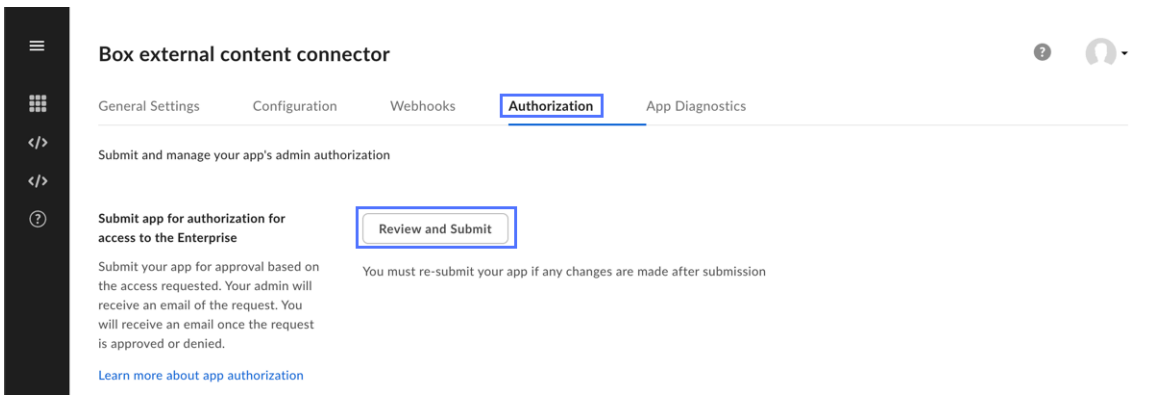


f. Copy the public key ID string that Box displays for the new public key and store it in a secure location.

Important: Your connector administrator needs this public key ID string when configuring the Box external content connector.

g. In the App Settings section, select **Download as JSON**, then save the downloaded JSON-format settings file in a secure location.

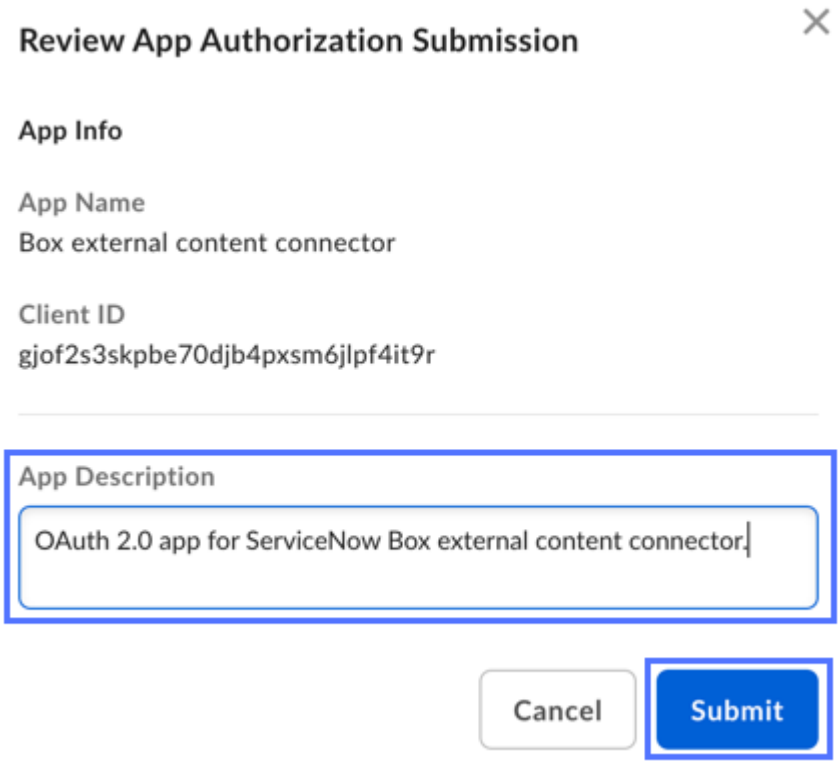
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Important: Your connector administrator needs this JSON-format settings file when configuring the Box external content connector.

h. Select **Save Changes**.
A message appears, reporting that the OAuth 2.0 app's configuration has been successfully updated.

3. Submit an authorization request for your new OAuth 2.0 application.



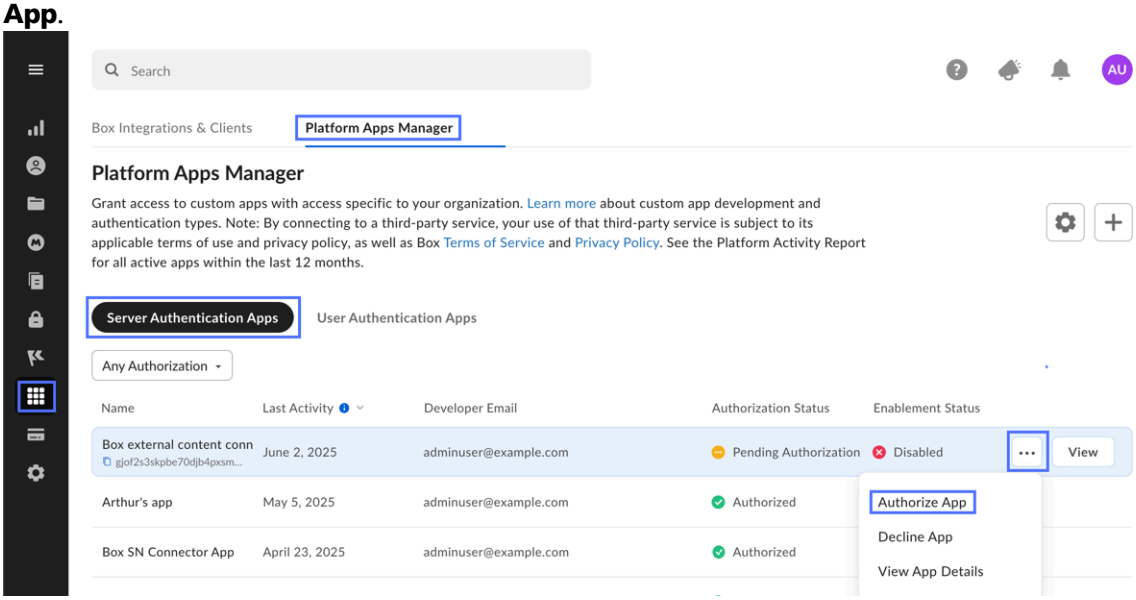
a. Navigate to the **Authorization** screen for your new OAuth 2.0 application.

b. Select **Review and Submit**.

c. On the Review App Authorization Submission screen, enter a description for your OAuth 2.0 application, then select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The app's Authorization Status shows **Pending Authorization**.



4. In the Box Admin UI portal, authorize your new OAuth 2.0 application.

   a. Navigate to https://app.box.com/master and log in with administrator credentials.

   b. Select the **Integrations** menu icon, then navigate to the **Platform Apps Manager** tab.

   c. Select **Server Authentication Apps** and find the entry for your new OAuth 2.0 application.

   d. Open the app entry's context menu by selecting its overflow icon ..., then select **Authorize App**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. On the Authorize App screen, select **Authorize**.

The app's Authorization Status changes to **Authorized**.

What to do next

Provide the following items to your connector administrator:

- The email address for the Box administrator account that you used to configure the OAuth 2.0 application.
- The public key ID string that you copied in step 2.f.
- The JSON-format settings file that you downloaded in step 2.g.

Your connector administrator needs these items to configure a Box external content connector to retrieve user boxes and security principals from your Box source system.

For details on creating and configuring a Box external content connector, see Create a Box external content connector.

Create a Box external content connector

Create an external content connector to retrieve searchable content and security principals from your Box source system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

A source system administrator must have already configured your Box source system to allow access by the Box external content connector. For the required source system configuration steps, see Configure Box for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Box* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Box external content connector.
Admin account email	Email address for a Box administrator account. As an example, you might enter `boxadmin@example.com`. If you don't know the administrator account email address to use, ask your Box administrator for it.
Public Key ID	ID string for the public key that your Box administrator uploaded in the OAuth 2.0 application in the Box developer console. As an example, you might enter `pf257ezq`. If you don't know the public key ID string to use, ask your Box administrator for it.
Passphrase	Passphrase for the encrypted private key file specified in **Encrypted private key file**. If you don't have the passphrase for the encrypted private key file, ask your Box administrator for it.
Encrypted private key file	PKCS#8-format encrypted private key file. If you don't have the encrypted private key file, ask your Box administrator for it.
Service account JSON file	JSON-format file containing configuration settings for the Box external content connector's OAuth 2.0 application in the Box developer console. If you don't have this JSON settings file, ask your Box administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Box external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Box external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Box external content connector

Specify the user boxes you want your Box external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Box external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Box external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Box external content connector crawls all user boxes from its specified source system and sends documents with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the user boxes to crawl when running content crawls
- Inclusion or exclusion filters for the file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Box external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **User box filtering** options:
   - To crawl all user boxes from the source system, select **Crawl all user boxes**.
   - To crawl only a specified set of user boxes from the source system, select **Include only these user boxes**, then use the **Add email addresses for user boxes to include** field and **Add** button to enter email addresses for users whose boxes you want the connector to include when crawling.

     As an example, you might enter `senthil@example.com` to only retrieve searchable content from this user's box.
   - To crawl all but a specified set of user boxes from the source system, select **Exclude only these user boxes**, then use the **Add email addresses for user boxes to exclude** field and **Add** button to enter email addresses for users whose boxes you want the connector to exclude when crawling.

     As an example, you might enter `laura@example.com` to exclude searchable content from this user's box.
5. Select one of the following **Filetype filtering** options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.

- To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

  As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.

- To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result

The Box external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Box source system using your modified crawl settings, create and run a one-time content crawl for your Box external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Cornerstone external content connector

The Cornerstone external content connector retrieves Catalogue and Learning objects from organization units in your Cornerstone Learning Management System (LMS) and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to update searchable content and metadata from your source system. Content crawls feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Cornerstone for external content indexing

Create and authorize an OAuth 2.0 application in Cornerstone OnDemand to allow the Cornerstone external content connector to access your source system.

Before you begin

You need a Cornerstone OnDemand account with the Edge APIs - Manage security permission.

Role required: none

About this task

The Cornerstone external content connector retrieves Catalogue and Learning objects from organization units in your Cornerstone source system using the Cornerstone API.

To allow the connector to access your Cornerstone source system via the API, you must register an OAuth 2.0 application in Cornerstone OnDemand. Your connector administrator can use settings copied from the OAuth 2.0 application to configure the Cornerstone external content connector for proper connection to your source system.

Procedure

1. In Cornerstone OnDemand, register a new OAuth 2.0 application for use by the Cornerstone external content connector.

   a. Log in to your Cornerstone OnDemand with administrator credentials.

   b. Select **Settings** > **Admin** > **Tools**, then select **Edge**.

   c. On the Edge page, in the Develop section, select **API Management**.

   d. On the API Management page, select **Manage OAuth 2.0 Applications**, then select **Register New Application**.

   e. On the new application form, fill in the fields.

Field	Description
Application Name	Name for your new OAuth 2.0 application. As an example, you might enter `Cornerstone-XCC`.
User ID	Identifier for the user account that runs the OAuth 2.0 application. Enter the ID for the administrator account you used to log in to Cornerstone OnDemand.
Access Token Validity Period	Validity period in seconds for access tokens for the OAuth 2.0 application. Enter `86400` (equivalent to 24 hours).

   f. In the drop-down list for the new application form, select *`Cornerstone`* **API**, then select the options for these API scopes.

   - training:read
   - employee:read
   - group:read
   - ou:read

- outype:read
- learning:read
- catalog:read
- transcript:read
- task:read
- certification:read

g. Select **Register Application**.

The new application appears, with its Client ID and Client Secret fields populated.

2. Copy the Client ID value for your new OAuth 2.0 application and store it in a secure location.

> **Important:** Your external content connector administrator needs this Client ID when configuring the Cornerstone external content connector.

3. Copy the Client Secret value for your new OAuth 2.0 application and store it in a secure location.

> **Important:** Your external content connector administrator needs this Client Secret when configuring the Cornerstone external content connector.

What to do next

Provide the following items to your connector administrator:

- The Client ID value for your new OAuth 2.0 application that you copied in step 2.
- The Client Secret value for your new OAuth 2.0 application that you copied in step 3.

Your connector administrator needs these items to configure a Cornerstone external content connector to retrieve Catalogue and Learning objects from your Cornerstone source system.

For details on creating and configuring a Cornerstone external content connector, see Create a Cornerstone external content connector.

Create a Cornerstone external content connector

Create an external content connector to retrieve searchable content from your Cornerstone source system.

Before you begin

A source system administrator must have already configured your Cornerstone Learning Management System (LMS) instance to allow access by the Cornerstone external content connector. For the required source system configuration steps, see Configure Cornerstone for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Cornerstone* tile, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Cornerstone external content connector.
Base URL	Base URL for your Cornerstone LMS system. If you don't have the base URL, ask your Cornerstone administrator for it.
Client ID	Client identifier for the OAuth 2.0 application that grants access to your Cornerstone LMS content. If you don't have the client identifier, ask your Cornerstone administrator for it.
Client Secret	Client secret for the OAuth 2.0 application that grants access to your Cornerstone LMS content. If you don't have the client secret, ask your Cornerstone administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Cornerstone external content connector.
9. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
10. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Cornerstone external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Cornerstone external content connector

Specify the organization units you want your Cornerstone external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the Cornerstone external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Cornerstone external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Cornerstone external content connector crawls your Cornerstone Learning Management System (LMS) and sends all Catalogue and Learning objects it finds to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the organization units to retrieve content from when running content crawls
- Inclusion or exclusion filters for the types of Catalogue and Learning objects to retrieve content from when running content crawls

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Cornerstone external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Organization units** options:
   - To crawl all organization units from the source system, select **Crawl all organization units**.
   - To crawl only a specified set of organization units from the source system, select **Include only these organization units**, then use the **Add organization units to include** field and **Add** button to enter names for organization units you want the connector to include when crawling.

     As an example, you might enter `Marketing` and `Sales` to only retrieve searchable content from the specified organization units.
   - To crawl all but a specified set of organization units from the source system, select **Exclude only these organization units**, then use the **Add organization units to exclude** field and **Add** button to enter names for organization units you want the connector to exclude when crawling.

     As an example, you might enter `Internal` to exclude searchable content from the specified organization unit.
5. In the Catalog/trainings and User/learner sections, select the options for the Cornerstone LMS content types that you want the connector to retrieve when running content crawls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result
The Cornerstone external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Cornerstone source system using your modified crawl settings, create and run a one-time content crawl for your Cornerstone external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Docusign external content connector

The Docusign external content connector retrieves agreements from envelopes in your Docusign source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Important:

The Docusign external content connector doesn't support the shared access feature in Docusign. As a result, users in search applications can't see searchable content and metadata from envelopes that they only have shared access to.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Configure Docusign for external content indexing

Create an app and integration key in Docusign to allow the Docusign external content connector to access your source system.

Before you begin
You need a Docusign account with the DS Admin permission profile. To learn more about permission profiles, see the Permission Profiles Docusign support resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: If you have multiple Docusign developer accounts (such as a work account and a personal account), you must set the account you want the external content connector to use as your default account. For details on setting a default Docusign account, see the Set a Default Account Docusign resource.

Role required: none

About this task

The Docusign external content connector retrieves agreements from envelopes in your Docusign source system using the eSignature REST API.

To allow the connector to access your Docusign source system via the eSignature REST API, you must create an app with an integration key in Docusign and generate a secret key for it. Your connector administrator can use this app's integration key and secret key to configure the Docusign external connector for proper connection to your source system.

Procedure

1. In Docusign, create a new app to allow access by the Docusign external content connector.
   a. Navigate to https://apps-d.docusign.com/admin and log in with your DS Admin account credentials.
   b. Navigate to **Integrations** > **Apps and Keys**.
   The Apps and Keys screen appears.
   c. Select **Add App and Integration Key**.
   d. Enter a name for your integration, then select **Create App**.
2. Record the integration key for your new Docusign app.
   a. Navigate to the General Info section to find the integration key for your new Docusign app.
   b. Copy the integration key GUID and record it in a secure location.

   Important: Your external content connector administrator needs this integration key GUID when configuring the Docusign external content connector.
3. Generate a secret key for your new Docusign app.
   a. Navigate to the Authentication section and select **Add Secret Key**.
   Docusign generates a secret key for your new app.
   b. Copy the secret key GUID and record it in a secure location.

   Important: Your external content connector administrator needs this secret key GUID when configuring the Docusign external content connector.
4. Specify the redirect URI for your new Docusign app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Additional settings** and select **Add URI**.

b. Enter `https://<instance-name>.service-now.com/oauth_redirect.do` as the callback URI, replacing `<instance-name>` with your ServiceNow AI Platform instance name.

c. Save your new redirect URI by selecting outside the URI field.
The new redirect URI appears.

What to do next

Provide the following items to your connector administrator:

- The integration key for your Docusign app that you copied in step 2.b.
- The secret key for your Docusign app that you copied in step 3.b.

Your connector administrator needs these items to configure a Docusign external content connector to retrieve envelopes and security principals from your Docusign source system.

For details on creating and configuring a Docusign external content connector, see Create a Docusign external content connector.

Create a Docusign external content connector

Create an external content connector to retrieve searchable content and security principals from your Docusign source system.

Before you begin

A source system administrator must have already configured your Docusign source system to allow access by the Docusign external content connector. For the required source system configuration steps, see Configure Docusign for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Docusign** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Docusign external content connector.
Authentication URL	Docusign authentication endpoint URL for the connector. This URL depends on which environment you want the connector to crawl: ○ For a development environment: `https://account-d.docusign.com` ○ For a production environment: `https://account.docusign.com`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	To learn more about endpoint URLs for development and production Docusign environments, see the https://developers.docusign.com/platform/api-endpoint-base-paths/ resource.
Client ID	Integration key GUID for the Docusign app that grants the connector access to your Docusign source system via the eSignature REST API. If you don't have this integration key GUID, ask your Docusign administrator for it.
Client Secret	Secret key GUID for the Docusign app that grants the connector access to your Docusign source system via the eSignature REST API. If you don't have this secret key GUID, ask your Docusign administrator for it.

6. Save and validate your connection settings.

   a. Select **Validate Connection**.
   You're prompted to grant the Docusign app access.

   b. Select **Allow Access**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Docusign external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Docusign external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Docusign external content connector

Define inclusion or exclusion filters to control which agreements you want your Docusign external content connector to make searchable.

Before you begin
A connector administrator must have already created the Docusign external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Docusign external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Docusign external content connector retrieves agreements from all envelopes in its specified source system and sends them to AI Search for indexing. Only

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

perform this task if you want to apply any of the following filters to limit which envelopes the connector retrieves agreements from when running content crawls:

- Inclusion or exclusion filter based on the sent date of the envelope
- Inclusion or exclusion filter based on the name of the envelope
- Inclusion or exclusion filter based on the status of the envelope

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Docusign external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Date** options:
   - To only retrieve content from agreements in envelopes that were sent in the last year, select **Sent last year**.
   - To only retrieve content from agreements in envelopes that were sent in the last quarter, select **Sent last quarter**.
   - To only retrieve content from agreements in envelopes that were sent in the last month, select **Sent last month**.
   - To only retrieve content from agreements in envelopes that were sent in the last week, select **Sent last week**.
5. Select one of the following **Envelopes** options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all envelopes from the source system, select **Crawl all envelopes**.
- To crawl only a specified set of envelopes from the source system, select **Include only these envelopes**, then use the **Add ID to include** field and **Add** button to enter IDs for envelopes you want the connector to include when crawling.

  As an example, you might enter `CS313157`, `CS214083`, and `CS990276` to only retrieve searchable content from the three specified envelopes.
- To crawl all but a specified set of envelopes from the source system, select **Exclude only these envelopes**, then use the **Add ID to exclude** field and **Add** button to enter IDs for envelopes you want the connector to exclude when crawling.

  As an example, you might enter `CS398287` to exclude searchable content from the specified envelope.

6. Select one of the following **Status** options:
   - To crawl envelopes with any status from the source system, select **Crawl all statuses**.
   - To crawl only envelopes with a specified set of statuses from the source system, select **Include only these statuses**, then use the **Status to include** field and **Add** button to enter statuses you want the connector to include when crawling.

     As an example, you might enter `published` to only retrieve searchable content from envelopes with the specified status.
   - To crawl envelopes with all but a specified set of statuses from the source system, select **Exclude only these statuses**, then use the **Status to exclude** field and **Add** button to enter statuses you want the connector to exclude when crawling.

     As an example, you might enter `draft` to exclude searchable content from envelopes with the specified status.
7. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
8. Select **Save and validate**.

Result

The Docusign external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Docusign source system using your modified crawl settings, create and run a one-time content crawl for your Docusign external content connector. To learn about

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

creating and running one-time content crawls, see Create a content crawl for an external content connector.

Dropbox external content connector

The Dropbox external content connector retrieves files from user folders and team folders in your Dropbox source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Dropbox for external content indexing

Create and authorize an OAuth 2.0 application in the Dropbox App Console to allow the Dropbox external content connector to access your Dropbox source system.

Before you begin

You need developer privileges for the Dropbox App Console.

Role required: none

About this task

The Dropbox external content connector retrieves files from user folders and team folders in your Dropbox source system using the Dropbox APIs.

To allow the connector to access your Dropbox source system via the Dropbox APIs, you must configure and authorize an OAuth 2.0 application in the Dropbox App Console. Your connector administrator can use settings copied from the OAuth 2.0 application to configure the Dropbox external connector for proper connection to your source system.

Procedure

1. In the Dropbox App Console, create a new OAuth 2.0 application for the Dropbox external content connector.
   a. Navigate to https://www.dropbox.com/developers/apps and log in with developer credentials.
   b. Select **Create app**.
   c. In the Choose an API step, select **Scoped access**.
   d. In the Choose the type of access you need step, select **Full Dropbox**.
   e. Enter a name for your new app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `ServiceNow external content connector`.

f. Select **Create app**.

You're taken to the Settings page for your new OAuth 2.0 application.

2. Copy the app key and app secret for your new OAuth 2.0 application.

a. On the Settings screen, copy the app key value and record it in a secure location.

> **Important:** Your external content connector administrator needs this app key when configuring the Dropbox external content connector.

b. To view the app secret, select **Show**.

c. Copy the app secret value and record it in a secure location.

> **Important:** Your external content connector administrator needs this app secret when configuring the Dropbox external content connector.

3. Configure the OAuth 2 redirect URI for your new OAuth 2.0 application.

a. In the OAuth 2 entry, enter `https://<instance-name>.service-now.com/oauth_redirect.do`, replacing `<instance-name>` with the name of your ServiceNow AI Platform® instance.
As an example, you might enter `https://example.service-now.com/oauth_redirect.do`.

b. Select **Add**.

The new redirect URI appears on the page for your application.

4. Configure permissions for your new OAuth 2.0 application.

a. Navigate to the Permissions page for your new OAuth 2.0 application.

b. Select the options for each of the following scopes.

- account_info.read
- files.metadata.read
- files.content.read
- sharing.write
- sharing.read
- team_info.read
- team_data.member
- team_data.content.read
- files.team_metadata.read
- members.read
- groups.read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some of these scope options may be automatically selected by default or when you select other scope options.

c. Select **Submit**.

A message indicates that your permissions change was successful.

What to do next

Provide the following items to your connector administrator:

- The app key that you copied in step 2.a.
- The app secret that you copied in step 2.c.

Your connector administrator needs these items to configure a Dropbox external content connector to retrieve files in user folders, files in team folders, and security principals from your Dropbox source system.

For details on creating and configuring a Dropbox external content connector, see Create a Dropbox external content connector.

Create a Dropbox external content connector

Create an external content connector to retrieve searchable content and security principals from your Dropbox source system.

Before you begin

A source system administrator must have already configured your Dropbox source system to allow access by the Dropbox external content connector. For the required source system configuration steps, see Configure Dropbox for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Dropbox** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Dropbox external content connector.
App key	App key for the OAuth 2.0 application that grants the connector access to your Dropbox content. If you don't have the app key, ask your Dropbox administrator for it.
App secret	App secret for the OAuth 2.0 application that grants the connector access to your Dropbox content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	If you don't have the app secret, ask your Dropbox administrator for it.

6. Save and validate your connection settings.

   a. Select **Validate Connection**.
   A warning message reports that you're connecting an app to your Dropbox account.

   b. Select **Continue**, then select **Allow**.
   You're returned to the connector creation page.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Dropbox external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Dropbox external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Dropbox external content connector

Specify the user and team folders you want your Dropbox external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Dropbox external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Dropbox external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Dropbox external content connector crawls all user and team folders from its specified source system and sends all content and binary files with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to ignore user or team folder content, or to use any of the following non-default settings:

- Inclusion or exclusion filters for the user folders to crawl when running content crawls
- Inclusion or exclusion filters for the team folders to crawl when running content crawls
- Inclusion or exclusion filters for the binary file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Dropbox external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. **Optional:** Deselect the **Crawl user content** option or the **Crawl team content** option depending on what content type you want the connector to retrieve.

   Note: If you deselect both content options, the connector won't retrieve any content from your source system.

5. If you selected **Crawl user content**, select one of the following **User content** options:
   - To crawl all user folders from the source system, select **Crawl all users**.
   - To crawl only a specified set of user folders from the source system, select **Include only these users**, then use the **Include only these users** field and **Add** button to enter email addresses for users whose folders you want the connector to include when crawling.

     As an example, you might enter `beth.anglin@example.com` to only retrieve searchable content from this user's folder.
   - To crawl all but a specified set of user folders from the source system, select **Exclude only these users**, then use the **Exclude only these users** field and **Add** button to enter email addresses for users whose folders you want the connector to exclude when crawling.

     As an example, you might enter `abel.tuter@example.com` to exclude searchable content from this user's folder.
6. If you selected **Crawl team content**, select one of the following **Team folder content** options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all team folders from the source system, select **Crawl all team folders**.
- To crawl only a specified set of team folders from the source system, select **Include only these team folders**, then use the **Include only these team folders** field and **Add** button to enter names for team folders you want the connector to include when crawling.

  As an example, you might enter `Marketing` and `AI Ambassadors` to only retrieve searchable content from these team folders.
- To crawl all but a specified set of team folders from the source system, select **Exclude only these team folders**, then use the **Exclude only these team folders** field and **Add** button to enter names for team folders you want the connector to exclude when crawling.

  As an example, you might enter `Legal` to exclude searchable content from this team folder.

7. Select one of the following **Files** options:
   - To retrieve all files with supported extensions from the source system, select **Crawl all files**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only files with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude files with the Comma-Separated Values (CSV) file format.

   For details on the supported file extensions, see Binary file extensions supported in External Content Connectors.
8. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
9. Select **Save and validate**.

Result

The Dropbox external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Dropbox source system using your modified crawl settings, create and run a one-time content crawl for your Dropbox external content connector. To learn about

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

creating and running one-time content crawls, see Create a content crawl for an external content connector.

Fluid Topics external content connector

The Fluid Topics external content connector retrieves Topics, Articles, Publications, and associated content pages delivered through portals in your Fluid Topics source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Note: Default retrieval limits in the Fluid Topics API may prevent the connector from indexing all of your source system content. To learn about these retrieval limits and how you can request to have them increased, see Request limits in Fluid Topics Knowledge Hub web services.

Configure Fluid Topics for external content indexing

Generate an API key in your Fluid Topics tenant to allow the Fluid Topics external content connector to access your Fluid Topics source system.

Before you begin

You need administrator access and API access for your Fluid Topics tenant.

Role required: none

About this task

The Fluid Topics external content connector retrieves Topics, Articles, Publications, and associated content pages delivered through portals from your Fluid Topics source system using the Fluid Topics API.

To allow the connector to access your source system via the API, you must generate an API key in Fluid Topics. Your connector administrator can use this API key and the URL for your Fluid Topics tenant to configure the Fluid Topics external connector for proper connection to your source system.

Procedure

1. Navigate to your Fluid Topics tenant and log in with administrator credentials.
2. Generate an API key.
   a. Navigate to **Administration** > **Integrations** > **API keys**.
   b. Select **Create & Add**.
   c. In the Name field, enter a unique name for your new API key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The API key name can only contain alphanumeric characters, hyphens, and underscores.

d. Select **Create & Add**.
Fluid Topics displays your new API key.

3. Copy the generated API key and store its value in a secure location.

> **Important:** Your external content connector administrator needs this API key when configuring the Fluid Topics external content connector.

4. **Optional:** Create a new Fluid Topics source and assign your new API key to it.

> **Note:** You only need to perform this step if there are no sources in your Fluid Topics tenant for this external indexing configuration.

a. Navigate to **Administration** > **Knowledge Hub** > **Sources**.
b. Select **New source**.
c. Select the **Exact Source Type Name** source type.
d. Enter a unique ID and unique name for your new source.
e. **Optional:** Enter a category and description for your new source.
f. Select **Next**.
g. Select **Admins and KHUB Admins**.
h. In the Allowed API keys section, select your new API key as an allowed API key for your new source.
i. Select **Save**.

What to do next

Provide the following items to your connector administrator:

- The URL for your Fluid Topics tenant.
- The API key that you copied in step 3.

Your connector administrator needs these items to configure a Fluid Topics external content connector to retrieve content and security principals from your Fluid Topics source system.

For details on creating and configuring a Fluid Topics external content connector, see Create a Fluid Topics external content connector.

Create a Fluid Topics external content connector

Create an external content connector to retrieve searchable content and security principals from your Fluid Topics source system.

Before you begin

A source system administrator must have already configured your Fluid Topics source system to allow access by the Fluid Topics external content connector. For the required source system configuration steps, see Configure Fluid Topics for external content indexing.

Role required: sn_ext_conn.xcc_admin

© 2026 ServiceNow, Inc. All rights reserved.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Fluid Topics* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Fluid Topics external content connector.
Portal URL	URL for your Fluid Topics tenant. This is typically `https://<organization>.fluidtopics.net`, where `<organization>` is the name of your organization. If you don't have the portal URL, ask your Fluid Topics administrator for it.
API Key	API key used to authenticate requests to your Fluid Topics tenant. If you don't have the API key, ask your Fluid Topics administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Fluid Topics external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Fluid Topics external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Fluid Topics external content connector

Specify restrictions on source content status, visibility, category/collection, tags, languages, and modification dates for the Fluid Topics external content connector's content crawls. Define inclusion or exclusion filters to limit the content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the Fluid Topics external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Fluid Topics external content connector.

Role required: sn_ext_conn.xcc_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

This task is optional. By default, the Fluid Topics external content connector crawls all content found in its specified source system and sends all retrieved items and binary files with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Filter retrieved content by status when running content crawls
- Filter retrieved content by visibility when running content crawls
- Filter retrieved content based on its category/collection, tags, languages, or modification dates when running content crawls
- Filter attachment binary files by extension when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Fluid Topics external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Status** options:
   - To retrieve content with any status, select **All**.
   - To retrieve only content with Published status, select **Published**.
   - To retrieve only content with Draft status, select **Draft**.
5. **Optional:** To crawl only content with public visibility, select the **Public visibility only** option. Selecting this option excludes all content that has user or group permission restrictions. With this option selected, the external content connector only retrieves content that's visible to all users in the source system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the **Content** section, select one of the following category/collection options:
   - To retrieve source system content from all categories and collections, select **Crawl all categories/collections**.
   - To retrieve only source system content from a specified set of categories and collections, select **Include only these categories/collections**, then use the **Add categories/collections to include** field and **Add** button to enter names for categories or collections you want the connector to include when crawling.

     As an example, you might enter `Wiki` to only retrieve searchable content from this category or collection.
   - To retrieve source system content from all but a specified set of categories and collections, select **Exclude only these categories/collections**, then use the **Add categories/collections to exclude** field and **Add** button to enter names for categories or collections you want the connector to exclude when crawling.

     As an example, you might enter `Confidential` to exclude searchable content from this category or collection.
7. In the **Content** section, select one of the following tags options:
   - To retrieve source system content with all tags, select **Crawl all tags**.
   - To retrieve only source system content with a specified set of tags from the source system, select **Include only these tags**, then use the **Add tags to include** field and **Add** button to enter tags you want the connector to include when crawling.

     As an example, you might enter `Glossary` and `New` to only retrieve searchable content with the specified tags.
   - To retrieve source system content with all but a specified set of tags, select **Exclude only these tags**, then use the **Add tags to exclude** field and **Add** button to enter tags you want the connector to exclude when crawling.

     As an example, you might enter `Draft` to exclude searchable content with the specified tag.
8. In the **Content** section, select one of the following language options:
   - To retrieve source system content in all languages, select **Crawl all languages**.
   - To retrieve source system content in only a specified set of languages, select **Include only these languages**, then use the **Languages to include** field to enter two-letter identifier codes for languages you want the connector to include when crawling.

     As an example, you might enter `en` and `ja` to retrieve only searchable content in English or Japanese.
   - To retrieve source system content in all but a specified set of languages from the source system, select **Exclude only these languages**, then use the **Languages to exclude** field to enter two-letter identifier codes for languages you want the connector to exclude when crawling.

     As an example, you might enter `en` and `fr` to exclude searchable content in English and French.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. In the **Content** section, select one of the following modification date options:
   - To retrieve content modified within the last year, select **Modified last year**.
   - To retrieve content modified within the last quarter, select **Modified last quarter**.
   - To retrieve content modified within the last month, select **Modified last month**.
   - To retrieve content modified within the last week, select **Modified last week**.
10. Select one of the following **Files** options:
    - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
    - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

      As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
    - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

      As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

    For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
11. **Optional:** In the **Files** options, change the **Max file size (MB)** value to your desired value.
    AI Search only indexes content and metadata from retrieved attachment files that satisfy this file size limit. It ignores attachment files that exceed this file size limit.
12. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
    When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

    This option is only available when the Platform Multimodal Service plugin is activated on your instance.
    - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
    - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
13. Select **Save and validate**.

Result
The Fluid Topics external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Fluid Topics source system using your modified crawl settings, create and run a one-time content crawl for your Fluid Topics external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request limits in Fluid Topics Knowledge Hub web services

By default, the Fluid Topics API limits the number of maps, topics, and unstructured documents retrieved by requests to Knowledge Hub web services. These default limits may prevent the Fluid Topics external content connector from indexing all of your source system content. To request increases to these limits, open a ticket in the Fluid Topics Help Center.

Default retrieval limits in the Fluid Topics API

The Fluid Topics external content connector retrieves content from your source system using requests submitted to Knowledge Hub web services provided by the Fluid Topics API. In particular, it retrieves your maps, topics, and unstructured documents via these web services.

By default, the Fluid Topics API imposes limits on how many items can be retrieved per web service request, as follows:

Item type	Default limit
Maps	Limit of 1,000 maps per request to the API's List maps Knowledge Hub web service. For details on this web service, including the limit, see the List maps topic in the Fluid Topics API Reference Guide.
Topics	Limit of 1,000 topics per request to the API's Search topics Knowledge Hub web service. For details on this web service, including the limit, see the Search topics topic in the Fluid Topics API Reference Guide.
Unstructured documents	Limit of 1,000 documents per request to the API's List unstructured documents Knowledge Hub web service. For details on this web service, including the limit, see the List unstructured documents topic in the Fluid Topics API Reference Guide.

If your source system contains more than 1,000 maps, topics, or unstructured documents, these default limits prevent the Fluid Topics external content connector from indexing all of your source system content. The connector must retrieve all of your maps, topics, or unstructured documents in a single request.

Increasing retrieval limits in the Fluid Topics API

To request increases to these Knowledge Hub web service retrieval limits, you can open a ticket in the Fluid Topics Help Center at https://helpcenter.fluidtopics.com/. Be sure to request increases to all of the retrieval-relevant limits so that the Fluid Topics external content connector can retrieve all of your source system content.

As an example, if your source system includes 544 maps, 1,817 topics, and 1,193 unstructured documents, you must request increases to the default retrieval limits for both the Search topics and List unstructured documents Knowledge Hub web services.

GitHub Enterprise Cloud external content connector

The GitHub Enterprise Cloud external content connector retrieves commits, issues, and pull requests from public and internal repositories in your GitHub Enterprise Cloud source system and makes their content and metadata searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Configure GitHub Enterprise Cloud for external content indexing

Create and authorize a GitHub App to allow the GitHub Enterprise Cloud external content connector to access your GitHub Enterprise Cloud content.

Before you begin

You need all of the following:

- The Organization Owner role for your GitHub Enterprise Cloud organization. For details on this role, see the https://docs.github.com/en/organizations/managing-peoples-access-to-your-organization-with-roles/roles-in-an-organization and https://docs.github.com/en/organizations/managing-peoples-access-to-your-organization-with-roles/maintaining-ownership-continuity-for-your-organization GitHub documentation resources.
- Access to a programming language that you can use to create a JSON Web Token (JWT) for a GitHub App, such as Ruby, Python, bash, or PowerShell. For details on this procedure and the supported programming languages, see the https://docs.github.com/en/enterprise-cloud@latest/apps/creating-github-apps/authenticating-with-a-github-app/generating-a-json-web-token-jwt-for-a-github-app GitHub documentation resource.
- Access to the curl command-line tool.

Role required: none

About this task

The GitHub Enterprise Cloud external content connector retrieves searchable content and metadata from commits, issues, and pull requests found in your GitHub Enterprise Cloud source system's public and internal repositories using the GitHub REST API.

To allow the connector to access your GitHub Enterprise Cloud source system via the REST API, you must configure and authorize a GitHub App for your organization in GitHub Enterprise Cloud. Your connector administrator can use settings copied from the GitHub App to configure the GitHub Enterprise Cloud external connector for proper connection to your source system.

Procedure

1. Create a new GitHub App for the GitHub Enterprise Cloud external content connector.

   a. Navigate to https://github.com/ and log in with your GitHub Enterprise Cloud credentials.

   b. Select your profile picture, then select **Your enterprise** from the context menu.
   If you don't use Enterprise Managed Users, select **Your enterprises**, then select **Settings**.

   c. In the menu, navigate to **Settings** > **Developer Settings** > *GitHub* **Apps**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **New *GitHub* App**.

e. On the Register new GitHub App page, enter a name for your new GitHub App.
As an example, you might enter `External content connector`.

> **Note:** The App name can't exceed 34 characters in length.

f. In the **Homepage URL** field, enter the URL for your organization's GitHub account.
As an example, you might enter `https://github.com/example`.

g. In the Webhook section, clear the **Active** option.

h. In the Permissions section, expand the Repository permissions list and select **Read-only** access for each of these permissions.

- Commit statuses
- Contents
- Discussions
- Issues
- Merge queues
- Pull requests

i. In the Permissions section, expand the Organization permissions list and select **Read-only** access for the **Members** permission.

j. In the **Where can this *GitHub* App be installed?** field, select the **Only on this account** option.

k. Select **Create *GitHub* App**.

A message indicates that your new GitHub App was successfully registered, and you're taken to its General settings page.

2. Get the client ID and private key for your new GitHub App from its General settings page.

a. In the About section, copy the client ID for your new GitHub App and store it in a secure location.

> **Important:** Your external content connector administrator needs this client ID when configuring the GitHub Enterprise Cloud external content connector.

b. In the Private keys section, select **Generate a private key**.

c. When prompted, download the PEM-format private key certificate file to a secure location.

> **Important:** Your external content connector administrator needs this PEM-format private key certificate file when configuring the GitHub Enterprise Cloud external content connector.

3. Install your new GitHub App.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the menu for your new GitHub App, select **Install App**.

b. In the entry for your GitHub organization account, select **Install**.

c. On the Install page for your new GitHub App, choose which repositories you want the external content connector to have access to.

- To grant the external content connector access to all repositories owned by your organization, select **All repositories**.
- To grant the external content connector access to a specified set of repositories owned by your organization, select **Only select repositories**, then use the **Select repositories** drop-down list to find and select the repositories you want to grant the connector access to.

d. Select **Install**.

4. Get the App Installation ID for your new GitHub App.

a. Get the identifier for your GitHub organization from the URL for your GitHub organization page.
The identifier for your organization is the URL element after the third slash in the URL for your GitHub organization page. As an example, if the URL for your GitHub organization page is `https://github.com/example`, the identifier for your organization is `example`.

b. Generate a JSON Web Token (JWT) for your new GitHub App.
For details on generating a JWT for a GitHub App using Ruby, Python, bash, or PowerShell, see the https://docs.github.com/en/enterprise-cloud@latest/apps/creating-github-apps/authenticating-with-a-github-app/generating-a-json-web-token-jwt-for-a-github-app GitHub documentation resource.

To generate a JWT, you need the client ID that you copied in step 2.a and the PEM-format client secret certificate file that you downloaded in step 2.c.

> **Important:** Your JWT expires 10 minutes after creation. If it expires before you can perform the next step, repeat this step to generate a new JWT.

c. Execute the following curl command, replacing `<org>` with the identifier for your GitHub organization and `<json-web-token>` with the JWT you generated.

```
curl --request GET \
  --url "https://api.github.com/orgs/<org>/installation" \
  --header "Accept: application/vnd.github+json" \
  --header "Authorization: Bearer <json-web-token>" \
  --header "X-GitHub-Api-Version: 2022-11-28"
```

d. In the JSON response object, find the application installation's `id` key-value pair, copy its value, and store it in a secure location.

> **Important:** Your external content connector administrator needs this App Installation ID when configuring the GitHub Enterprise Cloud external content connector.

What to do next

Provide the following items to your connector administrator:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The client ID that you copied in step 2.a.
- The PEM-format private key certificate file that you downloaded in step 2.c.
- The app installation ID that you copied in step 4.d.

Your connector administrator needs these items to configure a GitHub Enterprise Cloud external content connector to retrieve items and security principals from your GitHub Enterprise Cloud source system.

For details on creating and configuring a GitHub Enterprise Cloud external content connector, see Create a GitHub Enterprise Cloud external content connector.

Create a GitHub Enterprise Cloud external content connector

Create an external content connector to retrieve searchable content and security principals from your GitHub Enterprise Cloud source system.

Before you begin

A source system administrator must have already configured your GitHub Enterprise Cloud source system to allow access by the GitHub Enterprise Cloud external content connector. For the required source system configuration steps, see Configure GitHub Enterprise Cloud for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *GitHub Enterprise* **Cloud** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this GitHub Enterprise Cloud external content connector.
Client ID	Client ID for the GitHub App that grants the connector access to your GitHub Enterprise Cloud content. If you don't have the client ID, ask your GitHub Enterprise Cloud administrator for it.
App installation ID	App Installation ID for the GitHub App that grants the connector access to your GitHub Enterprise Cloud content. If you don't have the App Installation ID, ask your GitHub Enterprise Cloud administrator for it.
Certificate	PEM-format certificate file containing the private key for the GitHub App that grants the connector access to your GitHub Enterprise Cloud content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	If you don't have the PEM-format private key certificate file, ask your GitHub Enterprise Cloud administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a GitHub Enterprise Cloud external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a GitHub Enterprise Cloud external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a GitHub Enterprise Cloud external content connector

Specify the public and internal repositories you want your GitHub Enterprise Cloud external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the GitHub Enterprise Cloud external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a GitHub Enterprise Cloud external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the GitHub Enterprise Cloud external content connector crawls all public and internal repositories from its specified source system and sends all commits, issues, and pull requests to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Ignore one or more of the default content types when running content crawls
  - Commits
  - Issues
  - Pull requests
- Inclusion or exclusion filters for the repositories to crawl when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the GitHub Enterprise Cloud external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. In the Repositories section, select the options for the types of item you want the connector to retrieve searchable content and metadata from.
5. Select one of the following **Repositories** options:
   - To include content from items in all repositories from the source system, select **Crawl all repositories**.
   - To include only content from items in a specified set of repositories, select **Include only these repositories**, then use the **Add repository URLs to include** field and **Add** button to enter URLs for repositories you want the connector to include when crawling.

     As an example, you might enter `https://github.com/example/production` to only retrieve searchable content from items in the specified repository.
   - To exclude content from items in a specified set of repositories, select **Exclude only these repositories**, then use the **Add repository URLs to exclude** field and **Add** button to enter URLs for repositories you want the connector to exclude when crawling.

     As an example, you might enter `https://github.com/example/beta` to exclude searchable content from items in the specified repository.
6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This option is only available when the Platform Multimodal Service plugin is activated on your instance.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

7. Select **Save and validate**.

Result

The GitHub Enterprise Cloud external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your GitHub Enterprise Cloud source system using your modified crawl settings, create and run a one-time content crawl for your GitHub Enterprise Cloud external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

GitLab external content connector

The GitLab external content connector retrieves issues, wikis, merge requests, tags, branches, and commits from groups, projects, and repositories in your GitLab.com source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Prerequisites for the GitLab external content connector

To use the GitLab external content connector, your GitLab plan must satisfy all of these conditions:

Offering

You must be using the GitLab.com offering, not GitLab Dedicated or GitLab Self-Managed.

To learn more about GitLab offerings, see https://docs.gitlab.com/subscriptions/choosing_subscription/#choose-an-offering.

Group owner user account

You need a GitLab.com user account that owns all the public and private top-level groups you want the external content connector to crawl. The connector impersonates this user when retrieving searchable content, user access permissions, and security principals from your GitLab source system.

Public content requirements

Public content you want to retrieve must be in public top-level groups owned by your group owner user.

Private content requirements

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Private content you want to retrieve must be in a private top-level group on the Ultimate subscription tier. This group must be owned by your group owner user, and you must have configured access permissions for enterprise users in this private group. (The connector only retrieves user access permissions and security principals for enterprise users.)

To learn more about GitLab subscription tiers, see https://docs.gitlab.com/subscriptions/choosing_subscription/#choose-a-subscription-tier. For information about GitLab enterprise users, see https://docs.gitlab.com/user/enterprise_user/.

Limitations for the GitLab external content connector

The GitLab external content connector doesn't retrieve searchable content from personal GitLab.com projects.

When retrieving security principals from your GitLab.com source system, the GitLab external content connector doesn't support any of these security features:

- Custom roles
- Group access tokens
- Users that aren't Enterprise users
- Users with the Minimal Access role

Related topics

Create a user permission crawl for an external content connector

Configure GitLab for external content indexing

Create a personal access token for a group owner user account on GitLab.com to allow the GitLab external content connector to access your GitLab source system.

Before you begin

To use the GitLab external content connector, your GitLab plan must satisfy all of these conditions:

Offering

You must be using the GitLab.com offering, not GitLab Dedicated or GitLab Self-Managed.

To learn more about GitLab offerings, see https://docs.gitlab.com/subscriptions/choosing_subscription/#choose-an-offering.

Group owner user account

You need a GitLab.com user account that owns all the public and private top-level groups you want the external content connector to crawl. The connector impersonates this user when retrieving searchable content, user access permissions, and security principals from your GitLab source system.

Public content requirements

Public content you want to retrieve must be in public top-level groups owned by your group owner user.

Private content requirements

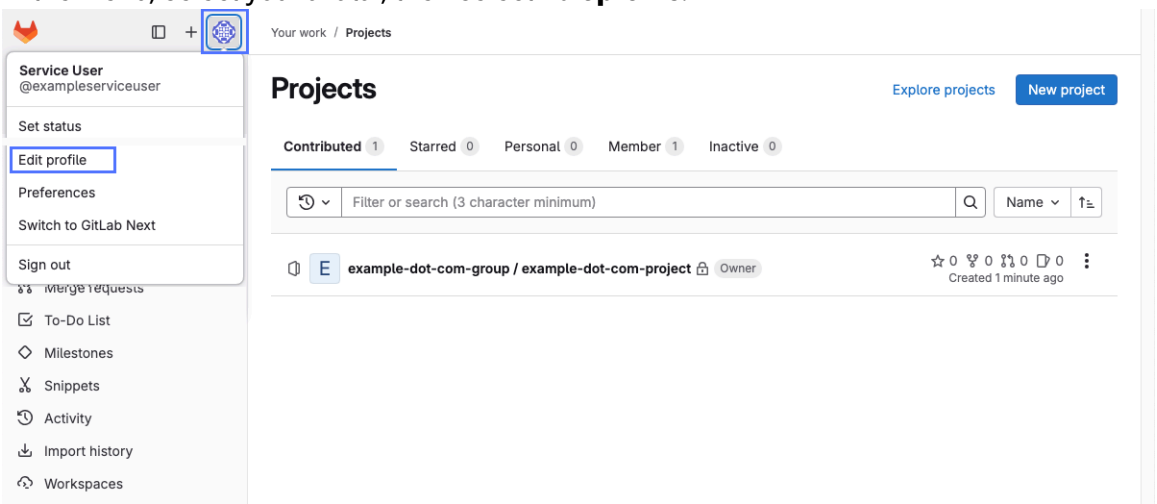
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Private content you want to retrieve must be in a private top-level group on the Ultimate subscription tier. This group must be owned by your group owner user, and you must have configured access permissions for enterprise users in this private group. (The connector only retrieves user access permissions and security principals for enterprise users.)

To learn more about GitLab subscription tiers, see https://docs.gitlab.com/subscriptions/choosing_subscription/#choose-a-subscription-tier. For information about GitLab enterprise users, see https://docs.gitlab.com/user/enterprise_user/.

You need login credentials for the group owner user account in your organization's GitLab.com instance.

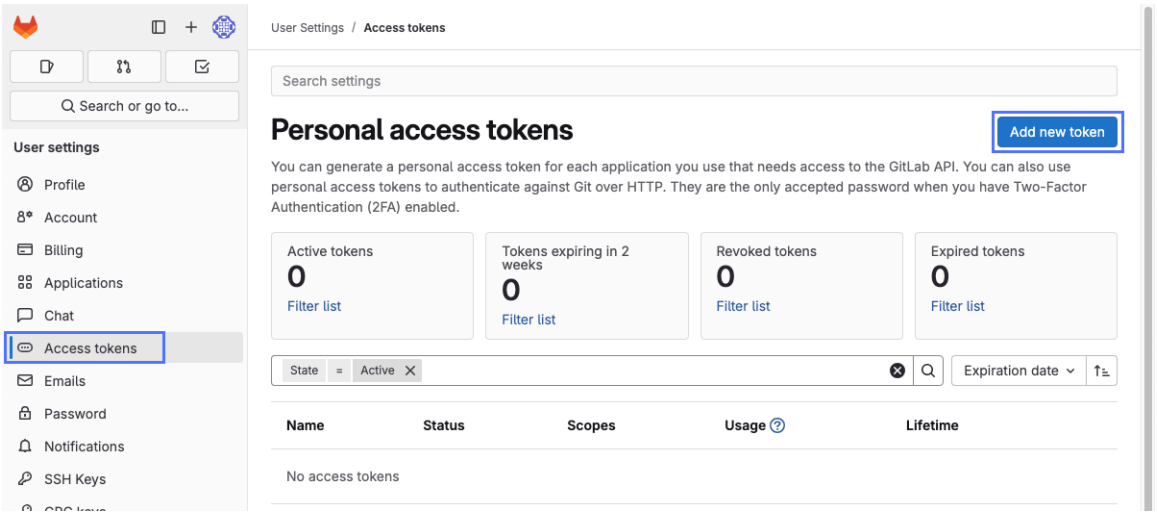
Role required: none



About this task

The GitLab external content connector retrieves content from your GitLab.com source system using the GitLab API and a personal access token with the *read_api* scope configured for the user account that owns all top-level groups you want to crawl. The connector uses this personal access token to impersonate the specified user when retrieving searchable content and security principals from your GitLab.com source system.

Your ServiceNow AI Platform instance admin needs this personal access token to configure the GitLab external content connector for proper connection to your GitLab.com source system.



Procedure

1. Log in to https://gitlab.com/ as the user that owns all top-level groups you want to retrieve searchable content from.
2. In the menu, select your avatar, then select **Edit profile**.

3. Select **Access tokens**, then select **Add new token**.

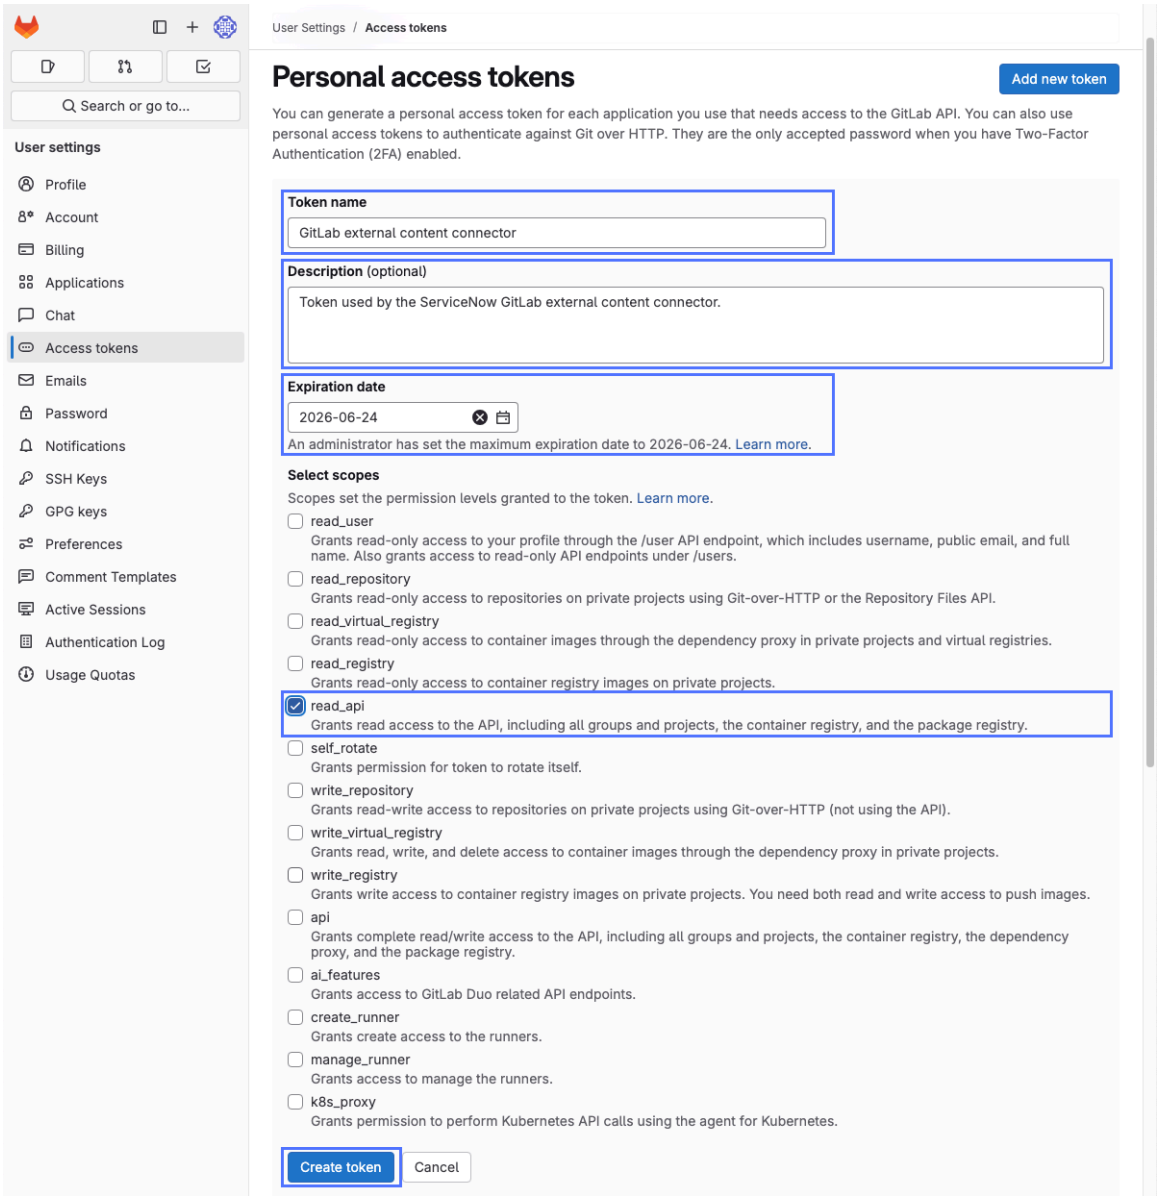
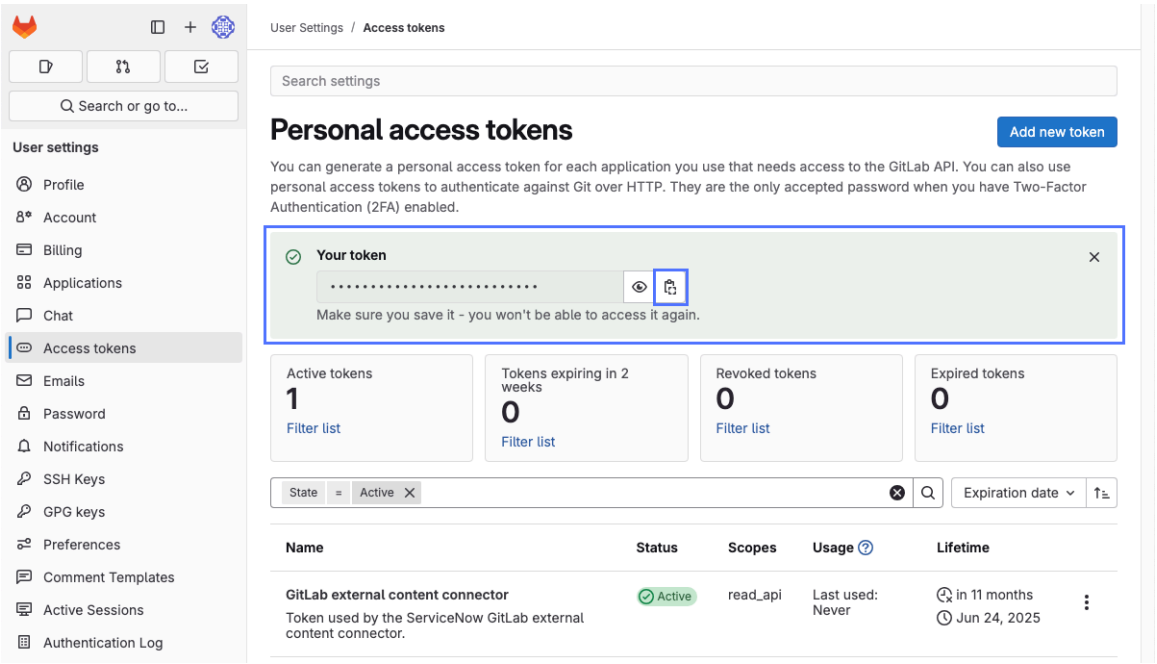
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Enter a name, optional description, and expiration date for your new personal access token.

   Note: If you don't enter an expiration date, the token's expiration date is automatically set to 365 days later than the current date.



5. Select the **read_api** scope for your new personal access token.
6. Select **Create token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. When prompted, select the copy icon to copy your new personal access token, then save it in a secure location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Your connector administrator needs this personal access token to create a GitLab external content connector. You won't be able to access the token again after creating it.

What to do next

Provide the following items to your connector administrator:

- The URL for your GitLab instance. This is typically https://gitlab.com/.
- The personal access token for the group owner user that you copied in step 7.

Your connector administrator needs these items to configure a GitLab external content connector to retrieve searchable content and security principals from your GitLab.com instance.

For details on creating and configuring a GitLab external content connector, see Create a GitLab external content connector.

Create a GitLab external content connector

Create an external content connector to retrieve searchable content and security principals from your GitLab source system.

Before you begin

A source system administrator must have already configured your GitLab source system to allow access by the GitLab external content connector. For the required source system configuration steps, see Configure GitLab for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Gitlab** tile, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this GitLab external content connector.
GitLab instance URL	GitLab.com instance URL for your source system, in this format: `https://gitlab.com`. The GitLab external content connector crawls content from your groups, projects, and repositories found in this source system.
Authentication token	Authentication token for a GitLab.com user that owns all top-level groups you want the external content connector to crawl. If you don't have the authentication token, ask your GitLab administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

> **Note:** If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a GitLab external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a GitLab external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a GitLab external content connector

Specify the groups, projects, and repositories you want your GitLab external content connector to crawl. Select the issues, wikis, merge requests, tags, branches, and commits you want the crawl to retrieve and feed to AI Search for indexing.

Before you begin
A connector administrator must have already created the GitLab external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a GitLab external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the GitLab external content connector crawls content from all subgroups, projects, and repositories found in top-level groups owned by the GitLab.com user that it's configured to impersonate, and sends all supported content types (issues, wikis, merge

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

requests, tags, branches, and commits) to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the subgroups to crawl when running content crawls
- Inclusion or exclusion filters for the projects/repositories to crawl when running content crawls
- Inclusion or exclusion filters for the types of content to retrieve from the source system when running content crawls
- Inclusion or exclusion filters for the branches to retrieve from the source system when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the GitLab external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Group filtering** options:
   - To crawl all subgroups found in top-level groups owned by the connector's impersonated GitLab.com user account, select **Crawl all groups**.
   - To crawl only a specified set of subgroups found in top-level groups owned by the connector's impersonated GitLab.com user account, select **Include only these groups**, then use the **Add group URLs to include** field and **Add** button to enter URLs for the groups that you want to include in the crawl.

     For example, you might enter `https://gitlab.com/example-dot-com/production` to include only searchable content from the `production` subgroup and all subgroups that it contains.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all except a specified set of groups found in top-level groups owned by the connector's impersonated GitLab.com user account, select **Exclude only these groups**, then use the **Add group URLs to exclude** field and **Add** button to enter URLs for the groups that you want to exclude from the crawl.

  For example, you might enter `https://gitlab.com/example-dot-com/test-*` to exclude searchable content from all subgroups with names that start with `test-`.

Note: Subgroup inclusion URLs can be specified as prefixes, with the wildcard character `*` at the end of the URL matching any string.

5. Select one of the following **Project/repository filtering** options:
   - To crawl all projects and repositories owned by the connector's impersonated GitLab.com user account, select **Crawl all projects/repositories**.
   - To crawl only a specified set of projects and repositories owned by the connector's impersonated GitLab.com user account, select **Include only these projects/repositories**, then use the **Add project/repository URLs to include** field and **Add** button to enter URLs for the projects and repositories that you want to include in the crawl.

     Note: Project and repository inclusion URLs can be specified as prefixes, with the wildcard character `*` at the end of the URL matching any string.

     For example, you might enter `https://gitlab.com/example-dot-com/prod-*` to include only searchable content from projects whose names start with `prod-`.
   - To crawl all except a specified set of projects and repositories owned by the connector's impersonated GitLab.com user account, select **Exclude only these projects/repositories**, then use the **Add project/repository URLs to exclude** field and **Add** button to enter URLs for the projects and repositories that you want to exclude from the crawl.

     Note: Project and repository exclusion URLs can be specified as prefixes, with the wildcard character `*` at the end of the URL matching any string.

     For example, you might enter `https://gitlab.com/example-dot-com/confidential273` to exclude searchable content from the `confidential273` project.
6. Enable the **Crawl content types** options for the types of content you want to retrieve when you run content crawls.
   The GitLab external content connector supports indexing of searchable content for these content types:

Content type	Searchable content indexed
Issues	Issue description
Wikis	MarkDown content converted to HTML (without attachments)
Merge requests	Merge request description (MarkDown) and discussions
Tags	Tag message
Branches	Commit message of head commit
Commits	Commit message

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: The GitLab external content connector doesn't support indexing of searchable content from any of these content types:

- Commit, issue, and wiki discussions
- Commit diffs
- Content from archived groups or projects
- Content from groups or projects in the pending deletion state
- Content from subgroups of top-level groups that aren't owned by the impersonated GitLab.com user
- Content of files attached to issues or merge requests
- Content of wiki attachments in formats other than plain text (.txt)
- Internal or confidential notes in merge request discussions
- Repository files

7. If you included the Branches content type in step 6, use the **Add branches to include in regex format** field and the **Add** button to specify Java regular expression patterns matching the names of branches you want to include in content crawls.
   As an example, you might specify `^2025.*$` to include branches with names that start with 2025, or specify `^.*$` to crawl all branches. To learn about Java regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.

   Note: The branch name expressions *`^main$`* and *`^master$`* are included by default. You can't remove these branches from the list.

8. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

9. Select **Save and validate**.

Result

The GitLab external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your GitLab source system using your modified crawl settings, create and run a one-time content crawl for your GitLab external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Google Drive external content connector

The Google Drive external content connector retrieves files and attachments from eligible shared drives in your Google Drive source system and makes their content and metadata searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Drive eligibility

To be eligible for crawling, a shared drive must be accessible by at least one member who is a user in the Directory and who has the Manager role (or is a member of a group with the Manager role). To learn more about the Directory, see https://support.google.com/a/answer/1628009. For details on the Manager role, see https://support.google.com/a/users/answer/12380484.

Delta content crawls

The Google Drive external content connector supports the ability to run delta content crawls in between full content crawls. Unlike full content crawls, delta content crawls only examine, retrieve, and index newly added, changed, or deleted items from your shared drives. By ignoring unchanged items, delta content crawling can significantly reduce the time taken to crawl content from the source system. This means you can refresh your searchable content more often by running delta content crawls between your scheduled full or partial content crawls.

To learn more about delta content crawls, see Delta content crawls for external content connectors. For details on the activation procedure for delta content crawls, see Activate delta content crawling for an external content connector.

Note: Delta content crawls don't replace full content crawls. They're supplemental crawls that enable you to refresh searchable content more frequently in between full content crawls.

Delta content crawls for the Google Drive external content connector have the following limitations.

- Delta content crawls can't detect membership changes for Google Drive shared drives. As a result, user access permissions to files and attachments from your shared drives may be out of sync until the connector completes its next full content crawl.
- If members with the Manager role are removed from shared drives, future delta content crawls may not retrieve changed items from those drives. As a result, searchable content may be out of sync with the source system until the connector completes its next full content crawl.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Configure Google Drive for external content indexing

Enable the Google Drive and Admin SDK APIs and create a Google Cloud service account to allow the Google Drive external content connector to crawl eligible shared drives and security principals in your Google Drive source system.

Before you begin

You need super administrator credentials for your organization's Google Cloud and Google Admin consoles. To learn about super administrator accounts, see the Prebuilt administrator roles and Super administrator account best practices Google resources.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: none

About this task

The Google Drive external content connector retrieves content from your Google Drive source system using APIs and a service account configured in the Google Cloud console. The connector also relies on domain-wide delegation for the service account, which is configured in the Google Admin console.

Your connector administrator can use settings copied from the Google Cloud console to configure the Google Drive external content connector for proper connection to your Google Drive source system.

Procedure

1. Enable the Google Drive and Admin SDK APIs for your selected project.
   a. Log in to the Google Cloud console at https://console.cloud.google.com/.
   b. If necessary, select the displayed project name to open the **Select a project** dialog box, then select the appropriate project for your organization's Google Drive content.
   The console displays the selected project's name.
   c. Locate and select the **APIs & Services** menu item.
   If this menu item is not visible on the Google Cloud page, enter `APIs & Services` in the search field and select the **APIs & Services** search result.
   d. On the APIs & Services page, select **Enable APIs and Services**.
   e. Locate and select the **Google Drive API** tile, then select **Enable**.
   The API appears in the Enabled APIs & services listing for your project.
   f. Repeat steps 1.c through 1.e, but this time locate, select, and enable the **Admin SDK API**.
2. Create a new Google Cloud service account for your selected project.
   a. In the Google Cloud console, locate and select the **IAM & Admin** > **Service Accounts** menu item.
   If this menu item is not visible on the Google Cloud page, enter `Service Accounts` in the search field and select the **Service Accounts** search result.
   b. On the Service accounts page, select **Create Service Account**.
   c. Enter a display name, an account ID, and a description for the service account, then select **Create and Continue**.
   d. Select **Done**.
   The service account appears in the Service Accounts listing for your project.
3. Add a private key to your new Google Cloud service account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Google Cloud console, on the Service Accounts page, select the email address for the service account.

b. In the service account editor, select the **Keys** section header.

c. Select **Add key**, then select **Create new key**.

d. In the Create private key dialog box, select the JSON key type, then select **Create**.

e. When prompted, download the JSON-format private key file to a secure location.

> **Important:** Your connector administrator needs the JSON-format private key file to configure a Google Drive external content connector.

f. Select **Close**.

4. Activate domain-wide delegation in Google Admin for your new Google Cloud service account.

a. In the Google Cloud console, on the Service Accounts page, copy and record the OAuth 2 Client ID value for your new service account.

b. Log in to the Google Admin console at https://admin.google.com/.

c. Navigate to **Security** > **Access and data control** > **API controls**.

d. Select **Manage domain wide delegation**.

e. In the API clients list, select **Add new**.

f. In the **Client ID** field, enter the service account's OAuth 2 Client ID that you copied in step 4.a.

g. In the **OAuth scopes** field, enter `https://www.googleapis.com/auth/drive.readonly, https://www.googleapis.com/auth/admin.directory.user.readonly, https://www.googleapis.com/auth/admin.directory.group.readonly`.
This field's value is a single comma-separated string, not multiple strings.

h. Select **Authorize**.

What to do next

Provide the following items to your connector administrator:

- Your Google Workspace domain name, in the format `example.com`. You can find your domain name by navigating to the https://admin.google.com/ac/domains/manage Google administration page.
- The email address for a user account that has permission to access your Google Workspace domain's user directory. The Google Drive external content connector uses this account to enumerate users and groups of the domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This should be an email address from your organization's domain, not a service account email address from the `iam.gserviceaccount.com` domain.

- The JSON private key file for the Google Cloud service account that you downloaded in step 3.e.

Your connector administrator needs these items to configure a Google Drive external content connector to retrieve searchable content and security principals from your Google Drive instance.

For details on creating and configuring a Google Drive external content connector, see Create a Google Drive external content connector.

Create a Google Drive external content connector

Create an external content connector to retrieve searchable content and security principals from your Google Drive source system.

Before you begin

A source system administrator must have already configured your Google Drive source system to allow access by the Google Drive external content connector. For the required source system configuration steps, see Configure Google Drive for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Google Drive* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Google Drive external content connector.
Workspace domain	Google Workspace domain for your source system, in this format: `https://workspace.example.com`. The Google Drive external content connector crawls eligible shared drives found in this domain. **Note:** The Google Drive external content connector only crawls eligible shared drives from your source system. It doesn't crawl user drives from your source system.
Service account email	Email address for a user account that has permission to access your Google Workspace domain's user directory. The Google Drive external content connector uses this account to enumerate users and groups of the domain. As an example, you might enter `google.service.account@example.com`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	If you don't know the email address to use, ask your Google administrator for it.
Service account JSON file	JSON-format private key file for the service account configured in Google Cloud for the Google Drive external content connector. If you don't have this JSON file, ask your Google administrator for it.

6. Save your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection setting entries fails, the system shows an error message. Verify your connection settings to ensure they're correct.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Google Drive external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Google Drive external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Google Drive external content connector

Specify the shared drives you want your Google Drive external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Google Drive external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Google Drive external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Google Drive external content connector crawls all eligible shared drives from its specified source system and sends documents with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the eligible shared drives to crawl when running content crawls

> **Note:** To be eligible for crawling, a shared drive must be accessible by at least one member who is a user in the Directory and who has the Manager role (or is a member of a group with the Manager role). To learn more about the Directory, see https://support.google.com/a/answer/1628009. For details on the Manager role, see https://support.google.com/a/users/answer/12380484.

- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Google Drive external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all eligible shared drives from the source system, select **Crawl all content**.
   - To crawl only a specified set of eligible shared drives from the source system, select **Include only these drives**, then use the **Add URL** field and **Add** button to enter URLs for shared drives that you want to include in the crawl.

     For example, you might enter `https://drive.google.com/drive/folders/1YKEQjtCzxiS7Uf9PVA` to include only searchable content from the specified shared drive.
   - To crawl all except a specified set of eligible shared drives from the source system, select **Exclude only these drives**, then use the **Add URL** field and **Add** button to enter URLs for shared drives that you want to exclude from the crawl.

     For example, you might enter `https://drive.google.com/drive/folders/X5pOsb29NYITGMZMGEq` to exclude searchable content from the specified shared drive.
5. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.

- To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save**.

Result

The Google Drive external content connector is updated with your crawl scope and file extension filter settings.

What to do next

To retrieve content from your Google Drive source system using your modified crawl settings, create and run a one-time content crawl for your Google Drive external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Filter content by label for a Google Drive external content connector

Configure a label filter for your Google Drive external content connector. The connector only retrieves content that has one or more of your specified label values applied.

Before you begin

Role required: admin

About this task

The Google Drive external content connector supports the use of labels to filter retrieved content. You can specify a list of label value IDs for your Google Drive connectors to check for during content crawls. The connectors only retrieve content items that have one or more of your specified label values applied.

Note: This task is optional. If you don't specify a list of label value IDs, your Google Drive connectors ignore labels when retrieving content items.

To learn more about labels and their IDs and values in Google Drive, see the Labels overview Google developer guide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the External Content Connector Configuration Tables [sn_ext_conn_base_connector_configuration] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sn_ext_conn_base_connector_configuration.list`.
   c. Press Enter.
2. If the Advanced Configuration field doesn't appear in the list view, add it to the list view.
   a. Select the Personalize List icon.
   b. In the Personalize List Columns dialog box, find the Advanced Configuration field in the Available list and use the Add icon to move it to the Selected list.
   c. Select **OK**.
3. Use the list editor to add the *`google_drive_label_include_filter`* property to the Advanced Configuration field value.
   To learn more about the list editor, see Use the list editor.
   a. Double-click or long-press (or use the keyboard shortcut) to open the Advanced Configuration field value.
   The list editor pane opens and displays the current field value.
   b. In the Advanced Configuration JSON object literal, add this new JSON property.

```
"google_drive_label_include_filter" : [ "label_id_1" ]
```

   c. Inside the brackets for the new JSON property's array value, replace the placeholder `"label_id_1"` string with a comma-separated list of label value IDs that you want Google Drive external connectors to use as filters when retrieving content.
   As an example, you might replace `"label_id_1"` as follows to filter on three label values with the specified IDs:

```
"google_drive_label_include_filter" : [
    "0Nlvb5ey59iFqWKEF8r8JjE2TykSaYY87y8RNNEbbFcb",
    "EmOll66ZEgwlbZH2iDvPTbAQ4lGEETKf363RNNEbbFcb",
    "LXpSpR3Tedghc59mo8hE3MiWsG4Xxqi2bzeSNNEbbFcb"
]
```

   With this JSON property specified, your Google Drive connectors only retrieve content items that have at least one of the three specified label values applied.

   Note: To find the ID for a Google Drive label value, edit the label value in Google Drive. The label value's ID appears in the **Label details** section of the **Preview** pane on the editor page. For details on editing labels in Google Drive, see the Edit and monitor classification labels for your organization Google Workspace Help resource.

   d. Select the Save icon or press Enter.
   The list editor pane closes and the field value is updated with your changes.

Result

When you run content crawls for your Google Drive external content connectors, the connectors only retrieve content items that have one or more of your specified label values applied.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HubSpot external content connector

The HubSpot external content connector retrieves tickets and notes from your HubSpot source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Note: The HubSpot API provides only limited information about document permissions. As a result, the external content connector may reindex a significant number of crawled documents when you add or remove HubSpot users or members of HubSpot groups. In extreme cases, adding a single user or updating membership for a single group can trigger an update of all crawled HubSpot documents in the AI Search index.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Configure HubSpot for external content indexing

Create and authorize a legacy public app in HubSpot to allow the HubSpot external content connector to access your HubSpot source system.

Before you begin

You need a HubSpot developer account. For details on developer accounts, see https://developers.hubspot.com/docs/getting-started/account-types.

Role required: none

About this task

The HubSpot external content connector retrieves tickets and notes from your HubSpot source system using the HubSpot API.

To allow the connector to access your HubSpot source system via the HubSpot API, you must configure and authorize a legacy public app in HubSpot. Your connector administrator can use settings copied from the public app to configure the HubSpot external connector for proper connection to your source system.

Procedure

1. In HubSpot, begin creating a new legacy public app for the HubSpot external content connector.

   a. Navigate to https://app-na2.hubspot.com/ (or your HubSpot URL, if different) and log in with your credentials.

   b. In the menu, select **Development**.

   c. In the Development menu, select **Legacy Apps**.

   d. On the Legacy Apps screen, select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. In the Create Legacy App dialog box, select **Public**.
You're taken to the Basic Info screen for your new draft legacy public app.

2. Configure required settings for your new legacy public app.

a. In the Public app name field, enter a name for your new legacy public app.
As an example, you might enter `HubSpot external content connector`.

b. Navigate to the **Auth** tab.

c. In the Redirect URLs section, enter `https://<instance-name>.service-now.com/oauth_redirect.do`, replacing `<instance-name>` with the name of your ServiceNow AI Platform® instance.

d. In the Scopes section, select **Add new scope**.

e. On the Add new scope form, select each of the following scopes as Required, then select **Update**.

- crm.objects.companies.read
- crm.objects.users.read
- files
- tickets

Note: The oauth scope is automatically selected as Required.

f. Select **Create app**.

The new legacy public app is created and you're taken to its Basic Info screen.

3. Copy the client ID and client secret for your new legacy public app.

a. Navigate to the **Auth** tab.

b. Copy the client ID for your new legacy public app and store it in a secure location.

Important: Your external content connector administrator needs this client ID when configuring the HubSpot external content connector.

c. Reveal the client secret by selecting **Show**.

d. Copy the client secret for your new legacy public app and store it in a secure location.

Important: Your external content connector administrator needs this client secret when configuring the HubSpot external content connector.

What to do next

Provide the following items to your connector administrator:

- The client ID that you copied in step 3.b.
- The client secret that you copied in step 3.d.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your connector administrator needs these items to configure a HubSpot external content connector to retrieve tickets, notes, and security principals from your HubSpot source system.

For details on creating and configuring a HubSpot external content connector, see Create a HubSpot external content connector.

Create a HubSpot external content connector

Create an external content connector to retrieve searchable content and security principals from your HubSpot source system.

Before you begin

A source system administrator must have already configured your HubSpot source system to allow access by the HubSpot external content connector. For the required source system configuration steps, see Configure HubSpot for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *HubSpot* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this HubSpot external content connector.
Client ID	Client ID for the legacy public app configured in your HubSpot source system that grants the connector access to your content. If you don't have the client ID, ask your HubSpot administrator for it.
Client Secret	Client secret for the legacy public app configured in your HubSpot source system that grants the connector access to your content. If you don't have the client secret, ask your HubSpot administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

> **Note:** If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a HubSpot external content connector.

9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a HubSpot external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a HubSpot external content connector

Specify the tickets you want your HubSpot external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the HubSpot external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a HubSpot external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the HubSpot external content connector crawls all tickets from its specified source system and sends all content, and binary attachment files with all supported file extensions, to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the tickets to crawl when running content crawls
- Inclusion or exclusion filters for the binary attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the HubSpot external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Tickets** options:
   - To crawl all tickets from the source system, select **Crawl all tickets**.
   - To crawl only tickets that have been modified in the last three months, select **Modified last 3 months**.
   - To crawl only tickets that have been modified in the last six months, select **Modified last 6 months**.
   - To crawl only tickets that have been modified in the last year, select **Modified last year**.
5. Select one of the following **Attachments** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The HubSpot external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your HubSpot source system using your modified crawl settings, create and run a one-time content crawl for your HubSpot external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Lucidchart external content connector

The Lucidchart external content connector retrieves documents from folders in your Lucidchart source system and makes their text content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Lucidchart for external content indexing

Create and authorize an OAuth 2.0 application in the Lucid developer tools and enable the SCIM API in the Lucid admin tools to allow the Lucidchart external content connector to access your Lucidchart content.

Before you begin
You must have an Enterprise subscription for Lucidchart, with the System for Cross-domain Identity Management (SCIM) feature enabled for your account. To learn more about enabling SCIM for your account, see the Lucid SCIM API reference at https://lucid.readme.io/reference/overview-scim.

You need admin privileges for the Lucid developer tools (https://lucid.app/developer) and the Lucid admin tools (https://admin.lucid.app/).

The connector administrator who will create your Lucidchart external content connectors needs an account in your organization's Lucidchart instance so that they can be assigned application collaborator roles for applications you create. Their account needs to have access to all of your Lucidchart content that you want the connector to be able to crawl or retrieve.

Role required: none

About this task
The Lucidchart external content connector retrieves searchable content from documents in your Lucidchart source system using the Lucid SCIM API.

To allow the connector to access your Lucidchart source system via the SCIM API, you must configure and authorize an OAuth 2.0 application in the Lucid developer tools and generate a SCIM bearer token in the Lucid admin tools. Your connector administrator needs the OAuth 2.0 application's client settings and the SCIM bearer token to configure the Lucidchart external connector for proper connection to your source system.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use the Lucid developer tools to create a new application for the Lucidchart external content connector.

   a. Navigate to https://lucid.app/developer and log in with admin credentials.

   b. Select **Create Application**.

   c. Enter a name for your new application.
   As an example, you might enter `Lucidchart external content connector`.

   d. Select **Create**.

   The General settings tab for your new application appears.

2. Invite your connector administrator to be a collaborator on your new application.

   Note: You can skip this step if you're the connector administrator who will create your Lucidchart external content connectors on your ServiceNow AI Platform instance. As the creator of the application, you're automatically added to it as an application collaborator with the **Owner** role.

   a. In the Collaborators section, select **Invite**.

   b. In the Invite application collaborator modal window, enter the email address for the connector administrator who will create your Lucidchart external content connectors.

   c. Select the **Tester** role for the invited application collaborator.

   d. Select **Invite**.

   e. Repeat these steps for each additional connector administrator you need to invite to be an application collaborator.

3. Create an OAuth 2.0 client in your new application.

   a. Navigate to **OAuth 2.0**.

   b. In the Create custom OAuth 2.0 client field, enter a name for your new OAuth 2.0 client.
   As an example, you might enter `Lucidchart external content connector OAuth 2.0 client`

   c. Select **Create OAuth 2.0 client**.
   The details for your new OAuth 2.0 client appear.

   d. Select the Copy icon to copy the **Client ID** value for your new OAuth 2.0 client, then record the value in a secure location.

   Important: Your external content connector administrator needs this client ID value when configuring the Lucidchart external content connector.

   e. Select the Copy icon to copy the **Client Secret** value for your new OAuth 2.0 client, then record the value in a secure location.

   Important: Your external content connector administrator needs this client secret value when configuring the Lucidchart external content connector.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. In the Authorized Redirect URIs section, select **Add Redirect URI**.

g. Enter `https://<instance-name>.service-now.com/oauth_redirect.do` as the callback URI, replacing `<instance-name>` with your ServiceNow AI Platform® instance name, then select **Add**.

4. Generate a SCIM bearer token that you can use to authenticate requests to the Lucid SCIM API.

a. Navigate to https://admin.lucid.app/ and log in with admin credentials.

b. Navigate to **App integration** > **General**.

c. In the Enabled integrations section, find the SCIM integration and select its **Settings** link.

Note: If the SCIM integration doesn't appear in the Enabled integrations section, ask Lucid support to enable SCIM for your account.

The SCIM integration settings screen appears.

d. In the SCIM setup subsection's IdP configuration section, select **Generate token**.

Note: If the link shows **Regenerate token** instead of **Generate token**, your account already has a SCIM bearer token generated. Skip to the next step.

e. Select the Copy icon to copy the **Bearer Token** value, then record the copied value in a secure location.

Important: Your external content connector administrator needs this SCIM bearer token value when configuring the Lucidchart external content connector.

What to do next

Provide the following items to your connector administrator:

- The OAuth 2.0 client ID that you copied in step 3.d.
- The OAuth 2.0 client secret that you copied in step 3.e.
- The SCIM bearer token that you copied in step 4.e.

Your connector administrator needs these items to configure a Lucidchart external content connector to retrieve documents, folders, and security principals from your Lucidchart source system.

Important: If you invited any connector administrators to be application collaborators in step 2, make sure they've accepted their invitations. Without the application collaborator role, they won't be able to create a Lucidchart external content connector.

For details on creating and configuring a Lucidchart external content connector, see Create a Lucidchart external content connector.

Create a Lucidchart external content connector

Create an external content connector to retrieve searchable content and security principals from your Lucidchart source system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

A source system administrator must have already configured your Lucidchart source system to allow access by the Lucidchart external content connector. For the required source system configuration steps, see Configure Lucidchart for external content indexing.

You must be an application collaborator with the Owner or Tester role on the new OAuth 2.0 application that grants the connector access to your Lucidchart content. If you're not sure whether you have this application collaborator role for the application, check with your Lucid administrator.

Important: The Lucidchart external content connector can only access searchable content and metadata from documents and folders that your Lucid account has access to when you create the connector. Work with your Lucid administrator to make sure your Lucid account has access to all documents and folders that you want the connector to be able to crawl and retrieve.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Lucidchart* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Lucidchart external content connector.
Admin Key/ SCIM Token	System for Cross-domain Identity Management (SCIM) bearer token generated for your Lucid account. If you don't have this SCIM bearer token, ask your Lucid administrator for it.
Client ID	Client ID for the OAuth 2.0 client application that grants the connector access to your Lucidchart source system. If you don't have this client ID, ask your Lucid administrator for it.
Client Secret	Client secret for the OAuth 2.0 client application that grants the connector access to your Lucidchart source system. If you don't have this client secret, ask your Lucid administrator for it.

6. Save and validate your connection settings.
   a. Select **Validate Connection**.
   You're redirected to Lucid to approve a request for access to your Lucid user account by the new OAuth 2.0 application that grants the connector access to your organization's Lucidchart content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. On the connection request page, select **Grant Access**.
You're redirected back to the connector creation page.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Lucidchart external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Lucidchart external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Lucidchart external content connector

Specify the folders you want your Lucidchart external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Lucidchart external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Lucidchart external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Lucidchart external content connector crawls all folders from its specified source system and sends documents with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the folders to crawl when running content crawls
- Inclusion or exclusion filters for the file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Lucidchart external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Date** options:
   - To retrieve content from documents that were published in the last year, select **Published last year**.
   - To retrieve content from documents that were published in the last quarter, select **Published last quarter**.
   - To retrieve content from documents that were published in the last month, select **Published last month**.
   - To retrieve content from documents that were published in the last week, select **Published last week**.
5. Select one of the following **Folders** options:
   - To crawl all folders encountered on the source system, select **Crawl all folders**.
   - To crawl only a specified set of folders encountered on the source system, select **Include only these folders**, then use the **Add folder name or ID to include** field and **Add** button to enter names or IDs for folders you want the connector to include when crawling.

     As an example, you might enter `MarketingFolder` to only retrieve searchable content from documents in folders with the specified name or ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all but a specified set of folders encountered on the source system, select **Exclude only these folders**, then use the **Add folder name or ID to exclude** field and **Add** button to enter names or IDs for folders you want the connector to exclude when crawling.

  As an example, you might enter `DraftFolder` to exclude searchable content from documents in folders with the specified name or ID.

6. Select one of the following **Documents** options:
   - To crawl all documents from the source system, select **Crawl all documents**.
   - To crawl only a specified set of documents from the source system, select **Include only these documents**, then use the **Add document name or ID to include** field and **Add** button to enter names or IDs for documents you want the connector to include in retrieval.

     As an example, you might enter `release_document` to only retrieve searchable content from documents with the specified name or ID.

   - To crawl all but a specified set of documents from the source system, select **Exclude only these documents**, then use the **Add document name or ID to exclude** field and **Add** button to enter names or IDs for documents you want the connector to exclude from retrieval.

     As an example, you might enter `DraftFolder2` to exclude searchable content from documents with the specified name or ID.

7. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
8. Select **Save and validate**.

Result
The Lucidchart external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Lucidchart source system using your modified crawl settings, create and run a one-time content crawl for your Lucidchart external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

ManageEngine external content connector

The ManageEngine external content connector retrieves public-domain knowledge articles from knowledge bases in your ManageEngine source system and makes their content and metadata searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector administrators can run or schedule content crawls to update searchable content and metadata from your source system. Content crawls feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Create a user permission crawl for an external content connector

Configure ManageEngine for external content indexing

Create a server-based OAuth 2.0 client application in the Zoho API console to allow the ManageEngine external content connector to access your ManageEngine source system.

Before you begin

You need the following permissions in your ManageEngine instance:

- Administrator or privileged access
- API access
- Read-only access to knowledge base articles and their attachments

Role required: none

About this task

The ManageEngine external content connector retrieves public-domain knowledge articles from knowledge bases in your ManageEngine source system using the ManageEngine REST API.

To allow the connector to access your ManageEngine content via the REST API, you must create a server-based OAuth 2.0 client application in the Zoho API console. Your connector administrator can use the ID and secret from this client application to configure the ManageEngine external connector for proper connection to your source system.

Procedure

1. Navigate to the Zoho API console at https://api-console.zoho.com/ and log in with Administrator or privileged credentials when prompted.
2. Create a new server-based OAuth 2.0 client application.

   a. Select **Get Started** or **Add Client**.
   The **Get Started** link appears if you haven't added any client applications. If you've previously added one or more client applications, the **Add Client** link appears instead.

   b. On the Choose a Client Type page, select **Server-based Applications**.

   c. On the Create New Client page, fill in the fields.

Field	Value
Client Name	Enter a unique name for your OAuth 2.0 client application.
Homepage URL	Enter `https://<instance-name>.service-now.com/`, where

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	`<instance-name>` is the hostname of your ServiceNow AI Platform® instance.
Authorized Redirect URIs	Enter `https://<instance-name>.service-now.com/oauth_redirect.do`, where `<instance-name>` is the hostname of your ServiceNow AI Platform® instance.

d. Select **Create**.

The API console displays your new server-based OAuth 2.0 client application.

3. Record the client ID and client secret for your new server-based OAuth 2.0 client application.

a. Select your new server-based OAuth 2.0 client application from the client list.

b. Navigate to the application's **Client Secret** page.

c. Copy the application's **Client ID** and store it in a secure location.

> **Important:** Your external content connector administrator needs this client ID when configuring the ManageEngine external content connector.

d. Copy the application's **Client Secret** and store it in a secure location.

> **Important:** Your external content connector administrator needs this client secret when configuring the ManageEngine external content connector.

What to do next

Provide the following items to your connector administrator:

- The URL for your ManageEngine instance.
- The client ID that you copied in step 3.c.
- The client secret that you copied in step 3.d.

Your connector administrator needs these items to configure a ManageEngine external content connector to retrieve public-domain knowledge articles from your ManageEngine source system.

For details on creating and configuring a ManageEngine external content connector, see Create a ManageEngine external content connector.

Create a ManageEngine external content connector

Create an external content connector to retrieve searchable content from your ManageEngine source system.

Before you begin

A source system administrator must have already configured your ManageEngine source system to allow access by the ManageEngine external content connector. For the required source system configuration steps, see Configure ManageEngine for external content indexing.

Role required: sn_ext_conn.xcc_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *ManageEngine* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this ManageEngine external content connector.
Portal URL	URL for your ManageEngine instance. This is typically `https://<organization>.manageengine.com`, where `<organization>` is the name of your organization. If you don't have the portal URL, ask your ManageEngine administrator for it.
Client ID	Client ID for the server-based OAuth 2.0 client application that grants the connector access to your ManageEngine instance. If you don't have the client ID for this application, ask your ManageEngine administrator for it.
Client Secret	Client secret for the server-based OAuth 2.0 client application that grants the connector access to your ManageEngine instance. If you don't have the client secret for this application, ask your ManageEngine administrator for it.

6. Save and validate your connection settings.
   a. Select **Validate Connection**.
   A Zoho Accounts window reports that the server-based OAuth 2.0 client application is requesting access to information from your ManageEngine instance.
   b. In the Zoho Accounts window, select the option to allow the OAuth 2.0 client application to access your Zoho account information, then select **Accept**.
   You're redirected to the connector creation page for connection setting validation.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a ManageEngine external content connector.

9. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
10. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a ManageEngine external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a ManageEngine external content connector

Delimit the set of knowledge articles you want your ManageEngine external content connector to retrieve. Define inclusion or exclusion filters to specify which articles the crawl retrieves and feeds to AI Search for indexing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

A connector administrator must have already created the ManageEngine external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a ManageEngine external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the ManageEngine external content connector crawls all knowledge bases from its specified source system and sends all public-domain knowledge articles and attachment binary files with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Filter knowledge articles by ID, author, modification date, or category when running content crawls
- Filter attachment binary files by extension when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the ManageEngine external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. In the **Articles** section, select one of the following article options:
   - To retrieve all knowledge articles found while crawling, select **Crawl all articles**.
   - To retrieve only a specified set of knowledge articles, select **Include only these articles**, then use the **Add article URL or ID to include** field and **Add** button to enter URLs or IDs for knowledge articles that you want the connector to include when crawling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `IT FAQ 2026` and `Troubleshooting` to retrieve only knowledge articles with the specified IDs.

- To retrieve all but a specified set of knowledge articles, select **Exclude only these articles**, then use the **Add article URL or ID to exclude** field and **Add** button to enter URLs or IDs for knowledge articles that you want the connector to exclude when crawling.

  As an example, you might enter `hfuzf762gh173` to exclude the knowledge article with the specified ID.

Note: Article URLs and IDs can be specified as prefixes, with the wildcard character `*` at the end of the URL or ID matching any string. As an example, specifying article ID `Troubleshoot*` includes or excludes articles with IDs `Troubleshooting` and `Troubleshooting guide`.

5. In the **Articles** section, select one of the following author options:
   - To retrieve knowledge articles from all authors, select **Crawl all authors**.
   - To retrieve only knowledge articles from a specified set of authors, select **Include only these authors**, then use the **Add author name to include** field and **Add** button to enter names for authors whose knowledge articles you want the connector to include when crawling.

     As an example, you might enter `Abel Tuter` and `Beth Anglin` to retrieve only knowledge articles by the specified authors.
   - To retrieve knowledge articles from all but a specified set of authors, select **Exclude only these authors**, then use the **Add author name to exclude** field and **Add** button to enter names for authors whose knowledge articles you want the connector to exclude when crawling.

     As an example, you might enter `Test user` to exclude knowledge articles from the specified author.
6. In the **Articles** section, select one of the following modification date options:
   - To retrieve knowledge articles modified within the last year, select **Modified last year**.
   - To retrieve knowledge articles modified within the last quarter, select **Modified last quarter**.
   - To retrieve knowledge articles modified within the last month, select **Modified last month**.
   - To retrieve knowledge articles modified within the last week, select **Modified last week**.
7. In the **Articles** section, select one of the following category options:
   - To retrieve knowledge articles from all categories, select **Crawl all categories**.
   - To retrieve only knowledge articles from a specified set of categories, select **Include only these categories**, then use the **Add category name to include** field and **Add** button to enter names for categories you want the connector to include when crawling.

     As an example, you might enter `Guide` and `Wiki` to only retrieve knowledge articles in the specified categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To retrieve knowledge articles from all but a specified set of categories, select **Exclude only these categories**, then use the **Add category name to exclude** field and **Add** button to enter names for categories you want the connector to exclude when crawling.

  As an example, you might enter `Confidential` to exclude knowledge articles from this category.

8. Select one of the following **Attachments** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
9. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
10. Select **Save and validate**.

Result

The ManageEngine external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your ManageEngine source system using your modified crawl settings, create and run a one-time content crawl for your ManageEngine external content connector.
To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft OneDrive external content connector

The Microsoft OneDrive external content connector retrieves files from individual drives in your Microsoft OneDrive source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Related topics

- Create a content crawl for an external content connector
- Create a user permission crawl for an external content connector

Create a public/private key pair for the Microsoft OneDrive external content connector

Generate a public/private key pair for the Microsoft OneDrive external content connector. Extract the public key as a DER-encoded binary X.509 format certificate for use in configuring API access for the connector in the Microsoft Entra admin center.

Before you begin

You must have access to the Java keytool utility. For details on the keytool utility, see https://docs.oracle.com/en/java/javase/21/docs/specs/man/keytool.html.

Role required: none

About this task

The Microsoft OneDrive external content connector uses a public/private key pair to authenticate with an OAuth 2.0 app configured in the Microsoft Entra admin center. Key pair authentication allows the connector to access your Microsoft OneDrive data via the Microsoft Graph API.

To configure public/private key pair authentication for the connector, you need to create the following items:

1. A public/private key pair in Java KeyStore (JKS) format.
   - Your connector administrator needs this JKS keystore file and its password when configuring settings for the Microsoft OneDrive external content connector.
   - When the Microsoft OneDrive external content connector runs a crawl, it uses the private key from this JKS keystore file to sign the authentication request it sends to the OAuth 2.0 app defined in the Microsoft Entra admin center.
2. A copy of the public key in DER-encoded binary X.509 certificate format.
   - Your administrator needs to upload this certificate file to the OAuth 2.0 app defined in the Microsoft Entra admin center that grants API access to the Microsoft OneDrive external content connector.
   - When the Microsoft OneDrive external content connector submits its authentication request to the OAuth 2.0 app defined in the Microsoft Entra admin center, the app uses the public key from this uploaded certificate to confirm that the authentication request was signed with the private key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If your organization has its own guidelines for generating public/private key pairs, follow those to generate a key pair and a public key certificate in the required formats.

Procedure

1. Generate a public/private key pair in JKS keystore format:

   a. Run this keytool command, replacing `<alias>`, `<jks-file>`, and `<password>` with values of your choice:

   ```
   keytool -genkey -alias <alias> -keyalg RSA -keysize 2048
    -keystore <jks-file>.jks -storepass "<password>" -storetype
    JKS -validity 360
   ```

   As an example, you might specify `ms-onedrive-connector-cert` as the key alias and the JKS repository filename, and enter a password:

   ```
   keytool -genkey -alias ms-onedrive-connector-cert -keyalg
    RSA -keysize 2048 -keystore ms-onedrive-connector-cert.jks
    -storepass "lwmoWTbbT+j+qvdQ" -storetype JKS -validity 360
   ```

   b. When prompted for your first and last name, enter the Common Name (CN) you want for the key pair, then press Enter.
   As an example, you might specify `Microsoft OneDrive external content connector` as the Common Name for the key pair.

   c. At each of the remaining distinguished name prompts, enter the requested information and press Enter.

   d. When prompted to confirm that the distinguished name is correct, enter `yes` and press Enter.

   e. When prompted for a key password, press Enter to use the same password you specified for the keystore file.

   Important: The key must use the same password as the keystore. Record this password in a secure location. Your connector administrator needs this password when configuring the Microsoft OneDrive external content connector.

   The keytool utility generates a new Java KeyStore (.jks) file containing your public/private key pair.

   Important: Ignore the keytool warning message about migrating your keystore to the PKCS12 format. The external content connector only supports the Java KeyStore format.

2. Export your public key in DER-encoded binary X.509 certificate format by running the following keytool command, replacing `<cer-file>` with a filename of your choice and replacing `<alias>`, `<jks-file>`, and `<password>` with the same values you used in step 1:

   ```
   keytool -export -alias <alias> -file <cer-file>.cer -keystore
    <jks-file>.jks -storepass "<password>" -storetype JKS
   ```

   As an example, you might specify `ms-onedrive-connector-cert` as the filename for the DER-encoded binary X.509 format certificate:

   ```
   keytool -export -alias ms-onedrive-connector-cert
    -file ms-onedrive-connector-cert.cer -keystore
   ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ms-onedrive-connector-cert.jks -storepass "1wmoWTbbT+j+qvdQ"
-storetype JKS
```

The keytool utility exports a copy of your public key as a DER-encoded binary X.509 format certificate file with your chosen filename.

Important: Ignore the keytool warning message about migrating your keystore to the PKCS12 format. The external content connector only supports the Java KeyStore format.

What to do next

Provide both of the files you generated to the admins who configure your Microsoft OneDrive instance and AI Search on your ServiceNow AI Platform® instance, as follows:

File	Description
DER-encoded binary X.509 format public key certificate file	Provide this certificate file to your Microsoft OneDrive administrator. They will need to upload the certificate to the Microsoft Entra admin center when configuring an OAuth 2.0 application for the Microsoft OneDrive external content connector. For more information on configuring an OAuth 2.0 application in the Microsoft Entra admin center for the Microsoft OneDrive external content connector, see Configure Microsoft OneDrive for external content indexing.
JKS keystore file and password	Provide this Java KeyStore file and its password to your ServiceNow AI Platform admins. They will need the file and password when configuring the Microsoft OneDrive external content connector. For details on creating and configuring the Microsoft OneDrive external content connector, see Create a Microsoft OneDrive external content connector.

Configure Microsoft OneDrive for external content indexing

Register an OAuth 2.0 application in the Microsoft Entra admin center to allow the Microsoft OneDrive external content connector to access your Microsoft OneDrive source system.

Before you begin

You need the following credentials and permissions for your organization in the Microsoft Entra admin center:

- Login credentials
- Permission to register an application
- Permission to add API permissions to an application
- Permission to grant admin consent for an application's API permissions
- Permission to upload certificates for an application

You must have created a public/private key pair for the Microsoft OneDrive external content connector and extracted the public key certificate in DER-encoded binary X.509 format. For details on creating the public/private key pair and extracting the public key certificate, see Create a public/private key pair for the Microsoft OneDrive external content connector.

Role required: none

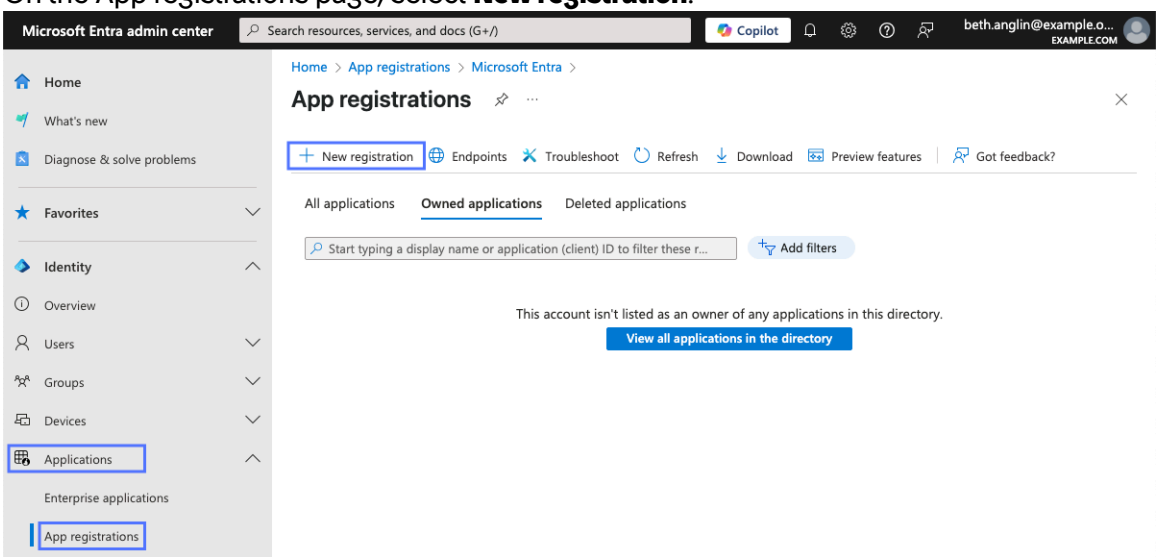
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Microsoft OneDrive external content connector retrieves content from your Microsoft OneDrive source system using the Microsoft Graph API.

To enable the connector to access your Microsoft OneDrive source system via this API, you must configure an OAuth 2.0 application in the Microsoft Entra admin center. Your connector administrator can use settings copied from this Microsoft Entra application to configure the Microsoft OneDrive external content connector for proper connection to your Microsoft OneDrive source system.

Procedure



1. Register a new application in the Microsoft Entra admin center.

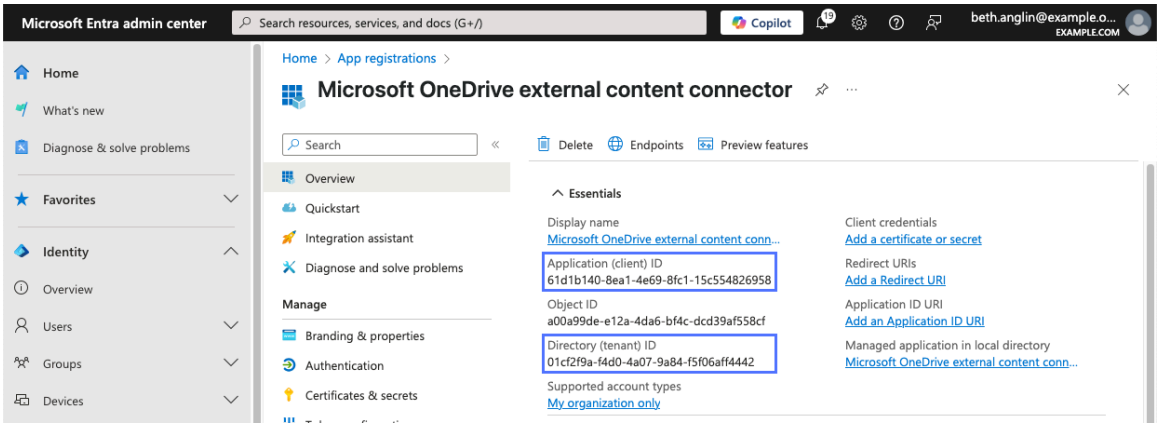
   a. Log in to the Microsoft Entra admin center at https://entra.microsoft.com/.

   > **Note:** If your Microsoft OneDrive tenant is in the Microsoft 365 GCC or GCC High cloud or the Microsoft 365 DoD cloud, log in at https://entra.microsoft.us/ instead.

   b. Select **Applications** > **App registrations**.

   c. On the App registrations page, select **New registration**.

   d. On the Register an application form, fill in the following fields:

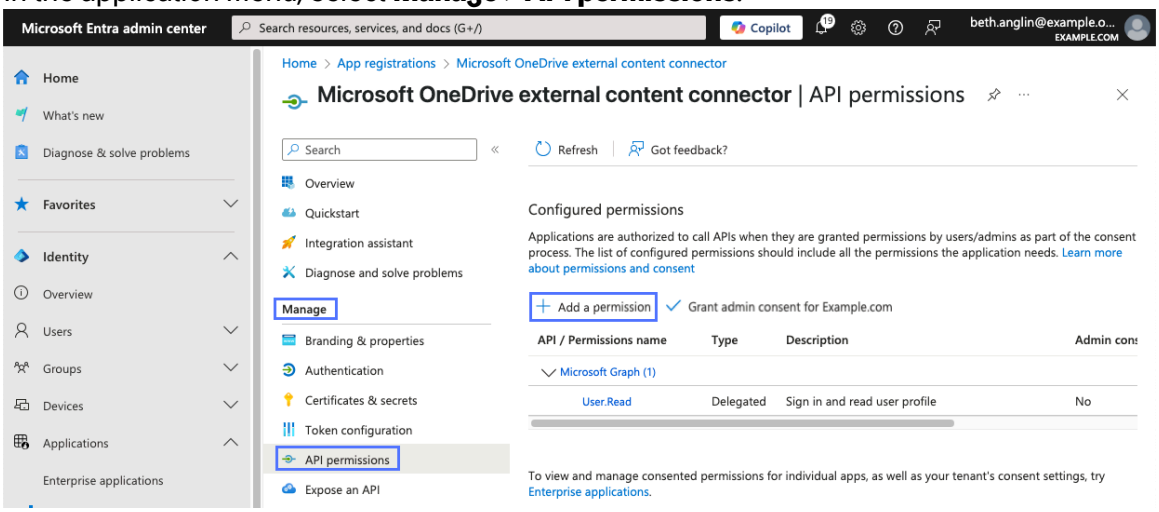


Field	Instructions
Name	Enter a unique name for your OAuth 2.0 application. For example, you might enter `Microsoft OneDrive external content connector`.
Supported account types	Select **Accounts in this organizational directory only (<instance-name> only - Single tenant)**, where `<instance-name>` is the name of your Microsoft Entra instance.
Redirect URI (optional)	Leave this field empty.

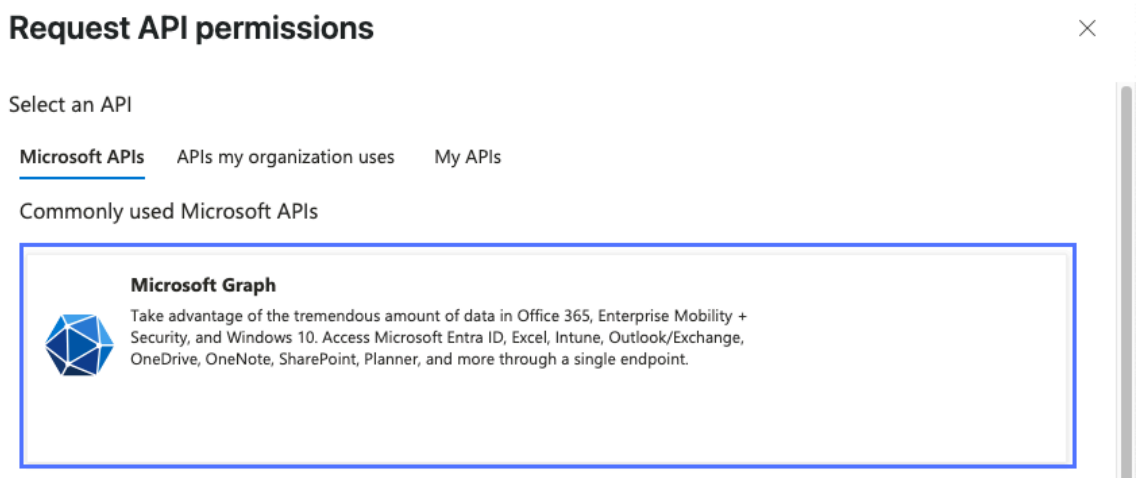
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Register**.
The new application's Overview page appears.

2. Record the values of the **Application (client) ID** and **Directory (tenant) ID** properties in a secure location.



Important: Your connector administrator needs the application's tenant and client IDs to configure a Microsoft OneDrive external content connector.



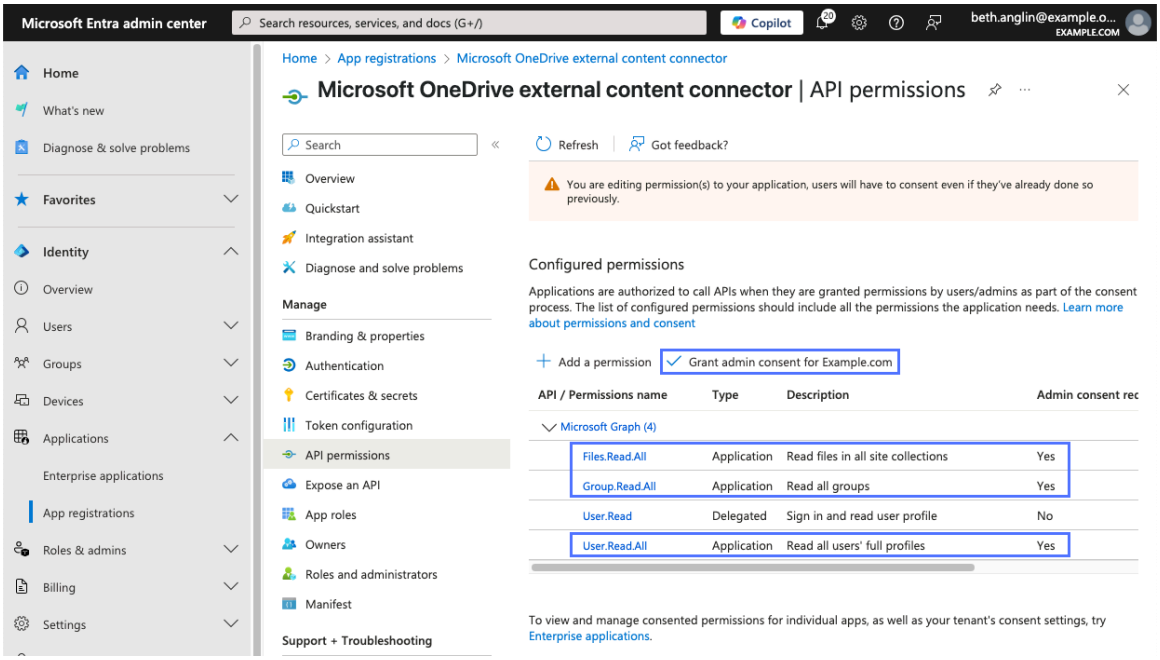
3. Add the API permissions required by the Microsoft OneDrive external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the application menu, select **Manage** > **API permissions**.

b. Select **Add a permission**, then select *Microsoft Graph*, then select **Application permissions**.

c. For each of the following permissions, enter the permission name into the **Select permissions** search field, then locate and select the option for the permission.

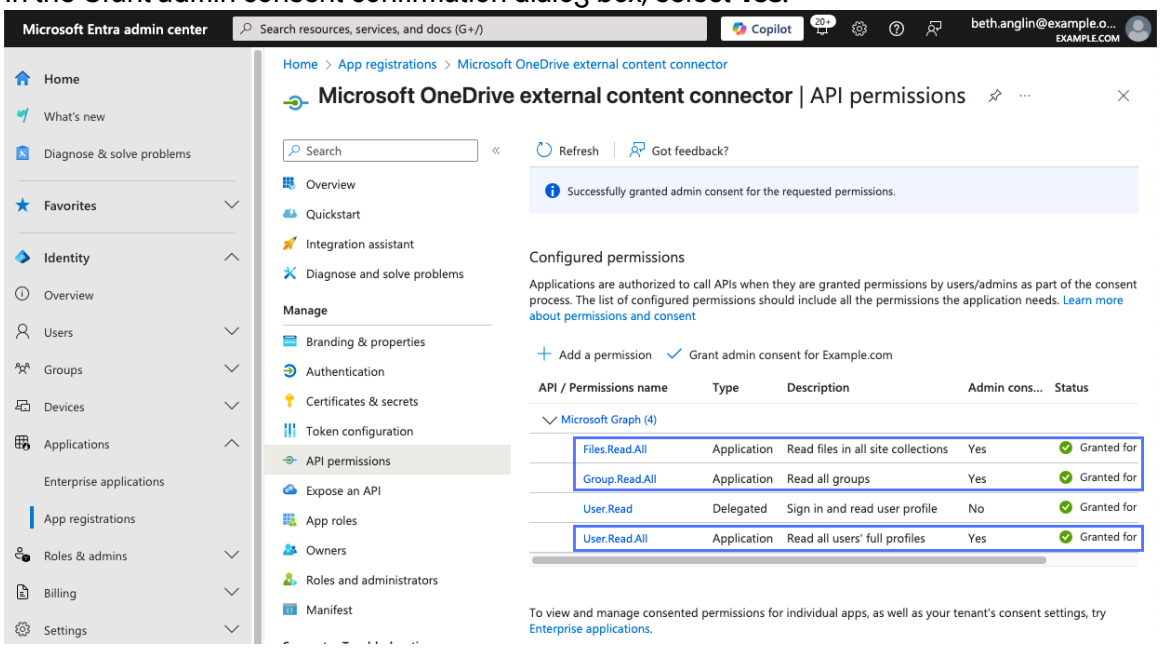


- Files.Read.All
- Group.Read.All or GroupMember.Read.All

  Note: Selecting the Group.Read.All permission improves the connector's crawl speed, but it also gives the connector read access to group chats in your Microsoft OneDrive source system. If you don't want the connector to have read access to your group chats, select the GroupMember.Read.All permission instead.

- User.Read.All

d. Select **Add permissions**.
The new Microsoft Graph permissions appear in the application's Configured permissions list.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Grant admin consent for the added API permissions.

   a. Select **Grant admin consent for <instance-name>**, where `<instance-name>` is the name of your Microsoft Entra instance.

   b. In the Grant admin consent confirmation dialog box, select **Yes**.

   The status for the added API permissions changes to `Granted for <instance-name>`, where `<instance-name>` is the name of your Microsoft Entra instance.

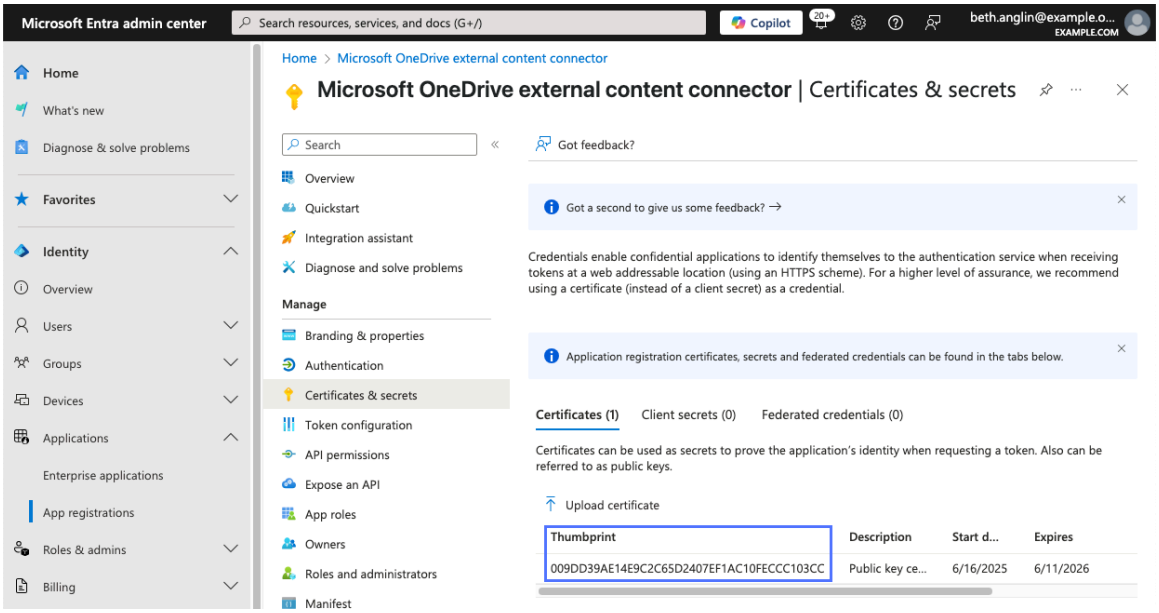
5. Upload your DER-encoded binary X.509 format public key certificate for the Microsoft OneDrive external content connector.

   a. In the Microsoft Entra application menu, select **Manage** > **Certificates & secrets**.

   b. Select **Certificates**, then select **Upload certificate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Select a file** and locate your DER-encoded binary X.509 format public key certificate file, then enter a description for it.



d. Select **Add**.
The DER-encoded binary X.509 format public key certificate appears in the Certificates list.

Note: You can drag the column separators in the Certificates list to view the entire thumbprint SHA1 hash value.

e. Copy the certificate's **Thumbprint** SHA1 hash, shown in hexadecimal format, and record it in a secure location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Your connector administrator needs the DER-encoded binary X.509 format public key certificate's SHA1 thumbprint hash to configure the Microsoft OneDrive external content connector.

f. Retain copies of the generated public/private key files and the key password in a secure location.

Note: You can't download the public key certificate or its password from the Microsoft Entra admin center.

What to do next

Provide the following items to your connector administrator:

- The OAuth 2.0 application's tenant ID and client ID that you recorded in step 2.
- The DER-encoded binary X.509 format public key certificate's SHA1 thumbprint hash in hexadecimal format that you recorded in step 5.e.

Your connector administrator needs these items to configure a Microsoft OneDrive external content connector to retrieve searchable content and security principals from your Microsoft OneDrive instance.

For details on creating and configuring a Microsoft OneDrive external content connector, see Create a Microsoft OneDrive external content connector.

Create a Microsoft OneDrive external content connector

Create an external content connector to retrieve searchable content and security principals from your Microsoft OneDrive source system.

Before you begin

A source system administrator must have already configured your Microsoft OneDrive source system to allow access by the Microsoft OneDrive external content connector. For the required source system configuration steps, see Create a public/private key pair for the Microsoft OneDrive external content connector and Configure Microsoft OneDrive for external content indexing.

Role required: sn_ext_conn.xcc_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **OneDrive** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Microsoft OneDrive external content connector.
Application (client) ID	Application (client) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft OneDrive instance. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Application (client) ID** field in the Essentials section. If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Application (client) ID** value.
Directory (tenant) ID	Directory (tenant) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft OneDrive instance. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Directory (tenant) ID** field in the Essentials section. If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Directory (tenant) ID** value.
JKS Certificate	Java KeyStore (JKS) file containing a public/private key pair generated with the Java keytool utility. These keys must match the public key from the DER-encoded binary X.509 format certificate uploaded to the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft OneDrive external content connector to access your source system data. If you don't have a copy of the JKS file, ask your security administrator for it. You can't download the JKS file from the OAuth 2.0 application's registration record in the Microsoft Entra admin center.
JKS certificate password	Password for the Java KeyStore (JKS) file specified in *`JKS Certificate`*. If you don't have the password for the JKS file, ask your security administrator for it. You can't retrieve the JKS certificate password from the registration record for the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft OneDrive external content connector to access your source system data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
JKS certificate thumbprint	Base64-encoded or hexadecimal SHA1 hash for the DER-encoded binary X.509 format public key certificate uploaded to the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft OneDrive external content connector to access your source system data. If you don't have this hash, ask your Microsoft Entra administrator for the SHA1 thumbprint hash for the application's DER-encoded binary X.509 format public key certificate, in either base64-encoded or hexadecimal format.
Settings for regulated markets	
Configure settings for regulated markets	Option to display *Authority endpoint* and *Graph API endpoint* settings fields.
Authority endpoint	URL for the Microsoft authorization server that you use to log in to your source system (Microsoft tenant). This field appears only when *Configure settings for regulated markets* is selected. Default value: `https://login.microsoftonline.com/` Cloud service endpoint URLs include: ○ `https://login.microsoftonline.com/`: Endpoint URL for the Microsoft 365 cloud ○ `https://login.microsoftonline.us/`: Endpoint URL for the Microsoft 365 GCC and GCC High cloud and the Microsoft 365 DoD cloud If you don't know the authority endpoint URL to use, ask your Microsoft administrator for it. **Important:** The authority endpoint URL must end with a trailing slash.
Graph API endpoint	Microsoft Graph API endpoint for your source system (Microsoft tenant). This field appears only when *Configure settings for regulated markets* is selected. Default value: `https://graph.microsoftonline.com/` Microsoft Graph API endpoint URLs include: ○ `https://graph.microsoftonline.com/`: Endpoint URL for the Microsoft Graph global service cloud ○ `https://graph.microsoftonline.us/`: Endpoint URL for the Microsoft Graph for US Government L4 cloud ○ `https://dod-graph.microsoftonline.us/`: Endpoint URL for Microsoft Graph for US Government L5 (DOD) cloud If you don't know the Microsoft Graph API endpoint URL to use, ask your Microsoft administrator for it. **Important:** The Microsoft Graph API endpoint URL must end with a trailing slash.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
Validate connection settings with test crawl	Option to run a short test crawl to verify whether your connection settings and source system permissions are correctly set. For more details on validating connection settings and source system permissions with a test crawl, see Verify your connection settings and source system permissions for an external content connector. **Important:** For connectors that support user permission crawls, all searchable content and metadata indexed by the validation test crawl is public until the connector completes its first user permission crawl. This means the test crawl's content will be visible to all users of portals and search applications that the connector is linked to.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Microsoft OneDrive external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Microsoft OneDrive external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Microsoft OneDrive external content connector

Specify the individual drives you want your Microsoft OneDrive external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the Microsoft OneDrive external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Microsoft OneDrive external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Microsoft OneDrive external content connector crawls all individual drives from its specified source system and sends files with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the individual drives to crawl when running content crawls
- Inclusion or exclusion filters for the file extensions to retrieve when running content crawls

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Microsoft OneDrive external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all individual drives from the source system, select **Crawl all content**.
   - To crawl only a specified set of individual drives from the source system, select **Include only these individual drives**, then use the **Add OneDrive owner emails to include** field and **Add** button to enter email addresses for the owners of individual drives that you want to include in the crawl.

     For example, you might enter `vanessa@example.com` to include only searchable content from the specified user's individual drive.
   - To crawl all except a specified set of individual drives from the source system, select **Exclude only these individual drives**, then use the **Add OneDrive owner emails to exclude** field and **Add** button to enter email addresses for the owners of individual drives that you want to exclude from the crawl.

     For example, you might enter `alex@example.com` to exclude searchable content from the specified user's individual drive.
5. Select one of the following **Filetype filtering** options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To retrieve all supported file types from the source system, select **Crawl all files**.
- To retrieve only files with specified extensions from the source system, select **Include only these file extensions**, then use the **Add file extensions to include** field to enter file extensions you want the connector to include when crawling.

  As an example, you might enter `.pdf` to only include searchable content from Portable Document Format (PDF) files found in the source system.
- To retrieve all files except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **Add file extensions to exclude** field to enter file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.txt` to exclude searchable content from Plain Text files found in the source system.

For details on the supported file extensions, see Binary file extensions supported in External Content Connectors.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result

The Microsoft OneDrive external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Microsoft OneDrive source system using your modified crawl settings, create and run a one-time content crawl for your Microsoft OneDrive external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Microsoft SharePoint Online external content connector

The Microsoft SharePoint Online external content connector retrieves pages from sites in your Microsoft SharePoint Online source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Microsoft SharePoint Online static and dynamic page content

Microsoft SharePoint Online pages built primarily with static text content authored in the Microsoft SharePoint Online editor produce searchable content that more closely matches what users see in a web browser. By contrast, pages that rely on dynamic web parts may not contain all of the content that users see in a web browser.

Microsoft SharePoint Online pages are stored as `.aspx` files in a site's Site Pages library. These files can include static content in their CanvasContent1 and WikiFields metadata fields. They can also include scripts that call a server-side engine to dynamically render viewable content at request time. The exact content rendered depends on user context, permissions, and web parts loaded as part of the page request.

Rendering a page's full viewable content requires an authenticated user session. The Microsoft SharePoint Online connector can't impersonate a user to trigger this rendering process. As a result, the connector cannot capture the final HTML output that a web browser would display.

For each page retrieved, the Microsoft SharePoint Online connector queries the SharePoint REST API's `_api/web/lists('<list-id>')/items(<item-id>)` endpoint to access the page's underlying list item. Via this API endpoint, the connector retrieves content primarily from the page's CanvasContent1 and WikiFields metadata fields. It also captures the page's other metadata fields such as title, author, and modification date where available. Page content stored exclusively in dynamic web parts may be retrieved only partially or not at all, since that content doesn't exist in the list item metadata.

To learn how to view the portion of a page's content that can be retrieved using the Microsoft SharePoint Online connector, see View retrievable page content using the Microsoft SharePoint Online REST API.

Microsoft SharePoint Online flags

Microsoft SharePoint Online uses several flags to define how sites, lists, and documents behave.

The Microsoft SharePoint Online external content connector automatically ignores any sites, lists, or documents that have any of the following flags set to true:

- *IsCatalog* (denotes a list used for storing assets or configuration)
- *IsPrivate* (denotes a list intended for restricted or internal use)
- *Hidden* (denotes a list that supports system features and isn't meant for user browsing)
- *NoCrawl* (denotes content that shouldn't be indexed for search)

These flags denote content that isn't relevant or user-facing and should be excluded from search results.

Estimate document volume for Microsoft SharePoint Online

Estimate the total number of documents included in your Microsoft SharePoint Online source system and the document counts for individual sites. Use this information to determine crawl scope settings needed for your Microsoft SharePoint Online external content connector.

Before you begin

You need the following credentials and permissions for your organization's Microsoft 365 admin center instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Login credentials
- Permission to configure and export the Microsoft SharePoint Online active site listing

For detailed information about access to reports in the Microsoft 365 admin center, see the Microsoft 365 reports in the admin center article on the Microsoft Learn site.

Role required: none

About this task

Before configuring a Microsoft SharePoint Online external content connector, you may find it helpful to estimate the number of documents available in your Microsoft SharePoint Online source system and in its individual sites.

By estimating the count of available documents, you can determine whether you need to restrict the crawl scope for your Microsoft SharePoint Online external content connector to avoid exceeding the indexed-document limit.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Log in to the Microsoft 365 admin center at https://admin.microsoft.com/.
2. Navigate to **Admin centers** > **All admin centers**, then select **SharePoint** in the list of admin centers.
3. Navigate to **Sites** > **Active sites**.
4. In the Active sites list, select the **Customize columns** header, ensure that the following columns are selected for display, then select **Apply**.
   - Site name
   - URL
   - Storage used (GB)
   - Files
5. Export and analyze the document counts for active sites.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Export**.

b. When prompted, save the active sites CSV list to a convenient location.

c. Open the exported active sites CSV list in a tool of your choice.

d. For each site entry in the active sites list, find the number of available documents in the Files field.
Use the Site name and URL field values to identify your sites.

e. Find the total number of available documents in your Microsoft SharePoint Online source system by adding up the Files field values for all the sites in the active sites CSV list.

What to do next

If your Microsoft SharePoint Online source system's total available document count exceeds the connector limit of one million (1,000,000) documents, you will need to limit the crawl scope for the Microsoft SharePoint Online external content connector. Choose a set of sites whose total document count is less than the connector limit, and inform your AI Search administrator so they can configure the external content connector's crawl settings to include only those sites.

For details on configuring the Microsoft SharePoint Online connector's crawl settings, see Configure crawl settings for a Microsoft SharePoint Online external content connector.

Create a public/private key pair for the Microsoft SharePoint Online external content connector

Generate a public/private key pair for the Microsoft SharePoint Online external content connector. Extract the public key as a DER-encoded binary X.509 format certificate for use in configuring API access for the connector in the Microsoft Entra admin center.

Before you begin

You must have access to the Java keytool utility. For details on the keytool utility, see https://docs.oracle.com/en/java/javase/21/docs/specs/man/keytool.html.

Role required: none

About this task

The Microsoft SharePoint Online external content connector uses a public/private key pair to authenticate with an OAuth 2.0 app configured in the Microsoft Entra admin center. Key pair authentication allows the connector to access your Microsoft SharePoint Online data via the Microsoft Graph API.

To configure public/private key pair authentication for the connector, you need to create the following items:

1. A public/private key pair in Java KeyStore (JKS) format.
   - Your connector administrator needs this JKS keystore file and its password when configuring settings for the Microsoft SharePoint Online external content connector.
   - When the Microsoft SharePoint Online external content connector runs a crawl, it uses the private key from this JKS keystore file to sign the authentication request it sends to the OAuth 2.0 app defined in the Microsoft Entra admin center.
2. A copy of the public key in DER-encoded binary X.509 certificate format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Your administrator needs to upload this certificate file to the OAuth 2.0 app defined in the Microsoft Entra admin center that grants API access to the Microsoft SharePoint Online external content connector.
- When the Microsoft SharePoint Online external content connector submits its authentication request to the OAuth 2.0 app defined in the Microsoft Entra admin center, the app uses the public key from this uploaded certificate to confirm that the authentication request was signed with the private key.

Note: If your organization has its own guidelines for generating public/private key pairs, follow those to generate a key pair and a public key certificate in the required formats.

Procedure

1. Generate a public/private key pair in JKS keystore format:

   a. Run this keytool command, replacing `<alias>`, `<jks-file>`, and `<password>` with values of your choice:

   ```
   keytool -genkey -alias <alias> -keyalg RSA -keysize 2048
    -keystore <jks-file>.jks -storepass "<password>" -storetype
    JKS -validity 360
   ```

   As an example, you might specify `ms-spo-connector-cert` as the key alias and the JKS repository filename, and enter a password:

   ```
   keytool -genkey -alias ms-spo-connector-cert -keyalg RSA
    -keysize 2048 -keystore ms-spo-connector-cert.jks -storepass
    "C?yuR4hrt2GU7g}3" -storetype JKS -validity 360
   ```

   b. When prompted for your first and last name, enter the Common Name (CN) you want for the key pair, then press Enter.
   As an example, you might specify `Microsoft SharePoint Online external content connector` as the Common Name for the key pair.

   c. At each of the remaining distinguished name prompts, enter the requested information and press Enter.

   d. When prompted to confirm that the distinguished name is correct, enter `yes` and press Enter.

   e. When prompted for a key password, press Enter to use the same password you specified for the keystore file.

   Important: The key must use the same password as the keystore. Record this password in a secure location. Your connector administrator needs this password when configuring the Microsoft SharePoint Online external content connector.

   The keytool utility generates a new Java KeyStore (.jks) file containing your public/private key pair.

   Important: Ignore the keytool warning message about migrating your keystore to the PKCS12 format. The external content connector only supports the Java KeyStore format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Export your public key in DER-encoded binary X.509 certificate format by running the following keytool command, replacing `<cer-file>` with a filename of your choice and replacing `<alias>`, `<jks-file>`, and `<password>` with the same values you used in step 1:

```
keytool -export -alias <alias> -file <cer-file>.cer -keystore
 <jks-file>.jks -storepass "<password>" -storetype JKS
```

As an example, you might specify `ms-spo-connector-cert` as the filename for the DER-encoded binary X.509 format certificate:

```
keytool -export -alias ms-spo-connector-cert -file
 ms-spo-connector-cert.cer -keystore ms-spo-connector-cert.jks
 -storepass "C?yuR4hrt2GU7g}3" -storetype JKS
```

The keytool utility exports a copy of your public key as a DER-encoded binary X.509 format certificate file with your chosen filename.

Important: Ignore the keytool warning message about migrating your keystore to the PKCS12 format. The external content connector only supports the Java KeyStore format.

What to do next

Provide both of the files you generated to the admins who configure your Microsoft SharePoint Online instance and AI Search on your ServiceNow AI Platform® instance, as follows:

File	Description
DER-encoded binary X.509 format public key certificate file	Provide this certificate file to your Microsoft SharePoint Online administrator. They will need to upload the certificate to the Microsoft Entra admin center when configuring an OAuth 2.0 application for the Microsoft SharePoint Online external content connector. For more information on configuring an OAuth 2.0 application in the Microsoft Entra admin center for the Microsoft SharePoint Online external content connector, see Configure Microsoft SharePoint Online for external content indexing.
JKS keystore file and password	Provide this Java KeyStore file and its password to your ServiceNow AI Platform admins. They will need the file and password when configuring the Microsoft SharePoint Online external content connector. For details on creating and configuring the Microsoft SharePoint Online external content connector, see Create a Microsoft SharePoint Online external content connector.

Configure Microsoft SharePoint Online for external content indexing

Register an OAuth 2.0 application in the Microsoft Entra admin center to grant the Microsoft SharePoint Online external content connector access to your Microsoft SharePoint Online source system.

Before you begin

You need the following credentials and permissions for your organization in the Microsoft Entra admin center:

- Login credentials
- Permission to register an application
- Permission to add API permissions to an application

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Permission to grant admin consent for an application's API permissions
- Permission to upload certificates for an application

You must have created a public/private key pair for the Microsoft SharePoint Online external content connector and extracted the public key certificate in DER-encoded binary X.509 format. For details on creating the public/private key pair and extracting the public key certificate, see Create a public/private key pair for the Microsoft SharePoint Online external content connector.

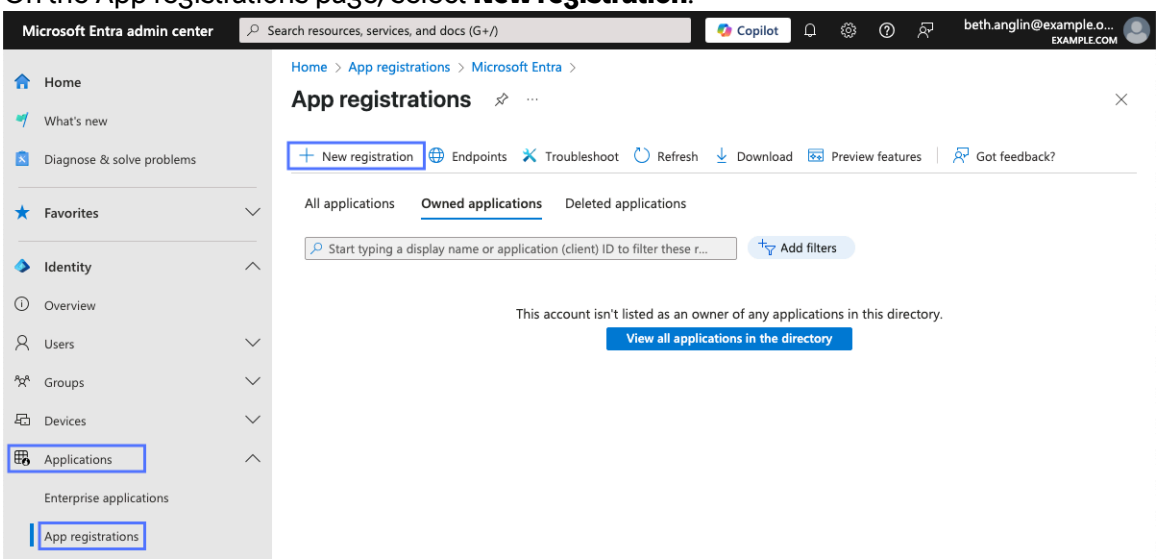
Role required: none

About this task

The Microsoft SharePoint Online external content connector retrieves content from your Microsoft SharePoint Online source system using Microsoft Graph and the Microsoft SharePoint REST APIs.

To enable the connector to access your Microsoft SharePoint Online source system via these APIs, you must configure an OAuth 2.0 application in the Microsoft Entra admin center. Your connector administrator can use settings copied from this Microsoft Entra application to configure the Microsoft SharePoint Online external content connector for proper connection to your Microsoft SharePoint Online source system.

Procedure

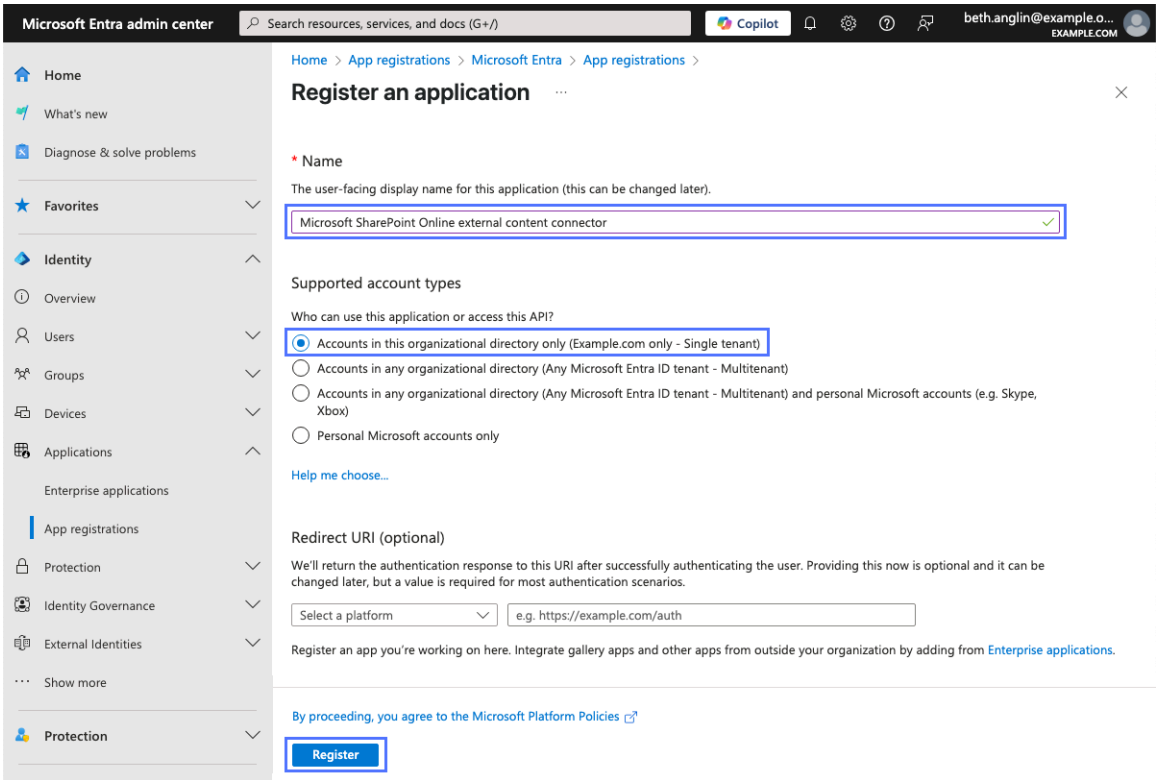


1. Register a new application in the Microsoft Entra admin center.

a. Log in to the Microsoft Entra admin center at https://entra.microsoft.com/.

> **Note:** If your Microsoft SharePoint Online tenant is in the Microsoft 365 GCC or GCC High cloud or the Microsoft 365 DoD cloud, log in at https://entra.microsoft.us/ instead.

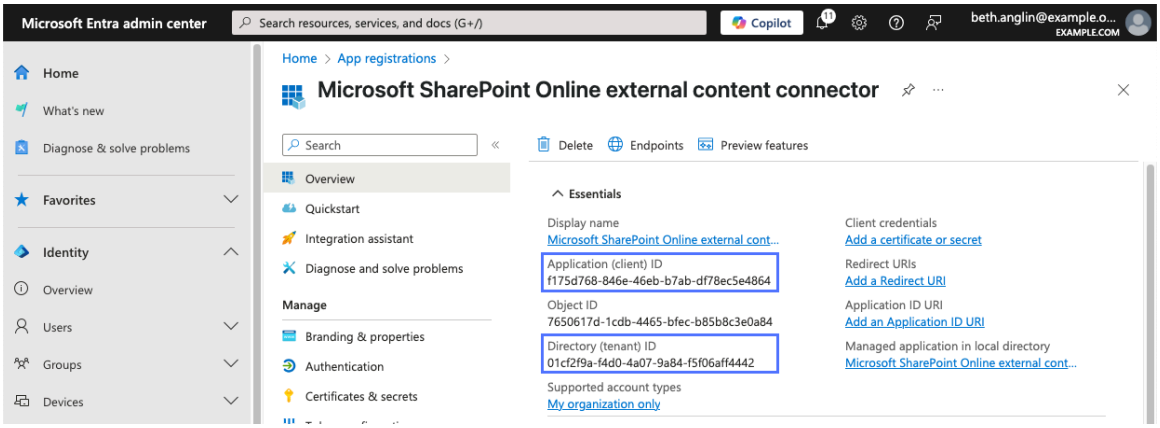
b. Select **Applications** > **App registrations**.



c. On the App registrations page, select **New registration**.

d. On the Register an application form, fill in the following fields:

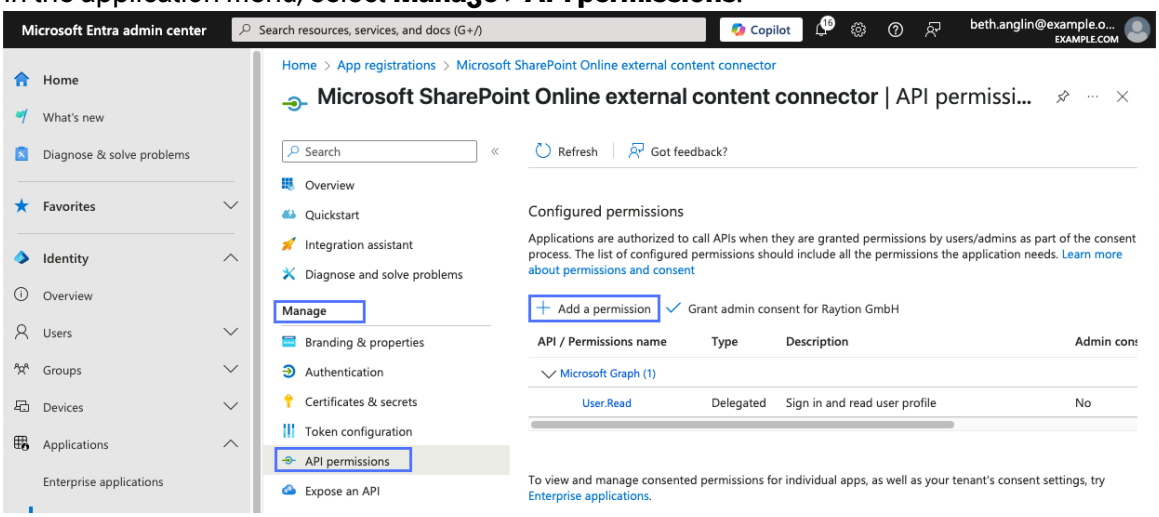
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



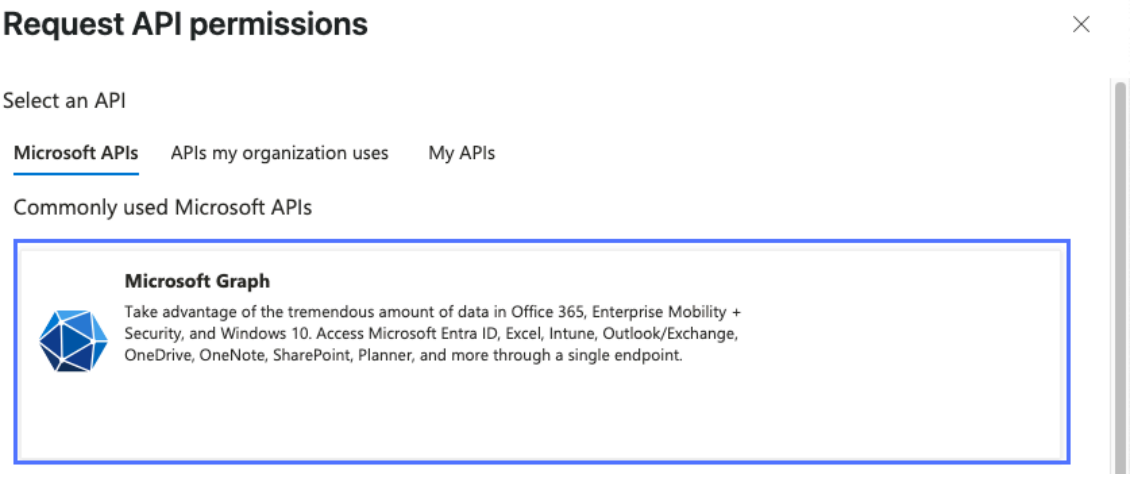
Field	Instructions
Name	Enter a unique name for your OAuth 2.0 application. For example, you might enter `Microsoft SharePoint Online external content connector`.
Supported account types	Select **Accounts in this organizational directory only (<instance-name> only - Single tenant)**, where `<instance-name>` is the name of your Microsoft Entra instance.
Redirect URI (optional)	Leave this field empty.

e. Select **Register**.
The new application's Overview page appears.

2. Record the values of the **Application (client) ID** and **Directory (tenant) ID** properties in a secure location.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

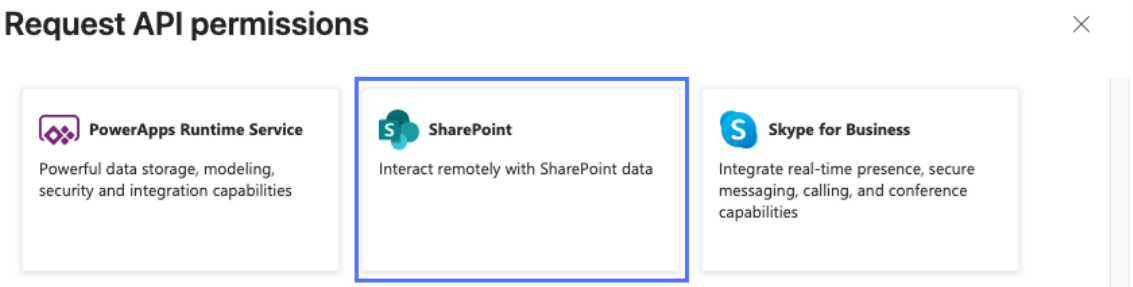


Important: Your connector administrator needs the application's tenant and client IDs to configure a Microsoft SharePoint Online external content connector.

3. Add the API permissions required by the Microsoft SharePoint Online external content connector.

   a. In the application menu, select **Manage** > **API permissions**.

   b. Select **Add a permission**, then select *Microsoft Graph*, then select **Application permissions**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

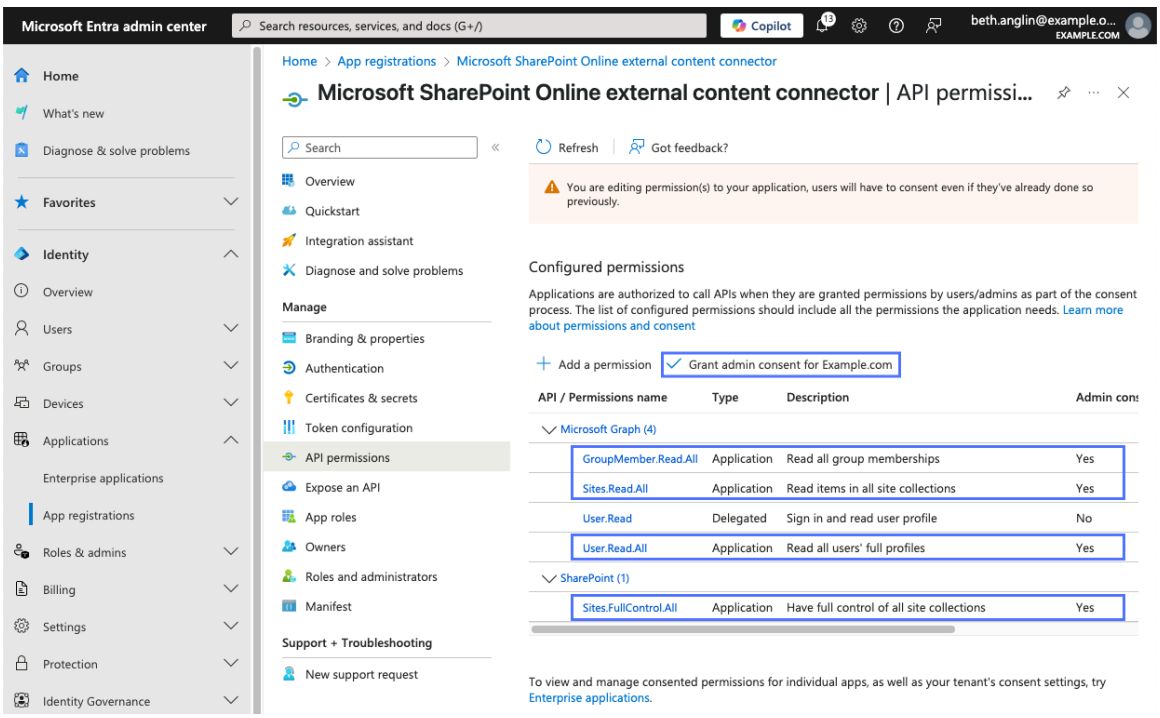
c. For each of the following permissions, enter the permission name into the **Select permissions** search field, then locate and select the option for the permission.

Permission	Description
GroupMember.Read.All	This permission allows the connector to read group memberships from Microsoft Entra ID.
Sites.Read.All	This permission enables the connector to perform automatic site discovery for crawl configuration and one-time crawls. **Note:** If you plan to specify the sites to crawl manually, don't select this permission. For more information on specifying sites for the connector to crawl, see Configure crawl settings for a Microsoft SharePoint Online external content connector. To learn more about one-time crawls, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.
User.Read.All	This permission allows the connector to read users from Microsoft Entra ID. User information includes user type and account enablement status.

d. Select **Add permissions**.
The new Microsoft Graph permissions appear in the application's Configured permissions list.

e. Select **Add a permission**, then select **SharePoint**, then select **Application permissions**.

f. In the **Select permissions** search field, enter either `Sites.FullControl.All` or `Sites.Selected`, then locate and select the option for the specified permission.



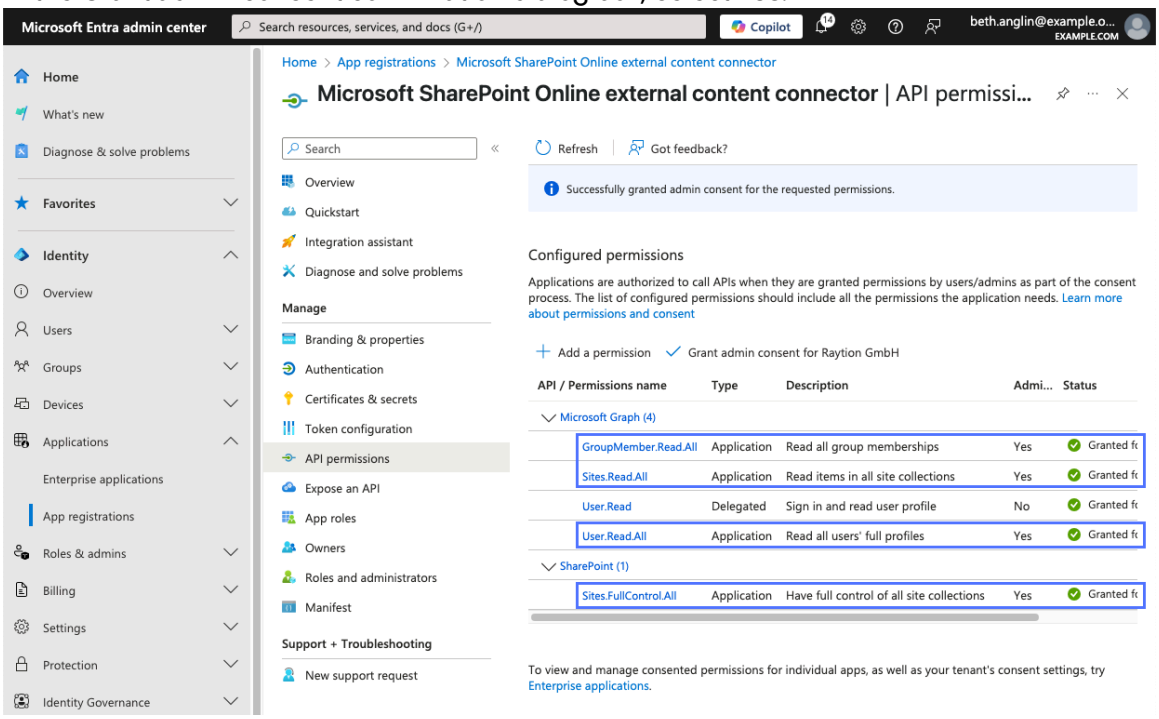
Note: The connector only requires one of these two permissions. Don't select both permissions.

Permission	Description
Sites.FullControl.All	This permission allows the connector to access content and user permissions from all sites and site collections in your Microsoft SharePoint Online tenant. Select this permission if your organization allows it. When you select this permission, no additional configuration is needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Permission	Description
Sites.Selected	This permission allows the connector to access content and user permissions from individual sites and site collections in your Microsoft SharePoint Online tenant. An administrator must grant FullControl permissions to your registered Microsoft Entra OAuth 2.0 app for each site or site collection that you want the connector to access content from. Select this permission if your organization doesn't permit you to grant Sites.FullControl.All permission to a registered application. To learn how to grant FullControl permissions for individual sites and site collections to your registered Microsoft Entra OAuth 2.0 app, see Configure site and site collection access for the Microsoft SharePoint Online external content connector.

g. Select **Add permissions**.
The new SharePoint permission appears in the application's Configured permissions list.



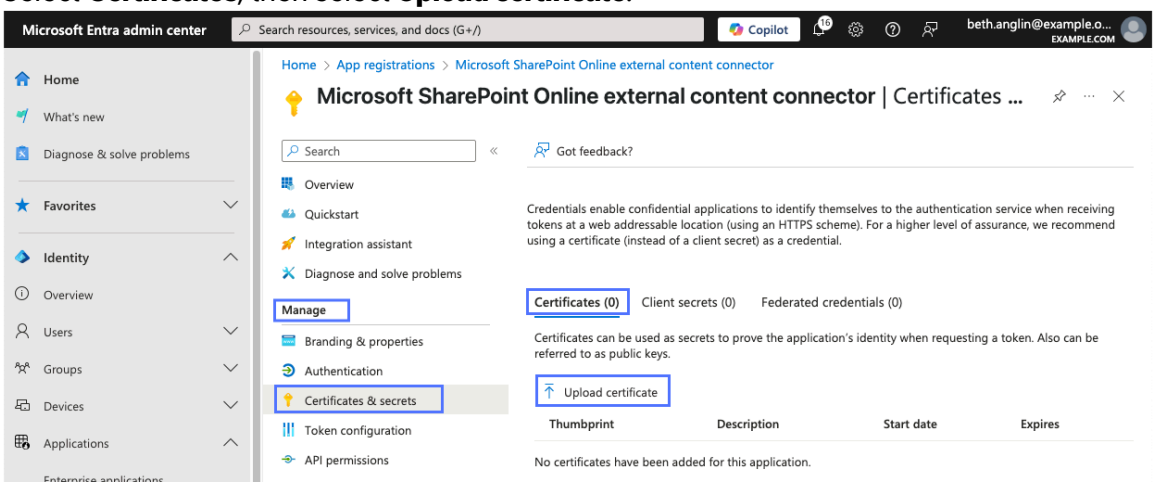
Tip: The SharePoint section of your application's API permissions list shows the entry for the SharePoint API permission that you selected in step 3.f. The images in this procedure show the Sites.FullControl.All permission, but your application may show the Sites.Selected permission instead.

4. Grant admin consent for the added API permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

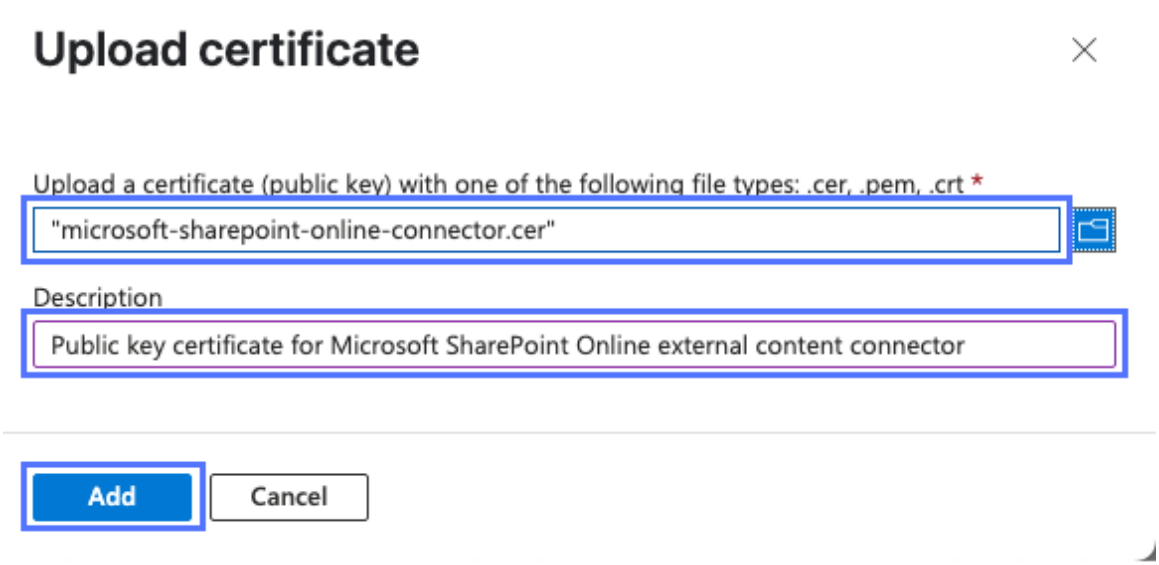
a. Select **Grant admin consent for <instance-name>**, where `<instance-name>` is the name of your Microsoft Entra instance.

b. In the Grant admin consent confirmation dialog box, select **Yes**.



The status for the added API permissions changes to `Granted for <instance-name>`, where `<instance-name>` is the name of your Microsoft Entra instance.

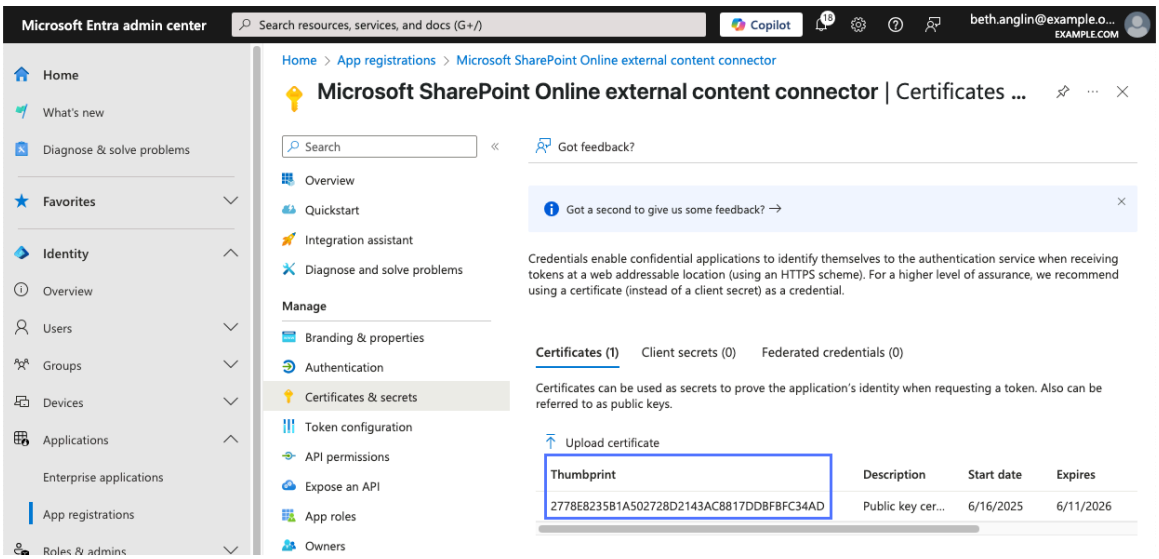
5. Upload your DER-encoded binary X.509 format public key certificate for the Microsoft SharePoint Online external content connector.



a. In the Microsoft Entra application menu, select **Manage** > **Certificates & secrets**.

b. Select **Certificates**, then select **Upload certificate**.

c. Select **Select a file** and locate your DER-encoded binary X.509 format public key certificate file, then enter a description for it.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Add**.
The DER-encoded binary X.509 format public key certificate appears in the Certificates list.

Note: You can drag the column separators in the Certificates list to view the entire thumbprint SHA1 hash value.

e. Copy the certificate's **Thumbprint** SHA1 hash, shown in hexadecimal format, and record it in a secure location.

Important: Your connector administrator needs the DER-encoded binary X.509 format public key certificate's SHA1 thumbprint hash to configure the Microsoft SharePoint Online external content connector.

f. Retain copies of the generated public/private key files and the key password in a secure location.

Note: You can't download the public key certificate or its password from the Microsoft Entra admin center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

If you granted Sites.Selected permission instead of Sites.FullControl.All permission in step 3.f, configure SharePoint API permissions for the site collections you want the Microsoft SharePoint Online connector to be able to crawl. For details on this procedure, see Configure site and site collection access for the Microsoft SharePoint Online external content connector.

Provide the following items to your connector administrator:

- The OAuth 2.0 application's tenant ID and client ID that you recorded in step 2.
- The DER-encoded binary X.509 format public key certificate's SHA1 thumbprint hash in hexadecimal format that you recorded in step 5.e.

Your connector administrator needs these items to configure a Microsoft SharePoint Online external content connector to retrieve searchable content and security principals from your Microsoft SharePoint Online instance.

For details on creating and configuring a Microsoft SharePoint Online external content connector, see Create a Microsoft SharePoint Online external content connector.

Configure site and site collection access for the Microsoft SharePoint Online external content connector

Allow the Microsoft SharePoint Online connector to crawl your sites and site collections by granting site-specific SharePoint API FullControl permissions to the OAuth 2.0 app registered in Microsoft Entra for the connector.

Before you begin

You must have PowerShell 7.0 or a later compatible version installed.

You need appropriate privileges or permissions to alter permissions for the target app, which is the Microsoft Entra OAuth 2.0 app that allows the Microsoft SharePoint Online external content connector to authenticate and access your source system content. These privileges and permissions depend on which authentication model you want to use when configuring site access for the target app:

- To use interactive browser-based login, your Microsoft Entra account needs administration privileges.
- To use service principal authentication, you need a service principal for a Microsoft Entra app that has the Sites.FullControl.All Microsoft Graph API application permission granted by a Microsoft Entra admin. This service principal app is distinct from the target app. You also need one of the following items:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For certificate-based service principal authentication, you need the certificate and private key for your service principal app in PFX format.

  Note:

  If you only have your service principal app's certificate and private key in a Java KeyStore (JKS) file, you can convert that file to PFX format using this Java keytool command:

  ```
  keytool -importkeystore -srckeystore <your-keystore>.jks
   -destkeystore certificate.pfx -deststoretype PKCS12
  -srcalias <your-alias> -deststorepass <your-pfx-password>
   -destkeypass <your-pfx-password>
  ```

  In this command, replace `<your-keystore>` and `<your-alias>` with the name and alias of the existing JKS file. Replace `your-pfx-password` with the password you want to specify for the PFX output file.

  For details on the Java keytool utility, see https://docs.oracle.com/en/java/javase/21/docs/specs/man/keytool.html.

- For client secret-based service principal authentication, you need the client secret for your service principal app. If you don't have the client secret, ask your Microsoft Entra administrator for it.

Role required: none

About this task

This task is only required if you specify the Sites.Selected SharePoint API permission instead of the Sites.FullControl.All permission when configuring the registered Microsoft Entra OAuth 2.0 app for the Microsoft SharePoint Online connector.

Note: For details on how these permissions are specified in the OAuth 2.0 app configuration process, see step 3.f in Configure Microsoft SharePoint Online for external content indexing.

By default, source system administrators grant the Sites.FullControl.All SharePoint API permission to the registered Microsoft Entra OAuth 2.0 app for the Microsoft SharePoint Online connector. This permission allows the connector to read content, metadata, and security information for all types of content in all source system sites and site collections.
