Administer the ServiceNow AI Platform

As a platform administrator, you have the power of the ServiceNow AI Platform at your fingertips. The ServiceNow AI Platform is an application platform as a service that automates business processes across the enterprise.

Get started

Choose one of these tiles to get started.

Start here to learn about the ServiceNow AI Platform

Learn how the ServiceNow AI Platform works.

Configure ServiceNow AI Platform core features

Configure settings that affect global ServiceNow AI Platform behavior and behavior for ServiceNow AI Platform applications.

Maintain and monitor the ServiceNow AI Platform

Identify health issues and settings that you need to change. Optimize ServiceNow AI Platform performance using performance monitoring and diagnostics.

Upgrade to the latest version

Plan and manage your ServiceNow AI Platform upgrades using Upgrade Center. Monitor upgrade progress and view a summary of upgrade results with Upgrade Monitor.

Additional Resources

Upgrade your platform administrator experience to the next level

Start here to learn about the ServiceNow AI Platform

Learn about the ServiceNow AI Platform and these important applications:

Admin Center

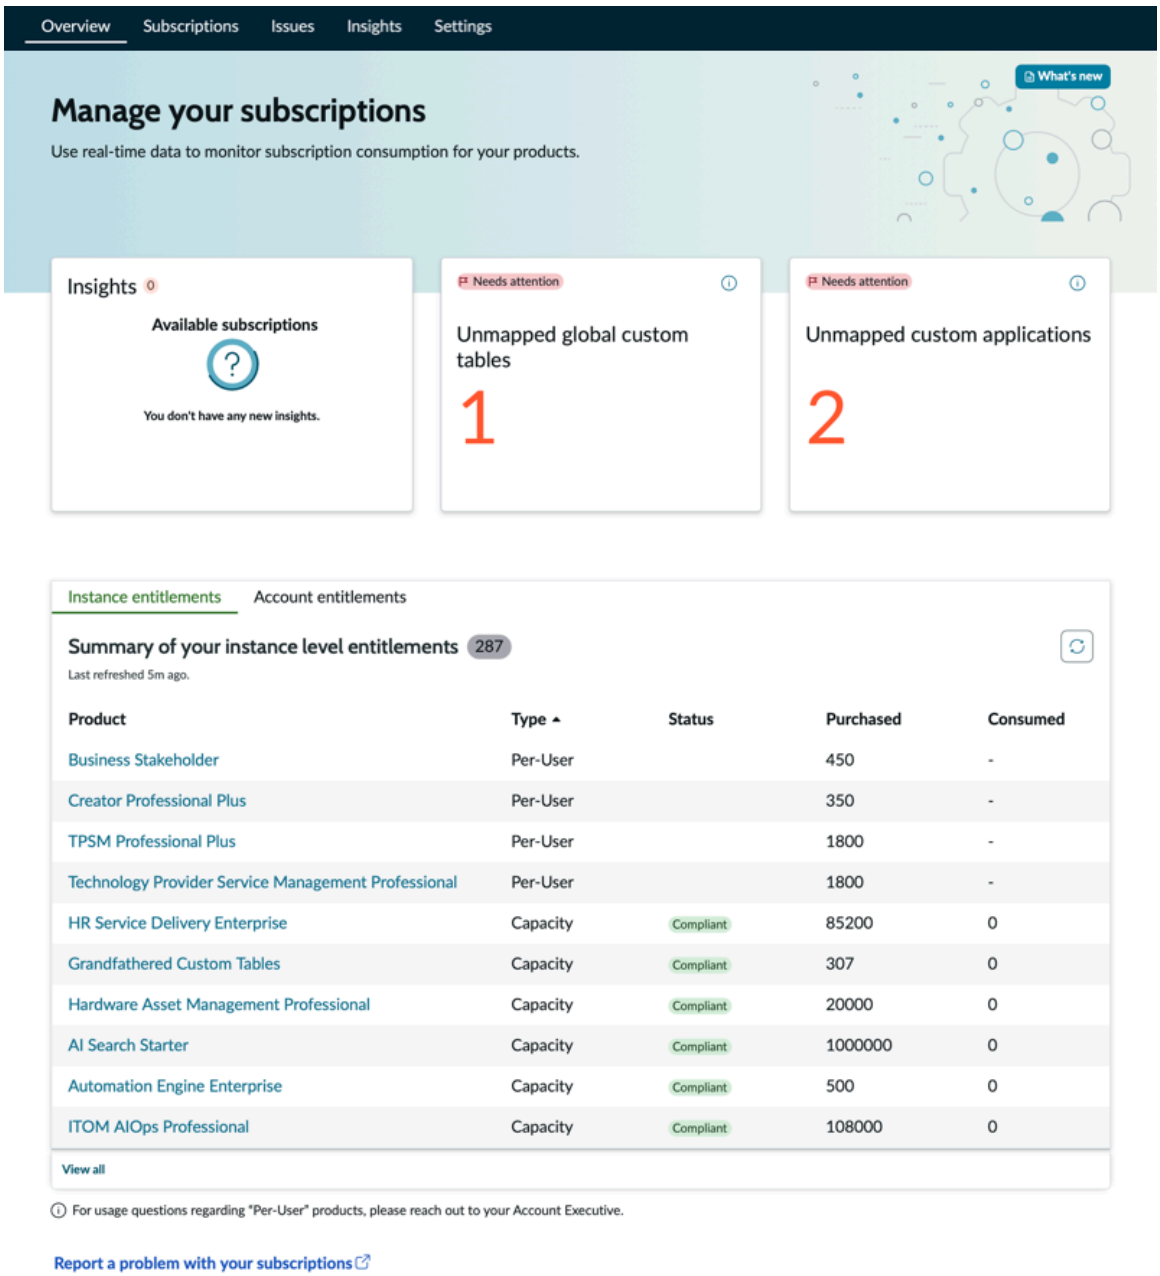
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A central hub for platform owners and admins to access platform capabilities, discover new applications, and get intelligent, actionable insights.

ServiceNow Store

Listings of ready-to-use applications, integrations, and products to help you accelerate your digital transformation.

Application Manager



One location to install, update, and manage licensed applications and plugins for your instance.

ServiceNow Otto for Setup

A guided experience to install, configure, and deploy certain ServiceNow products.

Subscription Management

A centralized management experience to help you understand your subscriptions and entitlements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure ServiceNow AI Platform core features

Explore core features that affect global ServiceNow AI Platform behavior as well as behavior in some ServiceNow AI Platform applications.

User administration

Configure users, groups, and roles to provide access to ServiceNow AI Platform applications and settings.

ServiceNow AI Platform tables and data

Learn how to work with ServiceNow AI Platform records in the classic environment.

Instance Clone

Copy data and metadata from one ServiceNow instance (source instance) to another ServiceNow instance (target instance).

Search administration

Configure search engines and interfaces for the ServiceNow AI Platform. Select AI Search for a consumer-grade search experience, or use the legacy Zing text search engine. Use Contextual Search to let service agents view relevant results based on an Incident or Problem record's query context and user intent.

Time configuration and currency configuration

Configure date and time fields, time zones for your users, and calendars.

Translation and localization

Provide service around the globe with language translation and localization for specified regions.

Integrations

Learn about integrating third-party applications into the ServiceNow AI Platform.

Notifications

Use Notifications to manage system email, create system notifications, and configure how your system responds to inbound email.

Service Level Management

Configure the Service Level Management (SLM) application to gather your service requirements, monitor your SLAs, and report on your SLA compliance.

Maintain and monitor the ServiceNow AI Platform

Instance Scan

Identify ServiceNow AI Platform health issues and incorrectly configured settings.

System Events and Scheduled Jobs dashboard

Monitor system events and determine which the system should process them.

Platform performance

Ensure system optimization through performance monitoring and diagnostics.

Plan and manage your ServiceNow AI Platform upgrade

Upgrade Center and Upgrade Console

Plan and manage your ServiceNow AI Platform upgrades using Upgrade Center or the latest experience, Upgrade Console.

Getting started on the ServiceNow AI Platform

ServiceNow AI Platform is the exclusive ServiceNow platform. It provides a range of options to improve and automate your business processes.

How the ServiceNow AI Platform works

The ServiceNow AI Platform is the foundation of ServiceNow. It enables data to flow seamlessly across applications and existing systems.

Basic system configuration

Customize UI and forms, create a mobile experience, and adjust other settings in applications across the ServiceNow AI Platform.

Admin Center

Admin Center provides a central hub for you to access platform capabilities, discover new applications, and get intelligent, actionable insights.

Subscription Management

With the ServiceNow® Subscription Management application, you can manage how your ServiceNow subscriptions are used on your instances.

How the ServiceNow AI Platform works

Learn how the ServiceNow AI Platform can provide the solutions that you need to improve your business and manage risk effectively. Powerful automation, AI, and embedded analytics optimize your workflow processes, with a wide variety of resources made to help you respond to business changes quickly and easily.

Basic system configuration

Modify your UI to suit your business operations, with various core configuration settings at your disposal. Use Form Administration to customize the appearance of forms and lists. Provide tailored UI through User Interface Configuration, and improve the navigation and search experience for users with Navigation and UI. Enhance your instance and applications with Localization and Time settings, and stay on the go with Mobile Device Support. A wide range of plugins expand the platform even further, with each customizable to your needs.

Admin Center

Discover the capability of available applications and how to implement them to work toward achieving your business goal. Your administrators will be able to get started quickly with setting up apps, loading initial data, and establishing roles, groups, and users. The admin center gives your team the power to customize user interfaces, update versions, applications, and modules

© 2026 ServiceNow, Inc. All rights reserved.

configurations, handle user access, monitor system performance and UI policies, and much more.

Subscription Management

Manage your ServiceNow subscriptions and how they're used on your instances with Subscription Management. This app helps you allocate and monitor subscriptions, and display current subscriptions in your instance. Active management of user-based subscriptions and monitoring of capacity subscriptions lets you track usage and adjust allocation efficiently. Enabled by default, this management app means you can plan for subscription renewals with no added costs.

How the ServiceNow AI Platform works

The ServiceNow AI Platform is the unified foundation for every ServiceNow product, bringing together AI, data, workflows, and security on a single data model.

Video overview

https://player.vimeo.com/video/980759261?badge=0&autopause=0&player_id=0&app_id=58479

Watch this video for an introduction to ServiceNow AI Platform architecture.

Overview of the ServiceNow AI Platform

The ServiceNow AI Platform is the unified foundation for every ServiceNow product. It brings together AI, data, workflows, and security to execute work across areas such as IT, CRM, employee experience, risk and security, and application development.

Built on unified data and enterprise governance, the platform enables AI that goes beyond recommendations to take action. ServiceNow AI Agents run workflows across enterprise systems, all governed by your business rules and policies.

With a single data model connecting to hundreds of systems, the platform gives AI the business context it needs to interpret what's happening and act accordingly across every department. This eliminates fragmented tools and enables organizations to put AI to work at scale—without compromising control.

Architecture

The ServiceNow AI Platform supports customization, live reports and monitoring, and strong data privacy. Services on the ServiceNow AI Platform are provided on a multi-instance basis, instead of running one instance with multiple users. Administrators can segregate their data between business entities in a multi-instance architecture, offering different experiences per instance while they all remain centrally managed through the platform. Customization options are available in all instances, with software installation, data importing, and creation of workflows, processes, applications, and UIs.

Performance, reliability, and scalability

The ServiceNow AI Platform is built for enterprise scale, with global datacenter availability and infrastructure that grows with your organization—whether you run a single department or a worldwide operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administration

The ServiceNow AI Platform Admin Center gives business administrators at-a-glance information and access to configuration management and AI-powered implementation with ServiceNow Otto for Setup.

Localization is available in more than a dozen languages and currencies. In-house and third-party translation services handle communications, virtual agent chat, user input translation, and more. For more information, see Translation and localization.

Upgrade and release management

The ServiceNow AI Platform delivers regular releases on a predictable cadence, with automated testing tools and upgrade options that keep your operations running through every update.

Ecosystem and marketplace

Extend the platform through the ServiceNow Store, where partner-built applications and integrations are available for deployment. A robust partner ecosystem means solutions exist for many industries, use cases, and technology environments.

Subscription Management

Subscription Management provides full visibility into active subscriptions and license consumption from a single location. Use it to right-size your deployment, add capabilities as needs evolve, and maintain budget control across your organization.

Integration

The Workflow Data Fabric enables connections between instances and external services on the ServiceNow AI Platform. Both unidirectional and bidirectional data integrations are available, along with email-based connection, and various other methods and technologies, all through the platform's MID Server system. Connection and automation occur in one place, with full instance and data replication, importing and exporting, and prebuilt processes to address various tasks and third-party services.

AI and automation capabilities

The ServiceNow AI Platform delivers AI experiences and intelligent AI Agents that go beyond recommendations to take action—running workflows across enterprise systems, all governed by your business rules and policies. Now Assist, generative AI, and flexible large language model (LLM) integration bring AI capabilities across every department.

The platform supports prompt customization and prebuilt AI experiences, with full visibility through AI Control Tower (legacy). Customize and extend capabilities with AI Agent Fabric to fit your organization's needs.

Platform agentic workflows

Prebuilt platform agentic workflows consisting of AI Agents help organizations accelerate AI-powered automation while maintaining governance, orchestration, and business rules. These out-of-the-box workflows address common enterprise tasks, enabling teams to reduce manual effort, shorten time to value, and scale adoption within a governed framework. Organizations can copy, extend, and customize these workflows to fit their unique processes and business needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security and compliance

The ServiceNow AI Platform protects enterprise data with end-to-end encryption, role-based access controls, and data residency options that meet global regulatory requirements. Check your entitlements to determine whether you have access to specific security and compliance features.

For more information, see Secure your instance.

Identity and access management

Secure every entry point with SSO, SAML, OAuth, and multi-factor authentication, combined with granular role-based access controls. The platform integrates with your existing identity providers so the right people have the right access across every instance and application.

For more information, see Identity and Access Management.

Workflow automation and Playbooks

The ServiceNow AI Platform executes work through a combination of structured workflows and agentic workflows. Playbooks provide stage-gated processes, decision logic, SLA enforcement, and audit trails that ensure AI agents act within the boundaries your organization defines. Agentic workflows break down complex, unpredictable tasks into manageable steps assigned to specialized AI agents. Together, Playbooks and agentic workflows support deterministic process execution and adaptive, context-driven agent action across every department.

Developer and low-code/no-code tooling

Build and extend applications faster with Build Agent, App Engine Studio, Workflow Studio, Integration Hub, and Playbooks, and more. The platform supports server-side JavaScript development, integration configuration, drag-and-drop workflow creation, user interface design, and AI-assisted application building. Create custom workflows, automate processes, and ship production-ready applications without sacrificing governance or control.

For more information, see App development, agentic development, and low-code.

Knowledge Management

The Knowledge Management capability on the ServiceNow AI Platform provides AI agents with continuous access to verified, current, and structured content across every department. The Knowledge Center closes gaps identified from live incident and case patterns, detects duplicates before they affect agent decisions, and continuously optimizes content for accuracy and accessibility. With knowledge, data, and agentic workflows running on a single unified model, the knowledge layer that governs agent actions scales as AI agents scale across the enterprise.

Platform Analytics and Process Mining

Distribute and consume Platform Analytics through data visualizations and dashboards with optional filters. Explore KPIs and receive insights into significant events in the data. Use dashboards to create a visual story with Platform Analytics data that you can share with multiple users. Use data visualizations based on table, indicator, or other data in dashboards across the Analytics Overview. Administrators can use Usage Insights to get information on user engagement with both mobile and web applications, including user population, retention, and behavior.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process Mining helps you discover ways to streamline your business, find bottlenecks and deviations in workflows, and filter and compare processes. Process Mining identifies where new agentic opportunities exist, measures the impact of agents already deployed, and connects improvement opportunities directly to action on the same platform.

For more information, see Platform Analytics and Process Mining.

Mobile

Your employees can find answers and get things done across IT, HR, facilities, and other departments—all from a mobile application powered by the ServiceNow AI Platform. The platform provides native mobile for the enterprise, delivering tailored experiences for routine employee needs from a single mobile app.

Take advantage of ready-to-use workflows for common use cases with direct connection to data. Simplify development with low-code mobile developer tools that create and customize apps for both iOS and Android. Brand your application completely—add your own logo, color theme, splash screen, and more.

For more information, see Mobile Platform.

Basic system configuration

Basic system configuration encompasses changes made to the platform as well as supporting applications. These changes can affect global settings as well as settings for particular applications.

Learn about these ServiceNow AI Platform basic system components and settings:

- ServiceNow plugins
- Find components installed with an application
- Available system properties
- Query join and complexity size limits
- Web proxy

Experimentation framework

The experimentation framework enables ServiceNow to test and release new features using A/B testing in order to collect feedback to improve product experiences.

Each experiment includes information about its scope and which feature variants are being tested. Only single customer instances or Gen AI Innovation Program participants have early access to new innovations via the experimentation framework.

The framework captures only aggregated usage metrics (such as feature usage, performance) to assess the impact of a feature. No personally identifiable information is collected, and all data handling aligns with our standard privacy and security practices.

You have full transparency and control over your instance's use of the experimentation framework. You can view active experiments by navigating to **All** > **Experimentation Framework** > **All Experiments**. You can also choose to opt out of individual experiments or turn off the framework entirely.

Opt out of an individual experiment

Opt out of a specific experiment while remaining enrolled in others.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Experimentation Framework** > **All Experiments**.
2. Select the experiment that you want to opt out of.
3. Select **Opt Out**.
4. Select **OK**.

Note: You can opt back in at any time.

Turn off experimentation framework

Turn off experimentation framework to opt out of all current and future experiments.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Experimentation Framework** > **All Experiments**.
2. Select **Disable Experimentation Framework**.
3. Select **OK**.

Note: You can re-enable experimentation framework at any time.

Feature Preview Program

The Feature Preview Program provides access to pre-release capabilities on your instance. You can activate, test, and provide feedback on individual features before they are generally available.

When a pre-release feature is added to your instance, you can access the Feature Preview Program to review feature details, activate the feature for testing, and provide feedback. You're fully in control of the feature preview experience and can turn features on or off at any time.The program displays all available pre-release features with information about what each feature includes and how it works. Your feedback on pre-release features helps identify issues, and refine functionality.

Each feature is made available on a per-feature basis, you must explicitly activate each feature you want to use, and you can deactivate any feature at any time. You can activate or deactivate pre-release features. For each feature, you can review the following information:

- Feature name
- Feature overview describing what the feature does
- Details about what is included in the feature

How the program works

Before a feature appears on your Feature Preview Program page, the product team that owns the feature works directly with a targeted set of customers to confirm their participation. Once your organization agrees to participate, the feature is released on your instance and is visible on the Feature Preview Program page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a new pre-release feature is added to your instance, a toggle notification appears to alert you. Selecting the notification takes you to the Feature Preview Program page, where you can review available features and choose which ones to activate.

Activation is per-feature. When you activate a feature, you provide consent for that specific feature only. Activating one feature does not affect other features listed on the page.

What to consider before activating a feature

Before you activate a pre-release feature, review the following considerations.

- **Environment:** Features activate directly on your production instance. Review the feature details carefully and confirm that activation is appropriate for your environment before proceeding.
- **Support:** If you experience issues with a pre-release feature, you can contact the product team directly through the Feature Preview Program page.
- **Access control:** The admin role is required to activate features. Review who in your organization has the authority to accept the consent agreement on behalf of your organization. If you're unsure, consult your platform owner or legal team before proceeding.
- **Reversibility:** You can deactivate a feature at any time. However, deactivating a feature disables its functionality but does not remove all artifacts it installed on your instance.

Accessing the Feature Preview Program

You can access the Feature Preview Program in the following ways:

Notification

When a pre-release feature is added to your instance, you receive a notification indicating that a pre-release capability is available. Select the notification to open the Feature Preview Program page.

All menu

Navigate to **All** > **Feature Preview Program**.

Providing feedback

Feedback is an important part of the Feature Preview Program. When you test pre-release features, your feedback helps improve the feature before it reaches general availability. You can provide feedback on feature functionality, usability, and performance. Your feedback helps identify issues, refine features, and confirm that the features meet customer needs when they are released.

You can activate or deactivate pre-release features from this page. After activating and testing a feature, provide feedback to the product team.

Activate a pre-release feature

Activate a pre-release feature on the instance so your users can try it out and provide feedback to the product team.

Before you begin

Before activating a feature, review the feature details, including its description, any dependencies, and the support terms that apply to pre-release features.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you activate a pre-release feature, you can test the feature and provide feedback before it reaches general availability. Accept the terms and conditions before activating the feature.

Important:

Features activate directly on your instance. Confirm that activation is appropriate for your environment before proceeding. Activation is per-feature. Activating one feature does not automatically activate others listed on the Feature Preview Program page. You can deactivate any feature at any time after activation.

Procedure

1. Access the Feature Preview Program using one of the following ways:
   - Select the notification when a pre-release capability is added to your instance.
   - Navigate to **All** > **Feature Preview Program**.
   - On the admin page, select **See all pre-release features** from the onboarding modal.

   If you received a notification that a new pre-release feature was added to your instance, you can select the notification to go directly to the Feature Preview Program page.
2. Review the feature details for the pre-release feature to activate.

   The feature detail page includes a description of the feature and information about what it includes.
3. Select **Activate**.
4. Review the terms and conditions.

   The consent agreement applies to this feature only, you're not providing consent for any other features listed in the program.
5. Select the check box to confirm that you have read the terms and conditions.
6. Select **Accept and activate**.

Result

The feature is now activated on your production instance. Your users can now access and try out the feature.

Note: If you have any queries or need clarifications about the pre-release feature, reach out to the product team.

What to do next

After activating a feature, you can contact the product team directly to share feedback.

If you decide to stop using the feature, you can deactivate it at any time. For more information, see Deactivate a pre-release feature.

Deactivate a pre-release feature

Deactivate a pre-release feature if it is not working as expected or if you no longer need the feature.

Before you begin

Role required: admin

You can deactivate a pre-release feature at any time. When you deactivate a feature, the functionality is removed from your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Deactivating a feature disables the feature's functionality on your instance. However, deactivating is not the same as uninstalling. When you deactivate a feature, artifacts that were installed as part of the feature may remain on your instance.

Important:

Residual artifacts left by a deactivated feature don't affect your instance's functionality, but they aren't automatically removed. After deactivating, review your instance for any artifacts that require manual cleanup.

Procedure

1. Navigate to **All** > **Feature Preview Program**.
2. Locate the active feature you want to deactivate.
3. Select **Deactivate**.

Result

The pre-release feature is deactivated and removed from your instance.

What to do next

After deactivating a feature, review your instance for any residual artifacts that the feature installed.

If you have questions or need assistance after deactivating a feature, contact the product team.

ServiceNow plugins

Plugins are software components that provide features and functionalities within a ServiceNow instance.

Differences between plugins and applications

Plugins and applications are separate components on the ServiceNow AI Platform.

- A plugin adds features to installed applications and extends functionality on the ServiceNow AI Platform. For additional details about plugins, see Plugin frequently asked questions for ServiceNow instances [KB0716626].
- An application is a standalone piece of code that implements a collection of features on the ServiceNow AI Platform. You can install applications from the ServiceNow Store or create your own applications.

Activating plugins

All plugins are provided by ServiceNow, but some plugins are activated differently.

- A set of plugins are activated on your instance by default. You can activate additional plugins on your instance depending on your business needs. For details, see Activate a plugin.
- Other plugins require activation by ServiceNow personnel. To request activation, follow the steps in Request a plugin.

There are some plugins that you can't activate or upgrade on your instance and the button is greyed out. This situation can happen in the following cases:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The plugin requires a subscription that you haven't purchased. To purchase a subscription, contact your ServiceNow account manager.
  - Some features are not included in the ServiceNow AI Platform and require a separate subscription. To purchase a subscription or to find plugin costs, contact the account manager in your company.
  - When you purchase a subscription, certain plugins are activated automatically. If a paid plugin isn't activated automatically, you can manually activate it from the All Applications list in your instance. If the plugin doesn't appear in the instance, submit a request via the Now Support Service Catalog.
  - You can't activate a plugin in your production instance. However, you can test a plugin by activating it in a non-production instance. This includes plugins that are associated with a for-fee subscription. When you're ready to activate the plugin in your production instance, request the plugin from Now Support.
- The plugin depends on other plugins being activated.
  - When you activate a plugin with dependent plugins, the system notifies you of the dependencies before it completes the activation. If you opt to continue with activation, the system automatically activates all the plugins required.
  - In some cases, the plugin works, but certain features that don't apply to your system aren't installed. When you ask to activate a plugin in this category, the system notifies you of the dependencies before it completes the activation. If you opt to continue, the system activates the requested plugin but doesn't include the features that depend on other plugins.
- The plugin is already activated on your instance.
  - To determine if a plugin is already activated, see Plugin Activation Status [KB0678767].
  - After a plugin is activated, you can't disable or deactivate it. If needed, you can hide the functionality. You should thoroughly test, in a non-production instance, the features that are installed when you activate the plugin before using them in a production instance.

After a plugin is activated, you cannot disable or deactivate it. You should thoroughly test, in a non-production instance, the specific features and functionalities that are installed when you activate the plugin before using them in a production instance. See Uninstall a ServiceNow plugin [KB0716414].

- If necessary, you can hide or disable the functionality by restricting access through the use of roles and ACLs.
- Some plugins support rollback contexts. For details on using rollback contexts, see Roll back and delete recovery.

A warning message appears if the alter table or create table operation fails when you activate or upgrade a plugin. Contact Customer Service and Support for help with processing any skipped tables.

Personal developer instances

You can test a plugin on your personal developer instance (PDI) before launching it in a production instance. If a plugin isn't active by default on a PDI, you can activate the plugin without requesting or purchasing it.

To activate a plugin on a PDI, use the All Applications page on your instance. If the plugin isn't available on the All Applications page, activate it from the . For more information, see Activate a plugin on a personal developer instance.

Note: Some plugins aren't available for activation on PDIs.

List of plugins (Brazil)

Activate a plugin

You can activate most plugins to expand features and functionalities in the ServiceNow AI Platform.

Before you begin

Role required: admin.

Note: Before requesting or activating a plugin, check whether the plugin has already been activated on your instance. For details on how to check a plugin activation status, see the Plugin Activation Status [KB0678767] article in the Now Support knowledge base.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate a plugin on a personal developer instance

You can test a plugin on your personal developer instance (PDI) before launching it in a production instance.

Before you begin

Request a PDI on the .

Role required: admin

About this task

If a plugin isn't active by default on a PDI, you can activate the plugin without requesting or purchasing it.

To activate a plugin on a PDI, use the All Applications page on your instance. If the plugin isn't available on the All Applications page, activate it from the .

Note: Some plugins aren't available for activation on PDIs.

Procedure

Activate the plugin from the All Applications page or the Developer Site.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activation method	Procedure
All Applications page	In your PDI, navigate to **System Applications** > **All Available Applications** > **All**. Find the plugin and then activate it. For more information on using the All Applications page, see Activate a plugin.
Developer Site	**a.** Sign in to the . **b.** On the home page, select **Manage my instance**. **c.** In the **Plugins for your instance** section, filter for plugins that are not activated. **d.** Hover over the plugin you want to install, and select one of the activation options.

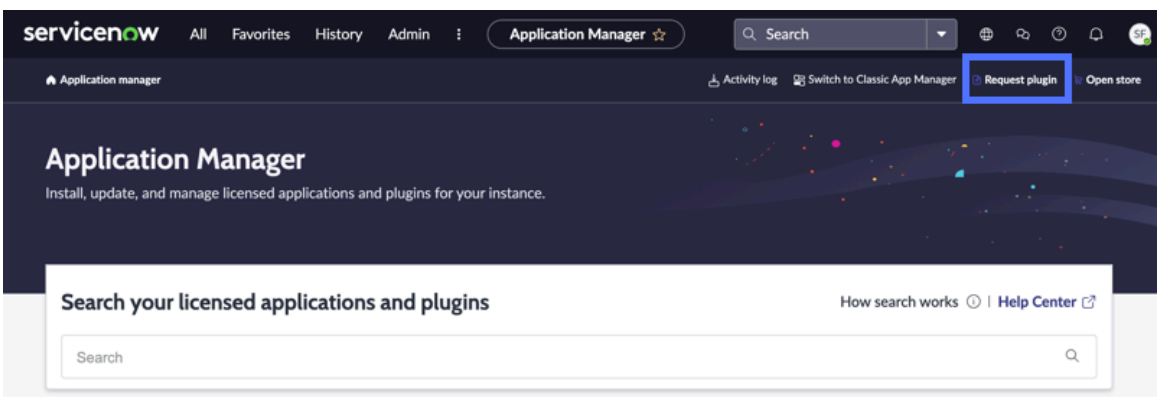
Request a plugin

If a plugin does not appear in the Application Manager, you cannot activate it yourself. Request activation of the plugin by ServiceNow personnel.

Before you begin

Note: Before requesting or activating a plugin, check whether the plugin has already been activated on your instance. For details on how to check a plugin activation status, see the Plugin Activation Status [KB0678767] article in the Now Support knowledge base.

Role required: admin



About this task

There are two ways to request a plugin:

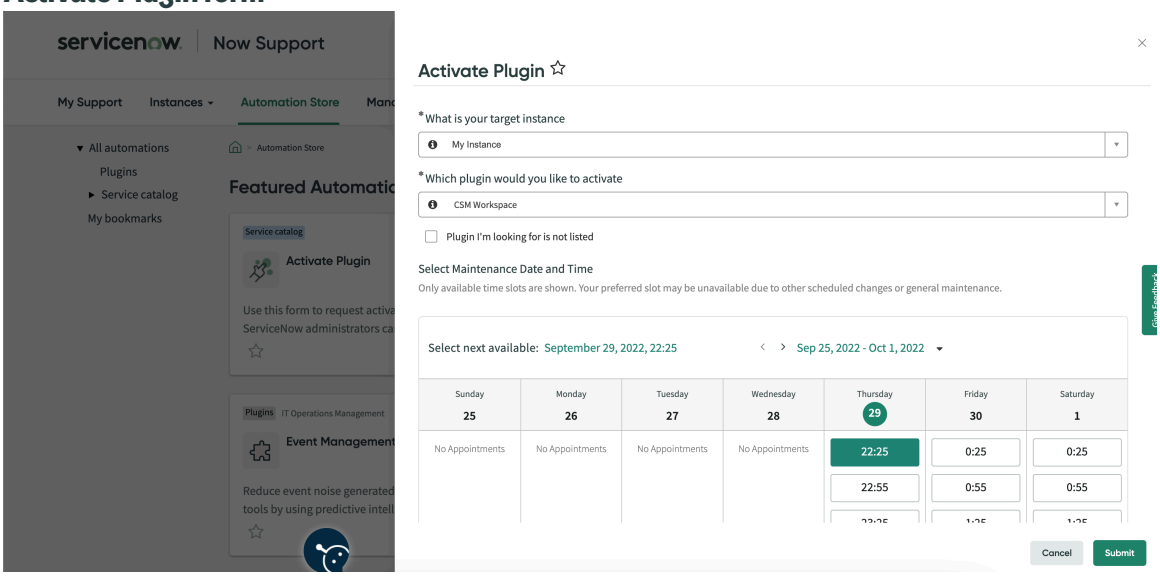
- Access the Now Support Service Catalog on Now Support. Open the Activate Plugin page using this link: Activate Plugin.
- Access the Now Support Service Catalog through the Application Manager on your instance by following the procedure.

Procedure

1. Navigate to **Admin** > **Application Manager**.
2. From the Application Manager, select **Request Plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the **Activate Plugin** form on Now Support, provide the following information.



Activate Plugin request form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/ Comments** field.

Example

For example, see the following request to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Available plugins and applications

You can view all plugins available to you in the Application Manager if you have the admin role.

Application Manager provides admins the ability to install, update, and manage licensed applications and plugins for their instance.

If a plugin does not appear within the Application Manager, it may require activation by ServiceNow personnel. Request these plugins through the Now Support Customer Service System instead of activating them yourself.

- For a list of all new and changed plugins for the Brazil release, see Plugin information for all Brazil features and products.
- For steps on activating a plugin yourself, see Activate a plugin.
- For steps on requesting a plugin that you cannot activate yourself, see Request a plugin.
- For steps on installing a ServiceNow Store application, see Install a ServiceNow Store application.

Find components installed with an application

Activating a plugin installs an application on your instance. Each application consists of components such as tables, user roles, and scheduled jobs. To view all components that are installed with an application, see the Application Files table.

Before you begin

- The application plugin must be activated.
- Roles required: admin or the application admin role

> **Note:** The application admin role is only required for applications that use the Application administration feature. For example, Vulnerability Response.

About this task

In the Application Files table, look up the components that are installed with the plugin for the application. If the application comprises multiple plugins, look up each plugin individually.

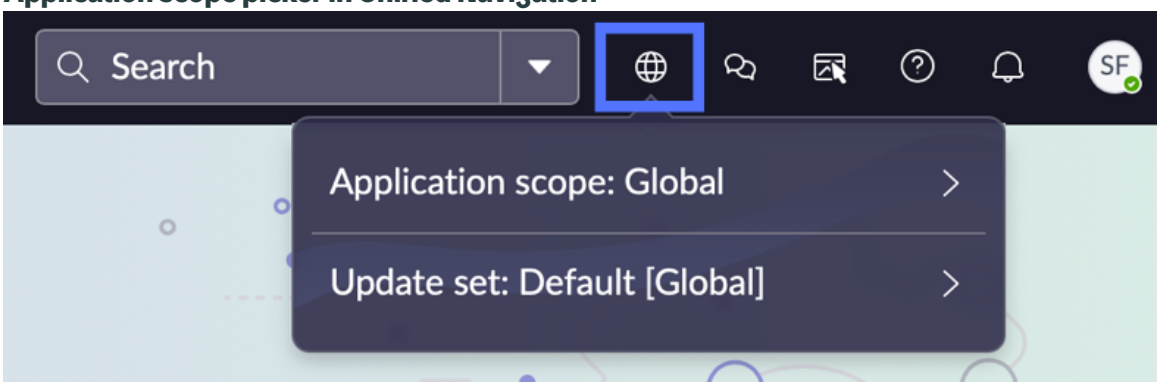
Procedure

1. In the navigation filter, enter: `sys_metadata.list`
   The list of Application Files records is displayed.
2. Click the personalize list icon ( ), and add the **Package** column to the list.
3. Filter the list with these conditions to show only the components for the plugin:
   [Package] [is] [*<plugin name>* **]**
4. In the **Class** column heading, click the menu icon ( ) and select **Group by Class**.
5. Select the class of information that you want to view.

Select an application from the application picker

Use the application picker to select the application scope to which any new records and updates apply.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Before you begin
Role required: delegated_developer or admin.

About this task
Application developers must select an application as their current scope context. Any new records become part of this application. The ServiceNow AI Platform also uses the current application scope to determine if the developer can view or make changes to records in other scope contexts.

Procedure

1. In the Unified Navigation menu, select the picker icon( ).
   When your application scope is set to a non-Global scope, the picker icon displays with a red ring ( ).
2. Select **Application scope** to open a list of scopes available to you.

Application scope picker in Unified Navigation

3. **Optional:** When admins change the application scope, the system automatically switches the current update set to be the application's default update set.
   Admins can modify this by selecting **Update set** and choosing a different one from the list.

What to do next
The application picker is part of the Next Experience picker. For more information, see Exploring Next Experience pickers.

For more information about application scoping, see Application scope.

For more information about selecting update sets, see Select the current update set in Unified Navigation.

Available system properties

Some properties are available on a system properties form, but some lesser-used properties are available only from the System Property [sys_properties] table. Sometimes, the property does not exist in a base instance, but can be added if you change the value.

Note: The Instance Security Hardening Settings content contains detailed descriptions, and compliance values, for the security-related system properties and plugins in the ServiceNow AI Platform. To learn more about each of these properties, see Instance Security Hardening Settings.

cdu.record.watcher.timeout

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Maximum waiting period for the Cloud Discovery schedule configuration wizard to stop watching the record watchers while validating account, member account Discovery, and logical database Discovery.

- Type: integer
- Default value: 120,000 milliseconds
- Location: System properties

com.cmdb.baseline.max_changes

Maximum number of changes and relationships for a CI that can appear in the baseline diff for the CI.

- Type: integer
- Default value: 100
- Location: **Configuration** > **CMDB Properties** > **Baseline Properties**

com.glide.acl_check_all_filter_on_new

Enforce ACL checks when a user creates a new record from a list in ui16/workspace.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.attachment.max_size

Sets the maximum file attachment size in megabytes. An empty value in this field allows attachments up to a maximum of 1 KB.

- Type: integer
- Default value: 1024
- Location: **System Properties** > **Security**

com.glide.cs.collab.event_queue.enabled

Switch to enable the event queue for badge count calculation and publish.

Note: If you set com.glide.cs.collab.event_queue.enabled to **true**, you must manually enable the Sidebar notification events process schedule record ("sys_trigger") by changing its *trigger_type* value.

com.glide.cs.collab.event_queue.threshold

Calculates the unread count for each member of a chat. If the chat has too many members, this responder thread will be slow so offload this to the event queue. Default value: 50.

com.glide.cs.collab.notify_all_members

If Sidebar is unable to deliver messages to a Microsoft Teams user, this property determines who a "message not sent" notification is sent to. If this property is **true**, then a notification is sent to all Sidebar users in the discussion. If **false**, then the notification is sent only to the sender of the message.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

com.glide.cs.collab.teams_outage_timer

Length of time the "message not sent" notification (see com.glide.cs.collab.notify_all_members) displays.

- Type: integer
- Default value: 5
- Location: System Property [sys_properties] table

com.glide.cs.conversation_history_cross_channel.enabled

Enables (**true**) or disables (**false**) the display of cross-channel conversation history in the chat panel when an agent is having a conversation with a requester.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.cs.field.boolean.show.choice_picker

Enables (**false**) or disables (**true**) a Boolean option to requesters whenever a dynamic choice node only has a single value associated. When set to **true**, the dynamic choice node displays to requesters with only the single value selection option and no Boolean option.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

com.glide.cs.gen_ai.enable_mid_topic_ai_search

Enables or disables AI Search result in Mid Topic Discovery using this flag.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.glide.cs.instance_uri_override

Enables Virtual Agent to use this URL value to override the instance URL for link generation. The value entered must be a direct, full URL such as http://www.example.com to work correctly.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

com.glide.cs.notification.create_llm_actions_after_topic_migration

Enables (`true`) or disables (`false`) whether actions for Virtual Agent notifications and Proactive Triggers are created after LLM topics are published during the NLU to LLM topic migration workflow.

- Type: true | false
- Default: true
- Location: System Property [sys_properties] table

com.glide.cs.proactive_trigger.create_llm_actions_after_topic_migration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enables (true) or disables (false) whether actions for Proactive Triggers are created after LLM topics are published during the NLU to LLM topic migration workflow.

- Type: true | false
- Default: true
- Location: System Property [sys_properties] table

com.glide.csp.self_script_src_svg

WHen enabled, prevents malicious file attachments that store cross site scripting (XSS) attacks from running in an instance. For more information, see Set safe content security policy for SVG files.

- Type: true | false
- Default: true
- Location: System Properties [sys_properties] table

com.glide.csv.loader.ignore_non_parseable_lines

Enables (`true`) or disables (`false`) ignoring one or more lines (rows) in an import set that contains bad data, such as a row that is missing a column of data.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.csv.loader.max_errors_allowed

Sets the maximum number of lines (rows) that an import can ignore before failing. If the import succeeds, the import lists the number of rows ignored due to errors.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

com.glide.email.max_read

Specifies the maximum number of emails a POP3 reader should process concurrently.

- Type: integer
- Default value: 20
- Location: Add the property to the System Property [sys_properties] table.

com.glide.event_handler.CollabNotificationEventHandler

Specifies the event handler for the sidebar_notification queue.

com.glide.event_manager.sidebar_notification.claim_limit

Specifies the number of sidebar_notification events the job on each node polls each time.

com.glide.interaction.autocreate_relationships

Specifies whether auto-logging of records in the interaction_related_record table is turned on or off during active interactions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.glide.loader.verify_target_field_size

Enables dynamic resizing of import set fields. With the default setting of **false**, up to 20 records of the source data are sampled to determine the import set field length. If the field is empty in all the sampled records, the default length of 40 is used. Any data loaded that exceeds the import set table field length is truncated. Set this property to **true** to allow any import set field to increase the column size by 100 to match the length of the data. For example, if the incoming source data has a length of 60, the system sets the length of the column to 160.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.par.coreui_single_migration.enabled

Allows users with the sys_admin role to hide the banner on Core UI dashboards that enables dashboard owners to migrate their dashboards to Next Experience.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.glide.par.coreui.migration.admin_redirection.enabled

Migrated responsive dashboards automatically redirect to the Platform Analytics experience library. Set this property to specify redirection for sys_admins. Set the value to false to enable users with the sys_admin role to open responsive dashboards in the Core UI experience. If Active Experience=Next for dashboards in the bridging tables, redirection is to the migrated version of the dashboard.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.glide.par.pae.drilldown_to_core_ui

Applies only to Platform Analytics experience:

When true, **Go to data** chart interactions for visualizations of tables open the Core UI list of table records. Redirections in general that open lists or charts open Core UI lists and charts.

When false, **Go to data** chart interactions for visualizations of tables open the Platform Analytics list of table records. Redirections in general that open lists or charts open Platform Analytics lists and charts.

For more information, see Chart interactions in a data visualization.

- Type: true | false (Boolean)
- Default value: true
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

com.glide.script.fencing.secure_child_tables

Controls whether to apply cross-scope access rules when querying application-administered child tables with `GlideRecord` from a parent table. When false, administrators can view child table data from the parent table, even if the child table scoping configuration is set to avoid this. If you set this property to true, you can change it back to false only by contacting Customer Service and Support.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.script.scoped_evaluator.allow_dynamic_cross_scope_eval_scoped_administration

Controls whether to allow scripts in applications with Scoped Administration enabled to be modified and executed by scripts in the global scope. When false, scripts in applications with Scoped Administration can't be modified or executed by scripts in the global scope.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.scripting.module.use_module_sandbox

Separates the JavaScript module runtime environment from scripts. Setting this property to false may improve performance.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.soap.include_non_db_fields

Controls whether non-database fields, such as the sys_tags field, are included in WSDLs and SOAP responses (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.glide.ssl.read.timeout

Sets the time-out value in seconds for SSL connections during read operations. Typically, this setting is used as part of LDAPS. If you enter timeout values for both this system property and the LDAP **Read timeout** field, the lowest timeout value takes precedence.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

com.glide.ui.virtual_host

Specifies Guided Tour Designer callout icons. When set, callout icons appear in the designer instead of letters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: String
- Value: pa,html,script,include scripts,glide,custprefix,_sn
- Location: System Property [sys_properties] table

com.glideapp.canvas

Enables (**true**) or disables (**false**) responsive canvas for dashboards. When enabled, all new dashboards use responsive canvas.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.apps.publish.include_inactive_choices

Specifies whether choice table selections marked as inactive (`sys_choice inactive attribute = true`) should be included when publishing an application (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.apps.publish.maxrows

Defines the maximum number of data records to include when publishing an application.

- Type: integer
- Default value: 1,000
- Location: System Property [sys_properties] table

com.snc.assessment.decision_matrix_filter_max_entries

Defines the maximum number of items to show for a decision matrix field filter.

- Type: integer
- Default value: 1,000
- Location: System Property [sys_properties] table

com.snc.assessment.signature_authentication

Requires authentication for a user signature.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.dd.publish_to_app_repo_enabled

Enables (**true**) or disables (**false**) display of the **Publish To App Repo** permission in Manage Developers.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

com.snc.dd.publish_to_app_store_enabled

Enables (**true**) or disables (**false**) display of the **Publish To App Store** permission in Manage Developers.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.dd.publish_to_update_set_enabled

Enables (**true**) or disables (**false**) display of the **Publish To Update Set** permission in Manage Developers.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

com.snc.dd.upgrade_app_enabled

Enables (**true**) or disables (**false**) display of the **Update App** permission in Manage Developers.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.hr.core.impersonateCheck

Allows a user to have identical permissions/access as the person they are impersonating. If **true**, access and restrictions apply when impersonating another user. If **false**, the user has identical permissions/access as the person they are impersonating.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.iam.log_level

Logging level for the business rule MapUpstreamImpactedCI. Debug is the most detailed option with full trace of how the Impacted CI List is calculated. Error is the minimal logging option with only severe errors being logged.

- Type: string
- Default value: info
- Possible values: debug, info, error
- Location: System Property [sys_properties] table

com.snc.on_call_rotation.reminders.showtz

Specifies whether to show the user time zone (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

com.snc.pa.activate_kpi_signals

Create this property and set to 'false' to deactivate the KPI Signals feature.

- Type: Boolean true | false
- Default value: Does not exist but is treated as 'true'
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.correlation.enable_insights

Enables the generation of key contributor insight cards.

- Type: true/false (Boolean)
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.dc.batch_score_insert

When true, Performance Analytics data collection jobs insert indicator scores to the database in batches. When false, indicator scores are inserted one by one. Even when true, batch score insertion is performed only as a fallback when nested data collection (com.snc.pa.dc.nested_collection) has been disabled.

- Type: Boolean true | false
- Default value: true
- Location: System Properties [sys_properties] table

com.snc.pa.dc.flush_snapshot_count

Maximum number of Performance Analytics snapshots to store in the memory during data collection. When this number is reached, the snapshots are offloaded to the database, freeing memory.

- Type: integer
- Default value: 1000
- Location: System Properties [sys_properties] table

com.snc.pa.dc.nested_collection

Activates a hierarchical approach to score collection, where Indicator > level 1 breakdown > level 2 breakdown. This approach is more resource efficient than a flat hierarchical approach, which creates redundant objects.

- Type: Boolean true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.dc.max_breakdown_elements_limit

Maximum number of breakdown elements retrieved by data collection for each breakdown source. This property is handled differently depending on whether nested collection is enabled. If nested collection is enabled, only those elements that have non-null scores count against this limit. If nested collection is disabled, such as under optimized data collection, all elements on the breakdown source count against the limit. When a breakdown source exceeds this limit, breakdown scores are not collected from that source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 10000
- Location: System Property [sys_properties] table

com.snc.pa.dc.max_error_count

Maximum errors that may occur before data collection is stopped.

- Type: integer
- Default value: 500
- Location: System Property [sys_properties] table

com.snc.pa.dc.max_records

Maximum number of records that are stored during a data collection.

- Type: integer
- Default value: 5000
- Location: System Property [sys_properties] table

com.snc.pa.dc.max_row_count_indicator_source

Maximum number of rows that are allowed to be fetched from an indicator source. This property only applies to jobs that do not use Optimized data collection.

- Type: integer
- Default value: 50000
- Location: System Property [sys_properties] table

com.snc.pa.dc.hsql.max_row_count_indicator_source

Maximum number of rows that are allowed to be fetched from an Indicator Source. This property only applies to jobs that use Optimized data collection.

- Type: integer
- Default value: 1 million
- Location: System Property [sys_properties] table

com.snc.pa.dc.script_timeout

Maximum time in seconds that a script is allowed to run during a data collection cycle.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

com.snc.pa.dc.use_hashcode_for_distinct

Sets whether Count Distinct aggregations are stored as separate values in memory or as a HashCode. When the value of this property is True, a HashCode is used, which consumes less memory than storing individual values.

- Type: Boolean true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

com.snc.pa.insight.max_days_in_past

By default, retrieve insights created within the number of days in the past that this property specifies.

- Type: Integer
- Default value: 14
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.insights.query_limit

Limit the number of rows when querying the par_computed_insight table in the GET response to the Insights API.

- Type: Integer
- Default value: 1000
- Location: The System Properties [sys_properties] table

com.snc.pa.target_batch_operation_limit

Applies only to KPI Details: The maximum number of targets that can be inserted or updated in one bulk action on the Targets Configuration page.

- Type: integer
- Default value: 100
- Location: System Property [sys_properties] table

com.snc.pa.dc.script.use.sandbox

Controls whether Performance Analytics data collection scripts use the sandbox. Only users with the security_admin role can modify this property.

> **Important:** Exercise caution when turning off this property. When set to false, unauthorized users may be able to execute malicious actions on your instance.

- Type: Boolean true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.pa.formula_indicator_valid_breakdown

Controls whether users can apply a breakdown to a formula indicator when not all contributing indicators in the formula use that breakdown. When true, all contributing indicators must use the formula. When false, a breakdown can be applied when at least one of the contributing indicators uses it.

- Type: Boolean true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.pa.xmr.processes.limit

The maximum number of KPI Signals Configurations (pa_xmr_processes) that can be evaluated by the KPI Signals Insight Job. After this number of processes have been evaluated, the remaining processes are ignored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: Integer
- Default: 1000
- Maximum: 10,000

com.snc.pdf.whitelisted_urls

Stores a list of URLs allowed to be rendered in a PDF generated by the PDFGenerationAPI - Scoped, Global. This list is only verified if the glide.pdf.url.whitelisting.enabled property is set to true.

- Type: string
- Location: System Property [sys_properties] table

com.snc.project.default_schedule

Stores the sys_id of the default schedule attached to projects.

- Type: string
- Location: System Property [sys_properties] table

com.snc.project.loglevel

Automatically resubmits timed-out Ajax requests.

- Type: choice list
- Default value: 0 (debugging disabled)
- Location: System Property [sys_properties] table

com.snc.project.wbs_gantt

Automatically resubmits timed-out Ajax requests.

- Type: true | false
- Default value: false
- Location: **Project** > **Administration** > **Properties**

com.snc.task.associate_ci

List of all task types where user wants to associate CIs using a List system.

- Type: string
- Default: incident,problem,change_request
- Location: System Property [sys_properties] table

com.snc.task.refresh_impacted_services

List of all task types where **Refresh Impacted Services** UI action is enabled.

- Type: string
- Default value: incident,change_request
- Location: System Property [sys_properties] table

com.snc.time_card.default_rate

(Cost Management plugin) Sets a default hourly rate to use if no labor rate cards apply to the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 50
- Location: System Property [sys_properties] table

com.snc.time_worked.update_task_timer

Enables (**true**) or disables (**false**) updating the task timer value based on changes to the task time worked records. Uses the Update task time business rule.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

csm_auto_account_domain_generation

When new account in Customer Service application is created, domain is created and placed under TOP domain. If parent field on account form is populated, and new record is inserted, it creates that account as a subdomain of the parent.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

css.assessment.caption.background.color

Sets the background color of the caption on assessment and survey questionnaires.

- Type: color
- Default value: #eee
- Location:
  - **Assessments** > **Admin** > **Assessment Properties**
  - **Survey Management** > **Administration** > **Properties**

css.assessment.caption.font.color

Sets the font color of the caption text on assessment and survey questionnaires.

- Type: color
- Default value: #ffffff
- Location:
  - **Assessments** > **Admin** > **Assessment Properties**
  - **Survey Management** > **Administration** > **Properties**

css.assessment.question.header.background.color

Sets the background color of question headers on assessment and survey questionnaires.

- Type: color
- Default value: #767676
- Location:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Assessments** > **Admin** > **Assessment Properties**
- **Survey Management** > **Administration** > **Properties**

css.$nav-highlight-main

Sets the color for the navigation expanded items highlight background.

- Type: color
- Default Value: #3D4853
- Location: System Property [sys_properties] table

css.$nav-hr-color

Sets the color for the navigation separator.

- Type: color
- Default Value: #303A46
- Location: System Property [sys_properties] table

css.$navpage-header-bg

Sets the color for the header background.

- Type: color
- Default Value: #303A46
- Location: System Property [sys_properties] table

css.$navpage-header-color

Sets the color for the banner text.

- Type: color
- Default Value: #FFFFFF
- Location: System Property [sys_properties] table

css.$navpage-nav-bg-sub

Sets the color for the background for navigator and sidebars.

- Type: color
- Default Value: #455464
- Location: System Property [sys_properties] table

css.$navpage-nav-border

Sets the color for the border for Core UI.

- Type: color
- Default Value: #DDD
- Location: System Property [sys_properties] table

css.$navpage-nav-color-sub

Sets the color for module text in Core UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: color
- Default Value: #BEC1C6
- Location: System Property [sys_properties] table

css.$navpage-nav-selected-bg

Sets the color for navigator selected tab background.

- Type: color
- Default Value: #4B545F
- Location: System Property [sys_properties] table

css.$navpage-nav-selected-color

Sets the color for the currently selected navigation tab icon color for Core UI.

- Type: color
- Default Value: #FFFFFF
- Location: System Property [sys_properties] table

css.tablet.gradient.start

Start color of the gradient for the tablet UI header.

- Type: color
- Default value: #666
- Location: **System Properties** > **Tablet UI Properties**

css.tablet.gradient.end

End color of the gradient for the tablet UI header.

- Type: color
- Default value: #111
- Location: **System Properties** > **Tablet UI Properties**

css.tablet.headerfooter.text.color

Color of the text and icons in the tablet UI header and footer.

- Type: color
- Default value: #ffffff
- Location: **System Properties** > **Tablet UI Properties**

glide.activity.last_viewed_timestamp.local_storage_limit

Specify the maximum number of last viewed timestamps to be stored in local storage.

- Type: integer
- Default value: 1000
- Location: System Property [sys_properties] table

glide.activity.last_viewed_timestamp.local_storage_retention_days

Specify the number of days for which the last viewed timestamps data should be retained in local storage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

glide.allow.new.cert_follow_on_task

Allow Desired State audit to create a new follow-on task for the same failure at each audit run. Applies only to audits that aren't scripted.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.amb.session.logout.overlay.style

Specifies a cascading style sheet (css) that defines an overlay. The overlay masks all onscreen data on timeout, and the login screen appears on top of the overlay.

Limited to core ServiceNow AI Platform functions, not applications.

- Type: string

  Example: `background-color: #000; opacity: 0.5`

- Default value: empty (no overlay)
- Location: System Property [sys_properties] table

glide.analytics.cache.enabled

When true, caching capability is turned on for data visualizations and Platform Analytics dashboards. Caching still needs to be turned on for individual dashboard and data visualizations in UI Builder and the inline dashboard editor, respectively.

- Type: true | false (Boolean)
- Default value: true
- Location: System property [sys_properties] table

glide.analytics.cache.enable_dashboard_default

When true, caching is enabled by default on dashboards newly created in the inline editor.

- Type: true | false (Boolean)
- Default: false
- Location: System property [sys_properties] table

glide.analytics.cache.expiration.age.in.seconds

Value in seconds of the expiration_time field in analytics cache records. Applies only when glide.analytics.cache.enabled is true.

- Type: integer
- Default value: 86400 (24 hours)
- Minimum value: 3600 (1 hour)
- Location: System property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.analytics.cache.dashboard_default_value

Default expiration time in hours for caches on dashboards created in the inline editor.

- Type: choice
- Choices: 1, 2, 4, 8, 12, 24 (hours)
- Default value: 24
- Location: System property [sys_properties] table

glide.analytics.cache.prefetch.max_refresh_counter

Number of times a cache entry can be re-fetched after expiring.

- Type: integer
- Default value: 10
- Location: System property [sys_properties] table

glide.analytics.cache.prefetch.min_age_in_seconds

Minimum cache entry age that allows cache prefetching, in seconds. Decreasing this value may impact instance performance.

- Type: integer (seconds)
- Default value: 28800 (8 hours)
- Location: System property [sys_properties] table

glide.angular.legacy

When true, enables legacy AngularJS behavior. When false, integrates AngularJS sanitizeUri and $http security patches. If you set this property to false, existing JSONP requests with cross-domain endpoints will fail. You can address this issue in your scripts by doing one of the following:

1. Add the domains of any newly failing requests to the *angular.jsonp.inclusion_list.urls* system property.
2. Opt out of this behavior by changing *angular.jsonp.inclusion_list.enabled* to false.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.apps.hub.current

URL of the team development parent instance.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.attachments.allow_html_in_ics

It governs the handling of .ics files with embedded HTML content. When set to **true**, the system permits the attachment of .ics files containing HTML content. This enhancement provides greater flexibility in managing calendar event attachments,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ensuring that files with HTML content can be included when necessary, while maintaining MIME type integrity.

- Type: text/html
- Default value: null
- Location: System Properties [sys_properties] table

glide.attachment.extensions

Comma-separated list of file extensions that can be attached. No value means that there are no restrictions.

- Type: string
- Default value: none
- Location: **System Properties** > **Security**

glide.attachment.role

Comma-separated list of roles that can create attachments.

- Type: string
- Default value: public
- Location: **System Properties** > **Security**

glide.authenticate.multisso.login_locate.user_field

Identifies a common login identifier.

- Type: string
- Default value: user_name
- Location: Add the property to the System Property [sys_properties] table.

glide.authenticate.sso.saml2.require_signed_authnrequest

Enables the Identity Provider Single sign-on service to receive a signed AuthnRequest.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.banner.image.url

URL used when clicking the banner image.

- Type: string
- Default value: home.do
- Location: System Property [sys_properties] table

glide.banner.image.url_target

Target frame used when clicking the banner image. Use `gsft_main` for the main frame, `_top` to replace the current browser window, `_blank` for a new window or tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: gsft_main
- Location: System Property [sys_properties] table

glide.basicauth.update_last_login_time

Controls whether the Last login and Last login time fields in a user record [sys_user] are updated when an integration user sends a web request to an instance using basic authentication. If true, the Last login and Last login time fields in the user's record are updated with web requests. To turn off this functionality, set this property and the *glide.oauth.update_last_login_time* system property to false.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.bsm.color.affect_neighbors

Color of an affected neighbor node. When a node has a service issue, all nodes that depend on that node are considered affected nodes. In the map, the affected nodes are parents or grandparents of the node with the service issue.

- Type: color
- Default value: Beige
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.font_family

Font family name used in the map text. If you designate a font that is not on the user system, the browser substitutes another font and the text may not render as you expect.

- Type: font name
- Default value: Arial
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.font_size

Font size of the text that appears with a CI node. The default size is magnified for nodes with more connections and reduced for downstream nodes.

- Type: integer
- Default value: 14
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.selection_background_color

Background color of a selected CI node. This color is also used with a node's Highlight Hierarchy option.

- Type: color
- Default value: RoyalBlue
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.selection_text_color

Color of the text that appears under a selected CI node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: color
- Default value: White
- Location: **BSM Map** > **Map Properties**

glide.bsm.map.style.text_color

Color of the text that appears under an unselected CI node.

- Type: color
- Default value: Black
- Location: **BSM Map** > **Map Properties**

glide.bsm.max_levels

Maximum level depth from the root CI that can be initially displayed in business service maps. Level depth is the graph distance between the root CI and a node. This value must be an integer.

- Type: integer (1-10)
- Default value: 5
- Location: **BSM Map** > **Map Properties**

glide.bsm.new_node_color

Color for nodes that became viewable from the last expand operation.

- Type: color
- Default value: PaleGreen
- Location: **BSM Map** > **Map Properties**

glide.bsm.max_nodes

Maximum number of downstream nodes to retrieve from the database for a CI. If more nodes exist in the database, they are not displayed in the map.

- Type: integer
- Default value: 1000
- Location: **BSM Map** > **Map Properties**

glide.bsm.refresh_interval

Seconds between each automatic reloading of troubles and tasks.

- Type: integer
- Default value: 30
- Range of possible values: 1 to 3600
- Location: **BSM Map** > **Map Properties**

glide.bsm.task_threshold

Change the CI glyph color from orange to red when the number of tasks reaches this threshold.

- Type: integer
- Default value: 3
- Location: **BSM Map** > **Map Properties**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.bsm.too_many_children

Maximum number of child nodes to display. Nodes are collapsed for the map to meet this limit.

- Type: integer, valid values 1 or greater
- Default value: 10
- Location: **BSM Map** > **Map Properties**

glide.businessrule.async_condition_check

Specifies whether the instance checks the condition statement of async business rules (the **When** field is set to async) prior to running the business rule. If **true**, the instance evaluates the async business rule conditions a second time before running the rule. If **false** or missing, the instance does not evaluate the conditions a second time.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.businessrule.callstack

Specifies whether business rule executions are logged in the daily log when they start and finish (**true**) or are not logged (**false**). Logging is useful for troubleshooting a problem where you must know which business rules are running and in which order.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.cache.size.service_cache

- Type: integer
- Default value: 20
- Location: Add the property to the System Property [sys_properties] table.

glide.canvas.grid.widget_render_concurrent_max

Defines the maximum number of widgets that can render simultaneously on a dashboard. With smaller values, individual widgets load more quickly. With larger values, fewer Ajax requests to the server are needed. Set the value of this property to half of the number of widgets that are visible when your most-used dashboard loads. For example, if six widgets are visible on the dashboard set the value to 3.

Note: This system property applies to responsive dashboards only.

Two is the minimum value, and 1 is interpreted as 2. For values of zero or lower, all widgets load simultaneously.

- Type: integer
- Default value: none
- Location: System Property [sys_properties] table

glide.cmdb.query.batch_time_limit_in_sec

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Time limit (in seconds) for running one batch to get one batch of query results (100 results).

- Type: integer
- Default value: 300
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.query.max_results_limit

Limits the number of results for a scheduled query and in the results section in the Query Builder when you click **Load All Results**.

- Type: integer
- Default value: 10,000
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.query.non_cmdb.black_listed_tables

Exclusion list of non-CMDB tables that appear in the CMDB Query Builder when creating a CMDB query.

- Type: string
- Default value: empty
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.query.query_time_limit_in_sec

Time limit (in seconds) for running an entire query to get all results.

- Type: integer
- Default value: 1,800
- Location: **Configuration** > **CMDB Properties** > **Query Builder Properties**

glide.cmdb.statemgmt.max_bulk_count

Maximum number of CIs that CI Lifecycle Management can process in a bulk update operation.

- Type: integer
- Default value: 1000
- Location: System Property [sys_properties] table

glide.cmdb.statemgmt.max_lease_expired_days

Maximum number of days that lease expiration can be set with for CI Actions.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

glide.cms.dashboards.sharing_with_secure_search

When enabled, the list of users, user groups, and roles that are visible in the sharing panel is restricted. The restriction is based on the configuration of the sys_user, sys_user_group, and sys_user_role ACLs. For more information, see Access control list rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There is a performance penalty associated with enabling this property. Performance degradation may be based on the number and complexity of business rules and ACLs on your instance.

- Type: true | false
- Default value: false
- Location: **System Properties** > **Dashboard Properties**

glide.cms.share_dashboards.role

When this property is empty, all users can share their own dashboards.

Note: This property does not apply to users with the admin and dashboard_admin roles. Users with these roles can always share any dashboard.

- Type: string
- Default value: empty
- Location: **System Properties** > **Dashboard Properties**

glide.chart.decimal.precision

Controls the rounding precision of non-currency numeric values displayed on reports. A **Decimal Precision** value specified in a report's style options overrides this property. Currency values always have a precision of 2.

- Type: integer
- Default value: 2
- Maximum value: 4
- Location: Add the property to the System Property [sys_properties] table.

glide.chat.invite_fields

(Chat plugin) Comma-separated list of fields (glide_list or references to sys_user or sys_group) used to generate the invitations when creating a chat room from a task. Users can select a check box for each of the specified fields to invite to the chat room users that are referenced by the fields.

- Type: string
- Default value: none
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.chat_room.create_roles

(Chat plugin) Comma-separated list of roles that are allowed to create chat rooms.

- Type: string
- Default value: none
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.chat.show_emoticons

(Chat plugin) Enables (**true**) or disables (**false**) rendering text emoticons as images.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.class.downgrade.enabled

Flag for allowing class downgrade during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.class.switch.enabled

Flag for allowing class switching during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.class.upgrade.enabled

Flag for allowing class update during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.cmdb.health.metricProcessor.maxRunningTime

Max time in minutes for which individual metric processor runs in each scheduled cycle.

- Type: integer
- Default value: 120
- Location: Navigate to **All** > **Configuration** > **Health Preference**, and then click **System Properties** in the right hand-side navigator.

glide.cmdb.health.src.cmdb_health_audit_only

When set to **true**, disables health results from sources other than CMDB Health audit (such as cloud discovery). Only results generated by CMDB Health audit appear in the CMDB dashboard.

For example, by default, if a CI is determined to be stale by Discovery, then that CI appears as stale in the CMDB dashboard even though CMDB Health audit did not determine that CI to be stale. To disable these stale CI health results, set the property to **true**.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cmdb.health.staleness_exclude_dependent_cis

Exclude dependent CIs for the staleness CMDB Health metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When enabled, dependent CIs are not checked for staleness, regardless of any staleness or inclusion rules that are defined for the respective CI types.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cmdb.logger.source.identification_engine

Enable and configure what type of details the system logs when using IRE outside the scope of identification simulation. For example, when using an API, ECC queue or scheduled jobs.

- Type: string
- Default value: info, warn, error, debug, or debugVerbose
- Location: Add the property to the System Property [sys_properties] table.

Note: Depending on the setting, the system can generate large amounts of data that might affect overall system performance. Set the value with caution, limiting the level of details and use time to the minimum necessary for testing or debugging.

glide.cmdb.logger.use_syslog.CMDBHealth

A comma-separated list that controls the level of logging of CMDB Health jobs. Logging creates entries in the system logs to capture messages generated by the health auditing process each time they run. This logging helps debugging if there is a failure.

- Type: string
- Default value: error
- Location: System Property [sys_properties] table

glide.cmdb_model.display_name.shorten

If **true**, generates shorter display names for product models if the name of the product model contains the manufacturer name.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cookies.http_only

Enables (**true**) or disables (**false**) the generation of HTTP-only cookies. Set this property to **false** to use Approval with E-Signature.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.cost_mgmt.calc_actual_cost

(Cost Management plugin) When an expense line is created for any task with a **Type** of **Planned task**, sums all task expense lines and adds the total to the **Work cost** field on the task record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.cost_mgmt.debug

(Cost Management plugin) Enables debugging of cost management processing. All logging events are recorded in the Financial Management Log [fm_log] table.

Note: This feature can generate a large number of log records. Enable the feature only during initial testing or when troubleshooting.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cost_mgmt.process_task_cis

(Cost Management plugin) Creates expense lines affected configuration items when creating a task expense line.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.cost_mgmt.service_allocation.method

(Cost Management plugin) Defines whether business service to cost center allocation costs should be calculated based on total units or allocated units.

For example, if the service supports 100 units but only has 50 units allocated, and cost center ABC is allocated 25 units. Using the **All units** method results in an allocation cost of 25/100, or 25% of the total cost of the service. In this case, we track unallocated costs separately. Using **Allocation units** method results in an allocation cost of 25/50, or 50% of the total cost of the service. In this case, all costs are allocated (recovered).

- Type: choice list
- Default value: all_units
- Location: System Property [sys_properties] table

glide.csv.export.line_break

Enables the user to control how exported CSV data appears in Notepad. Valid values are LF for a line feed between records and CRLF for a carriage return followed by a line feed.

- Type: string
- Default value: LF
- Location: System Property [sys_properties] table

glide.csv.use_row_currency

If false, exports currency and price field values in the user's currency. If true, exports currency and price field values in the currency of the row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.custom.ip.authenticate.allow

Comma-separated list or dash-separated range of IP addresses that are allowed access to view the stats.do, threads.do, and replication.do pages.

- Type: string
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.
- Instance Security Hardening Settings: Restrict performance monitoring access

glide.db.aggregates.trend.use_iso_week

If set to true, reports weekly trend by data according to ISO weeks. If false, data trended per week reports according to the first day of the week set by glide.ui.date_format.first_day_of_week.

- Type: true | false
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.db.audit.ignore.delete

Specifies the tables where the sys_audit_delete file is not updated when records are deleted.

- Type: string — comma-separated list of tables
- Location: System Property [sys_properties] table

glide.db.forced.chunk.threshold

Sets the threshold above which to forces chunk record deletions and updates. Chunking helps to prevent non-primary key deletions on huge tables from causing replication problems. Use this property to set a force chunk threshold when using the GlideRecord – UpdateMultiple methods.

- Type: integer
- Default value: 100000000 (100 million)
- Location: Add the property to the System Property [sys_properties] table.

glide.db.clone.allow_clone_target

Enables (**true**) or disables (**false**) use of a non-production instance as the target for a system clone.

- Type: true | false
- Default value: **false** for production instances, **true** for non-production instances
- Location: System Property [sys_properties] table

glide.db.impex.XMLLoader.max.file.size.mb

Controls the maximum file size allowed when importing an XML file, in megabytes. Attempting to import an XML file larger than this limit results in an error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Warning:** Use caution when modifying this property. Uploading a large XML file may impact performance and can cause an instance outage.

- Type: integer
- Default value: 100
- Location: **System Properties** > **Import Export**

glide.db.large.threshold

Sets the number of rows above which a table is considered large and uses a different method of querying for results. When this property is absent, the instance uses the default query method.

- Type: integer
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.db.loguser

Display (**true**) or suppress display (**false**) of database errors such as `Unique Key violation detected by database (Duplicate entry 'ABC' for key 'name').` to logged-in user.

- Type: true | false
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.db.max.aggregate.size

Sets the maximum number of groups that a grouped report or list renders. Larger values may affect system performance.

- Type: integer
- Default value: 20
- Location: Add the property to the System Property [sys_properties] table.

glide.db.max_view_records

Sets the maximum number of records returned when running a GlideRecord query in a script. Do not use values larger than the default because they may cause queries to consume excessive memory on the application server and can, in extreme cases, cause a system outage. This property does not control the maximum number of records that appear in a list, report, or exported file.

- Type: integer
- Default value: 10000
- Location: Add the property to the System Property [sys_properties] table.

glide.db.table.update_inactive_choices_enabled

Specifies whether choice table selections marked as inactive (`sys_choice inactive attribute = true`) should be loaded into client databases when applications are installed (**true**) or not (**false**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.debug.log_point

Specifies whether the log points feature should be enabled or not.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.debugger.log.ui

Specifies whether logs should be displayed under forms and lists and in the Session Log tab, or only in the Session Log tab.

- Type: choice list
- Default value: Page
- Location: System Property [sys_properties] table

glide.discovery.application_mapping

Enables or disables the Application Dependency Mapping (ADM) feature.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.discovery.log_debug_info

An optional property to populate debug information in Discovery log. If this property is set to **true**, the Discovery sensor extracts the debug information from ECC input message and writes this information to the Discovery log table, so that it is visible when inspecting discovery status.

- Type: true | false
- Default: false

glide.discovery.log_message_chars

When a log message is longer than this value, ServiceNow creates a preview of the message with an ellipsis at the end of the message to indicate that there is content that is not shown. The preview size prevents any one list row from taking up the entire screen.

- Type: integer
- Default value: 200 (characters)
- Location: **Discovery Definition** > **Properties**

glide.discovery.multi_page_serial_mode

This property controls the processing of multi-page pattern input records. **false** sets the pages to process in parallel and **true** sets the pages to process serially.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false

glide.discovery.sam_batch_update_size

Enables batching the updates to table cmdb_sam_sw_install when only the field last_scanned in the table has changed. This optimizes the overall discovery execution as it reduces the multiple single update queries on the database. The default value is 100 which means 100 records at a time in the table are batched and updated. By setting this property to 1, this switches to sequential updates.

- Type: integer
- Default value: 100

glide.discovery.use_cmdb_identifiers

Controls whether Discovery uses the CMDB Identification and Reconciliation Framework (introduced with the Geneva release) or the legacy identifiers from previous releases.

- Type: true | false
- Default value: true
- Location: **Discovery Definition** > **Properties**

glide.domain.notify_change

Displays a notification message telling the user that the domain picker automatically changed.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.domain.notify_record_change

Displays a notification message telling the user that the domain picker automatically changed because the record that the user is viewing changed the domain of the user.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.duplicate_ci_remediator.dry_run

Determines whether the Duplicate CI Remediator actually remediates CI duplication by updating records in the CMDB, or not.

- Type: true | false
- Default value: false
- Location: **Configuration** > **CMDB Properties** > **Duplicate CI Remediator Properties**

glide.duplicate_ci_remediator.max.cis

Threshold for the number of duplicate CIs, which if exceeded, support for reconciliation in the Duplicate CI Remediator is limited (1,000 by default).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 1000
- Location: **Configuration** > **CMDB Properties** > **Duplicate CI Remediator Properties**

Note: This threshold never exceeds 5,000, even if you set the property to a value greater than 5,000.

glide.duplicate_ci_remediator.max.field_length

Attributes in which max_length exceeds this property value (4000 by default) are excluded from the **Select Main CI**, **Merge Attribute Values**, and **Determine Duplicate CI Actions** tabs in the Duplicate CI Remediator wizard.

- Type: integer
- Default value: 4000
- Location: **Configuration** > **CMDB Properties** > **Duplicate CI Remediator Properties**

Note: This property impacts the performance of de-duplication tasks, therefore be cautious about setting this value.

glide.eccprobe.longrunner.class

Identifies the name of a script include that manages long running commands.

- Type: string
- Default value: LongRunner
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.retry_minutes

Allows bursts of polling errors up to specified minutes in duration.

- Type: integer
- Default value: 10
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.interval.initial_seconds

Initial polling period for long running commands in seconds.

- Type: integer
- Default value: 20
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.interval.backoff_percent

Percentage that polling period grows per poll.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.interval.max_seconds

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Maximum polling period. As the polling period decays, it gets longer until it reaches this maximum.

- Type: integer
- Default value: 300
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.debug

Allows LongRunner logs status on successful polls in addition to the usual messages on unsuccessful ones when set to **true**.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.eccprobe.longrunner.max_poll_count

Maximum number of polls that is executed per 5- second polling period. This number is generally not relevant, but may be used to contain polling under extreme loading conditions.

- Type: integer
- Default value: unlimited
- Location: System Property [sys_properties] table

glide.ecmdb.all_relationship_role

An example value is: itil,asset,configuration.

- Type: string
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.element.use_object_display_value

It ensures that the display value for GlideElementGlideObject fields like glide_date_time is calculated correctly.

- Type: true|false
- Default value: true
- Location: System Properties

glide.element.reference.use_actual_display_value

It controls the display value of GlideElementGlideObject fields like glide_date_time on Forms and Lists, and you would need to opt-in (set property value to true) to see the correct display value in these views.

- Type: true|false
- Default value: false
- Location: System Properties

`glide.email_address_filter.max_domains`

Sets the maximum number of domains that can be associated with a single email address filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 100

glide.email_address_filter.max_exceptions

Sets the maximum number of exceptions that can be associated with a single email address filter.

- Type: integer
- Default value: 1000

glide.email.append.timezone

Specifies whether to append the time zone to all dates and times in outbound emails (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

glide.email_client.quick_message.insert

Controls how quick messages are inserted in the email client. If the property is set to **true**, quick message content is inserted at the place of the cursor. If **false**, quick message content replaces existing content in an email draft.

- Type: true | false
- Default value: true

glide.email.forward_subject_prefix

Specifies the comma-separated list of prefixes in the subject line that identify a forwarded email.

- Type: string
- Default value: fw:,fwd:
- Location: Add the property to the System Property [sys_properties] table.

glide.email.journal.lines

Specifies the number of entries from a journal field (such as Additional comments and Work notes) included in email notifications. A value of **-1** includes all journal entries.

- Type: integer
- Default value: 3
- Location: **System Properties** > **Email**

glide.email.mail_to

Specifies the email address to send notifications that use the *${mailto:}* variable.

- Type: string
- Default value: SMTP email address that is active by default
- Location: Add the property to the System Property [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.email.name_split

Delimiter between the first and last name in an email address to identify users from incoming emails. For example, a delimiter of "." in the email address john.smith@company.com tells the system to look for a user record for John Smith.

- Type: string
- Default value: period (.)
- Location: **System Properties** > **Email**

glide.email.notification.save_when_no_recipients

Controls whether (**true**) or not (**false**) a notification-generated sys_mail record is saved even if there are no recipients. Used in conjunction with other notification recipient logging properties, this property enables troubleshooting problems with notifications.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.email.override.url

Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is: https://servicenow.customerdomain.com/production/nav_to.do.

- Type: string
- Default value: Instance URL
- Location: Add the property to the System Property [sys_properties] table.

glide.email.read.active

Enables (**true**) or disables (**false**) the inbound mail server.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

glide.email.reply_subject_prefix

Specifies the comma-separated list of prefixes in the subject line that identify an email reply.

- Type: string
- Default value: re:aw:,r:
- Location: System Property [sys_properties] table

glide.email.smtp.active

Specifies whether to enable (**true**) or disable (**false**) the outgoing mail server.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

glide.email.smtp.max_recipients

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

glide.email.smtp.max_send

Specifies how many emails to send through each new SMTP connection. The instance establishes a new SMTP connection if there are more emails to send than the specified value.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

glide.email_system_address_filter.max_address_filters

Sets the maximum number of email filters that can be associated with a single system address filter.

- Type: integer
- Default value: 100

glide.email.test.user

Specifies the comma-separated list of email addresses to which the instance sends all email messages. Typically used in non-production instances for testing purposes.

- Type: string
- Default value: none
- Location: **System Properties** > **Email**

glide.email.text_plain.strip_xhtml

Indicates whether both outbound and inbound emails that are shown in comments convert the XML to plain text (**true**) or preserve the XML (**false**).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.email.watermark.visible

Indicates whether the watermark in email notifications is visible (**true**) or is wrapped in a hidden div tag (**false**).

Note: Email clients that use the plain text version of the email show the watermark.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.email_client.show_sms_option

Specifies whether a check box appears in the email client for sending the message to the user's SMS device (**true**) or not (**false**). If no SMS device exists, the email client sends the message to the primary email device.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.entry.loggedin.page_ess

Specifies the page that an ESS user, who by definition has no roles, is redirected to when the user logs in.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.excel.boolean.display_value

If true, translates columns of type boolean to the user's language when exporting records in Excel format. If false, exports the values in English, regardless of the user language.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.excel.max_cells

Sets the maximum number of cells in an Excel export.

- Type: integer
- Default value: 500000
- Location: Add the property to the System Property [sys_properties] table.

glide.excel.use_user_date_format

Specifies whether Excel exports use the date/time format specified in a user's profile (**true**) or not (**false**). If **false**, exports the instance date/time format defined by the `glide.sys.date_format` property.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.export.csv.charset

Specifies the character set used to export CSV files. See Supported Character Encodings for a list of supported character encoding options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: windows-1252
- Location: Add the property to the System Property [sys_properties] table.

glide.export.csv.raw.value

When **true**, raw database values are exported instead of the display values when you export to CSV. When **false**, display values are exported.

- Type: true | false
- Default value: false
- Location: **System Properties** > **Import Export**

glide.export.escape_formulas

When **true**, string values that start with the characters +, -, =, or @ are prepended with a single apostrophe when you export to CSV, XLS, or XLSX files.

- Type: true | false
- Default value: **true** for new instances starting with Istanbul
- Location: System Property [sys_properties] table for new instances starting with Istanbul. For upgraded instances, Add the property to the System Property [sys_properties] table.

glide.export.excel.general_formatting

When **true**, values in cells in exported Excel files have the general format. When **false**, the cells in exported Excel files have the text format.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.export.excel.wrap_cells

When **true**, values in cells in exported Excel files are wrapped automatically. When **false**, the width of exported Excel columns is resized to fit 256 characters and values are not wrapped.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.fdih.retry.max_count

Specifies the maximum number of retry attempts when no value is specified in **Count** for a retry policy.

- Type: Integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.glidesoap.proxy_host

Specifies the proxy server hostname or IP address for SOAP clients.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: value of *glide.http.proxy_host*
- Location: System Property [sys_properties] table

glide.glidesoap.proxy_port

Specifies the port number for the proxy server for SOAP clients.

- Type: string
- Default value: value of *glide.http.proxy_port*
- Location: System Property [sys_properties] table

glide.guest.active.session.life_span

Sets the maximum session time for a guest session regardless of user activity, in minutes.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.guest.session_timeout

Sets the inactive session timeout for a guest session, in minutes.

> **Note:** This setting decouples a guest session timeout from the *glide.ui.session_timeout* property. Any changes to the *glide.ui.session_timeout* property do not affect a guest session timeout.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

glide.hd.payload_multi_page.device_history.mutex_expires

Total time the thread waits to update the Discovery history before giving up.

- Type: integer
- Default value: 1 minutes
- Location: System Properties

glide.hd.payload_multi_page.device_history.mutex_spin_wait

The time between when we check if the Discovery history database is free.

- Type: integer
- Default value: 100 ms
- Location: System Properties

glide.hd.payload_multi_page.device_history.mutex_max_spins

The number of times the Discovery history is checked before giving up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 600
- Location: System Properties

glide.hd.payload_multi_page.discolog.mutex_expires

Total time the thread waits to update the Discovery log before giving up.

- Type: integer
- Default value: 1 minutes
- Location: System Properties

glide.hd.payload_multi_page.discolog.mutex_spin_wait

The time between when we check if the Discovery log database is free.

- Type: integer
- Default value: 100 ms
- Location: System Properties

glide.hd.payload_multi_page.discolog.mutex_max_spins

The number of times the Discovery log is checked before giving up.

- Type: integer
- Default value: 600
- Location: System Properties

glide.help.default.page

Sets the overall help URL for the system if you are using context-sensitive help. This URL is used when there is not any context-sensitive help available for the form, list, or record.

- Type: string
- Default value: http://wiki.servicenow.com/
- Location: System Property [sys_properties] table

glide.history.max_entries

Sets the number of characters to display as a preview of journal input fields.

- Type: integer
- Default value: 250
- Location: System Property [sys_properties] table

glide.history_set.pull_journal_entries_from_journal_table

Determines whether journal field values in history sets are retrieved from the journal table (**true**) or the audit table (**false**). If auditing is disabled for a GlideRecord by setting `setWorkflow(false)`, journal entries will be missing from history sets unless set to **true**.

- Type: true | false
- Default value: true
- Location: Add a system property to the System Property [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.home.page

Specifies which page to load when a user selects a homepage from the banner.

- Type: string
- Default value: `home_splash.do?sysparm_direct=true`
- Location: System Property [sys_properties] table

glide.home.refresh_disabled

Enables (**true**) or disables (**false**) homepage refresh.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.home.refresh_intervals

Comma-separated list of refresh intervals available on homepages.

- Type: string
- Default value: 300,900,1800,3600
- Location: Add the property to the System Property [sys_properties] table.

> **Important:**
>
> The functionality found in homepages, arranging information from your instance to tell a story about your data, is found in dashboards on new instances. On upgraded instances with Next Experience enabled, users can view existing homepages if they have a direct URL, but they can't create or edit them. Responsive dashboards and Analytics Overview dashboards take over homepage functionality.
>
> Use the Homepage deprecation help tool to convert the homepages on your instance to responsive dashboards.
>
> For more information, see:
>
> - Dashboards in the Analytics Center.
> - Working with responsive dashboards.

glide.hosts.allowlist

Enables control over what hosts that a Fetch action can access. This affects HTTP APIs, like RESTMessageV2 - Scoped, Global and Fetch Fetch - Scoped, Global. Features of `glide.hosts.allowlist`:

- Supports a comma-separated list of URLs or IPs.
- Allows "*" for all.
- Allows subdomains via *.example.com.
- Has a global and a per-scope setting (prefix with the scopename to specify an entry is for a specific scope).
- Default value is an empty string, which is interpreted as no hosts are allowed for Fetch. For existing HTTP APIs, like RestMessageV2, empty is interpreted as all hosts are allowed (other than those restricted by the existing deny list).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: "" (empty string)
- Location: System Property [sys_properties] table

glide.html.enable_media_sites

Enables a URL option for media in the HTML Editor. The media attaches, but doesn't load in the HTML Editor.

- Type: string
- Default value: youtube.com,player.vimeo.com,vimeo.com
- Location: System Property [sys_properties] table

glide.html.escape_script

Enables (**true**) or disables (**false**) JavaScript tags in HTML fields.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.html.sanitize_all_fields

Specifies whether all HTML fields are sanitized to remove unwanted code (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: HTML sanitizer (instance security hardening)

glide.http.connection_timeout

Specifies the maximum number of milliseconds an outbound HTTP request (such as Web Services) waits to establish a connection.

- Type: integer
- Default value: 10000 (10 seconds)
- Location: System Property [sys_properties] table

glide.http.outbound.max_timeout

Specifies the number of seconds that RESTMessageV2 and SOAPMessageV2 APIs wait for a response from a synchronous call. The maximum value is 30 seconds.

To define a timeout longer than 30 seconds, set the *glide.http.outbound.max_timeout.enabled* system property to **false** and use the *waitForResponse()* method to set the timeout. For example, see Asynchronous SOAPMessageV2 example. If *glide.http.outbound.max_timeout.enabled* is set to true and a value is passed in the *waitForResponse()* method, the system uses the smallest value from either the *waitForResponse()* method or the *glide.http.outbound.max_timeout* system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 30
- Location: Add the property to the System Property [sys_properties] table.

glide.http.outbound.max_timeout.enabled

Enables setting a timeout in the *glide.http.outbound.max_timeout* system property.

To define a timeout longer than 30 seconds, set the *glide.http.outbound.max_timeout.enabled* system property to **false** and use the *waitForResponse()* method to set the timeout. For example, see Asynchronous SOAPMessageV2 example. If *glide.http.outbound.max_timeout.enabled* is set to true and a value is passed in the *waitForResponse()* method, the system uses the smallest value from either the *waitForResponse()* method or the *glide.http.outbound.max_timeout* system property.

- Type: boolean
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.http.proxy_bypass_list

Specifies the semicolon-separated list of addresses that bypass the proxy server. Use an asterisk (*) as a wildcard character to specify all or part of an address.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_host

Specifies the proxy server hostname or IP address.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_ntdomain

Specifies the domain used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_nthost

Specifies the hostname used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.http.proxy_ntpassword

Specifies the password used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_ntusername

Specifies the user name used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_port

Specifies the port number for the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_password

Specifies the password used to authenticate the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.proxy_username

Specifies the username used to authenticate the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.http.timeout

(Web service Consumer Plugin) Specifies the maximum number of milliseconds to wait before an outbound transaction times out.

- Type: integer
- Default value: 175000 (175 seconds)
- Location: Add the property to the System Property [sys_properties] table.

glide.i18n.force_index

Enables (**true**) or disables (**false**) indexing all translated fields, regardless of the value of the table attribute text_index_translations.

- Type: true | false
- Default value: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.identification_engine.batch_update_last_discovered

Controls batch update of last_discoveredfield in CIs that are being processed by the identification engine.

Set to **false** if there are business rules that apply to last_discovered field, and you want to trigger these rules when calling Identification and Reconciliation API.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_engine.dependent_items_local_cache_count

For optimization, a custom number of locally cached query result entries of dependent CIs.

- Type: integer
- Default value: 10000
- Location: Add a system property to the System Property [sys_properties] table.

Note: If there is a memory issue due to optimization related to using local cache, set the *glide.identification_engine.related_items_local_cache_count* and the *glide.identification_engine.dependent_items_local_cache_count* properties to 0.

glide.identification_engine.granular_insert_locking

Determines whether to use multiple granular insert locks or single global insert lock.

Set to **false** if there are performance issues associated with the usage of multiple granular insert locks.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_engine.independent_items_local_cache_count

For optimization, a custom number of locally cached query result entries of independent CIs.

- Type: integer
- Default value: 100000
- Location: Add the property to the System Property [sys_properties] table.

Note: Setting the value to 0 avoids using local cache for independent CIs and might affect performance.

glide.identification_engine.related_items_local_cache_count

For optimization, a custom number of locally cached query result entries of related/lookup items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 15000
- Location: Add the property to the System Property [sys_properties] table.

Note: If there is a memory issue due to optimization related to using local cache, set the *glide.identification_engine.related_items_local_cache_count* and the *glide.identification_engine.dependent_items_local_cache_count* properties to 0.

glide.identification_engine.skip_duplicates

Controls how identification processes a small set of duplicate CIs.

- When **true**: If the number of duplicate CIs is less than the threshold specified by *glide.identification_engine.skip_duplicates.threshold*, then one of the duplicate CIs is picked as a match and gets updated. The rest of the duplicate CIs are tagged as duplicates.
- When **false**: Matching a CI fails, and an error is logged.
- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_engine.skip_duplicates.threshold

Maximum number of CIs that can be in a set of duplicate CIs to allow identification to process the duplicate CIs according to the setting of *glide.identification_engine.skip_duplicates*.

If the number of duplicate CIs exceeds the threshold, then identification processes the duplicate CIs as if *glide.identification_engine.skip_duplicates* is set to **false**, regardless of the setting.

- Type: integer
- Default value: 5
- Location: Add the property to the System Property [sys_properties] table.

glide.identification_logs.max_run_ids

Maximum number of log runs that can be displayed when navigating to **Configuration** > **Identification Logs**.

- Type: integer
- Default value: 1000
- Location: **Configuration** > **CMDB Properties** > **Identification/Reconciliation Properties**.

glide.image_provider.security_enabled

Controls the security settings for images. If **true**, images are visible only to authenticated and authorized users. If **false**, images are visible to anyone with a URL to the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
  - New/zbooted instances: property is present and set to **true**
  - Upgraded instances: **false** if property is not present, unchanged if property is present
- Location: System Property [sys_properties] table

glide.imap.secure

Enables (**true**) or disables (**false**) SSL encryption for connections to the IMAP server.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.imap.secure_port

Specifies the communications port for IMAP secure connections.

- Type: string
- Default value: 995
- Location: Add the property to the System Property [sys_properties] table.

glide.imap.tls

Enables (**true**) or disables (**false**) starting the IMAP server in Transport Layer Security (TLS) mode.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import.debug

Enables (**true**) or disables (**false**) debug logging for all import processes.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import.error_message.generic

Enables (**true**) or disables display (**false**), failed imports to display a generic error instead of a verbose SQL message. This property should be enabled.

- Type: true | false
- Default value:
  - New/zbooted instances: **true** for starting with Istanbul
  - Upgraded instances: false
- Location: System Property [sys_properties] table

glide.import_excel.use_only_user_session_date_format

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If true, any Date or Date/Time value in an Excel spreadsheet is converted to a user session date format in the staging table upon Excel file import.

If false, any Date/Time explicit cell type in Excel is imported into a staging table with the user session date format, and any date value that is not explicitly in a Date/Time cell type in Excel is imported into a staging table using the system date format.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table if you want to change the value to false.

glide.import.sftp.debug

Enables (**true**) or disables (**false**) additional debug logging for SFTP imports. Enabling this property causes the instance to log all outgoing and incoming messages during the SSH session.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import.scp.debug

Enables (**true**) or disables (**false**) additional debug logging for SCP imports. Enabling this property causes the instance to log all outgoing and incoming messages during the SSH session.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import_set.preserve.leading.spaces

Specifies whether the import process preserves leading spaces in Excel data cells (**true**) or not (**false**). When **false**, the import process removes leading spaces from Excel data cells.

Note: The import process always removes trailing spaces from Excel data cells.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.import_set_row.dynamically_add_fields

Specifies whether an import set can add new columns to the staging table (**true**) or not (**false**). Instances that contain large numbers of import sets can sometimes become unresponsive when an import adds a column because the instance must alter every row in the staging table. Sometimes the database alter table action causes an outage. Setting this property to **false** prevents an import set from adding columns to the staging table and produces a log message. As a workaround, administrators can manually add a column to the staging table by creating a new dictionary entry and then reimporting the import set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ir.query_method

Sets the query method for global text search. Only the **Simple query** method is supported.

- Type: choice list
- Default value: simple
- Location: **System Properties** > **Global Text Search**

glide.active.session.timeout.invalidate.session

Specifies whether integration sessions can be invalidated by configuring a maximum active session time.

- Type: Boolean true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.integration.session_timeout

Sets the inactive session timeout for integration sessions, in minutes.

- Type: integer
- Default value: 1
- Location: Add the property to the System Property [sys_properties] table.

glide.integration.update_last_login_time.window.seconds

Controls the frequency of updates to integration user records.

- Type: integer
- Default value: 60
- Minimum value: 5
- Maximum value: 86400 (one day in seconds)
- Location: Add the property to the System Property [sys_properties] table.

glide.integrations.active.session.life_span

Sets the maximum session time for a integration session regardless of activity, in minutes.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.invalid_query.returns_no_rows

Controls how invalid GlideRecord queries are handled with respect to invalid or undefined field names. When this property is **true**, invalid queries containing invalid or undefined field names always return no rows. When this property is **false** (default), if a query is incorrect, and includes invalid or undefined field names, the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

invalid part of the query condition is ignored and results are based on the valid part of the query.

To override this logic at the session level, execute `gs.getSession().setStrictQuery(false)`. To restore strict query, execute `gs.getSession().setStrictQuery(true)`. To use this property, change the line `gr.addQuery('table', arguments.length == 1 ? record.getRecordClassName() : tableName);` in the Workflow script include to `gr.addQuery('table', (tableName) ? tableName : record.getRecordClassName() );`.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.itil.assign.number.on.insert

Controls whether (**true**) or not (**false**) a task number is generated and assigned on load (**Create New**) or when the task is submitted. This feature helps prevent unused task numbers.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.jdbcprobeloader.retry

Sets the number of times a JDBC probe attempts to connect to a JDBC data source.

- Type: integer
- Default value: 60
- Location: Add the property to the System Property [sys_properties] table.

glide.jdbcprobeloader.retry_millis

Sets the number of milliseconds a JDBC probe waits between retry attempts to a JDBC data source.

- Type: integer
- Default value: 5000
- Location: Add the property to the System Property [sys_properties] table.

glide.jquery.legacy

When true, enables legacy JQuery behavior. When false, integrates the JQuery 1.12.3 and 2.2.3 security patches. If you set this property to false, UI pages with incorrect HTML markup may render incorrectly. You can address this issue in your scripts by closing any html element tags that are self-closing and not in the valid list. For example, change `<div />` to `<div></div>`.

- Valid self-closing elements that do not need to be updated include:
  - `<area />`
  - `<base />`
  - `<br />`
  - `<col />`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `<embed />`
- `<hr />`
- `<img />`
- `<input />`
- `<link />`
- `<meta />`
- `<param />`
- `<source />`
- `<track />`
- `<wbr />`

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.knowman.search.apply_role_based_security

If **true**, honors read access of knowledge bases or articles specified for roles. If **false**, enables specified user criteria to override read access specified for roles.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.knowman.search_character_limit

Minimum number of characters required for knowledge search. Search terms with fewer than this number of characters return no results.

- Type: integer
- Default value: 3
- Location: System Property [sys_properties] table

glide.knowman.search.default_language

(Knowledge Management Internationalization Plugin v2) Default language for knowledge articles. If empty, defaults to the language of the logged-in user.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

glide.knowman.serviceportal.seo_portals

Value contains a comma-separated list of service portal record sys_ids. The SEO indexing of knowledge articles is enabled on the portals mentioned in the list and is blocked by the noindex metatag for other portals. If at least one portal is listed, SEO suggestions display when users author or edit knowledge articles.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the property value is empty, the indexing is enabled for all portals.

glide.knowman.show_language_option

(Knowledge Management Internationalization Plugin v2) Specifies whether the **Language** box appears (**true**) or is hidden (**false**) on articles with multiple translations.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.knowman.show_language_option.roles

(Knowledge Management Internationalization Plugin v2) Comma-separated list of roles that can see the Language box on articles with multiple translations.

- Type: string
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.knowman.show_links

Specifies whether the **Link** line appears (**true**) or is hidden (**false**) in a knowledge article.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ldap.allow_empty_group

Specifies whether all members can be removed from an Active Directory security group (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ldap.binary_attributes

Comma-separated list of LDAP attributes that should be converted from binary format to encoded64 strings. If you set this property, only the values listed are converted. The most common attributes are *`objectSID`* and *`objectGUID`*. These converted values are unique and can be used as the coalesce field on the LDAP import mapping. If this property is blank, ServiceNow tries to map these binary attributes without the conversion and they are not guaranteed to be unique since they are not properly converted to string values.

- Type: string
- Default value: objectsid,objectguid
- Location: System Property [sys_properties] table

glide.ldap.paging

Enables (**true**) or disables (**false**) LDAP paging query support. LDAP paging is a more efficient LDAP querying method for environments with more than 1000 users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.legacy.excel.export

Enables (**true**) or disables (**false**) exporting to XLS format when exporting to an Excel file. By default, only XLSX export is enabled. This property does not affect the Excel web service. When **true**, this property also allows users to select XLS or XLSX as the Easy Import template format.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.list.filter_max_length

Sets a maximum character limit for the condition builder query.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.lists.live_list_enabled

Enables a list refresh prompt.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.live_feed.company_feed_exclude_groups

Controls whether messages posted to a public group appear (**true**) or are omitted (**false**) on the Company Feed.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.live_services

(Chat plugin) Enables (**true**) or disables (**false**) Live Services, such as chat support.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.login.no_blank_password

Prevents (**true**) or allows (**false**) logins from users with blank passwords. Often, importing lists of users creates many users with blank passwords. By default, this property is set to **true** on production instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.login.home

Sets the default homepage that users see after login. If blank, the last page visited is used. The format is *<page>.do*.

- Type: string
- Default value: home.do
- Location: System Property [sys_properties] table

glide.max_journal_list_size

Sets the maximum size, in megabytes, of journal input fields.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

glide.messaging.reassign.enabled

Sets property that automatically reassigns messaging if the current agent is unavailable.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.notification.recipient.include_logging

Master switch to enable/disable logging all reasons a recipient was included. If **false**, no include logging is performed.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.notification.recipient.exclude_logging

Master switch to enable/disable logging all reasons a recipient was excluded. If **false**, no exclude logging is performed.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.notification.recipient.exclude_logging.device_inactive

Logs recipients who are excluded because their chosen notification device record is marked as inactive.

- Type: true | false
- Default value: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.device_schedule

Logs recipients who are excluded because the chosen notification device record's schedule field excludes it.

- Type: true | false
- Default value: true

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.event_creator

Logs recipients who are excluded because they initiated the notification event, such as updating an incident record, and the **Send to Event Creator** check box is cleared on the notification record.

- Type: true | false
- Default value: true

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.invalid_email

Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

To modify this property, you must enable the *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_calendar_integration_disabled

Logs recipients of calendar invitations who are excluded because the **Calendar Integration** field is set to **None** on the user record.

- Type: true | false
- Default value: true

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.user_inactive

Logs recipients who are excluded because the **Active** check box is cleared on the user record.

- Type: true | false
- Default value: true

The *glide.notification.recipient.exclude_logging* property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.exclude_logging.user_notification_disabled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Logs recipients who are excluded because the **Notification** field is set to **Disabled** on the user record.

To modify this property, you must enable the `glide.notification.recipient.exclude_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging

Enables or disables logging all reasons that a recipient was included. This property is a main switch. If **true**, the subsequent properties dealing with the inclusion of logging are enabled. If **false**, none of the subsequent properties relating to the inclusion of logging are enabled.

glide.notification.recipient.include_logging.delegate

Logs recipients who are included because they are delegates of another user.

- Type: true | false
- Default value: true

The `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module must be enabled to modify this property.

glide.notification.recipient.include_logging.event_parm

Logs recipients who are included because they are in the **parm1** or **parm2** fields of the event record.

To modify this property, you muse enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_fields

Logs recipients who are included via a notification target record, such as an incident record, specified in the **Users/Groups in Field** field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, if the record that triggered the notification is an incident, and the **assigned_to** field for the incident is listed in recipient_fields, that user is included as a recipient.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.group_email

Logs recipients who are included in a group email for any group provided in the notification record's recipient_groups or the event **parm1** or **parm2** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To modify this property, you must enable the *glide.notification.recipient.include_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.manager

Logs recipients who are included because they manage any group provided in the notification record's recipient_groups or the event **parm1** or **parm2** field.

To modify this property, you must enable the *glide.notification.recipient.include_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.membership

Logs recipients who are included via membership in any group provided in the notification record recipient_groups or the event **parm1** or **parm2** field.

To modify this property, you must enable the *glide.notification.recipient.include_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_users

Logs recipients who are included via notification record's **Users** field (recipient_users).

To modify this property, you must enable the *glide.notification.recipient.include_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.subscription

Logs recipients because they are subscribed via User Notification Preferences.

To modify this property, you must enable the *glide.notification.recipient.include_logging* property in the **System Properties** > **Email** module.

- Type: true | false
- Default value: true

glide.oauth.update_last_login_time

Controls whether the Last login and Last login time fields in a user record [sys_user] are updated when an integration user sends a web request to an instance using

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth authentication. If true, the Last login and Last login time fields in the user's record are updated with web requests. To turn off this functionality, set this property and the *glide.basicauth.update_last_login_time* system property to false.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.par.export.ppt.max_visualizations_allowed

For the ServiceNow Otto Data and Analytics skill "dashboard and visualization export," this property sets the maximum number of visualizations, and thus slides, that you can export from a Platform Analytics dashboard to Microsoft PowerPoint.

- Type: integer
- Default value: 150
- Location: System Property [sys_properties] table

glide.pdf_export_from_form_list.show_report_attrs

Enables or disables displaying the PDF page header for all PDFs generated from a list.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.pdf.max_rows

Sets the maximum number of rows in an exported PDF file.

- Type: integer
- Default value: 1000
- Location: Add the property to the System Property [sys_properties] table.

glide.pdf.font.size

Sets the font size for exported PDF files.

- Type: integer
- Default value: 8
- Location: Add the property to the System Property [sys_properties] table.

glide.pdf.url.whitelisting.enabled

Enables or disables whether external URLs provided should be rendered in the PDF output generated by the PDFGenerationAPI - Scoped, Global. Verifies against the allowed URLs listed in the com.snc.pdf.whitelisted_urls property.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.pg.any_rejection_rejects

Controls the default process guide rejection handling. If **true**, the first rejection rejects the entity. If **false**, all users must reject the approval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.phone_number_e164.allow_national_entry

When **true**, users can enter phone numbers in the local format listed in the territory selector. When **false**, users must enter phone numbers in the international format listed in the territory selector.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_national

When set to **true** or **form**, a Phone Number (E164) field displays phone numbers in a local format on forms but as an international format on lists. When set to **all**, a Phone Number (E164) field always displays phone numbers in a local format. When set to user, a Phone Number (E164) field only displays phone numbers in a local format when the phone number matches the locale setting of the current user.

- Type: string
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_territory_selector

Specifies whether to display (**true**) or hide (**false**) the territory selector. Hiding the territory selector restricts users to entering only local or national phone numbers.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_territory_text

When set to all, a Phone Number (E164) always displays the territory label. When set to national, a Phone Number (E164) displays the territory label only if the phone number is in local format. When set to read-only, a Phone Number (E164) displays the territory label in read-only mode regardless of whether the number is in local or global format. When set to read-only-national, a Phone Number (E164) displays the territory label in read-only mode only if the number is in local format. When set to list, a Phone Number (E164) displays the territory label in a list. When set to list-national, a Phone Number (E164) displays territory label in a list if the number is in national format. When set to none, a Phone Number (E164) does not display the territory label.

- Type: string
- Default value: read-only
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.display_users_idd

Specifies whether to display the international direct dialing prefix between the territory selector and the input box on forms (**true**) or not (**false**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.phone_number_e164.strict

Specifies whether all phone number fields must match the display format of the field's select territory. When **true**, the phone number input box displays a red line underneath phone numbers that do not match the territory format listed in the territory selector. Users cannot save an invalid phone number. When **false**, the phone number input box displays a green line underneath phone numbers that do not match the territory format listed in the territory selector. Users can save an invalid phone number, and the territory selector offers the option to select an **Other / Unknown** territory format.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.pop3.ignore_headers

Specifies the comma-separated list of email headers that cause the instance to ignore an email message. Use the format name:value to specify email header types and values. You can use a wildcard (*) for the subtype. For example, `Content-Type:multipart/*; report-type=delivery-status;` ignores emails containing a type of multipart and a parameter of *`report-type=delivery-status`*. For syntax specifications, see http://www.w3.org/Protocols/rfc1341/4_Content-Type.html.

- Type: string
- Default value: Auto-Submitted:auto-replied,X-FC-MachineGenerated:true,Content-Type:multipart/report; report-type=delivery-status;
- Location: **System Properties** > **Email**

glide.pop3.ignore_senders

Specifies the comma-separated list of senders that cause the instance to ignore an email message. Enter only the name before the at (@) sign.

- Type: string
- Default value: mailer-daemon, postmaster
- Location: **System Properties** > **Email**

glide.pop3.ignore_subjects

Specifies the comma-separated list of strings that cause the instance to ignore an email message if they are present at the start of a subject line. Values are case-insensitive.

- glide
- Type: string
- Default value: out of office autoreply, undeliverable:, delivery failure:,returned mail:,autoreply
- Location: **System Properties** > **Email**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.pop3.parse_end

[Legacy] Text indicating the end of the email body section where the instance should parse name:value pairs to change field values when processing inbound email actions. This property is no longer required to set field values from the email body.

- Type: string
- Default value: none
- Location: **System Properties** > **Email**

glide.pop3.parse_start

[Legacy] Text indicating the beginning of the email body section where the instance should parse name:value pairs to change field values when processing inbound email actions. This property is no longer required to set field values from the email body.

- Type: string
- Default value: none
- Location: **System Properties** > **Email**

glide.pop3.process_locked_out

Enables (**true**) or disables (**false**) the ability for locked out users to trigger inbound actions.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.pop3.reply_separators

Comma-separated list of separators that cause the instance to disregard everything below the text string in the message body. This list is case-sensitive.

- Type: string
- Default value: \n\n-----Original Message-----,\n\n _____ \n\nFrom:
- Location: **System Properties** > **Email**

glide.pop3readerjob.create_caller

Controls the behavior when an instance receives an email from an email address not associated with a user record. If **true**, the instance creates a new user record for the email address and places that new user in the **Caller** field of any created tickets. If **false**, the instance associates the new ticket to the **Guest** user record.

- Type: true | false
- Default value: false
- Location: **System Properties** > **Email**

glide.processor.json.row_limit

Specifies the maximum number of rows a JSON query returns.

- Type: integer
- Default value: 250
- Location: Add the property to the System Property [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.product.description

The value of this property is displayed as text in the banner next to the company logo.

- Type: string
- Default value: Service Management
- Location: **System Properties** > **Basic Configuration UI16**

glide.product.help_url

Global setting for the URL that the help icon goes to. Value must be empty for context-sensitive help to work.

glide.product.help_show

Controls whether the help icon, help.gifx, appears in (**true**) or is omitted from (**false**) the welcome banner.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.product.image.light

The Banner image displayed for Core UI Interface.

- Type: uploaded image
- Default value: none
- Location: **System Properties** > **Basic Configuration UI16**

glide.product.icon

Stores the favicon image displayed in bookmarks, tabs, and the browser address bar.

- Type: image
- Default value: favicon.ico?v=4
- Location: **System Properties** > **System**

glide.product.name

Specifies text to use in place of Service-now.com in the browser top title bar (and in browser tabs). This text is duplicated in the banner to the right of the logo unless you add `display: none;` to the end of the value field within the *`glide.product.name.style`* property.

- Type: string
- Default value: ServiceNow
- Location: System Property [sys_properties] table

glide.product.name.style

Specifies the CSS properties used to display the *`glide.product.name`* text in the banner to the right of the logo. To not display the text, add `display: none;` to the end of the value field in this property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: padding-bottom: 0px; padding-top: 0px;
- Location: System Property [sys_properties] table

glide.quota.manager.debug

Controls whether to display (**true**) or hide (**false**) additional information related to the Quota Manager, such as running transactions, canceled transactions, and which quotas are matched to transactions.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.quota.manager.heartbeat

Sets the number of seconds between the start of each Quota Manager heartbeat. This value determines how often the Quota Manager checks for transactions exceeding a quota and how often the Quota Manager writes status in the log file.

- Type: integer
- Default value: 1
- Location: Add the property to the System Property [sys_properties] table.

glide.quota.manager.minimum_transaction_time

Sets the minimum number of seconds that a transaction must run before the Quota Manager matches it to a transaction quota. You should set this value to at least 1 second because smaller values decrease performance, and because transactions shorter than 1 second are probably not worth canceling. For optimal performance, set this value to the value of your most restrictive quota. For example, if your most restrictive quota cancels transactions longer than 1 minute, set the minimum transaction time to 60 seconds.

- Type: integer
- Default value: 1
- Location: Add the property to the System Property [sys_properties] table.

glide.reconciliation.override.null

Flag for allowing or disallowing the update of an empty field by a lower priority data source.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table

glide.remote_glide_record.max_count

Control the maximum number of records that the GlideRecord query method returns when using the SOAP web service. The instance primarily uses this property to control the records returned when using a Perl API GlideRecord query.

> ⚠ **Warning:** If you set this property to a large value, such as 10000, socket timeout errors might occur with MID Servers. Keep the value of this property less than 1000.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 250
- Location: Add the property to the System Property [sys_properties] table.

glide.report.add_to_list_supported

Sets whether to support the add_to_list ACL for reporting on specified columns from the Available columns list when creating or sharing a list report.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.report.calendar.max_more_events_per_day

Specifies the maximum number of calendar events that can appear in the **+ <number>** pop-up for:

- A calendar day when calendar is in month or year view
- The top 'full day' section of a calendar day when a calendar is in day or week view

When this number is exceeded, a **+ many** link appears, which opens a list of events instead of a pop-up. For more information about the maximum number of events that can be displayed in a calendar day, see system property *glide.report.calendar.max_events_displayed_per_cell*.

- Type: integer
- Default value: 30
- Location: Add the property to the System Property [sys_properties] table.

glide.report.calendar.max_events_displayed_per_cell

Defines the maximum number of events that can appear in calendar report for:

- A calendar day when calendar is in month or year view
- The top 'full day' section of a calendar day when a calendar is in day or week view

Events that exceed this value are visible via a link in the calendar cell. See *glide.report.calendar.max_more_events_per_day* for more information.

- Type: integer
- Default value: 3
- Location: Add the property to the System Property [sys_properties] table.

glide.report.new_calendar

Enables (**true**) or disables (**false**) new calendar reports. Internet Explorer 7 and 8 do not support new calendars. If you open a calendar report in one of these browsers, the old version of calendar reports is always used.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.report_home.group_report.show_usr_grp

Enables (**true**) or disables (**false**) the Reporting preferences link in the user profile.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.required.attribute.enabled

Flag for enforcing required attributes (cannot be null) during identification and reconciliation.

- Type: true | false
- Default value: true
- Location: System Properties [sys_properties] table.

glide.rest.apis.disabled

Controls which REST APIs are available on the instance, along with glide.rest.apis.enabled. The value for this property is a comma-separated list of API names, such as Table API or Aggregate API. If neither this property nor glide.rest.apis.enabled is set, all REST APIs are available. If a particular API is specified in both properties, that API is disabled. If you disable specific APIs without explicitly enabling any APIs, all REST APIs except the disabled APIs are available.

- Type: string
- Default value: all REST APIs are enabled by default
- Location: System Property [sys_properties] table

glide.rest.apis.enabled

Controls which REST APIs are available on the instance, along with glide.rest.apis.enabled. The value for this property is a comma-separated list of API names, such as Table API or Aggregate API. If neither this property nor glide.rest.apis.disabled is set, all REST APIs are available. If a particular API is specified in both properties, that API is disabled. If you enable specific APIs, only those APIs are available.

- Type: string
- Default value: all REST APIs are enabled by default
- Location: Add the property to the System Property [sys_properties] table.

glide.rest.choice.allow_non_existing_value

Enables passing non-existing values to a choice field. Does not apply to Change REST API /api/sn_chg_rest/change.

- Type: true | false
- Default value: false

  If **true**, the choice field is set to a passed value, even if the passed value does not exist in the choice field.

- Location: Add the property to the System Property [sys_properties] table.

glide.rest.debug

Logs all stages of REST processing, including processing times.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.rest.replace_request_host_with_property

Ensures that generated links in an API payload, such as links to more pages and reference fields, are based off of the instance address not the request host address.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.rest.serialize.disable_response_stream_buffering

Enables streaming multipart responses immediately rather than buffering responses until complete. This property applies to only REST APIs that support multipart requests, such as the *Batch* API, and instances configured with Application Delivery Controller, version 2 (ADCv2).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.rollback.version

Controls whether rollback behavior is used (**true**) or not (**false**).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.rss.max_rows

Controls the maximum number of records returned by the RSS Feed Generator.

- Type: integer
- Default value: 1000
- Location: Add the property to the System Property [sys_properties] table.

glide.sc.reset_cascade

If **true**, forces variable cascading when navigating between pages in an order guide.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.schedules.repeat_nth

Controls how a schedule entry with **Repeats** set to **Monthly** and **Monthly Type** set to **Day of the Week** is defined. Choices are **Week** or **Day**. The **Week** option is defined as choosing a day of the month in the nth week selects the nth day of the month. The **Day** option is defined as choosing the nth day of the month selects the nth day of the month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: choice list
- Default value: day
- Location: System Property [sys_properties] table

glide.schedules.fifth

Controls how a schedule entry that selects the fifth occurrence of a day in month behaves in a month containing only four occurrences of the day. Choices are **Last**, **Next**, and **Strict**. The **Last** option selects the last (fourth) occurrence of the day. The **Next** option selects the first day of the next month. The **Strict** option skips the day completely. This property is valid only when the *glide.schedules.repeat_nth* property is set to **Day**.

- Type: choice list
- Default value: last
- Location: System Property [sys_properties] table

glide.script.ccsi.ispublic

Provides privacy control over client-callable script includes that are accessed by public pages. If **false**, all client-callable script includes are private.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.script.dot_walk.enforce_cross_scope_access_all_tables

Used to enforce dot-walk cross-scope access checks on tables where the associated dictionary attribute *enforce_dot_walk_cross_scope_access* is not set.

Important: If *glide.script.dot_walk.log_and_allow_violations* is set to **true**, the value of this property is ignored.

See KB2793170: Dot-Walk Scoping Security Enhancement for more information.

- Type: boolean
- Default value: true for new and zBooted Instances on Australia; not present for instances upgraded to Australia
- Location: Add the property to the System Property [sys_properties] table.

Note: To help prevent insecure configurations, this property cannot be manually added and set to **false**. For assistance, contact customer support.

glide.script.dot_walk.log_and_allow_violations

Allows dot-walk cross-scope access to unauthorized tables and logs the violation.

When set to **true**:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- JavaScript accessing a caller restricted table without the proper Cross-Scope Privilege (CSP) or Restricted Caller Access (RCA) records via dot-walk will be allowed to proceed
- A log message will be written to the application node log file
- The message may be displayed to the end user if the session is interactive

When set to **false**, system behavior is determined by the *glide.script.dot_walk.enforce_cross_scope_access_all_tables* property and the presence and value of the table attribute *enforce_dot_walk_cross_scope_access* on an individual table.

See KB2793170: Dot-Walk Scoping Security Enhancement for more information.

- Type: boolean
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.script.log_level

Controls the behavior of gs.log. Set this property to **none** to disable Glide script logging, or to **print** to save log data to the file system instead of the database. Use the default value **all** to save all Glide script logs to the database.

- Type: string
- Default value: all
- Location: Add the property to the System Property [sys_properties] table.

glide.script.dot_walk.log_stack_trace_when_blocked

When conditions prevent access to a protected table, a brief info message is displayed in the following format: "An attempt to dot-walk to table {0} present in {1} scope from {2} scope..." where appropriate values for {0}, {1}, and {2} are inserted.

When this property is set to **true**, a full stack trace is included with the log message.

When this property is set to **false**, no stack trace is included with the log message.

See KB2793170: Dot-Walk Scoping Security Enhancement for more information.

- Type: boolean
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.script_processor.admin

Specifies the user role necessary to access the Scripts - Background module. To require administrators to elevate privileges to access the module, set the value to **security_admin**.

- Type: string
- Default value: admin
- Location: Add the property to the System Property [sys_properties] table.

glide.script.use.sandbox

Enables the "script sandbox" feature. The script sandbox is mainly used when executing client-generated scripts such as query conditions and GlideAjax

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

expressions. For more information, see Enable script sandbox [Updated in Security Center 1.3].

- Type: true | false
- Default: true
- Location: System Property [sys_properties] table

glide.script.vtable.log.debug

Enables use of debug logs for remote table script definitions. Set this property to **true**. Prolonged use of this property can affect performance, so it is best to set its value to **false** when you finish a debugging session.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.search.suggestions.enabled

Set it to **true** (default) to enable search suggestions, or set it to **false** to disable search suggestions everywhere. For more information about search suggestions, see Enable search suggestions.

glide.secondary.query.sysid

Controls whether a secondary sort using sys_id as a sort key is automatically applied when sorting requested database records on a list. This property is useful when sorting records that have multiple records found for a single value of the primary sort key. Use this property to ensure that the **Next / Previous** buttons on forms display the proper record. If **false**, there is no secondary sort, therefore records with the same primary sort value are returned as they are found in the database and may be inconsistent.

Note:

- Setting this property to **true** may impact the load and sort processes.
- Secondary sorting using the sys_id is not supported by Document Tables and the ElasticSearch integration in Health Log Analytics. Primary sorting is used instead.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.security.auto.resubmit.ajax

Automatically resubmits timed-out Ajax requests.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.security.checkacl.before.setvalue

Controls how the high security setting glide.security.strict.updates processes ACLs. When **true**, the instance checks ACL rules for all columns before applying any updates to a row. When **false**, the instance applies ACL rules as each column is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

processed in alphabetical order. This behavior may result in one update preventing another update from occurring. For example, suppose that you create a custom ACL rule to prevent updates after a record is closed. If you attempt to close an incident and also add information to a custom resolution code field in the same update, the close action is applied first because it is controlled by the [incident.state] column and the custom field by the [incident.u_resolution_code] column. After the instance applies the close action, the custom ACL rule prevents further write updates to the row.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.security.csrf.handle.ajax.timeout

Handles errors for timed out Ajax requests.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.security.csrf.strict.validation.mode

Enforces strict validation on CSRF tokens so that users cannot resubmit a request if the CSRF token does not match.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: CSRF strict validation (instance security hardening)

glide.security.diag_txns_acl

Controls who can view the stats.do, threads.do, and replication.do pages. If **true**, only administrators or users from a known IP address are allowed to view the pages. If **false**, all users have access to the pages.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.
- Instance Security Hardening Settings: Performance monitoring (ACL) (instance security hardening)

glide.security.disable_ui_pages_sysparm_client_script

The system does not evaluate client scripts that are passed in URL parameters in UI pages. If you use URL parameters to load client scripts, you can add and disable this system property. Use this property only while you change the implementation to no longer depend on clients being passed in by URL parameters. Do not keep the system property disabled.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.security.file.mime_type.validation

Enables (**true**) or disables (**false**) MIME type validation for file attachments.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: Restrict uploaded MIME types

glide.security.granular.create

Requires users to have write access on all individual fields on a table before they can create a record in that table.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.security.manager

Enables more advanced contextual security manager compared with role-based simple security manager. Contextual security manager is aware of system table hierarchy and record context. It better protects data by controlling CRUD via ACL rules on table and field levels. For more information, see Enable the hardened java security manager

- Type: string
- Default: com.glide.sys.security.ContextualSecurityManager
- Location: System Property [sys_properties] table

glide.security.mime_type.aliasset

Creates customized mime type alias sets. For example, `image/png=image/x-png`.

- Type: string
- Location: Add the property to the System Property [sys_properties] table.

glide.security.strict_elevate_privilege

Forces all elevated roles to be treated equally for users with the administrator role. When enabled, administrators must explicitly, manually elevate themselves to any roles that are marked as elevated.

When disabled, administrators need only to manually elevate to the security_admin role. Other roles are automatically granted to administrators.

- Type: true | false
- Default value: **true** for new instances, **false** for upgraded instances
- Location: For new instances, this property is available on the System Property [sys_properties] table. For upgrades, Add the property to the System Property [sys_properties] table.

glide.security.use_csrf_token

Enables usage or a secure token to identify and validate incoming requests. This token is used to prevent Cross Site Request Forgery (CSRF) attacks. For more information, see Enable anti-CSRF token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default: true
- Location: System Property [sys_properties] table

glide.service_portal.search_as_you_type_behavior

Select search suggestions (Suggestions) or type-ahead functionality (Typeahead). For more information about search suggestions, see Enable search suggestions.

glide.set_x_frame_options

Enables (**true**) or disables (**false**) the X-Frame-Options response header to SAMEORIGIN for all UI pages. The X-Frame-Options HTTP response header can be used to indicate whether a browser should be allowed to render a page in a <frame> or <iframe>. Set this property to **true** to avoid clickjacking attacks, by ensuring that CMS content cannot be embedded into other sites.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: Implement the x-frame-options: SAMEORIGIN security header

glide.short_poll_delay

(Chat plugin) Sets the short polling delay, in milliseconds, for XMPP requests. Polling is the method by which the browser gets information from the server to send instant messages in chat.

- Type: integer
- Default value: 1000 (1 second)
- Location: **Social IT** > **Chat Administration** > **Properties**

glide.shortened_journal_length

Sets the number of characters to display as a preview of journal input fields.

- Type: integer
- Default value: 512000
- Location: Add the property to the System Property [sys_properties] table.

glide.smtp.dateformat

Specifies the date format to use for outgoing email notifications

- Type: string
- Default value: date format [sys_user.date_format] listed in the user record of the email sender.
- Location: Add the property to the System Property [sys_properties] table.

glide.smtp.default_retry

Enables (**true**) or disables (**false**) resending email when an unknown SMTP error code is encountered. The instance recognizes only the SMTP error codes defined in the *glide.smtp.defer_retry_ids* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Email**

glide.smtp.defer_retry_ids

Specifies the comma-separated list of SMTP error codes that force the instance to resend email.

- Type: string
- Default value: 421,450,451,452
- Location: **System Properties** > **Email**

glide.smtp.fail_message_ids

Specifies the comma-separated list of SMTP error codes that prevent the instance from resending email.

- Type: string
- Default value: 500,501,502,503,504,550,551,552,553,554
- Location: **System Properties** > **Email**

glide.smtp.timeformat

Specifies the time format to use for outgoing email notifications.

- Type: string
- Default value: time format listed in email sender's user record [sys_user.time_format].
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.allow_null_numeric_output

When **true**, SOAP XML responses return an empty element for numeric fields with no value. When **false**, numeric fields with no value return a value of 0 in the SOAP response.

Note: The property *glide.wsdl.show_nillable* must be **true** to allow null values in SOAP responses.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.default_security_policy

Specifies the name of SOAP security policy the instance uses when enforcing Web Services Security (WSS) for inbound requests.

- Type: string
- Default value: default security policy
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.import_set_insert_serialized

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controls the processing of web service inserts. If **true**, the instance processes multiple simultaneous inserts one at a time (serially across nodes) to ensure an accurate transform. Serialized processing slows the speed at which the instance processes inserts. If **false**, multiple simultaneous inserts into an import set table result in simultaneous transforms that may produce duplicate target records due to the coalesce value being created at the same time.

Note: Set this value to **false** only to optimize performance when the related transform map does not have a coalesce value that may be present simultaneously.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.soap.request_processing_timeout

Sets the maximum number of seconds that a SOAP request has to finish processing before the connection times out. This property computes a default value from the value of the property *glide.http.timeout* divided by 1000. There might be network infrastructure (such as proxy servers) in place that implements a shorter timeout. In this case, a socket timeout may occur unless this property is set to a shorter value. In general, you should set this property to a value several seconds less than the shortest socket inactivity timeout in effect anywhere in the network path between the client application and the ServiceNow instance.

- Type: integer
- Default value: 175 (value of *glide.http.timeout* divided by 1000)
- Location: System Property [sys_properties] table

glide.source_control.checksum_required

This property allows you to enable optional checksum validations and sanitizations. When set to **true**, continues to throw an error if the checksum validation of application files fails. This action prevents application developers on your instance from importing application files from source control that have been modified outside of an instance.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.source_control.checksum_quick_install

When set to **true**, bypasses the sanitization step(s) if the checksum matches. This action prevents an application developer from waiting for validation/sanitization steps to be processed if application files linked to a source control repository outside of your instance weren't modified.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.source_control.default_branch_name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sets the default GIT repository branch to work in for application files linked to source control.

- Type: string
- Default value: sn_instances/<instance_name>
- Location: System Property [sys_properties] table

glide.spell.dictionary.en

Sets the spell checker dictionary used in the system for English users. Dictionaries are available for Brazilian Portuguese (pb.dic), Czech (cs.dic), Dutch (nl.dic), English US (en.dic), English UK (en_uk.dic), Estonian (et.dic), Finnish (fi.dic), French (fr.dic), German (de.dic), Hebrew (he.dic), Hungarian (hu.dic), Italian (it.dic), Polish (pl.dic), Portuguese (pt.dic), Russian (ru.dic), Spanish (es.dic), and Thai (th.dic).

- Type: choice list
- Default value: en.dic (English US)
- Location: System Property [sys_properties] table

glide.spell.dictionary.max_matches

Specifies the maximum number of spelling errors that the spell-check should detect. By default, spell-check finds only 10 spelling errors. The instance ignores any additional errors after reaching the maximum value.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

glide.split_journal_audit_records

When set to **true**, ensures one-to-one mapping between [sys_journal_field] table and [sys_audit] table records for consistent synchronization. If *glide.history_set.pull_journal_entries_from_journal_table* is set to **true** and there are missing or duplicate comments in the activity stream, setting *glide.split_journal_audit_records* to **true** might resolve the issue. For more details, see Duplicate/Missing Comments in Activity Stream (UI 16) [KB2122007].

- Type: true | false
- Default value: false
- Location: Add a system property to the System Property [sys_properties] table.

glide.stax.allow_entity_resolution

Determines whether XML entities can be expanded during parsing by the streaming parser. For more information, see Disable Entity Expansion within the XMLDocument2 Streaming Parser.

- Type: true | false
- Default: false
- Location: System Property [sys_properties] table

glide.stax.whitelist_enabled

Enables definition of allowed external entities when entity expansion is needed for customizations. If *glide.stax.allow_entity_resolution* is set to true,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

set *glide.stax.whitelist_enabled* to true and define a listing of comma-delimited FQDN in the *glide.xml.entity.whitelist* property. For more information, see Require XMLdoc2 entity validation with allowlist.

- Type: true | false
- Default: true
- Location: System Property [sys_properties] table

glide.sys.activity_using_audit_direct

[Not Supported] Controls whether the record's history is generated using the Audit table (**true**) or not (**false**).

[Required] Set the value to **false** to generate history with History Sets.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.sys.audit_inserts

Specifies whether the Audit table audits inserts (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.sys.date_format

System date format for all users unless overridden in the user record.

- Type: date format
- Default value: yyyy-MM-dd
- Location: **System Properties** > **Basic Configuration U116**

glide.sys.default.tz

System timezone for all users unless overridden in the user's record.

- Type: timezone
- Default Value: none
- Location: **System Properties** > **Basic Configuration UI16**

glide.sys.domain.domain_change_notify

Domain legacy

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.sys.domain.no_change_roles

Domain legacy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: This field should be left empty.
- Location: System Property [sys_properties] table

glide.sys.domain.use_record_domain

Domain legacy

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.sys.domain.use_record_domain_for_client_scripts

Domain legacy

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.sys.fencing.restricted_caller_access.invalidation_mode

Controls how the system invalidates Restricted Caller Access records when a source code record, such as a script include, in a cross-scope access table is committed in an update set. For more information about RCA privileges, see Restricted caller access privilege settings.

- Type: string
- Default value: DB_LISTENER
- Valid values:
  - DB_LISTENER: Enables a database listener that monitors update set commits on source code tables and invalidates RCA records at the time of the commits so that cross-scope access is based on the latest source code updates.
  - SCRIPT_ENGINE: If an update set contains a script with changes, the script engine doesn't invalidate associated RCA records.
- Location: Add the property to the System Property [sys_properties] table.

glide.sys.time_format

System time format for all users unless overridden in the user's record.

- Type: time format
- Default Value: HH:mm:ss
- Location: **System Properties** > **Basic Configuration UI16**

glide.sys_reference_row_check

Specifies whether the script conditions of Access Control Rules apply to a table's reference fields (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the *glide.sys_reference_row_check* system property is not present, or has been set to false, script conditions for Access Control Rules are not applied. This means an ACL containing scripted conditions will pass it's check as long as the other ACL criteria are met (such as role requirements).

glide.template.max_context

Specifies the maximum number of templates displayed in a form's context menu. If more than this number are available, users can click **Apply Template** on the context menu to open the reference list of templates.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

glide.transform.reuse_coalesce_field_value

If **true**, avoid re-evaluation of coalesce scripts to get the values.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.translated_html.sanitize_all_fields

If **true**, all translated_html elements are sanitized using an HTML sanitizer. If **false**, an element is sanitized only if the dictionary attribute *html_sanitize* is set to **true**.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ts.index.attachment.debug

If **true**, enables log messages for exceptions that occur when indexing attachments. You can leave this property enabled during normal operations to capture stack trace information about any exceptions.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ts.index.attachment.list_terms.debug

If **true**, the system logs all indexed terms when an attachment is indexed.

For optimal performance, set this property to **false** during normal operations. Only enable this property when you are actively debugging an issue.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ts.reindex.sys_metadata.after.upgrade

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If **true**, the system automatically reindexes the sys_metadata table after an upgrade, without noticeable performance impact. To disable automatic reindexing, set the value to **false**.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity.displayname

Specifies whether the activity formatter shows **name** values (true) or **user_name** values (false).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity.email_roles

Specifies the list of roles (comma-separated) that can view email in the Activity Formatter.

- Type: string
- Default value: itil
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity.email.use_display

Specifies whether to display the email address or the user IDs (display value of the User table) in email headers (**true**) or not (**false**). If **true**, the instance searches for a user record with a matching email address. If the instance cannot find a matching user record, it displays the email address.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.form_button

Removes the activity stream button from forms.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.list_button

Removes the activity stream button from lists.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.page_size

Size of pages for Core UI form activity stream. A value of 0 means no paging.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 0
- Location: Still appears in the System Properties [sys_properties] table, but is no longer available.

glide.ui.activity_stream.scale_animated_gifs

Creates a thumbnail of animated `.gif` files. The maximum dimensions are 525 px width and 350 px height. The animation is not preserved in the thumbnail, but previewing the image displays the animation at its original size.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.activity_stream.scale_images

Creates a thumbnail of large images to display in the activity stream. The maximum dimensions are 525 pixels wide and 350 pixels high. If the user clicks the image or attachment, the preview is at full size.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.activity_stream.style.comments

Changes the color of the left bar in activity stream comments in Core UI.

- Type: color entry, either a name, such as **blue** or a code, such as **#0000FF**.
- Default value: transparent
- Location: System Property [sys_properties] table

glide.ui.activity_stream.style.work_notes

Changes the color of the left bar in activity stream work notes in Core UI.

- Type: color entry, either a name, such as **blue** or a code, such as **#0000FF**.
- Default value: gold
- Location: System Property [sys_properties] table

glide.ui.activity.style.comments

Changes the background color of the activity stream comments in UI15.

- Type: string
- Default value: background-color: background-color: WhiteSmoke
- Location: System Property [sys_properties] table

glide.ui.activity.style.work_notes

Changes the background color of the activity stream work notes in UI15.

- Type: string
- Default value: background-color: LightGoldenRodYellow
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.ui.allow.field.dependency.for.templates

Checks dependency for choice fields at the time of applying template, preventing invalid values to be set to the dependent field. For example, a subcategory field which depends on category field.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.allow_deep_html_validation

Allows administrators to prevent users from saving invalid HTML in a journal field.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.attachment.force_download_all_mime_types

Forces download of all MIME attachment files.

- Type: true | false
- Default value: true for new instances, false for upgraded instances
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: Restrict Downloadable MIME types

glide.ui.audit_deleted_tables

Comma-separated list of system tables for which the audit history tracks deletions.

- Type: string
- Default value: sys_user, sys_user_group, sys_user_role, sys_user_has_role, sys_user_grmember, sys_group_has_role, sys_security_acl_role
- Location: System Property [sys_properties] table

glide.ui.auto.recovery

Allows users to recover unsaved changes while working in the Studio.

- Type: true | false
- Default value: true
- Location: **Auto Recovery** > **Properties**

glide.ui.auto.recovery.exclude.field.types

Comma-separated list of field types to exclude from automatic recovery.

- Type: string
- Default value: none
- Location: **Auto Recovery** > **Properties**

glide.ui.auto.recovery.unsupported.field.types

Comma-separated list of field types no supported for automatic recovery.

- Type: string
- Default value: password,password2,glide_encrypted,video,user_image,image

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.ui.auto.recovery.unsupported.tables

Comma-separated list of tables to exclude from automatic recovery.

- Type: string
- Default value: v_ws_editor
- Location: **Auto Recovery** > **Properties**

glide.ui.auto_req.extend.session

If **true**, enables the user to extend their user session by selecting a homepage refresh time. If **false**, it enforces session timeout. The session timeout value is ignored when the user specifies an automatic refresh value.

For example, if the user selects **5 minutes** for automatic homepage refresh, the session is renewed every five minutes. By adding this property and setting the value to **false**, administrators can force the user session to time out even if the user page refreshes every **x** number of minutes. The user session times out after the value specified in the session timeout, plus the selected refresh value. This property takes effect when the **Remember me** check box is not selected for the user. Tablet and mobile devices do not support this feature.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.breadcrumb_max_entries

Specifies how many choices will be shown in the condition builder breadcrumb.

- Type: integer
- Default value: 10
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.buttons_bottom

Controls whether UI actions appear at both the bottom and top of the form (**true**) or only at the top (**false**). This property only works in a deprecated version of the UI.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.cert_task_activity.fields

Defines which journal field is the task activity field.

- Type: string
- Default value: work_notes
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.bar.horiz.max_col_slant_labels

Sets the maximum number of columns in a horizontal bar chart before slanting (angling) the labels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 5
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.height

Specifies the height of a chart in pixels.

- Type: integer
- Default value: 300
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.pie.labels

Enables (**true**) or disables (**false**) labels on pie chart slices.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.chart.pie.labels.max_items

Sets the maximum number of pie chart slice values that can be returned to display their labels.

- Type: integer
- Default value: 8
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.choice.display_none

Controls the label displayed for the empty option in choice fields. Set to **true** to display **None**. When set to **false**, displays the default **--None--** label.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.clickthrough.popup

- For reference fields, enables (**true**) or disables (**false**) display of the pop-up diamond icon for reference fields, and opening a new window when clicking the icon.
- For document ID fields, enables (**true**) or disables (**false**) displaying the information icon and opening a pop-up window with the document's form. To learn more Document ID field.

Note: Related lists do not appear on forms opened in the pop-up window.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.clickthrough.replace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enables (**true**) or disables (**false**) both the pop-up and click-through icons for reference fields.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.date_format.first_day_of_week

Specifies which day of the week that weeks start on for calendar reports (1=Sunday, 2=Monday...).

- Type: integer
- Default value: 1
- Location: System Property [sys_properties] table

glide.ui.date_picker.first_day_of_week

Specifies the first (leftmost) day of the week for the date and date/time picker (1=Sunday, 2=Monday...).

- Type: integer
- Default value: 1
- Location: System Property [sys_properties] table

glide.ui.default.applications

Comma-separated list of application names that open by default in the navigation pane when nothing is opened via user preferences. If the property is specified and is blank, no applications are opened in the navigation pane when no applications are opened via user preferences. If the property is not specified, the first application that is authorized for the user opens if no applications are opened via user preferences.

- Type: string
- Default value: first authorized application for the user
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.dirty_form_support

Enables (**true**) or disables (**false**) display of a confirmation message when a form has unsaved changes and the user leaves the form through any means except a submit (such as using the green back arrow, any form button, or other). This property is not supported in Safari.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.email.composer.enabled_plugins

These plugin options are for Seismic Email Client. Removing plugins could cause undesirable side effects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default values: link lists advlist table powerpaste searchreplace preview fullscreen placeholder readonlynoborder code image align_listitems emoticons anchor charmap media
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.email.composer.toolbar

These toolbar options are for Seismic Email Client.

- Type: string
- Default values: newdocument bold italic underline | strikethrough alignleft aligncenter alignright alignjustify | blocks fontfamily fontsize table cut copy paste | pastetext searchreplace bullist numlist outdent indent blockquote | undo redo link unlink code forecolor backcolor removeformat | hr visualblocks preview subscript superscript charmap image media fullscreen
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.encode_module_uri

Enables (**true**, the default) or disables (**false**) encoding of module URIs in the navigation pane. For information about how ServiceNow encodes module URIs, see Encoding module URIs.

glide.ui.escape_form_message

Specifies whether strings in `GlideForm` functions are sanitized to remove unwanted code (true) or not (false).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.escape_gwindow_message

Specifies whether strings in `GlideWindow` functions are sanitized to remove unwanted code (true) or not (false).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.export.choice_list_max_characters

Sets the maximum number of characters that will be included from a condition field type in an export to Microsoft Excel, as well as the maximum number of characters displayed in the list view condition builder in Core UI. (Note: This property has no effect on the length of condition field values in tables.)

- Type: integer
- Default value: 80
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.filter.first_day_of_week

Identifies the first day of the calendar week for the company. By default, the start of the week is Monday, meaning that the calendar week begins with Monday and ends with Sunday. To change this behavior, add the property

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.ui.filter.first_day_of_week to the instance as an integer property. Set the value to the integer corresponding with the day of the week that the calendar begins on, where 1 is Sunday, 2 is Monday, and so on. The function impacts all charts and calculations where the day of the week is used as a parameter.

- Type: integer
- Default value: 2
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.first.field.reference

Enables (**true**) or disables (**false**) having the first column in a list always link to the underlying record, even if it is a reference field. For example, if the first column on an Incident list is **Assigned to**, that value links to the Incident if this property is set to **true**.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.form_annotations

Enables (**true**) or disables (**false**) form annotations, which allow you to add Custom, Section Separator, and Line Separator to a form.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.form_multiple_splits

Enables (**true**) or disables (**false**) multiple splits and end splits in the form layout configuration slushbucket.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.gauge.view

Defines which view you want to be the default for homepage gauges.

- Type: string
- Default value: portal
- Location: System Property [sys_properties] table

glide.ui.glide_list.start.locked

Controls whether a glide_list (like the watch list) starts out locked (**true**) or unlocked (**false**) on a form.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.goto_use_contains

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controls whether the **Go to** navigation performs a "contains" query (**true**) or a "greater than" query (**false**) by default.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.homepage.parallel

Enables (**true**) or disables (**false**) use of parallel rendering.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.homepage.parallelism

Sets the maximum number of threads that should cooperate on rendering any given homepage.

- Type: integer
- Default value: 2
- Location: System Property [sys_properties] table

glide.ui.homepage.preview

Enables (**true**) or disables (**false**) displaying the preview icon for lists on the homepage.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.html.editor

Specifies which HTML field editor to use, TinyMCE or htmlArea (legacy).

- Type: string
- Default value: tinymce
- Location: **System Properties** > **UI Properties**

glide.ui.html.editor.default_target_link

Enables you to set a default target value for links in the TinyMCE.

- Type: string
- Default value: ''
- Location: System Property [sys_properties] table

glide.ui.html.editor.extended_valid_elements

Defines which elements remain in the TinyMCE text when the editor saves. This functionality can be useful to add or override specific elements that should be kept.

- Type: string
- Default value: blank
- Location: System property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.ui.html.editor.toolbar.line1

Configures the editing toolbar (first line) for HTML fields when TinyMCE is enabled. The **spellchecker** tool is not supported in Core UI or UI15.

- Type: string
- Location: **System Properties** > **UI Properties**

glide.ui.html.editor.toolbar.line2

Configures the editing toolbar (second line) for HTML fields when TinyMCE is enabled. The **spellchecker** tool is not supported in Core UI or UI15.

- Type: string
- Location: **System Properties** > **UI Properties**

glide.ui.html.editor.v4.paste.html_import

Controls how content being pasted from sources other than Microsoft Word is filtered. This includes content copied from TinyMCE itself.

- Type: choice list
- Default value: clean
- Location: System Property [sys_properties] table

glide.ui.html.image.allow_url

Enables (**true**) or disables (**false**) uploading an image via URL from HTML Fields.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.html.editor.remove_trailing_brs

Specifies whether an empty line containing a `<br>` tag is converted to a `<div> </div>` tag for TinyMCE HTML fields. If **true**, the tag is converted. If **false**, the tag is left as `<br>`.

- Type: true | false
- Default value: true
- Location: **System Properties** > **UI Properties**

glide.ui.html.toolbar

Configures the editing toolbar for HTML fields.

- Type: string
- Default value: list of buttons
- Location: **System Properties** > **UI Properties**

glide.ui.incident_activity.fields

Defines what fields are visible in the activity formatter. If the activities are customized, the system updates this property automatically.

- Type: string
- Default value: list of fields
- Location: **System Properties** > **UI Properties**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.ui.incident_activity.max_addresses

Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

- Type: string
- Default value: 5
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.incident_alert_activity.fields

Incident communication plan activity formatter fields — the list of fields tracked from the Incident Communication Plan form in the activity formatter.

- Type: string
- Default value: opened_by, work_notes, comments, severity, estd_distruption_time, actual_disruption_time
- Location: System Property [sys_properties] table

glide.ui.jelly.js_interpolation.protect

Enables or disables interpolation protection. If enabled, potentially dangerous Jelly expressions are wrapped with a filter that escapes the results or generates a SecurityException for possible security issues. For more information, see Enable Jelly JS interpolation protection.

- Type: true | false
- Default value: true
- Location: **System Properties** > **All Properties**

glide.ui.jelly.js_interpolation.protect_nested_expressions

Enables or disables interpolation protection specifically for nested Jelly expressions. For more information, see Enable Jelly JS interpolation protection for nested expressions.

- Type: true | false
- Default: true
- Location: System Properties [sys_properties] table

glide.ui.journal.use_html

Specifies whether TinyMCE is available for journal fields (**true**) or not (**false**).

- Type: true | false
- Default value: false

glide.ui.js_error_notify

Displays client script errors to users with the **client_script_admin** role. Also displays a generic error message to other users who encounter a client script error.

- Type: true | false
- Default value: true
- Location: **System Properties** > **All Properties**

glide.ui.label.enable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enables (**true**) or disables (**false**) using labels, such as Most Active, Most Recent, or user-created.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.m.clear_pasteboard_when_backgrounded

Clears the copy/paste clipboard when the application enters the background.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table. In Categories, add the mobile_post_auth category.

glide.ui.max_calendar_duration

Maximum number of days that a single calendar report entry can display.

- Type: integer
- Default value: 90
- Range of possible values: 90 to 400
- Location: System Property [sys_properties] table

glide.ui.max_calendar_records

Maximum number of records saved in a calendar report.

- Type: integer
- Default value if the property is not configured: 10,000
- Location: System Property [sys_properties] table

glide.ui.m_agents

Comma-separated list of browser agents considered as mobile browsers for the Smartphone Interface. These browsers are directed to the mobile pages instead of the full browser pages.

- Type: string
- Default value: iphone,android_phone,IEMobile,Windows Phone,iPod,Windows CE,BlackBerry,BB10
- Location: System Property [sys_properties] table

glide.ui.max_ref_dropdown

Maximum number of records for a reference field that is displayed as a choice list. If the number of available records is greater than this value, the field appears as a reference field, not as a choice list.

- Type: integer
- Default value: 25
- Location: System Property [sys_properties] table

glide.ui.mentions.default_limit

Number of users with same name displayed in Activity Stream Compose editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 5
- Location: System Property [sys_properties] table

glide.ui.mobile_agents

Comma-separated list of browser agents considered as mobile browsers for the Legacy Smartphone Interface. These browsers are directed to the mobile pages instead of the full browser pages.

- Type: string
- Default value: iPod,Windows CE,BlackBerry,Android,Opera Mini,IEMobile,Windows Phone,iphone
- Location: System Property [sys_properties] table

glide.ui.nav.stripe.select.maxchars

Numerical character limit for list menu choices within the nav stripe. The nav stripe appears at the top of the page when using UI11.

- Type: integer
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.personalize_form

Enables the Personalize Form menu.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.personalize_form_role

Determines which roles can access the Personalize Form menu.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

glide.ui.polaris.experience

Enables the Next Experience user interface, landing page, and Unified Navigation. For more information, see Next Experience UI.

This property does not affect anything in workspaces, such as Platform Analytics Components. Workspaces, UI Builder, and related features are always enabled.

- Type: true | false
- Default value: true on new instances, false on upgrades from Tokyo or earlier.
- Location: The System Property [sys_properties] table

glide.ui.polaris.global_search

Toggles the Next Experience search function.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true when *glide.ui.polaris.experience* is true.
- Location: The System Property [sys_properties] table

glide.ui.polaris.history.url.param_blocklist

URL parameters that are excluded when the system identifies and clears duplicate URLs from the history. This property applies only to the Next Experience Unified Navigation, which is enabled when *glide.ui.polaris.experience* is true.

- Type: string
- Default value: ["tinyId"]
- Location: The System Property [sys_properties] table

glide.ui.polaris.list_style.enable_highlighted_value_style

Enables highlighted value style on list cells. This property applies only when *glide.ui.polaris.experience* is true.

- Type: true | false
- Default value: true when *glide.ui.polaris.experience* is true.
- Location: The System Property [sys_properties] table

glide.ui.polaris.login.show_illustrations

Enables display of illustrative graphics on the stylized login page. This property applies only when *glide.ui.polaris.experience* is true.

- Type: string
- Default value: true when *glide.ui.polaris.experience* is true.
- Location: The System Property [sys_properties] table

glide.ui.polaris.menus

Toggles the Unified Navigation menus in the header. This property applies only when *glide.ui.polaris.experience* is true, meaning that Next Experience Unified Navigation is enabled.

- Type: true | false
- Default value: true when *glide.ui.polaris.experience* is true.
- Location: The System Property [sys_properties] table

glide.ui.reference.readonly.clickthrough

Enables (**true**) or disables (**false**) reference pop-ups on read-only reference fields. Reference pop-ups and click-throughs are hidden by default if a client script, UI policy, or ACL makes the field read-only. Being able to see or click through to the target record is unrelated to the reference field being writable.

If **false**, the administrator can override the system setting for a specific field by adding the *readonly_clickthrough=true* attribute to the dictionary entry.

- Type: true | false
- Default value: false
- Location: **System Properties** > **UI Properties**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.ui.remember_view

Enables (**true**) or disables (**false**) use of user preferences for the last view.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.remember.me.default

Controls whether the **Remember me** check box is selected (**true**) or cleared (**false**) by default.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.report.extend_calendar_choices

Controls which field styles are applied during calendar highlighting. If **false**, field styles in only the Task table are used. If **true**, the calendar first uses field styles from the table that the report is based on. If no applicable styles exist in that table, the calendar uses field styles from the Task table.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.report.old_report_builder

Enables (**true**) or disables (**false**) use of the old report builder UI.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.section508

Enables (**true**) or disables (**false**) rendering of alternate text in place of images.

- Type: true | false
- Default value: false
- Location: **System Properties** > **UI Properties**

glide.ui.show_live_feed_activity

Enables (**true**) or disables (**false**) live feed for a record in the activity formatter.

- Type: true | false
- Default value: false
- Location: **System Properties** > **UI Properties**

glide.ui.show_template_bar

Controls whether the template bar can be displayed on the specified table. For example: `glide.ui.show_template_bar.incident = false`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.session_timeleft

Sets how much time, in minutes, users have to extend a session before it times out due to inactivity.

- Type: integer
- Default value: 2
- Location: System Property [sys_properties] table

glide.ui.active.session.life_span

Sets the maximum session time for sessions regardless of activity, in minutes.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.ui.session_timeout

Sets the inactive session timeout, in minutes.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

glide.ui.stream_icon

Toggles the displaying of the activity stream button on the specified table. For example: `glide.ui.stream_icon.hr_case = true`.

- Type: true | false
- Default value: false

glide.ui.syntax_editor.context_menu

Enables disables the context menu in script editor.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.syntax_editor.linter.eslint_config

Defines linting configurations using the ESLint utility.

- Type: string
- Default value: All recommended ESLint rules are enabled, except no-undef, no-unused-vars, no-empty, and semi.
- Location: System Property [sys_properties] table

glide.ui.table.labels

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Controls whether the system uses verbose labels for table names (**true**) or literal table names (**false**).

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.tablet_enabled

Enables (**true**) or disables (**false**) the tablet UI.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.tablet_agents

Uses the tablet UI if one of the specified strings (comma-separated) appears in the browser user_agent header.

- Type: string
- Default value: ipad,android_tablet
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.tablet.title

Displays the specified text as a brief page title for tablet UI.

- Type: string
- Default value: ServiceNow
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.tablet.title.ios_webapp

Displays the specified text as the default home screen icon label used in iOS version 6 and later.

- Type: string
- Default value: ServiceNow
- Location: **System Properties** > **Tablet UI Properties**

glide.ui.task.insert

Enables (**true**) or disables (**false**) the use of **Insert** and **Insert and Stay** options on tables derived from Task (such as Incident, Change, and Problem).

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.textarea.character_counter

When **true**, displays a count of available characters for journal and multi-line text fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.textarea_initial_rows

Sets the number of rows initially displayed for multiline form elements. When the element is selected for editing, it is expanded. Set this value to 0 or blank to ignore this property. This functionality is used to conserve space on a form when multiline elements take up too much space.

- Type: integer
- Default value: 0
- Location: System Property [sys_properties] table

glide.ui.update_on_iterate

Controls whether updates are saved (**true**) or discarded (**false**) when a user clicks the blue arrows on a form.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.ui_policy_debug

Enables (**true**) or disables (**false**) logging of UI policy processing in the JavaScript debug window

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.user_cookie.life_span_in_days

Sets the expiration time period for the 'remember me' cookie.

Note: When a user accesses an instance with 'remember me' enabled, the access resets the cookie expiration period until the maximum (glide.ui.user_cookie.max_life_span_in_days) life span limit is reached.

- Type: integer
- Default value: 15 (days)

Note: Maximum value 30.

- Location: System Property [sys_properties] table

glide.ui.user_cookie.max_life_span_in_days

Sets a maximum cap for the *glide.ui.user_cookie.life_span_in_days* cookie to expire before forcing a user to re-authenticate into the instance.

- Type: integer
- Default value: 30 (days)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Maximum value 365 days.

- Location: System Property [sys_properties] table

glide.ui.welcome.profile_link

Enables (**true**) or disables (**false**) allowing users to click their name in the welcome message and see their user profile.

- Type: true | false
- Default value: In new instances **true**. In existing instances **false**.
- Location: System Property [sys_properties] table

glide.ui11.show_switch_link

This property only affects a deprecated version of the UI. It is no longer supported. Displays (**true**) or hides (**false**) a banner link for switching between the UI11 and legacy interfaces.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.update.suppress_update_version

Comma-separated list of tables for which updates are not tracked in the Versions [sys_update_version] table. You cannot compare and revert versions for tables in this list.

- Type: string
- Default value: sys_user,sys_import_set_row
- Location: Add the property to the System Property [sys_properties] table.

glide.user.default_password

Default password for new users created from incoming email. Users must reset the password at first login.

- Type: string
- Default value: password
- Location: **System Properties** > **Email**

glide.userauthgate.extauth.check

Enables (**true**) or disables (**false**) the *`UserAuthenticationGate`* checks for both external and internal authentication mechanisms.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.user.trusted_domain

Comma-separated list of trusted domains for which the instance automatically creates a guest user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a "guest user" but does not create a guest user in the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: *
- Location: **System Properties** > **Email**

glide.workflow.model.cache.max

Maximum number of models held in the workflow cache. You must restart the instance after changing this property to apply the change.

- Type: integer
- Default value: 300
- Location: **Workflow** > **Properties**

glide.wsdl.definition.use_unique_namespace

Enables (**true**) or disables (**false**) use of a unique WSDL namespace value when publishing a ServiceNow table through web services. If **true**, the WSDL target namespace is www.service-now.com/<table name>.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.wsdl.maximum_hierarchy

Maximum number of hierarchical levels returned in a WSDL when hierarchical SOAP web service is enabled. This property has a maximum value of 3.

- Type: integer
- Default value: 3
- Location: Add the property to the System Property [sys_properties] table.

glide.wsdl.show_nillable

Enables (**true**) or disables (**false**) allowing a WSDL element to be valid if it has no element content despite a {content type} which would otherwise require content.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.ws.use_row_lock

If **true**, avoid using the current web service lock that applies before running the transform. Use the row lock that applies after the OnStart method.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.xmlhttp.excessive

Sets the number of items visible in the Available half of a many-to-many or one-to-many collection box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

glide.xmlprocessor.use_unload_format

Enables (true) or disables (false) unloading the XML using the display_value format. To unload using this format, add the parameter *useUnloadFormat=true* to the request URL.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

google.maps.auto_close

If **true**, automatically closes the current info window before opening a new one. Clear the check box to enable multiple pop-up windows to remain open at once.

- Type: true | false
- Default value: true
- Location: **System Properties** > **Google Maps**

google.maps.client

Client ID for Google Maps API for Business. This client ID authorizes production use of Google Maps API for Business. By default, this ID is provided by ServiceNow. ServiceNow may require you to purchase a separate Client ID based on your usage.

- Type: string
- Default value: gme-servicenow
- Location: **System Properties** > **Google Maps**

google.maps.key

Map key from Google, tied to the URL of the server. This key is the private key authorizing development use of Google Maps.

- Type: string
- Default value: empty
- Location: **System Properties** > **Google Maps**

google.maps.latitude

Starting latitude of the map. This value determines the starting latitude displayed in Google Maps.

- Type: string
- Default value: 36.008522
- Location: **System Properties** > **Google Maps**

google.maps.longitude

Starting longitude of the map. This value determines the starting longitude displayed in Google Maps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: -95.221764
- Location: **System Properties** > **Google Maps**

google.maps.max_items

Maximum number of items to display on the map. This setting determines how many icons can be displayed on a map.

- Type: integer
- Default value: 500
- Location: **System Properties** > **Google Maps**

google.maps.table

Table used by the map. This setting names the table containing the name, longitude, and latitude fields.

- Type: string
- Default value: cmn_location
- Location: **System Properties** > **Google Maps**

google.maps.zoom

Starting zoom level of the map (1 is the lowest).

- Type: integer
- Default value: 4
- Location: **System Properties** > **Google Maps**

help.base.default

(Context-Sensitive Help plugin) Sets the base URL for help contexts in which ServiceNow wiki is **false** and an absolute URL is not specified.

- Type: string
- Default value: http://servicenow.com/docs/?context=
- Location: System Property [sys_properties] table

help.base.servicenow

(Context-Sensitive Help plugin) Sets the base URL for help contexts in which ServiceNow wiki is **true**

- Type: string
- Default value: http://servicenow.com/docs/?context=
- Location: System Property [sys_properties] table

mid.server.rba_debug_powershell

Enables probe-level debugging for PowerShell probes. With this property enabled, PowerShell probes write detailed activity information to the MID Server log.

- Type: true | false
- Default value: false
- Location: **Orchestration** > **MID Server Properties**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

mid.version.override

Sets an override condition for the current version for all MID Servers in your environment. For more information on version control, see MID Server version control properties.

- Type: string
- Default value: none (If this property is left empty, the MID Servers get their version information from the mid.buildstamp property.)
- Location: Add the property to the System Property [sys_properties] table.

par_vis_config.data_source.can_select_indicator

Specifies roles (comma-separated) which can select indicators as data sources from the Data Visualization configuration panel. If empty, all users can select the indicator sources that they have access to.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

par_vis_config.live_refresh_rate_min_value

Specifies the minimum interval in seconds for the **Live refresh rate** setting in the Data Visualization configuration. If set, a user can still set an empty or 0 value.

- Type: integer
- Default value: 30 (seconds)
- Location: System Property [sys_properties] table

par_viz.table_data.max_data_points

Maximum number of data points for data visualization charts based on table sources.

- Type: integer
- Default value: 10000
- Location: System Property [sys_properties] table

par_viz.table_data.max_groups

Maximum number of groups to be displayed for data visualization charts based on table sources.

- Type: integer
- Default value: 50
- Location: System Property [sys_properties] table

password_reset.activity_monitor.incident_threshold

Specifies the maximum number of lockouts before an alert is issued.

- Type: integer
- Default value: 10 (lockouts)
- Location: System Property [sys_properties] table

password_reset.activity_monitor.incident_window

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specifies the amount of time that is used for recording and counting the number of user lockouts.

- Type: integer
- Default value: 60 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.captcha.ignore

Enables and disables CAPTCHA functionality.

The password reset application uses Google re-CAPTCHA as the default CAPTCHA service. To use the base system CAPTCHA, change the *password_reset.captcha.google.enabled* system property to *false*.

- Type: true | false
- Default value: false
- Location: **Password Reset** > **Properties**

password_reset.qa.num_enroll

Specifies the number of questions a user must select and answer to be enrolled in the password reset program.

Note: This security question property can be overridden by adding a value for the *num_enroll* parameter in a security question verification.

- Type: integer
- Default value: 5 (questions)
- Location: **Password Reset** > **Properties**

password_reset.qa.num_reset

Specifies the number of questions a user must answer to verify their identity during the password reset process.

Note: This security question property can be overridden by adding a value for the *num_reset* parameter in a security question verification.

- Type: integer
- Default value: 3 (questions)
- Possible values: integers that are less than the number specified for the *num_enroll* property.
- Location: **Password Reset** > **Properties**

password_reset.request.max_attempt

Specifies the number of password reset attempts a user has before they are locked out for a period determined by the value in *max_attempt_window*.

- Type: integer
- Default value: 3 (attempts)
- Location: **Password Reset** > Properties

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

password_reset.request.max_attempt_window

Specifies how long a user is locked out or prevented from changing their password after trying the maximum number of times.

- Type: integer
- Default value: 1440 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.request.retry_window

Specifies the length of time before the count for password reset attempts refreshes.

- Type: integer
- Default value: 1440 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.request.success_window

Specifies how long a user is locked out after they have successfully reset their password.

- Type: integer
- Default value: 10 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.sms.default_complexity

Specifies the number of characters in the SMS code that are required for a user to reset their password.

Note: This SMS code property can be overridden by adding a value for the complexity parameter in an SMS code verification.

- Type: integer
- Default value: 4 (digits)
- Location: **Password Reset** > **Properties**

password_reset.sms.expiry

Specifies the amount of time, in minutes, until the SMS code sent to the user expires.

Note: This SMS code property can be overridden by adding a value for the expiry parameter in an SMS code verification.

- Type: integer
- Default value: 5 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.sms.max_per_day

Specifies the maximum number of SMS codes that are sent to a user within one 24-hour period. When a user clicks the **Send Verification Code** button, the 24-hour period begins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This SMS code property can be overridden by adding a value for the *max_per_day* parameter in an SMS code verification.

- Type: integer
- Default value: 10 (per day)
- Location: **Password Reset** > **Properties**

password_reset.sms.pause_window

Specifies the amount of time to pass before another SMS code can be sent to a user.

Note: This SMS code property can be overridden by adding a value for the *pause_window* parameter in an SMS code verification.

- Type: integer
- Default value: 2 (minutes)
- Location: **Password Reset** > **Properties**

password_reset.wf.refresh_rate

Specifies how often to check the status of the workflow. Represented in the password reset process progress bar.

- Type: integer
- Default value: 90000 (milliseconds)
- Location: **Password Reset** > **Properties**

password_reset.wf.timeout

Specifies the maximum wait time, in milliseconds, for the workflow to execute. The workflow is triggered during the password reset request when the user clicks **Submit**.

- Type: integer
- Default value: 500 (milliseconds)
- Location: **Password Reset** > **Properties**

promin.show_records.limit

Specifies the maximum number of records that can be returned for an arc or node for the **Show Records** link to display. If more records are returned than the set limit, the link does not display.

- Type: integer
- Default value: 100,000 (records)
- Location: Add the property to the System Property [sys_properties] table.

remember_me.max_duration_in_days

Sets a maximum cap for the *remember_me_cookie.duration_in_days* cookie to expire before forcing a user to reauthenticate into the instance.

- Type: integer
- Default value: 30 (days)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Maximum value 365 days.

- Location: System Property [sys_properties] table

remember_me_cookie.duration_in_days

Sets the default expiration for the "remember me" cookie. When a user logs in with "remember me" enabled, each login within the expiration limit resets the expiration period.

- Type: integer
- Default value: 15 (days)

Note: Maximum value 30 days.

- Location: System Property [sys_properties] table

sa_analytics.aggregation.include_service

Includes all CIs for alert aggregation. If **false**, includes only CIs not related to a business service.

- Type: true | false
- Default value: true
- Location: **Alert Aggregation and RCA** > **Properties**

sa_analytics.aggregation_enabled

Enables alert aggregation. Enables aggregation of correlated alerts for services and alert groups.

- Type: true | false
- Default value: true
- Location: **Alert Aggregation and RCA** > **Properties**

sa_analytics.alert.severity_threshold

Alert severity threshold, above which alerts are included in analysis. Only alerts with severity that is above the threshold are included in alert aggregations and root cause CI analysis.

- Type: choice list
- Default value: Info
- Other possible values:
  - Warning
  - Minor
  - Major
  - Critical
- Location: **Alert Aggregation and RCA** > **Properties**

sa_analytics.rca_enabled

Enables (**true**) or disables (**false**) root cause analysis for business services. Enables RCA for alerts associated with business services, to identify root-cause CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false
- Location: **Alert Aggregation and RCA** > **Properties**

sa_analytics.rca.input_purge_days

Purge staging tables (in days). Number of days that RCA input is kept before it is purged.

- Type: integer
- Default value: 90
- Range of possible values: 30-180
- Location: **Alert Aggregation and RCA** > **Properties**

sa_analytics.rca.learner_group_interval_secs

Time interval (in seconds) criteria for grouping alerts. Interval that alerts must be created in, to be included in a group.

- Type: integer
- Default value: 300
- Range of possible values: 60-900
- Location: **Alert Aggregation and RCA** > **Properties**

sa_analytics.rca.learner_query_interval_secs

Length of time period (in seconds) from which to include alerts for analysis. Period of past time from which to include alerts in alert aggregation analysis.

- Type: integer
- Default value: 86400
- Range of possible values: 43200-86400
- Location: **Alert Aggregation and RCA** > **Properties**

sa_analytics.rca.output_purge_days

Number of days that RCA output is kept before it is purged.

- Type: integer
- Default value: 3
- Range of possible values: 3-5
- Location: System Property [sys_properties] table

sa_analytics.rca.query_probability_threshold

Confidence score % threshold, above which RCA correlated alert groups appear in the Event Management dashboard and alerts console. Confidence score that must be met by RCA correlated alert groups before the groups are displayed on the Event Management dashboard and alerts console.

- Type: integer
- Default value: 0
- Range of possible values: 0-100
- Location: **Alert Aggregation and RCA** > **Properties**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sam.install_deletion_deadline

Defines the number of days after which a software install is deleted if not discovered with the configuration item. Use a value that is greater than the number of days between consecutive Discovery runs.

- Type: integer
- Default value: 7
- Location: System Property [sys_properties] table

security.list.internal.domains

Other domains (excluding the ones in the comma-separated list in this property) are classified as external email domains. The counts of incoming emails from these external domains display in the External Incoming Emails metric in the Instance Security Center.

- Type: choice string
- Default value: None
- Other possible values: Comma-separated list of all internal email domains in the organization.
- Location: System Property [sys_properties] table

sn_acc_vis_content.set_assigned_to

Determines if Assigned To attribute is overridden by ACC-V or not.

- Type: Boolean
- Default value: false

sn_acc_vis_content.assigned_to_user_order

Defines the source of Assigned To user and its priority for ACC-V. The order of the username sources defined is used to define the priority based on which the Assigned To user is set for a computer CI. For example, computer_system_username, logged_in_users. These two different sources decide which user name derived from which source takes preference in deciding the attribute Assigned To for a computer CI.

computer_system_username: The source is derived from the native command for Windows machine wmic computersystem get user username.

Logged_in_users: Source is OsQuery which gets logged in users from the OsQuery table.

- Type: choice string
- Default value: computer_system_username, logged_in_users

sn_acc_vis_content.persist_os_user_type

Persists the type of users that you are interested in for ACC-V.

- Type: Comma separated parameter
- Default value: local,system

sn_acc_vis.column_name_for_user_mapping

The name of the column in the Agent Client Collector Discovery result containing user identity information, such as a username or an email address. This property

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

maps a discovered device to a user record (sys_user), which is then used to set the **Assigned to** field in the Computer CI (cmdb_ci_computer) table. If the field is empty, the discovered device is mapped based only on the username and not the domain.

- Type: String
- Default value: <empty>

sn_agent.disco_minimum_threshold_for_rediscovery_minutes

The minimum number of minutes since the last Enhanced Discovery on a given IP before a rediscovery can be triggered. This helps to prevent too frequent Enhanced Discovery in cases where a network intermittently has a break or a laptop is rebooted repeatedly.

- Type: Integer
- Default value: 60

sn_agent.disco_disable_ci_clobber_of_agentless_disco

If true, checks whether CI already exists discovered with matching criteria (discovery_source=ServiceNow) and instead of re-discovering, links the agent record to existing CI.

- Type: Boolean
- Default value: true

sn_agent.disco_ci_clobber_of_agentless_disco_threshold_days

The maximum number of days since an existing CI has been discovered using Agent-less Discovery where the existing CI links instead of re-discovering it using the Agent.#This takes effect when disco_disable_ci_clobber_of_agentless_disco is true and it has been an extended period of time (over 14 days, by default) since a non-ACC discovery_source (like ServiceNow) has discovered the CI. Once this threshold is exceeded, Enhanced Discovery is allowed to execute and clobber an existing CI regardless of whether a CI has been previously discovered by a non-ACC discovery_source. This enables the most recent discovered data to be present in the CMDB.

- Type: Integer
- Default value: 14

sn_agent.host_data_collection.disable_when_container

If true, when host data collection occurs and it is found that the Agent Client Collector is running in a container, the incoming data will not be processed and the host data collection status will be set to disabled.

- Type: Boolean
- Default value: true

sn_acc_vis_content.persist_sam_usage_metrics

Controls how SAM usage metrics are stored based on reclamation rules. If **true**, store usage according to defined reclamation rules and store usage for all licensable software for which no reclamation rule is defined. If **false**, store SAM usage only according to defined reclamation rules.

- Type: Boolean
- Default value: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sn_analytics_list.pagination_max_value

Maximum number of records per page in a List visualization in Platform Analytics experience.

Danger: Raising this property above 100 might lead to memory issues.

- Type: integer
- Default value: 100
- Location: System Property [sys_properties] table

sn_app_insights.minutes_between_triggers

How many minutes to wait before sending out a notification for an identical metric trigger.

- Type: Integer
- Default value: 30

sn_app_insights.p1_predict_factor.semaphores

The normalizing factor for data for the semaphores metric in the p1 prediction model.

- Type: Integer
- Default value: 21

sn_app_insights.p1_predict_factor.sys_load

The normalizing factor for data for the sys_load metric in the p1 prediction model.

- Type: Integer
- Default value: 923

sn_app_insights.p1_predict_max_cooldown

The number of consecutive "no p1 predicted" minutes required to exit the p1 alert state.

- Type: String
- Default value: 5

sn_app_insights.p1_predict_threshold

The minimum confidence required for the p1 predict model to predict a p1 alert state.

- Type: Integer
- Default value: 90

sn_bm_client.dashboard_display_unit

Time unit to use for KPI values on the Benchmarks dashboard. Options are **Hours** or **Days**.

- Type: choice list
- Default value: Days
- Location: System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sn_chg_soc.change_soc_initial_limit

Defines the number of change_request records to display on load of the Change Schedule.

- Type: Integer
- Default value: 40
- Location: System Property [sys_properties] table

sn_chg_soc.change_soc_scroll_load_limit

Defines the number of change_request records to display as the Change Schedule is scrolled.

- Type: Integer
- Default value: 20
- Location: System Property [sys_properties] table

sn_chg_soc.change_soc_total_limit

Defines the total number of change_request records that can be displayed on a Change Schedule.

- Type: Integer
- Default value: 1000
- Location: System Property [sys_properties] table

sn_chg_soc.landing_page.pinned_notification

Shows a message for pin or unpin a change schedule.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

sn_chg_soc.schedule_window_days

Specifies the number of days to be factored before and after the respective start/end of a change_request record when displaying blackout and maintenance window spans on the Change Schedule page.

- Type: Integer
- Default value: 30
- Location: System Property [sys_properties] table

sn_disco_cd.scheduled_job_time_out_in_mins

This property sets the value for the maximum run time of the scheduled job for Cloud Resources in minutes.

- Type: integer
- Default value: 120

sn_disco_certmgmt.cert_task_default_approval_group

This property is used to set default Approval Group name for Certificate Inventory and Management for manual approval processes for requesting new, renewing, or revoking certificates for automated workflows only. You can add more than one

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

approval group, separated by commas. The task chooses the current domain group first and then the global domain group. If no group is found, the task will fail.

- Type: string
- Default value: none

sn_disco_certmgmt.default_cert_order_validity_period

This property is used to set the validity period of the certificate order being placed in Certificate Inventory and Management.

- Type: integer
- Default value: 1000 days

sn_disco_certmgmt.default_cert_task_priority

This property is used to configure New and Renew task priorities in Certificate Inventory and Management. Accepts values 1, 2, 3, 4, 5. If any invalid value (<1 || >5 || other strings) is provided, the value reverts to P3.

- Type: integer
- Default value: 3 (if property doesn't exist)

sn_disco_certmgmt.default_revoke_cert_task_priority

This property is used to configure Revoke task priorities in Certificate Inventory and Management. Accepts values 1, 2, 3, 4, 5. If any invalid value (<1 || >5 || other strings) is provided, the value reverts to P1.

- Type: integer
- Default value: 1 (if property doesn't exist)

sn_global_searchui.hide_results_count

Hides (**true**) or displays (**false**) the number of matching records for search groups and tables on the Global search page.

To modify this property, select **Enhanced Global Search UI** from the application picker before opening the System Properties table.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

sn_nowassist_va.com.glide.cs.gen_ai.enable_mid_topic_ai_search_conversational_catalogs

In Mid Topic Discovery AI Search results, change the value to true to show catalog results. By default, these Mid Topic AI Search results only show knowledge base results.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

sn_nowassist_va.nass_animated_avatar_enabled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An animated sparkle icon appears while the LLM response streams to the end user. The animated sparkle icon changes to the static branded Virtual Agent icon after the response has fully loaded. If this system property is set to `false`, the animated ellipsis icon appears after the loading messages.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

sn_query_gen.default_source_type

The data source type that AI Data Explorer uses in responses—table or indicator—when there are no query keywords or explicit context to determine this. Does not apply in agentic mode.

- Type: Choice (table | indicator)
- Default value: table
- Location: System Property [sys_properties] table
- Learn more: Indicator vs Table data source selection

sn_query_gen.hidden_insights.groupby.min_fields

The target number of group-by fields for extended analysis in AI Data Explorer. These group-by fields are taken from the default list view of the relevant table. When this list view contains fewer eligible fields than the property value, the system looks for more eligible fields on the table to try to reach this count.

- Type: Integer
- Default value: 5
- Location: System Property [sys_properties] table
- Learn more: Extended analysis

sn_query_gen.segments.disable.filter

When set to true, excludes all segments from sys_filter from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table.

- Type: Boolean (true/false)
- Default value: false
- Location: System Property [sys_properties] table
- Learn more: Segments in the Query Generation semantic layer

sn_query_gen.segments.disable.manual_segment

When set to true, excludes all segments from sn_query_gen_segment_table_config (manual segments) from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table.

Important: The ability to disable manual segments is intended for testing and troubleshooting purposes only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: Boolean (true/false)
- Default value: false
- Location: System Property [sys_properties] table
- Learn more: Segments in the Query Generation semantic layer

sn_query_gen.segments.disable.report_sources

When set to true, excludes all segments from sys_report_source from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table.

- Type: Boolean (true/false)
- Default value: false
- Location: System Property [sys_properties] table
- Learn more: Segments in the Query Generation semantic layer

sn_query_gen.segments.disable.sys_app_module

When set to true, excludes all segments from sys_app_module from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table.

- Type: Boolean (true/false)
- Default value: false
- Location: System Property [sys_properties] table
- Learn more: Segments in the Query Generation semantic layer

sn_query_gen.segments.disable.pa_cubes

When set to true, excludes all segments from indicator sources (pa_cubes) from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table.

- Type: Boolean (true/false)
- Default value: false
- Location: System Property [sys_properties] table
- Learn more: Segments in the Query Generation semantic layer

sn_query_gen.segments.disable.report

When set to true, excludes all segments from sys_report from AI Data Explorer search results. During the next Sync Segments Job, all segments of that type are deactivated in the Segment table.

- Type: Boolean (true/false)
- Default value: false
- Location: System Property [sys_properties] table
- Learn more: Segments in the Query Generation semantic layer

sn_query_gen.segments.indicator.inactivity_threshold_multiplier

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applies a multiplier to how long ago an indicator value can have changed for that indicator to be "recently changed." The [Query Generation] Sync Segments job deactivates segments based on indicators that have not recently changed. The value that is multiplied differs by indicator frequency (see Segments in the Query Generation semantic layer).

- Type: Integer
- Default value: 1
- Location: System Property [sys_properties] table

sn_query_gen.segments.reports.last_viewed_threshold_days

Defines how many days ago a report can have run for that report to be considered "recently run." The [Query Generation] Sync Segments job deactivates segments based on reports that have not run recently. It also deactivates report sources whose reports have not run recently.

- Type: Integer
- Default value: 180
- Location: System Property [sys_properties] table

sn_vad_genai.com.glide.small_talk.closure.prompt_enabled

Includes a confirmation message to end the conversation whenever closure small talk is recognized.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

subscription.custom_table.enforce_entitlement

You can enable guardrails around custom tables when using certain applications, such as Mobile Studio, in a production or non-production environment.

When set to **true**, the property limits the list of custom tables available in applications such as Mobile Studio to those you are entitled to use, based on the active subscriptions present on your instance. If you want to remove these guardrails, setting the property to **false** enables you to access to all custom tables, regardless of your active subscription entitlements.

- Type: Boolean
- Default value:
- Location: System Property [sys_properties] table

Note: Setting this property to **false** enables you to use applications with custom tables that may not be entitled. See the service description for your active subscriptions to determine which custom tables (if any) you are entitled to use with selected applications.

sys_par_insights_enabled

Enables the Proactive Analytics feature.

- Type: true/false (Boolean)
- Default value: true

© 2026 ServiceNow, Inc. All rights reserved.

- Location: To change the value, create this property in the System Properties table.
- More information: Add a system property

tablet.footer.text

Text that appears on the footer of the tablet UI.

- Type: string
- Default value: Copyright ServiceNow 2012
- Location: **System Properties** > **Tablet UI Properties**

tablet.header.text

Text that appears on the right-hand side of the tablet UI header.

- Type: string
- Default value: ServiceNow
- Location: **System Properties** > **Tablet UI Properties**

Add a system property

Add or create a property to control system behavior.

https://player.vimeo.com/video/1163458459?h=2fcc45d396&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: admin

For more information on creating system properties for your own applications, take the training on the ServiceNow® Developer Site.

About this task

Some properties in the system aren't visible in an instance by default and must be added to the System Property [sys_properties] table. If a feature requires the addition of the property, you can add a system property.

Important: System properties store configuration information that rarely or never changes. Each time you change or add a system property, the system flushes the cache to keep all nodes in the cluster in sync. This cache flush has a very high performance cost for one to 10 minutes, which can potentially cause an outage if done excessively. To prevent such outages, don't use a system property to store configuration information that changes more than once or twice a month. Instead, use a custom table to store regularly changing configuration information.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property doesn't exist by searching for the property name.
3. Select **New**.
4. Complete the System Property form using the database name of the property.

   Make sure to specify the correct data **Type** and add the new value that you want the property to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties that you add already contain default values. You add properties to change this value.

Field	Description
Name	Name of the property you're creating.
Description	Type a brief, descriptive phrase describing the function of the property.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, `Blue=0000FF, Red=FF0000, Green=00FF00` displays **Blue**, **Red**, and **Green** in the list, and saves the corresponding hex value in the property value field.
Type	Select the appropriate data type from the list (for example, **integer**, **string**, or **true|false)**.
Value	Set the desired value for the property. All property values are stored as strings. When retrieving properties via the *`gs.getProperty()`* method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Ignore cache	The system stores system property values in server-side caches to avoid querying the database for configuration settings. When you change a system property value, the system always flushes the cache for the sys_properties table. Use this field to determine whether to flush this property's value from all other server-side caches. The default cleared check box means that the system will flush all server-side caches and retrieve the current property value from the database. Leave the check box cleared when you want to ensure all caches have the current property value. Select the check box to ignore flushing some server-side caches, thus flushing only the cache for the sys_properties table and preserving the prior property value in all other caches. This option avoids the performance cost of flushing all caches and retrieving new property values. Typically, you should only select the check box and enable ignoring the cache when

Field	Description
	you have a system property that changes more frequently than once a month, and the property value is only stored in the sys_properties table.
Private	Set this property to true to exclude this property from being imported via update sets. Keeping system properties private prevents settings in one instance from overwriting values in another instance. For example, you may not want a system property in a development instance to use the same value as a production instance.
Read roles	Define the roles that have read access to this property.
Write roles	Defines the roles that have write access to this property.

5. Select **Submit**.
   Depending on the property name, an administrator might be able to change its value only through a new module. It may also appear in one of the Properties pages in System Properties.

   Note: If the **Ignore cache** check box is selected, the system flushes the server cache when the parameter is changed.

Create a system properties module

You can add a module in the application navigator to access the list of system properties. This module makes it easy to add properties to the System Properties table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Application Menus**.
2. Search for the application you want to add the properties table to, for example **System Properties**.
   Select an application that is restricted to the admin role so that non-admin users cannot access it.
3. From the Modules related list, click **New**.
4. Complete the form fields.

Field	Description
Title	Module name. For example, **All Properties**.
Application Menu	Specifies the name of the application menu the module appears under. This field should automatically be populated with the name of the application you accessed the Modules related list from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Link type	Specifies the type of link this modules opens. For a list of system properties, select **List of Records**.
Table	Specifies the table used by the module. Select **System Properties [sys_properties]**.

5. Click **Submit**.
6. Verify that the module was created. For example, navigate to **System Properties** > **All Properties**.

What to do next

If you want to include additional parameters for the list of system properties module, see Create a module.

Query join and complexity size limits

The platform uses a relational database to store data. Retrieving data can involve multiple joins to create a single result set. While these joins are usually simple, in certain cases the system may issue very large joins to bring together large numbers (>20) of tables.

Database engines normally handle multiple joins quite well. The relational model assumes joins are cheap and efficient, and this is usually true. Rarely, however, exceedingly large joins may cause a database performance issue.

To mitigate this potential complexity, use the following property to limit join complexity and size.

Navigate to **System Properties > System** and find the property with this description:

Max number of database joins per query. Smaller values cause the system to issue a larger number of less complex queries. Larger values reduce the number of queries at the cost of additional complexity per query. In the absence of known database issues stemming from large join counts, this property should remain unchanged.

This property specifies the maximum number of joins the system prefers to do. In certain edge cases, more complex queries might need to be issued, but generally no more than this number of joins will be issued. e.g., a value of 10 will result in no more than 10 tables being joined together in any given query.

The system must compensate for the fewer joins by issuing more queries to retrieve necessary data, so tuning this number down will result in more queries being sent to the database. In most cases, tuning this parameter is counterproductive.

Note: In the absence of known database issues stemming from large join counts, this parameter should remain unchanged.

Web proxy

Several properties support Web proxy configuration.

Note: Set these properties in the System Properties `[sys_properties]` table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proxy setup properties

Property	Description	Examples
glide.http.proxy_host	Specify the proxy server hostname or IP address. • Type: string • Default value: none	proxy.company.com, 192.168.34.54
glide.http.proxy_port	Specify the port number for the proxy server. • Type: string • Default value: none	8080, 9100
glide.http.proxy_username	Specify the username used to authenticate the proxy server. • Type: string • Default value: none	proxyuser
glide.http.proxy_password	Specify the password used to authenticate the proxy server. • Type: string • Default value: none	password
glide.email.override.url	Set the URL to use in emailed links in place of the instance URL. The URL should end with `nav_to.do`. • Type: string • Default value: instance URL	https://servicenow.customerdomain.com/production/nav_to.do

NTLM authentication

NTLM is the most complex of the authentication protocols supported by a basic web server.

NTLM is the most complex of the authentication protocols supported by a basic web server such as HttpClient. It is a proprietary protocol designed by Microsoft with no publicly available specification. Early versions of NTLM were less secure than Digest authentication due to faults in the design. However, these were fixed in a service pack for Windows NT 4 and the protocol is now considered more secure than Digest authentication.

NTLM authentication requires that an instance of NTCredentials be available for the domain name of the server or the default credentials. Since NTLM does not use the notion of realms, HttpClient uses the domain name of the server as the name of the realm. Also, the username provided to the NTCredentials should not be prefixed with the domain:

- Correct: adrian
- Incorrect: DOMAIN\adrian

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are some significant differences in the way NTLM works compared with basic and digest authentication. These differences are generally handled by HttpClient. However, having an understanding of these differences can help you avoid problems when using NTLM authentication.

- NTLM authentication works almost exactly the same as any other form of authentication in terms of the HttpClient API. The only difference is that you need to supply NTCredentials instead of UsernamePasswordCredentials (NTCredentials actually extends UsernamePasswordCredentials so you can use NTCredentials right throughout your application, if needed).
- The realm for NTLM authentication is the domain name of the computer being connected. This can be troublesome because servers often have multiple domain names. Only the domain name that HttpClient connects to, as specified by the HostConfiguration, is used to look up the credentials. While initially testing NTLM authentication, it is best to pass the realm in as null, which is used as the default.
- NTLM authenticates a connection and not a request. So you need to authenticate every time a new connection is made and keeping the connection open during authentication is vital. For this reason, NTLM cannot be used to authenticate with both a proxy server and the web server, nor can NTLM be used with HTTP 1.0 connections or web servers that do not support HTTP keep-alives.

Note: Set these properties from the System Properties `[sys_properties]` table.

NTLM authentication

Property	Description	Examples
glide.http.proxy_ntusername	Specify the username used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	username
glide.http.proxy_ntpassword	Specify the password used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	password
glide.http.proxy_nthost	Specify the hostname used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	nthost
glide.http.proxy_ntdomain	Specify the domain used to authenticate the proxy server with NTLM authentication. • Type: string • Default value: none	DOMAIN

Proxy servers for SOAP clients

Administrators can specify separate proxy settings for SOAP clients, such as the MID Server or ODBC Driver.

To specify a proxy server for a MID Server, see MID Server configuration

To specify a proxy server for the ODBC driver, see Configure ODBC to use proxy servers

Bypass the proxy server

Administrators can configure the instance to bypass the proxy server for specific URLs or URL patterns.

Typically, internal addresses do not need a proxy server for SOAP communications.

Bypass the proxy server

Property	Description	Examples
glide.http.proxy_bypass_list	Specify the semicolon-separated list of addresses that bypass the proxy server. Use an asterisk as a wildcard character to specify all or part of an address. • Type: string • Default value: none • Location: System Properties `[sys_properties]` table	127.0.0.1;*.internal.com;localhost

Admin Center

Admin Center provides a central hub for platform owners and admins to access platform capabilities, discover new applications, and get intelligent, actionable insights.

Use the Admin Center application to discover the capability of the available applications and how they can be implemented to work towards achieving your business goal.

Admin Center summary

If you are new to Admin Center, read this summary to learn what the product can do.

The first stop experience within Admin Center is the Admin Home page. It helps you manage and track all your administrative work within a single page experience. You can prioritize your work based on the instance data. See Admin Home for more information about Admin Home features.

Admin Center offers easy access to a number of key applications administrators need. You can access these applications directly from the **Admin** menu on the Admin Home page.

- Adoption Blueprints: Adoption Blueprints lists the available applications and features that are recommended to achieve business goals. You can target the strategic business improvements with a set of apps and features. See Adoption blueprints for more information.

  Note: Adoption Blueprints platform feature is available by default with instance upgrade to Tokyo and above.

- AI Admin Hub: The AI Admin Hub console provides you with quick and effortless access to the important information that you need to set up, configure, and monitor Now Assist features and skills. See Overview tab in AI Admin Hub for more information.
- Application Manager: As an admin, you have the ability to install, update, and manage licensed applications and plugins on your instance using the Application Manager application. See Application Manager for more information.

  Note: Application Manager store application is available by default with the instance upgrade of Vancouver and above.

- Security Center: Use the Security Center application to help your organization maintain the security of your ServiceNow deployments. See Security Center for more information.

  Note: Security Center is available by default from the Vancouver release and above with the instance upgrade. For the previous releases, you can install it from the ServiceNow store.

- Subscription Management: Proactively manage your subscriptions and monitor subscription usage on your instances using the Subscription Management application. See Subscription Management for more information.

  Note: The legacy version Subscription Management is available by default with the Vancouver release. You can install the new version of Subscription Management on your Vancouver instance from the ServiceNow® Store. You can also have both the legacy and new version on your Vancouver instance.

- Configuration Hub: Access and zoom in all the relevant details related to the selected application(s) using the Configuration Hub application. You can also track and view delta

changes, over-allocated licenses, and customizations on a single screen. See Configuration Hub for more details.

Note: Configuration Hub store application is available by default with instance upgrade of Vancouver patch 2 and above.

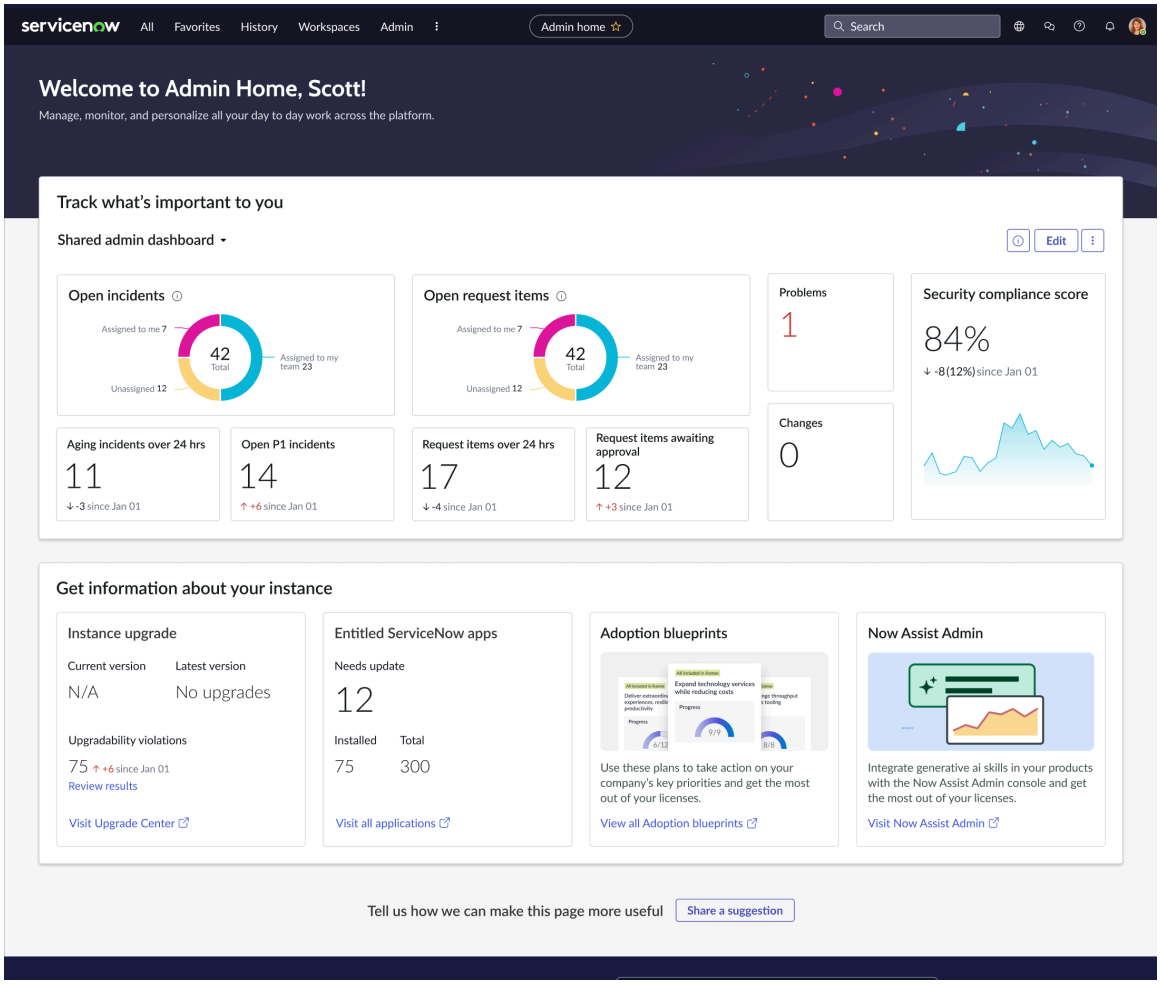
- Upgrade Management: Leverage ServiceNow Upgrade Management for a comprehensive and efficient upgrade experience. Streamline your upgrade process by accessing all necessary tools and insights in one place. See Upgrade Console for more information.

You can also access the Admin Experience Product Hub on the ServiceNow Community for additional resources about Admin Center and the applications.

Administering Admin Home

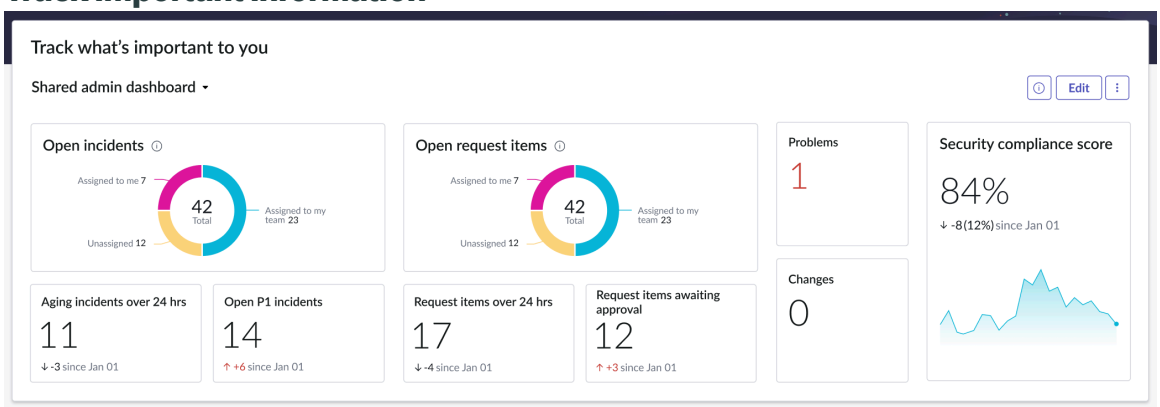
Take control of your daily administrative tasks with our intuitive dashboard. Quickly access and manage essential tasks and tools to boost productivity.

Admin Home



Manage and track your daily administrative work and tools on your instance by quickly accessing the cards on the dashboard. It helps you stay updated on any high priority incidents or problems on the instance that might need immediate attention.

https://www.youtube.com/watch?v=CcawQzC4uuk



Use the advanced Admin Home page to accomplish the following:

- Get notified of the critical and high priority incidents
- Stay updated about the problems and changes on the instance
- Create and switch to your personalized dashboard based on what is most important to you
- Stay updated on the current version, scheduled upgrade, and licensed applications status on your instance
- Get a comprehensive, single-page view of the delta changes on the instance

Discovering adoption blueprints

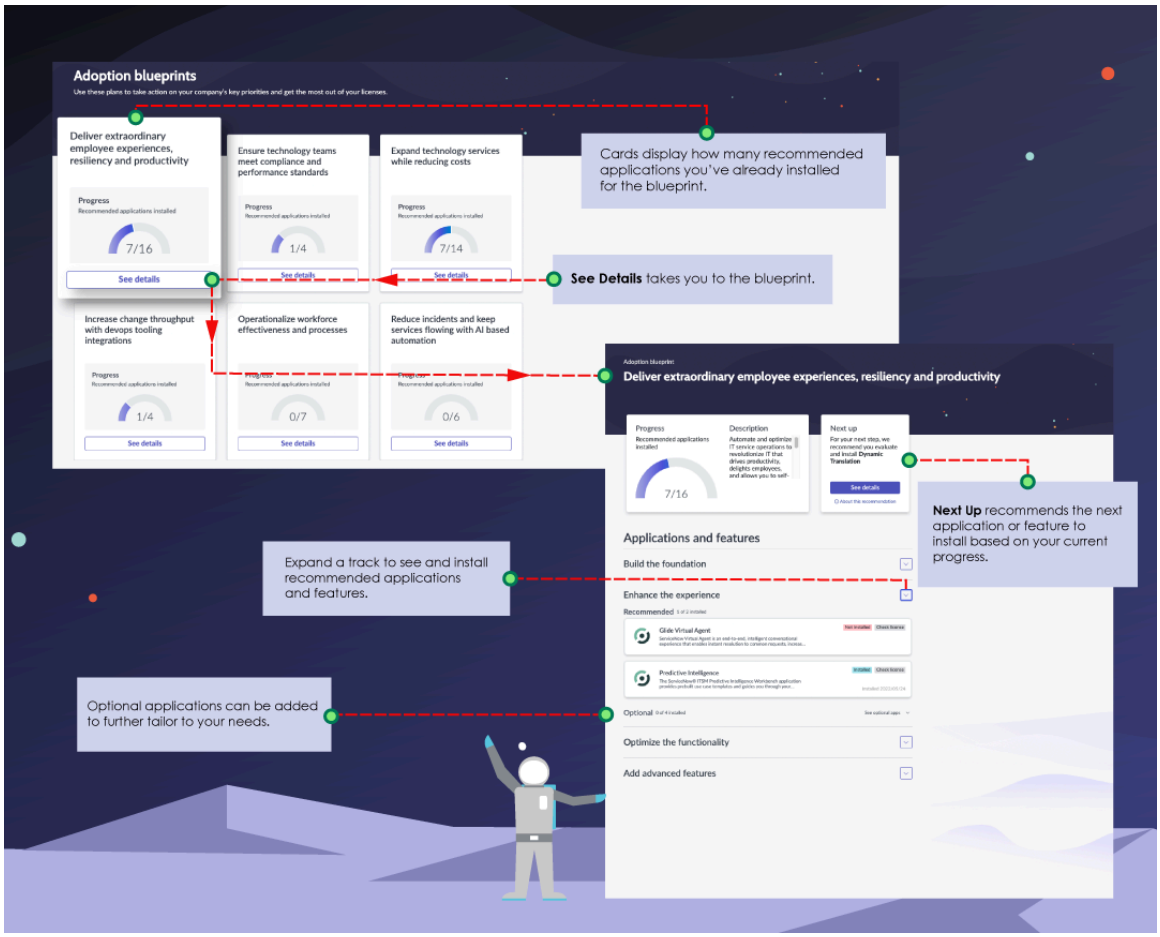
Adoption blueprints provide a roadmap of applications and features, along with suggested solutions to help you reach your business objectives.

Explore the following to know more about adoption blueprints.

- Adoption blueprint overview: Get an overview of adoption blueprint and its suggested roadmap for you to achieve the business goal.
- Select your adoption blueprint: You have six different adoption blueprint to select from that closely relates to your organization business goals.
- Install applications for the selected adoption blueprint: Know all the applications, plugins, and features that need to be installed depending on your selected adoption blueprint.

Adoption blueprints

Adoption blueprints display the applications and features available to you and the recommended solutions to achieve business goals.



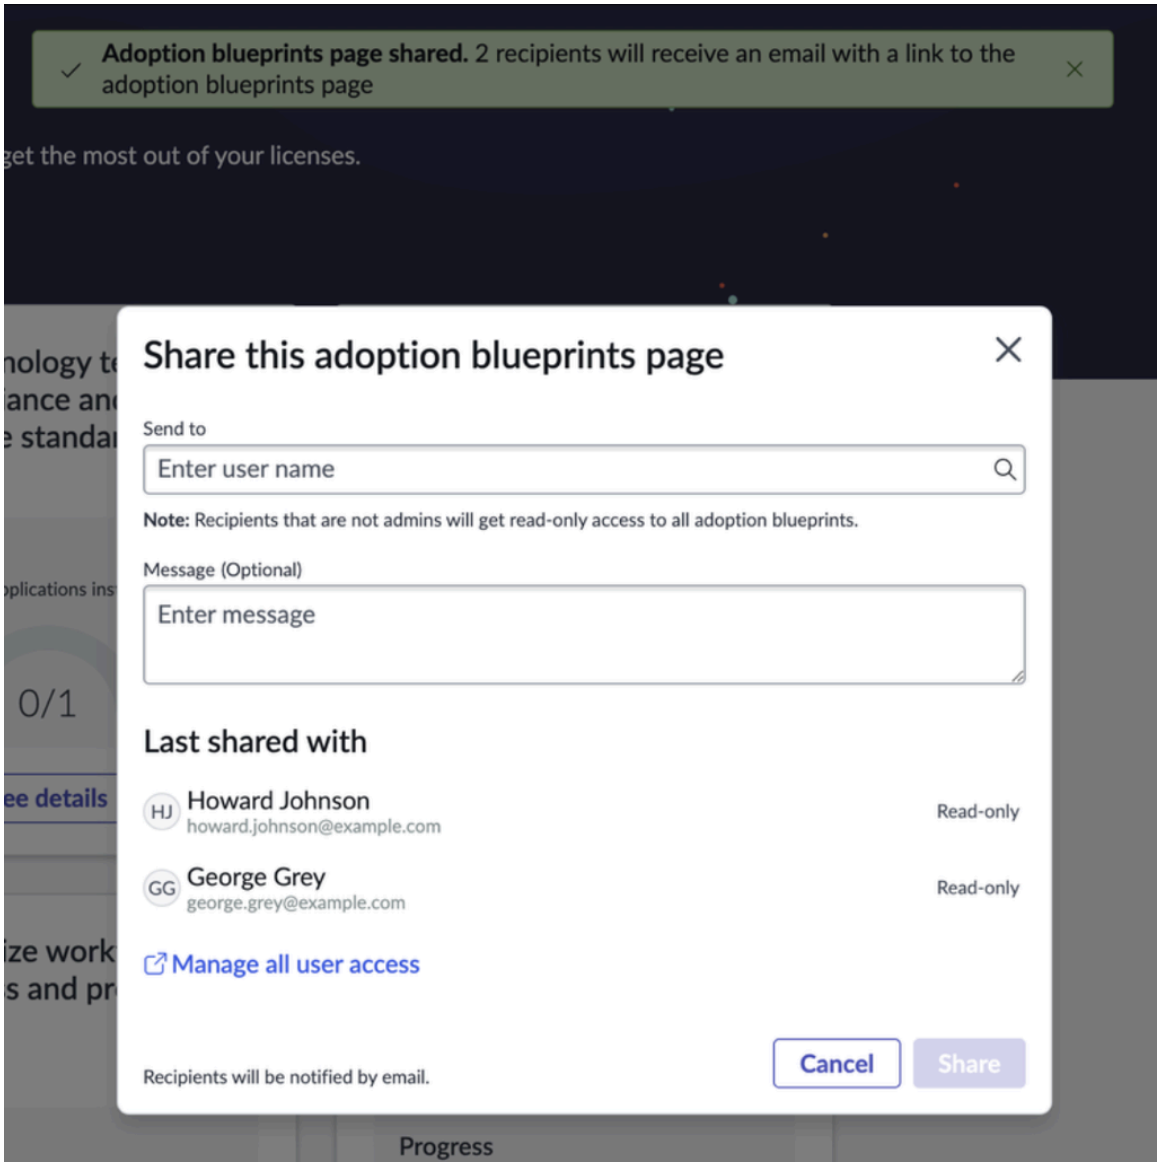
Adoption blueprints are the specific and measurable results that an organization needs to accomplish their growth. You can target the strategic business improvements with a set of apps and features.

Some of the goals based on which adoption blueprints are recommended:

- Optimizing operation to efficiently meet the goals of your organization
  - Reduced service operations cost for premium quality services
  - Focused on simplifying and automating transactions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Managing risk more efficiently by improving prioritization, efficiency, and operational reporting
- Delivering seamless employee experience to increase engagement and productivity with proper utilization of resources



Each adoption blueprint displays the progress you have made in working towards your strategic goal. The number of applications that have been installed includes only the recommended applications.

See Select your adoption blueprint for more information.

Select **Share** if you want to share information about adoption blueprints, recommended applications and features. You can share the information with more than one recipient. The recipients are notified via email. You can also view the people with whom the details have been shared previously.

Note: If the information is shared with a non-admin user, the share functionality provides a read-only access to the non-admin users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you select the adoption blueprint, the following tracks for the recommended applications and features within the selected adoption blueprint show up.

- Build a foundation
- Enhance the experience
- Optimize the functionality
- Add advanced features

The recommended applications and features have been arranged in the order of impact in the process of giving you a measurable result. They can also be referred as crawl, walk, run, and fly phases respectively.

Note: The applications and features mentioned in different tracks are only recommended to be installed. Some of the recommended applications and features in each track may already be installed in your instance and not require any additional action.

In each of the tracks, the applications are mentioned in the following order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Recommended applications which are not yet installed
2. Recommended applications which are already installed but need to be updated
3. Recommended applications which are already installed in your instance.

Note: The recommended applications don't need to be installed at all or in the order listed.

Select your adoption blueprint

Select an adoption blueprint that matches one of the strategic goals of your organizations. It also gives you a list of recommended applications that can be installed in the right combination to realize your business goal.

Before you begin

Role required: admin

Procedure

1. Access Adoption blueprint in one of the following ways.

Option	Steps
Using left navigation	**a.** Navigate to **All** > **Admin Center** > **Adoption Blueprints**. **b.** Select one of the Adoption Blueprints that can be implemented to work towards your organizational business goal.
Using Admin tab option	**a.** Navigate to **Admin** > **Adoption Blueprints**. **b.** Select one of the Adoption Blueprints that are recommended as solutions towards a business goal.

2. Select an adoption blueprint from the Adoption blueprint page.
3. Select **See Details** to view the details of the selected adoption blueprint.
   The adoption blueprint details page shows the progress of the installation of the recommended applications.
4. Scroll down to see all the tracks for the selected adoption blueprint.
   See Adoption blueprints for more information.
5. **Optional:** Expand the Optional list to view the optional list of applications and features that may be beneficial for you to install.
   The total number of recommended applications and features mentioned in the progress section doesn't include the optional applications.

   Note: The installation of each of the recommended and optional applications and features is not mandatory to achieve the business goal.

6. Review the Next Up card to view the application recommended to install next.

   Note: You can skip this step if you don't want to install the application mentioned in the Next Up card. You are also required to consider the current needs of your organization along with the suggested applications.

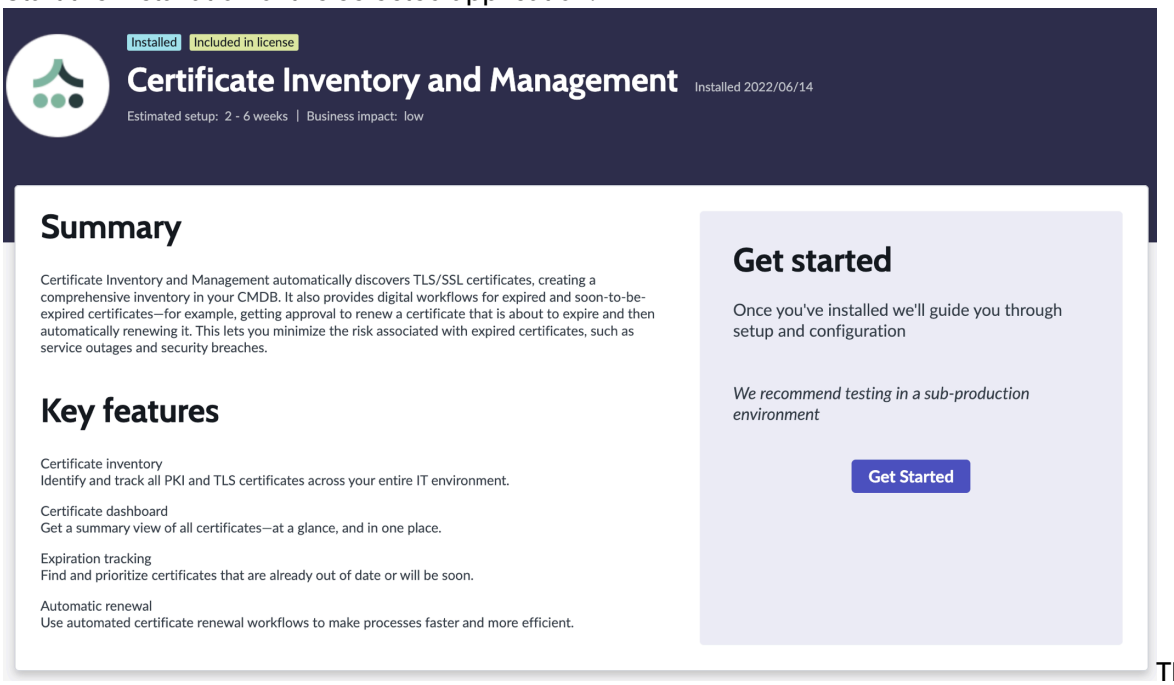
Install applications for an adoption blueprint



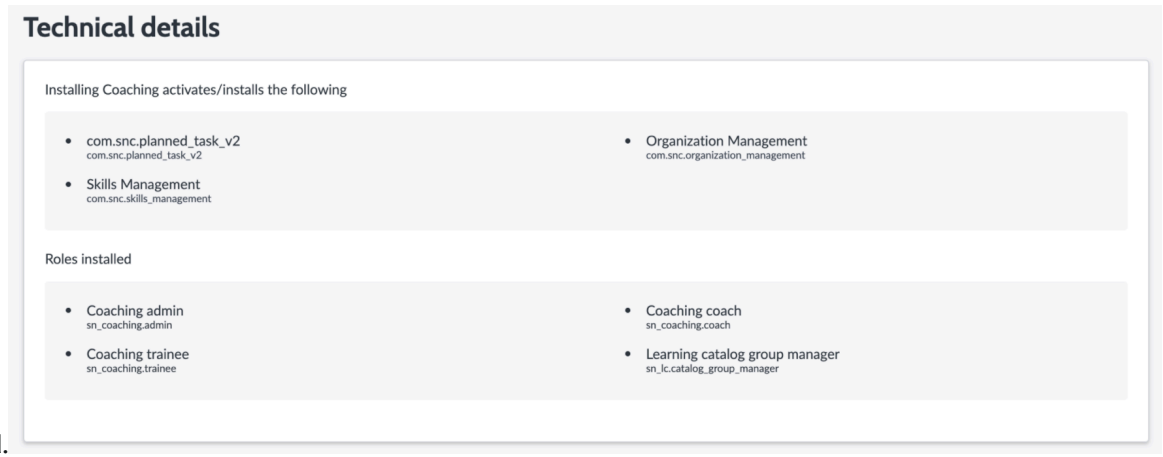
Install applications from the selected adoption blueprint to work towards achieving a certain business goal of your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Select the application you want to install from the Adoption Blueprints details page.
   An application details page with the key features about the selected application appears.
2. Start the installation of the selected application.



The button to start the installation or activation may vary depending on the selected application.

- **Activate**: If you have selected a plugin
- **Install**: If you have selected an application
- **Update**: If the installed application needs to be updated
- **Get started**: If the application or the plugin is already installed

Note: You can view the configuration page of the application by clicking **Get Started**.

Note: Some applications and plugins show dependency applications and roles that need to be installed.

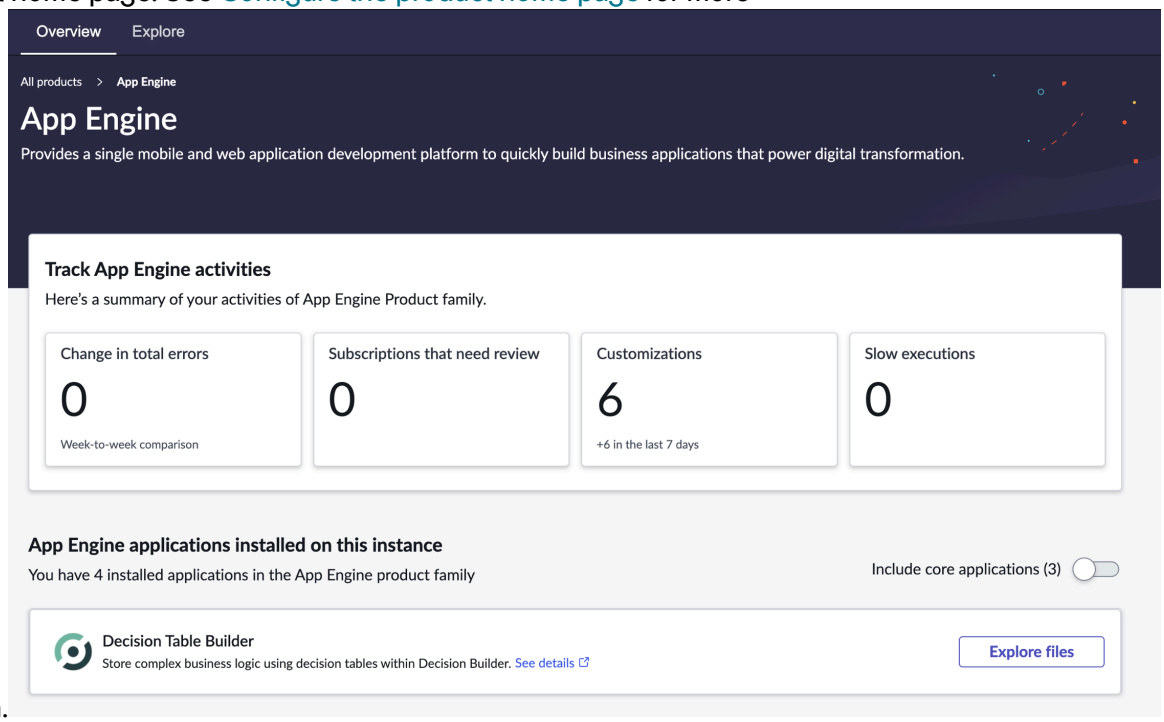
Configuration Hub

Experience the ability to zoom into an application or a group of applications and view all the relevant tables and records on a single page using the Configuration Hub. As an admin you can access all relevant details related to the selected application(s).

You can achieve the following by using Configuration Hub.

- One-stop experience to access all relevant information
- Enhanced ability to save your preferences for all tables and records
- Ability to track and view delta changes, over-allocated licenses, and customizations on a single screen
- Enhanced use of multiple filters simultaneously to drill down to a particular application
- Ability to open and edit a record within Configuration Hub. You don't need to navigate to the record using the conventional ways.

Note: Configuration Hub store application is available by default with any instance upgrade of Vancouver patch 2 and above. You can navigate to Configuration Hub from the **Admin** menu.



You can search through all the application, console or product names that have been installed on the instance within a certain scope.

Note: The application name doesn’t populate in the search bar if it’s not yet installed on the instance. The number under the family name shows the number of applications in the selected family have been installed on the instance. If there is a product family that doesn’t have any app installed, it won’t show up on the list.

It can also help you search applications that have been grouped by SN store, taxonomy or product families. When you select a product family, it takes to

the product home page. See Configure the product home page for more information.

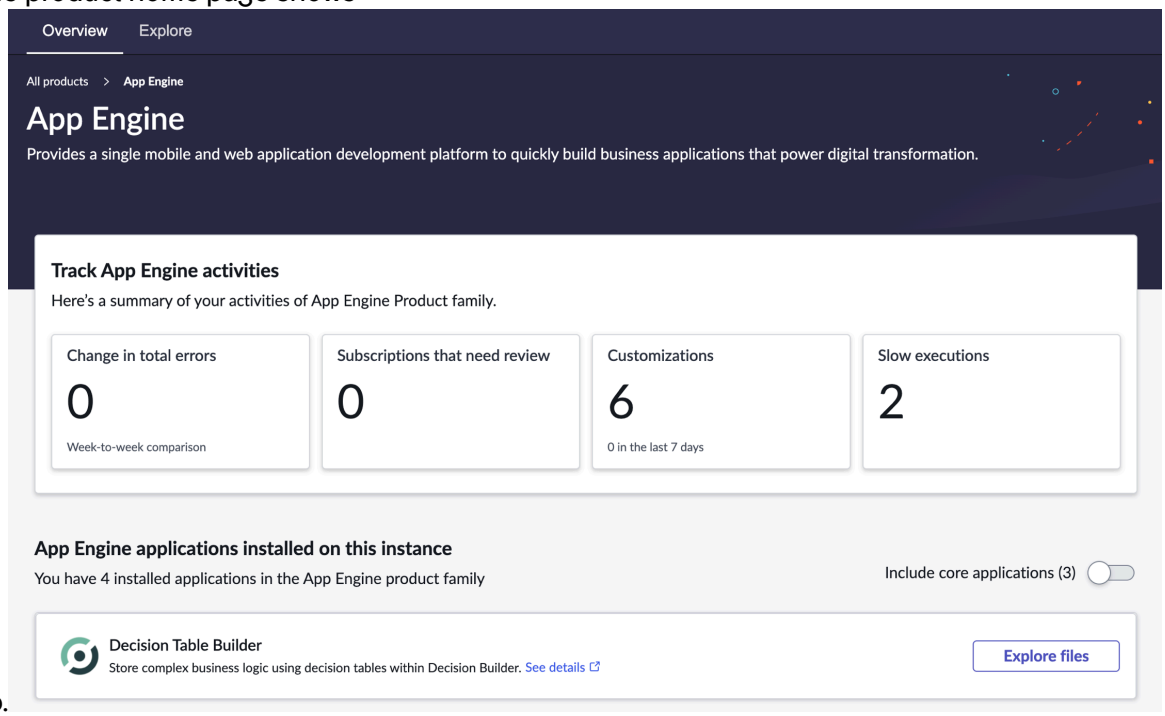
Configure the product home page

Track delta changes, over-allocated subscriptions, customizations, and slow execution on the product home page by selecting a product family

Before you begin

Role required: admin

Procedure



1. Access Configuration Hub in one of the following ways.

Option	Steps
Using left navigation	Navigate to **All** > **Admin Center** > **Configuration Hub**.
Using Admin tab option	Navigate to **Admin** > **Configuration Hub**.

2. Select one of the product families as per your requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The product home page shows

up.

3. Track the following activities in the Overview tab.
   - Change in total errors: Weekly delta change in errors
   - Subscriptions that need review: Number of licenses that have been over-allocated
   - Customizations: Total modified files related to the installed applications within the selected product family.

     Note: The number mentioned under the total customizations is the number of files that have been modified recently within last 7 days.

   - Slow execution: The number of slow transactions, events and scripts on the instance.

   By default, the core applications are hidden. Core applications are installed by default as you upgrade your instance. You can't uninstall the core applications. But you can use the toggle to show all the applications including the core apps.

   Note: It is recommended not to modify the core applications and its functionality so that during an upgrade you don't have too many skipped files.

   Select **See details** to read more about the store applications that have been installed. Select **Explore files** to list the records in the selected application of the product.
4. Drill down to a particular application by selecting the **Explore** tab.

   Note: The first time the **Explore** option is loaded, it takes in all the applications displayed in the **Overview** section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can do the following in the Explore tab:

- Search for table names, sys_id, or relevant records in the Configuration tables search bar.

  Note: You can also display the files as per machine names.

- Select a particular table from the left navigation bar and all the records in that table show up.

  Note: The number mentioned next to the table name is the number of records in that table. The records also satisfy the Applications in filter. You can also save your table preference by pinning the required tables.

- You can make edits in the records directly within Configuration Hub. You don't have to open the records in a conventional way to make edits in them.

Admin Center reference

Exploring the ServiceNow Store

Learn about the ServiceNow Store procurement workflow and how apps, products, and integrations can help your organization enhance the ServiceNow AI Platform experience.

ServiceNow Store overview

The ServiceNow Store offers ready-to-use applications, integrations, and products to help you accelerate your digital transformation. These solutions are prebuilt, pretested, and designed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

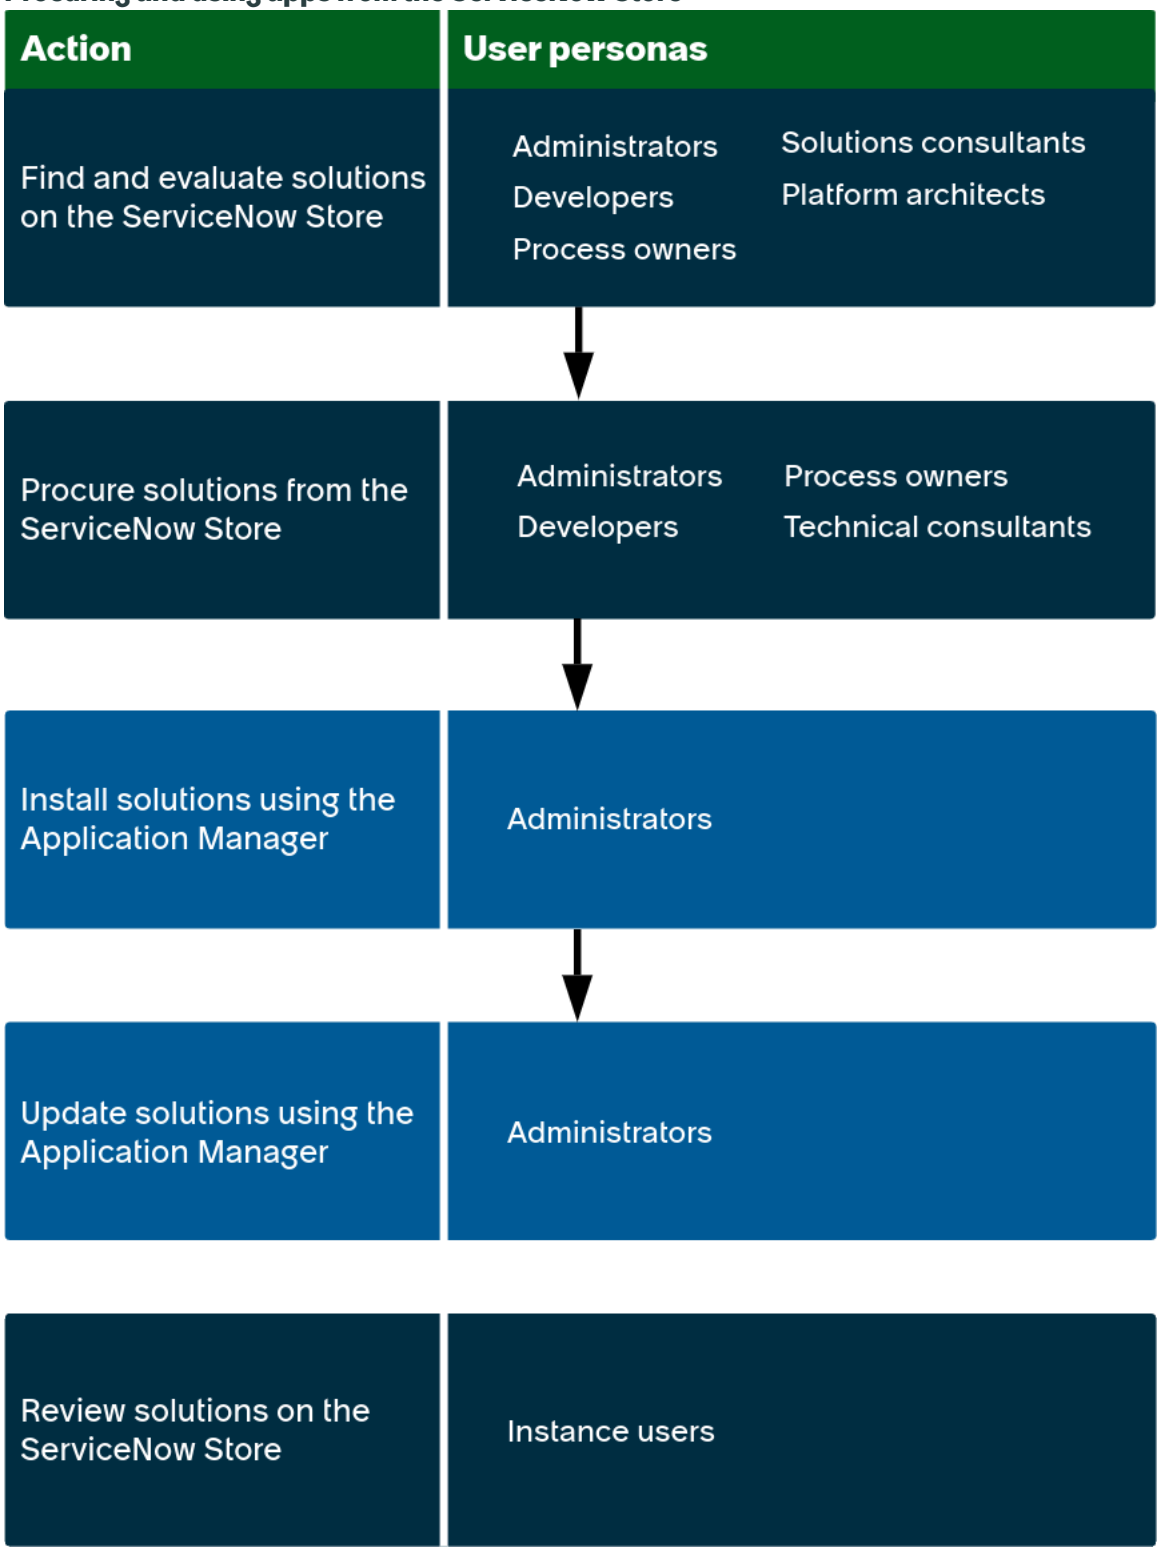
to work with the ServiceNow AI Platform, so you can deploy fully functional software without building or testing new code.

Each solution is developed and tested by ServiceNow or certified partners. Before being listed in the ServiceNow Store, every solution goes through a rigorous certification process to ensure it meets standards for stability, performance, and data security.

ServiceNow Store listings also undergo a content and marketing review to make sure they accurately describe the solution and include information needed to make informed decisions.

ServiceNow Store users

The following table provides examples of the different types of ServiceNow Store users and how they use the ServiceNow Store:



User	Description
Administrators and developers	Find, evaluate, and share solutions. They might also procure solutions based on their organizational roles and responsibilities.
Process owners, business owners, and similar roles	Find and evaluate solutions for departmental needs. They might also procure apps, or approve the procurement of paid apps, depending on their specific responsibilities.
Platform architects	Assess whether solutions align with internal guidelines, evaluate requirements and dependencies, and understand potential impacts on instance stability and performance.
Solution consultants	Stay updated on available solutions. They help find and evaluate options that meet organizational or departmental needs.
Technical consultants	Understand apps at a technical level, prepare detailed demonstrations of which solutions might fulfill organizational needs, and might procure trials from the ServiceNow Store to use in demonstrations.
Instance users	Leave feedback on apps, products, and integrations in the form of reviews on the ServiceNow Store. Instance users include anyone who uses their organization's ServiceNow AI Platform instance.

ServiceNow Store workflow

The following shows the overall workflow of finding, procuring, and installing solutions from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procuring and using apps from the ServiceNow Store

1. Find and evaluate solutions on the ServiceNow Store to determine which apps might improve your organization's ServiceNow AI Platform experience. Finding and evaluating solutions might be done by administrators, developers, process owners, solutions consultants, or platform architects.
2. Procure apps or trials from the ServiceNow Store to extend production or non-production instance capabilities. Procurement might be done by administrators, process owners, developers, or technical consultants.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Install procured solutions using the Application Manager. Installation must be performed by an administrator. For more information about using the Application Manager, see Application Manager.
4. Update installed solutions using the Application Manager to take advantage of the latest improvements. Upgrades must be performed by an administrator. For more information about using the Application Manager, see Application Manager.
5. Leave a review on the ServiceNow Store listing details of any app or product that you have used. Anyone who has experience using a solution can leave a review at any time.

What to explore next

To learn more about using the ServiceNow Store, see:

- Tracking your ServiceNow Store activity
- Plugins, apps, integrations, and products
- Getting apps and trials from the ServiceNow Store
- Reviewing apps
- Getting apps as an on-premise customer
- Using the ServiceNow Store in a regulated environment
- ServiceNow Store reference

Tracking your ServiceNow Store activity

The My Store Activity page lets you view important information related to apps and products that you have purchased, trialed, or requested.

My Store Activity page

You can access the My Store Activity page from your user profile menu after logging in to the ServiceNow Store. From the My Store Activity page, you can select the **In Process**, **Store Applications**, or **ServiceNow Products** tabs to view the following information:

My Store Activity page tabs

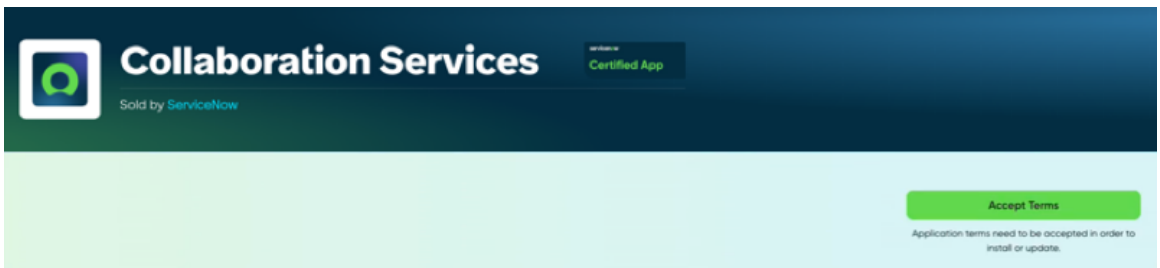
Tab	Available information
In Process	• Pending purchases • Requests that are still being processed • Requests that have been rejected
Store Applications	Searchable lists that provide details about the following: • Apps your organization has procured • Payments (available to enterprise customers only) • Demo requests (available to enterprise customers only)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

My Store Activity page tabs (continued)

Tab	Available information
	From **Payments**, you can export all invoices by selecting **Export as CSV**. You can also view an individual invoice by selecting the transaction ID. From **Demo Requests**, you can view information about any trials you have requested, including the amount of time remaining for each trial.
ServiceNow Products	A searchable list that provides details of all products that your organization has procured.

For more information about apps and products, see Plugins, apps, integrations, and products.



ServiceNow Store application listing details

The listing details page for a ServiceNow Store application shows information about the app and its features, as well as technical information about the versions available.

You can view an app's listing details by selecting an app in the ServiceNow Store. Listing details include a header with procurement options, app details, and version details.

Header

The listing details header shows procurement options, as well as basic information like the application name and the provider. For partner applications, you can select the provider name to view the seller profile.

There are a number of possible procurement options and additional statuses that can be found in the listing details header. Options include but not limited to requesting a 30-day trial, requesting purchase, and signing custom terms and conditions.

Procurement options might be updated or replaced with status messages depending on what actions you take. For example, once you request a trial, the button with that option is replaced with a status message letting you know the trial has been requested. After the trial has been approved, the message is replaced with an option to start the 30-day trial.

Application status messages in the ServiceNow Store are based on the procurement status of an application. After an application is fully procured, a message that it's available for installation is displayed. Installation can be managed through the Application Manager. For more information, see Application Manager.

App details

The app details section includes the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary

An overview of key information about the application, including the following:

- Rating
- Pricing
- Custom table count (the number of unallocated custom tables this application requires)
- Latest version
- Compatibility

Description

An overview of what the application can help you accomplish on your ServiceNow AI Platform instance.

Key features

A list of features and capabilities the application can add to your ServiceNow AI Platform instance.

Ratings and reviews

A summary of ratings on a five-star scale, where five stars is the best, and a list of user reviews. For more information about leaving reviews, see Reviewing apps.

Links and documents

Additional information made available by the provider. Links and documents might include product documentation, release notes, installation guides, case studies, and more.

Licensing requirements

A description of custom table requirements, AI usage, and subscription considerations for applications on the ServiceNow Store.

Terms and conditions

Downloadable ServiceNow Store terms of use and any terms and any other conditions applicable for the application.

Contacts

For partner applications, this shows contact information for the application provider. For applications built by ServiceNow, contact your account administrator or a sales agent.

Version details

The version details section includes the following information:

Version summary

Displays release date, custom table count, and platform release compatibility for the selected version. Select available platform release versions and application versions using the drop-down menus at the beginning of the version summary.

Dependencies

Lists of application dependencies and plugin dependencies that are required for the application to function correctly. For more information about dependencies, see Evaluating version requirements and dependencies.

Release notes

Information about what's been added, removed, or fixed in the selected application version.

Resource permissions

Information about how the application accesses cross scope and cross origin resources, and how its system usage is controlled, if provided by the developer.

Requirements

Hardware and software requirements for the application.

Plugins, apps, integrations, and products

Learn the difference between plugins, apps, integrations, and products, and understand the role each plays in the ServiceNow AI Platform.

Plugins

A plugin is a set of customizations that extends the functionality of the ServiceNow AI Platform and any apps already installed on your instance. Some plugins are pre-activated in your instance, while others might need to be activated manually by you or by ServiceNow personnel.

New plugins are made available during instance upgrades in accordance with your organization's ServiceNow licensing agreement. Plugins can't be purchased through the ServiceNow Store.

For more information about plugins, see ServiceNow plugins.

Applications/apps

An application is a standalone piece of code that implements a collection of features on the ServiceNow AI Platform. You can try, buy, or get apps according to your ServiceNow licensing agreement through the ServiceNow Store.

After getting an app from the ServiceNow Store, install it using the Application Manager. For more information, see Application Manager.

You can also create your own apps. For more information about creating apps for your ServiceNow AI Platform instance, see Building applications.

Integrations

An integration is a type of app that connects your instance to various systems outside the ServiceNow ecosystem, helping to streamline the flow of data within your organization. Integrations can be procured from the ServiceNow Store, either on their own or as part of a product.

Products

Products are collections of apps that work together to add additional features and capabilities to your ServiceNow AI Platform instance.

For more information about procuring products, see Getting products.

Configuring ServiceNow Store

Configure your ServiceNow Store user account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

The ServiceNow Store is a marketplace of applications, integrations, and products that work with the ServiceNow AI Platform. You can log in to the ServiceNow Store using your Now Support account credentials by default.

To configure application-specific notification settings, see Configure ServiceNow Store application notification preferences.

Configure ServiceNow Store application notification preferences

You can set notification preferences for each application you have procured and each trial you have requested. By default, notifications are sent to the email address associated with your Now Support account.

Before you begin

Role required: none

Procedure

1. Log in to the ServiceNow Store using your Now Support account credentials.
2. Select your name to open the user options.
3. Select **My store activity**.
4. Select the **Select Action** drop-down menu next to the application whose notification setting you want to change.
5. Select **Manage Notifications**.
6. Select the edit icon to change which email address receives application notifications.

Block application entitlements from the ServiceNow Store

As a service provider, block one or more instances from receiving application entitlements through the ServiceNow Store. An application can be installed in any entitled instance.

Before you begin

- Your company must be a service provider.
- The application must already be licensed to your company, or be available to install without a license.
- You must be logged into the ServiceNow Store with your Now Support account credentials.

Role required: none

About this task

Entitled instances can install applications. By default, all instances you manage are entitled to your licensed applications and free applications. Service providers can block application entitlement for any instance they manage.

If your organization isn't a service provider, all eligible instances within the organization are entitled and can install licensed and free applications.

Procedure

1. Log in to the ServiceNow Store using your Now Support credentials.
2. Find and select the application in the ServiceNow Store to navigate to the listing details.
3. Select **Manage entitlements**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Move instances from the **Available to install** column to the **Install blocked** column to prevent them from installing the application.
5. Select **Save changes**.

Result
Blocked instances can't install the application.

Getting apps and trials from the ServiceNow Store

Learn more about the different procurement flows for apps from the ServiceNow Store.

Overview of getting apps and trials

Applications must be procured from the ServiceNow Store if any of the following scenarios apply:

- The application has custom terms and conditions that must be agreed to.
- The application requires a paid license or subscription.
- The application requires the provider's approval to install.

Application state indicators can help you determine whether an application must be procured from the ServiceNow Store before it can be installed. Any applicable application state indicators are shown as part of application details page in the Application Manager. For more information about application state indicators, see Application state indicators in Application Manager.

Procure apps for any production or non-production instance in one of the following ways:

- Get a free application

  Get an app that's available at no additional cost from the ServiceNow Store when the app has custom terms and conditions or requires provider approval.

- Buy a ServiceNow application

  Log in to the ServiceNow Store and purchase an application that lists ServiceNow as the provider.

- Buy a partner application

  Log in to the ServiceNow Store and purchase an application that lists a non-ServiceNow provider.

- Get a product

  Procure products from the ServiceNow Store based on the terms of your license. A product is a collection of functionalities, typically including multiple applications, that aims to fulfill a category of business need.

Many apps provide a 30-day trial at no additional cost. The trial enables you to install the app on your non-production instances to determine whether you want to continue with procurement for production instances.

If a trial is available for an app, the listing has a **Request 30-day trial** option in the app listing and the app details page in the Application Manager shows the "Trial Available" state indicator.. For more information about starting an app trial, see Start an application trial from the ServiceNow Store.

Once an app has been procured, it’s available to install from the Application Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional information

- Contact a seller

  Contact an app's provider through the ServiceNow Store to ask questions about the app and its procurement.

- Evaluating version requirements and dependencies

  Learn how version compatibility and technical dependencies can affect your ability to install and use apps.

- Terms and conditions in the ServiceNow Store

  Learn about when terms and conditions must be signed in the ServiceNow Store. Unsigned terms and conditions block procurement and installations.

- Application Manager

  Use the Application Manager to install, update, repair, or uninstall an app after it's been procured.

Start an application trial from the ServiceNow Store

Request a 30-day trial of an app to test its functionality in a non-production instance.

Before you begin

You must be logged in to the ServiceNow Store with your Now Support account credentials.

Role required: none

About this task

You can request a 30-day trial of any app that includes a **Request 30-day trial** option in its listing details. The trial enables you to install the app on your non-production instance for evaluation.

If you decide to install the app on a production instance after evaluation, return to the ServiceNow Store and purchase the app or request the necessary license. For more information, see Buy a ServiceNow application or Buy a partner application.

Procedure

1. **Optional:** On the ServiceNow Store listing details for the app or integration, select **Request 30-day trial**.

   (Optional) Trial approvals are granted at the app provider's discretion, and trial requests expire after six months. If your trial request isn't approved, you can make a new request after the first request expires.

   To contact a seller about a trial request, see Contact a seller.

2. If no approval is required or if you already received approval, navigate to the ServiceNow Store app listing details and select **Start 30-day Trial**.
3. **Optional:** If you're a service provider managing trials for other organizations, select **Manage entitlements** to choose which non-production instances can install the application during the trial period.

   a. Select **Save**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The app is entitled and available for installation on the non-production instances you have selected within 24 hours. If the application isn't available from the Application Manager within 24 hours, contact Now Support for assistance.

Confirmation emails for the application and any dependencies that were procured are sent to the email address associated with your ServiceNow Store account. For information about configuring which email address receives notifications for this application, see Configure ServiceNow Store application notification preferences.

What to do next
Use the Application Manager to install the app on non-production instances for evaluation. For more information about the Application Manager, see Application Manager.

You can track the trial expiration date through the **Store Applications** section of the My Store Activity page. For more information, see Tracking your ServiceNow Store activity.

Get a free application

Get an app that's available at no additional cost from the ServiceNow Store when the app has custom terms and conditions or requires provider approval.

Before you begin
You must be logged in to the ServiceNow Store with your Now Support account credentials.

Role required: none

About this task
Applications that are available at no additional cost must be procured from the ServiceNow Store before installation in the following scenarios:

- If the application has the "Approval Required" state indicator in the Application Manager, it must be requested through the ServiceNow Store.
- If the application has the "App Terms Not Accepted" state indicator in the Application Manager, it has custom terms and conditions that must be accepted from the ServiceNow Store.
- If a new application version has the "App Terms Not Accepted" indicator in the Application Manager, that version has custom terms and conditions that must be accepted from the ServiceNow Store before the application can be updated.

For more information about application state indicators, see Application state indicators in Application Manager.

Procedure
1. Log in to the ServiceNow Store using your Now Support account credentials.
   For more information about accessing isolated federal or regional version of the ServiceNow Store, see Access the ServiceNow Store for a regulated environment.
2. Find and select the application in the ServiceNow Store to navigate to the listing details.
3. **Optional:** Select **Request app** to request procurement approval if required by the provider.
   You receive an email informing you whether the request is approved.
4. **Optional:** Accept any unacknowledged custom terms and conditions from the ServiceNow Store.
   a. From the application listing details in the ServiceNow Store, select **Accept Terms**.
   b. Download and review the custom terms and conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the option to agree to the terms and conditions.

d. Select **Accept**.

Result

If you use the commercial ServiceNow Store, the application is available for installation from the Application Manager within 24 hours. If you use an isolated federal or regional instance of the ServiceNow Store, the application is available within two business days of final approval. For more information about using the Application Manager, see Application Manager.

Confirmation emails for the application and any dependencies that were procured are sent to the email address associated with your ServiceNow Store account.

Trouble?

If the application isn't available to install from the Application Manager within the expected amount of time, try the following actions.

- Verify that all necessary dependencies have been procured. For more information, see Evaluating version requirements and dependencies.
- Review application state indicators from application's details in the Application Manager. For more information about what each indicator means, see Application state indicators in Application Manager.
- If the previous options don't work, contact Now Support for assistance.

What to do next

Install the app on compatible production or non-production instances, based on whether you have a hosted or on-premise instance:

- If your instance is in a hosted environment, install the app using the Application Manager. For more information, see Install an application or plugin.
- If your instance is in an on-premise environment, download the encrypted app file from your federal or regional instance of the ServiceNow Store and upload the file to your instance. For more information, see Getting apps as an on-premise customer

Buy a ServiceNow application

Log in to the ServiceNow Store and purchase an application that lists ServiceNow as the provider.

Before you begin

You must be logged in to the ServiceNow Store with your Now Support account credentials.

Role required: none

Procedure

1. Log in to the ServiceNow Store using your Now Support credentials.
2. Find and select the application to view its listing details.
3. Initiate purchase based on the option displayed on the listing details page.
   - If the application requires additional approval, the listing details page displays a **Request purchase** option.
   - If the application doesn't require additional approval, the listing details page displays a **Request license** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A sales agent or your account executive contacts you to process approved purchases. If the application uses the standard terms and conditions, it's available to install from the Application Manager within 24 hours of confirmation.

4. **Optional:** If the application displays the "App Terms Not Accepted" state indicator in the Application Manager, accept the custom terms and conditions from the ServiceNow Store. For more information about application state indicators, see Application state indicators in Application Manager.
   a. From the application listing details in the ServiceNow Store, select **Accept Terms**.
   b. Download and review the custom terms and conditions.
   c. Select the option to agree to the terms and conditions.
   d. Select **Accept**.

Result

The application is available for installation from the Application Manager within 24 hours of license confirmation. For more information about using the Application Manager, see Application Manager.

Confirmation emails for the application and any dependencies that were procured are sent to the email address associated with your ServiceNow Store account.

Trouble?

If the application isn't available to install from the Application Manager within the expected amount of time, try the following actions.

- Verify that all necessary dependencies have been procured. For more information, see Evaluating version requirements and dependencies.
- Review application state indicators from application's details in the Application Manager. For more information about what each indicator means, see Application state indicators in Application Manager.
- If the previous options don't work, contact Now Support for assistance.

Buy a partner application

Log in to the ServiceNow Store and purchase an application that lists a non-ServiceNow provider.

Before you begin

You must be logged in to the ServiceNow Store with your Now Support account credentials.

Role required: none

Procedure

1. Log in to the ServiceNow Store using your Now Support credentials.
2. Find and select the application in the ServiceNow Store to navigate to the listing details.
3. Initiate purchase based on the option displayed on the listing details page.
   If an application requires additional approval from the provider, the listing details page displays a **Request purchase** option. If the application doesn't require any additional approval, the listing details page displays **Contact seller** instead.

Option	Procedure
Request purchase	Select **Request purchase** to send a request to the provider. Approval is granted at the provider's discretion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Procedure
Contact seller	**a.** Select **Contact seller**. **b.** In the **Reason for contacting** section of the pop-up window, select **Purchases**. **c.** In the **Message to the seller** field, enter your message. **d.** Select **Send** to submit the message to the application provider.

You receive an email informing you whether the provider approves the purchase.

4. When you receive an email confirmation that your purchase has been approved, follow any additional instructions in the email to complete the purchase.
5. **Optional:** If the application displays the "App Terms Not Accepted" state indicator in the Application Manager, accept the custom terms and conditions from the ServiceNow Store. For more information about application state indicators, see Application state indicators in Application Manager.
   a. From the application listing details in the ServiceNow Store, select **Accept Terms**.
   b. Download and review the custom terms and conditions.
   c. Select the option to agree to the terms and conditions.
   d. Select **Accept**.

Result

The application is available for installation from the Application Manager within 24 hours of license confirmation. For more information about using the Application Manager, see Application Manager.

Confirmation emails for the application and any dependencies that were procured are sent to the email address associated with your ServiceNow Store account.

Trouble?

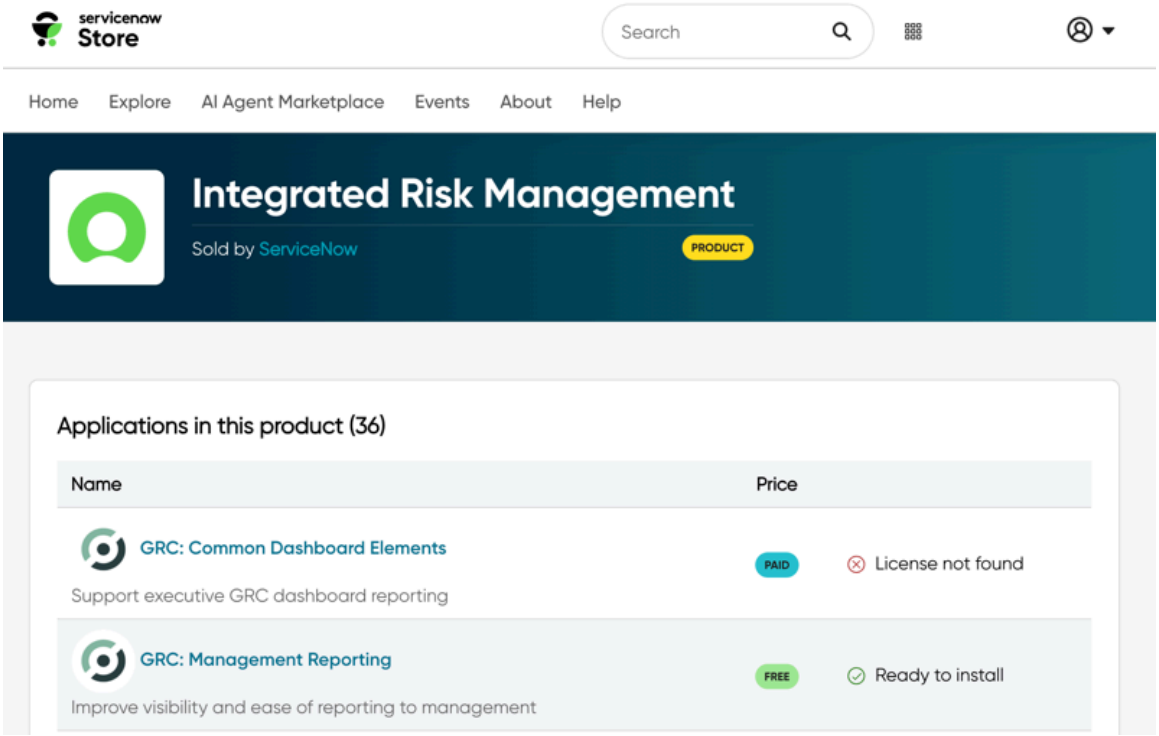
If the application isn't available to install from the Application Manager within the expected amount of time, try the following actions.

- Verify that all necessary dependencies have been procured. For more information, see Evaluating version requirements and dependencies.
- Review application state indicators from application's details in the Application Manager. For more information about what each indicator means, see Application state indicators in Application Manager.
- If the previous options don't work, contact Now Support for assistance.

Getting products

Procure products from the ServiceNow Store based on the terms of your license. A product is a collection of functionalities, typically including multiple applications, that aims to fulfill a category of business need.

Overview of getting products



You can browse all products available from the ServiceNow Store by navigating to the **Explore** tab and selecting **ServiceNow Products**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Product details page

From the product details page, you can see all applications included in the product and whether each one is ready to install. Applications that aren't part of your license yet display "License not found."

Product details

Each unlicensed application in a product must be procured individually. Select each unlicensed application and request procurement from the application details page. For more information, see Buy a ServiceNow application.

Contact a seller

Contact the provider of an app through the ServiceNow Store to ask questions about the app and its procurement.

Before you begin
Role required: None

If an app is provided by a partner of ServiceNow, you can contact the provider through the ServiceNow Store with or without logging in.

If you have questions about an app offered by ServiceNow, contact your account executive or a ServiceNow sales representative.

Note: If your organization uses a federal or regulated instance of the ServiceNow Store, the **Contact Seller** button is unavailable. Instead, navigate to the **Contacts** section of the listing details using the side menu or select **View seller profile**, then use the contact information provided to contact the seller directly. For more information about getting applications in regulated environments, see Using the ServiceNow Store in a regulated environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From the summary section of the app listing details, select **Contact Seller**.
2. On the contact form, fill in the fields, which depend on whether you're logged in with your Now Support credentials.

Logged in status	Fields displayed
Logged in	Provide the reason for contacting the seller and your message.
Not logged in	On the guest contact form, fill in the fields. For a description of the field values, see Guest contact form fields.

3. Select **Send** to submit the form.

Result

If you contact the seller about a purchase, you might receive an email notification from the ServiceNow Store informing you that the seller has agreed to a custom order. In this case, you can procure the app from the ServiceNow Store according to the terms described in the email.

Otherwise, the seller responds to you directly using the contact information that's provided in the contact form or that's associated with your Now Support account.

Evaluating version requirements and dependencies

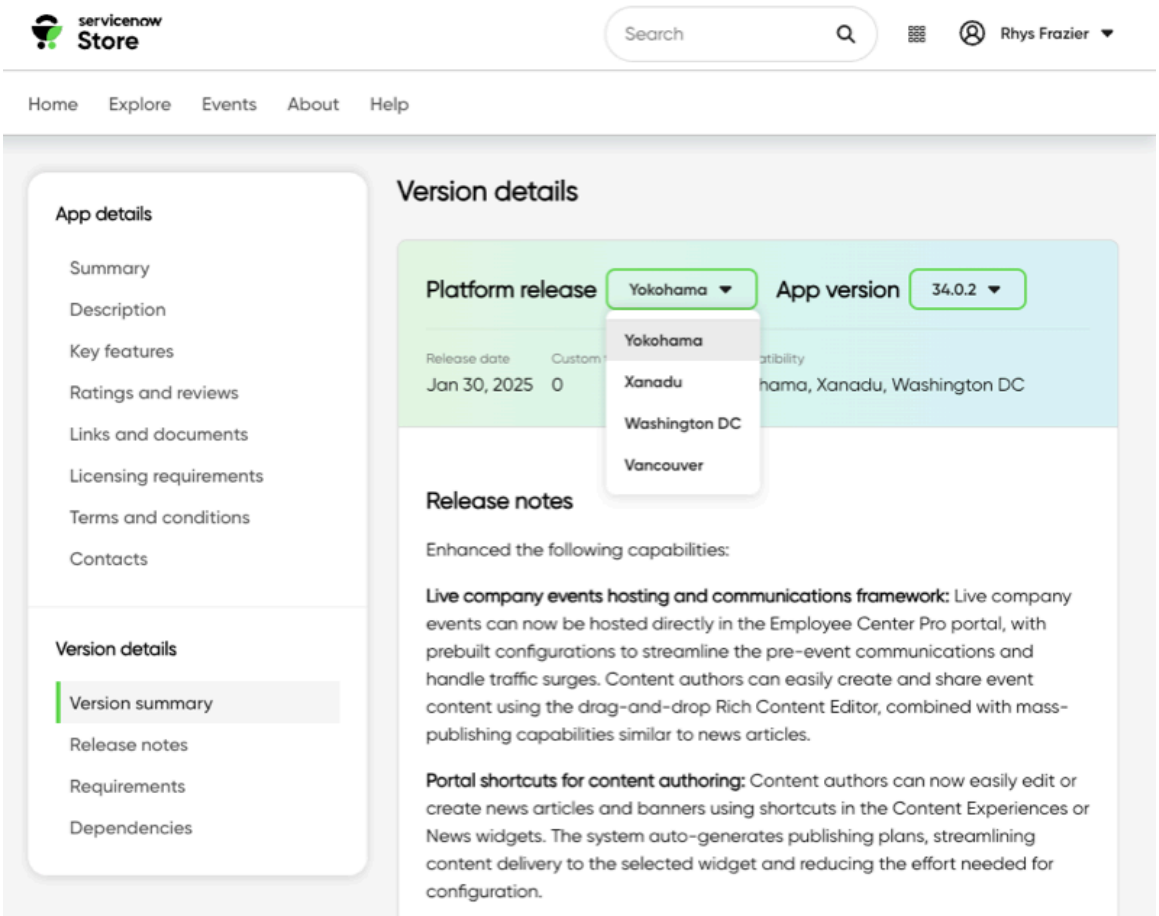
Reviewing technical requirements when deciding to implement a new app, product, or integration is necessary to confirm that the software can work correctly in your environment. Verify version compatibility with your ServiceNow AI Platform instance and check dependencies to make sure that an app will be ready to install after procurement.

Version support

The ServiceNow Store supports up to two platform releases before the current platform release. For example, if the current platform release is Yokohama, the ServiceNow Store maintains app versions that are compatible with Yokohama, Xanadu, and Washington DC.

However, it can't be guaranteed that new apps are compatible with any platform releases before the most current one. Available apps might, for example, be compatible with only Yokohama or with only Yokohama and Xanadu.

If you find that your ServiceNow AI Platform release version is no longer supported in the ServiceNow Store, upgrade your instance to take advantage of recent features and improvements. For more information, see Using ServiceNow AI Platform upgrade tools.

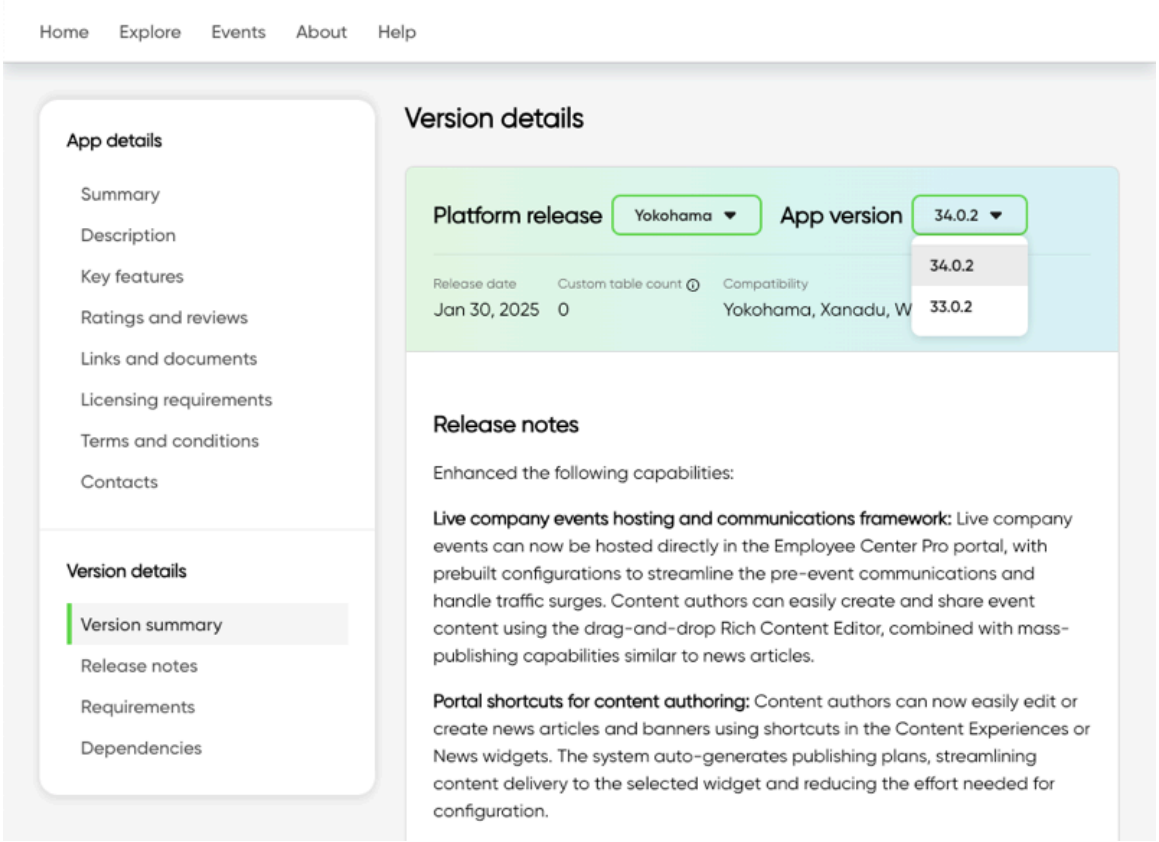


Checking version compatibility

The app you want to procure must be compatible with your instance's platform release version. If you can't procure an app, check whether it's compatible with your version.

Apps on the ServiceNow Store might be compatible with multiple ServiceNow AI Platform releases. Select **Version summary** from the navigation panel of the listing details or scroll to the version details section to determine platform release compatibility. You can select the platform release version that matches your instance by using the platform release drop-down menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Platform release compatibility in an app listing details

Some apps and integrations are available in more than one version. Each of these versions might be compatible with a different major platform release. Use the app version drop-down menu to view release notes and decide which version is right for your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing other app versions in app listing details

About dependencies

Dependencies are the additional apps, integrations, and plugins that an app might require to work correctly. Select **Dependencies** from the navigation panel of the listing details or scroll to the version details section to view an app's dependencies.

Any app on the ServiceNow Store might have application dependencies or system plugin dependencies.

Application dependencies

Include apps and integrations that are required for the app you want to procure. App dependencies that don't require an additional purchase are procured automatically. Paid app dependencies can be purchased through the ServiceNow Store

System plugin dependencies

Must be activated on your instance before an app can be installed and can’t be obtained from the ServiceNow Store. Instead, plugins must be obtained through your ServiceNow license and version upgrades. For more information about plugins, see ServiceNow plugins.

Each application dependency is listed with a symbol. The symbol indicates a category that describes how you can acquire the app dependency. App dependencies use the following categories.

Note: You must be logged in to the ServiceNow Store to see the app dependency categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

App dependency symbols

Symbol	Category	Description
	Application is available to install or update	This dependency is already entitled on your instance and is available to install through the Application Manager when you install the app that requires it. For more information about the Application Manager, see Application Manager.
	Unavailable to install application in production	This app isn't already entitled on your instance, and must be procured before it or the app that requires it can be installed. If this app requires purchase, procure it through its ServiceNow Store listing details, or contact you ServiceNow account manager to initiate procurement. If this app is available at no additional cost, it's automatically procured with the app that requires it in the following situations: • If the app doesn't have custom terms and conditions • If the app doesn't require approval from the provider

Unresolved dependencies in procured apps

If you procured an app but it still can't be installed through the Application Manager, you might have unresolved dependencies. You can verify whether there are unresolved dependencies by logging in to the ServiceNow Store and returning to the app listing details. If an application dependency must be procured manually, a red x icon () indicates that the app is unavailable to install in production.

The list of application dependencies contains links that direct you to the ServiceNow Store listing details for each app dependency. From the listing details, you can manually procure the required app.

Plugin dependencies can't be resolved from the ServiceNow Store. For more information about managing plugins, see ServiceNow plugins.

Terms and conditions in the ServiceNow Store

Learn about when terms and conditions must be accepted in the ServiceNow Store. Unaccepted terms and conditions block procurement and installations.

Applications in the ServiceNow Store might use standard or custom terms and conditions. You can review and download all terms and conditions that apply to an application from its listing details page.

Standard terms and conditions

Standard terms and conditions include the Store Standard Terms of Use and Vendor App Subscription Terms and Conditions. Standard terms and conditions must be accepted in the following scenarios:

- If you're a new ServiceNow Store customer
- If you're an existing ServiceNow Store customer and haven't yet accepted the standard terms and conditions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you log in to the ServiceNow Store, an alert message tells you if you must accept the standard terms and conditions. You can review, accept, and download the standard terms and conditions from the link in the alert message.

Standard terms and conditions must be accepted before you can procure or install applications, integrations, and products.

Custom terms and conditions

Application providers can also include custom terms and conditions that must be accepted before their applications can be procured. If an application has custom terms and conditions, you're prompted to accept them when you procure the application from the ServiceNow Store. If the application uses custom terms and conditions, procurement and installation are blocked until the custom terms and conditions are accepted.

Reviewing apps

Reviewing apps, products, and integrations on the ServiceNow Store lets providers know what's working well and what future updates customers want to see.

Overview of reviewing apps

You can leave a review on any ServiceNow Store solution that you have used. Either log in to the ServiceNow Store with your Now Support credentials to leave a review or submit a guest review.

You can view published reviews by selecting **Ratings and Reviews** from the app details navigation panel.

Reviews left on an application only show up in the environment where the review was made. For example, reviews made from the commercial ServiceNow Store are only visible on the commercial ServiceNow Store. Reviews made from a regulated regional or federal instance of the ServiceNow Store are only visible to users in the same instance of the ServiceNow Store.

Review an app

Use your Now Support credentials to log in to the ServiceNow Store and leave a review on any app or integration you have used.

Before you begin

- The app you’re reviewing must be installed on your instance.
- You must be logged in to the ServiceNow Store with your Now Support credentials.

Role required: None

About this task

You can review an app after your organization buys or trials it. App reviews provide valuable feedback about what you like and what possible updates you want to see in the future.

Reviews left on an application only show up in the environment where the review was made. For example, reviews made from the commercial ServiceNow Store are only visible on the commercial ServiceNow Store. Reviews made from a regulated regional or federal instance of the ServiceNow Store are only visible to users in the same instance of the ServiceNow Store.

Note: Your company is visible in any reviews that you leave while logged in to the ServiceNow Store unless your organization uses an isolated federal or regional instance. If your company uses an isolated federal or regional instance, "Verified ServiceNow Customer" is displayed instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to the ServiceNow Store using your Now Support credentials.
2. Find and select the app that you want to review on the ServiceNow Store.
3. From the app details navigation panel, select **Ratings and Reviews**.
4. Select **Write a Review**.
5. Select a number of stars out of five.
6. Enter your comments in the review field.
7. Select **Post**.

Result

For commercial customers, your company, review, and rating are visible in a review posted to the app listing details. For customers using a federal or regulated ServiceNow Store instance, only the rating and review fields are made visible.

Submit a guest review

Submit a guest review to leave feedback on an app or integration if you aren't logged in.

Before you begin

Role required: None

About this task

Reviews left on an application only show up in the environment where the review was made. For example, reviews made from the commercial ServiceNow Store are only visible on the commercial ServiceNow Store. Reviews made from a regulated regional or federal instance of the ServiceNow Store are only visible to users in the same instance of the ServiceNow Store.

Procedure

1. In the ServiceNow Store, find and select the listing of the app you want to review.
2. From the navigation panel in the app listing details, select **Ratings and reviews**.
3. Select **Write a Review**.
4. On the guest review form, fill in the fields.
   For a description of the field values, see Guest review form fields.
5. Select **Submit**.

Result

For commercial customers, your company, review, and rating are visible in a review posted to the app listing details. For customers using a federal or regulated ServiceNow Store instance, only the rating and review fields are made visible.

Getting apps as an on-premise customer

If you have an on-premise (self-hosted) instance, you can procure apps from the ServiceNow Store. Download encrypted apps and products to install on your instance, or connect your instance to the ServiceNow Store to sync purchases with your instance directly.

Overview of using the ServiceNow Store for on-premise instances

If you have an on-premise instance, there are two ways that you can procure apps and products from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use a computer with network access to download encrypted application files, and then transfer those files to your on-premise instance.
- Connect your on-premise instance to the ServiceNow Store to sync purchases with your instance and make them available for installation. Contact Customer Service and Support to connect your instance to the ServiceNow Store.

Procuring apps and products without connecting to the ServiceNow Store

Use the following steps to procure apps and products without connecting your instance to the ServiceNow Store.

1. Get an app or product as an on-premise customer

   Procure and download an encrypted app from the ServiceNow Store for use with your on-premise instance.

2. Upload an app to an on-premise instance

   Upload an application's encrypted file to your on-premise instance to make it available for installation.

3. Install the app or product using the Application Manager

   After uploading the encrypted app file, use the Application Manager to install the application to your on-premise instance.

For information about updating applications in unconnected on-premise instances, see the article Upgrade guidance for self-hosted customers [KB0598275] on the Now Support Knowledge Base.

Procuring apps and products by connecting to the ServiceNow Store

Contact Customer Service and Support to connect your instance to the ServiceNow Store.

After Customer Service and Support confirms that your instance is connected to the ServiceNow Store, follow the same steps used to procure and install applications in hosted instances. Refer to Getting apps and trials from the ServiceNow Store for more details.

Get an app or product as an on-premise customer

Procure and download encrypted apps, products, and dependencies from the ServiceNow Store for use with your on-premise (self-hosted) instance.

Before you begin

You must be logged in to the ServiceNow Store with your Now Support account credentials.

Role required: none

About this task

If your on-premise instance isn't connected to the internet or to the ServiceNow Store, you can download encrypted applications to use on your instance. Procure and download an application or product and its dependencies using a computer with internet access, then transfer the necessary files to your instance.

If your on-premise instance has been connected to the ServiceNow Store, refer to Getting apps and trials from the ServiceNow Store instead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: You must repeat this process for each instance you want to upload an app or product to.

Procedure

1. From a computer with internet access, log in to the ServiceNow Store and procure the app or product.
   - For more details about procuring apps and products from the commercial ServiceNow Store, see Getting apps and trials from the ServiceNow Store.
   - For more details about procuring apps in a regulated environment, see Using the ServiceNow Store in a regulated environment.
2. From the app listing details or product page on the ServiceNow Store, select **On-prem download**.
3. In the pop-up window, use the **Select on-prem instance** drop-down list to select an instance associated with your account.
4. Select an encryption certificate through the **Use existing**, **Generate new**, or **Upload new** options.
   - Select **Use existing** if you recently downloaded an application for the same instance you selected in step 3. If no certificate is automatically populated when you select **Use existing**, select **Generate new** or **Upload new** instead.
   - Select **Generate new** if you don't have an encryption certificate or if your encryption certificate has expired.
   - Select **Upload new** if you want to use the same encryption certificate you generated to install an application on a different instance.

Option	Procedure
Use existing	If a certificate is automatically populated, pro ceed to the next step. If no certificate is auto matically populated, select **Generate new** or **Upload new** instead.
Generate new	**a.** In the **Password** field, enter the password you want to use with the new certificate. **b.** Select **Generate**. A new encryption certificate is available for download.
Upload new	**a.** In the **Password** field, enter the password that was used to generate the certificate you want to use. **b.** In the **Upload file** field, add the encryption certificate. **c.** Select **Upload**.

For more information about generating encryption certificates and uploading them to your ServiceNow AI Platform instances, see How to generate and upload a certificate for on-prem store app | Troubleshooting common issues or errors [KB1080332].

5. Select a compatible application version to download from the **Version** drop-down list next to the application name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only versions compatible with the instance selected in step 3 are displayed.

On-prem product downloads display multiple applications with **Version** drop-down lists. Applications that you don't specify a version for are excluded from download.

6. Select **Download Application** to download an encrypted `.store` file with the selected apps and their dependencies.

> **Note:** The `.store` file has an expiration date two weeks from the date of download. If more than two weeks pass before you upload it to your instance, you must download a new `.store` file.

What to do next

Transfer the `.store` file to your on-premise instance to upload the app. For more information, see Upload an app to an on-premise instance.

Upload an app to an on-premise instance

Upload an application's encrypted file to your on-premise instance to make it available for installation.

Before you begin

Role required: admin

- The same certificate used when downloading the app must be installed to the instance.
- For instances that aren't connected to the internet, the system property `sn_appclient.app.install.offline` must be set to `true`. If the value is set to `false`, contact Customer Service and Support and request it be changed to `true`.

Procedure

1. From your ServiceNow AI Platform instance, access the Application Manager by navigating to **Admin** > **Application Manager**
2. Select **Upload Offline Application**.
3. Upload the `.store` file you received when you downloaded the application from the ServiceNow Store.
4. Locate and select the app from the list on the **Available for you** page.

Trouble?
If you can't find the app, refresh the Application Manager and try again.

What to do next

Install the uploaded application through the Application Manager. For more information, see Install an application or plugin.

Using the ServiceNow Store in a regulated environment

Certain regulated environments require an isolated instance of the ServiceNow Store to meet data security requirements. If your instance is in a regulated environment, you might need to get apps and products from a federal or regional version of the ServiceNow Store.

Overview of using the ServiceNow Store in a regulated environment

Regulated instances of the ServiceNow AI Platform are hosted in datacenters that comply with the specific regional, organizational, or governmental needs of the customers that use

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

them. With a regulated instance, an organization or government body can determine specific requirements, including data residency, privacy and security, and compliance requirements.

Some regulated environments require their own isolated instances of the ServiceNow Store to meet security requirements. Isolated instances of the ServiceNow Store are available in both federal and regional regulated instances.

Not all regulated environments require an isolated instance of the ServiceNow Store. If your environment doesn't have access to an isolated federal or regional ServiceNow Store, use the commercial ServiceNow Store instead. For more information about which environments have access to an isolated federal or regional ServiceNow Store, see Environments with federal or regional ServiceNow Store instances.

Important: Applications and products available in federal and regional instances of the ServiceNow Store aren't accredited. You must perform your own security review to confirm that an application or product meets the requirements for your regulated instance.

Procuring and installing apps in a regulated environment

1. Access the correct version of the ServiceNow Store for your environment.
   - If your regulated environment has an isolated federal or regional instance of the ServiceNow Store, see Access the ServiceNow Store for a regulated environment.
   - If your regulated environment doesn't require an isolated federal or regional instance, use the procurement process for the commercial ServiceNow Store instead. For information about procuring apps from the commercial ServiceNow Store, refer to Getting apps and trials from the ServiceNow Store.
2. Procure an application from an isolated federal or regional instance of the ServiceNow Store.
   - To request a 30-day trial, log in to your federal or regional instance of the ServiceNow Store and use the same process that users of the commercial ServiceNow Store do. For more information, see Start an application trial from the ServiceNow Store.
   - To get an application that's available at no additional cost, log in to your federal or regional instance of the ServiceNow Store and use the same process that users of the commercial ServiceNow Store do. For more information, see Get a free application.
   - To request a paid application, see Request a paid app for a regulated environment.
   - To complete procurement of an application for an on-premise instance, see Get an app or product as an on-premise customer.
3. Install an application in a regulated environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you have a hosted instance in a regulated environment, see Install an application or plugin.
- If you self-host your instance, see Upload an app to an on-premise instance.

Additional info

- Environments with federal or regional ServiceNow Store instances

  Certain regulated environments contain an isolated instance of the ServiceNow Store to support data security requirements. Find out whether your environment has its own federal or regional instance of the ServiceNow Store.

- Listing types not available in regulated environments

  To preserve data privacy standards, certain types of app listings can't be offered in federal or regional instances of the ServiceNow Store.

- Terms and conditions in the ServiceNow Store

  Learn about when terms and conditions must be accepted in the ServiceNow Store. Unaccepted terms and conditions block procurement and installations.

Environments with federal or regional ServiceNow Store instances

Certain regulated environments contain an isolated instance of the ServiceNow Store to support data security requirements. Find out whether your environment has its own federal or regional instance of the ServiceNow Store.

Currently, regulated environments with access to isolated instances of the ServiceNow Store include the following:

- Government Security Cloud (GCC)
- National Security Cloud (NSC)
- ServiceNow Protected Platform: Australia (SPP-AU)
- ServiceNow Protected Platform: Singapore (SPP-SG)

If there isn't an isolated instance of the ServiceNow Store available for your environment, use the commercial ServiceNow Store.

Listing types not available in regulated environments

To preserve data privacy standards, certain types of app listings can't be offered in federal or regional instances of the ServiceNow Store.

The following listing types aren't available in isolated federal or regional instances of the ServiceNow Store:

OEM Solutions

Cloud-based services and solutions that are made available to customers both inside and outside the ServiceNow ecosystem.

Partner beta apps

Early-stage, experimental projects that partners are developing to introduce new functionalities to the ServiceNow AI Platform.

Innovation lab offerings

Early-stage, experimental projects that ServiceNow teams are developing to introduce new functionalities to the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the ServiceNow Store for a regulated environment

Log in to the isolated instance of the ServiceNow Store contained in your regulated environment.

Before you begin
Role required: none

You must have access to Now Support in a regulated environment.

Procedure

1. Log in to Now Support for your regulated environment.
2. Access the ServiceNow Federal Store by scrolling to the end of the page and selecting the **Visit the ServiceNow Federal Store** button.

Result
You're logged in to the federal or regional instance of the ServiceNow Store that corresponds with your regulated environment.

Request a paid app for a regulated environment

Request to buy a paid app from a federal or regional ServiceNow Store instance to make that app available on your regulated instance.

Before you begin
Role required: none

Procedure

1. Access the federal or regional ServiceNow Store instance that corresponds to your regulated environment.
   For more information, see Access the ServiceNow Store for a regulated environment.
2. Find and select a paid app or integration.
3. Conduct a security review to verify that the app or integration meets the requirements for your regulated instance.
4. Request to purchase a license for the application or integration.
   - If the application is provided by ServiceNow, select **Request license**.
   - If the application is provided by a partner and requires approval, select **Request purchase**.

   If your request is approved, a sales representative or your account executive contacts you by email to process your purchase. Approval is granted at the provider's discretion.

   For questions about an application provided by ServiceNow, contact your account executive. For questions about an application provided by a partner, contact the partner directly.
5. Follow the emailed instructions to complete the purchase.

   Note: It can take up to two business days for the application to become available in the Application Manager after final license confirmation.

6. **Optional:** If the application displays the "App Terms Not Accepted" state indicator in the Application Manager, accept the custom terms and conditions from the ServiceNow Store. For more information about application state indicators, see Application state indicators in Application Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the application listing details in the ServiceNow Store, select **Accept Terms**.

b. Download and review the custom terms and conditions.

c. Select the option to agree to the terms and conditions.

d. Select **Accept**.

Result

Confirmation emails for the application and any dependencies that were procured are sent to the email address associated with your ServiceNow Store account. For information about configuring which email address receives notifications for this application, see Configure ServiceNow Store application notification preferences.

The application is available to install within two business days. If the application still can't be installed after two business days, contact Now Support for assistance.

What to do next

Install the app on compatible production or non-production instances, based on whether you have a hosted or on-premise instance:

- If your instance is in a hosted environment, install the app using the Application Manager. For more information, see Install an application or plugin.
- If your instance is in an on-premise environment, download the encrypted app file from your federal or regional instance of the ServiceNow Store and upload the file to your instance. For more information, see Getting apps as an on-premise customer

ServiceNow Store reference

Reference topics provide more information about guest review form fields and types of ServiceNow Store listings.

Guest contact form fields

A description of the fields on the Guest contact form in the ServiceNow Store.

Guest contact form

Field	Description
Name	Full name.
Company	Name of your company or organization.
Business Email	Email address used within your organization.
Phone	Phone number where you can be reached.
Country	Country where you are located.
Message to Seller	Question or request.

Guest review form fields

A description of the fields on the Guest review form in the ServiceNow Store, as well as which fields are publicly visible after the review is published.

Guest review form

Field	Description	Visibility
Version	Version number of the app you're reviewing.	Not publicly visible.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guest review form (continued)

Field	Description	Visibility
First Name	First or given name.	Not publicly visible.
Last Name	Last or family name.	Not publicly visible.
Email	Your email address.	Not publicly visible.
Company	Name of your company or organization.	Publicly visible for commercial customers. Replaced with "Verified ServiceNow Customer" for customers using a regulated ServiceNow Store instance.
Review	Feedback about the app. Your feedback could include whether you recommend the app, how user-friendly it is, features you'd like to see added in the future, and so on.	Publicly visible.
Rating	Number of stars out of five, where a five-star rating is the highest and a one-star rating is the lowest.	Publicly visible.

ServiceNow Store glossary

Review important terms related to the ServiceNow Store to help determine which listings meet your organization's needs.

application

A standalone piece of code that implements a collection of features on the ServiceNow AI Platform. You can procure apps from the ServiceNow Store to install on an instance.

app

beta apps

Early-stage, experimental projects that ServiceNow partners are developing to introduce new functionalities to the ServiceNow AI Platform. Partners might invite you to try an app or integration that's in beta. Beta apps can only be installed in hosted non-production instances.

built on ServiceNow solutions

Apps and integrations that help you customize the ServiceNow AI Platform for specific and industry and market needs. Apps and integrations built on ServiceNow solutions have passed the ServiceNow Partner Solutions Center of Excellence process. This process verifies alignment with ServiceNow quality standards related to software development life cycle and business outcomes.

built with ServiceNow offerings

Services, dashboards, and implementation guides offered by ServiceNow partners and customized for your organization's needs. Offerings built with ServiceNow have passed the ServiceNow Partner Acceleration process to verify alignment with ServiceNow quality standards related to software development life cycle and business outcomes.

custom tables

A non-exempt table created by a platform administrator and not included as part of the base ServiceNow AI Platform system. Custom table entitlements are included with certain licenses and subscriptions. For more information, see Custom tables.

generative AI

Applications and solutions that incorporate Now Assist, a generative AI experience purpose-built for the ServiceNow AI Platform.

innovation lab

Early-stage, experimental projects that ServiceNow teams are developing to introduce new functionalities to the ServiceNow AI Platform. Innovation labs are available on the ServiceNow Store.

integration

Connects your instance to other services, licenses, and apps outside the ServiceNow ecosystem to streamline the flow of data within your organization.

MSP ready

A ServiceNow Store listing filter for applications and integrations that have domain separation enabled. Managed Service Providers (MSPs) can procure and manage these applications on behalf of their customers.

plug and play

Applications and integrations that can be used without additional customization or setup after installation.

product

A collection of apps that coordinate to add features and capabilities to a ServiceNow AI Platform instance. Products can be obtained through the ServiceNow Store.

Application Manager

Application Manager provides admins the ability to install, update, and manage licensed applications and plugins for their instance.

Get started

What to explore next

To learn more about configuring and using Application Manager, see:

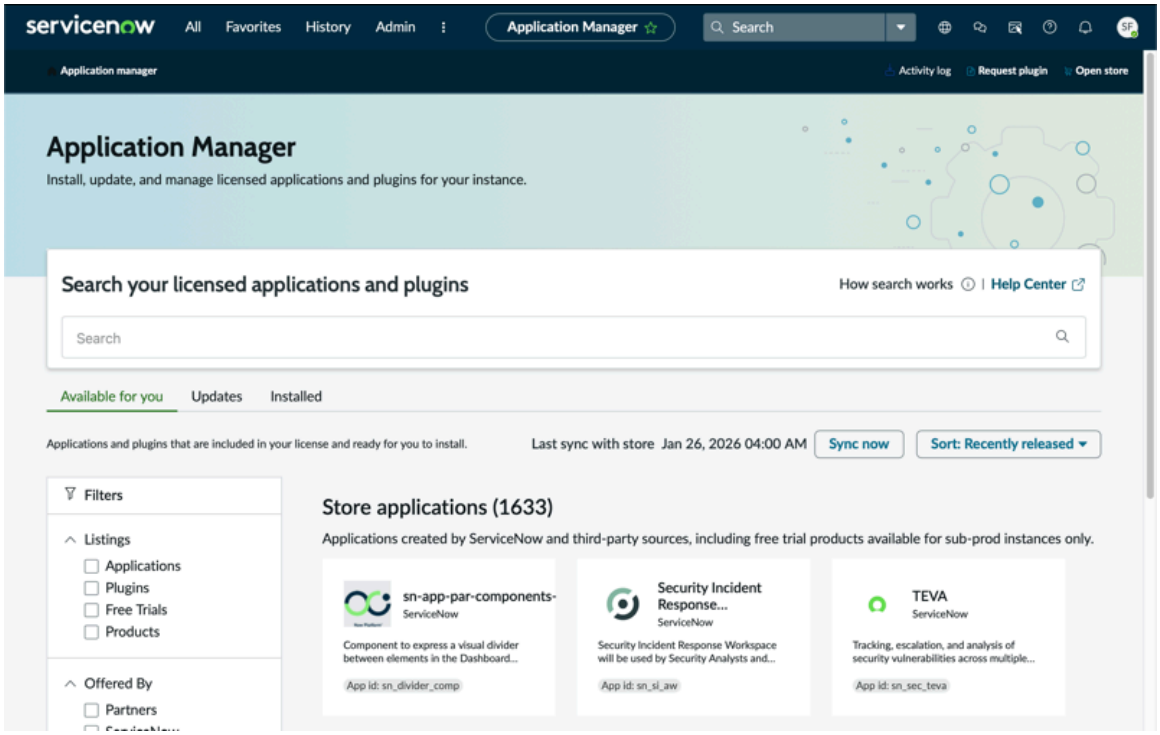
- Configuring Application Manager
- Installing applications, plugins, and products
- Updating applications
- Uninstalling applications
- Repairing applications and plugins
- Application Manager reference

Application Manager activity log

The Activity log displays recent and upcoming Application Manager activity for quick reference.

The **Activity log** is available in the Application Manager home toolbar. You can use the **Filter** drop-down menu of the Activity log to view items based on the following criteria:

- Recently added
- In progress
- Scheduled
- Failed
- Completed



Application Manager available for you tab

The **Available for you** tab displays all applications, products, and plugins.

The applications and products in **Available for you** include the ones available for purchase from the ServiceNow Store and the ones that are already licensed. For more information about procuring applications and products from the ServiceNow Store, see Getting apps and trials from the ServiceNow Store.

The plugins in this section include those that are licensed and ready to install and those that need to be requested. For more information about requesting plugins, see Request a plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An automatic synchronization with the ServiceNow Store happens every 24 hours. If an app isn't displaying in the Application Manager, you can manually synchronize using the **Sync now** button.

Filtering applications

You can use the search bar and apply filtering options to find applications, products, or plugins that meet your organization's needs. You can also filter applications by the following attributes:

Free

Applications that are available at no additional cost.

Paid

Applications that require a paid license.

Licensed

Paid applications that you already have a license for. These applications can be installed.

Compatible

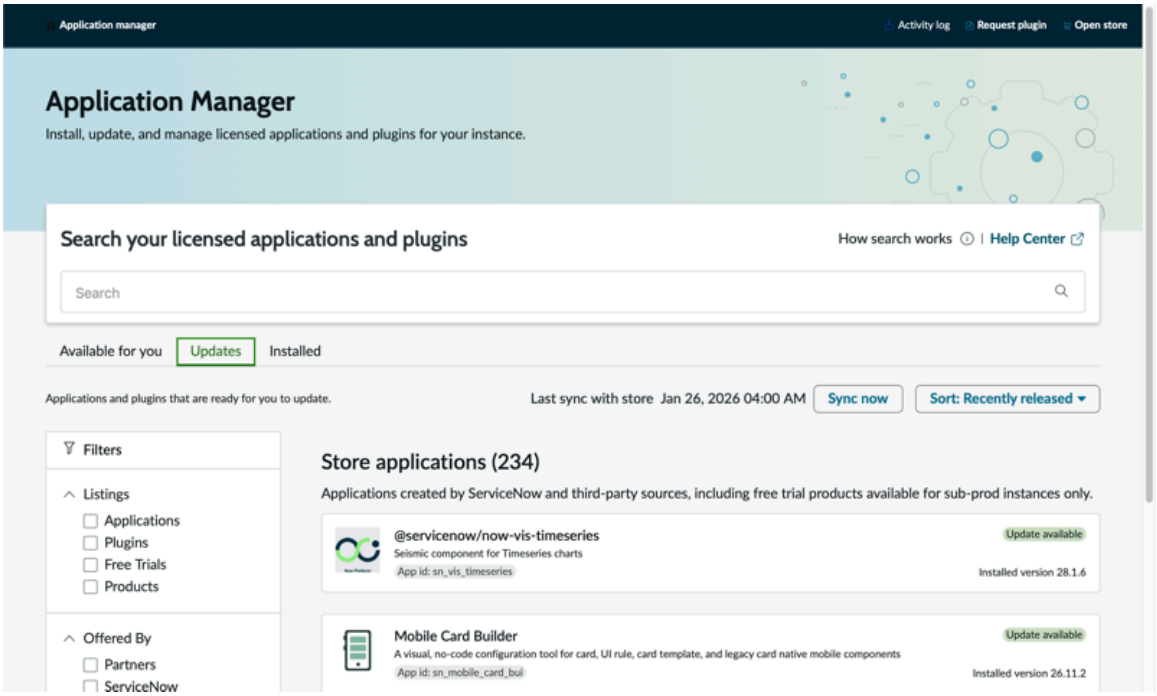
Application versions that are compatible with your instance of the ServiceNow AI Platform.

Upcoming Renewals

Applications with subscriptions that need to be renewed soon.

Trial Started

Applications that are currently in a trial period.



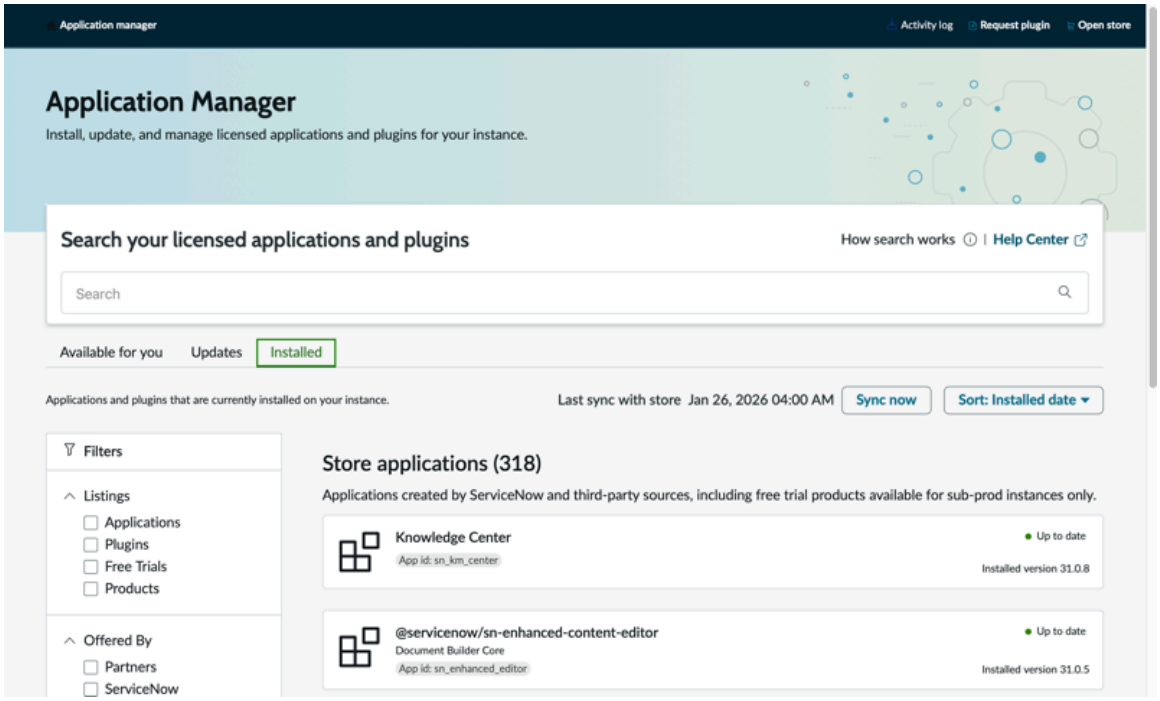
Application Manager Updates tab

You can check whether updates are available for installed applications and plugins at any time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Updates

The **Updates** tab displays applications and plugins that are ready for you to update. If there are updates available, they're displayed and a green **Update available** message is displayed on the tile. You can also apply filters to narrow your search or use the sorting option to display by alphabetical order or based on recently released.



Application Manager installed tab

You can view all installed applications and plugins from one place in the Application Manager.

The **Installed** tab displays applications and plugins that are currently installed on your instance. Installed applications and plugins display their current version, as well as notifying you if the app is up to date or has an update available. You can also apply filters to narrow your search or use the sorting option to display by alphabetical order or based on recently released.

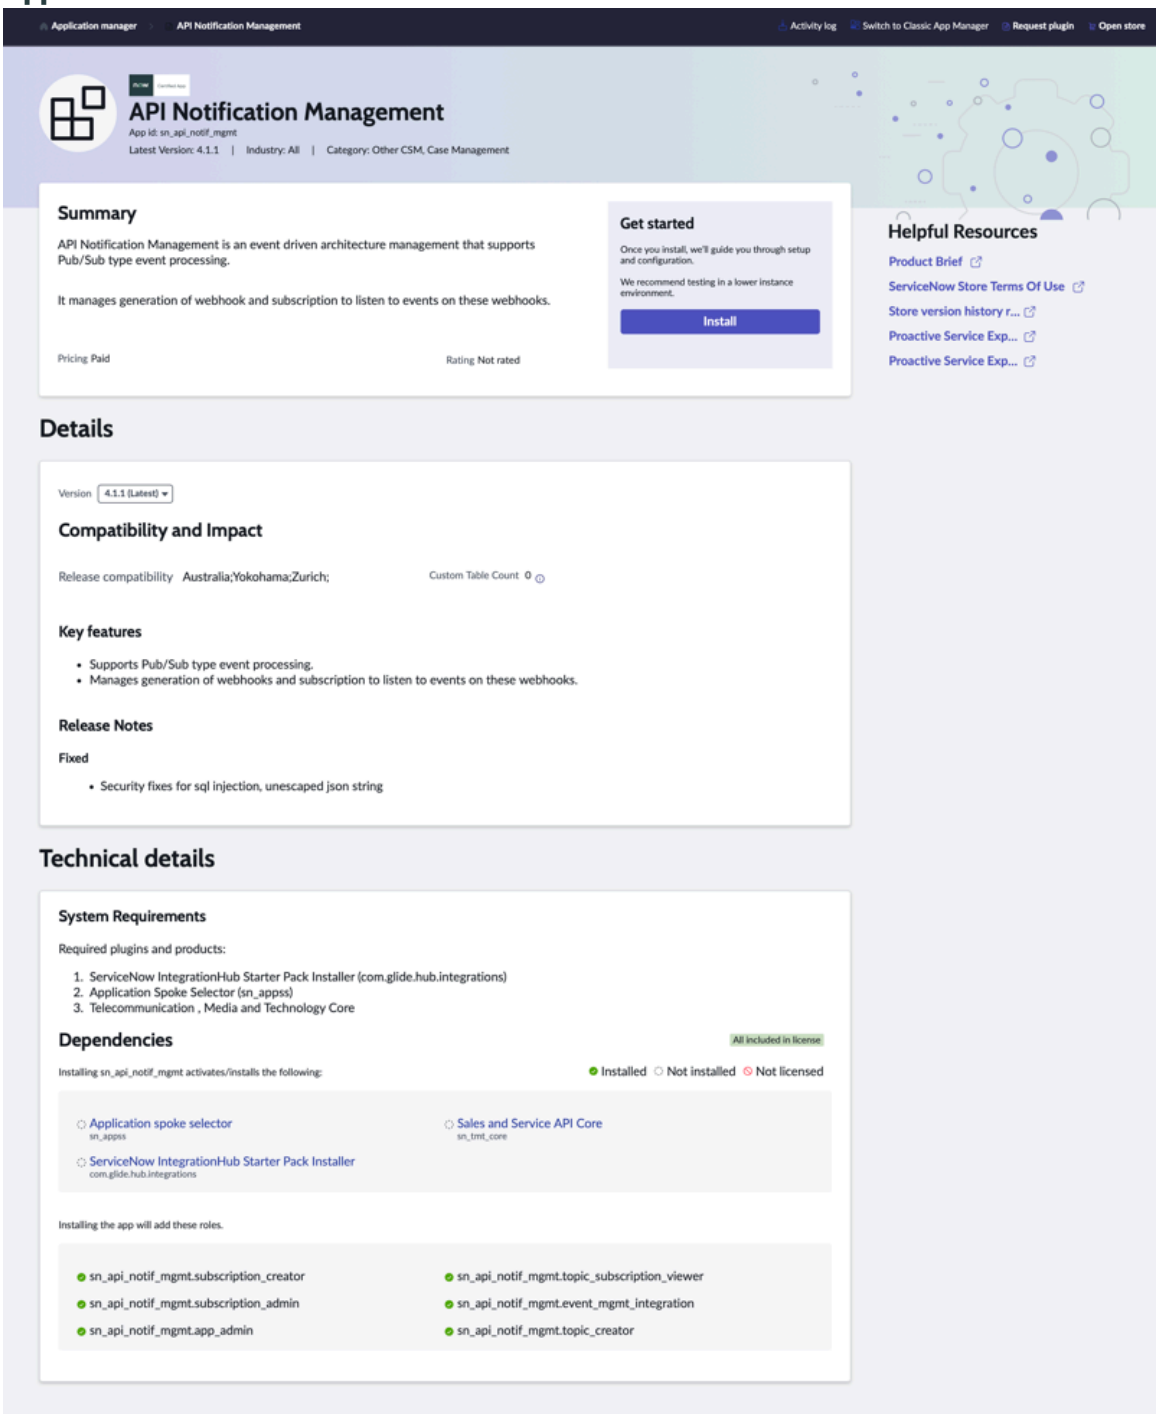
Application Manager application details

The details page in the Application Manager displays key information about applications, plugins, or products that are installed or available to install.

When you select an application, plugin, or product the details page is displayed.



For an application, this page includes the following:

- Application state indicators, if applicable
- Application summary
- Version selector
- Compatibilities
- Key features
- Release notes
- Technical details such as system requirements and dependencies
- Resource usage permissions for the application, if provided by the developer

For a plugin or product, this page shows a summary of the plugin or product's function and its dependencies.

Now Assist application details

Dependencies

Application details include information about required dependencies, including whether each dependency is installed, available to install, or not yet licensed.

Each application dependency in the technical details section is listed with a symbol. The symbol indicates a category that describes whether the dependency is already available, or must be procured. Dependencies use the following categories.

App dependency symbols

Symbol	Category	Description
✅	Installed	This dependency is already installed on your instance
◌	Not installed	This dependency isn't installed yet, but is available for installation. It's automatically installed when you install the application that requires it.
🚫	Not licensed	This dependency must be procured from the ServiceNow Store before it can be installed. Select the dependency and review any application state indicators for additional details. For more information about application state indicators, see Application state indicators in Application Manager. For more information about procuring applications, see Getting apps and trials from the ServiceNow Store.

Configuring Application Manager

Set up and configure Application Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

Application Manager is a ServiceNow AI Platform feature that is active by default. You don't need to activate a plugin.

By default, the Available for you page of the Application Manager automatically synchronizes with the ServiceNow Store every 24 hours. For information about deactivating auto sync with the ServiceNow Store, see Deactivating automatic synchronization with the ServiceNow Store.

Deactivating automatic synchronization with the ServiceNow Store

By default, the Application Manager in hosted ServiceNow AI Platform instances syncs automatically with available applications and updates from the ServiceNow Store. Automatic synchronization can be deactivated so you can receive updates only when you choose to.

Automatic syncing with the ServiceNow Store can be deactivated by taking the instance offline. If you take the instance offline, you can use the **Sync now** button in the Application Manager to sync the Available for you page with the ServiceNow Store.

To take the instance offline, contact Customer Service and Support and request that the `sn_appclient.app.install.offline` system property be set to `true`.

Installing applications, plugins, and products

Application Manager enables you to install any applications, plugins, or products that are included in your license or that have been procured from the ServiceNow Store.

Overview of using the Application Manager to install

You can view all applications, plugins, and products available for your instance by navigating to the Application Manager and selecting the **Available for you** tab. From there, you can install new applications, products, and plugins to your instance.

Note: Some applications and plugins can't be uninstalled after they've been installed.

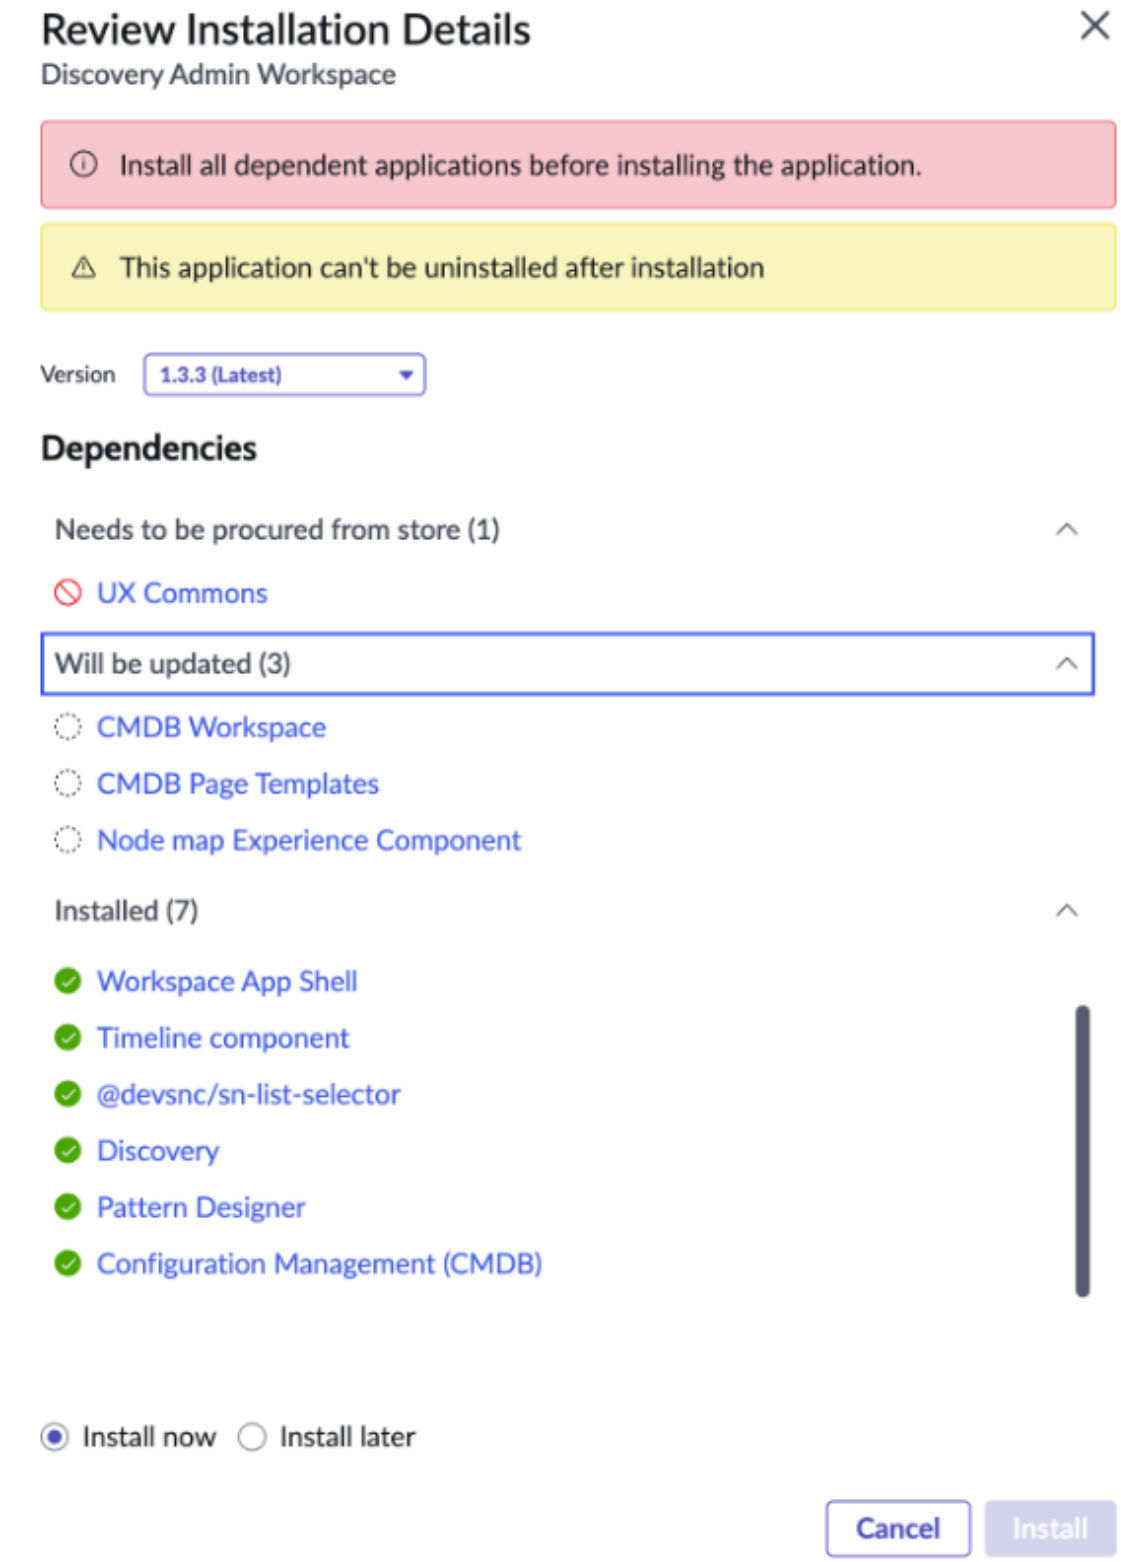
Installation details

When you install or update applications or products, the Application Manager displays installation details for you to review. Use installation details to verify version and dependency details.

A pop-up window prompting you to review installation details is shown when you install or update an application, plugin, or product. Installation details include the following components:

Installation detail components

Component	Description
Version selector	Enables you to choose a licensed application or product version compatible with your instance. If the latest version isn't available, you might need to procure it from the ServiceNow Store to sign updated terms and conditions. If you have already procured the latest version and don't see it as an option in the version



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installation detail components (continued)

Component	Description
	selector, you might need to upgrade your instance to a compatible release version.
(Optional) Dependencies list	If the application or product has dependencies, the dependencies are listed in the following categories: • Needs to be procured from the store • Will be updated • Installed • Inactive plugins
Installation options	Enables you to choose to complete installation now or later. If you choose to install later, you can determine the date and time of installation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: installation details

Dependencies that need to be procured from the ServiceNow Store

When installing or updating an application or product, you might have dependencies that need to be procured from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about procuring applications and products from the ServiceNow Store, see Getting apps and trials from the ServiceNow Store.

Inactive plugins in dependencies

Some plugins must be activated before they can be installed. Any plugins that must be activated before they can be installed are categorized as inactive plugins in the dependency list. Inactive plugins might not block installation of the plugin, application, or product that requires them, but could result in reduced functionality.

For more information about how to activate plugins, see ServiceNow plugins.

Entitle an application

Entitle an application from your ServiceNow AI Platform instance if the application has been purchased but not yet linked to the instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Admin Center** > **Application Manager**.
2. From the filter options, select the **Instance not entitled** indicator.

   Note: The **Instance not entitled** filter is only displayed if your instance has an application that has been purchased and not entitled.

3. Select the menu icon on the application tile, and select **Entitle this instance**.
4. In the Application entitlement dialog box, select **OK**.

Result

The application is entitled and can be installed.

Install an application or plugin

Install an application or plugin to make its features available on your instance.

Before you begin

For domain-separated instances:

- applications must be installed and updated from the global domain.
- The `sys_user` table record for the user who completes the task must also be in the global domain.

Role required: admin, sn_appclient.app_client_user, or sn_appclient.app_client_company_installer

Note: Some applications and plugins can't be uninstalled after they've been installed.

About this task

This topic describes how to install an application or plugin. For information about updating applications or plugins, see Update an application or plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **Available for you** tab of the Application Manager in one of the following ways.
   - Navigate to **Admin** > **Application Manager** > **Available for you**
   - Navigate to **All** > **Admin Center** > **Application Manager** > **Available for you**.
2. Find and select the application or plugin you want to install.
   You can search for an application or plugin by name, or use the sort and filter options available in the Application Manager.
3. Select **Install**.
4. Select the application version that you want to install from the **Version** drop-down menu.
5. If the application or plugin has dependencies, verify that all necessary dependencies can be updated or installed.
   If any dependencies are categorized as **Needs to be procured from store**, procure the necessary dependencies and sync the Application Manager with the ServiceNow Store before continuing. For more information about unavailable dependencies that block installation, see Evaluating version requirements and dependencies.
6. Install the application now or schedule installation for a later time.

Installation option	Procedure
Install now	**a.** Leave the default option to **Install now** selected. **b.** Select **Install**.
Install later	**a.** Select the option to **Install later**. **b.** Enter a start date and start time. **c.** Select **Schedule**.

Result

If you choose to install the application or plugin now, it and its dependencies begin to install immediately. Scheduled installations begin at the chosen date and time.

Install all applications in a product

Install all applications and plugins included in a product using Application Manager.

Before you begin

For domain-separated instances:

- applications must be installed and updated from the global domain.
- The `sys_user` table record for the user who completes the task must also be in the global domain.

Role required: admin, sn_appclient.app_client_user, or sn_appclient.app_client_company_installer

Note: Some applications and plugins can't be uninstalled after they've been installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **Available for you** tab of the Application Manager in one of the following ways.
   - Navigate to **Admin** > **Application Manager** > **Available for you**
   - Navigate to **All** > **Admin Center** > **Application Manager** > **Available for you**.
2. Find and select the product you want to install.
   You can search for a product by name, or use the sort and filter options available in the Application Manager.
3. Review the technical details of each included application to verify that you have access to all required dependencies.

   a. Select an application dependency and scroll to the technical details section of the application details page.
   From the technical details section, you can review the dependencies of the individual application. You can see which dependencies are installed, not installed, and not licensed.

   b. **Optional:** Procure any dependencies that aren't licensed from the ServiceNow Store.
   For more information, see Getting apps and trials from the ServiceNow Store.

   c. Go back to the product details page and repeat for each application dependency.

4. From the product details page, select **Install**.
5. Select the desired versions of each application to be included in the product.
6. **Optional:** Select **Load demo data** if you want demo data to be included in the installation.
7. Select **Proceed**.
8. Install the product now or schedule installation for a later time.

Installation option	Procedure
Install now	a. Leave the default option to **Install now** selected. b. Select **Install**.
Install later	a. Select the option to **Install later**. b. Enter a start date and start time. c. Select **Schedule**.

Result

If you choose to install the product now, it and its dependencies begin to install immediately. Scheduled installations begin at the chosen date and time.

Updating applications

Update your installed applications when new versions are available to get the latest features. You can update most applications to more recent versions directly from the Application Manager, without returning to the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of using the Application Manager to update

You can view applications and plugins that can be updated by navigating to the Application Manager and selecting the **Updates** tab. From there, you can update most applications and plugins without returning to the ServiceNow Store.

There are some exceptions that might require you to procure the new application version or a dependency from the ServiceNow Store:

- A new dependency has been added to support new features of the application or product that requires it. The dependency must be procured for the first time.
- The dependency's provider requires that each new version of the dependency is requested and approved. The dependency is eligible for update after procuring the updated version from the ServiceNow Store.
- A new version of a previously installed dependency has updated terms and conditions that must be accepted. The dependency is eligible for update after procuring the updated version of the dependency from the ServiceNow Store.
- The provider of an application or product requires that each new version is procured from the ServiceNow Store. The application or product dependencies are available for update after procuring an updated version of the application or product from the ServiceNow Store.

For more information about procuring applications and products from the ServiceNow Store, see Getting apps and trials from the ServiceNow Store.

Notifications about available updates

By default, emailed notifications are sent when updates are available for ServiceNow Store applications and products. Default notifications are sent to the primary account administrator and to the individual who procured the application or product.

For more information about contact roles and notifications in the ServiceNow AI Platform, see Company key contacts and notification list overview on Now Support [KB0547262].

Update an application or plugin

Update an application or plugin to get the latest features that are compatible with your instance version.

Before you begin

For domain-separated instances:

- applications must be installed and updated from the global domain.
- The `sys_user` table record for the user who completes the task must also be in the global domain.

Role required: admin or sn_appclient.app_client_user

Procedure

1. Navigate to the **Updates** tab of Application Manager in one of the following ways.
   - Navigate to **Admin** > **Application Manager**.
   - Navigate to **All** > **Admin** > **Application Manager**.
2. Select the **Updates** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trouble?
If nothing is displayed in the **Updates** tab, try selecting **Sync now** to sync your instance with the latest application versions available on the ServiceNow Store. If no applications are populated in your **Updates** tab after the sync, the latest application versions available for your instance are already installed.

3. Find and select the application or plugin that you want to update.
   You can search for an application or plugin by name, or use the sort and filter options available in the Application Manager.
4. From the Summary section of the details page, select **Proceed to update**.
5. Select a compatible application version or a compatible Now Assist Suite version from the version drop-down menu.
   For additional information about Now Assist Suites, see Now Assist suite versions.
6. **Optional:** If you have available application customizations, use the **Customized ver.** drop-down menu to select which customization to use.
   Your customizations might not be compatible with a new application version. Update the application in a non-production instance, then make any necessary changes to your customization and validate compatibility before making updates in production instances. For more information about managing customizations, see Manage customizations to applications.
7. If the application or plugin has dependencies, verify that all necessary dependencies can be updated or installed.
   If any dependencies are categorized as "Needs to be procured from store" or "Installation blocked," procure the necessary dependencies and sync the Application Manager with the ServiceNow Store before continuing. For more information about unavailable dependencies that block updates, see Updating applications.
8. Install the update now or schedule installation for a later time.

Installation option	Procedure
Install now	**a.** Leave the default option to **Install now** selected. **b.** Select **Install**.
Install later	**a.** Select the option to **Install later**. **b.** Enter a start date and start time. **c.** Select **Schedule**.

Result

If you choose to install the update now, the application or plugin and its dependencies begin updating immediately. Scheduled updates begin at the chosen date and time.

Auto-upgrade

The auto-upgrade mechanism automatically upgrades ServiceNow-managed applications and plugins across your instances on a regular schedule without requiring manual intervention. Auto-upgrade applies exclusively to ServiceNow-managed applications and plugins; customer-customized or third-party applications aren't included in automatic upgrades.

Auto-upgrade enables continuous delivery of ServiceNow-managed applications and plugins by automating the upgrade process, eliminating the need for your manual intervention. Instead of waiting for you to manually upgrade each application or plugin, the system automatically

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

schedules and installs upgrades at optimal times, keeping your applications current with minimal effort.

Note: The auto-upgrade mechanism is disabled by default. You must enable the sn_app_auto_upgr.enabled system property to activate it.

Key benefits

The auto-upgrade feature provides the following benefits:

- Enables continuous delivery of ServiceNow-managed applications or plugins by removing the bottleneck of your initiated action.
- Distributes installation load across the platform infrastructure by randomizing upgrade schedules within a 24-hour window.
- Respects your high-usage periods by enforcing blackout windows during configured times.
- Orchestrates multiple application or plugin upgrades in batches, reducing the number of installation operations across instances.

How it works

The auto-upgrade mechanism operates through a combination of polling, scheduling, and batch orchestration to upgrade applications or plugins automatically:

- Automated polling: Your instances poll the API every 2 hours to check for pending SN-managed application or plugin upgrades. When new upgrades are available, the system automatically schedules installations within a 24-hour window of publication.
- Blackout window enforcement: Control automated polling with blackout windows and system properties. The system honors your configured high-usage periods (for example, Monday through Friday, 9 AM to 5 PM) during which no automated installations occur. Instance upgrade schedules are treated as implicit blackout periods to prevent conflicts. You can manage polling frequency and auto-upgrade controls using three system properties in System Properties:
  - sn_app_auto_upgr.enabled (master on/off switch)

    Note: Auto-upgrade is disabled by default. You must enable the sn_app_auto_upgr.enabled property to activate the mechanism.

  - sn_appclient.scheduled_jobs_config (polling frequency and operational settings)
  - sn_app_auto_upgr.platform_upgrade_lookahead_hours (platform upgrade detection window)
- Batch install orchestration: New application or plugin upgrade requests are added to existing active batch install plans if the target installation window is still open. If the window has closed, a new batch is created. The system handles multiple applications or plugins in a single batch and includes retry logic for failed installations.
- Environment targeting: Application business units specify whether a release targets non-production environments, production environments, or both. Custom target dates can be configured beyond the default 24-hour window.
- Read-only enforcement: All ServiceNow-managed application or plugin metadata is enforced as read-only at installation time, overriding any application-level settings to prevent your customizations.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto upgrade failure resolutions

If an auto-upgrade installation fails, the system includes retry logic within the batch orchestration process. Depending on the failure, the system may automatically schedule a retry operation. If automatic retry does not resolve the issue, check the following areas:

- Verify that the instance is not in a blackout window or explicit instance upgrade schedule during the scheduled installation time.
- Check the status of auto-upgrade tasks in the activity log to understand the progress and outcome of installations. For more information about the activity log, see Application Manager activity log. Task status values indicate the stage of the upgrade operation:
  - Assigned: The batch install plan has been created and the task is queued for execution
  - In Progress: The batch install plan is currently executing the application or plugin upgrade
  - Success: The application or plugin upgrade completed successfully
  - Failed: The application or plugin upgrade failed; review the failure details and configure retry settings if needed
- Resolve withdrawn application errors. If an application or plugin version is withdrawn from the store before auto-upgrade installation, the system treats it as a failed installation and displays an error message indicating the application or the plugin is unavailable. Check the error details to determine next steps.

Uninstalling applications

Application Manager can be used to uninstall applications that are no longer in use on your instance.

Overview of using the Application Manager to uninstall

Some applications can be uninstalled from your instance to remove scripts, background jobs, and roles that are no longer needed. In some cases, it's possible to keep the associated fields and data after uninstalling the application that generated them.

Note: Some applications and plugins can't be uninstalled after they've been installed.

Uninstall an application

Uninstall an unused application to remove unnecessary or conflicting scripts, background jobs, and roles from your instance.

Before you begin

Role required: admin, sn_appclient.app_client_user, or sn_appclient.app_client_company_installer

About this task

Note: Some applications and plugins can't be uninstalled after they've been installed.

Procedure

1. Navigate to the **Installed** tab of Application Manager in one of the following ways.
   - Navigate to **Admin** > **Application Manager** > **Installed**.
   - Navigate to **All** > **Admin Center** > **Application Manager** > **Installed**.
2. Find and select the application or plugin you want to uninstall.
   You can search for an application or plugin by name, or use the sort and filter options available in the Application Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From the Quick Actions section of the details page, select **Uninstall**.
4. If you want to delete fields and metadata associated with the application from your instance, clear the check box labeled **Retain fields and data**.
   If the application can't be uninstalled, clearing the **Retain fields and data** check box might resolve the issue.
5. Select **OK**.

Repairing applications and plugins

Repairing an application or plugin returns it to its original state without needing to uninstall and reinstall it manually. Repairing applications or plugins can help resolve issues related to accidental modifications or corrupted files.

Overview of repairing applications and plugins

When you repair an application or plugin, all the files with sys_update_xml records are added to the remote update set. The remote update set is named with the format: "Repair/Upgrade app <app scope name> at <timestamp>".

Repairing applications with customizations

When you repair an application with a customization, the customization is also repaired unless it's linked to a source control repository.

It’s assumed the complete set of customizations for an application is within the application customization. When repairing, installing, or upgrading the underlying application or plugin that has an associated app customization, changes made outside of that application customization are overwritten.

For more information about customizations, see Customization vs. configuration with Creator Studio.

Repair an application or plugin

Repair an application procured through the ServiceNow Store or a plugin included in your instance. Repairing apps or plugins can resolve issues caused by unintentional modifications, corrupted files, or partial deletion.

Before you begin

Role required: admin

Procedure

1. Navigate to the **Installed** tab of Application Manager in one of the following ways.
   - Navigate to **Admin** > **Application Manager** > **Installed**.
   - Navigate to **All** > **Admin Center** > **Application Manager** > **Installed**.
2. Find and select the application or plugin you want to repair.
   You can search for an application or plugin by name, or use the sort and filter options available in the Application Manager.
3. From the Quick Actions section of the details page, select **Repair**.

Application Manager reference

Reference topics provide information to help understand Application Manager status indicators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation and Application Manager

Domain separation is unsupported for Application Manager. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Overview of domain separation in Application Manager

Application Manager enables instance-level administrators to install and manage applications for their instances. Data within the Application Manager isn't filtered, displayed, or managed at the domain level.

Related topics

Domain separation for service providers

Application state indicators in Application Manager

Application detail page headers display indicators with additional information about the state of that application. Indicators tell you about any specific requirements, limitations, or blockers related to installing the application.

State indicators

Indicator	Meaning	Action needed
None	No application state indicators apply to this application.	No action needed. If all dependencies can be installed or updated, the application is available for installation. For more information about application dependencies, see Application Manager application details.
"Unavailable for Instance"	The app can't be installed on the type of instance you're currently in.	Install the app from a different kind of instance. For example, trials can only be installed in non-production instances. For more information about installation, see Installing applications, plugins, and products.
"Incompatible"	The application version isn't compatible with either the	Select a compatible application version from the version selector in

State indicators (continued)

Indicator	Meaning	Action needed
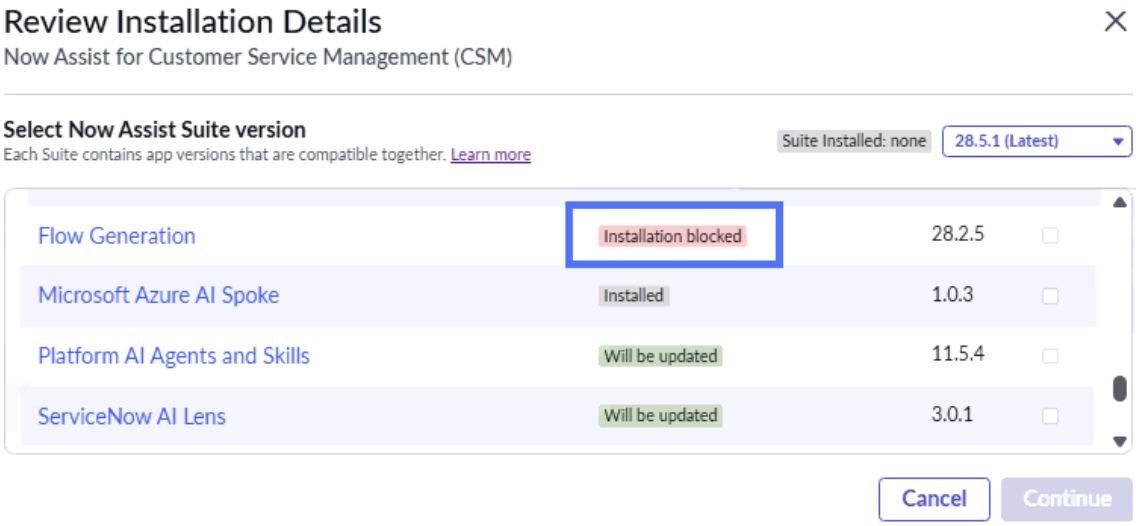
		For more information about purchasing applications, see Buy a ServiceNow application or Buy a partner application.
"Trial Deactivation Requested"	The provider of this application has requested that you deactivate the trial.	Uninstall or deactivate the application on your instance. For more information, see Uninstalling applications. If you have questions, you can contact the application provider. For more information, see Contact a seller.
"Service Provider Blocked"	Your service provider hasn't made this application available on the current instance.	If you want to install the application on the current instance, contact your service provider and request access.
"Beta App"	This application is part of the ServiceNow Store beta program. The provider has made it available to you for evaluation and feedback.	Refer to the information that was provided in the Beta Publish Program agreement.
"Innovation Lab"	This application is an innovation lab offering. Innovation lab applications are early-stage, experimental projects being developed to introduce new functionality to the ServiceNow AI Platform. Due to the experimental nature of innovation lab offerings, these applications are unsupported and have no warranty.	This state indicator is for informational purposes and requires no action. Refer to other application state indicators for installation availability, if present. If no other application state indicators and all dependencies can be installed or updated, the application is available for installation. For more information, see Application Manager application details.



App installation blocked when installing or updating Now Assist Suite

Unlicensed applications can block the installation or update of Now Assist Suites.

Symptom

When attempting to update or install a Now Assist application, another application that is part of the same Now Assist Suite displays an "Installation blocked" indicator in the installation details. The update or installation can't be completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause

The application version that displays "Installation blocked" isn't licensed.

Resolution: License the required application version

Procedure

If your organization uses the application, license the version required for the Now Assist Suite installation.
To license the necessary application version, contact your account executive or request the license through the ServiceNow Store. For more information about licensing applications through the ServiceNow Store, see Buy a ServiceNow application.

Resolution: Uninstall the application

Procedure

If your organization doesn't use the application that blocks installation, uninstall it through the Application Manager.
For more information about uninstalling applications, see Uninstall an application.

Multi-Instance Management

Multi-Instance Management offers tools and visibility to control how instances share information for enabled applications. This feature can be utilized for ServiceNow applications when they need to communicate data across multiple instances within a customer's account.

- Basic trust configuration for data sync applications: Certain ServiceNow applications have the ability to provide data visibility across instances within a customer's account.

  Note: This ability can be leveraged only if you have Security Center and Subscription Management installed on your instance. See Security Center and Subscription Management for more information.

- Cross-instance application trust configuration: Multi-Instance Management provides a mechanism to streamline the management of trust configurations across your entire multi-instance environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multi-Instance Setup simplifies setting up cross-instance communication with a single user interface where administrators can configure and monitor non-production instances connected to a controller. Every connection is requested, reviewed, and approved or rejected to help avoid silent failures or undocumented instance relationships. For more information, see Multi-Instance Setup.

Basic trust configuration for data sync applications

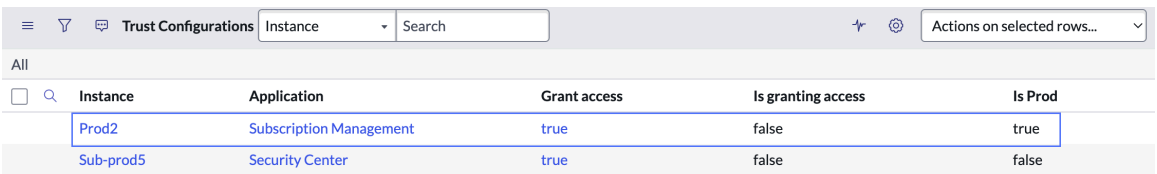
Certain ServiceNow applications have the ability to provide data visibility across instances within a customer's account.

Data visibility is protected by a trust configuration per instance, per application. You can configure the data sharing for production and non-production instances for the applicable applications by navigating to **All** > **Multi-Instance Management** > **Trust Configuration**.

Note:

By default, non-production instances allow application data sharing with production only. Production instances do not allow application data sharing with any other instance. However, these can be updated by the admin for each instance based on business needs.

If you demote a production instance to non-production, or promote a non-production instance to production, all previous customizations to data sharing settings are reset to the default configuration.



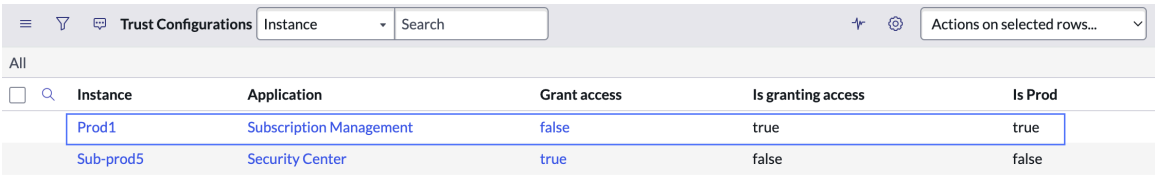
The **Grant access** column indicates the permission granted by the instance that you're currently logged in to for the instance named in the same row's instance column. The **Is granting access** column displays whether or not the instance mentioned in the Instance column has granted access to the instance you're currently logged in to; it can't be edited.

The following are some examples for data sharing restrictions between instances.

Example: Logged in to Prod1

In the following example, you're logged in to Prod1. Prod1 has granted access to the instance Prod2 for the application Subscription Management, as indicated by the `True` value in the **Grant access** column.

Prod2 hasn't granted access to Prod1, as indicated by the `False` value in the **Is granting access** column.



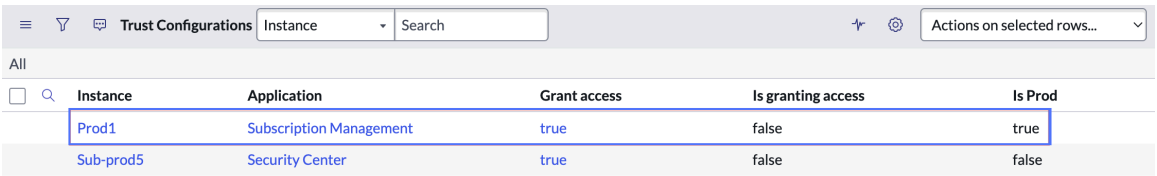
To revoke access for the Subscription Management app from Prod1 to Prod2, update the value in the **Grant access** column to `False` while logged in to Prod1.

Example: Logged in to Prod2

In the following example, you're logged in to Prod2. Prod1 has granted access to the instance Prod2 for the application Subscription Management, as indicated by the `True` value in the **Is granting access** column.

Prod2 hasn't granted access to Prod1, as indicated by the `False` value in the **Grant access** column.

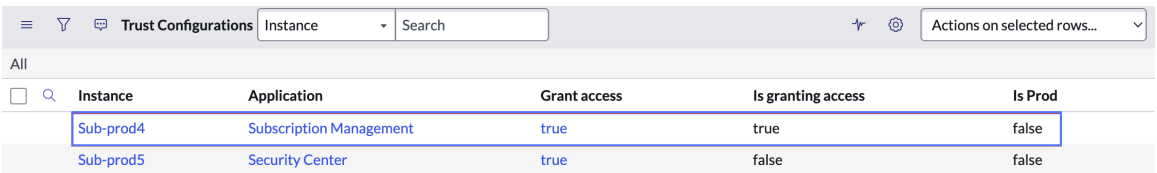
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To grant access from Prod2 to Prod1 for the Subscription Management application, update the value in the **Grant access** column to `True` while logged in to Prod2.

Example: Logged in to Sub-prod2

In the following example, you're logged in to Sub-prod2. Prod1 hasn't granted access to the instance Sub-prod2 for the application Subscription Management, as indicated by the `False` value in the **Is granting access** column.



Sub-prod2 has granted access to Prod1, as indicated by the `True` value in the **Grant access** column.

To revoke access from Sub-prod2 to Prod1 for the Subscription Management application, update the value in the **Grant access** column to `True` while logged in to Sub-prod2.

Example: Logged in to Sub-prod3

In the following example, you're logged in to Sub-prod3. Sub-prod4 has granted access to the instance Sub-prod3 for the application Subscription Management, as indicated by the `True` value in the **Is granting access** column. Sub-prod3 has also granted access to Sub-prod4, as indicated by the `True` value in the **Grant access** column.

Cross-instance application trust configuration

Multi-Instance Management provides a mechanism to streamline the management of trust configurations across your entire multi-instance environment.

The multi-instance capability introduces new concepts, describing how communication is supported across instances for enabled applications and their capabilities. In order to do this securely, you need to define how these instances trust each other. This can be defined as a trust profile. The trust profile defines how a set of instances communicate for a given application. In order for this profile to be applied to each instance, that profile needs to be propagated out to the instances that will participate in a given application.

Multi-Instance Management offers a centralized mechanism for configuring and maintaining trust settings across your multi-instance deployment. This simplifies the process of propagating trust settings to all instances under your control by designating a production instance by designating a production instance to manage the trust configurations on all the instances it should manage remotely.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trust concepts

Trust profile

The Trust profile defines the ideal trust configuration of all the instances that participate in a specific application. The trust profile is specific to an enabled application. It defines how the instances leverage the application capabilities to communicate with each other. Once the application's trust profile with the trust configuration for each instance is defined, it can be shared with the managed instances. This will trigger the automatic population of trust tables within those instances. This automation depends on whether there is a Trust profile manager defined. If not, trust configuration needs to be manually created on each instance.

For example, if you're currently logged into sub-prod 2 and Prod 1 has management privileges over sub-prod 2, you can use the **Sync Trust Profile** button on Prod 1 to distribute trust profiles to all instances under Prod 1's management. The updated trust profile will then be reflected on Prod 2.

Capabilities and operations

Capabilities are application features that would be leveraged for cross instance communication. It is a group of granular operations that are available as a part of the application.

Enabled applications within an instance possesses a trust profile, which is established for every capability it exposes. To ensure seamless communication between instances for these capabilities, a trust configuration must be defined. This trust profile encompasses all the necessary trust configurations between instances for a specific application and its capabilities.

Trustor and Trustee

Trustor can be defined as the instance that is trusting the other instances with viewing its data and/or receiving messages from the trusted instance.

For example, you're logged into Prod 1. There are 2 other sub prods- sub-prod 1 and sub-prod 2. If Prod 1 trust sub-prod 1 and sub-prod 2, then Prod 1 is the Trustor and sub-prod 1 and sub-prod 2 are Trustees.

> **Note:** The trust concept works on the instance for a given application at the capability level. The table that lists the instances trusted by your instance has 3 columns: application, capability, and Trustee instance.

When instances are required to communicate, they consider the application trust configuration before communicating with each other.

For example, if an enabled application on Prod 1 needs to send a message to Sub-prod 1 and Sub-prod 2, these sub-prods must trust Prod 1 to receive the message and act on it. In this scenario, the sub-prods are the trustors, and Prod 1 is the trustee.

If Prod 1 doesn't trust sub-prod 1 and sub-prod 2, messages from the sub-prods to Prod 1 are not processed.

You can go to the trust table and create a new trust record.

Trust configuration management

Managing instances

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The table shows the instance that is designated as the manager instance for the instance you are logged into. If you are logged into the managing instance, the table will be blank.

For example, you're logged into Prod 1. The instances shown in the Managing Instances table are the instances that are being managed by Prod 1 for particular applications.

Managed instances

The table shows the instances that you are managing.

For example, you're logged into Prod 1. The instances shown in the Managed Instances table are the instances that Prod 1 is managing for the specified applications.

Managed instances must grant permission to managing instances in order to automatically distribute trust profiles.

Note: An instance can't be both a managing and a managed instance. An instance can manage several instances simultaneously. An application within an instance can be managed by only one instance at a time.

Configure Manager Instances

Implement the following steps to configure the Manager Instances in Multi-Instance Management.

Before you begin

Role required: admin or sn_mif.mif_admin.

Procedure

1. Log onto the instance that will be managed.
2. Go to **Multi-Instance Management** > **Manager Instances**.
   The Manager Instances list shows up.

   Note: sn_mif_managed_by_instance is the table for defining the manager instances.

   The manager instance table provides a list of multi-instance applications and the manager instances associated with each for trust configuration, for example, Impact Health.
3. Select **New** to designate a manager.
   The Manager Instances form shows up.
4. On the Manager Instances form, fill up the following.

Entry	Description
Manager Instance	Select a manager instance from the list of in stance names using the lookup option. **Note:** Only production instances should be designated as the primary managers for both production and sub-production instances. Sub-production in stances may manage other sub-produc tion instances under specific, defined conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entry	Description
Application	Select the appropriate application from the application list using the lookup option.

5. Select **Submit**.

Configure Managed Instances

Implement the following steps to configure the Managed Instances in Multi-Instance Management.

Before you begin

Role required: admin or sn_mif.mif_admin.

Procedure

1. Go to **Multi-Instance Management** > **Managed Instances**.
2. Select **Add managed instances**.
   The Add managed instances modal shows up. The managed instances allow the managing instance to remotely distribute trust profile configurations. The modal shows a list of instances where the approval request is sent.

   Note: The instances that show up on the list are pulled from the instance table. The instances that belong to the same account and customer are only shown in the list for the request to be sent.

3. Select **Send Requests** to send the request to the selected instances to allow to be managed.
   A message informs you that managing instance requests were successfully sent and are pending approvals.
4. Refresh the managed instance and you will see the list of instances you have sent the request to with pending approval.
   The Managing instance needs to approve them.
5. Go to the Managed By Instances instance and refresh it.
   You will see the approvals requested.
6. Select the information icon next to the application name on the Managed By Instances instance.
   The Manager Instances record pops up.
7. Select **Open Record** in the pop up to open the record.
8. Select one of the following actions Manager Instances record.
   - Approve Manager Instance
   - Reject Manager Instance

   Note: If you are an Multi-Instance Management admin, you will also be notified by an email about the approval requests.

9. Once approved, review the Managed Instances instance and the status updates.

   Note: The status shows as Revoked in the Managed Instances instance if its been deleted from the Managed By Instances instance. If a request is approved by the system, the status shows as Auto-Approved.

Multi-Instance Setup

Multi-Instance Setup discovers non-production instances related to a production instance and connects instances to support cross-instance communication and data sharing with various ServiceNow applications.

Cross-instance communication is important for secure data exchange, synchronization, and collaboration between instances and is required to promote and govern applications across environments. Multi-Instance Setup simplifies setting up cross-instance communication with a single user interface where administrators can configure and monitor non-production instances connected to a controller. Every connection is requested, reviewed, and approved or rejected to help avoid silent failures or undocumented instance relationships.

Multi-Instance Setup user interface

Multi-Instance Setup and Multi-Instance Management

Multi-Instance Setup is built on Multi-Instance Management and simplifies the process of connecting instances but there are some distinctions between the two features:

- Multi-Instance Management is the ServiceNow AI Platform framework that establishes trust between individual instances at the level of a specific application or capability. Configuring Multi-Instance Management trust directly means working with manager and managed instance relationships one application at a time.
- Multi-Instance Setup manages the relationship between a controller and its non-production instances at the environment level, rather than configuring trust per application and capability. Multi-Instance Setup automatically maintains the underlying Multi-Instance Management trust relationships that individual applications rely on. Other ServiceNow applications that need cross-instance trust automatically manage their own per-capability trust profiles.

  Multi-Instance Setup also adds environment types on top of the Multi-Instance Management framework, which only distinguishes non-production instances from production instances.

Multi-Instance Setup workflow

From Multi-Instance Setup, administrators can configure cross-instance communication in a few steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. From the production instance, the instance admin sets the instance as the controller.
2. To add non-production instances to the controller, the admin chooses to run a scan that automatically discovers non-production instances or adds them manually and assigns each one an environment type.

   Multi-Instance Setup automatically sends an access request to each non-production instance's administrator.
3. From a non-production instance, the admin of that instance approves or denies the request to manage the instance from the controller.

   After the admin approves the request, cross-instance communication between the controller and that non-production instance is active.

For more information about using Multi-Instance Setup, see Connecting controller and managed instances.

Install Multi-Instance Setup and AMF Core

You can install the Multi-Instance Setup application and AMF Core plugin if you have the admin role.

Before you begin

Review the Multi-Instance Setup application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

On the production instance that you want to set as the controller, you must install the Multi-Instance Setup application (sn-app-amf) and the AMF Core plugin (com.glide.amf). To detect non-production instances to manage, you must install the AMF Core plugin (com.glide.amf) on any non-production instance that you want a controller to manage.

Roles and tables are installed with the AMF Core plugin (com.glide.amf). For more information, see Components installed with AMF Core.

Procedure

1. From a production instance, navigate to **All** > **Application Manager**.
2. Find the Multi-Instance Setup application (sn-app-amf) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   A list of the versions available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.
6. Repeat the previous steps to install the AMF Core plugin (com.glide.amf) on the controller instance and each non-production instance that you want it to manage.

What to do next

Set the production instance as the controller so you can begin managing non-production instances. For more information, see Connecting controller and managed instances.

Components installed with AMF Core

The following components are installed with activation of the AMF Core plugin (com.glide.amf).

Roles installed

Role title [name]	Description	Contains roles
AMF Core administrator [sn_amf.amf_core_admin]	Defines and manages connections between controller and managed instances.	sn_mif.mif_admin
AMF Core viewer [sn_amf.amf_core_read]	Views connections between controller and managed instances.	sn_mif.mif_read

Tables installed

Table	Description
AMF Instance [sn_amf_instance]	Controller and managed instances and their instance type.
AMF Instance Type [sn_amf_instance_type]	Configured instance types: Development, Production, and Test by default.

Connecting controller and managed instances

Connecting a production instance to the non-production instances it manages involves three steps: setting the controller, adding the instances to manage, and approving requests to manage instances.

Before a production instance can manage non-production instances, you must set it as the controller. Then, you connect it to one or more non-production instances by adding them as managed instances. Adding a managed instance automatically sends an access request to that instance's administrator, and after the admin approves the request, the connection is active.

Set a production instance as a controller

Set a production instance as a controller that manages non-production instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Install Multi-Instance Setup and AMF Core.

Role required: sn_amf.amf_core_admin or admin

About this task
The controller, or manager, is a production instance used to manage connected non-production instances. A production instance must be set as a controller before you can discover or add non-production instances.

Procedure
1. From a production instance, navigate to **All** > **Multi-Instance Setup** > **Multi-Instance Setup**.
2. From the pop-up window, select **Set as controller**.

What to do next
From the controller instance, you can discover or add any non-production instances that you want to manage.

Add managed instances to the controller

Add non-production instances to a controller and request approval for the controller to manage them.

Before you begin
A production instance must be set as a controller, or manager, that can manage non-production instances.

To detect non-production instances to manage, you must install the AMF Core plugin (com.glide.amf) on any non-production instance that you want a controller to manage. For more information, see Install Multi-Instance Setup and AMF Core.

Role required: sn_amf.amf_core_admin or admin

About this task
To add managed instances, you can run a scan to automatically discover related non-production instances or add them manually. Each instance has an assigned environment type, which identifies a managed instance's role in your application life cycle. Multi-Instance Setup uses three default environment types (Development, Test, and Production) but you can create custom environment types if needed.

The environment type can be used by other ServiceNow applications that use Multi-Instance Management for cross-instance communication, such as Developer Sandboxes. Otherwise, custom environment types are primarily a label for your own use.

Note: Multi-Instance Setup adds environment types on top of the Multi-Instance Management framework, which only distinguishes non-production instances from production instances.

Procedure
1. From the controller instance, navigate to **All** > **Multi-Instance Setup** > **Multi-Instance Setup**.
2. Select **Add instance**.
3. From the pop-up window, select one of the following options for adding instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Run scan	Run a scan to automatically discover related non-production instances. The scan reads the instance's defined update set sources, such as a source connecting a test instance to a production instance, to iden tify instances and their environment types. **a.** Review the discovered instances and their environments. **b.** Select **Save and request access**. If no instances are discovered, select **Add an other instance** to add instances manually in stead.
Skip and set up manually	Manually add an instance if you already know the instance name and environment. **a.** From the Instance drop-down list, select an instance. **b.** From the Environment drop-down list, com plete one of the following steps: ▪ Select an existing environment type. ▪ Enter a name for the environment and se lect **Create environment**. **c.** To add more instances, select **Add another instance** and repeat the previous steps. **d.** Select **Save and request access**.

Result

Multi-Instance Setup automatically sends a request to each instance's admin to grant management control to the controller instance. In the Status column of the Managed Instances list, an instance appears with a status of Approval pending until the admin responds to the request. In the Action needed column, you can select a link to open the request in the non-production instance.

Trouble?

If you need to change an environment assignment after adding an instance, select **Edit** to change the environment for one or more instances.

What to do next

The admins for each non-production instance must review and approve requests to manage instances and make connections active.

Review a request to manage an instance

Review a request to allow a controller to manage an instance.

Before you begin

Role required: sn_amf.amf_core_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to a request in one of the following ways depending on the instance type.

Option	Description
From the non-production instance	Navigate to **All** > **Multi-Instance Management** > **Instance Configuration** > **Manager Instances**.
From the controller instance	**a.** Navigate to **All** > **Multi-Instance Setup** > **Multi-Instance Setup**. **b.** From the Managed Instances list, identify an instance that has a status of Approval pending. **c.** From the Action needed column, select the link to open the pending request. **d.** Select **Go to requests**. On the non-production instance, the Manager Instances list that contains all requests from controllers opens.

2. From the Approval column of the Manager Instances list, select one of the following options:
   - **Approve** to grant the controller access to manage the instance.
   - **Reject** to deny the controller access to manage the instance.

Result

If a request is approved, the connection between the controller and managed instance is active. This connection supports cross-instance communication and data sharing with other ServiceNow applications, such as Developer Sandboxes, Automated Test Framework, and more.

Trouble?

To resend a request that was previously rejected, you must add the non-production instance to the controller as a managed instance again. For more information, see Add managed instances to the controller.

ServiceNow Otto for Setup

The ServiceNow Otto for Setup provides a unified, guided experience to set up, configure, and adopt ServiceNow products. It connects Admin Home, product hubs, and the Configuration Console into a single path from product activation to full configuration.

Administrators can manage entitlements, install required components, apply recommended configurations, complete guided setup steps, track progress, and package changes for promotion. The experience reduces manual effort and complexity by streamlining installation and configuration tasks. The Setup Hub is available with or without AI. All setup capabilities —including installation, default configurations, guided steps, and update set packaging are supported without AI, while AI-assisted features, such as agents and conversational experiences, are available when included in the subscription.

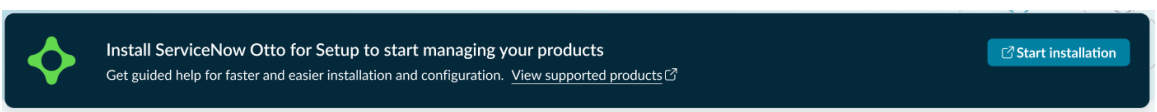
Explore ServiceNow Otto for Setup

ServiceNow Otto for Setup simplifies installing, configuring, and deploying ServiceNow products by automating setup, applying best practices, tracking progress, and packaging changes for production.

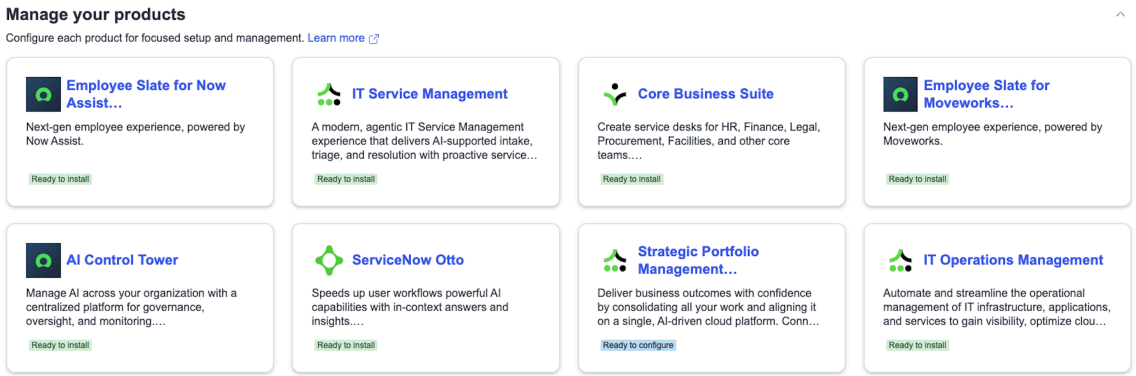
ServiceNow Otto for Setup overview



ServiceNow Otto for Setup offers a guided approach for installing, configuring, and deploying ServiceNow products. It streamlines the end-to-end setup by automating installation tasks, applying recommended configurations, monitoring setup progress, and preparing changes for production, making deployments more efficient and less manual.

This application is available to all users with Foundation SKUs for ITSM, CBS, ITOM, Employee Slate and ESM, and Pro+ SKUs for Simplified ITSM, ITOM and HRSD.

Note: ServiceNow Otto for Setup supports tiered SKUs (Advanced and Prime) for ITOM, Simplified IT Service Management, HAM and CBS, including entitlement-driven flows and experiences.



Installing ServiceNow Otto for Setup is the first step to experience automatic product installations and implementation of default configurations on your ServiceNow instance.

Note: You can install the ServiceNow Otto for Setup application either directly from the ServiceNow store or from the prompt on the Admin Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zero touch install automatically installs ServiceNow Otto for Setup along with selected applications and plugins for net new ServiceNow customers in supported non-production instances, displays installation status, and enables users to begin configuration without manual setup. A contextual banner appears during initial onboarding to help you get started and you can dismiss it when you no longer need it.

Admin Home displays the installation status for each product to clearly indicate readiness and required action. Each product shows one of three states to help you understand the current state and determine the next step at a glance.

- Installation in progress: Indicates when the system is preparing the product in the background
- Ready to configure: Indicates when installation is complete and you can start the setup process
- Ready to install: when the product is not yet installed or installation did not complete successfully

The ServiceNow Otto for Setup capability helps you with the following:

- Automatic installation of the required products and implementation of default configurations.
- Visually clear and modular UI for focused task management.
- Provides an intuitive and critical tools interaction.
- Ensures maintaining control with minimal effort by significantly improving task completion speed through centralized access and reduced navigation steps.
- Supports customizations as per user entitlements.

ServiceNow Otto for Setup users

ServiceNow Otto for Setup has the following roles.

Users	Description
admin	The admin role helps you assign product family specific roles to users

Explore this section to learn more about setting up an application and ServiceNow Otto admin with ServiceNow Otto for Setup.

- Set up an application: Set up an application with ServiceNow Otto for Setup
- Set up ServiceNow Otto: Set up ServiceNow Otto with ServiceNow Otto for Setup

To learn more about managing update set batch file, see Manage update set for ServiceNow Otto for Setup.

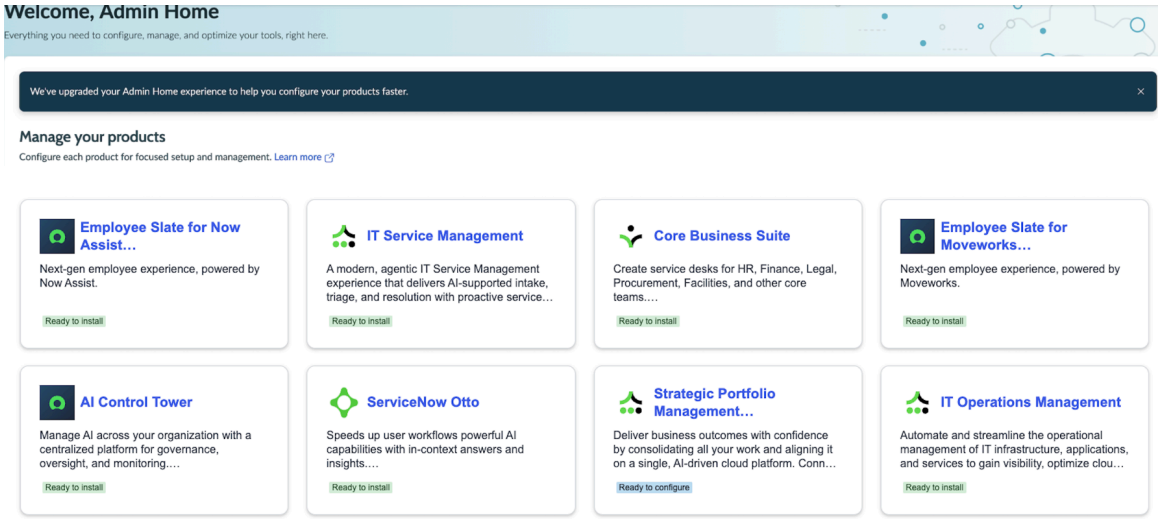
Set up an application with ServiceNow Otto for Setup

Implement the following steps to set up a specific application or plugin with ServiceNow Otto for Setup on your instance.

Before you begin

Before performing this task, you must install ServiceNow Otto for Setup application either from ServiceNow store or from the prompt on the Admin Home page.

This application is available to all users with Foundation SKUs for ITSM, CBS, ITOM, Employee Slate and ESM, and Pro+ SKUs for Simplified ITSM, ITOM and HRSD.



Note: ServiceNow Otto for Setup supports tiered SKUs (Advanced and Prime) for ITOM, Simplified IT Service Management, HAM and CBS, including entitlement-driven flows and experiences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

Procedure

1. Navigate to your Admin Home page on your instance.
   The system dynamically renders application and plugin cards based on your admin entitlement status.

   The image shows only a sample set of products. Available products may change as new products are added in future releases. The products displayed in Product Hub depend on the entitlements available for your instance.

   Note: If you use an earlier version of Admin Center, see Install plugins for ServiceNow Otto for installation information about ServiceNow Otto. In the latest version of Admin Center, the ServiceNow Otto card appears in the Manage your products section.

   Note: The Manage your products section is collapsible by default. You can expand it to see all the product family cards.

2. Select a specific product family card in the Manage your products section to start the setup process.
   The Product Hub page for the selected product family shows up.
3. **Optional:** Select **Start setup** from Option 1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional)

Note: This step is not applicable for all product families. The above UI is visible only for specific product families that are being set up for the first time.

The detailed Product Hub page for the selected product shows up. You can see the list of app bundles that needs to be installed.

(Optional) The Product Hub page displays a single product tier based on entitlements, using a descending order to show the highest tier when multiple tiers are available. For example, if both Foundation and Advanced tiers are installed for Simplified ITSM, only the Advanced tier is displayed. Under the Not installed section, only apps associated with the Advanced tier entitlement are shown. At the Product Hub level, the tiering approach can be configured as either Tiered or All Active Resources. For example, ITSM and CBS use the Tiered approach, while ITOM uses the default (All Active Resources) approach.

4. **Optional:** Select **Upload batch** from Option 2.
   This step is applicable only if you are setting up ITSM from another ServiceNow instance. See Manage update set for ServiceNow Otto for Setup for more information.
5. Select the install icon next to the app bundle mentioned under the Not installed tab to start the installation process of the specific app bundle.
   You can also see the information about the app bundles that have either been installed or have available updates under the Installed and Updates available tabs.
   Once the app bundle is installed, it moves under the Installed tab.

   Note: In case of Core Business Suite (CBS), it follows two steps installation process. The CBS app is installed first, followed by its corresponding apps mentioned under the Not installed tab. The green banner shows up only for CBS setup process.

6. **Optional:** Review the information in the Configuration insights section.
   Once an app is installed, corresponding information about the new configurations that have either been added or updated show up in the Configuration insights section.

   Note: This section is visible only for CBS setup process. This section shows up only when you have an application under the Installed tab for the CBS setup process.

   Select **More info** to show the total steps configured for each module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **More info** count reflects the combined total of manual and default configurations applied.

7. **Optional:** Select **Upload batch** to upload a batch file and set up the update set for ServiceNow Otto for Setup.

   Note: This step is applicable only if you need to setup the update set for either ITSM or CBS. See Manage update set for ServiceNow Otto for Setup for more information.

8. **Optional:** Expand What's included to view the applications included in the app bundle.

   (Optional) You can also explore the Helpful resources section in Product Hub page that include links to configuration guidance, product documentation, release notes, and the ServiceNow Community.

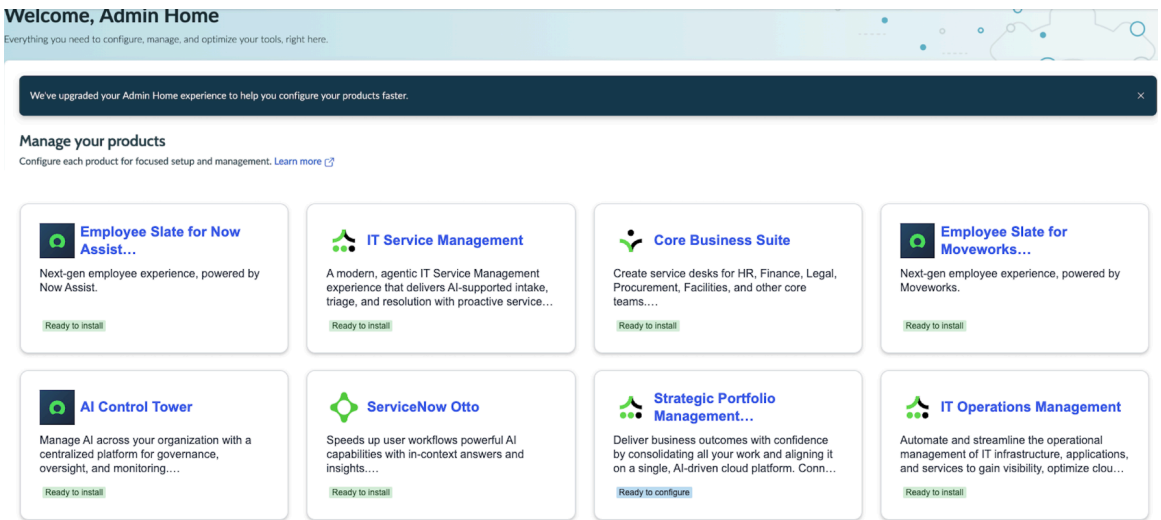
   Note: The What's included section stays collapsed by default.

9. Select **Configure** to move to the Configuration Console page.
   See Configure in ServiceNow Otto for Setup for more information.

Set up ServiceNow Otto with ServiceNow Otto for Setup

Implement the following steps to set up ServiceNow Otto with ServiceNow Otto for Setup on your instance.

Before you begin



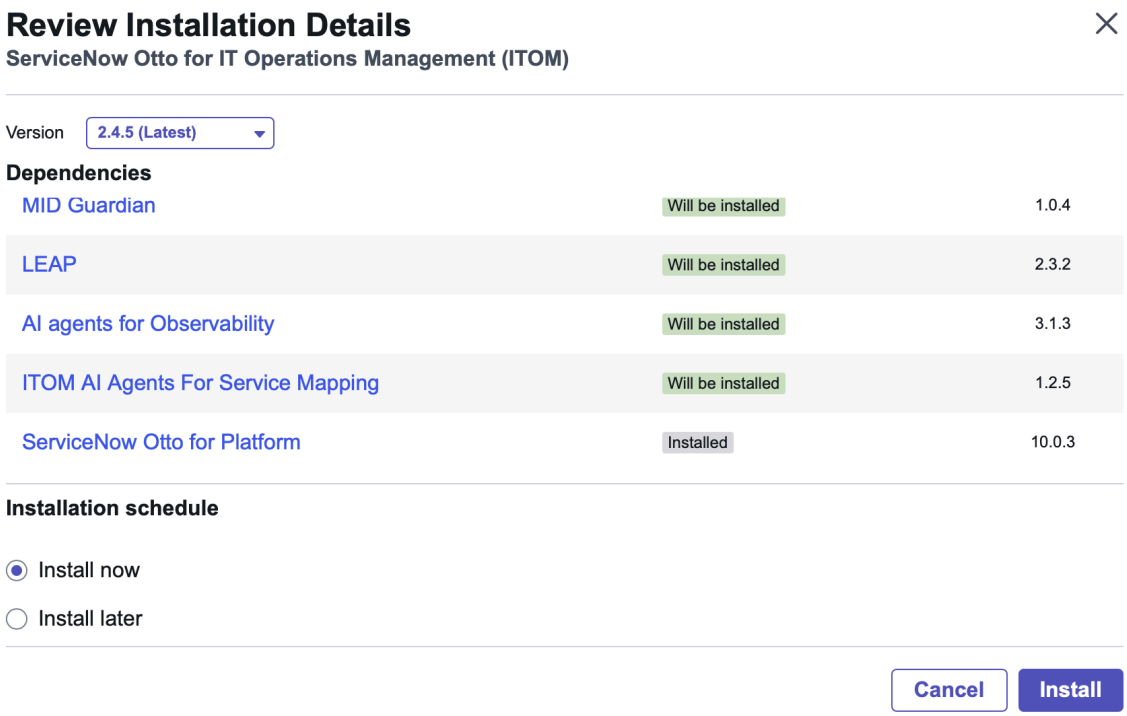
Before performing this task you must install ServiceNow Otto for Setup application from ServiceNow store or from the prompt on the Admin Home page.

This application is available to all users with Foundation SKUs for ITSM, CBS, ITOM, and ESM, and Pro+ SKUs for ITSM and HRSD.

Role required: admin

Procedure

1. Navigate to your Admin Home page on your instance.
   The system dynamically renders application and plugin cards based on your admin entitlement status.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The image shows only a sample set of products. Available products may change as new products are added in future releases. The products displayed in Product Hub depend on the entitlements available for your instance.

Note: If you use an earlier version of Admin Center, see Install plugins for ServiceNow Otto for installation information about ServiceNow Otto. In the latest version of Admin Center, the ServiceNow Otto card appears in the Manage your products section.

Note: The Manage your products section is collapsible by default. You can expand it to see all the product family cards.

2. Select the ServiceNow Otto card to start the setup process.
   The Product Hub page for ServiceNow Otto shows up.
3. Select the redirect icon next to the app bundle mentioned under the Not installed tab to start the installation process of the specific app bundle.
   The App manager page shows up.
4. Select **Install** in the Get started section.

The Review Installation Details modal shows up. It shows a list of corresponding applications that will be installed as part of the installation process.

5. Select **Continue** and then **Install** in the Review Installation Details modal.

   You also get the option of scheduling the installation process either for immediate execution or later processing.

   The Installation progress bar shows up. As soon as the installation starts, the selected app bundle card moves to queue on the Product Hub page.
6. Once you are done installing all the necessary applications and plugins, select **Go to ServiceNow Otto Admin** on the Product Hub page to boost your AI capabilities.
   See AI Admin Hub for more information on configuration of ServiceNow Otto Admin module.

Manage update set for ServiceNow Otto for Setup

Upload a batch update set to promote validated configuration changes from a non-production instance to production in a single, controlled deployment, ensuring consistency and reducing manual errors.

Before you begin

Before performing this task you must install ServiceNow Otto for Setup application from ServiceNow store or from the prompt on the Admin Home page.

This application is available to all users with Foundation SKUs for ITSM, CBS, ITOM, and ESM, and Pro+ SKUs for ITSM and HRSD.

The following conditions should be met:

- Preset and manual configurations are completed and verified in the non-production instance.
- The batch update set is packaged in the non-production instance, and the XML file is downloaded. These update set files are then uploaded in the production instances. See Understand the Configuration page flow in ServiceNow Otto for Setup for more information.
- The production instance version is compatible with the source non-production instance.

The following task is performed on a production instance only after the above conditions are met:

https://player.vimeo.com/video/1174403543?h=c089e8f858&badge=0&autopause=0&player_id=0&app_id=58479

Role required: admin

Procedure

1. Navigate to your Admin Home page on your instance.
   The system dynamically renders application and plugin cards based on your admin entitlement status.
2. Select **View product overview** for AI-native IT Service Management product family card to start the setup process.
   The Product Hub page for AI-native IT Service Management shows up.
3. Select **Upload batch** under Option 2 - Coming from another ServiceNow instance? option.
   The Upload your batch update set as XML file modal shows up.
4. Select +Add file in the modal to upload the batch file and select **Continue**.
   The Update set ready modal shows up with "Upload successful with no conflicts detected" message.

   Note: This message is visible only if the batch file doesn't have any errors.

   When the batch file contains errors, the "Your update set has conflicts that need attention" message shows up.

5. Select **Preview** in the Update set ready modal.
   You can also select Open KB article if you want to view the KB article about uploading batch file.
   The Retrieved Update Set form shows up on a new tab.
6. **Optional:** Select **Commit Update Set Batch** in the form.

   Note: The **Commit Update Set Batch** option is visible only when there is no error in the batch file. You are required to resolve the errors in the batch file before selecting **Commit Update Set Batch**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Commit Update Set Batch modal gets displayed showing the progress of the batch file being committed.

If the commit operation fails, an error message is shown stating the failure. Review the commit status and any error details presented and navigate back to the Product Hub page. The Product Hub page provides a See Logs link to the commit logs, with details of the specific reasons for any commit failures.

Note: Resolve all commit log errors before retrying to upload the update set xml file again. Ensure the non-production and production instances are running compatible versions.

7. **Optional:** Select Preview Problems for Batch related list to review the errors in the update set batch file.

   Note: This step is applicable only when there are errors in the update set batch file.

   The list of errors shows up under the Preview Problems for Batch related list.
8. **Optional:** Select any of the available actions to resolve the errors.

   Note: This step is applicable only if there are any errors in the update set batch file. You are then required to resolve the errors in the batch file and then proceed with the **Commit Update Set Batch** option. The **Commit Update Set Batch** option appears once the errors are resolved in the batch file.

9. Navigate back to the Product Hub page to see the progress.
   The extraction of these update sets are done on the Configuration Console page. See Understand the Configuration page flow in ServiceNow Otto for Setup for more information.
10. Once the update set commit completes, you can either select **Upload another update set** or **Configure** depending on the requirement.
    If you want to upload another batch file, select **Upload another update set**. You can also select **Configure** if you are done uploading the update set batch file and wants to proceed with the configuration process.

Result

These steps complete the successful uploading and committing of the update set batch file.

Mandatory and optional app selection modal

The app selection modal enables platform admins to view, select, and install product bundles with clear separation of mandatory and optional apps. The modal validates licensing, prevents modification of required apps, and integrates with App Manager APIs to verify transparent and guided installations.

When installing product bundles, platform admins need visibility into what will be installed and control over optional components. The app selection modal addresses this need by presenting a guided experience that separates mandatory apps from optional apps, validates licensing constraints, and enables informed selection decisions.

The modal integrates directly with App Manager APIs, ensuring that all app metadata, availability, and licensing rules remain current and authoritative. This approach eliminates manual app management and reduces the risk of invalid installations caused by missing required apps or licensing conflicts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

The app selection modal provides the following benefits:

- Transparent installation visibility: Admins see exactly which apps are mandatory, which are optional, and why certain apps may be unavailable due to licensing constraints.
- Installation safety: Mandatory apps are pre-selected and locked, preventing accidental deselection of required components and eliminating installation failures caused by missing dependencies.
- User control over optional components: Admins can customize installations by selecting or deselecting optional apps that match their organizational needs, reducing bloat and unnecessary features.
- Clear licensing guidance: The modal displays messaging for unlicensed optional apps, enabling admins to make purchasing decisions or defer component installation until licenses are available.
- Dynamic item count: The modal displays a real-time count of selected items that updates as admins select or deselect optional apps, providing clear visibility into the total installation scope.
- Reduced installation errors: App Manager API integration ensures that app metadata, validation rules, and install requests align with current system state, preventing silent failures.

Use cases

The app selection modal is useful in the following scenarios:

- Standard product bundle installation: A platform admin installing a new product bundle wants to understand the base components (mandatory) before committing to optional add-ons. The modal provides clear visibility, enabling an informed decision about which optional apps to include in the initial installation.
- Licensing-constrained installations: An organization has licenses for some but not all components in a bundle. The admin uses the modal to identify which optional apps require additional purchasing, defer installation of those apps, and proceed with available components.
- Multi-team deployments: A large enterprise deploys the same product bundle across multiple business units with varying requirements. The modal allows each unit's administrator to customize the installation by selecting region-specific or team-specific optional apps without affecting the base functionality.
- Phased adoption: An organization plans to roll out additional functionality over time. The admin installs the mandatory core apps immediately and deselects optional apps, deferring their installation to a later phase when users are ready to adopt them.

As of Brazil release, the mandatory and optional app selection capability is available for Business Units (BUs) to configure.

Considerations

Consider the following when using the app selection modal:

- Mandatory apps are non-negotiable: Apps marked as mandatory by App Manager can't be deselected. These represent core dependencies required for the product to function correctly. If licensing or dependency issues prevent a mandatory app from being available, the entire installation is blocked with a clear error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Licensing rules are authoritative: App availability and licensing constraints are controlled by App Manager and can't be overridden within the modal. If an app is marked as unlicensed or unavailable, it can't be selected regardless of admin preference.
- Selection state is not saved between sessions: Optional app selections apply only to the current installation attempt. If an admin closes the modal without completing the install, their selections aren't retained for future sessions.
- App dependencies are opaque to the modal: The modal presents which apps are mandatory versus optional but does not display dependency graphs or explain why specific apps are required. Admins who need to understand app relationships should consult App Manager documentation or contact their implementation team.
- Item count updates dynamically: As admins select and deselect optional apps, the install button updates to show the current count of selected items. This count includes mandatory apps plus selected optional apps.
- Install button availability: The install button is disabled if zero apps are selected for installation (that is, if no mandatory apps are available and no optional apps are selected). This prevents silent failures caused by empty install requests.

Select apps during product installation

Use the app selection modal to review mandatory and optional apps, customize your installation by selecting optional components, and complete the product installation through product hub installation flow.

Before you begin

Before you begin:

- Your instance must have the Product Hub product available for installation.
- Your system must have active licensing for at least the mandatory apps in the bundle.

Role required: admin

About this task

When installing a new product bundle, the app selection modal displays which apps are required and which are optional. Use this procedure to customize your installation by selecting which optional apps to include.

Procedure

1. Navigate to the product bundle installation on the Product Hub page.

   Look for the Install option or product bundle installation entry point.

2. Select the product bundle you want to install.

   The system enforces the selection of mandatory apps defined for the product bundle. These apps can't be deselected during installation. After reviewing the selected apps, proceed to the next step.

3. Review the mandatory apps section in the app selection modal.

   Apps that are defined as mandatory and included in the user's entitlement are displayed with selected, disabled checkboxes and can't be deselected. Optional apps remain selectable and can be included or excluded during installation.

4. Review the optional apps section and decide which optional components to include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system retrieves the apps that are entitled and available in the instance. Apps are then presented as either mandatory or optional based on the product bundle configuration. Mandatory apps can't be deselected, while optional apps can be selected or cleared during installation.

Select the checkboxes for optional apps you want to include in this installation.

5. Select or deselect optional apps and observe the item count update.

   As you select or deselect optional apps, the install button count updates in real-time. The count displays total selected items, including mandatory apps plus your selected optional apps. For example, if a bundle has 3 mandatory apps and 5 optional apps, and you select 2 optional apps, the install button shows "Install 5 selected items" (3 mandatory + 2 optional).

6. Verify the total count of apps being installed before proceeding.

   The install button displays text similar to "Install X selected items" where X represents the total. The button remains inactive if zero apps are available for installation (for example, if all mandatory apps are unavailable).

7. Select the install button to begin the installation.

   The system submits an install request containing all mandatory apps and only the optional apps you selected. App Manager validates the request and executes the installation.

   The installation begins and the system displays progress updates. On completion, a confirmation message appears listing all installed apps.

   Trouble?

   If the installation fails with an error message, verify the following:

   - You have the appropriate admin role or permissions.
   - Your instance has sufficient disk space for all selected apps.
   - No dependency conflicts exist between selected apps (consult with your implementation team if you're unsure).

   If issues persist, contact your ServiceNow implementation team or support.

Result

The selected product bundle and all mandatory plus chosen optional apps are installed on your instance. The apps are then available for use by users with the appropriate roles.

What to do next

After installation completes, consider the following next steps:

- Verify that the installed apps are accessible from the appropriate menu or navigation area.
- Assign roles to team members who need to use the new apps.
- For additional optional apps installed later, repeat this procedure to install additional components if needed.
- Refer to the concept topic for more information about how licensing and app availability work.

Individual plugin installation from Product Hub

Individual plugin installation enables you to discover, review, and install standalone plugins directly from Product Hub without requiring a bundled apps package. This capability supports

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

flexible deployment scenarios, early adoption, and validation of plugins before committing to full product bundles.

Product Hub traditionally expose product bundles, providing guided installations of complete product packages with mandatory and optional apps. Individual plugin installation extends this capability by allowing admins to install specific standalone plugins without committing to an entire bundle. This approach enables business units (BUs) such as ITAM to adopt plugins incrementally, validate functionality before broader deployment, and maintain granular control over their instance's capabilities.

Individual plugins are surfaced alongside bundled products in Product Hub. Each plugin displays its name, description, current status, and required dependencies. The installation process leverages the same guided framework used for bundled installs, including entitlement validation, dependency checking, installation progress tracking, and dynamic item count display. Individual plugin installation workflows mirror the product bundle installation experience, ensuring consistency across product bundle installation scenarios.

Key benefits

Individual plugin installation provides the following benefits:

- Flexible deployment: Admins can activate only the capabilities they need, avoiding unnecessary components and reducing instance bloat from unwanted functionality.
- Early adoption: Business units can validate new plugins in controlled environments before deciding on broader deployment or full product adoption.
- Incremental rollout: Organizations can phase plugin adoption over time, aligning deployments with business priorities and readiness schedules rather than bundled all-or-nothing approaches.
- Faster time to value: Admins bypass the overhead of evaluating and installing entire product bundles when they only need specific capabilities.
- Simplified licensing: Plugin-level licensing constraints are evaluated independently, allowing admins to proceed with available plugins and defer others pending license acquisition.
- Clear dependency visibility: The install flow displays all required dependencies, helping admins understand what will be activated alongside their selected plugin.

Use cases

Individual plugin installation is useful in the following scenarios:

- Selective capability adoption: An organization needs a specific plugin's functionality but does not want the additional apps that would come with a full product bundle. Individual plugin installation lets them activate exactly what they need.
- Pilot deployments: A business unit tests a plugin in a sandbox or development instance before deciding whether to roll it out to production. If validation is successful, they proceed with installation in production; if not, they can defer or abandon the plugin without affecting other deployments.
- Phased rollout: A large enterprise rolls out multiple plugins over time according to organizational readiness. Using individual plugin installation, different teams can adopt plugins on their own schedule without waiting for bundled product releases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Licensing optimization: An organization has licenses for some plugins but not others. They install available plugins immediately and defer others until additional licensing is procured, avoiding all-or-nothing delays.
- Feature experimentation: IT teams evaluate whether a plugin's capabilities align with business requirements before committing to broader rollout, minimizing waste and maximizing ROI on technology investments.

Considerations

Consider the following when using individual plugin installation:

- Dependencies are mandatory: When a plugin has required dependencies, all of them must be installed as part of the transaction. You can't selectively skip dependencies even if you don't intend to use them. Dependencies are identified during installation planning and validated before execution begins.
- Entitlements are authoritative: Plugin availability is controlled by active licensing and can't be overridden within Product Hub. If a plugin or dependency lacks appropriate licensing, installation is blocked until licensing is obtained.
- Plugins are registered by business units: Not all plugins are automatically eligible for individual installation through Product Hub. Plugins must be explicitly registered in the Product Hub registry by their owning business unit. Contact your implementation team if a plugin you need is not visible in the hub.
- Individual plugin installs don't include bundle customization: Individual plugin installation follows a streamlined path with pre-defined mandatory apps and dependencies. If you need fine-grained control over optional components, consider the bundled product installation flow instead.
- Installation status reflects App Manager state: The plugin's installation status in Product Hub is synchronized with App Manager. If a plugin is set to inactive or is uninstalled outside of Product Hub (for example, via direct App Manager operations), the status in Product Hub updates to reflect the current state.

Install an individual plugin from Product Hub

Use Product Hub to discover, review, and install an individual standalone plugin without requiring a full product bundle installation.

Before you begin

Before you begin:

- Your organization must have active licensing for the plugin you want to install.
- Your instance must have access to Product Hub and the plugin must be registered as available for individual installation.

Role required: admin

About this task

Use this procedure to install a standalone plugin through Product Hub when you want to activate specific functionality without installing an entire product bundle. Individual plugin installation validates your entitlements, checks dependencies, and guides you through the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to Product Hub.
   A list of available products, bundles, and individual plugins shows up.
2. Locate and select the individual plugin you want to install.

   Individual plugins are displayed alongside bundled products in the Product Hub. Look for the plugin by name, description, or category. Each plugin displays its current status (Not installed, Installed, Updates available).
3. Review the plugin details and dependencies in the expanded view.

   The plugin details pane displays the plugin's name, description, current status, and a "What's included" section listing all required dependencies (other plugins, apps, or platform prerequisites).
4. Verify that your organization has valid licensing for the selected plugin.

   The system automatically validates your entitlements. If the plugin or any of its required dependencies lack appropriate licensing, an error message appears with guidance on what licensing is needed.

   Note: You can't proceed with installation until licensing is valid.

   The system displays either a green status indicator (entitlements valid) or a red status indicator with actionable error messaging (licensing missing).

   Note: If you receive a licensing error, contact your ServiceNow account team to purchase the required licenses. Once licensing is activated, refresh the Product Hub and retry this procedure.
5. Select the install button to initiate the plugin installation.

   The system validates all dependencies, then submits the install request to App Manager.

   The installation begins immediately.
6. Verify the item count before selecting Install.

   The install button displays a count of total items to be installed, including the selected plugin and all its required dependencies. The item count updates dynamically as the selection is finalized. The button remains enabled once all licensing validations pass.
7. Monitor the installation progress in the Product Hub.

   The plugin status displays real-time installation progress, showing percentage complete and current phase.

   Note: Don't navigate away from this screen during installation. Installation typically completes within minutes depending on plugin size and instance performance.

   When installation completes successfully, the plugin status updates to "Installed" and a confirmation message is displayed. You may refresh the page or navigate away.

   If the installation fails, the system displays an error message explaining why (for example, missing dependencies, entitlement validation failure, or network error). Note the error details and complete the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify that all listed dependencies have valid entitlements.
- Confirm that your instance has sufficient disk space for the plugin and its dependencies.
- Check your network connectivity to App Manager services.
- Contact your ServiceNow implementation team if issues persist.

8. Verify that the plugin is active and accessible in your instance.

   After installation completes, the plugin is automatically activated. Depending on the plugin type, you may need to navigate to the corresponding module or menu to confirm the plugin is functioning. For example, a dashboard plugin might appear under a new dashboard category, or an app plugin might appear in the app launcher.

Result

The individual plugin and all its required dependencies are successfully installed and activated on your instance. The plugin is now available for use by users with the appropriate roles. You can track the plugin's status in Product Hub going forward, including any available updates.

What to do next

After the plugin installation completes, consider the following next steps:

- Assign appropriate roles to team members who need to use the newly installed plugin.
- Configure the plugin settings if required (consult the plugin's documentation for configuration guidance).
- Test the plugin functionality in your instance to confirm it meets your needs.
- Monitor Product Hub for any available plugin updates and plan upgrade windows as needed.
- Refer to the Individual plugin installation from Product Hub for more information about dependencies, entitlements, and considerations.

Jumbo apps and entitlement validation

Jumbo apps are large application bundles that support mandatory and optional app selection during installation. Entitlement validation confirms that admins have appropriate licensing for mandatory apps before installation proceeds, while optional apps display licensing status inline to inform installation decisions.

Jumbo apps are large product bundles that bundle multiple applications together. Unlike standard apps or smaller product packages, jumbo apps support granular control over which components are installed by offering mandatory and optional app selections. Product Hub workflow leverages entitlement validation to confirm licensing requirements are met before allowing installations to proceed.

Entitlement validation operates at two levels: mandatory app validation and optional app validation. This layered approach prevents invalid installations caused by missing licenses while giving you the flexibility to defer optional components when licenses aren't available.

Jumbo apps vs standard products

Jumbo apps follow a different installation workflow than standard products:

- Standard products: Use the app selection modal within Product Hub, where admins select mandatory and optional apps directly.
- Jumbo apps: Redirect admins to App Manager, where they configure version, choose optional features, and complete installation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For jumbo apps, when an admin selects Install from Product Hub, they are navigated to App Manager to complete the installation experience.

Mandatory vs optional app designation

Business Units (BUs) register jumbo apps by populating specific fields on the Product Hub resource table:

- Mandatory apps: Identified through the product resource configuration. These apps are essential for core functionality and can't be deselected by admins.

  Note: Licensing for mandatory apps is a hard requirement — installations can't proceed without valid entitlements.

- Optional apps: Also defined in product resource configuration. These apps add supplementary capabilities and can be selected or deselected by admins during installation. Licensing for optional apps is informational — admins can defer installation if licenses are unavailable.
- Jumbo app identification: The system distinguishes jumbo apps from regular apps through a product type flag or resource classification. This classification enables the mandatory/optional app selection modal and triggers enhanced entitlement validation workflows.

Entitlement validation rules

Entitlement validation follows these rules:

- Mandatory apps require active licensing: Every mandatory app in a jumbo bundle must have a valid, active entitlement. Expired, inactive, or missing licenses block installation and prevent the modal from displaying.
- Entitlement checks validate against mandatory apps only before modal display: Pre-modal validation only checks mandatory apps. Optional app licensing is evaluated after the modal displays, allowing admins to see the full picture before deciding which components to install.
- Optional app licensing is non-blocking: If an optional app lacks valid entitlements, it displays as disabled within the modal with an inline message. Admins can proceed with installation of available apps.
- App Manager is the source of truth: All entitlement queries delegate to App Manager APIs. Product Hub doesn't cache or override App Manager licensing rules. If App Manager reports an app as unlicensed, it is treated as unlicensed regardless of other factors.
- Installation fails if App Manager validation fails: Even if pre-modal and modal-level validation passes, if App Manager rejects the install request during submission (for example, due to a changed licensing state or validation rule), the installation is blocked with an error message.

Entitlement validation rules reference

Technical reference documenting entitlement validation rules, error states, and validation logic for jumbo apps and App Manager integration in product bundle installation workflows.

Validation phases

Entitlement validation occurs in three distinct phases during the apps installation workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Validation phases

Phase	When it occurs	What is validated	Result if validation fails
App selection	After the admin starts the installation workflow	For jumbo apps, Product Hub redirects the admin to App Manager. App Manager determines which apps are mandatory or optional and displays the selection experience	The selection experience remains available and displays information about missing dependencies when applicable.
Install submission	After the admin submits the install request	App Manager performs the required installation checks before proceeding	Installation is blocked and App Manager displays an error or dependency message

Mandatory app validation rules

For jumbo apps, App Manager determines which apps are mandatory and which are optional.

- Are determined by App Manager
- Can't be deselected
- Remain visible in the selection experience even when required dependencies or entitlements are unavailable
- Can prevent installation from completing if App Manager detects missing dependencies or other validation issues

Optional app validation rules

For jumbo apps, App Manager determines which apps are optional.

- Can be selected or cleared during the installation process
- Are presented by App Manager based on the product configuration and instance state
- Don't affect the selection state of mandatory apps.

Error states and messaging

Error states

Error state	When it occurs	User action required
Missing dependency	A required dependency is unavailable during installation	Review the message provided by App Manager and resolve the dependency before retrying
Install validation failed	App Manager can't complete the install request	Review the error details and retry after addressing the reported issue

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

App Manager integration

- Product Hub redirects jumbo app installations to App Manager
- App Manager determines which apps are mandatory and optional
- App Manager displays the app selection experience and any dependency-related messaging
- App Manager performs validation checks before installation
- If required dependencies are unavailable, App Manager can block the installation and provide guidance to the administrator.

Implementation notes

- Jumbo app identification: Product Hub identifies jumbo apps and redirects administrators to App Manager for installation. App Manager determines which apps are mandatory or optional based on its configuration and business logic.
- Jumbo app installation workflow: For jumbo app installations, Product Hub redirects administrators to App Manager. App Manager provides the installation experience, including app selection, dependency messaging, and installation validation.
- Fallback behavior: If App Manager can't provide the installation experience or validation results, the administrator receives an error message and installation can't continue until the issue is resolved.

Configure in ServiceNow Otto for Setup

Understand and learn how to configure the Platform module and other product modules in ServiceNow Otto for Setup by following the steps in each category.

Understand the Configuration page flow	Configure Platform module	Configure product modules
Understand the Configuration page flow to start the configuration process for other specific modules	Learn how to configure the Platform module with ServiceNow Otto for Setup	Learn how to configure other product modules with ServiceNow Otto for Setup

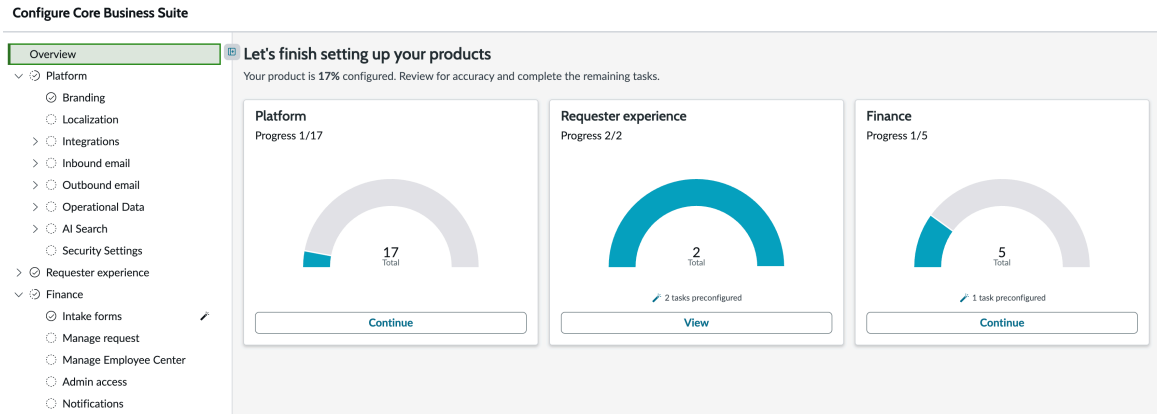
Understand the Configuration page flow in ServiceNow Otto for Setup

Implement the following steps to understand the configuration page flow to start the configuration process for either the Platform module or a specific product module on your instance.

Before you begin

Before performing this task you must install ServiceNow Otto for Setup application from ServiceNow store or from the prompt on the Admin Home page.

Role required: admin



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Once the setup of an application completes, select **Configure**.

   Note: The **Configure** option shows up only after the setup of an application completes.

   The Configuration Console page shows up.

2. Select Configuration Summary on the left panel of the Configuration Console page.
   You can see the modules and their specific configuration progress.

   Note: If the selected product module has enabled the update set functionality, a batch update set is created in the preferred scope that has been provided at the console level. This information shows up at the top menu bar on loading the Configuration Console page. Any update or metadata changes made on the console are captured in this update set unless you move to a different application or have switched to a different update set.

   The preferred scope can be updated depending on the next selected console item. For example, if you want to configure the Branding console item and it can be done in Global scope, you can override the preferred scope that was provided at the console level.

   The Platform module and the product specific module show up. The Platform module is a common module for all product modules. The product modules are based on the entitlement of the admin.

3. Select **Get Started** on the modules.
   You are redirected to the first configuration of the selected module. See Configure the Platform module in ServiceNow Otto for Setup for more information on Platform configuration steps.
4. **Optional:** Find a console item efficiently using the Search configurations search bar on the left navigation.
5. **Optional:** Expand the left panel configurations to view the pre-configured configurations.

   Note: The configurations that are pre-configured are marked with a checkmark and a magic wand. You can modify the default configurations that are preconfigured and marked with a Magic icon.

6. Select the Manage Task icon on a selected console item.
   You can then either create a new task or open a related task. If you select the Create a task option, the Product Console Task form. Fill up the fields on the form and select **Submit** to create a new task for the console item.

   You can also select the Open related tasks option to open the list of tasks that are being previously created and linked to the selected console item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select a configuration that needs to be configured.
   Select each individual configurations that aren't pre-configured and complete the configurations. You need to expand each configuration to make its console items selectable.

   Note: Every application has different configurations that are either pre-configured or need to be configured.

8. Select **Package and download** to consider all the update made in configuring the selected console item.
   This step packages the current batch of configuration changes into an update set XML file. A new XML file is created every time you make any configuration changes.
9. Select **Configure with AI** to start AI-assisted configuration or receive guided assistance with ServiceNow Otto agent.

   Note: As a pre-req, install ServiceNow Otto for the **Configure with AI** button to show up on the Configuration Console page.

   You can now use the agent to ask questions in natural language and get guidance during the configuration process. The agent retrieves relevant information from ServiceNow documentation and presents a summarized response with links to related topics. For example, if you ask “What are roles?”, the agent searches the ServiceNow documentation site and returns a definition along with links to learn more. Select the **Choose something else** pill in the ServiceNow Otto agent chat view to review all available console items and start a different configuration path.

   The adoption of LitJS components in NAP enables the import and use of reusable components, promoting a scalable and consistent framework while improving development efficiency. You can also select the **ServiceNow Otto** icon on the menu bar to see the Open in expanded view pill that guides you through the configuration process using LitJS components.

   The ServiceNow Otto panel shows up and starts the agentic configuration process.

   Note: The **Configure with AI** button appears only for console items that are backed by AI capabilities.

10. **Optional:** Select **Download XML** to download the XML update set batch file.
    You can also select **Back to configuration summary** to go back to the Configuration Console page.
11. Review the labels and icons next to some selected console items.
    - The Label icon indicates that the particular console item is either mandatory or recommended.
    - The Update label indicates that the particular console item has been updated by the selected product family.
    - The New label indicates that the particular console item is new.
    - The Lock icon indicates that there is a pre-requisite that needs to be completed before unlocking the particular console item.

      Note: The Lock icon disappears as soon as the pre-requisite console item is marked as completed.

    - The Tick mark icon indicates that the console item has been configured either manually or using agents.
    - The Gear icon indicates that the default configuration of a console item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a new update is available, the system displays a banner on the Configuration Console page.

Note: Select How this works link to find more information about the console items. The following modal shows up with these options on selecting the help link.

12. Select **Mark as configured** when you complete the configuration process of a configuration.
13. **Optional:** Scroll down to the Configuration activity section on the Configuration Console page to review the configured items and completed batch files by accessing **Configured items** and **Completed batches** tabs.

    (Optional) You can download a batch file from **Completed batches** tab view. Under the **Configured items** tab, you can see the console items that were marked as configured after the current active batch update set was created.
14. **Optional:** Select **Go to active batch** file to review all the update that were captured in the currently active batch file.
    Select the Child Update Sets related list to view the child update sets under the parent update set.

    Note: You can review the child update sets to know the exact update made in the active batch file.
15. Select **Go to Update Set** on the Configuration Console page.

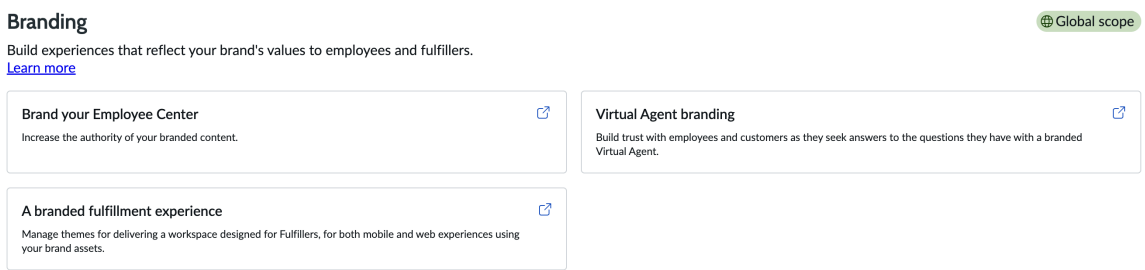
    Note: This option shows up only when the entire configuration of the application completes.

    You can then export the update set and move it to either test instance or production instance.

What to do next

After the configuration completes, you can promote the changes to test or production instances by re-running the auto-installation, committing retrieved update sets, and validating ATF tests.

Configure the Platform module in ServiceNow Otto for Setup



Complete the following steps to configure the Platform module.

Note: The Platform module is visible only if the selected product module configures the Platform changes for a particular install.

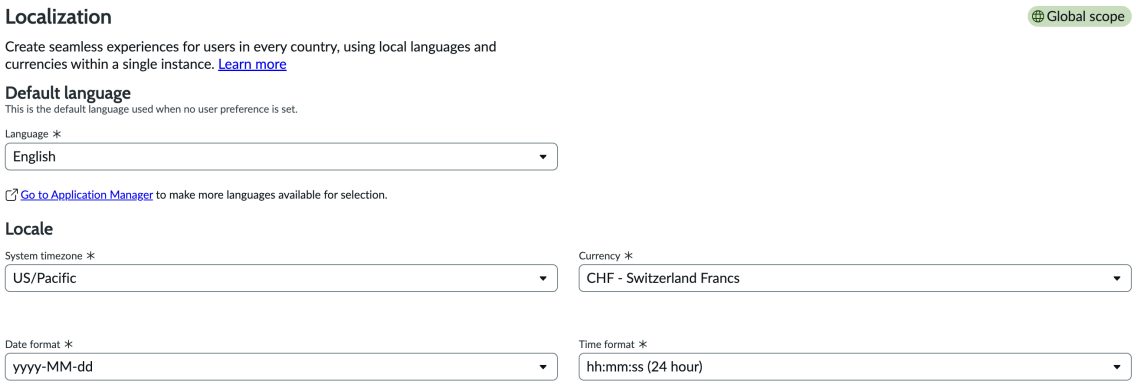
Note: You must be in Global scope to perform steps marked with the Global scope label.

Branding

Build the theme and experiences to reflect your brand's values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can see the following information on the Branding page:



- Brand your Employee Center: Set your portal theme to reflect your brand. Use the branding editor for portal to provide the title, uploading the company logo, tag line, background, etc. See ABC for more information.
- Virtual Agent branding: Set your brand theme either through an AI agent or virtual agent. You can create a brand or a theme using the virtual agent conversation system. See ABC for more information.
- A branded fulfillment experience: Set the themes to deliver a workspace for both mobile and web experiences. See Theme builder for more information. See ABC for more information.

See Branding and theming for more information.

Localization

Enable users worldwide to interact in their preferred language and currency through one integrated system

Note: You are required to have Global scope to modify Localization settings.

Default language

You can set the language for the instance without impacting the system language. Select a language for the instance from the dropdown menu. English is the default language.

Note: The languages shown in the dropdown menu correspond to the languages configured in the instance.

Select the Go to Application Manager link to install more languages. Once a new language is installed, it shows up in the dropdown menu.

Note: Only one language can be selected at a time.

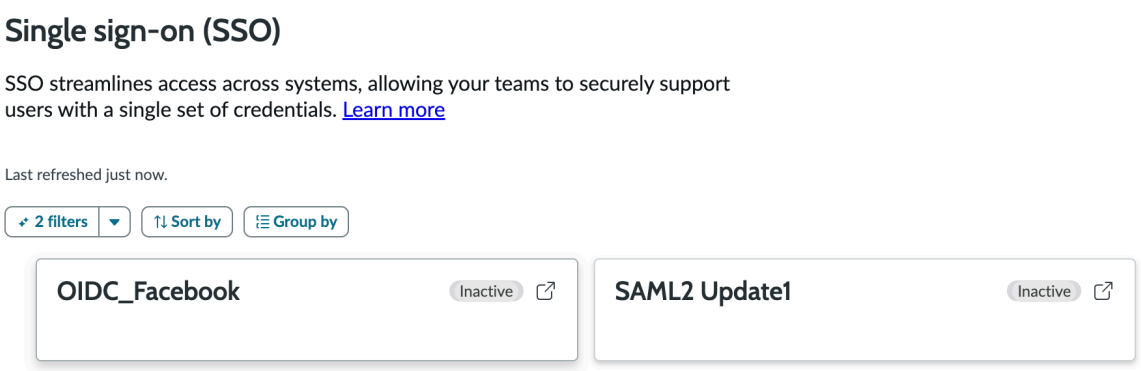
Locale

The locale options are for timezone, currencies, and date/time format.

Field	Description
System timezone	Timezone of the instance. US/Pacific is the default timezone.
Currency	Currency set for the instance. USD-United States Dollars is the default currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Date format	Date format set for the instance. MM-dd-yyyy is the default date format.
Time format	Time format set for the instance. h.mm.ss (24 hr) is the default time format.



Note: Select **Save** to save the recent settings. You can also undo the most recent change by selecting **Undo**. By selecting **Undo**, the values are reverted back to the most recent saved values.

See Localization for more information.

Identity management integrations

Manage access and user profile by integrating with Identity providers and LDAP directories.

Single sign-on (SSO)

SSO simplifies secure multi-system access using one set of credentials.

Note: You are required to install Multiple Provider Single Sign-On Enhanced UI plugin before creating a new SSO provider. Select the Go to Application Manager link to install the plugin.

Once the plugin is installed, the existing SSO providers show up. Select the Identity Provider link to create a new SSO provider. You can create an identity provider of one of the following types:

- Digest
- SAML
- OpenID Connect

Note: Although the Digest type is an option, it is not supported. OIDC and SAML are the only two providers that are supported.

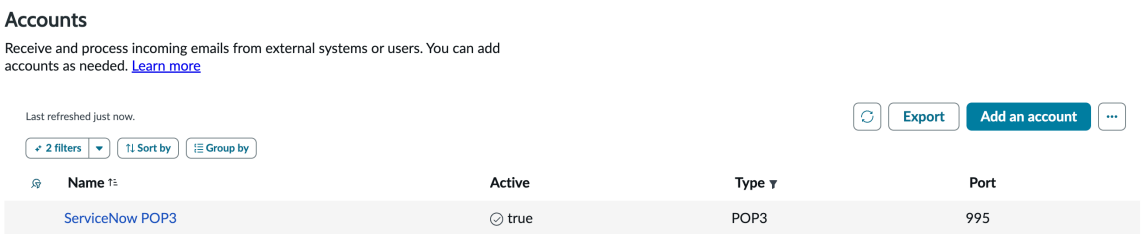
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lightweight directory access protocol (LDAP)

Lightweight directory access protocol (LDAP)

Synchronize user and group data to streamline user management, authentication, and access control. Learn more

Add an LDAP server



LDAP syncs user and group data to centralize authentication and access control.

On selecting LDAP on the left hand side panel, the gallery of the existing LDAP servers shows up. Select **Add an LDAP server** to create a new LDAP server.

Inbound email

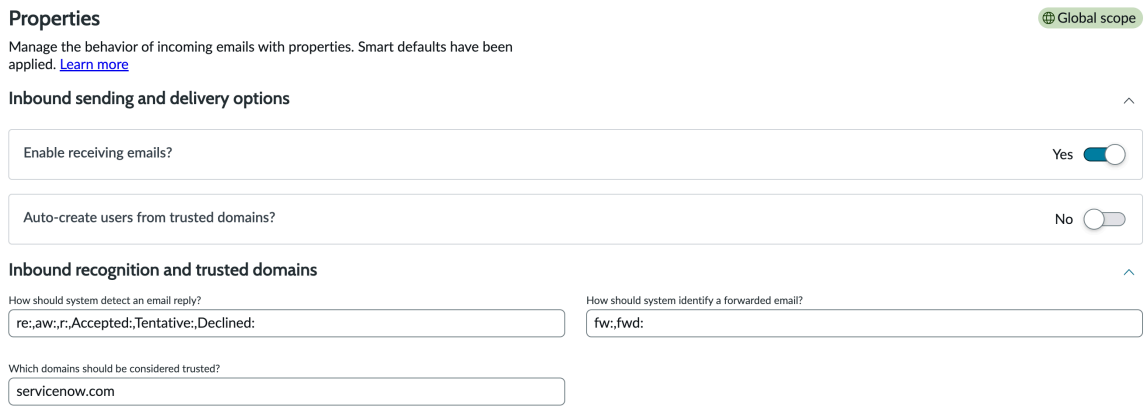
Use the inbound email to receive and process incoming emails from external systems or users.

Accounts

Use Accounts to process inbound emails from external sources and users. On selecting Accounts under Inbound email, a list of existing accounts shows up. Select **Add an account** to create a new account.

Field	Description
Name	Name of the account
Type	States the type of account. It can either be POP3 or IMAP.
Authentication	States the authentication method of the account

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
	Note: Authentication is a mandatory field
Server	Remote server to which this account connects. To activate a server for an on-premises installation, enter the full address (FQDN) of the node (for example, `node.customerdomain`). **Note:** Server is a mandatory field
Username	Username used to create the account **Note:** Username is a mandatory field
Password	Password used to set up the account **Note:** Password is a mandatory field
Connection Security	Type of secure connection. Choose a setting: • None: No secure protocol is used. • STARTTLS: Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS. • SSL/TLS: Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server. **Warning:** Selecting a less secure protocol like STARTTLS or None may expose your data. To better ensure the security of data in your email server, select SSL/TLS.
Port	Connection TCP port.
Active	Optional checkbox to create an active account
Enable Debug Logging	Option to create node logs for the raw data that is exchanged with the email server. You can review the node logs by navigating to **System Logs** > **Utilities** > **Node Log File Browser**.

Select **Export** to export the accounts on to an Excel, CSV, JSON or PDF. You can then select the delivery type either through download or email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties

Manage the behavior of incoming emails with Properties.

- Inbound sending and delivery options: You can enable receiving emails and can also enable auto-create users from trusted domains
- Inbound recognition and trusted domains: You can setup conditions for the following:
  - How to detect an email reply
  - How to identify a forwarded email
  - Which domains should be trusted

Note: Select **Save** to save the recent property settings. You can also undo the most recent change by selecting **Undo**. By selecting **Undo**, the values are reverted back to the most recent saved values.

Actions

Email actions determine how and when the system responds to service requests. On selecting Actions under Inbound email, a list of existing actions shows up. Select **Add an action** to create a new action.

Field	Description
Name	Name of the action
Target table	Select the table where the action adds or updates records.
Active	Optional checkbox to create an active action
Action type	Type of the action. Select the type of action the instance takes. Select **Record Action** to modify a record in the instance, or select **Reply Email** to have the instance send an email back to the source of the inbound email.
Stop processing	Optional checkbox to help prevent the system from running additional inbound email actions after this action runs.

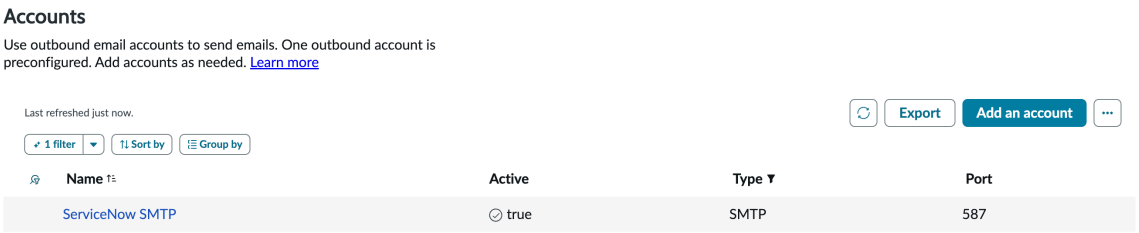
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



See Inbound email configuration for more information.

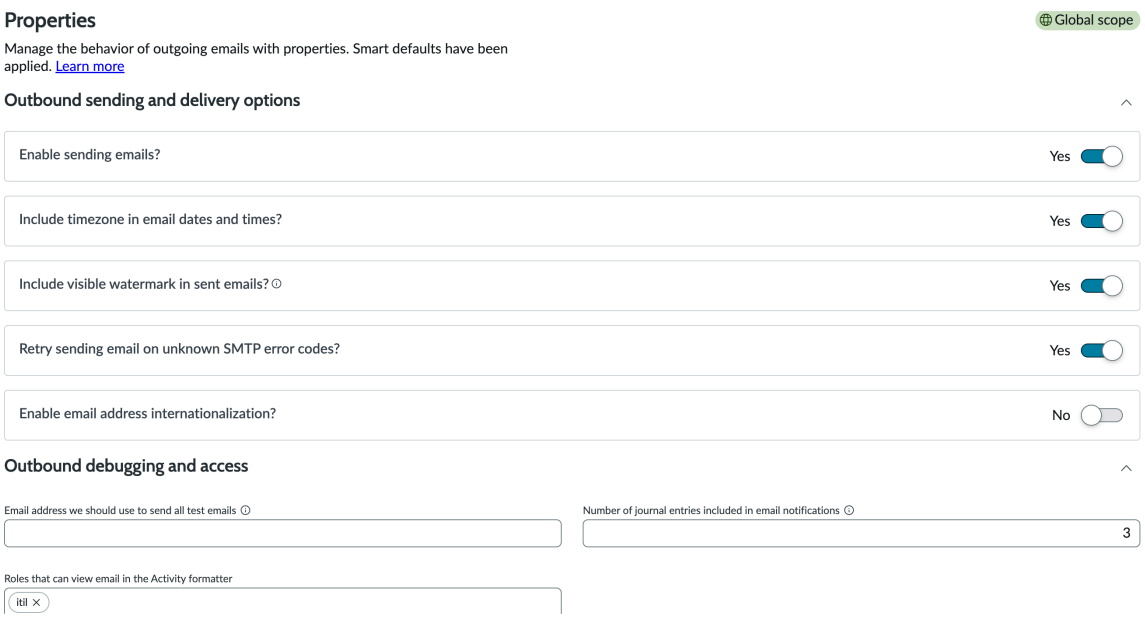
Outbound email

Use outbound email accounts to send emails.

Accounts

Use Accounts to process the outbound emails. On selecting Accounts under Outbound email, a list of existing accounts shows up. Select **Add an account** to create a new account.

Field	Description
Name	Name of the account
Type	States the type of account. It can either be POP3 or IMAP.
Authentication	States the authentication method of the account **Note:** Authentication is a mandatory field
Server	Remote server to which this account connects. To activate a server for an on-premises installation, enter the full address (FQDN) of the node (for example, `node.customerdomain`). **Note:** Server is a mandatory field
Username	Username used to create the account **Note:** Username is a mandatory field
Password	Password used to set up the account **Note:** Password is a mandatory field
Connection Security	Type of secure connection. Choose a setting: • None: No secure protocol is used. • STARTTLS: Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• SSL/TLS: Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server. **⚠ Warning:** Selecting a less secure protocol like STARTTLS or None may expose your data. To better ensure the security of data in your email server, select SSL/TLS.
Port	Connection TCP port.
Active	Optional checkbox to create an active account
Enable Debug Logging	Option to create node logs for the raw data that is exchanged with the email server. You can review the node logs by navigating to **System Logs** > **Utilities** > **Node Log File Browser**.

Select **Export** to export the accounts on to an Excel, CSV, JSON or PDF. You can then select the delivery type either through download or email.

Properties

Manage the behavior of outgoing emails with Properties.

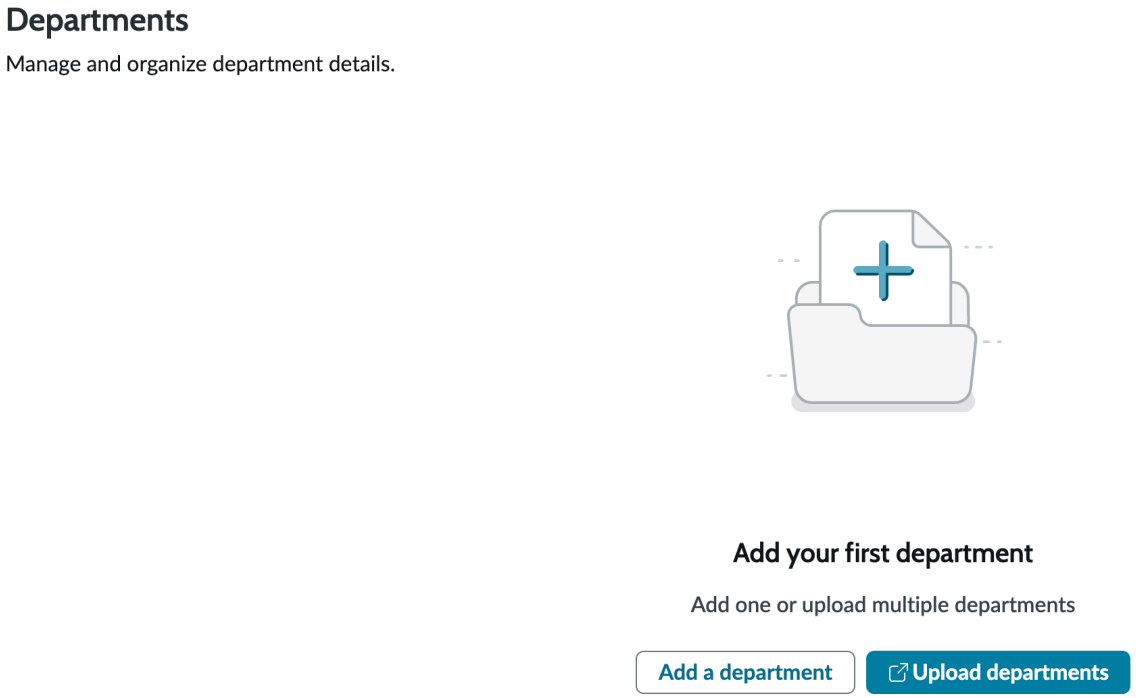
- Outbound sending and delivery options: You can either enable or disable the following options:
  - Enable sending emails
  - Include timezone in the email
  - Include visible watermark in the outbound emails

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Retry sending email on unknown SMTP error codes
- Enable internationalization of email address

- Outbound debugging and access: You can configure the following:
  - Email address to be used to send all test emails
  - Number of journal entries to be included in email notifications
  - Roles that can view email in the Activity formatter

Note: Select **Save** to save the recent property settings. You can also undo the most recent change by selecting **Undo**. By selecting **Undo**, the values are reverted back to the most recent saved values.



See Outbound email configuration for more information.

Operational data

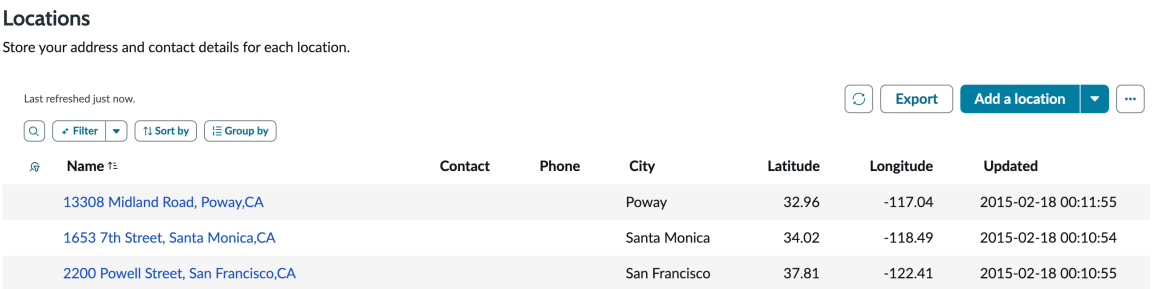
Configure departments, locations, users, groups, and roles to establish the foundation for your ServiceNow implementation.

Departments

Manage and organize department details. On selecting Departments under Operational data, a list of existing departments shows up. You can modify an existing department by selecting it from the list. Select **Add a department** to individually add a new department.

Field	Description
Name	Name of the department
Department head	Name of the department head
ID	ID of the department
Primary contact	Primary contact of the department

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
Description	Optional description of the department

You also have an option of **Bulk upload** to add more than one departments from an excel. If you select **Bulk upload** from the dropdown menu, you get the option of creating the Excel template and uploading the sheet where the department records are saved.

Select **Save** to save the recent department settings and redirect you to the list of existing departments. Select **Save & add more** to save the current department settings and reloads the Add a department form.

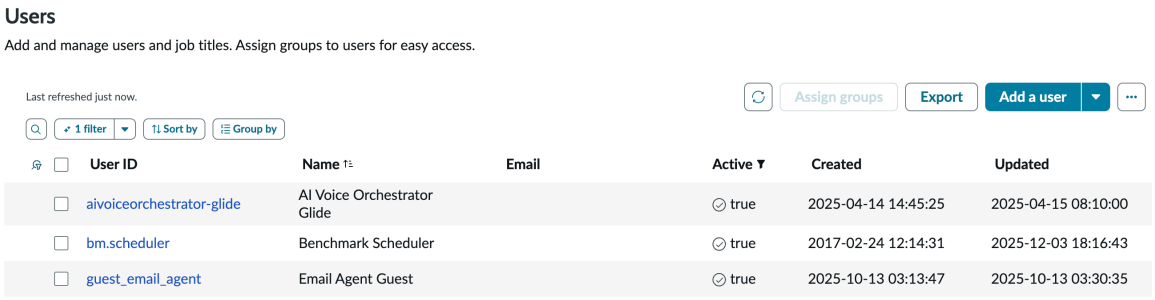
Locations

Store your address and contact details for all locations. On selecting Locations under Operational data, a list of existing locations shows up. You can modify an existing location by selecting it from the list. Select **Add a location** to individually add a new location.

Field	Description
Name	Name of the location
Contact	Contact information of the location
Street	Street name or number of the location
Phone	Contact number of the location
Fax phone	Fax contact number of the location
City	Name of the city of the location
State/Province	Name of the state or province of the location
Parent	Define parent location to manage multi-level location definition.
Zip/Postal Code	Zip or postal code of the location
Latitude	Exact latitude geo location
Longitude	Exact longitude geo location
Country	Name of the country of the location

Note: The fields that are marked with asterisks are mandatory.

You also have an option of **Bulk upload** to add more than one location from an excel sheet. If you select **Bulk upload** from the dropdown menu, you get the option of creating the Excel template and uploading the sheet where the location records are saved.



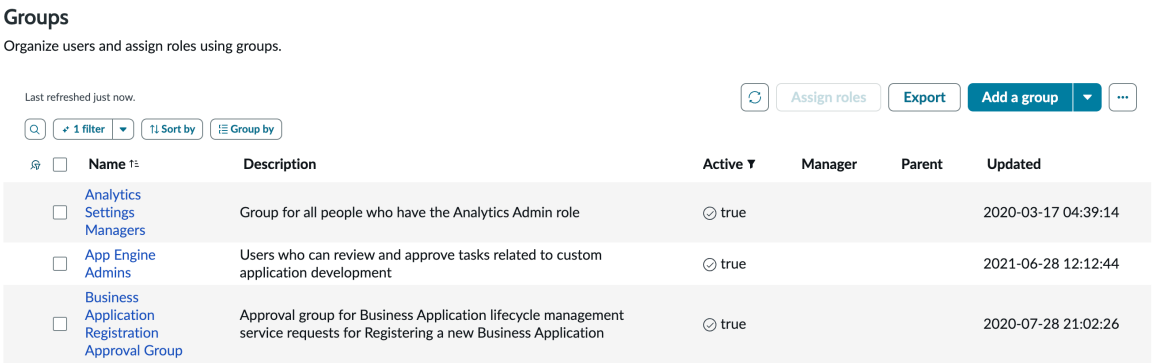
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select **Save** to save the recent location details and redirect you to the list of existing locations. Select **Save & add more** to save the current location details and reloads the Add a location form.

Users

Add and manage users with job titles, then assign groups for simplified access control. On selecting Users under Operational data, a list of existing users shows up. You can modify an existing user by selecting it from the list. Select **Add a user** to individually add a new user.

If you select the checkmark next to an existing user, the **Assign roles** option is enabled. The Assign roles & users modal shows up on the right panel.

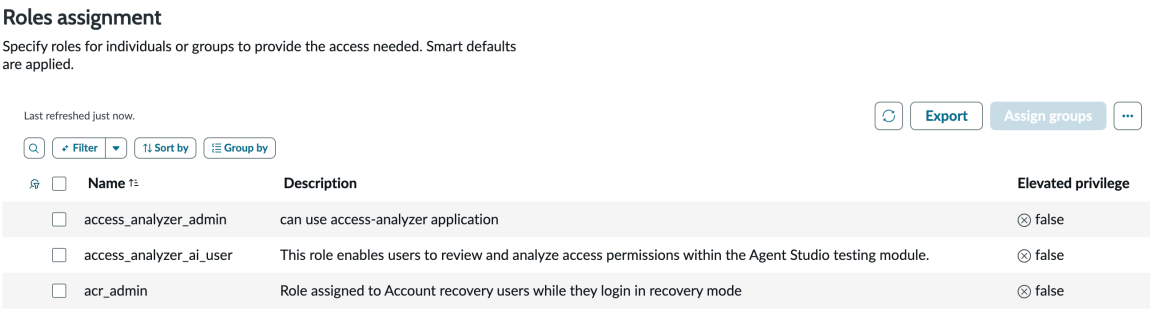


You also have an option of **Bulk upload** to add more than one user from an excel. If you select **Bulk upload** from the dropdown menu, you get the option of creating the Excel template and uploading the sheet where the user records are saved.

Select **Save** to save the recent user details and redirect you to the list of existing users. Select **Save & add more** to save the current user details and reloads the Add a user form.

Groups

Use Groups to organize users and assign roles. On selecting Groups under Operational data, a list of existing groups shows up. You can modify an existing group by selecting it from the list. Select **Add a group** to individually add a new group.



You also have an option of **Bulk upload** to add more than one group from an excel. If you select **Bulk upload** from the dropdown menu, you get the option of creating the Excel template and uploading the sheet where the group records are saved.

Select **Save** to save the recent user details and redirect you to the list of existing groups. Select **Save & add more** to save the current group details and reloads the Add a group form.

Roles assignment

Define roles for users and groups to control access permissions, leveraging smart defaults. On selecting Roles assignment under Operational data, a list of existing roles shows up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can't modify the details of any existing role nor can you create a new role.

Groups assignment

Organize users and assign roles using groups.

Field	Description
Name	Name of the group
Description	Detail description of the group
Active	State of the group if its active or not
Manager	Name of the assigned manager of the group
Parent	Name of the parent group
Updated	Date when the group information was last updated

Select **Add a group** if you want to add a group to configure. You can also export the list of groups into an excel sheet or an available file type by selecting **Export**.

Roles assignment

Specify roles for individuals or groups to provide the access needed.

Field	Description
Name	Name of the role
Description	Detail description of the role
Elevated privilege	States if the role has any elevated privilege or not

Select **Assign groups** if you want to assign a role to a group. You can also export the list of roles into an excel sheet or an available file type by selecting **Export**.

Note: You must select one or more roles to get it assigned to a group.

Assets

Configure the hardware and consumables to setup the assets for your ServiceNow implementation.

Hardware

Configure the assets with intuitive workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Display name	Name of the hardware
Asset tag	Tag ID of the hardware
Model category	Category name of the hardware
State	State of the hardware
Assigned to	Name of the assigned person
Cost	Cost of the hardware

Select **Add a hardware** if you want to add a hardware to configure. You can also export the list of hardware into an excel sheet or an available file type by selecting **Export**.

Consumables

Manage assets with intuitive work flows and life cycle visibility.

Field	Description
Display name	Name of the consumable
State	State of the consumable
Substate	Detailed state of the consumable
Stockroom	Name of the location where the consumable has been stocked
Quantity	Available quantity of the consumable in the stockroom
Model category	Category of the consumable

Select **Add a consumable** if you want to add a consumable to configure. You can also export the list of consumables into an excel sheet or an available file type by selecting **Export**.

Knowledge management

Configure a self-service platform for users to store, share and manage content.

Implement the following steps to complete the configuration:

1. Set up a knowledge base: Configure the knowledge base to define where articles are stored, how content is structured, and who can access it. Select **Set up** to start setting up the Knowledge base.
2. Review the flows: Define and configure workflows for article creation, review, approval, and publication, including approval stages and reviewer assignments. Select **Review** to start reviewing the flow.
3. Article templates: Predefined forms provide a consistent content structure by enabling authors to create articles using standard fields such as Problem and Solution. Select **Review** to start reviewing the article templates.
4. Add knowledge base articles: Create and manage knowledge articles to continuously enhance the self-service knowledge base. Select **Import articles** to start importing the knowledge base articles.

See Knowledge Management for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB

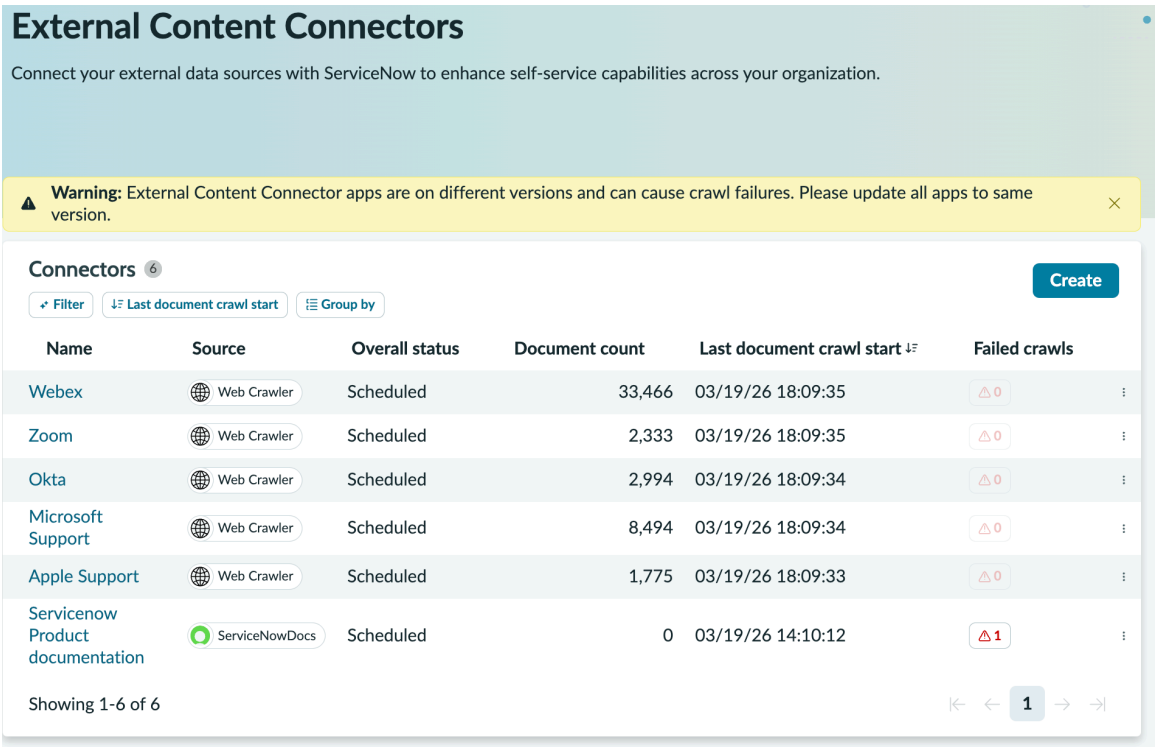
Using the configuration items (CI), monitor the infrastructure and ensure continuous service operations.

Based on the CI type (for example, Service, Offering, Computer) selected in the **Configuration item type** field, a CI list of similar CI type is displayed. You can do the following for the similar CI type:

- Edit CIs from the displayed list
- Export the CI list
- Upload CIs
- Add a CI

Note: Use the *cmdb_lite_ci_config* system property to define the CI types that should be displayed in the **Configuration item type** field.

For information about CI, see Overview of CMDB and Create a CI class.

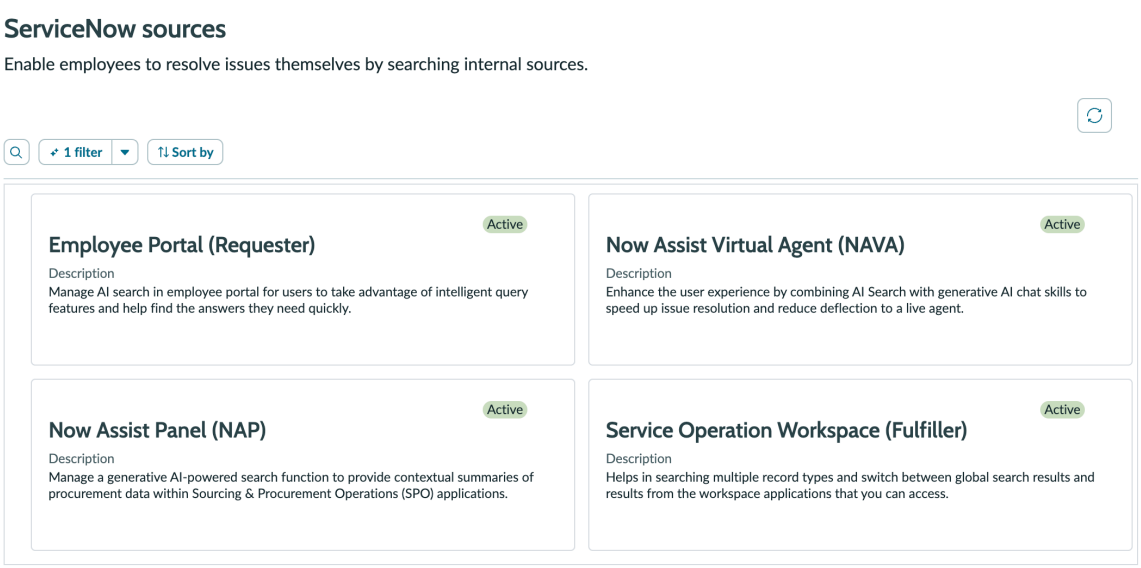


AI Search

Configure and maintain the AI-Search engine to experience a modern search experience.

External sources

Connect your external data sources with ServiceNow to enhance self-service capabilities across your organization.



Warning: External Content Connector apps are on different versions and can cause crawl failures. Please update all apps to same version.

ServiceNow sources

Enable employees to resolve issues themselves by searching internal sources.

- AI Control Tower (AICT): See Guided setup for more information on configuration of the AICT module.
- Hardware Asset Management (HAM): See Configuration Console for Hardware Asset Management for more information on configuration of the HAM module.
- Cloud Cost Management (CCM): See Configuring ServiceNow Otto for Cloud Cost Management (CCM) for more information on configuration of the CCM module.
- HR Service Delivery (HRSD): See AI-Native HR Service Delivery Implementation for more information on configuration of the HRSD module.
- Operational Technology: See Access ServiceNow Otto for Setup (OT) for more information on configuration of the Operational Technology module.
- Enterprise Asset Management (EAM): See Install Enterprise Asset Management from the Admin Home page for more information on configuration of the EAM module.
- Software Asset Management (SAM): See Configuration Console for Software Asset Management for more information on configuration of the SAM module.

ServiceNow Otto for Setup references

The reference topics provide additional information about ServiceNow Otto for Setup.

General guidelines

Practice the following general guidelines for an enhanced ServiceNow Otto for Setup experience.

Instance specific configurations

The following configurations are excluded from the update set and must be re-configured directly on the production instance:

- Single Sign-On (SSO)
- LDAP directory integration
- Notification templates and settings

Validation checks

If you encounter an error immediately after uploading the update set XML file, perform the following validation checks:

- Confirm that you are uploading the XML file downloaded from the non-production instance.
- Verify that the file has not been modified, renamed, or corrupted after download.
- If the issue persists, repackage the batch update set in the non-production instance, download the XML file again, and retry the upload.

Preview errors

Preview errors indicate conflicts or unresolved dependencies in the update set. Resolve each error on the Update Set Preview page before you can commit the update set. For each preview problem record, there is an Available Actions dropdown. The following resolution options are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available Actions	Description	When to use
Compare with local	Opens a side-by-side comparison view of the incoming update set version against the version currently on the production instance.	Use this action prior to selecting Accept or Skip in order to review the specific differences between the two versions and make an informed resolution decision.
Accept remote update	Overwrites the existing record on the production instance with the version contained in the update set.	Select this option when the incoming configuration from the update set is the correct and intended state of the record, and the local version on production should be replaced. **Note:** It is recommended to use the Compare with local action before selecting Accept remote update or Skip remote update for any conflict. Accepting a remote update will overwrite the existing production record and cannot be undone through the update set process.
Skip remote update	Discards the conflicting change from the update set and retains the existing record on the production instance.	Select this option when the local version on the production instance is the correct state, or when the incoming change is not applicable to the target environment.
Show local record	Shows the local version of the update set version available on the production instance.	Select this option to view the local version of the current update set version on the production instance.
Show local update	Shows the local update of the update set version available on the production instance.	Select this option to view the update made to the current update set version on the production instance.

AI agents in ServiceNow Otto for Setup

Refer to the following information about the Platform AI agents in ServiceNow Otto for Setup.

Note: The **Configure with ServiceNow Otto** button appears only for console items that are backed by AI capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents for configurations

AI Agent	Description
Admin configurations	
AI Search Configuration Agent	Configures AI search for ServiceNow internal tables by defining internal search sources, search profiles, and table mappings through conversation.
AI Search XCC Agent	Configures external content connectors for AI Search for public websites (for example, Zoom, Apple Support, and Okta) and SharePoint repositories. The agent guides with connector discovery that aligns with user requirements, authentication, content scope, crawl scheduling, search profile mapping, and error recovery.
Group and roles assignment agent	Provides user access through group-based associations. Creates a user group, manages users in a group, assigns roles to a group, and adds users to a role.
IA Operational Data Workflow Agent	Automates bulk data imports into ServiceNow for departments, users, locations, and groups. Supports both file-based and LDAP-based imports. Reduces the time and effort needed to migrate operational data during implementation.
SSO Configuration Agent	Automates Single Sign-On setup (OIDC and SAML) in ServiceNow using identity provider configuration data. Supports Q&A and troubleshooting throughout the setup process.

Scopes and roles for console items

Review the following information regarding the scopes and roles required for configuration for each console item in the Platform module.

Scopes for console items

Console item name	Scopes
Branding	Global
Localization	Global
Identity management integrations	Global
Inbound email	Global
Outbound email	Global
Operational data	Global
AI Search	Global
Security Settings	Global
Assets	Global

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles for console items configuration

Console item name	Roles
Branding	admin
Localization	admin
Identity management integrations	admin for SSO, user_admin and import_admin for LDAP
Inbound email	email_account_admin
Outbound email	email_account_admin
Operational data	admin, user_admin for Roles assignment
AI Search	admin
Security Settings	sn_vsc.security_center_viewer, sn_vsc.se
Assets	admin

ServiceNow Otto for Setup terminology

Before getting started with ServiceNow Otto for Setup, it's important to understand some key terms used in the application.

application scope

A unique namespace and a set of permissions to access application files and data. Admins can specify the data that is accessible to other applications from the application record or from each table record.

Automated Test Framework (ATF)

Enables you to create and run automated tests to confirm that your instance works after making a change. Examine failed test results to identify the changes that caused the failure and the changes that you should review.

clone

Copy data/metadata between instances to ensure parity.

configuration page

Central settings and the installation recap display modules and items.

Install (IL)

One-click install of required apps/plugins and standard presets in sub-prod and target environments.

Integration Hub

A framework used to interact with third-party platforms in ServiceNow.

MID Server

An on#premises service that enables secure connections to internal enterprise systems.

Product hub

Product-centric view of entitlements, outcomes, and content.

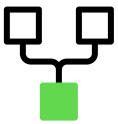
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

update set

A collection of customizations made to a customer instance that can be transferred to another instance. When an instance is customized, the change is added automatically to the current update set. You can have only one current update set per user at a time.

Subscription Management

Subscription Management enables you to proactively manage your subscriptions and monitor subscription usage on your instances.



https://player.vimeo.com/video/1018055648?h=5c896ae137&badge=0&autopause=0&player_id=0&app_id=58479

Watch this short video to see an overview of Subscription Management.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Get started

Explore  Learn about Subscription Management benefits and features.	**Configure**  Configure Subscription Management settings.	**Manage per-user subscriptions**  Allocate per-user subscriptions using recommended groups.
Map custom tables and applications  Stay in compliance by mapping custom tables and applications to subscriptions.	**Monitor capacity subscriptions**  Learn how capacity subscriptions are calculated on your instance.	**Reference**  Get details about types of subscriptions, meters, and domain separation.

Exploring Subscription Management

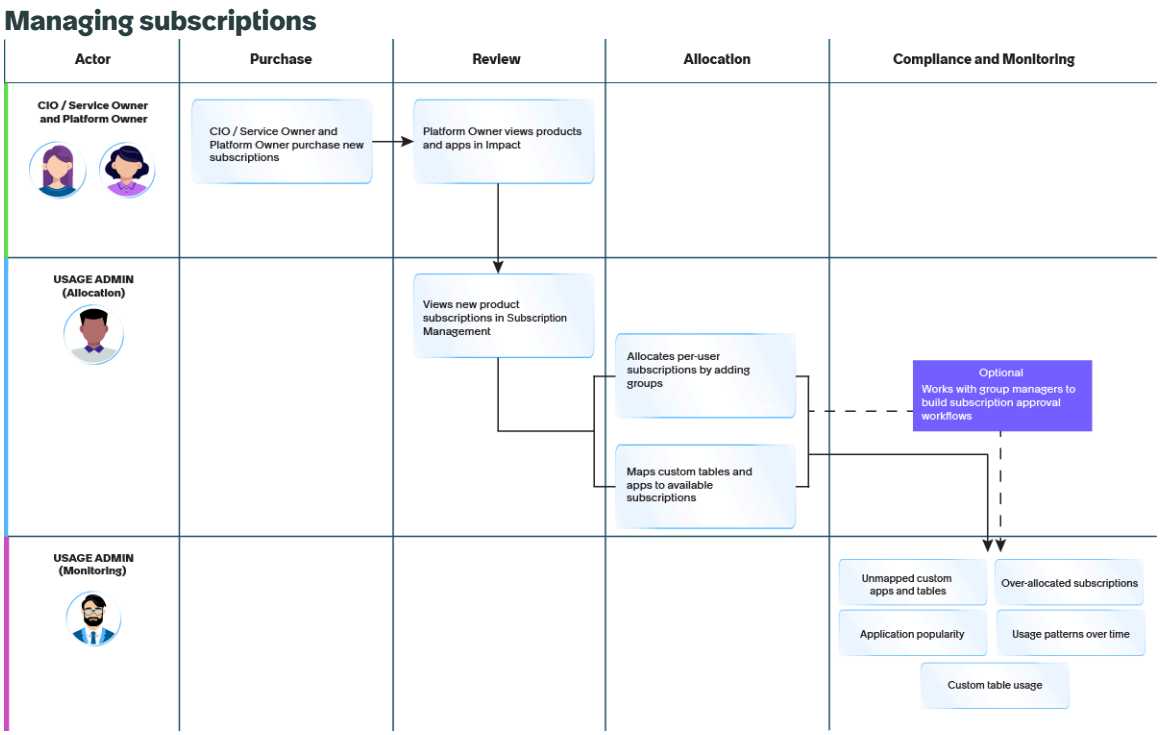
Learn how Subscription Management helps you track and manage your product subscriptions and their applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subscription Management Overview

Subscription Management gives you an accurate, consolidated view of your entitlements where you can proactively manage your subscriptions.

- Gain visibility and control of your product subscriptions and their applications.
- Access a real-time view of your entitlement data.
- Maximize subscription usage and make informed decisions about purchases by viewing insights.
- Stay in compliance and avoid unexpected costs by tracking subscription usage and allocations over time.



Subscription Management users

Users

User	Description
Usage admin	The usage admin allocates per-user subscriptions by adding groups to a product subscription. The usage admin maps custom tables and custom applications to subscriptions with available entitlements to maximize subscription usage and stay in compliance.

Subscription Management workflow

This infographic shows a sample end-to-end workflow of how different users in an organization work together to purchase, allocate, and manage subscriptions.

In this workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The chief information officer or service owner works with the ServiceNow platform owner to purchase new subscriptions.
2. After the purchase is complete, the platform owner views the products and applications in Impact.
3. The usage admin views the new product subscriptions in Subscription Management on the production instance. For more information, see Product subscriptions overview.
4. The usage admin performs the following tasks in Subscription Management:
   - Allocates per-user subscriptions by adding groups to a product subscription, which grants entitlement to all group members. For more information, see Managing per-user subscriptions in Subscription Management.
   - Maps custom tables and custom applications to subscriptions with available entitlements to maximize subscription usage and stay in compliance. For more information, see Managing custom tables and applications in Subscription Management.
5. If the organization requires security approvals before adding users to groups or financial approvals before subscriptions are assigned to users, the usage admin works with group managers to create subscription approval workflows that determine who gets a subscription when new users are added to groups.
6. The usage admin monitors subscription usage to stay in compliance and make informed decisions on future purchases, consistently monitoring the following data:
   - Over-allocated subscriptions
   - Unmapped custom applications and tables
   - Usage patterns over time
   - Application popularity
   - Custom table usage

Subscription Management benefits

Benefit	Feature	User
Fix over-allocated subscriptions	Insights	Usage admin
View unallocated subscriptions	Insights	Usage admin
Allocate available subscriptions using recommended groups	Allocate subscriptions	Usage admin

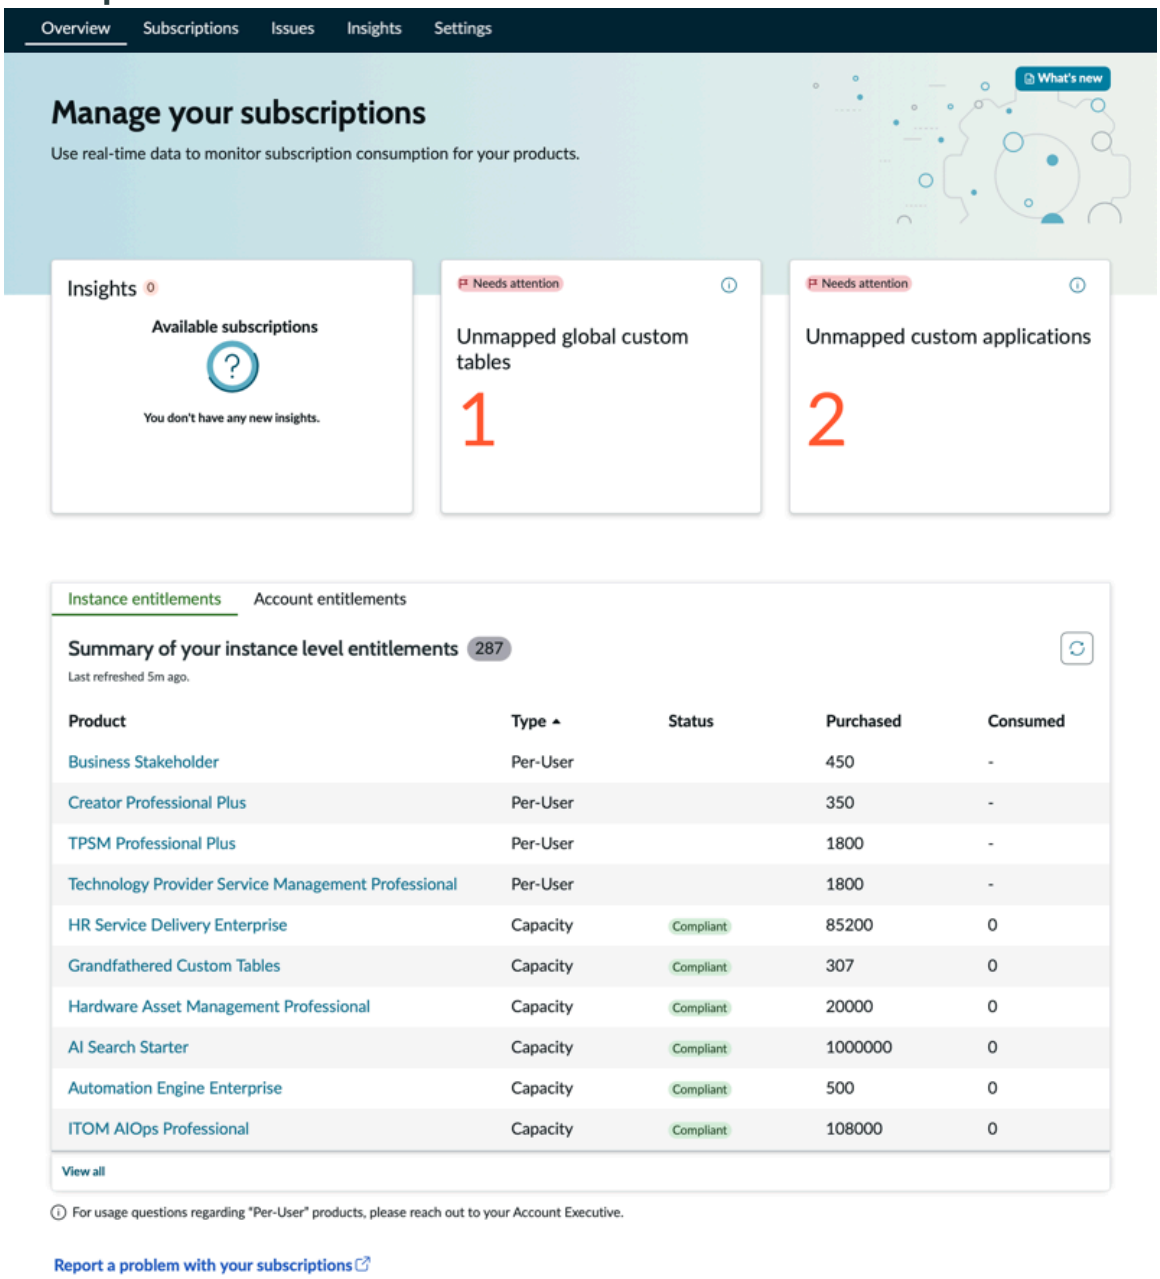
- Configuring Subscription Management
- Managing per-user subscriptions in Subscription Management
- Managing custom tables and applications in Subscription Management
- Monitoring capacity subscriptions
- Subscription Management reference
- Types of subscriptions in Subscription Management

Product subscriptions overview



View a summary of your product subscriptions in Subscription Management.

Key benefits

- Determine whether you have any over-allocated subscriptions.
- Check for unallocated subscriptions that you can allocate to maximize usage and give users entitlement to ServiceNow products.
- Determine whether any custom tables in the global scope or any custom applications aren't mapped to subscriptions.
- Stay in compliance by monitoring the **Status** column in the list of product subscriptions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subscriptions overview

Required ServiceNow AI Platform roles

The usage_admin, sn_sub_man.admin, or admin roles are required to view and edit Subscription Management.

Accessing product subscription overview information

View subscription overview information on the **Overview** tab in Subscription Management by navigating to **Admin** > **Subscription Management** or **All** > **Subscription Management** > **Subscription Management**.

Accessing user-based subscription information

Allocation details and status for user-based subscriptions are hidden from the Subscription Management overview to help prevent inaccuracy when allocations are incomplete. Contact your account executive for complete user-based subscription allocation details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

View a summary of your instance-level entitlements in the **Instance entitlements** tab.

- Identify when subscriptions are over-consumed and view insights into actions you can take to maximize subscription usage.
- Determine whether any custom tables and custom applications on your instance aren't mapped to a valid product subscription. You must map custom tables and custom applications that you create to a product subscription.
- View product subscription details by selecting the product name.
- Identify which type of subscriptions you have by viewing the values in the **Type** column. The subscription type determines the properties and attributes of the product subscriptions that your company receives and whether to allocate subscriptions manually.
  - Product subscription types include per-user, capacity, unrestricted user, unlimited, and display only.
  - Per-user subscriptions are automatically allocated by role for administrators that haven't manually allocated per-user subscriptions before. If an administrator has manually allocated per-user subscriptions in the past, they can continue to make manual allocations. Capacity, unrestricted user, and unlimited subscriptions are allocated on your instance automatically. Display-only subscriptions aren't measured on your instance.
  - Product subscriptions provide entitlements for different applications and can include different add-ons.

  For more information, see Types of subscriptions in Subscription Management.
- Determine whether your subscription allocations are in compliance by viewing the values in the **Status** column. Adjust allocations if subscriptions are over-allocated.

  Compliant

  The number of allocated subscription entitlements is lower than the number of purchased subscriptions.

  Near capacity

  The number of allocated subscription entitlements exceeds the threshold for your instance. You define the threshold on the **Settings** tab.

  Even

  The number of allocated subscription entitlements equals the number of purchased subscription entitlements.

  Over-c

  The number of allocated subscription entitlements exceeds the number of purchased subscription entitlements.

  Account-level only

  The subscription allocation status isn't calculated. Only applies to Creator Plus products.

  You can customize the near capacity threshold for your instance in the **Settings** tab. For more information, see Configure subscription allocation status in Subscription Management.
- View a summary of the Creator Plus subscriptions on the instance that you're currently accessing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the total number of Creator Plus subscriptions that your company has purchased in the **Purchased** column.
- Monitor the total number of Creator Plus allocations on your current instance in the **Allocated** column. Contact your account executive for up-to-date information about per-user subscription allocations.

View a summary of your account-level entitlements in the **Account entitlements** tab.

- View an account-level summary of Now Assist usage.
  - View the aggregated total of Now Assist usage entitlements from all the subscriptions that your account has purchased in the **Purchased** column.
  - View the total number of Now Assist usage entitlements consumed across all your instances in the **Allocated** column.
  - View additional details about Now Assist usage by selecting the product name.
- View an account-level summary of Now Assist creators.
  - View the total number of Creator Plus subscriptions that your account has purchased in the **Purchased** column.
  - Monitor unique Creator Plus allocations across all your instances by checking the **Allocated** column.

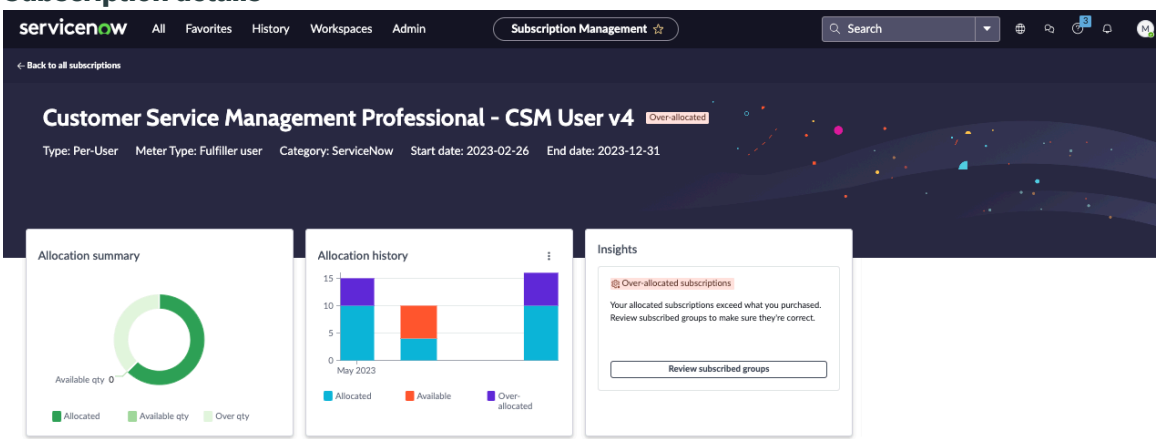
    Note: Users allocated to a Creator Plus subscription on multiple instances are automatically de-duplicated in the count on the **Account entitlements** tab. When a user is allocated to a Creator Plus subscription on more than one instance, that user counts toward the allocation total only once.

  - View additional details about Now Assist creators by selecting the product name.
- View an account-level summary of your cloud capacity.
  - View the total amount of cloud capacity that your account has purchased in the **Purchased** column.
  - View the total amount of cloud capacity consumed across all your instances in the **Allocated** column.
  - View additional details about cloud capacity by selecting the product name.

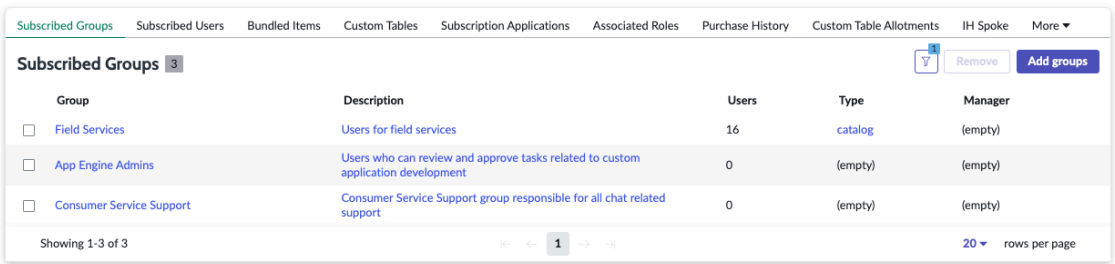
Reports

Title	Type	Source Table	Description
Insights	List	Subscription Insights definition [sn_sub_man_st_subscription_insights]	List of over-allocated subscriptions and available subscriptions
Unmapped global custom tables	Single Score	Custom Table Inventory [ua_custom_table_inventory]	Count of custom tables that aren't mapped to a subscription
Unmapped custom applications	Single Score	Custom Table Inventory [ua_custom_table_inventory]	Count of custom applications that aren't mapped to a subscription

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Viewing product subscription details in Subscription Management



View a summary of your subscription allocations, allocation totals over time, and track your custom table entitlements in Subscription Management.

Key benefits

- See how a product subscription is measured by viewing the subscription's meter type.
- Match a product subscription in Subscription Management to your purchase order.
- View the groups and users that you have added to a subscription.
- View your entitlements for custom tables, portal visits, or transactions.
- View the custom tables and applications that you have mapped to a product subscription.

Subscription details

Required ServiceNow AI Platform roles

The usage_admin, sn_sub_man.admin, or admin role is required to view and edit Subscription Management.

Accessing subscription details

View subscription details on the details page by navigating to **Admin** > **Subscription Management** or **All** > **Subscription Management** > **Subscription Management**, and selecting a product or a subscription from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

- See how a subscription is measured and the type of entitlement it provides by checking the **Meter Type** field.
  - Entitlements for users with fulfiller-type access are tracked through a per-user subscription with a Fulfiller User meter type.
  - Entitlements for users who have fewer access rights than fulfiller users are tracked through a per-user subscription with a Business Stakeholder User meter type.
  - Entitlements for users with the now.assist.creator role are tracked through a per-user subscription with a Creator User meter type.
  - The creation and retention of platform objects such as custom tables is tracked through a capacity subscription with a Capacity meter type.

  For more information, see Types of subscriptions in Subscription Management.
- See how a capacity subscription total is calculated by selecting the Capacity Definition record and viewing the definition details. For more information, see Monitor capacity subscription calculations in Subscription Management.
- View the groups you have added to a subscription in the **Subscribed groups** tab. View the total number of users who belong to each group in the **Users** column.
- View the total number of active users in the **Active users** column. The count of active users excludes users who haven't logged in to the instance in the last 365 days, users assigned Web service access only, or users with an empty User ID.

  Only active users count toward the subscription allocation totals that appear throughout Subscription Management.
- View each active user who belongs to the subscribed groups in the **Subscribed users** tab. Only active users with allocated subscriptions appear in this list.
- Stay in compliance by monitoring your product subscription add-on usage on the **Bundled Items** tab. Product subscription add-ons can include bundled custom tables, portal visits, and transaction entitlements.
- Plan for future purchases and keep your subscriptions current by monitoring the start and end dates for each of your product subscriptions in the **Purchase History** tab.

  Note: Multiple entries for the same product might appear if modifications are made to a product.
- View the Workflow Data Fabric capabilities that are included with a product subscription and their relative token use rate on the **Token ratio** tab. For more information, see Monitoring Workflow Data Fabric capability usage with Subscription Management.
- View the applications that are included with a product subscription on the **Subscription applications** tab.
  - View application entitlement details, including the application's related plugins and associated roles by selecting an application.
  - Determine whether an application is available to install from the current product subscription by checking the **Installation status** column.
- Maximize subscription usage and grant entitlement to the right users by allocating per-user subscriptions. You allocate per-user subscriptions by adding one or more groups to a product subscription. Subscription Management helps you with the allocation process by

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

recommending groups based on their assigned roles. For more information, see Allocate subscriptions in Subscription Management.

Note: To simplify the Subscription Management experience, the manual allocation workflow for user-based subscriptions is unavailable if you have never used it. Automatic allocation of user-based subscriptions is based on user and group roles. For more information, see Automatic subscription assignment.

Consolidated subscriptions

When you purchase multiple qualifying subscriptions for certain types of products, such as Integration Hub, those individual subscriptions combine into a single subscription pool. Any usage against that subscription deducts from the common pool.

- Capacity subscriptions with a common capacity definition are consolidated into one capacity subscription. For example, if you purchased two different Integration Hub subscriptions that are measured using the same capacity definition, they're consolidated into one Integration Hub Pool capacity subscription. Other types of capacity subscriptions with matching definitions are consolidated as well, but aren't labeled as a pool. For any consolidated capacity subscription, you can view the combined products in the **Subscription line items** tab on the details page.
- Capacity subscriptions can also consolidate entitlements for secondary line items such as custom tables, transactions, or portal visits from other product subscriptions. For example, if you have two Integration Hub transaction subscriptions combined in a pool, transaction entitlements that are included as a secondary line item from another capacity subscription are added to the pool if the capacity definition matches. In this scenario, three separate entries appear on the **Subscription line items** tab, one for each product that contributes to the pool.
- Custom table entitlements that come with per-user subscriptions can also be consolidated under one product subscription. When custom table entitlements are consolidated under one subscription, the total number of custom tables appears in the **Purchased** column on the **Bundled Items** tab. The **Bundled Items** tab only appears on one of the product subscriptions that contributed to the pool of custom tables.
- Unrestricted User subscriptions aren't consolidated into a single product subscription.

Reports

Title	Type	Source table	Description
Allocation summary	Donut	Subscription license detail definition [sn_sub_man_st_subscription_license_detail_metric] table	View a real-time summary of your subscription allocation. If an allocation is nearing capacity, consider reducing the number of allocated subscriptions or purchasing more subscriptions.
Account-level allocations	Donut	Account level entitlements [sn_sub_man_st_account_level_entitlement] table	View a summary of Creator Plus allocations across all of your instances. If the

Title	Type	Source table	Description
			account-level allocation is nearing capacity, consider reducing the number of allocated subscriptions or purchasing more subscriptions.
Allocation history	Bar	Subscription license detail definition [sn_sub_man_st_subscription_license_detail_metric] table	View subscription allocation details over time. Prepare for future purchases or plan for changes according to the allocation trends.

Monitoring Workflow Data Fabric capability usage with Subscription Management

You can monitor Workflow Data Fabric capability usage and the relative token use rate of each capability with Subscription Management.

Overview of monitoring Workflow Data Fabric capability usage

Workflow Data Fabric subscriptions include tokens that can be used for Workflow Data Fabric capabilities. Using a capability expends a number of tokens determined by the terms of your Workflow Data Fabric license.

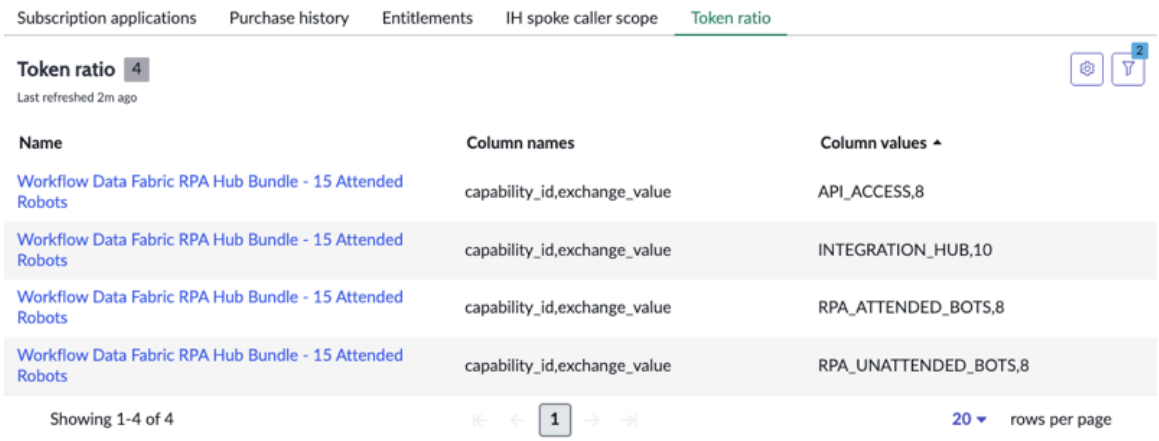
You can track token usage over time from the **Allocation summary** of a Workflow Data Fabric subscription details page.

Workflow Data Fabric token ratios

The **Token ratio** tab of the subscription details page shows the number of tokens expended each time a capability is used. Each row in the tab represents a capability. The **Column names** and **Column values** columns show how each capability is tracked.

The following table shows definitions of the entries in the **Column names** column.

Column names definitions



Column name entry	definition
capability_id	A unique identifier for each Workflow Data Fabric capability.
exchange_value	The number of tokens expended when the associated capability is used.

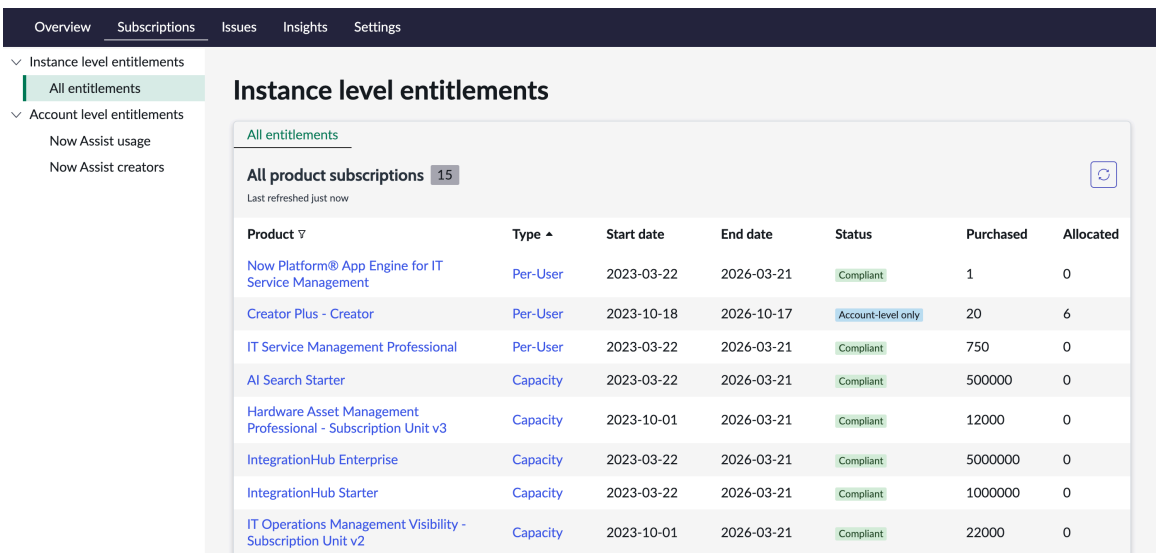
The **Column values** column has two comma-separated entries per row. The first entry corresponds to the capability_id, while the second entry corresponds to the exchange_value.

Example: Workflow Data Fabric token ratio tab

Match the entries under **Column names** to the entries under **Column values** to determine how many tokens are expended per Workflow Data Fabric capability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The first row under **Column values** displays "API_ACCESS, 8." Because the entries under **Column values** correspond to capability_id and exchange_value from **Column names**, the capability_id is "API_ACCESS" and the exchange_value is "8." In other words, a Workflow Data Fabric capability that requires API access expends eight tokens.



Viewing instance-level entitlements in Subscription Management

View a complete list of the product subscriptions purchased for your current instance.

Key benefits

- View details for product subscriptions, including purchase information and usage history by selecting the product name.
- Plan for future purchases and keep subscriptions current by monitoring the start and end dates for each of your product subscriptions.
- Stay in compliance by monitoring the subscription allocation values in the **Status** column.

Instance-level entitlements

Accessing your instance-level entitlements

Access your instance-level entitlements by navigating to **Admin** > **Subscription Management** > **Subscriptions** or **All** > **Subscription Management** > **All Subscriptions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subscription types

Identify which type of subscriptions you have and whether to allocate subscriptions manually by viewing the values in the **Type** column.

Per-User

Provides entitlements to users according to their assigned roles and associated access rights. You allocate per-user subscriptions manually by adding groups with metered roles or access rights to a product subscription. Subscription Management helps you with the allocation process by recommending groups based on their role assignments

Unrestricted User

Provides entitlements for an organization's number of active users regardless of their role assignments. An active user is any user whose record in the Users [sys_user] table has a value in the **User ID** field and has the **Active** field set to true.

Capacity

Automatically tracks measured units, and counts of transactions, records created, or resources managed such as devices, software, or nodes.

Unlimited

Provides entitlements for active users, with no limit to the number of users that can be allocated. An active user is any user whose record in the Users [sys_user] table has a value in **User ID** field and has the **Active** field set to true.

Display Only

Displays information. This type of subscription doesn't support allocation.

Subscription status

Determine whether your subscription allocations are in compliance by viewing the values in the **Status** column.

Compliant

The number of allocated subscription entitlements is lower than the number of purchased subscriptions.

Near capacity

The number of allocated subscription entitlements exceeds the threshold for your instance. You define the threshold on the **Settings** tab.

Even

The number of allocated subscription entitlements equals the number of purchased subscription entitlements.

Over-c

The number of allocated subscription entitlements exceeds the number of purchased subscription entitlements.

Account-level only

The subscription allocation status isn't calculated. Only applies to Creator Plus products.

Missing subscriptions

Purchased subscriptions might not appear on the **Subscriptions** tab for one or more of the following reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Subscription data arrives on production instances only.
- Self-hosted instances don't receive subscription information. Contact your account manager for assistance.
- Subscription data might not yet have arrived. The data is downloaded daily.

Viewing account-level entitlements in Subscription Management

View an account-level summary of entitlements and consumption in Subscription Management.

Key benefits

- View and track Now Assist usage across all your instances.
- View and track Now Assist Creator consumption across all your instances.
- View and track cloud capacity entitlements across all your instances.

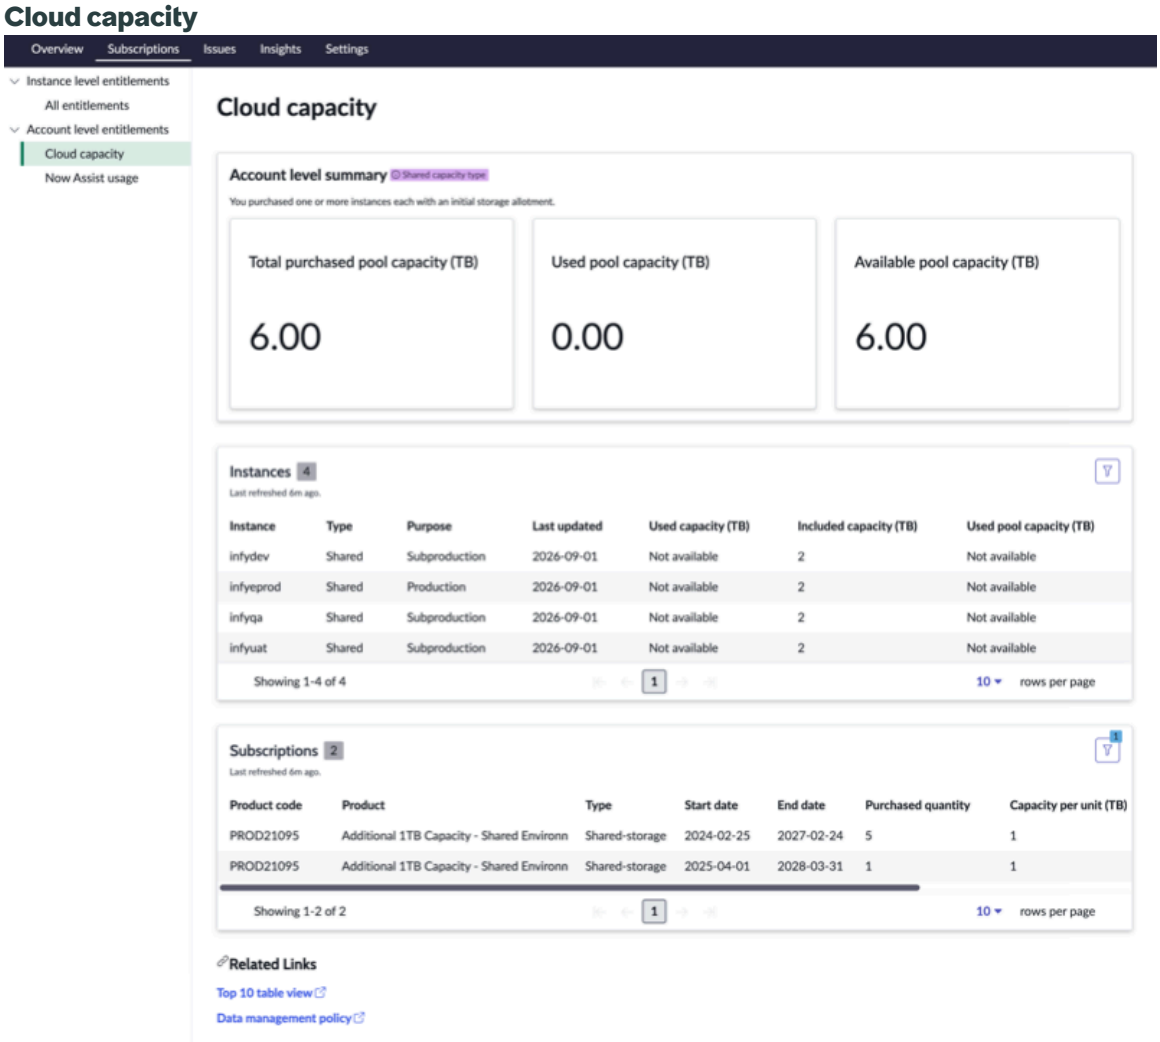
Accessing your account-level entitlements

Access your account-level entitlements by navigating to **Admin** > **Subscription Management** > **Subscriptions** or **All** > **Subscription Management** > **All Subscriptions** > **Account level entitlements**.

Viewing production and non-production instances

To view the entitlement data for all your instances, access your account-level entitlements on the **Subscriptions** tab in Subscription Management on a production instance. On a non-production instance, only entitlement data and usage for the instance that you're currently accessing is displayed.

Note: On a production instance, you can view entitlement data for all the instances owned by your account. However, if data sharing is restricted on an instance, that instance's entitlement data is hidden. You can disable the restriction by updating the trust configuration on that instance. See Share subscription data from another instance.



Monitoring cloud capacity in Subscription Management

View an account-level summary of your cloud capacity and track usage across all the instances associated with your account in Subscription Management.

Key benefits

- View the total amount of cloud capacity purchased for your account.
- View the total amount of cloud capacity consumed across all your instances.
- View the available cloud capacity for your account.
- Stay in compliance by monitoring excess cloud capacity consumption.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

The usage_admin, sn_sub_man.admin, or admin role is required to view and edit Subscription Management.

Accessing cloud capacity details

Access details about cloud capacity by navigating to **Admin** > **Subscription Management** > **Subscriptions** > **Cloud capacity**.

Use cases

- View the total amount of capacity purchased by your account by checking the **Total purchased pool capacity (TB)** card.
- View the total amount of capacity used by checking the **Used pool capacity (TB)** card.
- Monitor available capacity or overage by checking the value in the **Excess pool capacity (TB)** card.
- View cloud capacity usage for the instances associated with your account in the **Instances** list.
  - View the amount of capacity each instance has consumed in the **Used pool capacity (TB)** column. This applies to shared, dedicated, and hybrid capacity types.
  - View whether an instance's capacity is included with the instance or added separately in the **Hosting** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

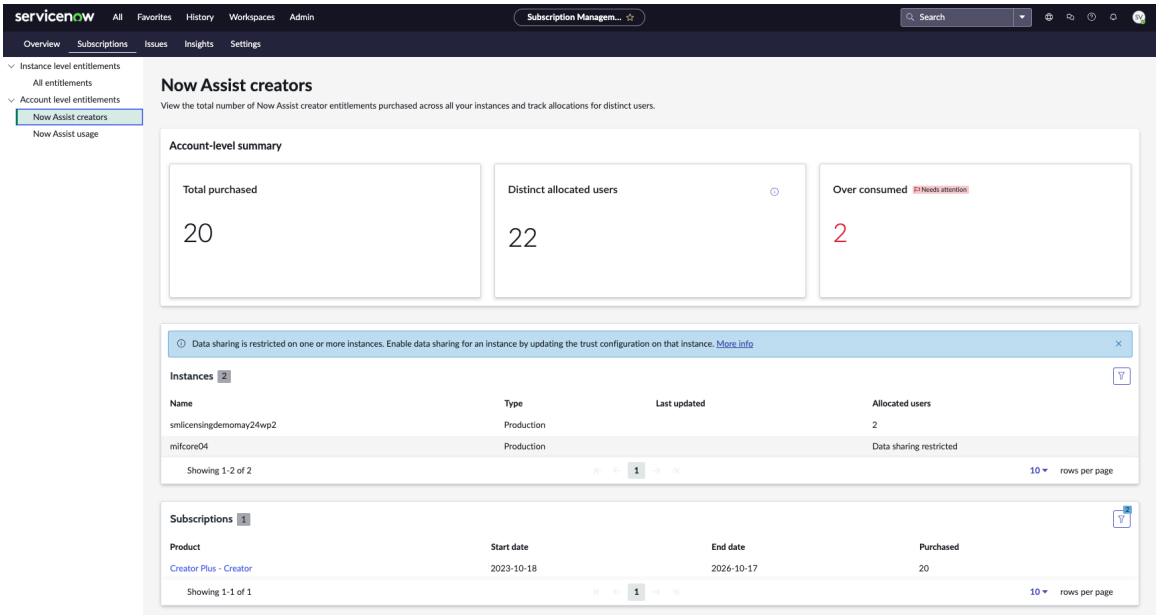
In some scenarios, data isn't displayed in the **Instances** list.

- If data sharing is restricted on an instance, usage data for that instance is hidden. You can disable the restriction by updating the trust configuration on that instance. See Share subscription data from another instance.
- Capacity values are displayed only for instances on Xanadu or higher. If an instance appears in the list but isn't on at least Xanadu, the capacity value appears as Not available.

The sum of all the values in the **Used pool capacity (TB)** column equals the value in the Used pool capacity (TB) card. Only instances on at least Xanadu are included in the count.

- View details about your cloud capacity, including the purchased quantity, capacity per unit, and total pool capacity purchased in the **Subscriptions** list.
  - The total pool capacity purchased is calculated by multiplying the number of capacity environments you purchased by the capacity per unit.
  - The sum of all the values in **Total purchased primary pool capacity (TB)** column equals the value in the **Total purchased pool capacity (TB)** card.
  - The **Subscriptions** list includes both instance-level entitlements (capacity included with an instance) and account-level entitlements (additional capacity purchased separately). The **Total purchased pool capacity (TB)** card reflects the sum of both.
  - With shared capacity, additional capacity you might receive based on your purchase history appears in the **Subscriptions** list without an end date. The amount of additional capacity you receive can fluctuate depending on your future purchases and renewals of existing subscriptions.
- Identify which tables are driving storage growth on specific instances from the Data management Console. You can access the Data Management Console by selecting the **Data Management Console** link included in the Cloud Capacity report in Subscription Management, or by navigating to **All** > **System Data Management** > **Data Management Console**. For more information about the Data Management Console, see Data Management overview.

Monitoring Now Assist creators in Subscription Management



View a summary of your Creator Plus entitlements and track allocations for distinct users across all of your instances in Subscription Management.

Key benefits

- View the total number of Creator Plus entitlements that you purchased across all your instances.
- View the total number of Creator Plus entitlements allocated to unique users across all your instances.
- Track the availability of the remaining Creator Plus entitlements that you can allocate to users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Now Assist Creator Plus entitlements

Required ServiceNow AI Platform roles

The usage_admin, sn_sub_man.admin, or admin role is required to view and edit Subscription Management.

Accessing Creator Plus entitlements

Access details about Creator Plus entitlements by navigating to **Admin** > **Subscription Management** > **Subscriptions** > **Now Assist creators**.

Use cases

- Compare the total number of Creator Plus entitlements that your company has purchased to the total number of Creator Plus entitlements allocated across all your instances.
- Monitor the number of Creator Plus entitlements that are allocated to unique users across all your instances in the **Distinct allocated users** card.

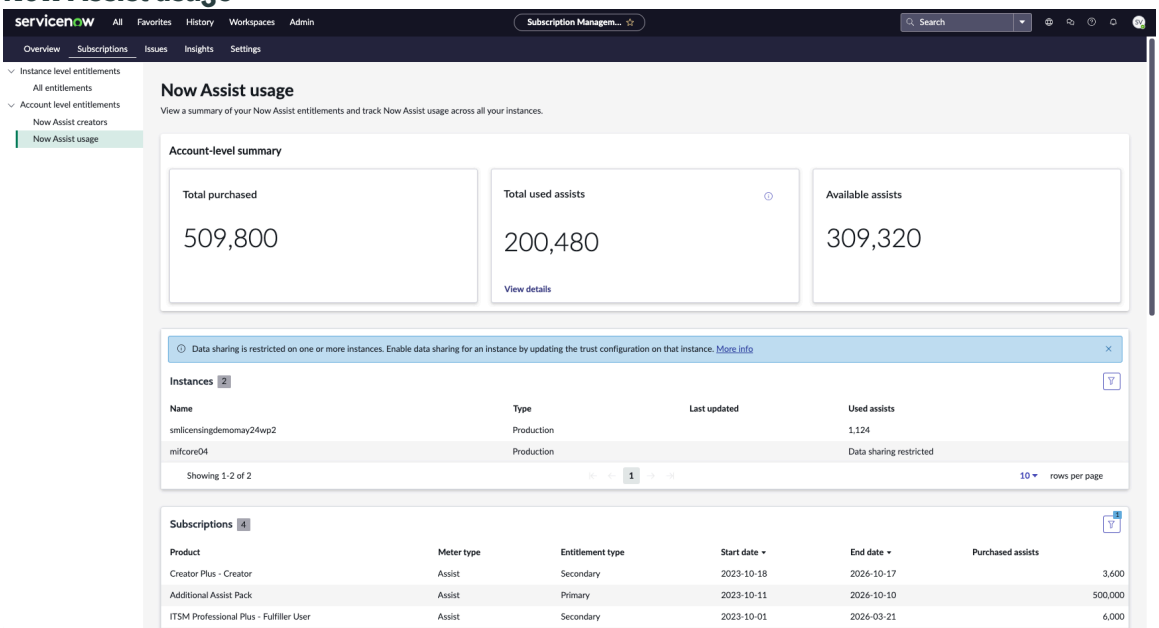
  Note: Users allocated to a Creator Plus subscription on multiple instances are automatically de-duplicated in the total count. When a user is allocated to a Creator Plus subscription on more than one instance, that user counts toward the allocation total only once.

- View Creator Plus assignments by instance in the **Allocated users** column in the **Instances** list.

  In some scenarios, data isn't displayed in the **Instances** list.

  - Only instances on Washington DC Patch 2 and higher are listed in the **Instances** list.
  - If data sharing is restricted on an instance, usage data for that instance is hidden. You can disable the restriction by updating the trust configuration on that instance. See Share subscription data from another instance.
- View Creator Plus product subscription details by selecting a product in the **Subscriptions** list. On the details page, allocate available Creator Plus subscriptions by adding one or more groups with the Creator role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Monitoring Now Assist usage in Subscription Management

View a summary of your Now Assist entitlements and track Now Assist usage across all of your instances in Subscription Management.

Key benefits

- View an account-level summary of your Now Assist entitlements.
- Track Now Assist usage, including Moveworks Assists, across your production and non-production instances.
- Track Now Assist usage by domain in domain-separated instances.
- View a summary of Now Assist usage by skill.
- Plan for future purchases by analyzing Now Assist usage over time.

Now Assist usage

Required ServiceNow AI Platform roles

The usage_admin, sn_sub_man.admin, or admin role is required to view and edit Subscription Management.

Accessing Now Assist usage details

Access details about Now Assist usage by navigating to **Admin** > **Subscription Management** > **Subscriptions** > **Now Assist usage**.

Use cases

- Compare the total number of Now Assist entitlements that your company has purchased to the total number of Now Assist entitlements consumed across all your instances. Monitor the available number of Now Assist entitlements for your account.
- Visualize Now Assist consumption over time by selecting **View details** in the Total used assists card. Monitor compliance for your account for the current contract period or determine when Now Assist usage exceeded the total purchased count.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

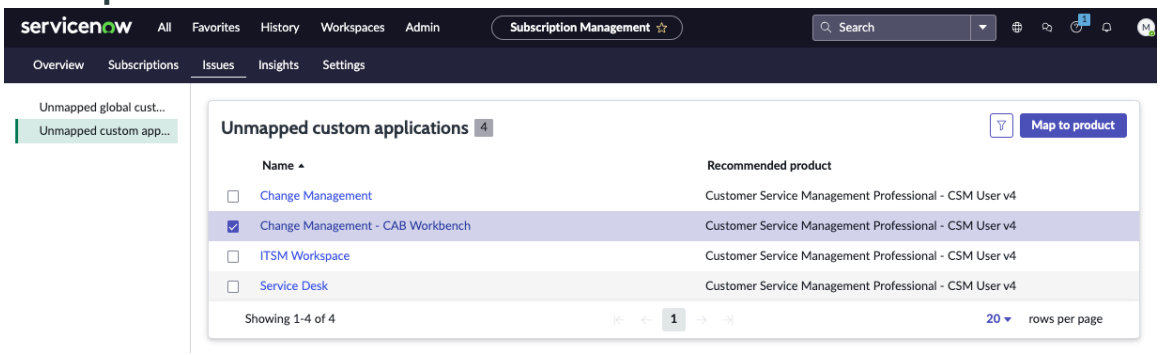
Note: Assists used in demo instances are excluded from total used assists.

- View the number of assists consumed by each of your instances in the **Used assists** column in the **Instances** list.

  In some scenarios, data isn't displayed in the **Instances** list.

  - Only instances on Washington DC Patch 2 and higher are listed in the **Instances** list.
  - If data sharing is restricted on an instance, usage data for that instance is hidden. You can disable the restriction by updating the trust configuration on that instance. See Share subscription data from another instance.
- View details for each of your products that include assists in the **Subscriptions** list.
  - Determine whether assists are the primary or secondary line item in a purchase according to the value in the **Entitlement type** column.
  - Verify the start date and end date for each product.
  - View the total number of entitlements provided by each product in the **Purchased assists** column.
- View and filter the number of assists used by domain from the **Used assists** column of the **Domain** list. The **Domain** list is only available if domain separation is enabled and there are domain values other than global.
- Determine cumulative Now Assist usage by skill on your current instance. Data in the table is updated nightly. If your current instance doesn’t have any active subscriptions with assists, the list of skills is empty.
  - View Moveworks assists broken down by skill. Moveworks skill names are distinguished by the "MW" prefix.
  - View the number of times a skill has been used in the **Number of actions** column.
  - View the relative cost for each assist in the **Assist ratio** column.
  - Determine which skills are consuming the most Now Assist entitlements by checking the **Total assists** column. Total assists are calculated by multiplying values in the **Number of actions** column by values in the **Assist ratio** column.
  - Analyze Now Assist usage over time on your current instance by viewing the Utilization history chart. Monitor monthly or daily usage using the filter. Look for trends related to Now Assist skills. If usage continues to grow every month, consider purchasing more entitlements to stay in compliance.

Addressing issues in Subscription Management



Stay in compliance by mapping custom tables and custom applications to subscriptions in Subscription Management.

Key benefits

- Identify custom tables and custom applications that aren't mapped to subscriptions.
- Maintain accurate entitlements by mapping custom tables and custom applications to a recommended product subscription or a product subscription of your choice.
- Plan for future subscription needs by assessing your custom table entitlements.

© 2026 ServiceNow, Inc. All rights reserved.

Subscription issues

Accessing subscription issues

Access information on subscription issues on the **Issues** tab by navigating to **Admin** > **Subscription Management** > **Issues** or **All** > **Subscription Management** > **Issues**.

Unmapped global custom tables

Determine whether you have custom tables in the global scope that aren't mapped to a valid product subscription by accessing the **Unmapped global custom tables** tab. Keep custom table entitlements current by mapping the tables to a product subscription. For more information, see Map custom tables to a product subscription in Subscription Management.

Recommended subscriptions for unmapped custom tables appear on the **Issues** tab the day after the unmapped custom table is created.

Unmapped custom applications

Determine whether you have custom tables in a scoped application that aren't currently mapped to a valid product subscription by accessing the **Unmapped custom applications** tab. Ensure that entitlements for these tables are current by mapping the application to a product subscription.

You map tables in a scoped application at the application-level, which eases administration because you don't need to map tables individually after the application is mapped. For more information, see Map a custom application to a product subscription in Subscription Management.

Recommended subscriptions for unmapped custom applications appear on the **Issues** tab the day after the unmapped custom table is created.

Recommended subscriptions

When you map custom tables or custom applications to subscriptions, Subscription Management displays recommended subscriptions based on the following criteria:

The table belongs to an app scope or package

The custom table or tables in the application belong to an app scope or package associated with the recommended subscription.

The table extends another table

The custom table or tables in the application extend another table mapped to the recommended subscription.

The table has a relationship to another table

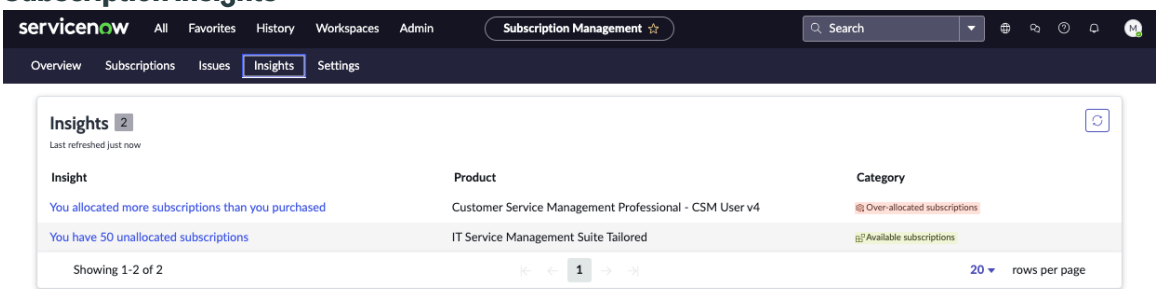
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The custom table or tables in the application are related to a different custom table or a ServiceNow default table associated with the recommended subscription.

The table doesn't meet any of the previous criteria

The custom table or tables in the application don't meet any of the previous criteria. If you have an App Engine subscription, Subscription Management recommends mapping the table or application to an App Engine subscription.

If the criteria for recommending a subscription aren't met and you don't have an App Engine subscription, Subscription Management can't display recommended subscriptions for unmapped applications and tables. Unmapped applications and tables without subscription recommendations are counted in the Subscription Management Overview reports, but aren't shown in subscription Issues. You can map any missing custom applications and tables to a subscription from the Custom Applications list or the Custom Table Inventory list. For more information, see Map a missing custom app to a product subscription in Subscription Management and Map a missing custom table to a product subscription in Subscription Management.



Discovering insights in Subscription Management

Identify when subscriptions are over-allocated and view actions you can take to maximize subscription usage in Subscription Management.

Key benefits

- View product subscriptions that are over-allocated and require adjustments or more entitlements.
- View product subscriptions with available subscriptions that you can allocate by adding groups.
- Maximize subscription usage by allocating your available subscriptions.

Subscription insights

Accessing subscription insights

Access subscription insight information on the **Insights** tab by navigating to **Admin** > **Subscription Management** > **Insights** or **All** > **Subscription Management** > **Insights**.

Over-allocated subscriptions

Identify over-allocated per-user subscriptions on your instance by accessing the **Insights** tab. Stay in compliance by performing one or more of the following actions:

- Remove a group from a subscription
- Remove a role from a group
- Remove users from a group
- Purchase more subscriptions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Remove a group from a product subscription in Subscription Management.

Available subscriptions

Identify available subscriptions on your instance by accessing the **Insights** tab. Maximize subscription usage and grant entitlements to the right users by allocating available subscriptions.

You allocate per-user subscriptions by adding one or more groups to a product subscription. Subscription Management helps you with the allocation process by recommending groups based on their assigned roles. For more information, see Allocate subscriptions in Subscription Management.

Configuring Subscription Management

Set up and configure Subscription Management.

Configuration overview

Subscription Management is free and active by default for all production instances and non-production instances. You don't have to activate a plugin.

1. Create a Subscription Management administrator

   Assign the usage_admin role to at least one user who will manage subscriptions for your organization.

2. Share subscription data from another instance

   View subscription data from other production instances in areas of Subscription Management that provide account-level summaries of subscription usage.

3. Configure subscription allocation status in Subscription Management

   Configure the consumption status threshold using a percentage value that represents what near capacity means for your instance.

Create a Subscription Management administrator

Create a Subscription Management administrator by assigning the usage_admin role to an administrator.

Before you begin

Role required: admin

About this task

Usage admins review and manage how purchased subscriptions are used on your production instance. They add groups to appropriate subscriptions, monitor usage of applications, and update subscriptions as needed.

Assign the usage_admin role to at least one person in your organization. Only admins, sn_sub_man.admins, and usage_admins can use Subscription Management.

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select an existing user.
3. Update the user's role assignment by selecting **Edit** in the Roles related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Add the usage_admin role.
5. Select **Update**.

Share subscription data from another instance

View subscription data from another instance by enabling data sharing on that instance.

Before you begin
Role required: usage_admin, sn_sub_man.admin, or admin

About this task
By default, data sharing is restricted between production instances, which means you can't see subscription data for other production instances in Subscription Management. To view subscription data from another production instance, modify the trust configuration settings on that instance.

For more information about modifying the trust configuration for an instance, see Basic trust configuration for data sync applications.

Note: Subscription data from a non-production instance is only viewable from a production instance.

In this scenario, the instance for viewing subscription data across all your instances is considered the primary production instance.

Procedure
1. Log in to the instance that has subscription data that you want to view on your primary production instance.
2. Navigate to **All** > **Multi-Instance Management** > **Trust Configuration**.
3. In the list of instances, find the primary production instance.
4. Share data from your current instance by changing the value in the **Grant access** column to true.

Result
Subscription data is shared with your primary production instance.

What to do next
Log in to your primary production instance to view the subscription data that is now shared with that instance. Repeat these steps for each additional production instance that has subscription data that you want to view from the primary production instance.

Configure subscription allocation status in Subscription Management

Identify when you're close to allocating all of your subscriptions by configuring an allocation status threshold if you prefer a threshold other than the default value of 90 percent in Subscription Management.

Before you begin
Role required: usage_admin, sn_sub_man.admin, or admin

Procedure
1. Navigate to the **Settings** tab in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Settings**.
   - Navigate to **All** > **Subscription Management** > **Settings**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In the **Allocation Status** tab, enter a percentage value that represents near capacity for your instance.
   If you want the **Status** column to display Near capacity before reaching the 90 percent threshold, enter a lower percentage value.
3. Select **Save**.

Result
When the number of allocated subscriptions exceeds the percentage you configured, the value Near capacity appears in the **Status** column throughout Subscription Management.

Manage subscriptions in an on-premise installation

Download licensing and usage definition data to view and manage subscriptions for your on-premise installation.

Before you begin
Role required: customer_admin or partner_admin

About this task
You can view and manage entitlements for an on-premise installation by uploading entitlement information. An automated workflow is available through the Now Support portal to request the necessary licensing and usage definition data.

Licensing and usage definition data can only be requested for production, sub-production, and demo instances. Development instances aren't supported.

Note: Account-level entitlements aren’t available in an on-premise installation. To calculate entitlements across all your instances, you must log in to each individual instance to gather entitlement data and then aggregate the totals.

Procedure
1. Log in to Now Support.
2. Navigate to **Automation Store** > **Service Catalog** > **Instance Management**.
3. Find and select **Request On-Prem Licensing Information**.
4. Select your company.
   If there are no child companies, the parent company is selected by default and the field is read-only.
5. Select an instance whose data you want to request.
   Only on-premise instances for the Yokohama family release and above can be selected.
6. Select **Submit**.

Result
You receive an email when the request has been processed.

What to do next
After the request has been processed, view on-premise licensing requests to download the data.

View on-premise licensing information requests

After a request for on-premise entitlement data is processed, you can find and download the data through Now Support.

Before you begin
Role required: customer_admin or partner_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Log in to Now Support.
2. Navigate to **Automation Store** > **Service Catalog** > **My Licensing Requests**.
3. From the completed licensing request, download the attached XML or JSON files.

What to do next

Import the entitlement data to your on-premise instance.

Import on-premise entitlement data

Import entitlement data for your on-premise instance to manage subscriptions for the instance.

Before you begin

Role required: admin sn_sub_man.admin, or usage_admin

Procedure

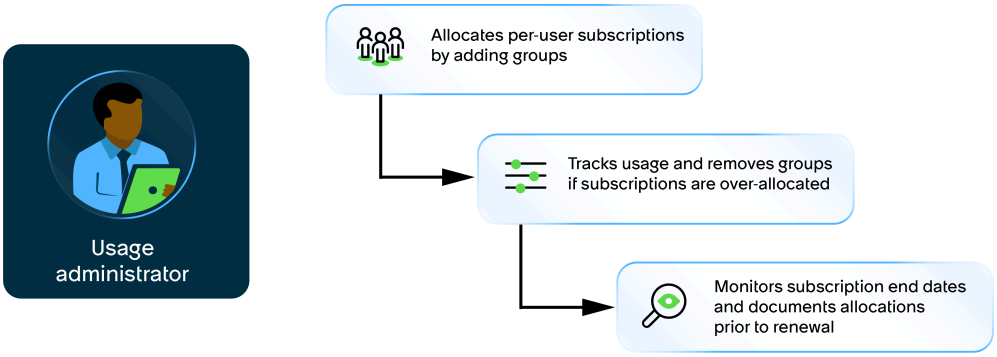
1. From the instance whose data you downloaded, navigate to **All** > **Subscription Management** > **Import Entitlement Data**.
2. Upload the zip file as an attachment.
   If your instance doesn't enable zip files to be uploaded, attach the contents of the zip file instead.
3. Select **Process**.

Result

A few minutes after the state changes to "Processed," the data in the Subscription Management dashboard can be refreshed. If there are scheduled jobs running or queued, it might take longer for the Subscription Management dashboard to refresh.

Managing per-user subscriptions in Subscription Management

Manage your per-user subscription allocations using Subscription Management.



Overview of managing per-user subscriptions

To simplify the Subscription Management experience, the manual allocation workflow for user-based subscriptions is unavailable if you have never used it. Automatic allocation of user-based subscriptions is based on user and group roles. For more information, see Automatic subscription assignment.

If you have manually allocated user-based subscriptions before, you can still make manual allocations. To manually allocate user-based subscriptions, follow the process in this infographic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing per-user subscriptions

- Allocate subscriptions in Subscription Management

  Subscriptions are managed in Subscription Management using groups. Subscriptions are measured and audited in Subscription Management using roles. You allocate subscriptions by adding one or more groups with measured roles to a product subscription.

- Remove a group from a product subscription in Subscription Management

  You can potentially over-allocate subscriptions, meaning more users possess an entitlement than the number of purchased subscriptions. Subscription Management flags over-allocated subscriptions for you. To stay in compliance, remove users or groups from the subscription or purchase more subscriptions.

- Maintain per-user subscription allocations in Subscription Management at renewal

  When a per-user subscription renews, a new product SKU might be added to your account. Maintain your current allocations during the renewal process by documenting your allocations before the renewal date.

Recommended groups

Allocate per-user subscriptions by adding groups recommended by Subscription Management based on their roles. For example:

- If the Service Desk group has a fulfiller-type role in the ITSM application, you can add the Service Desk group to the ITSM product subscription to allocate the fulfiller subscriptions included with ITSM to all the users in the group.
- If you have available ITSM subscriptions, you can add groups that are recommended by Subscription Management based on the types of roles they have.

Groups that you add to a product subscription are considered subscribed groups. Consider assigning a group manager who is responsible for managing group membership and role assignments.

Measured roles

Roles that require a subscription are considered measured roles. Measured roles grant users access to an application and are categorized by the level of access they provide.

When possible, simplify role administration by assigning measured roles to groups instead of assigning roles directly to individual users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatic subscription assignment

If your organization has never manually allocated user-based subscriptions before, entitlements are automatically assigned based on user roles and ACL access. Reviewing how roles are evaluated for automatic subscription assignment can help you make decisions about which roles users should have.

If your organization has never manually allocated user-based subscriptions, Subscription Management evaluates user roles and assigns users the lowest-cost subscription that meets the access needs of their roles..

Custom and customized roles are classified for auto-assignment according to the Access Control Lists (ACLs) each role contains. Users with custom or customized roles are assigned subscription entitlements based on access granted to tables within a subscription product. For more information about subscription auto-assignment for custom and customized roles, see the article Understanding Custom Role Validation - Use Verification [KB1637906] on the Now Support Knowledge Base.

Allocate subscriptions in Subscription Management

Give users entitlement to ServiceNow products by allocating subscriptions in Subscription Management.

Before you begin

Role required: usage_admin, sn_sub_man.admin, or admin

About this task

To simplify the Subscription Management experience, the manual allocation workflow for user-based subscriptions is unavailable if you have never used it. Automatic allocation of user-based subscriptions is based on user and group roles. For more information, see Automatic subscription assignment.

If you have manually allocated user-based subscriptions before, you can still make manual allocations.

Procedure

1. Navigate to Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management**.
   - Navigate to **All** > **Subscription Management** > **Subscription Management**.
2. Select a product with subscriptions that you want to allocate.
3. Allocate subscriptions by adding recommended groups based on role type.

   a. On the details page, select **Add groups**.

   b. Select the check box next to one or more groups.
   The User group includes all user accounts in the `sys_user` table. The Active user group excludes users who haven't logged in to the instance in the last 365 days, users assigned Web service access only, or users with an empty User ID.

   c. Select **Add groups**.

Result

All group members are allocated subscriptions, giving each member entitlement to use the product. Subscribed users are updated during a daily scheduled job, so it might take up to a day for the changed to be reflected in Subscription Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trouble?
If you can't manually allocate user-based subscriptions despite having manually allocated them in the past, see Missing subscribed groups and users tabs in subscription management [KB2974856]

Remove a group from a product subscription in Subscription Management

Fix an over-allocated subscription and free up entitlements by removing a group from a product subscription in Subscription Management.

Before you begin
Role required: usage_admin, sn_sub_man.admin, or admin

About this task
To simplify the Subscription Management experience, user-based subscriptions are automatically allocated based on role if you haven't manually allocated user-based subscriptions before. To resolve over-consumed user-based subscriptions, reduce the number of users with roles that provide access to the over-consumed subscription. For more information, see Add a user to a group and Managing roles.

If you have manually allocated user-based subscriptions before, you can still make manual changes to the subscribed groups using the following process.

Procedure
1. Navigate to Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management**.
   - Navigate to **All** > **Subscription Management** > **Subscription Management**.
2. Identify an over-allocated subscription by checking either the **Status** column on the **Overview** tab or the list of over-allocated subscriptions on the **Insights** tab.
3. Select the over-allocated product subscription.
4. On the subscription details page, select the **Subscribed Groups** tab.
5. Select the check box next to one or more groups that you want to remove.
6. Select **Remove**.
7. In the dialog box, confirm that you want to remove entitlements for all users in the selected groups by selecting **Remove**.
   Subscribed users are updated during a daily scheduled job, so it might take up to a day for removal of groups to be reflected in Subscription Management.
8. **Optional:** Verify that the subscription is no longer over-allocated by checking the value in the **Status** column on the **Subscriptions** tab.

Trouble?
If you can't manually allocate user-based subscriptions despite having manually allocated them in the past, see Missing subscribed groups and users tabs in subscription management [KB2974856]

What to do next
The group is removed from the subscription. If the group still has a measured-role that requires a subscription, add the group to a different subscription or remove the measured-role from the group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Maintain per-user subscription allocations in Subscription Management at renewal

Ensure subscription allocations remain consistent throughout the renewal process.

Before you begin
Role required: usage_admin, sn_sub_man.admin, or admin

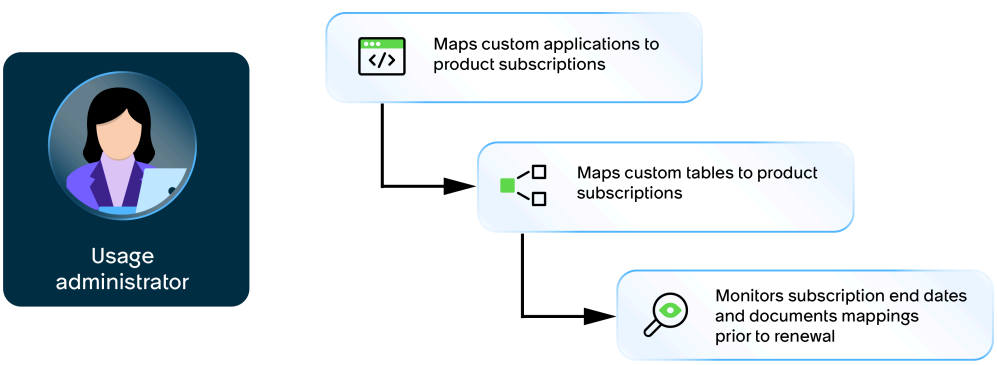
About this task
When a per-user subscription renews, a new product SKU might be added to your account. This SKU is treated as a new product subscription in Subscription Management. If you've manually allocated user-based subscriptions in the past, you must re-allocate renewed subscriptions by adding groups with measured roles to the subscription.

If you haven't manually allocated user-based subscriptions before, allocations are made automatically based on user and group roles. No action is necessary to maintain allocations after renewal.

Procedure

1. Before the renewal date, monitor the subscription end dates on the details page and document the current group allocations.
   See Viewing product subscription details in Subscription Management.
2. After the renewal date, add the documented groups to the renewed subscription in Subscription Management.
   See Allocate subscriptions in Subscription Management.

What to do next
Continue to monitor subscription renewal dates to ensure that your allocations are accurate throughout each renewal.



Managing custom tables and applications in Subscription Management

Keep your custom table entitlements updated by mapping all of your custom applications and tables to valid subscriptions in Subscription Management.

Overview of managing custom tables and applications

To successfully manage your custom tables and applications, follow the process in this infographic.

Managing custom tables and applications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Map a custom application to a product subscription in Subscription Management

  Map a custom application to a product subscription so that when developers add more tables to the application, they're automatically mapped to the subscription. Track your custom table usage to ensure that your organization doesn't run out of custom table entitlements.

- Map custom tables to a product subscription in Subscription Management

  Map custom applications and custom tables on your production instance to a valid subscription. On non-production instances, mapping is recommended but not required.

- Maintain custom table and application mappings at renewal in Subscription Management

  When a subscription renews, a new product SKU might be added to your account. Maintain your current custom table mappings during the renewal process by documenting your mappings before the renewal date.

Custom tables

A custom table is defined as a table that you create on the ServiceNow AI Platform that isn't provided by ServiceNow. Some tables are exempted from being classified as a custom table.

Note: For more information on custom tables on the ServiceNow AI Platform, see Table administration. For a detailed description of custom table use rights and exempt tables, see the Custom Table Guide on http://www.servicenow.com/upgrade-schedules.html

Subscriptions come with custom table entitlements that dictate the number of custom tables that you can map to a subscription. The number of custom table entitlements depends on the subscription.

Custom applications

A custom application is defined as an application that you create on the ServiceNow AI Platform that isn't provided by ServiceNow. If your organization purchased App Engine, you can use Subscription Management to manage your custom application subscriptions.

App Engine usage

App Engine subscriptions entitle you to develop applications and deploy custom tables in production instances. Based on your App Engine version, you monitor the subscription usage of your App Engine applications differently.

- You can view and manage App Engine V2 subscriptions in Subscription Management just like any other product subscription. You can map your applications and custom tables to an App Engine V2 subscription and allocate per-user subscriptions by adding groups with measured roles to an App Engine V2 subscription.

- You can't view App Engine V1 subscription details on the details page like other subscriptions. Users with the usage_admin, sn_sub_man.admin, or admin roles can view App Engine V1 subscription details and usage information by navigating to the **App Engine usage** module from the filter navigator. This module only appears if you have App Engine V1.

  For details on auditing App Engine V1 usage, see the article Auditing App Engine v1 [KB0999383] in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.

Map a custom application to a product subscription in Subscription Management

Maintain accurate entitlement for custom tables in a scoped application by mapping the application to a product subscription in Subscription Management. To stay in compliance, you must map custom tables to a product subscription.

Before you begin

Role required: usage_admin, sn_sub_man.admin, or admin

About this task

As your developers create and deploy new custom applications and tables on your instances, use Subscription Management to map them to subscriptions. After you map a custom application to a product subscription, additional tables that developers add to the application are automatically mapped to the subscription.

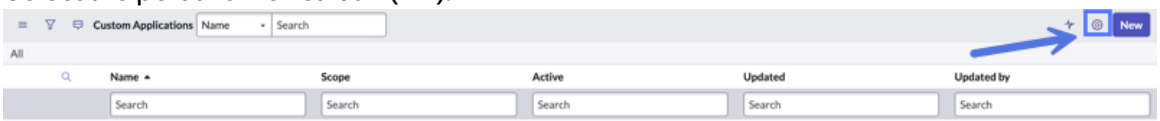
Procedure

1. Navigate to the **Issues** tab in Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Issues**.
   - Navigate to **All** > **Subscription Management** > **Issues**.
2. In the **Unmapped custom applications** tab, look for custom applications that aren't mapped to a subscription.
3. Update your entitlements by mapping one or more custom applications to a recommended product or a product of your choice.
   When possible, Subscription Management displays recommendations for product subscriptions with available custom table entitlements in the **Recommended Product** column. Subscription Management can't display product subscription recommendations for some unmapped custom applications, which therefore aren't shown in the **Unmapped custom applications** tab. For more information about mapping missing custom applications to product subscriptions, see Map a missing custom app to a product subscription in Subscription Management.

Option	Description
Map to a recommended product	**a.** Select the check box for one or more un mapped custom applications. **b.** Select **Map to product**. **c.** Select **Confirm**.
Map to a product of your choice	**a.** Select an unmapped custom application. **b.** In the **Subscription** lookup list on the Cus tom Application form, select a subscription. **Note:** The lookup list doesn't include expired, grandfathered, or Store ap plication subscriptions. If you have a Store application with custom tables that must be mapped to a subscrip tion, select a subscription with a cus tom table entitlement. **c.** Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
One or more custom applications are mapped to a product subscription and your custom table entitlement count is updated. If you mapped a custom application to a subscription through the Custom Application form, Subscription Management is updated the next day.



Map a missing custom app to a product subscription in Subscription Management

Map a custom application to a product subscription when that application isn't shown in the **Unmapped custom applications** tab of **Subscription Management**. To stay in compliance, you must map custom tables that belong to a custom application to a product subscription.

Before you begin
Role required: usage_admin, sn_sub_man.admin, or admin

About this task
Subscription Management can't display product subscription recommendations for some unmapped custom applications, and those applications aren't shown in the **Unmapped custom applications** tab. As a result, you might see fewer applications in the **Unmapped custom applications** tab than the number shown on the Unmapped Custom Applications report in the Subscription Management Overview page. You can map any missing custom applications to product subscriptions from the Custom Application list.

Procedure
1. Navigate to the **Issues** tab in Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Issues**.
   - Navigate to **All** > **Subscription Management** > **Issues**.
2. Select the **Unmapped custom applications** tab.
3. Select **Map missing applications from the custom application list**.
4. Select the personalize list icon ( ).

5. Adjust the columns shown on the Custom Application list by moving **Subscription(subscription_entitlement)** from the **Available** column to the **Selected** column.
6. Select **OK**.
   In the **Subscription** column, you can see which product subscriptions each of your custom applications are mapped to.
7. Select an unmapped custom application.
   You can identify unmapped custom applications using the **Subscription** column. The **Subscription** column for unmapped custom applications is empty.
8. On the header of the Custom Application form, select the form title.
9. Change the view by selecting **Subscription**.
10. In the **Subscription** lookup list on the Custom Application form, select a product subscription. The lookup list doesn't include expired, grandfathered, or Store application subscriptions. If you have a Store application with custom tables that must be mapped to a subscription, select a subscription with a custom table entitlement.
11. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The custom application is mapped to a product subscription and your custom table entitlement count is updated. Updates made through the Custom Application form show in Subscription Management the next day.

Map custom tables to a product subscription in Subscription Management

Maintain accurate entitlement for custom tables in the global scope and stay in compliance by mapping the tables to a product subscription in Subscription Management. Mapping your custom tables keeps your custom table allotment updated and helps you avoid running out of custom table entitlements.

Before you begin
Role required: usage_admin, sn_sub_man.admin, or admin

Procedure
1. Navigate to the **Issues** tab in Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Issues**.
   - Navigate to **All** > **Subscription Management** > **Issues**.
2. In the **Unmapped global custom tables** tab, look for custom tables that aren't mapped to a subscription.
3. Update your entitlements by mapping one or more custom tables to a recommended product or a product of your choice.
   When possible, Subscription Management displays recommendations for product subscriptions with available custom table entitlements in the **Recommended Product** column. Subscription Management can't display product subscription recommendations for some unmapped custom tables, which therefore aren't shown in the **Unmapped custom applications** tab. For more information about mapping missing custom tables to product subscriptions, see Map a missing custom table to a product subscription in Subscription Management

Option	Description
Map to a recommended product	**a.** Select the check box next to one or more unmapped custom tables. **b.** Select **Map to product**. **c.** Select **Save**.
Map to a product of your choice	**a.** Select an unmapped custom table. **b.** In the **Subscription** lookup list on the Cus tom Table Inventory form, select the sub scription. **c.** Select **Update**. **d.** Repeat these steps for each remaining un mapped table.
Manually map to a product through the Cus tom Applications table	If subscription recommendations shown in the Subscription Management UI aren't cor rect for your environment, you can manually update custom table mappings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	a. From the platform's application navigator, select **All**. b. In the navigation filter, enter `sys_app.list`. c. Select the Update Personalized List icon  . d. Move **Subscription(subscription_entitlement)** from the **Available** column to the **Selected** column. e. Select **OK**. f. Find and select the record for the custom table you want to map. g. In the **Subscription** field, find and select the product subscription the table should be mapped to. h. Select **Save**.

Result

One or more custom tables are mapped to a product subscription and your custom table entitlement count is updated. If you mapped a custom table to a subscription through the Custom Table Inventory form, Subscription Management is updated the next day.

Map a missing custom table to a product subscription in Subscription Management

Map a custom table in the global scope to a product subscription when that table isn't shown in the **Unmapped global custom tables** tab of Subscription Management. To stay in compliance, all custom tables must be mapped to a product subscription.

Before you begin

Role required: usage_admin, sn_sub_man.admin, or admin

About this task

Subscription Management can't display product subscription recommendations for some unmapped global custom tables, and those tables aren't shown in the **Unmapped global custom tables** tab. As a result, you might see fewer tables in the **Unmapped global custom tables** tab than the number shown on the Unmapped Global Custom Tables report in the Subscription Management Overview page. You can map any missing custom tables to product subscriptions from the Custom Table Inventory list.

Procedure

1. Navigate to the **Issues** tab in Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Issues**.
   - Navigate to **All** > **Subscription Management** > **Issues**.
2. Select the **Unmapped global custom tables** tab.
3. Select **Map missing tables from custom table inventory list**.
4. If the Custom Table Inventory list is in the default view, select **Custom Table Inventory** > **View** > **Subscription Entitlement**.
   In the **Subscription** column, you can see which product subscriptions each of your custom tables are mapped to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select an unmapped custom table.
   You can identify unmapped custom tables using the **Subscription** column. The **Subscription** column for unmapped custom tables is empty.
6. In the **Subscription** lookup list on the Custom Table Inventory form for the table, select a product subscription.
7. Select **Update**

Result
The custom table is mapped to a product subscription and your custom table entitlement count is updated. Updates made through the Custom Table Inventory form show in Subscription Management the next day.

Maintain custom table and application mappings at renewal in Subscription Management

Ensure custom table and application mappings remain consistent throughout the renewal process.

Before you begin
Role required: usage_admin, sn_sub_man.admin, or admin

About this task
When a subscription renews, a new product SKU might be added to your account. This SKU is treated as a new product subscription in Subscription Management, requiring you to re-map custom applications and custom tables to the subscription to stay in compliance.

Procedure

1. Before the renewal date, monitor the subscription end dates and document the current list of custom application and custom table mappings.
   See Viewing product subscription details in Subscription Management.
2. After the renewal date, map the documented tables and applications to the renewed subscription in Subscription Management.
   See Map a custom application to a product subscription in Subscription Management and Map custom tables to a product subscription in Subscription Management.

What to do next
Continue to monitor subscription renewal dates to ensure that your mappings are accurate throughout each renewal.

Grandfathered and exempted tables

Grandfathered and exempted custom tables are treated differently than other custom tables on your instance. Refer to your organization's ServiceNow® contract for additional information.

Grandfathered tables

Depending on your organization's legacy subscription entitlements and contractual migration, grandfathered tables might be allotted to your production instance. Grandfathered table entitlements enable preservation of your organization's previous custom table entitlements through license migration. This one-time process ensures that custom tables that currently exist in a production instance don't count against your new custom table entitlements.

Grandfathered custom tables can't be transferred, reused, or otherwise classified as another custom table type. If you delete a grandfathered custom table, you can't classify any other custom table as a grandfathered custom table to take its place. Once a custom table has been associated with a grandfathered table subscription, it remains in the Custom Table Inventory even if the table is deleted from the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view your grandfathered tables, enter `ua_custom_table_inventory.list` in the filter navigator, and then add a filter with the condition **[Allotment type] [is] [Grandfather]**.

If you have a combination of custom and grandfathered tables in one application, the grandfathered tables must be mapped to a grandfathered table subscription. The remaining custom tables to one other subscription. Reach out to Customer Service and Support for help mapping a grandfathered table to a grandfather table subscription.

Example: Grandfathered tables on an instance

Scenario: Your organization purchases three new subscriptions with entitlements for a total of 55 App Engine Starter custom tables (formerly Bundled Custom Tables). To ensure your organization doesn't lose the previous custom table entitlements, a grandfather subscription with an entitlement for 25 grandfathered tables is allotted to your instance. This subscription requires support to identify and map the existing 25 tables. These subscriptions result in a total custom table entitlement of 80. Once a custom table has been assigned to the grandfather subscription there is no option to revert this.

Multiple subscriptions with grandfathered and custom table entitlements

Subscription	Number of custom table entitlements	Number of mappable tables
Grandfathered subscription	25	25
New Subscription 1	25	25
New Subscription 2	25	25
New Subscription 3	5	5

Exempted tables

Exempted tables are custom tables that don't count toward your subscription entitlements. These tables consist mostly of custom extensions of certain system-related tables, such as sys_portal_page and sys_user_preference, that you extend for operational improvements in your production instance.

To view a list of exempted tables, enter `ua_exempted_table_inventory.list` in the filter navigator.

The Custom Table Guide legal schedule provides the complete definition of which tables are considered exempt.

Note: Legal schedules are enforced based on when the contract is executed.

To find past versions of the Custom Table Guide, see the Legal Schedules Custom Table Guide.

Monitoring capacity subscriptions

Manage and track capacity subscriptions using Subscription Management.

Overview of monitoring capacity subscriptions

Capacity subscription usage is calculated using a table query or scripted definition. You can view a Capacity Definition record to view the details of the table query or scripted definition. You can also execute the definition on demand to view the latest counts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After determining how a capacity total for a subscription is calculated, you can maintain compliance by adjusting the number of assigned resources or increasing your capacity subscription. For example, you can determine which tables are queried for active users or how usage is defined for devices when the system allocates CIs to a capacity subscription.

Learn how capacity totals are calculated

Monitor capacity subscription calculations in Subscription Management

View how a capacity total is calculated to keep your subscription in compliance.

Before you begin

Role required: usage_admin, sn_sub_man.admin, or admin

Procedure

1. Navigate to Subscription Management in one of the following ways.
   - Navigate to **Admin** > **Subscription Management** > **Subscriptions**.
   - Navigate to **All** > **Subscription Management** > **All Subscriptions**.
2. In the list of all your product subscriptions, select a capacity subscription.
3. On the subscription details page, preview the Capacity Definition record by selecting the record ID next to the **Capacity Definition** field.
   If the Capacity Definition record ID is unavailable, contact your account executive for usage calculation details. For more information about how subscription usage is calculated for different products, see Values for Subscription-Based Products [KB0727967].
4. Depending on the definition type, review the following details to view how usage is calculated.

Type	Description
Table query	View the **Table Name**, **Query**, **Aggregation Type**, and **Aggregation Column**. View how the count is calculated by examining the SQL query.
Scripted definition	View how usage is calculated by examining the contents of the **Script** field.

5. **Optional:** Select **Open Record** to view the full Capacity Definition record details.
6. **Optional:** Select **Execute** to run the query or script immediately and view the latest results.

   Note: Executing a script or table query in a Capacity Definition record does not count toward the execution total that is monitored by the system.

   The total time required to execute and the latest count are displayed. The count from prior executions is displayed in the Previous Executions related list.
7. If the capacity subscription is out of compliance, adjust the number of allocated resources or increase the capacity subscription.

Subscription Management reference

Reference topics provide information about subscription types, meters, and domain separation support.

Types of subscriptions in Subscription Management

Subscriptions to ServiceNow applications come in different types. The type of subscription determines the allocation ofusers, access to applications, and custom application and table entitlements.

Each type of product subscription is measured according to a meter. For details on the different types of meters and what they measure see Values for Subscription-Based Products [KB0727967].

Subscription type	Associated meter types	Usage allocation method	Description
Capacity	• Devices • Subscription Units • Transactions	No manual steps are required. Usage is automatically calculated and shown in your instance.	Automatically tracks measured units, and counts of transactions, records created, or resources managed such as devices, software, or nodes.
Display Only	None	Allocation isn't measured	Displays information. This type of subscription doesn't support allocation.
Per-User	• Rights-based user: measure of Fulfiller Users and Business Stakeholder Users • Application user: measure of users with any level of access to a product; includes Creator Users	Manually allocated	Provides entitlements to users according to their assigned roles and associated access rights. You allocate per-user subscriptions manually by adding groups with measured roles or access rights to a product subscription. Subscription Management helps you with the allocation process by recommending groups based on their role assignments.
Unlimited	Unlimited: No measurement limit	Automatically allocated by your instance	Provides entitlements to users, with no limit to the number of users that can be allocated.
Unrestricted User	Unrestricted user: Instance-wide measure of all active users	Automatically allocated by your instance	Provides entitlements for an organization's number of active users regardless of their role assignments. An active user is any user whose record in the Users [sys_user] table has a value

Subscription type	Associated meter types	Usage allocation method	Description
			in the **User ID** field and has the **Active** field set to true.

Subscription form

The Subscription form contains important information about your subscription.

You can view the subscription form by entering `license_details.list` in the filter navigator to open the Subscriptions [license_details] table. Select a subscription name to open the Subscription form. Some fields don't appear for ServiceNow Store apps.

Subscription form

Field	Value
Name	Name of the subscription.
Category	Source of the purchased subscription: ServiceNow platform or ServiceNow Store.
Type	Type of subscription: • Per-User • Unrestricted User • Capacity • Unlimited • Display To learn more about subscription types, see Types of subscriptions in Subscription Management.
Start date/End date	Start and end of the subscription period as agreed in your service contract. This information appears in the General section of the service contract for the subscription.
Capacity Definition	The ID of the Capacity Definition. Learn how the total is calculated by selecting the Capacity Definition record ID on the product subscription details page. See Monitor capacity subscription calculations in Subscription Management.
Display only	Value of **true** indicates that user allocation or monitoring is not currently supported for the subscription.
Product Code	The product SKU shown on your subscription order form.

Related links

The related links on the subscription form may vary depending on the subscription.

Link	Description
Manage Your Tables	See custom tables mapped to the subscription.
View Subscription History	View subscription status, dates, and trend information.
View User Subscription History	Lists user allocation history for the subscription. The list shows a user's current subscription status and how they were allocated.

User sets and groups in Subscription Management

Subscription Management uses groups (previously user sets) to provide entitlement to sets of users.

User set and groups overview

Prior to Quebec, Subscription Management used user sets to group users together. Usage_admins grouped users by conditions, such as what city or department they are in. User sets could then be assigned to subscriptions to give every user in the user set a license to the subscription.

In Quebec and later releases, all user sets are converted to groups. A group is a set of users who share a common purpose. Similar to user sets, groups can be added to subscriptions. Adding a group to a subscription gives every user in the group entitlement.

User set conversion

On upgrade to Quebec or later releases, all current user sets convert to groups. The new groups contain the same users and properties as your user sets. The conversion is a one-time occurrence, and users are not automatically added or removed from the new group after the conversion.

Group management

Admins and user_admins create groups and add users in the **User Administration** application.

To learn more about creating and editing groups, see Creating groups.

Components installed with Subscription Management

Several components are installed with activation of the Subscription Management plugin (com.glide.subscription_management), including user roles and tables.

Roles installed

Role title [name]	Description	Contains roles
Usage administrator [usage_admin]	Administers Subscription Management. Allocates subscriptions, maps custom tables and custom applications to subscriptions.	sn_sub_man.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Table	Description
Subscription Insights definition [sn_sub_man_st_subscription_insights]	[Remote table] Records for available subscriptions and over-allocated subscriptions
Subscription license detail definition [sn_sub_man_st_subscription_license_detail_metric]	[Remote table] Subscription allocation metrics and history

Subscription Management roles

Subscription Management is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Usage administrator [usage_admin]

Administers Subscription Management. Allocates subscriptions, maps custom tables and custom applications to subscriptions.

Contains Roles

List of roles contained within the role.

None

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevate to a privileged role.

No

Special considerations

None

Domain separation and Subscription Management

Domain separation is supported for Subscription Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic*

The support level is Basic but has some exceptions or special conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider (SP) use cases.
- The user interface, cache keys, reporting, rollups, and aggregations all use the domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

Sample use case: When an SP uses chat to respond to a tenant-customer's message, the client must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of domain separation in Subscription Management

Subscription Management enables you to manage your subscriptions and monitor subscription usage on your instances. Domain separation is enabled for user-based subscriptions and for monitoring Now Assist usage.

Note: This feature is only available in domain-separated instances. This feature isn't visible in instances without domain separation.

How domain separation works for user-based subscriptions in Subscription Management

In domain-separated instances, Subscription Management provides information about the domain of each user that has been allocated a user-based subscription.

Users in the SP domain can view the domains that each of their tenant users is a part of from the **Subscribed users** tab of subscription details. The **Domain** column shows the domain hierarchy of all child and grandchild domains and enables you to filter subscribed users by domain.

Users in tenant domains can only view subscription allocations from the global domain and domains that their organization manages. Users in tenant domains can't see user subscription allocations from parent or sibling domains.

Note: User records created before domain separation is activated are in the global scope until manually assigned a domain. Subscription allocations to global users are visible in all domains.

The Allocation Summary section in the subscription details displays information based on the total number of subscription allocations available across all domains. Administrators can use this information to help avoid over-allocating user subscriptions in tenant domains.

If you make allocation changes that aren't reflected in the Allocation Summary or Allocation History, clear the cache.

Monitoring Now Assist usage by domain

In domain-separated instances with Now Assist, Subscription Management provides information about assist usage by domain.

Users in the SP domain can view assist usage by domain by navigating to **Admin** > **Subscription Management** > **Subscriptions** > **Account level entitlements** > **NowAssist usage** and reviewing the current instance details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users in tenant domains can only view their own Now Assist usage. Users in tenant domains can't see the number of assists used in parent or sibling domains.

Domain separation for service providers

Now Support administration

The Now Support portal is where you can access self-help, get technical support, and manage your ServiceNow instances.

Who uses the Now Support portal

If you are responsible for managing, monitoring, or maintaining your company's ServiceNow instance(s), then you will likely use the Now Support portal. ServiceNow Customer Administrators are the gatekeepers and manage their companies' Now Support users. Administrators can then add or remove other users, such as developers, architects, and partners. What you can do within the portal will vary based on your role.

Note: For information about the types of notifications different Now Support users may receive, see KB0547262: Company Key Contacts and Notification List Overview on Now Support.

View Now Support users

As a Now Support admin, you can view active and inactive users and their roles.

Before you begin

Role required: admin

Procedure

1. Navigate to **Now Support**
2. Select the drop-down profile menu.
3. Select **Manage users and accounts**.
4. Select **View all Users** or search for a specific user.

Create a user in Now Support

You can create users in Now Support and assign them access roles.

Before you begin

Role required: admin

Procedure

1. Navigate to **Now Support**
2. Select the drop-down profile menu.
3. Select **Manage users and accounts**.
4. Select **View all Users**.
5. Select **Add new user**.
6. Fill in the required fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the appropriate Now Support access roles.
8. Select **Submit**.

Manage user access in Now Support

You can manage users in Now Support and change their access roles.

Before you begin
Role required: admin

Procedure

1. Navigate to **Now Support**
2. Select the drop-down profile menu.
3. Select **Manage users and accounts**.
4. Select **View all Users** or search for a specific user.
   You can also select **Locked users** or **Inactive users** to find the user you are looking for.
5. After you select the user you want to change access for, select **Edit Role(s)** from the **Actions** pull-down field.
6. Add or remove Now Support access roles.
7. Select **Confirm**.

Configure ServiceNow AI Platform core features

The ServiceNow AI Platform provides for a multitude of customization options to your applications. Customize your UI, handle user and data administration, and localize your instance for time zones, currencies, and more.

User administration	ServiceNow AI Platform tables and data	Forms, fields, and lists
		
Set up users, groups, and roles.	Manage data with external sources, and configure data tables.	Control the action and appearance of forms, fields, and lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search administration  Enable users to find the information through Zing or AI search engines and specialized search experiences.	**Notifications**  Manage system email, notifications, and responses to inbound messages.	**ServiceNow AI Platform translation and localization**  Match languages and currency everywhere on the globe.
Time configuration  Create calendars, schedule events, and display time info to users around the world.	**Currency administration**  Manage the way financial data is displayed.	**Events**  Get in-depth analysis for all displays and user-based events in your application.

User administration

Create account access types and related roles to work within your instance. User records give you control over individual single account types and the records or actions that they can access. Group records expand control further, to assign access to teams or departments, as well as to subgroups or by skill associations. Customize instances even more with Roles, and assign access to various apps or modules. Troubleshoot and test it all with Tools that provide auditing, impersonation, and more.

See User administration.

ServiceNow AI Platform tables and data

Manage and use your business information effectively on the ServiceNow AI Platform. Take advantage of Data Management to store, transfer, import, and archive data. Work with multiple records at once using Table Administration, and connect with third-party or external instances to handle data with Financial Services Remote Tables.

See ServiceNow AI Platform tables and data.

ServiceNow AI Platform forms, fields, and lists

Take control of every aspect of data collection and usage in your instance. Forms on the ServiceNow AI Platform are fully customizable, with options for personalization, templates, attachments, UI, and more. Create and modify Fields, used in forms and displayed in lists or tables. Define user access to all your data with Lists, including custom controls and functions.

See ServiceNow AI Platform forms, fields, and lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search administration

Help your users find information with ease using ServiceNow search administration products. AI Search and the Zing search engine provide intelligent search results and proper indexing. Focus your data requests with Table searches, and go wider with Global searches, all with configurable search systems across the ServiceNow AI Platform. Improve search assistance with search suggestions, Contextual Search based on intent, and search data analysis.

See Search administration.

Time configuration

Keep your business on-time with the ServiceNow AI Platform. Handle schedule and event info collection with Date/Time fields, and manage personnel, users, and data across Time Zones. Business and fiscal calendars and event system schedulers are all available and tailored to best help you and your users. Time displays, counts, and time-based data analysis all help you manage your work and track historical info.

See Time configuration.

Currency administration

Monitor currency values with ServiceNow currency administration systems. Configure Standard Currency fields for financial and non-financial records and applications, or use expanded Foreign Exchange (FX) Currency fields for added configuration options.

See Currency administration.

Service Level Management

Ensure your services to your customers are properly managed and documented. The full series of ServiceNow modules for Service Level Management lets you define service contracts and service level agreements (SLA) as needed. Repair, monitor, and validate SLA records for time and duration accuracy, get analyses and reports on service, and separate record domains for information display and control.

See Service Level Management.

ServiceNow AI Platform translation and localization

Communicate effectively with users and customers around the world. The Localization Framework provides info to users in a variety of languages and currencies across a multitude of apps—all within the same instance. Dynamic Translation helps accommodate users even more fully, by actively translating text in forms and other applications.

See ServiceNow AI Platform translation and localization.

ServiceNow AI Platform integrations

Bring ServiceNow and external applications together with integrations on the ServiceNow AI Platform. Make onboarding and service configuration easy by adding to your instance. Integrate other instances, third-party apps, and data sources, and make helpful features such as Single Sign-on available throughout your enterprise.

See ServiceNow AI Platform integrations.

Exploring user administration

User administration controls who can access features and data on your instance by managing users, groups, and roles.

Overview of user administration

Creating users, groups, and roles provide a flexible and scalable way to manage access to features on the ServiceNow AI Platform. By creating user accounts, assigning users to groups, and defining roles and permissions, administrators can verify that users have the appropriate level of access to applications and data. This enables organizations to control access to sensitive data, support organizational policies, and improve overall security. Additionally, users, groups, and roles can be easily managed and modified over time as organizational needs change.

Workflow

Subscriptions, users, groups, and roles work together to help you define who can access features on your instance.

1. Subscription Management

   Understand your subscriptions. Subscription management enables you to manage your subscriptions proactively and monitor subscription usage on your instances.

   Subscriptions may include per-user subscriptions. For more information, see Managing per-user subscriptions in Subscription Management.

2. Creating users, companies, and departments

   Create an account record for the individuals who have access to your instance. Each user account has a unique login ID, password, and set of permissions (roles) that define what they can do and access within the platform.

3. Creating groups

   Define groups that have similar roles or permissions. Groups enable you to apply permissions (roles) to multiple users at the same time. When a user is a member of a group, that user has the same permissions that have been defined for the group.

   You can view group members by navigating to **All** > **User Administration** > **Groups**. Select a group name and view the members in the Group Members related list.

4. Managing roles

   Roles describe the types of activities that a user can perform on the instance. Each role has a set of permissions that can govern what the users and groups can do, such as read, write, create, or delete records. Roles can be assigned to users and groups. Users can have multiple roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a complete list of the roles included with the ServiceNow AI Platform, see Base system roles.

Role records are stored in the Roles [sys_user_role] table.

5. Monitoring instance usage

   Users with the admin or usage_admin role can view the **Application usage overview** and ServiceNow Store **usage overview** dashboards to track instance usage.

6. Monitoring user activity

   Users with the admin role can impersonate users, manage user sessions, and use non-interactive sessions.

User preferences

Users can configure many UI features. Some examples include the number of rows per page in a list or whether the response time displays at the bottom of a list or form. Administrators can modify or delete these preferences as needed. For more information, see User preferences.

User groups

A group is a set of users who share a common purpose. Groups may perform tasks such as approving change requests, resolving incidents, receiving email notifications, or performing work order tasks. Any business rules, assignment rules, system roles, or attributes that refer to the group apply to all group members automatically. Users with the user_admin role can create and edit groups.

When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

Note:

You can view group members by navigating to **All** > **User Administration** > **Groups**. Select a group name and view the members in the **Group Members** related list.

Group records are stored in the Groups [sys_user_group] table.

User roles

Roles control access to features and capabilities in applications and modules. The admin role provides access to all features and capabilities.

After access has been granted to a role, all the groups or users assigned to the role are granted the access. Roles can contain other roles, and any access granted to a role is granted to any role that contains it.

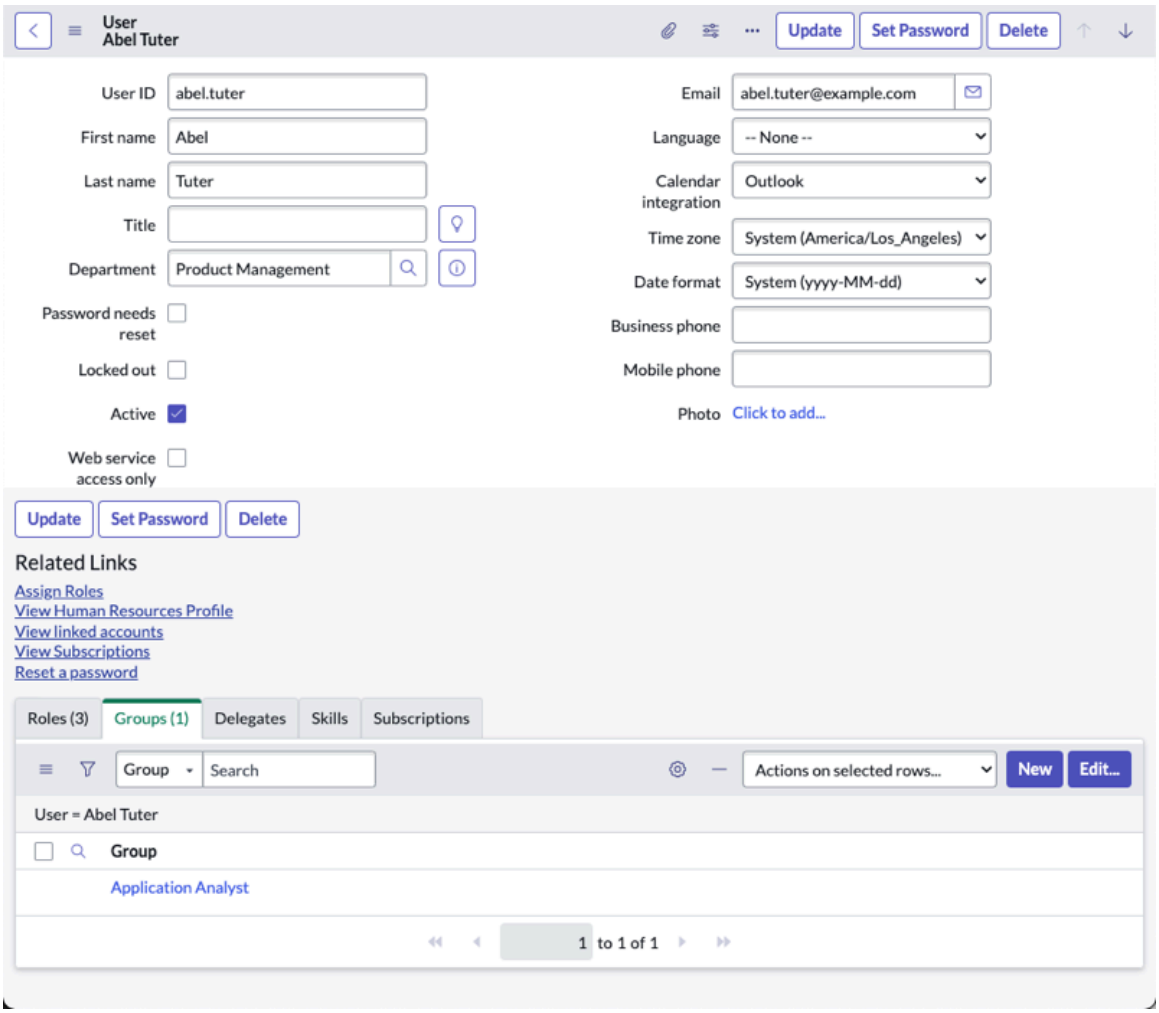
For a complete list of the roles included with the ServiceNow platform, see Base system roles.

Note:

When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

Role records are stored in the Roles [sys_user_role] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The User record

Learn about user records and their use within the ServiceNow AI Platform.

User account records

User records establish a relationship between an individual and your ServiceNow instance. User records consist of a user name, a password, and information relating to the individual, such as contact information, location, and job title.

User record

User records are stored in the Users [sys_user] table.

Note: ServiceNow occasionally adds service accounts to the sys_user table to facilitate some platform features and functionality. For more information, see KB1648003: (OOTB) Out of the box local user accounts in sys_user.

Related records

User records are associated with records on several other tables to control permissions, preferences, and other features.

Roles

Roles control access to features and capabilities in applications and modules. For more information on roles, see Managing roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

Groups

A group is a set of users who share a common purpose. Users assigned to groups are automatically assigned to all roles associated with that group. For more details, see Creating groups and Managing roles.

Delegates

In addition to role and group assignments, users can be assigned as delegates, giving them permission to act with the same permissions as a delegator user. See Delegating roles for more information on delegation.

Skills

Use skill management to associate users with their areas of training and expertise. For more information on skill management, see Skill Management.

Subscriptions

Administrators use subscriptions to control which users have access to purchased subscriptions on their instances. Details on subscription management can be found at Subscription Management.

User preferences

User accounts are also connected with user preferences. Users can save personalized preferences to configure many UI features, as well as preferences regarding the notifications they receive. Details on administering user preferences are found at User preferences.

Date and time formatting

Note: From the Brazil release, Date format and Time format settings have been relocated from the user profile to the Language & Region section within the user's Preferences. The time zone setting continues to be available in the user profile from the Brazil release.

For releases before Brazil, you can set your preferred date and time formatting through the User record. If you don't specify a preference in these fields, the system applies default formatting.

Before the Brazil release, the Date format field appears in the User record by default and can be modified without specific permissions. However, the Time format field must be added to the User record by revealing additional form fields. For instructions on showing or hiding form fields, see Configuring the form layout. If you can't modify form fields, contact your organization's user administrator to update your time format preferences.

The Date and time format field in **User Menu** > **Preferences** > **Language & Region** extends the options you select in the Date format and Time format fields of your User record. For more information, see Configure Next Experience language and region preferences. Time zone settings automatically sync between the User record and your preferences.

System and guest users

Some automated processes use the system or guest user to apply and track changes to records. As a result, some records may show that they were last updated by system or guest.

For example, when a user logs in for the first time in a day, some fields on that user's record are updated by the system user. These fields can include **Last login** and **Last login time**. If a user has

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a failed login attempt or is locked out, some fields on that user's record are updated by the guest user, such as **Failed Login Attempts** or **Locked Out**.

If a record was last updated by the system or by guest users, you can identify the updated fields by enabling auditing for the table. View the audit history to see the changes. For more information, see Configuring auditing for a table and Knowing about History sets.

Creating users, companies, and departments

Create user records for the individuals who access your instance. Users can be assigned to groups with defined roles to determine what records and actions they can access.

Creating users

Users are typically added through Lightweight Directory Access Protocol (LDAP) directory integrations. Admins can also manually add users to the instance, enable self-registration for new users, and impersonate users to ensure that they have the proper access privileges.

For more information on LDAP integrations, see Lightweight Directory Access Protocol integration.

Create a user

You can add a user to your instance to enable them to log in and use designated application features.

Before you begin

Role required: user_admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
User ID	Create a unique identifier for this user's ServiceNow login user name. Typical examples of user IDs are `cwitherspoon` and `charlie.witherspoon`. You can't create a user whose User ID duplicates an existing user. If you do import duplicates from an update set, the more recently created name takes the duplicate User ID.
Given name	Enter the user's given (often their first) name.
Family name	Enter the user's family name (often their last name). **Note:** You can clear the **First Name** field, or the **Last Name** field in an existing user record, but you can't clear both at the same time.
Title	Enter a title or job description, or select one from the list.
Department	Select the user's department from the list.
Password	Assign a password to the user. To set up the user's password, fill in the fields on the form and **save** the record. Then, select **Set Password**. This password can be permanent or temporary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Password needs reset	Select this check box to require the user to change the password during the first login.
Locked out	Select this check box to lock the user out of the instance and terminate all their active sessions. The system helps prevent users with the admin role from locking themselves out.
Active	Select this check box to make this user active. Only the administrator sees an inactive user in: ○ Lists of users ○ The selection list on reference fields (magnifying glass icon) ○ The auto-complete list that appears when you type into a reference field
Web service access only	It designates a user as a non-interactive user. This field is available with Non-Interactive Sessions. **Note:** The Web service access only check box is automatically enabled when you select **Machine** in the Identity type field. The Web service access only check box is automatically disabled when you select **Human** or **AI**.
Internal Integration User	Select this check box to Mark service accounts as internal integration users.
Email	Enter the user's email address. To enter a non-standard email address that doesn't pass field validation, you must deactivate the validation script first: **a.** Navigate to **System Definition** > **Validation Scripts**. **b.** Select the **email** record. **c.** Clear the **Active** check box and save the change. **d.** Complete the user profile, including the email address, and update or submit the record. **e.** Reactivate the email validation script.
Identity type	Select the user identity type based on the user: ○ Human - Select this for a real person, such as an employee, customer, or admin. ○ Machine - Select this for a non-human system or device, such as a server, application, or service account that makes automated requests. ○ AI - Select this for an autonomous AI-driven system. AI users should be used when an AI agent or agentic workflow needs permissions greater than that of the invoking user. See Security for AI agents for more information on using AI type users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ The Web service access only check box is automatically enabled when you select **Machine** in the Identity type field. The Web service access only check box is automatically inactive when you select **Human** or **AI**. ○ Changing Identity type from **AI** to other types and vice versa is restricted.
Language	Select your preferred language from the list.
Calendar integration	Select **Outlook** to have this user receive meeting notifications via email directly to the calendar. Otherwise, select **None**.
Time zone	Select the user's time zone.
Date format	Select the user's preferred format for dates. The following date formats are supported: ○ 08/19/26 ○ 19/08/26 ○ 08-19-2026 ○ 08/19/2026 ○ 19-08-2026 ○ 19/08/2026 ○ 19.08.2026 ○ 2026/08/19 ○ 2026.08.19 ○ 2026-08-19 For more information, see GlideDateTime - Global.
Time format	Select the user's preferred format for time. The following time formats are supported: ○ 16:30:45 ○ 16.30.45 ○ 04:30:45 PM ○ 04.30.45 PM ○ 16:30 ○ 16.30 ○ 04:30 PM ○ 04.30 PM For more information, see GlideDateTime - Global.
Business phone	Enter the user's business phone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Mobile phone	Enter the user's mobile phone number.
Photo	Attach a photo of the user, if appropriate.

The minimum fields required to create a user record are: **User ID** and either **First name** or **Last name**.

You can select the **Personalize Form** icon to remove fields.

4. **Optional:** Add **Roles**, **Groups**, **Delegates**, **Skills**, and **Subscriptions** to the user.
   For more information, see Managing roles, Creating groups, and Delegating roles.
5. Select **Submit**.
   The new user record appears in the list.

User self-registration

The User Registration Request [com.snc.user_registration] plugin provides the ability for unregistered users to request access to a ServiceNow instance. An administrator can activate the plugin.

A user can request an account by navigating to the instance. If the plugin is installed, a new section is added to the welcome screen to allow users to request a user account.

The user can complete and submit the self-registration form, and see a confirmation that it was submitted. The user receives an email when the account is registered.

Note:

- Starting with the Brazil release, User Registration Request plugin (`com.snc.user_registration`) is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. External User Self-Registration plugin (`com.snc.external_user_self_registration`) provides the latest experience for this functionality.
- If the email address entered in the self-registration form is already in the system, the request is not submitted.

Approve a self-registered user account

When a user submits a self-registration form, an admin can review and approve it.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Pending User Registrations** and open the request.
2. Use the **Create User** and **Reject** related links on the registration request form to approve or deny the request.
   - If **Create User** is selected, a new user is created using the email address as the **User ID**.
   - If **Reject** is selected, the request is marked **Rejected**.

   If the request was accepted, the user is sent an email notification with the login information. If it was denied, the user is sent an email with the rejection information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable automatic self-registered user account approval

Admins can enable users to self-register. Enable automatic approval of such accounts to streamline user registration.

Before you begin
Role required: admin

Procedure

1. Navigate to **System Properties** > **System**.
2. Select **Enable auto processing of user registration request**
3. Select **save**
   If enabled, registration requests do not require approval. Instead, the business rule *`Auto-Process User Registration`* creates the user record from the information provided.

What to do next
Request activation of the Explicit Roles (`com.glide.explicit_roles`) plugin. The Explicit Roles plugin creates two roles to differentiate between internal and external users.

Add a new company

You can add companies that represent vendors, manufacturers, or customers with whom you do business. These companies provide a way to categorize users, groups, and assets.

Before you begin
Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Companies**.
2. Click **New**.
3. Complete the form with the company details.

Company fields

Field	Description
Name	Name of the company.
Phone	Company phone number.
Fax phone	Company fax number.
Manufacturer	Whether the company is a manufacturer.
Vendor	Whether the company is a vendor.
Stock symbol	Three or four letter stock symbol for the company.
Stock price	Current price at which company stock is sold.
Street	Mailing street address of the company.
City	City in which the company is located.
State	State or province in which the company is located.
Zip/Postal code	Zip or postal code for the company.
Notes	Any information about the company that would be helpful for others to know.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Fields that can be added by Personalize a form:	
Latitude	The latitude of the company, if applicable. This field is populated by a business rule called *get_lat_long*. Deactivate this business rule to prevent the system from overwriting any values populated in the field manually. Latitude is expressed as a floating point data type. Latitude from upgraded versions of ServiceNow expressed in any format other than floating point appears in a column called **Old Latitude**. The system attempts to convert all latitude values from previous versions to the floating point notation, where possible. **Note:** This field doesn't display by default. You can add it by personalizing the form.
Longitude	The longitude of the company, if applicable. This field is populated by a business rule called *get_lat_long*. Deactivate this business rule to prevent the system from overwriting any values populated in the field manually. Longitude is expressed as a floating point data type. Longitude from upgraded versions of ServiceNow expressed in any format other than floating point appears in a column called **Old Longitude**. The system attempts to convert all longitude values from previous versions to the floating point notation, where possible. **Note:** This field doesn't display by default. You can add it by personalizing the form.

Note: The IT Finance application adds a Finance view to the Company form. The Finance view adds a chart that shows expenses that were allocated to the company.

What to do next

Normalize company data to create consistency when referring to a company name, such as a vendor or manufacturer. For more information see, Normalization data services.

Normalization data services

The Normalization Data Services plugin helps maintain consistency for table fields that refer to a company name.

Tables related to configuration items and assets usually contain columns referring to a company name, such as a vendor or manufacturer. Often, these tables refer to the same company by several different names. This situation can happen for many reasons. For example, vendors sometimes use different company names depending on the device. This inconsistency creates problems, especially for reports that rely on these company names.

The Normalization Data Services plugin helps alleviate this problem.

When you enable and configure the Normalization Data Services plugin, the system downloads a list of standard company names that ServiceNow has compiled. It also downloads a list of common variants of that name. Anytime the plugin finds a company-name field with one of those variants, it substitutes the standard name in its place.

Note: The Normalization Data Services plugin refers to a standard name as a normalized name and to a variant name as a discovered name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

While the Normalization Data Services plugin provides services similar to the field normalization feature, this plugin doesn't require you to manually set up the mappings from one name to another. If you like, you can add your own mappings to the set. However, you automatically start with extensive lists of common company names (normalized names) and their variants (discovered names).

The Normalization Data Services plugin stores data in two tables. The Normalized Company Names table contains the list of normalized company names. The Normalized Mappings table contains the mappings between each discovered name and its normalized name.

Important: If you edit a field whose value is a normalized name, you change the normalized name for ALL discovered names that map to it. These types of updates occur regardless of the table in which you edit the field.

The Normalization Data Services plugin adds a unique index or hash on the [core_company] table. You can store only one company record for a company name. The unique hash is the same for two companies with the same name. The uniqueness is required for many features to work correctly. For example, **Discovery**, which creates customer management database (CMDB) models and CIs. On a domain separated instance, the unique index is expanded to hash,sys_scope. This enables each domain to have its own version of a company with the same name.

Implementing normalization data services using guided setup

You can implement Normalization Data Services using a guided setup.

Normalization Data Services guided setup provides a sequence of tasks that help you configure the Normalization Data Services plugin on your instance. To open Normalization Data Services guided setup, navigate to **Normalization Data Services** > **Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

Note: Because the Normalization Data Services feature requires an internet connection to download mapping information, this feature isn't supported for on-premise instances.

Activating the plugin

In the first task of the guided setup, you activate the Normalization Data Services plugin (com.glide.data_services_canonicalization.client). Activating the plugin installs all the necessary schema to support normalizing references to Company records in the configuration management database (CMDB) and Asset Management.

Downloading normalized data

In this task, you download the repository of all enterprise vendor names and the mappings to their normalized counterparts. After the download finishes, you can view the downloaded data in the Normalized Company Names [cds_client_name] table. You can verify mappings in the Normalized Mappings [cds_client_mapping] table. For example, you can verify that "Dell", "DELL", "Dell (UK)" are mapped to "Dell Inc.".

Updating reference qualifiers

This task modifies the reference qualifiers in reference fields linked to the Companies [core_company] table, helping to ensure that users can only select from a list of normalized company names. For example, when creating a Computer (cmdb_ci_computer) record, users can only select "Dell Inc." and not "Dell" or "Dell Incorporated".

Some reference qualifiers may not get updated. To normalize these reference qualifiers manually, see KB0784201.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activating normalization properties

In this task, select the properties you want to activate. See Normalization properties.

Enable the **Normalize existing canonical core_company records** property if the Companies [core_company] table has two or more records that were both set to Normalized ("canonical=true") before any mapping. This option ensures only one [core_company] record is set to Normalized. When you normalize the CMDB tables later in guided setup, the normalization job reassigns the proper normalized value.

For example, prior to mapping, both “DELL Inc” and “Dell Inc.” are set to Normalized ("canonical=true"). You define a new mapping for “DELL Inc” to “Dell Inc.”. If this property is true, guided setup denormalizes "DELL Inc", and updates the manufacturer field in the CMDB records to “Dell Inc." when the CMDB tables are normalized.

Normalizing data

To finish the guided setup, complete the remaining tasks by normalizing data in the following tables:

- Configuration Items (CMDB)
- Configuration Items (CMDB) Model
- Software Asset Management tables

Normalized company names table

The Normalization Data Services plugin stores the normalized company names in the Normalized Company Names table.

Normalized company names fields

Field	Description
Name	The normalized name for this company.
Table	The table in which this name is stored.
Description	[optional] A description with further information about this company or record.
Field	The field in which this name is stored.
Customer override	**True**, if the customer has an override in place for this name. Otherwise, **false**.

Normalized company names related lists

List	Description
Normalized mappings	A list of all the discovered names that map to this normalized name.

See KB0819618 for more information.

Normalized Mappings table

The Normalized Mappings table lists all the discovered names and the normalized name to which each maps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Normalized mappings fields

Field	Description
Discovered name	A variant of a normalized name in the database.
Normalized name	The normalized name to which the discovered name maps.
Table	The table in which this name is stored.
Field	The field in which this name is stored.

Normalized company names related lists

List	Description
Related mappings	A list of all the discovered names that map to the same normalized name as the selected record.

Actions

List	Description
Promote discovered name	Replaces the normalized name with the discovered name for the selected record and for all the records in its related mappings list.

Normalization properties

On the normalization properties form, you can see and change the configurable properties for the Normalization Data Services plugin.

Normalization Properties

Field	Description
Reference qualifiers on all tables that reference the company will be updated to use the Normalized field.	If **Yes**, any reference field for the company – for any table across the platform – uses the Normalized name. This service only works if you have run the Update Reference Qualifiers task in the Guided Setup.
Enable a business rule that automatically normalizes manufacturer names for configuration items.	If **Yes**, the system normalizes company names when you add or update configuration items by a mechanism other than Discovery (such as by manual import sets).
Enable Discovery to use the normalization service for the manufacturer name.	To have Discovery use the normalized company name for the manufacturer name, select **Yes**.
This property is to enable or disable the Normalization process.	To enable the Normalization Data Service process, select **Yes**. To disable, select **No**. For details, see Normalization data services.
Normalize existing canonical core_company records.	Select **Yes** to update an existing normalized (canonical=true) Companies record to not-normalized (canonical=false) if a mapping is present. For details, see KB0957144 .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Changing normalized company names

You can change a normalized company name several different ways. In all cases, that change affects all normalized fields referring to that company.

You have several options for changing a normalized company name:

- Edit the Normalized Name field in the Normalized Mappings table. This method is preferred.
- Edit the Normalized Company name table.
- Edit the Company Name field on any table that refers to the Company [core_company] table.

Warning: If you edit a field whose value is a normalized name, you change the normalized name for ALL discovered names that map to it.

Change a normalized company name

You can change normalized company names by editing records in the Normalized Company Name table.

Before you begin

Role required: admin

About this task

You can add and edit records in the Normalized Company Names table.

Procedure

1. Navigate to **All** > **User Administration** > **Normalization Data Services** > **Normalized Mappings**.
2. Find the record with the name that you want to replace and edit the Normalized name field. The system changes the Normalized Company name for every discovered name that maps to that normalized name.

Enabling duplicate company names in extension tables

You can create records with duplicate company names in extension tables, such as Customer Account [customer_account] table, without causing normalization conflicts in Normalization Data Services.

If your ServiceNow instance has company records in the Company [core_company] table from IT Service Management (ITSM) or IT Operations Management (ITOM), and you are adopting Customer Service Management (CSM), you may encounter errors when creating Customer Account records for the same companies.

Normalization Data Services manages company name normalization across the Company [core_company] table and its extension tables, such as Customer Account [customer_account] table. By default, Normalization Data Services enforces unique company name across all company-related tables. This causes conflicts when a vendor in the Company table and a customer account share the same name.

The *glide.cmdb.canonical.use_base_core_company_only* property introduces support for creating duplicate company names in extension tables. When you enable this property, Normalization Data Services restricts unique company name validation to the base, Company [core_company] table only. Each duplicate record in an extension table still links to the correct normalized record in the base table.

Enable this property if you are upgrading from Zurich or an earlier release. You must use Customer Service Management with one or more of the following applications that extend the Company [core_company] table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ITSM Software Asset Management
- Hardware Asset Management

Configure Normalization Data Services to create duplicate company name in extension table

Configure the Normalization Data Services feature to enable records with duplicate company names across core company's extension tables, such as Customer Account [customer_account] table.

Before you begin

Role required: admin

About this task

Note: This procedure applies only if you are upgrading from Zurich or an earlier release. If you are on the Australia release or later, this feature is enabled by default and no action is required.

Procedure

1. Navigate to **All** > **System Definitions** > **Script includes**.
2. Search for and open the **ClearNonCoreCompanyExtensionsFix** script.
3. Select **Run Script**.
   The script clears the hash values and sets the Normalized flag to false for all duplicate company name records in the Company [core_company] extension tables.
4. Verify that the script ran successfully.

   a. Navigate to **All** > **System Log** > **All**.

   b. Search for the following log entries in the Log [syslog_list.do] table.
      - [ClearNonCoreCompanyExtensionsFix] Cleared hash
      - [ClearNonCoreCompanyExtensionsFix] Set canonical=false

   The log entries confirm that the hash values are cleared and the normalized flag is set to false.
5. Add the *glide.cmdb.canonical.use_base_core_company_only* system property and set its value to **True**.
   For more information, see Add a system property.
6. Normalize data in the CMDB table.
   a. Navigate to **All** > **Normalization Data Services** > **Guided Setup**.
   b. In the Normalize Configuration Items (CMDB) Model step, select **Configure**.
   c. Select **Start Update**.
   d. Select **Close** after the update completes.
7. Verify if you can create records with duplicate company names in extension tables.

   a. Navigate to **All**, and then enter `customer_account.list` in the filter to go to the Customer Account table.

   b. Select **New**.

   c. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see Account form.

d. Select **Submit**.

8. **Optional:** If you're using Hardware Asset Management (HAM), run the following one-time script.

a. Navigate to **All** > **System Definitions** > **Script includes**.

b. Select **New**.

c. Enter a **Name** for the script include.

d. Enter the script include code in the **Script** field.

```
var worker = new CanonicalUpdaterWorker();
          var tables = {
          'sn_hamp_hw_manufacturer': ['company'],
          'cmdb_hardware_product_model':
 ['normalized_company'],
          'cmdb_consumable_product_model':
 ['normalized_company'],
    };
    for (var table in tables) {
         if (tables.hasOwnProperty(table)) {
         var fields = tables[table];
         for (var i = 0; i < fields.length; i++) {
             worker.addNormalization(table, fields[i]);
         }
       }
    }
    worker.setProgressName(gs.getMessage("Normalization Data
 Service"));
    worker.setBackground(true);
    worker.start();
```

e. Select **Submit**.

f. Select **Run Script**.

Add a department

Departments provide another way to categorize users, groups, and assets. You can add departments and assign them to users.

Before you begin

Role required: user_admin or admin

About this task

An administrator may need to configure the form to show all the fields listed in the steps. For more information see Personalize a form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **User Administration** > **Departments** > **Create a new record**.
2. Enter or modify the department name, ID, and description.
3. Select the company that the department is associated with.
4. **Optional:** Add a department head, primary contact, or both from your list of users.
5. Select **Submit**.

Creating groups

Admins can add users to one or more groups.

Create a user group

Create groups and assign roles to them. Users assigned to the group inherit the roles.

Before you begin

Role required: user_admin

Procedure

1. Navigate to **All** > **User Administration** > **Groups**.
2. Select **New**.
3. On the form, fill in the fields.

   Some fields appear after personalizing the form. Personalize a form.

Field	Description
Name	Name of the group.
Manager	Group manager or lead.
Type	Category for this group. For example, a group designated as type **catalog** is a service catalog group and can also be accessed under the **Service Catalog** > **Catalog Policy** > **Fulfillment Groups** module. See Configure assignment group types for more information. You may need to Personalize a form to add the **Type** field. Activating the Work Management plugin adds the **Type** field automatically. **Note:** ITIL is added for groups with an empty group type. Also, the default reference qualifier for tasks enables these groups to assign tasks and other task types to the group.
Group email	Group email distribution list or the email address of the point of contact, such as the group manager.
Parent	Other group of which this group is a member. If a group has a parent, the child group inherits the roles of the parent group. The members of the child group aren't members of the parent group. For example, if an incident is assigned to the parent group and you select the **Assigned to** lookup icon, only the members in the parent group are available. The members of the child group aren't available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Check box that indicates whether the group is active or inactive. Inactive groups still appear in any reference field that already references the group, but aren't visible by non-admin users in: ○ lists of groups ○ the reference lookup list for reference fields ○ the auto-complete list of groups displayed when you type into a reference field
Exclude manager	Check box that controls whether the group manager receives email notifications.
Include members	Check box that controls whether the group members receive individual emails when someone sends an email to the **Group Email** address. The only exception to this functionality is for approval notifications, whereby all members of a group receive an approval notification, regardless of the **Include members** selection. See Receive notifications for more information.
Description	Helpful information about the group.

4. **Optional:** Remove or hide a group.

   a. **Note:** Only users in the hidden group are able to see the hidden group when selecting a group in a reference field.

   Create a true/false field labeled `Hidden` on the Group form.
   For more information on creating fields, see Add and customize a field in a table
   The system creates a field called **u_hidden** on the **Users [sys_user_group]** table and enables use of the **Hidden** check box to designate a hidden group.

   b. Create a new before query business rule on the [sys_user_group] (Group) table with the following script:

```
if (!gs.hasRole("admin") && !gs.hasRole("groups_admin") &&
 gs.getSession().isInteractive()) {
  var qc = current.addQuery("u_hidden", "!=",
 "true"); //cannot see hidden groups...
  qc.addOrCondition("sys_id",
 "javascript:getMyGroups()"); //...unless in the hidden group
}
```

   Note: For more information, see Before Query business rules.

Result
The user group is created based on the configuration that you've provided.

Note:

When `glide.ui.schedule_job_for_group_parent_change` is set to true, removing a parent group results in the roles of the parent group being added to the child group asynchronously. If `glide.ui.schedule_job_for_group_parent_change` is set to false, the roles of the parent group are added to the child group synchronously when the parent group is removed.

Add a user to a group

Add a user to a group so that the user inherits all the roles assigned to the group.

Before you begin
Role required: user_admin

About this task
If you're a non-admin user, you can't add a user to a group that contains the admin role. Likewise, if you don't have a security_admin role, you can't add a user to a group that contains the security_admin role.

Procedure
1. Navigate to **All** > **User Administration** > **Groups**.
2. Select a group **Name**.
3. In the **Group Members** related list, select **Edit**.
4. Select one or more names in the **Collection** list.
5. Select **Add** and **Save**.
6. **Optional:** Remove a user from a group when they change roles.
   a. Navigate to **All** > **User Administration** > **Groups**.
   b. Select a group **Name**.
   c. In the **Group Members** related list, select the check box next to each group member name you want to remove.
   d. From the **Actions on selected rows** menu, select **Delete**.

      Note: Before selecting **Delete**, first make sure you have properly selected the rows containing the users you want to remove from the group.

Configure assignment group types

Use the **Type** field to define categories of groups. Once defined, you can use these categories to filter assignment groups based on the group type using a reference qualifier.

For example, when selecting an assignment group from the Incident form, **Type** can be used to filter groups based on whether they're typically involved in the Incident management process. Groups such as Network or Help Desk are displayed as they're typically involved. Groups such as HR or New York are omitted.

The following items are provided in the base system.

- The types **catalog**, **itil**, and **survey**.
- The reference qualifier on [task.assignment_group] filters on **[Type] [equals] [itil]**.
- A reference qualifier named *`GetGroupFilter`* is available to filter for group types using Create a dynamic filter option.

Note: Dictionary overrides enable administrators to filter a group type on an extended table using a simple reference qualifier override.

Add a group type

You can add additional group types to filter assignment groups for tasks.

Before you begin
Role required: admin

About this task
You may need to configure the form to display the **Type** field. For more information see: Personalize a form

Procedure

1. Navigate to **All** > **User Administration** > **Groups**.
2. Select a group record.
3. Select the lock icon beside **Type**.
4. Select the lookup icon beside the selection field.
   The Group Types dialog opens.
5. Complete the following steps.

   a. Select **New**.

   b. Enter the group type name and description.

      Example
      For example, to define a type for a group as **incident** and **problem**, enter: **incident,problem**.

      Example
      Select **Submit**.

   The Group form reopens with the new type listed.
6. **Optional:** Add additional group types if needed.
7. Select **Update**.

Assign a group type

You can assign group types to filter assignment groups for tasks.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Groups** and select the desired group.
2. Select the lock icon beside **Type**.
3. Select the lookup icon beside the selection field and select one or more group types.

   Note: Because the default behavior of `task.assignment_group` is to filter out groups with group types defined, adding a type to a group filters it out of the **Assignment Group** field on tasks. To change the behavior, set up the reference qualifier.

4. Select **Update**.

Managing roles

Administrators can create and configure roles that grant specific permissions, which govern what users and groups with that role can do.

Base system roles

Administrators can assign one or more base system user roles to grant access to base system platform features and applications.

To learn more about managing per-user subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Important: Avoid granting an admin role when more specialized roles are available.

Administrator [admin]

The administrator role. This role has access to all system features, functions, and data because administrators can override access control list (ACL) rules and pass all role checks. Avoid assigning this role to your users when more targeted roles are available.

Contains Roles

List of roles contained within the role.

Groups

List of groups this role is assigned to by default.

None

Elevated

Whether the role is an elevated role. Elevated roles aren't assigned to users or groups, and must be used by elevation. For details, see Elevated privilege roles.

No

Special considerations

Grant this privilege carefully. If you have sensitive information, such as HR records, that you must protect, create a custom admin role for that area. Train any users authorized to see those records to act as the administrator. Also note the Special Administrative Roles.

Note: Users with roles related to the Key Management Framework can only be modified by admins with the kmf_admin role. For details on KMF roles, see Roles installed with Key Management Framework.

Agent administrator [agent_admin]

Agent administrators can download and administer the built-in system agent. They can manage MID Server-related scripts.

Contains Roles

No

Special considerations

None

Approval administrator [approval_admin]

Approval administrators can view or modify approval requests not directly assigned to them. Use the approver_user role to enable approvers to view or modify only requests directly assigned to them.

Fulfillers may approve within the product to which they are subscribed (ITSM Fulfiller approving within ITSM). This approval may be in the platform or via email. No additional entitlement is required.

Fulfillers may not approve beyond the product to which they are subscribed (ITSM Fulfiller approving within Procurement, GRC, etc.). This approval would need an additional approval entitlement for the user.

This role is assigned to users who are administrators and have thorough information and training on business processes. None.

Business process manager [business_process_manager]

Business process managers can create, read, and update any business process and manage the relationship of business processes with other records. This role is assigned to business process managers who are usually specialists and manage multiple business processes in the organization. Assign this role to users who generally work with other employees and are experts around business processes.

In the context of GRC, users with the sn_grc.manager role automatically inherit this role that enables them to manage the business processes for the entire organization.

Contains Roles

List of roles contained within the role - business_process_user.

CMDB administrator [sn_cmdb_admin]

The configuration management data base (CMDB) administrator is a key role required for interacting with the CMDB Workspace and the Service Graph Workspace. CMDB administrators can access all CMDB data, tools, and UIs within the CMDB Workspace and Service Graph Workspace. Users with this role can set policies that an editor can't, such as class manager and app service requirements.

As you drill down in the CMDB Workspace or the Service Graph Workspace, there are some dashboards and list views that require specific roles in addition to the CMDB Admin, CMDB Editor, or CMDB User roles.

Special administrative roles

Certain roles grant specific administrative rights without the full privileges of the admin role. For example, an administrator can grant a user the right to change UI policy but not client scripts.

To learn more about managing per-user subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

These roles don't change the behavior of the admin role, which grants full administrative privileges.

Important: You can't rename roles of any kind in the ServiceNow AI Platform

Assignment rule administrator [assignment_rule_admin]

Create, modify, and delete assignment rules.

Read-only role

The read-only role (*snc_read_only*) restricts a user or a group of users to read-only access on the tables to which the user already has access.

This role is designed to complement other roles a user possesses. Its purpose is to restrict actions like the insert, update, or delete operations on the tables accessible through their existing roles.

After you assign this role to a user, they can no longer create, update, or delete records on ANY tables.

Note: Assign this role only to users. Don't assign this role to other resources in the system, including applications, access control levels (ACLs), and so on.

The *snc_read_only* role can be assigned to any user to limit access to data without having to create ACLs for system tables, custom tables, and fields. This practice is useful for performing internal or external audits without enabling a user to have insert or update access to data.

Users with the *snc_read_only* role have the following restrictions regardless of other roles and privileges that they have.

- Can't insert, update, or delete records from the UI or when using the GlideRecord API.
- Can't activate or upgrade plugins.
- Can't directly run SQL.
- Can't upload XML files.
- Can only run background scripts when on an instance in the public sandbox environment.

Note: These role restrictions are in place even if impersonating another user with write access such as an admin.

Exempt tables from the read-only restriction

Three system properties control which tables users with the *snc_read_only* role can still create, update, or delete records on. These properties are not created on instances by default. To use them, manually add each property to the System Properties [sys_properties] table and set the value to a comma-separated list of table names. See Add a system property.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

snc_read_only exempt table system properties

Property	Description
glide.security.snc_read_only_role.tables.exempt_create	Comma-separated list of tables in which users with the *snc_read_only* role can create records.
glide.security.snc_read_only_role.tables.exempt_write	Comma-separated list of tables in which users with the *snc_read_only* role can update records.
glide.security.snc_read_only_role.tables.exempt_delete	Comma-separated list of tables in which users with the *snc_read_only* role can delete records.

Activate the read-only role

If it isn't already active, an administrator can activate the Read-Only User Role (com.snc.read_only.role) plugin.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Read-Only User Role (com.snc.read_only.role) plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Read-only role properties

These system properties control the snc_read_only role. The following default values are used for the properties.

System properties for Read-only role

Name	Description
glide.security.snc_read_only_role.tables.exempt_create	Specifies which tables are exempt from the read-only role enforcement and enable the creation of new records. • Type: string • Default value: sys_user_session, sysevent, syslog, syslog_transaction, sys_user_preference, sys_ui_list,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties for Read-only role (continued)

Name	Description
	sys_ui_list_element, sys_db_cache, user_multifactor_auth • Location: System Properties [sys_properties] table
glide.security.snc_read_only_role.tables.exempt_write	Specifies which tables are exempt from the read-only role enforcement and enable the updating of existing records. • Type: string • Default value: sys_user_session, sysevent, syslog, syslog_transaction, sys_user_preference, sys_ui_list, sys_ui_list_element, sys_db_cache, user_multifactor_auth • Location: System Properties [sys_properties] table
glide.security.snc_read_only_role.tables.exempt_delete	Specifies which tables are exempt from the read-only role enforcement and enable the deletion of existing records. • Type: string • Default value: sys_user_preference, sys_ui_list, sys_ui_list_element, sys_db_cache, user_multifactor_auth • Location: System Properties [sys_properties] table

After you configure these properties, assign the read-only role as needed. When you log in, you're restricted from creating, updating, or deleting records on ANY tables unless you modified these properties.

Note: Test the read-only role by assigning it to a user and then impersonating that user.

Application specific roles

Applications you install on your instance may include additional roles. Follow the links in this section to see roles installed along with applications.

System roles

Administrators can control access to features and capabilities on a ServiceNow instance by assigning roles to users.

Your ServiceNow AI Platform instance includes roles to grant access to the platform features and applications included in a base system instance. Applications you install on your instance may include additional roles to control access to those installed features. For more information about roles, see Exploring user administration.

Important: Base system and roles installed with applications can be deactivated by administrators, but can't modify or rename these roles.

Base system roles

Base system roles are present in all ServiceNow instances and don't require the installation of additional plugins.

Role	Description
admin	The system administrator role. This role has access to all system features, functions, and data because administrators can override access control list (ACL) rules and pass all role checks. Avoid assigning this role to your users when more targeted roles are available. **Warning:** Grant this privilege carefully. If you have sensitive information, such as HR records, that you need to protect, you must create a custom admin role for that area. You must also train any users authorized to see those records to act as the administrator. Also note the Special Administrative Roles.
agent_admin	Agent administrators can download and administer the system's built-in agent. They can manage MID Server-related scripts.
ais_admin	AI search administrators can query, create, update, and delete indexing and search settings and log messages through the AI Search application.
approval_admin	Approval administrators can view or modify approval requests not directly assigned to them. Use the approver_user role to enable approvers to only view or modify requests directly assigned to them. Use of this role requires a Fulfiller license. Use of the approver_user role requires an Approver license.
approver_user	Approver users can modify requests for approval routed to them. They also have all capabilities of requesters. **Note:** There's a fee associated with this role. Don't assign it to users without confirming your organization has the appropriate entitlement.
assignment_rule_admin	Assignment rule administrators can manage assignment rules.
asset	Asset users can manage hardware and software assets.
business_process_admin	Business process admins can create, read, update, and delete all records and their relationships in the business process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description
	In the context of Governance, Risk, and Compliance (GRC), users with the sn_grc.admin role who manage GRC applications and their setup automatically gain access to this role. This access enables the GRC administrators to administer a business process and its records similar to other GRC tables. **Important:** This role is assigned to users who are administrators and have thorough information and training on business processes.
business_process_manager	Business process managers can create, read, and update any business process and manage the relationship of business processes with other records. This role is assigned to business process managers who are usually specialists and manage multiple business processes in the organization. These users generally work with other employees and are experts around business processes. In the context of GRC, users with the sn_grc.manager role automatically inherit this role that enables them to manage the business processes for the entire organization.
business_process_user	Business process users can update the business processes that a user owns and can also read any business process. This role must be assigned to the respective process owners who manage the business process that they own. This role can also be provided to users who are required to view the business processes in the organization and understand them better. In the context of GRC, users with the sn_risk.user role are automatically assigned this role as this role enables them to manage the business processes they own as well as read all business processes.
catalog	Catalog users can access service catalog requests.
catalog_admin	Catalog administrators can manage the Service Catalog application, including catalog categories and items.
catalog_editor	Catalog editors can create, modify, and publish items within categories that they're assigned to.
catalog_item_designer	Catalog item designers can view the status of their category requests. This role is granted automatically to users when they make a request for an item designer category.
catalog_manager	Catalog managers can view and assign catalog editors to their categories. Can also create, modify, and publish items within their categories.
category_manager	Category managers can create, edit, and delete model categories.
cmdb_dedup_admin	CMDB de-duplication admins can review and remediate CMDB de-duplication tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description
cmdb_ms_user	CMDB multiscource readers can access and run a multi-source CMDB query, but can't create a query. This role contains Contains cmdb_read role.
cmdb_ms_editor	Can create and run a query, has full read and write access, but can't do Recompute. Contains cmdb_ms_read role.
cmdb_ms_admin	Can create and run a query, and can modify CMDB 360 properties. Contains cmdb_ms_write role.
cmdb_read	Can read any CMDB table. Contained in admin and itil.
communication_manager	Manages communication for major incidents and is responsible for communicating with all stakeholders.
contract_manager	Can create, edit, and delete contracts through the Contract Management application.
data_classification_admin	Administers all aspects of the Data Classification application, data classification code setup and assignment,
data_classification_auditor	Audits Data Classification code assignments.
ecmdb_admin	Can administer the CMDB.
filter_admin	Can manage filters.
filter_global	Can create global filters.
filter_group	Can create filters that belong to groups of which the user is a member.
gauge_maker	Can create gauges from reports. Starting with Helsinki, reports are no longer made into gauges.
guided_tour_admin	Can manage and administer Guided Tour functionality.
image_admin	Can manage image files on the Images [db_image] table.
impersonator	Can impersonate users. This role doesn't allow impersonation of admin users.
import_admin	Can manage all aspects of import sets and imports.
import_scheduler	Can schedule imports. **Warning:** Grant this role carefully. The import_scheduler role is equivalent to giving the user the admin role, because the import_scheduler has the ability to execute scripts with administrator level privileges.
import_set_loader	Can load import sets.
import_transformer	Can manage import set transform maps and run transforms.
incident_manager	Manages Incident properties and Major Incident trigger rules.
inventory_admin	Can create and delete stock information. Only users with the inventory_admin role can edit stock rules, stockrooms, and stockroom types.
inventory_user	Has access to stock information. Can create and manage transfer orders.
itil	Can perform standard actions for an ITIL helpdesk technician. Can open, update, close incidents, problems, changes, configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description
	management items. By default, only users with the itil role can have tasks assigned to them.
itil_admin	Possesses more privileges than the itil role and is intended for team leads. This role has the ability to delete incidents, problems, changes, and other related entities when both the itil and itil_admin roles are assigned. In addition, the itil_admin role grants full control of the CMDB. The itil_admin role includes all of the permissions granted to the sn_cmdb_admin role, which provides full access to CMDB data, tools, and UIs.
knowledge	Can create, edit, and review knowledge base articles.
knowledge_admin	Can manage the knowledge base.
list_updater	Can use Update Entire List and Update Selected menu options on lists.
maint	Reserved for ServiceNow use.
mid_server	Role that any MID server user should be granted. This role gives the MID server access to the tables it ordinarily uses.
model_manager	Can create CMDB models. Model manager can control the base models and any model extensions that aren't software or consumables. Consumable models are controlled by the asset manager role (asset). Software models are control by the software asset manager role (SAM).
major_incident_manager	Initiates the major incident process by assessing and approving major incident candidates or creating a major incident. Maintains the ownership and accountability for the life cycle of the incident. Identifies the users and groups to be involved in the resolution activities and sets up communication channels.
nobody	The nobody role means that no user has access - not even admin or maint. Use the nobody role carefully. The nobody role takes precedence over the admin override option on ACLs, so even admins can't have access. See Create an ACL rule. Don't assign it to specific users. You can use this role in ACLs that control access to resources, such as UI pages, processors, script includes, and records. **Warning:** Applying the nobody role may be irreversible if applied to some important system functions.
personalize	Can configure forms, lists, rules, controls, scripts.
personalize_choices	Can configure choices and predefined responses for non-journal fields designated as choice or suggestion fields.
personalize_control	Can configure controls on lists, such as filters, links, and buttons.
personalize_dictionary	Can configure dictionary entries and labels.
personalize_form	Can configure forms.
personalize_list	Can configure lists and list calculations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description
personalize_responses	Can configure predefined responses for journal fields designated as suggestion fields.
personalize_rules	Can configure business rules and scripts. This role contains the following specialized roles for granting selective, administrative access to rules and scripts: • business_rule_admin • client_script_admin • ui_policy_admin • ui_action_admin
personalize_styles	Can configure field styles.
personalize_ui	Can configure forms and lists.
public	No login is required to access features or functions with the public role.
release_admin	Can edit Release history for a release.
report_admin	Can manage reports.
report_global	Can create global reports.
report_group	Can create reports and share reports with groups that the user is a member of. Users with this role can edit reports shared by other users in the group.
report_publisher	Can make reports available on a public page.
report_scheduler	Can schedule a report to be emailed.
script_fix_admin	Can create and manage fix scripts but can't run fix scripts.
search_application_admin	Can query, create, update, and delete records on search UX-related tables. Contains the ais_admin role.
sn_appclient.app_client_user_install_installer	Can install applications containing the same company as the currently logged in instance. User role that enables first-time installation of applications for the company associated with the current instance. A user with this role can't install an application for another company.
sn_appclient.app_client_user	Can install applications containing the same company as the currently logged in instance.
sn_cmdb_admin	Provides full access to CMDB data, tools, and UIs. A CMDB Admin, for example, sets policies in the CI Class Manager and application service requirements. CMDB Admin provides the highest level of access to the CMDB.
sn_cmdb_editor	Provides access to CMDB records. A CMDB Editor can't change policies such as in the CMDB Data Manager or in the CI Class Manager.
sn_cmdb_user	Provides read-only access to CMDB data and to basic UIs such as CMDB reports and dashboards.
soap	Can query, create, update, and delete records on all tables, as well as execute scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description
soap_create	Can create records on all tables and columns.
soap_delete	Can delete records on all tables and columns.
soap_ecc	Can query, create, and update on the ECC Queue table only.
soap_query	Can query records on all tables and columns.
soap_query_update	Can query and update records on all tables and columns.
soap_script	Can execute business rule endpoint function via script.do.
soap_update	Can update records on all tables and columns.
survey_admin	Can see all Surveys, their definitions, questions, instances created by them and others. Survey administrators can use all modules in the Survey application menu.
survey_reader	Users with survey reader role can view surveys and related information, such as survey responses, survey groups, scorecards, and reports. Survey_reader can't change or modify a survey or survey responses.
task_editor	Can edit protected task fields.
template_editor	Can create templates for personal use, and modify or delete personal templates. Included in the itil role in the base system.
template_editor_global	Can create templates for global use.
template_editor_group	Can create templates for groups.
template_scheduler	Can schedule template-based record creation.
text_search_admin	Can customize Global Text Search groups and tables.
timecard_admin	Can approve, modify, and delete the time cards of other users.
ts_admin	Can administer Zing text indexing and search engine.
unlimited_createnow	Role for CreateNow unlimited licensed users.
upgrade_app	Can upgrade installed applications containing the same company as the currently logged in instance. Can't perform first-time installations of applications published to the Application Client page.
user	Available for customer use, has no function in the base system.
user_admin	Can administer users, groups, locations, and companies.
view_changer	Can switch active views.
workflow_admin	Can create, edit, publish, or delete graphical workflows.
workflow_creator	Can create new graphical workflows.
workflow_publisher	Can publish graphical workflows.

Application-specific roles

Applications you install on your instance may include additional roles. Follow the links in this section to see roles documentation on roles installed along with applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Product	Application
Platform Capabilities	Advanced Work Assignment

Create a role

Create a role to control access to features and capabilities in applications and modules. The new role doesn't have access to any application or module until you add other roles to it, or add it to the appropriate applications and modules.

Before you begin

Role required: admin

About this task

After access has been granted to a role, all groups or users assigned to the role are granted the access. Roles can contain other roles, and any access granted to a role is granted to any role that contains it.

For a complete list of the roles included with the base instance, see Base system roles

Warning: If your organization hasn't manually allocated user-based subscriptions before,subscription assignments are based on user roles and the kind of access each role permits. Creating, customizing, and assigning roles can have subscription usage impact. For more information about how roles are evaluated for subscription assignment, see Automatic subscription assignment.

Move this action to the background so you aren't waiting when adding a number of group members by adding the system property `glide.ui.schedule_slushbucket_save_for_group_roles`. Set the system property to **true**. The system user is used to create records or update existing ones since the action is running in the background.

Procedure

1. Navigate to **All** > **User Administration** > **Roles** and create a record.
2. Complete the form.

Field	Description
Name	Enter a name for the role. **Note:** You can't rename roles of any kind in the ServiceNow AI Platform. If you manually create a role, you can't rename it after you save it.
Requires Subscription	Indicates whether users with this role require a subscription to stay in compliance. **Yes** Measured-role that requires a subscription. You can allocate subscriptions to users with this role by adding one or more groups to a product subscription. To learn more, see Managing per-user subscriptions in Subscription Management. **No** Not a measured-role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Unspecified Neither
Application	Select the application that contains this record.
Elevated privilege	A role that requires elevated privilege can't be assigned to a user at login by the system. Instead, a user must manually elevate privileges to receive the elevated role. Select this option to mark this role as required to elevate it to high security. See Elevated privilege roles for more information.
Description	Select the roles to delegate to the group member.

Grant a role access to applications and modules

Roles control access to features and capabilities in applications and modules. You add a role to an application or module to enable the role to grant access to the application or module for all users with the role.

Before you begin
Role required: admin

About this task
Warning: If your organization hasn't manually allocated user-based subscriptions before,subscription assignments are based on user roles and the kind of access each role permits. Creating, customizing, and assigning roles can have subscription usage impact. For more information about how roles are evaluated for subscription assignment, see Automatic subscription assignment.

Procedure
1. Navigate to **All** > **System Definition** > **Applications** or **System Definition** > **Modules**.
2. Select the appropriate application or module to open it in form view.
3. Select the lock to open the **Roles** field.
4. Add the desired roles to the application or module.
5. Select the lock to close the **Roles** field, and then save your changes.

Assign a role to a group

You can assign a role to a group to grant access to applications and modules to group members.

Before you begin
Role required: user_admin or admin

About this task
When you assign roles to groups rather than to individual users, members of the group inherit the role. When a user switches groups, the new group role is assigned automatically. For information about the Service Mapping roles, see Control user access to application services.

Procedure
1. Navigate to **All** > **User Administration** > **Groups**.
2. Select the group to assign a role.
3. In the **Roles** related list, select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Add the desired roles to the group.
5. Select **Save**.

Assign a role to a user

A user inherits roles from all groups to which they belong. You can also assign roles directly to a user. Whenever a user is assigned a new role, it only takes effect after logging in with a new session.

Before you begin

Role required: user_admin or admin
When possible, simplify user administration by assigning roles to groups. Create groups that contain all the roles necessary for specific personas, and then assign users to those groups.

About this task

To grant the admin role to a user, you must also have the admin role. To grant the security_admin role to a user, you must also have the security_admin role. You must elevate to the security_admin role before granting the security_admin role to other users. See Elevate to a privileged role.

You can't delete roles that are assigned to the group from the user record. You must remove the user from the group record.

Warning: If your organization hasn't manually allocated user-based subscriptions before,subscription assignments are based on user roles and the kind of access each role permits. Creating, customizing, and assigning roles can have subscription usage impact. For more information about how roles are evaluated for subscription assignment, see Automatic subscription assignment.

Procedure

1. Navigate to **All** > **User Administration** > **Users** and then open a user record.
2. In the **Roles** related list, select **Edit**.
3. In the **Collection** list, select the desired roles, and then select **Add**.
   The **Collection** list displays only roles for applications and plugins that are installed on your instance. If a role does not appear, the corresponding application may not be installed.

   Note:

   The System administrator (admin) role provides access to all system features, functions, and data, regardless of security constraints. Avoid assigning this role to users when more targeted roles are available.

4. Select **Save**.

What to do next

Note: If the user is logged in when you update their roles and they're unable to access records enabled by the new role, they may need to log out and back in again.

Add a role to an existing role

When you add a new role to an existing role for a user, the user inherits the access that is granted by the new role.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Warning: If your organization hasn't manually allocated user-based subscriptions before,subscription assignments are based on user roles and the kind of access each role permits. Creating, customizing, and assigning roles can have subscription usage impact. For more information about how roles are evaluated for subscription assignment, see Automatic subscription assignment.

Procedure

1. Navigate to **All** > **User Administration** > **Roles** and open the existing role.
2. Click **Edit** in the Contains Roles related list.
3. Use the slushbucket to add one or more roles to the existing role.
4. Click **Save**.

The users with the existing role inherit the access that is granted by the new role.

Create a group role

Create a group role to control access to features and capabilities in applications for all members in a group.

Before you begin

Role required: admin.

About this task

Warning: If your organization hasn't manually allocated user-based subscriptions before,subscription assignments are based on user roles and the kind of access each role permits. Creating, customizing, and assigning roles can have subscription usage impact. For more information about how roles are evaluated for subscription assignment, see Automatic subscription assignment.

Procedure

1. Navigate to **All** > **User Administration** > **Group Roles**.
2. Select **New**.
3. Fill in the fields on the form and then select **Submit**.

Field	Description
Group	Select a group.
Role	Select the role to apply to the group.
Inherits	Select this option to have all members of the group inherit the role. This option is selected by default.

Note: To move this action to the background so you aren't waiting when adding a number of group members, add the system property *glide.ui.schedule_slushbucket_save_for_group_roles* and set it to true.

Audit user roles

Changes to user roles are tracked in the Audit Roles [sys_audit_role] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Note: If the Prevent duplicate entries with Contextual Security: Role Management V2 plugin is installed, you must Enable role auditing with Contextual Security: Role Management V2.

Procedure

Navigate to **All**, and then enter `sys_audit_role.list` in the filter.
The Audit Roles [sys_audit_role] table displays changes to user roles.

Field	Description
Changed by	The user who made the change.
Count after change	Direct role added as a result of the change (if any), plus the number of inherited roles added.
Granted by group	If the role was inherited, the group that the role was inherited from.
Operation	The type of change. Values include: • Added • Removed
Role	The affected role.
User	The affected user.

Delegating roles

Administrators can grant users the ability to assign roles within groups. However, these users can only assign roles that they already have.

Role delegators are users responsible for assigning roles to other users within a group. This role can be assigned manually by granting the role_delegator role to the user, or through the **Group Manager Change** business rule.

The **Group Manager Change** business rule, which is disabled by default, automatically grants the role_delegator role to a user who is designated manager of a group in the **Manager** field on the **Group** form. The role is removed when the user is no longer the manager of the group.

Activate the business rule to take advantage of it. For more information on **Business rules**, see Classic Business rules.

Reviewing Roles and Role Changes

To view roles and role changes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Individual users: Navigate to **User administration** > **Users** select a user, and review the **Roles** related list.
- Role delegators: Review who can give roles in which groups by navigating to **User administration** > **Role delegators**.
- For all role changes: To see a history of role changes, navigate to **System security** > **Reports** > **Role audit**. See Audit user roles for more information.

Designate role delegators

Designate role delegators to assign roles to users who are in a particular group.

Before you begin
Role required: admin

About this task
Delegators can assign roles that they inherit from a group. They can also assign roles that an administrator assigned to them.

Procedure

1. Navigate to **All** > **User Administration** > **Designate Role Delegator**.
2. Select the group that includes the user who you want to be the role delegator.
3. Select the user.
4. Select **Submit**.
   A change request for the role delegator request is created and automatically approved.

Assign roles as a role delegator

If you're a role delegator, you can delegate roles that are assigned to you for groups that you manage.

Before you begin
Role required: role_delegator

Procedure

1. Navigate to **User Administration** > **Delegate Roles in Group**.
2. Fill out the form.

Field	Description
Group	Select the group in which to delegate a role or roles to a member. Any group can be selected, including groups that the role_delegator doesn't belong to or groups that the role_delegator doesn't manage.
User	Select the group member to delegate a role or roles.
Roles to delegate	Select the roles to delegate to the group member. The roles available for delegating are only the roles that the role_delegator has.

(Optional) To remove a delegated role from a user, open the delegation record and remove the unwanted role or roles.

Prevent a role from being delegated

You can prevent roles from being delegated to users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
By default, the following roles can't be delegated.

- admin
- public
- role_delegator

> **Note:** A user with the role_delegator role can't delegate this role to other group members.

Procedure
1. Navigate to **All** > **User Administration** > **Roles**.
2. Open the role.
3. Configure the form to add the **Grantable** or **Can delegate** fields.
4. Clear the check box for one or both of these fields.
5. Select **Update**.

Time-limited role

Time-limited roles give users the defined role during the defined time period.

Assigning the time-limited roles ensures users have elevated access only when needed, without requiring manual revocation. When you assign a time-limited role to a user, you specify a start and end date. The system automatically activates the role at the start date and removes it when the end date passes, eliminating the need for manual access cleanup.

Supported roles and limits

Time-limited roles enhance security by automatically reducing privileges when no longer needed, support compliance through time-bound access policies, and improve efficiency by eliminating manual tracking and revocation. The following table provides information about the available time-limited roles and limits:

Configuration information and limits of time-limited role

Supported Roles	Assignment Rules
• `admin` • `snc_read_only` • `impersonator` • `snc_required_script_writer_permission`	• Maximum of four concurrent time-limited roles per user can be assigned • Time-limited role can be maximum of 5 days per user. • Time-limited assignments can handle more than one role assignment to a user, even if the total duration across assignments is less than five days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Grant a time-limited user role

Learn how to assign a role to a user temporarily. Use this feature if you have a user who needs to perform a one-time action that is normally outside their roles.

Before you begin

Role required: user_admin

Note:

- Time-limited user roles can be assigned to a user for a maximum of 5 days.
- For a user, you can assign only `admin`, `snc_read_only`, `impersonator`, and (or) `snc_required_script_writer_permission` role as time-limited role.
- Time-limited user roles are not displayed to the assigned users under the **Roles** tab of the user (sys_user) record.
- When the time-limited role assigned users log in, they see a notification regarding the role assignment.
- Time-limited assignments can handle more than one role assignment to a user, even if the total duration across assignments is less than five days.

About this task

Warning: Usage of Time-limited User Roles may consume access and use rights procured by customer and could result in additional subscription fees.

Procedure

1. Navigate to **All** > > **User Administration** > **Time-limited user roles**.
2. Select **New**.
3. Fill in the fields on the form.

   All fields except Comments are mandatory.

Fields	Description
Active	Determines if the time limited role assignment is active.
Role	The role assigned to the user. Only admin, impersonate, and snc_readonly are allowed
User	The user to be assigned the time limited role
Start Time	The start time and date for the time limited role
End Time	The end time and date for the time limited role **Note:** **End Time** cannot be more than 5 days from the **Start Time**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Comments (Optional)	Additional comments or information for the limited role assignment

4. Select **Submit**.

Result
The specified user now has the role. They must complete their restricted task between the start time and the end time.

Monitoring user activity

Learn about the tools available to administrators for monitoring users on their instance.

User administration tools

In addition to storing information on a user, user accounts are also associated to groups and roles. Your instance uses groups and roles to determine which records and features an individual may access.

Impersonation

Administrators can select user records for impersonation. Use this feature to experience the instance as another user, with that user's preferences and permissions. User impersonation can be a valuable tool for testing and troubleshooting. For more information on impersonation, see Impersonating users.

Investigating user account activity

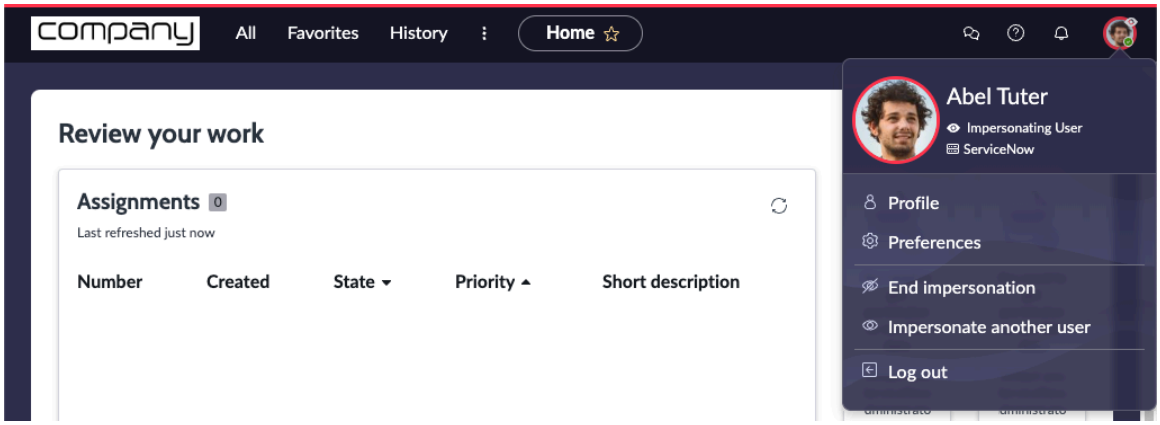
At any time there is a need to review specific user behavior, below are the recommended steps on how to review the transaction logs and event logs:

- Locate the IP address of successful/failed login for a particular ServiceNow user for their instance
- Modify the time frame of the search
- Limiting the scope of the search by user name
- View successful/failed login attempts

For more information about investigating user activity, see the How to investigate user account activity [KB0564981] article in the Now Support Knowledge Base.

User sessions

With user session management, and administrator can view and terminate individual user sessions, lock out users from the instance, and make users inactive. For details on managing user sessions, see Managing user sessions.



User records are also associated with transaction logs. Administrators can use these logs to track all browser activity for an instance.

Impersonating users

Administrators are able to impersonate other authenticated users, a feature primarily used for testing.

This function enables the administrator to access the system exactly as the impersonated user, including identical menus and modules. All actions performed by the administrator during impersonation are recorded as if they were executed by the impersonated user.

Impersonation limitations

When you impersonate a user, all scope-protected roles and encryption module roles are supported if the **Impersonation** option is configured in the module access policy. See Create a module access policy for details.

Impersonating a user enables access to scope-protected and encryption roles, as defined in the access policy. However, if impersonating a user with an admin role, access to certain features and modules is limited unless the impersonator already possesses those roles.

Impersonating a user with an application-specific admin role, like Human Resources admin or Security Incident Response, limits access to certain features such as security incidents and profile information, unless these roles are already assigned to the impersonating admin. This restriction extends to certain modules and applications in the navigation bar, and admins can't change the password of users with application admin roles.

The following actions or conditions cause a user impersonation to end:

- The user impersonates a different user
- The user session ends, for example after a user logs out of their instance

> **Note:** When an administrator starts impersonating a user, the 'Impersonate Begin' event is logged in the system log. Similarly, the 'Impersonate End' event is recorded when impersonation concludes under one of the two conditions listed above.

Impersonation requirements

The user account to be impersonated must have a user ID. You can find this ID in the User [sys_user] record for the account. If this value is missing, the message `The user you selected could not be impersonated` appears.

You need several different accounts to test the system.

- An admin account to do work
- An information technology infrastructure library (ITIL), or similar, account to test as a technician
- An ESS account to test as an end user

More logins may be required to adequately test the system.

> **Note:** If you try to impersonate a user who is either locked out or inactive, the system will automatically log you out if you initiate an action or select a link. Remember that all changes made during impersonation only apply to that session. To help ensure accuracy, log out and then log back in after completing the impersonation.

Mobile impersonation

Mobile impersonation is available on ServiceNow mobile apps. For information on mobile impersonations, see Mobile impersonation.

Manage the visibility of the impersonation feature

Before users can impersonate another user, an administrator must make the feature visible.

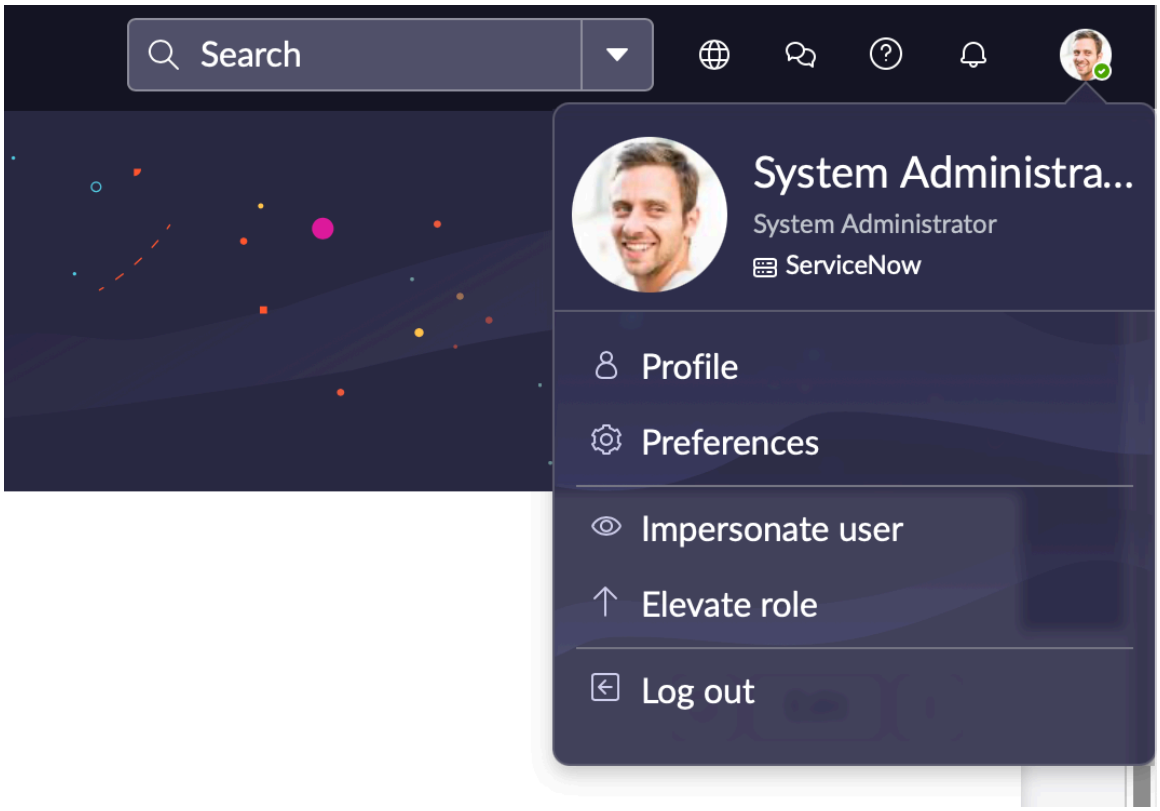
Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System properties** > **UI properties**.
2. Select a check box under **Enable impersonation button in the banner line** to display or conceal the button.
3. Select **save** at the top of the page.
   Admins can still impersonate users via the **impersonate_dialog** UI page.

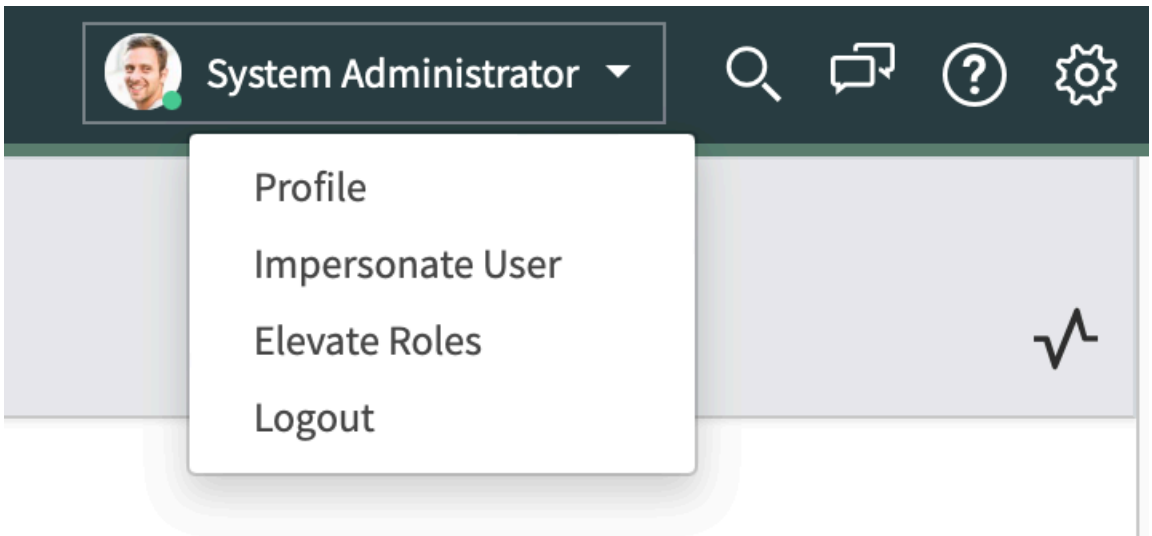
Impersonate a user

You can select a user or enter a different user name to perform an impersonation.



Before you begin
Role required: impersonator

Procedure

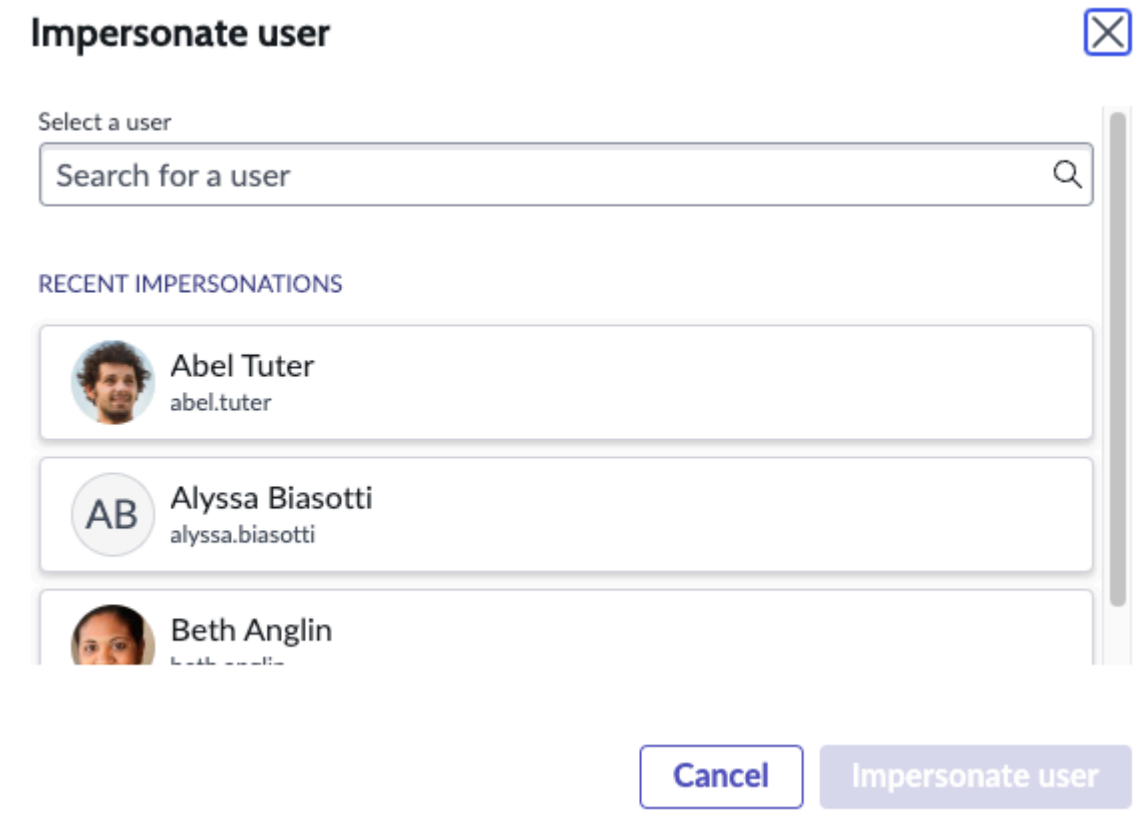


1. In the banner frame, select your user profile picture to open the user menu.
2. Select **Impersonate User**.

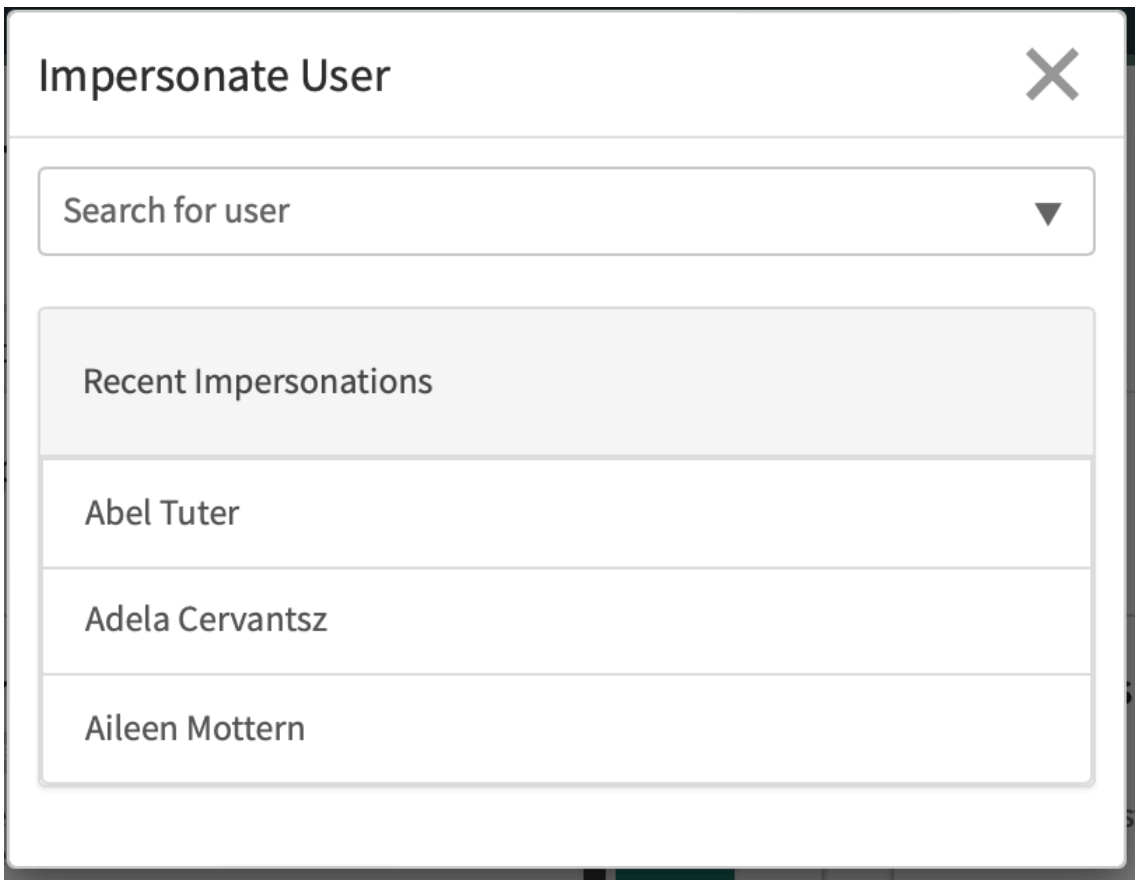
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In Next Experience:

- In Core UI:



The Impersonate user dialog box displays.



3. Select a user from the **Recent Impersonations** list or enter a different user's name in the user selection field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In Next Experience:

- In Core UI:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Impersonate User**.
5. **Optional:** To impersonate another user while impersonating a user, open the user menu and select **Impersonate another user**.
6. To return to your original login, open the user menu and select **End Impersonation**.

> **Note:** In some cases, impersonating a user might cause an issue that makes it difficult to switch back. If you're presented with a broken page while impersonating a user in a test environment, you may need to force a logout. To do so, navigate to http://<instance name>.service-now.com/logout.do and log back in.

Impersonation logs

Impersonations are logged in the system log.

Log impersonations for either interactive (UI) or non-interactive sessions.

Impersonation logging for interactive sessions

Interactive sessions are performed through the user interface (UI). Enable or disable impersonation logging for interactive sessions using the *glide.sys.log_impersonation* property.

If you enable impersonation logging for interactive sessions by setting *glide.sys.log_impersonation* to **true**, all interactive sessions are recorded in the log.

Property	Description
glide.sys.log_impersonation	Enables (**true**) or disables (**false**) impersonation logging for interactive sessions.

Impersonation logging for non-interactive sessions

Non-interactive sessions are performed by applications and scripts, not through the UI.

Impersonation logging of non-interactive sessions is turned off by default. If you enable impersonation logging by setting the *glide.sys.log_impersonation.non_interactive* property to **true**, impersonations of non-interactive sessions are recorded in the impersonate log.

Even with *glide.sys.log_impersonation.non_interactive* set to **true**, the system doesn't log certain common impersonation tasks performed on behalf of the default users (*system*, *soap.guest*, and *guest*) because the application impersonates those default users to perform a variety of tasks.

Use the *glide.sys.log_impersonation.non_interactive.exclusion* property to exclude impersonations by other users in addition to the default users.

Property	Description
glide.sys.log_impersonation.non_interactive	Enables (**true**) or disables (**false**) impersonation logging for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	non-interactive sessions.
glide.sys.log_impersonation.non_interactive.exclusion	Excludes impersonation logging of non-interactive sessions for specified users. Enter user names as a comma-separated list. Default users (**system**, **soap.guest**, and **guest**) don't need to be included in the list.

User impersonation auditing

User impersonation auditing creates a structured, dedicated audit trail for every impersonation session.

Impersonation activity is indistinguishable from regular user activity in a standard audit trail, you can't reliably attribute changes to the administrator who made them rather than the user they were impersonating. With the user impersonation auditing you can capture every impersonation session as a self-contained audit set, clearly separated from ordinary session data and accessible to administrators through system logs.

Plugin and feature property

- Plugin required for user impersonation auditing (`com.glide.security.audit`).
- Property to control the feature user impersonation auditing (`glide.audit.user.impersonation.enabled`).

Accessing impersonation audit records

Impersonation audit records are available to security administrators through **System Logs** > **User Impersonation**. The list view displays a summary of all impersonation sessions recorded on the instance, including the identities of both parties and the session duration. Selecting any session record opens the detail view, which presents the complete audit set — the start entry, all actions in chronological order, and the closing entry — in a single place. This allows a security administrator to verify that the actions taken during a session were appropriate and within the expected scope of the impersonation.

Audit record fields

Each entry in an impersonation audit set, whether a session-level record or an action-level entry, captures the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impersonation audit record fields

Field	Description	Example value
Impersonated by	User who initiated the impersonation session.	`john.smith`
Impersonated to	User whose identity is being assumed.	`jane.doe`
Impersonation Start Time	Timestamp when the impersonation session began.	`2024-06-10 09:15:32` UTC
Impersonation End Time	Timestamp when the session was terminated.	`2024-06-10 09:47:11` UTC

Select the **Impersonation Start Time** to know more about the impersonation activity. Following details are displayed:

- Created
- Type
- Origin Application
- Created by
- Response time
- Output length
- SQL count
- SQL time
- Business rule count
- ACL Time
- URL

You can use the **Personailze List Columns** options to add more columns to the log.

Note: Impersonation audit records follow the same retention policy as transaction logs. The default retention period is `seven` days, but this is configurable by a system administrator. Any change to the transaction log retention setting applies equally to impersonation audit records.

Managing user sessions

The ServiceNow AI Platform provides the ability to view and terminate individual user sessions, lock out users from the system, and make users inactive.

Regardless of the number of windows you have open in a browser, it's considered to be one session. However, if you have two separate browsers open (such as Google Chrome and Safari), it's considered to be two separate sessions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Terminating a user session effectively logs that user out of the next transaction, which is usually the next browser select. Use the terminate sessions feature when you want to perform system maintenance.
- Locking a user out of the system means they can no longer log in or generate any actions from any email messages that they send to the instance. Locking users out also terminates their sessions.
- Making a user inactive means they don't show up in any fields that reference active users on the **User** table.

Configure a maximum active time for user sessions

Secure your instance by enforcing a maximum time for sessions regardless of user activity.

Before you begin

Role required: admin

About this task

By default, sessions expire only after a period of inactivity. Enforcing a maximum active session time ends sessions regardless of whether a user has been active recently, including whether they recently selected to extend a session. The active session timeout should be greater than the value configured for the inactive session timeout. For example, if sessions are configured to time out after 30 minutes of inactivity, the active session timeout should be greater than 30 minutes.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Filter the System Properties [sys_properties] list for the following properties and then select a property to open its record.
   - *`glide.ui.active.session.life_span`*: Sets the maximum session time for authenticated user sessions regardless of user activity. Authenticated users are logged out of the instance after the time specified and must enter their credentials again to access the instance.
   - *`glide.guest.active.session.life_span`*: Sets the maximum session time for guest user sessions regardless of user activity. This setting helps secure an instance using applications that involve guest user sessions, such as Agent Chat.
3. In the **Value** field, enter the number of minutes before the session times out regardless of user activity.
   The value should be greater than the value of the corresponding properties for an inactive session timeout: *`glide.ui.session_timeout`* for authenticated users or *`glide.guest.session_timeout`* for guest users. By default, the inactive session timeout for both authenticated and guest users is 30 minutes.
4. Select **Update**.

Related topics

Configure a maximum active time for integration sessions

Modify user session timeout after inactivity

Specify when to time out user sessions after a period of inactivity.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, after 30 minutes of inactivity in the application, the platform logs the user out automatically, unless the **Remember Me** check box in the login screen is selected. Making the interval longer can lead to the unnecessary maintenance of inactive sessions in memory. Adjust this timeout setting to no more than a few hours, although up to 24 hours is workable.

Note:

- Ajax calls to the server keep the session alive (such as Labels and Refreshing dashboards).
- Polling keeps the session alive when the chat desktop is open (requires the Chat plugin).

Procedure

1. Clear the **Remember Me** check box in the login screen.
2. In the navigation filter, enter `sys_properties.list`.
3. From the System Property [sys_properties] list, search for *`glide.ui.session_timeout`*.
4. If *`glide.ui.session_timeout`* doesn't exist, select **New** to add a new property using the following values:
   - **Name**: *`glide.ui.session_timeout`*
   - **Description**: Type a brief description. In this case, enter something like `Override the default session timeout (30). This value is in minutes.`
   - **Type**: Select the appropriate data type. In this case, select **Integer**.
   - **Value**: Change the default value from 30 minutes to a value of your choice.

   Note: The session timeout can also be set through installation exit customizations.

What to do next

Administrators may also want to add the following properties to the System Properties table.

- *`glide.security.csrf.handle.ajax.timeout`*: Handles errors for timed out Ajax requests when set to **true**.
- *`glide.security.auto.resubmit.ajax`*: Automatically resubmits timed-out Ajax requests when set to **true** and the Log in to an instance check box is selected or Change the default value of the Remember me check box. A pop-up appears to users asking them to continue.
- *`glide.ui.auto_req.extend.session`*: When set to **true**, the system automatically extends a user's session by the value they select for the homepage refresh time. If there's no homepage refresh time, the standard timeout value applies. Tablet and mobile devices don't support this property. When set to **false**, user sessions time out when the **Remember me** check box is clear. The timeout is based on whether there's a homepage refresh time. When there's no homepage refresh time, the standard timeout value applies. When there's a homepage refresh time, the user session times out after the timeout value plus one interval of the homepage refresh time. For example, if a user selects a refresh interval of five minutes, then that session expires after the timeout value plus five minutes.

  Note: Users who select the **Remember me** check box are unaffected by session timeout properties.

Administrators can also add the following properties to configure additional timeout settings for user sessions. These additional settings help to conserve system resources:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *glide.session.unauthorized.timeout.enabled*: Enables an alternate session timeout for unauthenticated, guest sessions. Guest sessions are created for HTTP requests to the instance that don't contain authentication information. By default this property is set to **true**.
- *glide.unauthorized.session_timeout*: Specifies the time, in minutes, after an authenticated user logs out of an instance before the session ends. Set the property to a value greater than **0** and less than the value in the *glide.ui.session_timeout* property.

Related topics

Modify integration session timeout after inactivity

Prompting users to extend a session

Configure how much time users have to extend a session before it times out due to inactivity.

Before you begin
Role required: admin

About this task
By default, users are prompted to extend their session two minutes before it expires with an "Extend your session" dialog box. This procedure explains how to adjust the timing of when users are presented with this prompt.

Procedure

1. Navigate to **All**, and then enter `sys_properties.list` in the navigation filter.
2. Open the *glide.ui.session_timeleft* property.
3. In the **Value** field, enter the number of minutes before the session timeout to prompt users to extend their session.
   Setting the value to zero turns off prompting users to extend their sessions.
4. Select **Update**.

Lock out a user

Lock out a user when you don't want the user to access the instance.

Before you begin
Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Users** and select the user from the list.
2. Select the **Locked Out** check box, and update the record.

Mark a user inactive

You can mark a user inactive so the user doesn't show up in any fields that reference active users on the **User** table.

Before you begin
Role required: admin

About this task
Note: By default, when you mark a user inactive, you lock out that user. The **Lock Out Inactive Users** business rule governs this behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you clear the **Active** checkbox, the user is locked out and cannot access the instance. This functionality is controlled through a Glide property *glide.authenticate.only.allow.active.user.login* which will only allow the active users to access the instance.

Procedure

1. Navigate to **All** > **User Administration** > **Users** and select the user from the list.
2. Clear the **Active** check box, and update the record.

Terminate a user session

You can terminate a user session, for example, if you're going to perform system maintenance and users are still logged in.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Logged in users**.
   You can only see users who are logged in to the same application node as you. If the Active field on a user record value is false, the user is logged in but not currently running a transaction. Most users appear as inactive at any given time.
2. Select the session that you want to end.
3. Select **Lock Out Session**.
   The session is terminated, and the user is redirected to the login page at the next attempted transaction. The user isn't locked out. Multiple user sessions may be associated with one user. Terminating a user session only affects the specific session.

Note: Mobile user sessions can't be terminated using this process.

Non-interactive sessions

The Non-Interactive Sessions plugin creates a distinction between interactive and non-interactive users.

Interactive users

New users added to the instance automatically become interactive users. Interactive users can perform the following actions:

- Use their user name and password to log in to the UI or a service portal.
- Connect to an instance from a URL that calls a UI page, form, or list, for example, https://<instance name>.service-now.com/incident.do.
- Connect with single sign-on, for example, digest authentication or a Security assertion markup language (SAML).
- Use their credentials to authorize SOAP connections if allowed by strict security.
- Use their credentials for other API connections such as WSDL, JSON, XML, or XSD without restriction.

Non-interactive users

Non-interactive users can only use their credentials to authorize API connections such as JSON, SOAP, and WSDL. They can't log in to the ServiceNow UI. The strict security high security setting determines if non-interactive users are subject to Contextual Security Manager requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Distinguishing between interactive and non-interactive users increases instance security by helping to ensure that users abide by the principle of least privilege.

Installed with Non-Interactive Sessions

Note: Non-Interactive Sessions is enabled for all new instances since the Calgary release. If you don't see it in the list of plugins, request it using the Activate Plugin service catalog item in Now Support.

- Adds a column titled **Web Service Access Only** [web_service_access_only] to the **User** [sys_user] table.
- Changes all existing users to be interactive users (web_service_access_only=false).
- Updates the User form to display the **Web Service Access Only** [web_service_access_only] field by default.

Create a non-interactive user for web services

Non-interactive users can only connect to a ServiceNow instance from an API protocol. Use this feature to set up user accounts for web service authentication purposes.

Before you begin
Role required: user_admin or admin

About this task
Non-interactive users can't log in to an instance or a service portal or connect through single-sign-on. They can be used as a MID Server user if they're flagged as an Internal Integration User.

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Search for the user to be updated.

   Example
   For example, SOAP user.
3. Select the **Web Service Access Only** check box.
4. Select **Update**.

Note:

The ServiceNow platform uses any user name and password credentials supplied with a request even if the High Security Settings don't require authorization for a given API protocol. For example, if a SOAP request supplies a user name and password, the instance verifies those credentials even if SOAP requests don't require authorization. To avoid verifying user credentials, the request must not include them.

Make a non-interactive user record interactive

Manually switch a non-interactive user to an interactive user.

Before you begin
Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Search for the user you want to update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, **System Administrator**.

3. Clear the **Web Service Access Only** check box.
4. Select **Update**.

Update web service user accounts for strict security

If your instance requires strict security, add the soap role to any user accounts used for web services.

Before you begin
Role required: user_admin or admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select a web service user from the list.
3. From the **Roles** related list, select **Edit**.
4. Add soap to the **Roles List**.
5. Select **Save**.
6. Select **Update**.

Require authentication

You can specify whether non-interactive sessions require authentication from the **High Security Settings** module.

Before you begin
Role required: admin with elevated privileges

About this task
A non-interactive session bypasses the UI to connect to the instance at an API level. Typically, non-interactive sessions use set protocols such as JSON, SOAP, XSD, or WSDL. By default, all non-interactive sessions require authentication.

Procedure

1. Log in with an administrator user with the security_admin role.
2. Elevate your privileges to use security_admin.
3. Navigate to **All** > **System Security** > **High Security Settings**.
4. Select the matching **Requires authorization...** option for the protocol you want to set.
   For example, **Requires authorization for incoming SOAP requests**.
5. Select the check box to require authentication for the non-interactive session method.

   Clear the check box to enable the non-interactive session method to connect without providing any credentials.

Note:

Activating the Non-Interactive Sessions plugin might restrict existing users who manage SOAP and WSDL-based integrations from logging in, unless they already possess the SOAP role.

ServiceNow AI Platform tables and data

ServiceNow provides options for managing your data on the ServiceNow AI Platform.

Table administration	Data management	Export data	Roll back and delete recovery
			
Learn about working with complex, large amounts of data, by using tables and records on the ServiceNow AI Platform.	Explore options for storing and deleting data with ServiceNow.	Learn about exporting data from the ServiceNow AI Platform.	Learn how to roll back actions and recover deleted records.

Table administration

Handle data and process management for all your ServiceNow applications. Administrative roles on the ServiceNow AI Platform give you access to tables and records to manage incidents, problems, database changes, and more. Build graphical representations of tables and their relationships (such as parent or child tables) using Schema maps, and define elements in your database with Data Dictionary tables. Work with complex relationships between multiple sets of records using Many-to-Many Task Relations.

Data Management

Manage the growth of data on your instance with our set of Data Management tools. Keep performance smooth by archiving records, delete older records using table cleaner, and manage large tables with database rotations.

Exporting data

Export individual or multiple records from the ServiceNow AI Platform in a variety of formats.

Roll back and delete recovery

Roll back a software upgrade or plugin activation. Recover deleted records and related changes.

Table administration

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table.

Custom tables

Custom tables enable you to expand the functionality of the ServiceNow AI Platform and create custom applications.

About custom tables

Custom tables are tables that aren't part of the base ServiceNow AI Platform system, but are created by a ServiceNow AI Platform administrator and not otherwise exempt. Custom tables can be used to configure and extend base system workflows, and to add new functionality or custom applications to your ServiceNow AI Platform instance. For more information about building custom applications, see Building applications.

Entitlements for custom tables are included in certain subscription licenses based on the terms of the contract. If you don't have enough custom table entitlements, you can upgrade your license or purchase additional products that include custom table entitlements.

ServiceNow Store applications that consume custom tables

Some applications available from the ServiceNow Store at no additional cost require a number of unallocated custom table entitlements. If an application consumes custom table entitlements, the application listing details and contract show how many are needed. For more information about application listing details, see ServiceNow Store application listing details.

Additional information

- Custom Table Guide legal schedule

  Review the most recent complete definitions of custom and exempt tables.

  Note: Legal schedules are enforced based on when the contract is executed. For past versions of the Custom Table Guide, see Legal schedules archive.

- Map custom tables to a product subscription in Subscription Management

  Maintain accurate entitlement for custom tables in the global scope and stay in compliance by mapping the tables to a product subscription in Subscription Management. Mapping your custom tables keeps your custom table allotment updated and helps you avoid running out of custom table entitlements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

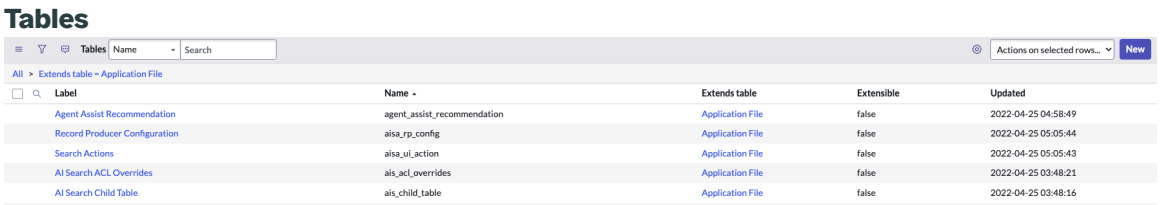
- Map a missing custom table to a product subscription in Subscription Management

  Map a custom table in the global scope to a product subscription when that table isn't shown in the **Unmapped global custom tables** tab of Subscription Management. To stay in compliance, all custom tables must be mapped to a product subscription.

Data dictionary tables

Access details related to tables, columns, and field labels in your instance.

Tables



All of the information on an instance is stored in tables, which consist of a series of records. The record in turn holds a series of fields that hold the individual bits of data and can be viewed either as a list or a form.

The Tables [sys_db_object] table contains a record for each table in the database.

Access the Tables [sys_db_object] table by navigating to **System Definition** > **Tables**. From the Tables list, an administrator can create a custom table, or select an existing table to view table details. In the table form, an administrator can access table administration options.

- View, add, or modify columns with a searchable and sortable embedded list, define the auto-number format, make the table extendable by other tables, and create modules for the table.
- Launch a schema map for a table by clicking the **Show Schema Map** related link.
- Open the dictionary entries for the table by right-clicking the form header and selecting **Show Dictionary Record**.
- Navigate directly to the default list or form view for the table by clicking the **Show List** or **Show Form** related link.
- Delete all records from a table by clicking the **Delete All Records**.

The following image shows a list of the tables that extend the Application File table.

Dictionary Entries

The Dictionary Entries [sys_dictionary] table, also called the **System Dictionary**, defines every table and field in the system. It contains information about data type, character limit, default value, dependency, and other attributes of a field.

Access the system dictionary in one of these ways:

- To see the system dictionary list view, navigate to **System Definition** > **Dictionary**.
- To view particular dictionary definition, right-click the list header, form header, or field label, and select **Configure Dictionary**.

The following image shows a filtered list of dictionary entries for the Incident table and the Task table, which it extends.

© 2026 ServiceNow, Inc. All rights reserved.

Dictionary Inc Task

Dictionary Entries | Table | Search | Actions on selected rows... | New

All > Table = incident .or. Table = task

Table	Column name	Type	Reference	Default value	Display	Text index	Audit	Updated
incident	resolved_at	Date/Time	(empty)		false	false	false	2022-04-25 04:29:00
incident	resolved_by	Reference	User		false	false	false	2022-04-25 04:29:00
incident	rfc	Reference	Change Request		false	false	false	2022-04-25 04:16:53
incident	severity	Integer	(empty)	3	false	false	false	2022-04-25 04:16:53
incident	subcategory	String	(empty)		false	false	false	2022-04-25 04:16:53
incident	sys_id	Sys ID (GUID)	(empty)		false	false	false	2022-04-25 04:16:53
task		Collection	(empty)		false	true	false	2022-04-25 05:43:21
task	active	True/False	(empty)	true	false	false	false	2022-04-25 03:45:17

Field Labels

The Field Labels [sys_documentation] table, also called the **Language File**, contains information about the labels and hints for each table and column in the system.

Access the language file in one of these ways:

- To see the list view, navigate to **System Definition** > **Language File**.
- To see the field label for a particular field, right-click the field label on the form.

The following image shows the language file filtered to display only labels on the Incident table.

Field Labels

Field Labels | Table | Search | Actions on selected rows... | New

All > Table = incident

Table	Element	Language	Label	Plural	Hint	Updated
incident	problem_id	en	Problem	Problems	Related problem, if one exists	2022-04-25 04:16:53
incident	notify	en	Notify	Notifies		2022-04-25 04:16:53
incident	business_impact	en	Business impact	Business impacts		2022-04-25 05:00:23
incident	severity	en	Severity	Severities		2022-04-25 04:16:53
incident	reopened_by	en	Last reopened by	Last reopened by		2022-04-25 04:16:53

System dictionary

View a list of all tables in columns in your instance from the system dictionary.

Each row in the system dictionary represents either a table or a column in one of the tables. The system dictionary provides options for administrators to modify tables and fields, which in turn define lists and forms.

Use caution when changing system dictionary records because changes can have a high impact on functionality. In particular, changes to dictionary entries for system tables, which are tables that begin with sys_, can create system-wide issues such as the inability to use update sets.

Dictionary changes are difficult to reverse. Also, dictionary changes automatically apply to all extended tables unless a dictionary override is defined. Be sure that changes are well-tested before applying them to a production instance.

Creation options

When you create a field from the system dictionary, it is automatically added at the end of the first section of the default form view.

In most cases, use the following interfaces rather than creating entries directly on the system dictionary:

- To create tables and fields, use the Tables module.
- To create fields, configure the table form.

Table relationships

You can create relationships between tables by extending tables, referencing records in another table, creating many-to-many relationships, and joining tables in a database view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables can be related to each other in several ways.

Extensions

A table can extend another table. The table doing the extending (child class) includes all of the fields of the other table (parent class) and adds its own fields. For instance, the Incident [incident] table has all of the Task [task] table fields (because an incident is a special form of task) and has its own incident-specific tasks. See Table extension and classes.

One-to-many

Within a table, a field can hold a reference to a record on another table. There are three types of one-to-many relationship fields.

Reference fields

Allow a user to select a record on a table defined by the reference field. For instance, the **Caller** field on the Incident table allows the user to select any record on the User table.

Glide lists

Allow a user to select multiple records on a table defined by the glide list. For instance, the **Watch list** field on the Incident [incident] table allows the user to select records on the User [sys_user] table.

Document ID fields

Allow a user to select a record on any table in the instance. These fields are much less common, but one example is the **Document** field on the Translated Text [sys_translated_text] table.

Many-to-many

Two tables can have a bi-directional relationship, so that the related records are visible from both tables in a related list.

Database views

Two tables can be joined virtually in a database view to enable reporting on data that might be stored over more than one table.

Table extension and classes

Enable one or more child tables to share fields and records with a parent table. Administrators and application developers can only extend tables during table creation.

Administrators and application developers typically extend tables to create a set of related records that share information. For example, in the base system, the Task and the Configuration Item tables have multiple extensions:

Sample extended tables in the base system

Original table	Related tables extended from original table
Task [task]	• Incident [incident] • Problem [problem] • Change Request [change_request]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample extended tables in the base system (continued)

Original table	Related tables extended from original table
Configuration Item [cmdb_ci]	• Application [cmdb_ci_appl] • Computer [cmdb_ci_computer] • Database [cmdb_ci_database]

A table that extends another table is called a child class, and the table it extends is the parent class. A table can be both a parent and child class both extending and providing extensions for other tables. A parent class that is not an extension of another table is called a base class.

Administrators can use these tools to see the relationships between classes.

- Schema map
- System dictionary
- Tables module

Extending a table:

- Links the new table to the extending table.
- Creates system fields in the new table.
- Creates one or more database tables to store the parent and child classes. The number of tables the system creates depends upon the extension model selected during table creation.

Extension models

The ServiceNow AI Platform offers these extension models.

- Table per class
- Table per hierarchy
- Table per partition

The extension model determines these attributes.

- The number of database tables created
- The derivation of fields from parent classes
- The replication of records from child classes

Table per class

Tables created

Creates a separate database table for the parent class and each child class.

Fields derived from parent class

Child classes derive fields from parent classes.

Dictionary records created for parent class

A parent class has a Dictionary record for the collection and for each field that can be derived from it. For example, the Contract [ast_contract] table has 59 Dictionary records, which define the table and its fields.

Dictionary records created for child classes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each child class only has Dictionary entries for fields unique to the class.

Records replicated

The parent class replicates each record stored in its child classes. Each child class only stores records unique to the class. Replicated records have the same Sys ID value in each table. The system replicates any change you make to a child record to the matching record in the parent table. For example, Contract [ast_contract] table replicates records from the Lease [ast_lease] and Warranty [ast_warranty] tables.

Table per hierarchy

Tables created

Creates one database table for the parent class, which stores all records for the parent and child classes. Child classes do not have separate database tables.

Fields derived from parent class

Child classes derive fields from parent classes. For example, the Incident table derives fields from the Task table.

Dictionary records created for parent class

A parent class has a Dictionary record for the collection and for each field that can be derived from it. For example, the Task table is a parent class that has 66 Dictionary records, which define the table and its fields.

The Dictionary entry for the parent class contains a sys_class_name column whose value indicates which child class each record belongs to. For example, Incident records have a sys_class_name value of incident, and change records have a sys_class_name value of change.

Dictionary records created for child classes

Each child class only has Dictionary entries for fields unique to the class. For example, the Incident table only has 22 Dictionary records, which are not already defined in the Task table.

Records replicated

Record replication is not needed, because the parent class stores all records that belong to the hierarchy. For example, the Task table contains all records from its child classes such as the Change, Incident, and Problem tables.

Table per partition

Tables created

Creates one database table for the parent class, which stores all records for the parent and child classes. Child classes do not have separate database tables. As the database table reaches a storage limit, the system dynamically adds storage tables (partitions) to store additional records.

Fields derived from parent class

Child classes do not derive fields from parent classes. Instead each child class has its own list of fields. For example, the Base Configuration Item [cmdb], Configuration Item [cmdb_ci], and Hardware [cmdb_ci_hardware] tables all have their own field definitions.

Dictionary records created for parent class

A parent class has a Dictionary record for the collection and for each field relevant to it. For example, the Base Configuration Item [cmdb] table is a parent class that has 48 Dictionary records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system replicates changes made to parent class Dictionary entries to child class Dictionary entries. For example, when you change the name column in the parent class Base Configuration Item [cmdb] table, the system replicates it to child class Dictionary entries such as the Configuration Item [cmdb_ci] and Hardware [cmdb_ci_hardware] tables.

The Dictionary entry for the parent class contains columns for sys_class_name and sys_class_path whose values indicate which child class each record belongs to. For example, Hardware records have a sys_class_name value of cmdb_ci_hardware, and computer records have a sys_class_name value of cmdb_ci_computer.

When the database table reaches a storage limit, the system updates the Dictionary entry for the parent class to include columns for sys_storage_alias and storage_table_name. These storage column Dictionary entries allow administrators to manage the parent class and its storage tables as a single logical unit.

Dictionary records created for child classes

Each child class has a Dictionary record for the collection and for each field relevant to it. For example, the Hardware table has 73 Dictionary records with some records duplicating columns in the parent class.

Records replicated

Record replication is not needed, because the parent class stores all records that belong to the hierarchy. For example, the Base Configuration Item [cmdb] table contains all records from its child classes such as the Application [cmdb_ci_appl], Computer [cmdb_ci_computer], and Hardware [cmdb_ci_hardware] tables.

Storage aliases

Learn about the role storage aliases play in data manipulation and field creation in the ServiceNow AI Platform.

Understanding storage aliases is important for effective data management and schema customization in the ServiceNow AI Platform, particularly when dealing with complex table hierarchies like those in the Task [task] table.

By default, administrators have access to the Storage Column Aliases [sys_storage_alias] table within an instance. However, transactional processes against this table can't be performed by an administrator from the user interface.

Table hierarchy and models

Understanding storage aliasing requires knowledge of table hierarchies within the Task [task] table, which involves two models: Table per hierarchy and Table per class.

Table per hierarchy

This model uses a single physical table, the Task [task] table, which features a flattened hierarchy where all columns within the task hierarchy exist only on the task table. For example, fields related to change requests aren't on a separate Change Request [change_request] table but are integrated into the Task [task] table. You can verify whether a table is Table per hierarchy by checking the extension model field in the Tables [sys_db_object] table. If the table's parent is a direct child of the Task [task] table, the table uses Table per hierarchy.

An extended table inherits the hierarchy of its parent. For example, the IMAC [change_request_imac] table is a child table of the Change Request [change_request] table, which extends the Task [task] table. Because the Change Request [change_request] table is Table per hierarchy, the IMAC [change_request_imac] table model is also Table per hierarchy. Legacy tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

such as the Incident [incident] table, Change Request [change_request] table, and Problem [problem] table are all part of the flattened Task [task] table hierarchy.

Table per class

This model applies to tables that physically exist in the database. It's used for new tables directly extending from the Task [task] table when the task row count exceeds 1 million rows. Unlike Table per hierarchy, Table per class doesn't use glomming because it doesn't operate within a flattened hierarchy.

Storage alias definition

A storage alias is created for every field on a table within an instance. Familiarize yourself with the key fields on the Storage Column Aliases [sys_storage_alias] table.

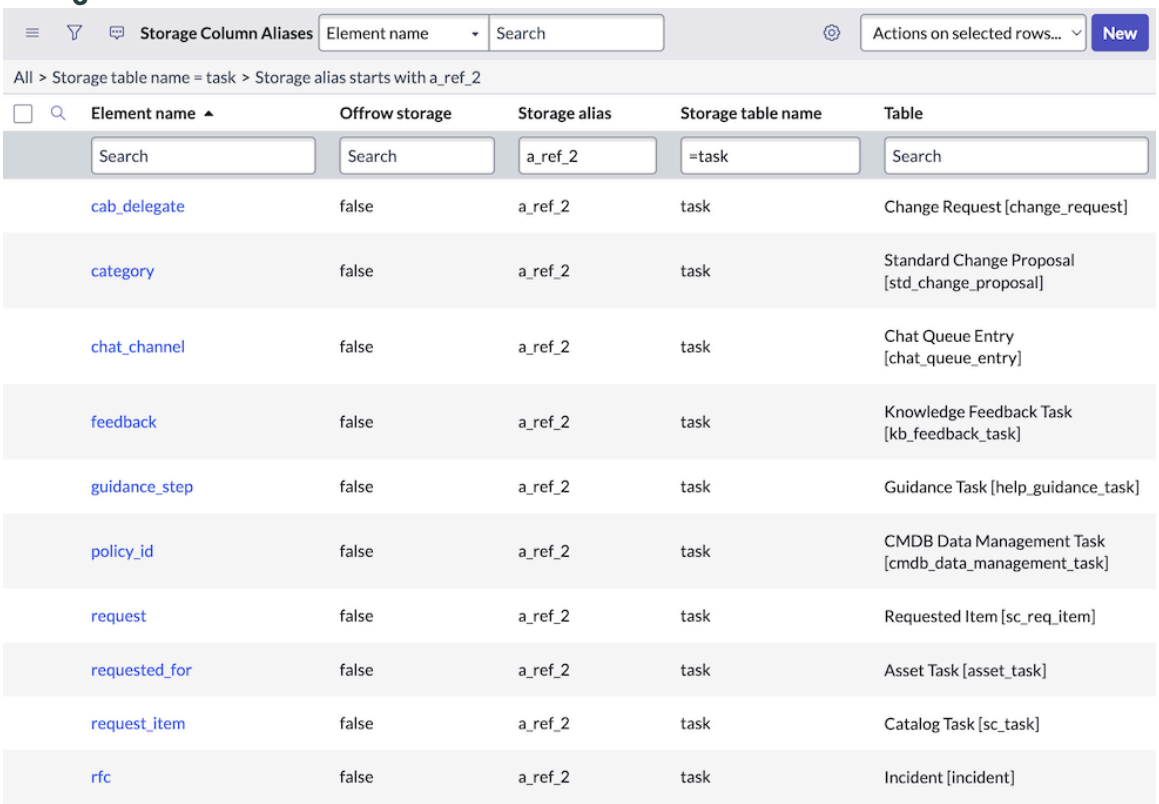
Element Name

Indicates how the field appears to users, which is important for user interface interactions and scripting.

Storage Alias

Indicates the exact physical column where the data for a field is stored. The storage alias value is used in combination with the table_name value to identify what data to manipulate. The storage alias value is the actual physical column on the Task [task] table.

Storage Table Name



Specifies the physical table that houses the element. For Table per hierarchy tables, the value is always task. For Table per class tables, the value is the name of the physical table.

Table

Specifies the logical class that each element links to on the physical Task [task] table. The Table element holds the table_name value which is the class discriminator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage column aliases

Storage Column Aliases | Element name | Search | Actions on selected rows... | New

All > Storage table name = task > Storage alias starts with a_ref_2

Element name	Offrow storage	Storage alias	Storage table name	Table
Search	Search	a_ref_2	=task	Search
cab_delegate	false	a_ref_2	task	Change Request [change_request]
category	false	a_ref_2	task	Standard Change Proposal [std_change_proposal]
chat_channel	false	a_ref_2	task	Chat Queue Entry [chat_queue_entry]
feedback	false	a_ref_2	task	Knowledge Feedback Task [kb_feedback_task]
guidance_step	false	a_ref_2	task	Guidance Task [help_guidance_task]
policy_id	false	a_ref_2	task	CMDB Data Management Task [cmdb_data_management_task]
request	false	a_ref_2	task	Requested Item [sc_req_item]
requested_for	false	a_ref_2	task	Asset Task [asset_task]
request_item	false	a_ref_2	task	Catalog Task [sc_task]
rfc	false	a_ref_2	task	Incident [incident]

In this example, the storage alias for the cab_delegate element is a_ref_2 and the physical storage table where the data is stored is task. The example depicts 10 logical elements in different logical classes on the Task [table] that all link to the same alias a_ref_2 on the physical Task [task] table.

The sibling elements are glommed, which means they share one physical column on the Task [task] table. You can query data from the logical element cab_delegate using a query like:

```
SELECT a_ref_2 from task WHERE sys_class_name='change_request'
 AND a_ref_2 IS NOT NULL
```

The query specifies data in the physical column a_ref_2. The class discriminator change_request is used in combination with the storage alias a_ref_2 to query the logical element cab_delegate from the logical class change_request on the physical Task [task] table.

The naming convention for fields created in the actual physical tables can vary depending on the type of field. In this example, a_ref_2 is an alias on the Task [task] table that holds values for reference fields.

Functionality and usage

Storage aliases serve multiple purposes.

Mapping

Aliases map logical elements (Table per hierarchy) or physical elements (Table per class) to the actual physical columns in the backend database. The logical element can be glommed to a physical column that is larger than the logical element's max_length.

Glomming

Aliases allow multiple sibling elements to share a single physical column in a Table per hierarchy model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label mapping

Aliases associate sys_documentation (label) records with their respective elements, enhancing visibility in forms, reports, and list views.

Restrictions and rules

- Two logical elements within the same class can't share a physical column. For example, two string fields created on the Incident [incident] table can't map to the same physical column in the database.
- A parent element and its child can't share a physical column. For example, a field created on the Incident [incident] table can't be mapped to a physical column when that physical column is already mapped to a field on the Task [task] table.
- Only sibling elements can share a physical column. For example, a reference field on the Change Request [change_request] table and a reference field on the Incident [incident] table and can both map to the same physical column.
- Fields created directly on the Task [task] table (where sys_class_name is 'task') can't be glommed.

Managing tables and indexes

Administrators can modify the database structure using table administration tools.

Custom tables and fields

Administrators can add custom tables, define fields, and manage field labels. Administrators can also delete custom tables that aren't needed or delete all the records in a table without deleting the table itself.

Dictionary entries

The system dictionary is a table, called Dictionary Entry `[sys_dictionary]`, that contains details for each table and defines every column within each table in an instance. Administrators can modify tables and fields in the system dictionary, which subsequently define the lists and forms that users access throughout the instance.

Dictionary attributes

Dictionary attributes define global behavior for fields. An administrator applies attributes directly to the dictionary entry to control various aspects of how the table or field behaves across the entire system.

Dictionary overrides

Dictionary overrides enable administrators to override field settings on extended tables. Dictionary overrides enable administrators to customize the behavior of a field for a specific table that inherits from another table. Overrides are used to change the inherited dictionary attributes on child tables without affecting the parent table or other child tables.

Table flattening

With table flattening, the Task [task] table and Base Configuration Item [cmdb] table have a hierarchy of related tables where one or more child tables extend from a parent table.

The extension model does not affect how the tables appear or function in the instance. All table functionality, including database views, remains unchanged by the extension model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table indexes

An index puts unordered tables into order, and efficiently speeds up queries to columns in your tables, by creating pointers to where information is stored in your database. Administrators can add indexes to access table data more easily.

Many-to-many table relationships

Many-to-many (M2M) table relationships enable administrators to associate records between two tables in a bidirectional and flexible manner. This relationship type is used to create links between records where each record from one table can relate to multiple records in another table, and vice versa.

Note: It is to be noted that when you de-activate or delete a field from the dictionary on a table, it might impact on the personalized UI view lists and will remove all regardless if they contain the de-activated/deleted field.

Create a table

Administrators and application developers can create custom tables to store application data. After you create a table, you can also modify field types and field labels.

Before you begin

Role required: admin

Check your custom table entitlements before creating custom tables. See Managing custom tables and applications in Subscription Management.

About this task

ServiceNow AI Platform application subscriptions include custom table entitlements. You can create custom tables for any purpose, up to the entitlement limit in the subscription. To learn more about how your usage administrator maps the custom tables that you create to subscriptions, see Map custom tables to a product subscription in Subscription Management.

Note: It is best to create tables when building applications with tools. To learn more, see Building applications. To minimize the existence of unneeded and extraneous tables in an instance, don't overdo table creation. Create only those tables you need to minimize administration tasks and shorten upgrade times. Do not extend the [sys_choice] table. Extending the [sys_choice] table is not supported.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select **New**.
3. On the form, fill in the fields.

Control	Description
Label	Enter a unique label for the table (such as **Laptops** or **Thin Clients**). The label appears on list and form views for the table. Updating the **Label** field also updates the label record in the language file for the current language. See Field Labels in Data dictionary tables.
Name	Edit the table name, which is automatically populated based on the table label and a prefix as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control	Description
	○ For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application. ○ For a table in the global application, the name is prefixed with the string `u_`. ○ For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string `st_` to indicate that it's remote and part of an application. ○ For a remote table in the global application, the name is prefixed with the string `u_st_`. You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).
Extends Table	Select the table to extend. Extending a base table incorporates all the fields of the original table and creates system fields for the new table. If they are in the same scope or if they can be configured from other scopes, you can extend tables that are marked as extensible. This option is not available if you select the **Scriptable Table** check box to designate that this table is scriptable.
Application	[Read only] Displays the application associated with this table. If you are working on an application or are creating a table from an application record, the field defaults to that application. Otherwise, the field defaults to **Global**. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default.
Remote Table	Option to designate this table as a remote table. A remote table is a table to which you can associate a script definition for retrieval of data from an external data source. Unlike a standard internal table, the data doesn't come from records in the current instance. If you select this check box, you cannot access the **Extends Table** option because scriptable tables cannot be extended from other tables. **Note:** To learn more about scriptable tables, see: ○ Retrieving and caching external data using remote tables ○ Create a remote table ○ Create a script definition for a remote table
Create module	Select the check box and then complete the **Add module to menu** field to create a list module in the application menu. This option is available only when creating a table.
Add module to menu	Select an existing menu or select **Create new** and enter a new menu name. This option is available only when the **Create module** check box is selected.

4. In the **Columns** section, use the **Table Columns** embedded list to add columns to the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Column label	Define a unique label for the column. The label appears on list headers and form fields for the column. When you update the **Column label** field, the system also updates the label in the language file for the current language.
Type	[Mandatory] Define the field type for the column. See Field administration and Field types. To preserve existing data, only change fields between the same basic type (for example, **Choice** and **String**). A warning appears if a change to a custom field results in data loss. You cannot change a base system field, that results in data loss.
Reference	Make the field into a Reference field type by entering the referenced table name. **Note:** Dynamic reference creation is enabled for this field. So, if you enter a table name that does not match an existing table, a new table is created when you save changes to the current table record. If the current table has a module in the application navigator, then a module for the newly created table is automatically created in the same application menu.
Max length	[String fields only] Limit the length of the field. A length of under 254 appears as a single-line text field. Anything 255 characters or over appears as a multi-line text box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	Note: ○ You can only change this value if the **Type** of the field is **String**. Changes for any other type of field are ignored. ○ On an Oracle instance, you cannot increase the maximum length of a string field to greater than 4000 because it requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with ServiceNow Technical Support to request the change. ○ To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field results in data loss. For a base system field, you cannot make a change that results in data loss.
Default value	Specify the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field can use a default value of *2* but cannot use a default value of *two*. These values can be overridden with dictionary overrides.
Display	Indicate whether this field is the Display values (appears on records that reference this table). **Note:** This option does not control whether this field is displayed on lists or forms.

5. In the **Controls** section, define additional table options.

Control	Description
Extensible	Select the check box to enable other tables to extend this table. Clear the check box to prevent the creation of additional child tables; existing child tables remain unchanged.
Live feed	Select the check box to enable record feeds for the table. This option adds the **Show Live Feed** icon () in the form header.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control	Description
Auto-number	Select the check box, and then define the number format to add an auto-numbered field to the table. The check box is available only when a number format does not exist for the table. Otherwise, you can edit the existing number format.
Create access controls	Select the check box and then complete the **User role** field to create basic security rules for the table.
User role	Enter a new name or select an existing user role that is required to access this table. This option is available only when the **Create access controls** check box is selected.

6. In the **Application Access** section, define the scope protection for the table.
For more information, see Application access settings.

Control	Description
Accessible from	Specify which application scopes can access the table: **All application scopes** Can be accessed from any application scope. **This application scope only** Can be accessed only from the current application scope.
Can read	Select the check box to enable script objects from other application scopes to read records stored in this table. This option offers runtime protection. For example, a script in another application can query data on this table. First select read access to grant any other API record operation.
Can create	Select the check box to enable script objects from other application scopes to create records in this table. This option offers runtime protection. For example, a script in another application can insert a new record in this table. This option is available only when the **Can read** check box is selected. Clear the check box to prevent script objects from other application scopes from creating records in this table.
Can update	Select the check box to enable script objects from other application scopes to modify

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control	Description
	records stored in this table. This option offers runtime protection. For example, a script in another application can modify a field value on this table. This option is available only when the **Can read** check box is selected. Clear the check box to prevent script objects from other application scopes from modifying data stored in this table.
Can delete	Select the check box to enable script objects from other application scopes to delete records from this table. This option offers runtime protection. For example, a script in another application can remove a record from this table. This option is available only when the **Can read** check box is selected. Clear the check box to prevent script objects from other application scopes from deleting records from this table.
Allow access to this table via web services	Select the check box to enable users to make inbound Web services web service queries to this table. This option offers both design-time and runtime protection. The user performing the query must have the correct permissions to access this table, even when this check box is selected. Clear the check box to prevent users from making web service queries to this table.
Allow configuration	Select the check box to enable applications from other application scopes to create configuration records for this table that change its functionality. For example, an application designer can select this table from the **Tables** list on business rules, client scripts, or UI actions. This option offers design-time protection. Clear the check box to prevent application designers from selecting this table when creating configuration records.

7. Click **Submit**.

What to do next

To change the field labels in your table or the label of the table itself, perform the following task:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to the Field Label [sys_documentation] table, and filter the table to show the table that has the fields you want to change. To find the label that represents the table itself, filter the records where **Element** is empty.
2. Open the field record that you want to change, and make your updates. For a description of each field, see Field Label table.

Global default fields

When you create a new custom table, several fields appear in the **Table Columns** embedded list. For all tables, required system fields are added automatically. You cannot delete or modify these fields.

For tables that extend another table, fields on the parent table also appear on the **Table Columns** embedded list for the current table. If you modify these fields, remember that all changes to fields on the parent table also affect all child tables, not just the current table.

These required system fields are added to all tables:

Required system fields

Field	Type	Description
Class [sys_class_name]	System Class Name	If the table is extensible, a string field that indicates which child table contains the record.
Created [sys_created_on]	Date/Time	A time-stamp field that indicates when a record was created.
Created by [sys_created_by]	String	A string field that indicates the user who created the record.
Sys_id [sys_id]	Sys ID	The Unique record identifier (sys_id) for the record.
Updates [sys_mod_count]	Integer	A numeric field that counts the number of updates for this record since record creation.
Updated by [sys_updated_by]	String	A string field that indicates the user who most recently updated the record.
Updated [sys_updated_on]	Date/Time	A time-stamp field that indicates the date and time of the most recent update.

Deleting custom tables

Administrators can delete custom tables that are no longer needed. For example, delete a table from an application that is under development because the business requirements change.

A table is custom if an administrator created it and it is not part of a system upgrade or plugin activation. Custom table names always begins with `u_`, or `x_` for scoped tables.

Warning: You cannot delete base system tables. If you inadvertently delete such a table, it is automatically recreated when you upgrade an instance.

You cannot delete a table that has associated tables that extend from it.

You must first delete all records in the table before you delete the table itself. If you do not first delete the records, errors can result on the parent table if it references the records. Deleting the records removes any references from the parent table. To learn more, see delete the records in the table.

Delete a custom table

If you no longer need a custom table, you can delete it after you delete all the records in the table.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Open the table to delete.
3. Select **Delete All Records**.

   Deleting all records before deleting the table ensures that the business logic is properly executed (for example, reference cascade rules or other delete business rules). If you do not delete all records from the table first, then you must manually fix any other records or tables that the table deletion impacts. Cascade deletions are also taken care of in this step.
4. Select **Delete**.
   The **Delete** button is only available for custom tables beginning with u_ (global) or x_ (scoped).
5. In the confirmation dialog box, enter `delete` and click **OK**.

   The table and all items that reference the table are deleted, including:

   - Choice list items
   - Forms, form sections, lists, and related lists
   - Reports and Performance Analytics widgets
   - Reference fields that reference the table
   - Access controls

Related topics

Deleting custom tables

Delete all records from a table

You may decide to delete all the records on a table without deleting the table itself. For example, the administrator may want to delete all incidents on a test instance without deleting the incident table itself.

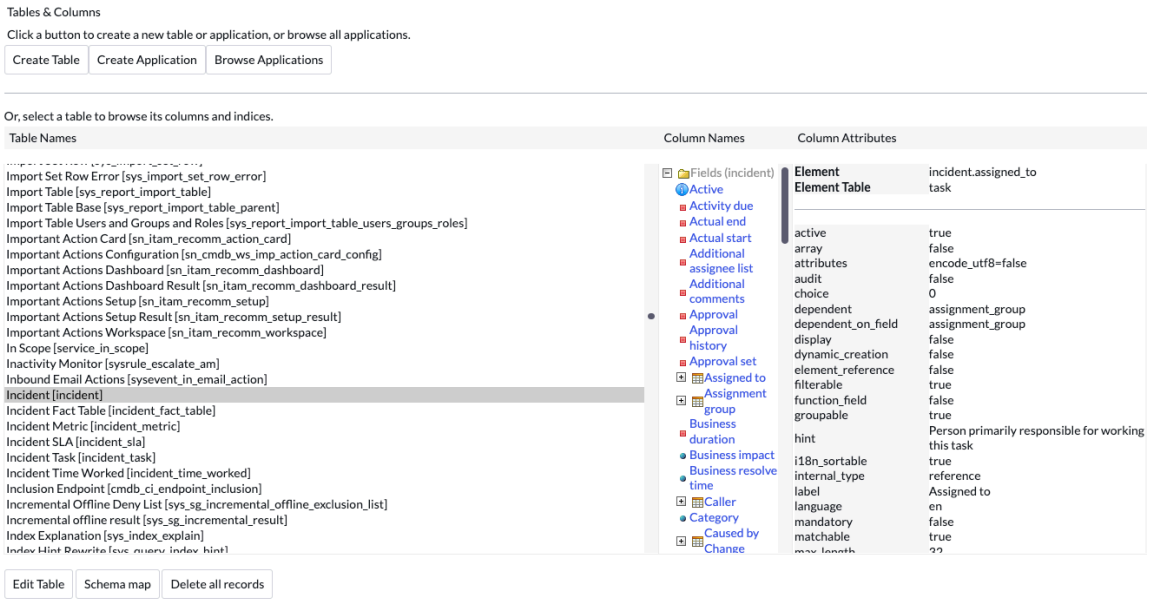
Before you begin
Role required: admin

About this task
When you prepare to delete many records from a table, consider the following guidelines to minimize impact on performance.

- Limit the number of records to be deleted in a single delete action to prevent the table from being locked. Use the `setLimit()` method described at setLimit.
- Minimize triggering an excessive number of business rules as a result of this deletion. Use the `setWorkflow(Boolean e)` method described at setWorkflow.

Note: Deleting all records for a table also deletes records from tables that extend the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



There are several methods for deleting table records. Depending on the number of records to be deleted, choose the method that would be most efficient in your environment. Use these methods with caution. Before performing this procedure, be sure that you do not need any of the records.

Procedure

- From the **Tables and Columns** module, complete the following steps.

1. Navigate to **System Definition** > **Tables & Columns**.
2. Select the table for which to delete records.

   Note: If the table you want to delete records from belongs to a scoped application, select that application in the scope picker. Alternatively, configure scope-to-scope access. See Restricted caller access privilege settings.

   Note: Some system tables do not allow this method of deleting records, for example, you cannot delete all user records [sys_user]. The list of tables does not include system tables that you cannot delete records from.

3. Click **Delete all records**.
4. In the confirmation dialog box, enter `delete` and click **OK**.

- From a list view, complete the following steps.

1. In List v2, navigate to the list view that displays the table records, click the context menu, and then navigate to **Show**.
2. In List v3, click **<Number> rows per page** in the footer.
3. Set the number of rows per page to display the max number.
4. Select all the rows on the page.
5. Click **Actions on selected rows**, and then click **Delete**.
6. Continue deleting all rows on a page until all records are deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The selected table is empty of records. The table still exists, and any references to the table on other tables (such as business rules or reference fields) are preserved.

Modify dictionary entries

Modify dictionary entries by configuring a field on a form or from the Dictionary module.

Before you begin
Role required: admin

Procedure
1. Navigate to the dictionary entry one of the following ways.
   - Navigate to a field on a form, right-click the field, and select **Configure Dictionary** or **Show <field name>**.
   - Navigate to **System Definition** > **Dictionary**, and click an entry for a field or table. Entries for tables have **Type** set to **Collection**.

   The system dictionary entry opens.
2. Update the dictionary entry fields.
3. Select **Update**.

Dictionary entry form

The Dictionary Entry form was redesigned to provide an Advanced view and additional fields. You might need to configure the form to see all fields.

Dictionary Entry form

Field	Description
Table	Defines the table in which the element is created. **Note:** This list shows only the tables that meet the scope protections for adding fields.
Type	Defines the field type of the column or, if the **Type** is **Collection**, indicates that the dictionary entry represents the table. For more information, see Field administration. You can change the type of a field. To preserve existing data, only change between logical types that map to the same physical type on the database. For example, Choice and String.
Active	Enables or disables the field. When this check box is cleared, the field is hidden in lists and forms in the Classic Environment. However, inactive fields are still available for queries. Additionally, disabling a field by clearing this option doesn't remove it from a configured list. Inactive fields display in admin-configured lists until an admin updates the list layout to remove them. See below for additional behavior notes. • Forms: Deactivated fields are removed from forms. • Lists: Inactive fields continue to display in admin-configured lists until an admin updates the list layout to remove them. If an inactive field is removed from an admin-configured default view, any personal lists will reset to follow the default view, thus removing the inactive field from the personal list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary Entry form (continued)

Field	Description
	• Reports: Existing reports that include inactive fields will continue to work, because the data still exists in the records. However, deactivated fields are not available when creating new reports or list layouts if they are not present in admin-configured lists. • Condition Builder: Deactivated fields are not available in the Condition Builder, unless a you are using an existing URL with filters containing the inactive field. **Show Matching**, **Filter Out**, and **Group By** can also be used on an inactive field if the column is present in the list view. • ServiceNow API: The ServiceNow API does not check whether a column is active or inactive. The old values for the field remain in the records and cannot be undone. • Scripts: Inactive fields may still be referenced in scripts. (Server side scripts that use GlideRecord can read and write to inactive fields).
Function field	If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Once the new function record is saved, you cannot clear the check box to make the field a regular field.
Read only	Legacy option that controls whether users can change the field value in the user interface. This option is selected and greyed out in the following cases: • When the field was marked as read only prior to the Australia release. • When an option is selected in the **Read only option** field.
Read only option	Controls whether a field is read only and whether it can be changed by a client script or server-side APIs. For details, see Configuring read-only security options.
Audit	Enables or disables auditing for a table. Turning on Auditing (History) for a Table. **Note:** This option only applies to tables.
Text index	Determines whether searches index the text in a table. **Note:** This option only applies to tables. To exclude fields from indexing, see Remove an index for a specific field.
Column label	Defines a unique label for the column. The label appears on list headers and form fields for the column. • Updating the **Column label** field also updates the label in the language file (for the current language). • When you create a new column, the column name is populated automatically based on the label, which is prefixed with u_ to indicate that it is custom. For example, if you enter **Activity Description** as the column label, the column name defaults to **u_activity_description**.

Dictionary Entry form (continued)

Field	Description
Column name	Defines the field name of the column. When you create a new field, this name is populated automatically based on the label and a prefix as follows: • For a field on a table in a different scope, the name is prefixed with the scope to indicate that it is custom and not part of that application. • For a field on a table in the same scoped application, the name does not have a prefix, which indicates that it is part of the application. • For a field in a global application, the name is prefixed with u_ to indicate that it is custom. You cannot modify the prefix; however, you can modify the rest of the name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). You cannot change the name of an existing dictionary record. **Note:** You cannot enter consecutive (double) underscores in a column name. For example if you enter `my__sample_name` as the column name, it is automatically changed to `my_sample_name` when you save the dictionary entry.]
Max length	Provides a logical limit for the size of string fields to determine how the system displays them in the user interface and how to map them to physical database data types. String fields with a length under 255 characters appear as a single-line text fields. String fields with a length over 254 characters appear as a multi-line text box. The system maps the field length to the closest physical data type available on the database. Sometimes, this results in more available length than originally specified. For example, entering a length of 50 maps to the closest physical data type of VARCHAR(100), which provides up to a 100 character limit or double the requested field length. Likewise, entering a length of 1000 maps to the closest physical data type of MEDIUMTEXT, which provides up to a 4000 character limit or four times the requested field length. **Note:** • You can only change this value for a **String** field. Changes for any other type of field are ignored. • Users on an Oracle instance cannot increase the maximum length of a string field to anything greater than 4000 through the application UI as this requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with technical support to request the change. • To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field results in data loss. For a base system field, you cannot make a change that results in data loss.
Mandatory	Determines whether this field must contain a value to save a record. For more information, see Make a field mandatory.

Dictionary Entry form (continued)

Field	Description
	Note: You can override this option for extended tables.
Display	Indicates that this field is the Display values for reference fields. Set this to true for the one field whose value you want to use as the text displayed in links to this table on lists and forms. By default, the **Number** field is the display value for all task tables. **Note:** • This option does not control whether a list or form displays this field as part of the layout. Instead, see List configuration and Personalizing Forms. • The display value becomes part of the form title when viewing an individual record from a table. • You can set a different display value on an extended table than the display value on a parent table by using a dictionary override.
Function definition	Defines the function that the field performs. Starts with `glidefunction:`, followed by the operation to be performed (for example, `concat`), followed by function parameters. Constants must be enclosed in single quotes. For example, the following function definition creates a field that shows the short description, followed by a space, followed by the caller name: `glidefunction:concat(short_description, ' ', caller_id.name)` **Note:** Function parameters support dot-walking. See Dot-walking to data in related tables.
Attributes [Advanced view]	Alters the behavior of a field or functionality that depends on the field. For more information, see Dictionary Attributes. Attributes can be overridden for extended tables with dictionary overrides. You can also configure attributes for this dictionary entry through the **Attributes** related list.
Default Value	
Use dynamic default [Advanced view]	Allows you to specify a default value that is generated dynamically based on a dynamic filter.
Dynamic filter value [Advanced view]	Specifies the Create a dynamic filter option that determines the default value if the **Use dynamic default** option is selected.
Default value	Specifies the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field uses a default value of 2 but cannot use a default value of two. These values can be overridden with dictionary overrides.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary Entry form (continued)

Field	Description
Reference Specification	
Reference	Makes the field into a Reference field type. If you enter a name that does not match an existing table, a new table is created when you save your changes to the dictionary record. If the current table has a module in the application navigator, a module for the new table is automatically created in the same application menu.
Use reference qualifier [Advanced view]	Specifies the type of qualifier to use: • Simple: A set of choice lists where you can specify a reference qualifier condition. • Dynamic: A Create a dynamic filter option that you can use to build the qualifier. • Advanced: A static encoded query string or JavaScript code that you can use to build the qualifier.
Reference qual condition	Specifies a condition when the reference qualifier runs if the **Simple** qualifier type is selected.
Dynamic ref qual [Advanced view]	Specifies the Create a dynamic filter option that determines the reference qualifier when the **Dynamic** qualifier type is selected.
Reference qual [Advanced view]	Filters the records available for a reference field if the **Advanced** qualifier type is selected. Reference qualifiers can be overridden with dictionary overrides.
Reference key [Advanced view]	Identifies a field other than sys_id to use as the unique identifier for reference fields.
Reference cascade rule [Advanced view]	Defines what happens to a record if the record it references is deleted. Select one of the following options: • Clear: Clears the references (default). • Delete: Deletes all referencing records. • Restrict: Prevents record deletion if there is a referencing record. • None: Does not change referencing records.
Reference floats [Advanced view]	Enables the **Edit** button on related lists for one-to-many relationships.
Dynamic creation	For reference fields, determines whether entering a value that does not match an existing record creates a record on the referenced table. If selected, use the **Dynamic creation script** field to define how to create the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary Entry form (continued)

Field	Description
[Advanced view]	
Dynamic creation script [Advanced view]	When the **Dynamic creation field** is selected, allows you to enter a script for creating a record on the referenced table.
Dependent Field	
Dependent on field [Advanced view]	Specifies a field on which the current field depends. For more information, see Make a field dependent **Note:** You can override this value for extended tables. .
Choice List Specification	
Choice	Allows users to see a list of suggested values in one of the following ways: • List menu without -- None -- • List menu with -- None -- • Suggestion field type If a choice is used, either define a Choice list field type or use the fields **Choice** table and **Choice** field to copy choices from another field elsewhere in the dictionary.
Choice table [Advanced view]	Populates the field choices with the same values as another choice field. If the **Choice** field is set to anything besides **None**, select a table to draw choice values from. The field **Choice field** must also be populated. For example, if **Choice table** is set to the Incident [incident] table, this field has the same choice list as one of the choice fields on Incident. **Choice field** (see below) determines which field.
Choice field [Advanced view]	Populates the field choices with the same values as another choice field. If the **Choice** field is set to anything besides **None**, select a field from the table you selected for **Choice table**. For example, if the **Choice table** field is set to the Incident [incident] table, and **Choice Field** is set to **Priority**, this field has the same choices as the **Priority** field on Incident, even if those choices change. **Note:** This field must be a choice field.
Calculated Value	
Calculated [Advanced view]	Determines whether the value of the field is calculated from other values. If selected, use the **Calculation** field to define how the calculation is performed. The **Calculation Type** field allows you to select script or formula based calculation for the column value. When filtering, sorting or grouping by a calculated field, the sort order is based on the stored field value from the last time the field was updated, not the last time the field appeared.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary Entry form (continued)

Field	Description
	Note: In relation to business rules, calculated fields are populated first before any business rule, even a before business rule, is run. Calculated fields are then populated again if necessary after any before business rules run.
Calculation Type [Advanced view]	Allows you to select script based calculation or formula based calculation for a column. For more information about predefined functions and example formulas, see Formulas for column values in Table Builder.
Calculation [Advanced view]	Allows you to enter a script or formula based on the selected Calculation Type. When the **Calculation Type** is **Formula**, you can enter a predefined function or formula for calculating the value of the field. You can use a predefined formula or combine other formulas to create a formula according to your requirements. When the **Calculation Type** is **Script**, you can enter a script for calculating the value of the field. These can be overridden for extended tables with dictionary overrides. You can use the current object in this script. As with access control rules, the script can: • Evaluate to true or false. • Return an answer variable set to true or false. • Set a field value directly, such as: `current.display_name="name"`. **Note:** Fields display as read-only when calculated scripts are applied. For example, by adding a script to the calculated field on a dictionary record that is set to Active, the Active field is made read-only on the form. Inline editing of the Active field from the list view is also disabled.
Additional fields	
Class	Identifies the table that the current table extends. Tables that do not extend other tables specify their own name in this field. For more information, see .
Defaultsort	Obsolete.
Size class	Determines whether the platform handles this table as a large table by reducing the amount of memory stored for each row during queries. There is a scheduled job which runs and sets the value of this field.
Spell check	Enables or disables spell check on the field.
Unique	Requires the field value to be unique. **Warning:** Making a field unique when the corresponding table already has different values for that field causes data loss. Before you enforce uniqueness on a field, verify that no records in the table for the field have values, or that they all have the same value.
UI action	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary Entry form (continued)

Field	Description
Default view or Advanced view	Changes the form view to the default or advanced view. The fields change based on the view. If you are using the default view, you must write a script to accomplish the same tasks that advanced view fields provided.
Related Lists	
Access Controls	Provides access to the access controls that permit or limit access to the data in the table.
Choices	Provides access to the options in the choice list field you are editing.
Dictionary overrides	Provides access to the dictionary overrides for this field.
Attributes	Provides access to the dictionary attributes for this entry.
Labels	Provides access to the labels used for the table or field you are editing.

Configuring read-only security options

Control the ability to edit read-only fields by configuring read-only options.

Read-only fields are intended to restrict modifications in specific situations. In addition, the system provides configurable read-only options that enable you to customize the behavior of read-only fields according to your requirements, while balancing usability and security. You can adjust the read-only behavior by updating the **Read only option** field in a dictionary record.

Available read-only options

Instance Configured

Default **Read only option** value for read-only fields created prior to the Australia release. Used for maintaining backwards compatibility and testing read-only behavior in non-production instances.

When the **Read only option** is set to Instance Configured in a dictionary record, read-only behavior is derived from the *glide.read_only.legacy_read_only_behavior* system property. By default, the property is set to client_script_modifiable, which honors the pre Australia read-only behavior, allowing changes to read-only fields through client scripts.

Display Read Only

Displays the field as read-only in the UI, but allows changes to the read-only field through client scripts and server-side operations such as *TableAPI*, *GraphQL*, and *GlideRecordSecure()*.

Client Script Modifiable

Displays the field as read-only in the UI, and allows changes to read-only fields through client scripts but not through background scripts or server-side APIs like *TableAPI*, *GraphQL*, and *GlideRecordSecure()*.

Strict read only

Displays the field as read-only in the UI, but prevents any changes from both client scripts and server-side APIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Testing read-only behavior

The Instance Configured read-only option maintains backwards compatibility for read-only fields created prior to the Australia release, and also enables you to test other read-only options on a non-production instance before implementing them on your production instance.

When the **Read only option** is set to Instance Configured, read-only behavior is determined by the *glide.read_only.legacy_read_only_behavior* system property. The default value for the *glide.read_only.legacy_read_only_behavior* system property is *client_script_modifiable*, which means the field appears as read-only in the UI, but can still be changed by a client script.

You can test read-only behavior on a non-production instance by updating the system property with the following values and then validating that your fields and client scripts work as expected.

- *display_read_only*
- *client_script_modifiable*
- *strict_read_only*

Important: The *glide.read_only.legacy_read_only_behavior* system property is only intended for testing read-only behavior on non-production instances. Updating this property affects all fields where the **Read only option** field is set to Instance Configured.

For example, to verify that tighter security controls still work with your client scripts and other customizations, you can set the *glide.read_only.legacy_read_only_behavior* property to *strict_read_only* in a non-production instance, and then test the behavior. After you verify the behavior in a non-production instance, you can update individual fields on your production instance to use the Strict Read Only option on a field-by-field basis.

Test read-only options

Test read-only behavior on a non-production instance before updating **Read only option** field values on your production instance.

Before you begin

Role required: admin

About this task

Read-only fields created prior to the Australia release are automatically set to **Instance Configured** after upgrading to at least Australia. You can use the **Instance Configured** option to test the read-only options introduced in the Australia release in a non-production instance before making changes in your production instance.

When a field's **Read only option** is set to Instance Configured, read-only behavior is derived from the *glide.read_only.legacy_read_only_behavior* system property. By default, the property is set to client_script_modifiable, which honors the pre Australia read-only behavior, allowing changes to read-only fields through client scripts.

Important: The *glide.read_only.legacy_read_only_behavior* system property is only intended for testing read-only behavior on non-production instances. Updating this property affects all fields where the **Read only option** field is set to Instance Configured.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the System Properties [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search for a system property record with name *`glide.read_only.legacy_read_only_behavior`*.
3. Select the *`glide.read_only.legacy_read_only_behavior`* system property.
4. In the Value field, enter the read only option that you want to test.
   The option that you enter determines how strict the system treats the security of read-only values once they've been entered. Each option displays the field as read-only in the UI.

Option	Description
`display_read_only`	Allows changes to the read-only field through client scripts and server-side operations such as *`TableAPI`*, *`GraphQL`*, and *`GlideRecordSecure()`*.
`client_script_modifiable`	Allows changes to the read-only field through client scripts but not through background scripts or server-side APIs like *`TableAPI`*, *`GraphQL`*, and *`GlideRecordSecure()`*.
`strict_read_only`	Prevents any changes from both client scripts and server-side APIs.

5. Select **Update**.

What to do next

Test any client scripts or server-side APIs that update read-only fields work as expected in your non-production environment. After testing the functionality, you can update individual fields in your production instance and set the **Read only option** field to the option that you verified in your non-production instance.

Make a field read only

Control whether a field is read only and whether it can be changed by a client script and server-side APIs.

Before you begin

Role required: admin

About this task

You can customize the behavior of a read-only field, including whether a client script or server-side API can modify the read-only field value. You control the read-only behavior by updating the **Read only option** field in a dictionary record.

For details on read only options, see Configuring read-only security options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the field's dictionary entry in one of the following ways.
   - Navigate to a field on a form, right-click the field, and select **Configure Dictionary** or **Show <field name>**.
   - Navigate to **System Definition** > **Dictionary**, and click an entry for a field or table.
2. Make the field read only by selecting an option in the **Read only option** field.
   The option that you select determines how strict the system treats the security of read-only values once they've been entered. Each option displays the field as read-only in the UI.

Option	Description
Display Read Only	Allows changes to the read-only field through client scripts and server-side operations such as *TableAPI*, *GraphQL*, and *GlideRecordSecure()*.
Client Script Modifiable	Allows changes to the read-only field through client scripts but not through background scripts or server-side APIs like *TableAPI*, *GraphQL*, and *GlideRecordSecure()*.
Strict Read Only	Prevents any changes to the read-only field from both client scripts and server-side APIs.

3. Select **Update**.

Altering tables and fields using dictionary attributes

Dictionary attributes alter the behavior of the table or field that the dictionary record describes. Administrators can add or modify dictionary attributes.

Adding an attribute

To add or remove an attribute to a table or field, open a dictionary record, select the **Advanced** link, and modify the **Attributes** field. Alternatively, in a dictionary record, select **New** in the Attributes related list. For details on modifying dictionary entries, see Modify dictionary entries.

Attributes are comma-separated. If attributes exist on a dictionary record, add a comma with no spaces before adding an attribute.

For an attribute that accepts true/false values:

- To specify a value of true, you can either enter `attribute` or `attribute=true`.
- To specify a value of false, you can either ensure that the attribute does not appear or enter `attribute=false`. To maintain the values during upgrades, do not remove an attribute that is on a table by default.

Maintaining attribute values for upgrades

If you remove an attribute that is part of the base system, it is automatically restored during an upgrade. To prevent upgrades from changing the behavior of your system, leave the attribute on the table or field, but set its value as desired.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if a field has the attribute `knowledge_search=true` by default, do not remove the attribute to set it to false; rather set it to `knowledge_search=false`.

Available dictionary attributes

Name	Value	Target Element	Description
allow_null	true/false	field_name field	If present or true, enables you to enter `None` as the field
allow_public	true/false	table_name field	If true, the table name field displays tables from all scopes instead of only the current scope.
allow_references	true/false	field_name field	If true, a tree is displayed to select from that includes reference fields so you can dot-walk.
allowHugeAlter	true/false	any table	If true, enables you to add a column to a table with more than 100 million rows.
approval_user	name of field containing the users for the approval type this field represents	integer field	Specifies the table fields that are used to perform lookups using a matcher. You specify approvals as table fields that have an attribute of *`approval_user=<field_name>`*, where <field_name> indicates the field in the table that contains the users for this approval type. • Fields with this attribute contain an integer value that indicates the sequence for the approvals. • All approval fields with the same sequence number indicate that multiple approvals are required before continuing. • Approvals are requested in the order of the sequence numbers. For example, all approvals with sequence number 100 must be approved before approvals with sequence number 200 are requested.
attachment_index	true/false	any table	If true, attachments on the table are indexed for search purposes. To learn more, see Index attachments on a table.
barcode	true/false	string field	Enables a string field to access a camera on a mobile device to scan and process a bar code.
base_table	name of base table type	table_name field	Specifies the table_name field that enables you to select any table that is derived from the table specified

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			by this attribute. By default, the base table itself is also included in the list (but see *skip_root* to turn off this behavior).
calendar_elements	list of field names, separated by semicolons (";")	any calendar event table	Specifies the list of fields used when constructing the description of a calendar event. If not specified, the display name plus short description are used. The *calendar_elements* attribute does not support derived (dot-walked) fields.
collection_interval	interval specified as "HH:MM:SS" (like "01:02:30" for one hour, two minutes, and 30 seconds)	collection field	Specifies the interval of metrics collection.
close_states	inactive state integer values	task state field	Used by the *TaskStateUtil* API to identify the list of inactive state values delimited by semicolons (;)
critical	true/false	any field in the apm_application table	Defines fields that have critical information about an application, which enables tracking the entry of critical information.
current_location	true/false	string field	Enables a string field to access the GPS location of a mobile device.
disable_execute_now	true/false	any table derived from sys_auto	If present or true, disables the usual **Execute Now** button. The ServiceNow AI Platform applications that use schedules, such as Discovery, use this attribute to substitute their own more appropriate action.
default_rows	integer value	multitext fields	Sets the default number of rows in a multitext field.
default_close_state	state integer value	task state field	Used by the *TaskStateUtil* API to identify the default close state value for a task table.
default_work_state	state integer value	task state field	Used by the *TaskStateUtil* API to identify the default working state value for a task table.
detail_row	name of field to display in detail row	any table	Displays the value of the specified field as a Lists for each record in the list view. UI15 is required to use this attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			Note: If different *detail_row* attributes are defined for a parent table and a child table, the system uses the child table attribute.
display_image	true/false	table with fields of the user_image type	If present or true, displays records of the user_image type in an image form. If the record is in the [sys_user] table, and the image is not available, the user initials are displayed.
document_viewer_audit	view, download, or all	any table	When the Document Viewer is enabled, this attribute keeps a record of the user actions that are performed on attachments. The values are as follows: • **view**: Enables an audit when users view an attachment • **download**: Supplies audit information for only downloaded attachments • **all**: Shows audit information when attachments are viewed and downloaded
email_client	true/false	any table	If present or true, causes an icon (an envelope) to appear in the more options menu in the form header. If you click it, a pop-up email client appears.
enforce_dot_walk_cross_scope_access	true/false	any table	This attribute enforces dot-walk cross-scope access restrictions for individual tables. The attribute must be added to the dictionary record for the table (the record in sys_dictionary with Type = "Collection" for the specific table). • To enable enforcement, add *enforce_dot_walk_cross_scope_access* or *enforce_dot_walk_cross_scope_access* • To turn off enforcement, add *enforce_dot_walk_cross_scope_access*
exclude_auto_recovery	true/false	any table	Disables automatic recovery of draft records for this table and its extensions.
exclude_from_rollback	true/false	any table	Excludes this table (and any of its descendant tables) from being

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			recorded for rollback. For example, use this attribute to preserve records that are created from an automated test. For tables excluded by default, see Tables excluded from rollback after running an automated test.
extensions_only	true/false	any table	Specifies that the table should only have records in tables that extend it. For example, the Task table has this attribute because you would create incident, problem, change records, and not task records.
field_list_selector	true/false	any glide_list	Enables the user to select a field from the dependent table (or current if the dependent is not specified). Some workflow activities use this attribute.
field_decorations	UI Macro name list, separated by semicolons (";")	most fields (except list and multiline text fields)	Similar to *ref_contributions*, causes the named UI macro to be invoked when the field is rendered on a form.
format	format name	any numeric field	Specifies a named format to use instead of the standard numeric formatting. Options are as follows: • **glide_duration**: Formats a time specified in milliseconds as **ddd hh:mm:ss**. • **none**: Disables automatic number formatting (for example, changes 2,500–2500). **Note:** This attribute applies only to display values and not user input values.
glide.db.oracle.ps.query	true/false	any table	If present and false, prevents the use of Oracle prepared queries on the table.
global_visibility	true/false	any table with a sys_domain column	If present or true, makes this table visible globally even if there are domain restrictions (that is, the sys_domain field has a value).
hasLabels	true/false	any table	If present or true, marks this table as being the target of a label at some point. You can manually set this attribute, but it is normally set automatically whenever a label is generated. When true, the label engine runs on any change to the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			table, and updates the labels as needed.
hasListeners	true/false	any table	If present or true, marks this table as available for listeners to get events (insert, update, delete).
hasWorkflow	true/false	any table	Instructs the workflow engine to listen for changes to the table and fires events to a workflow when a record associated with a particular workflow has changed.
hide_email_icon	true/false	email field	If true, the default email icon does not display. The default value is false.
html_sanitize	true/false	any HTML or translated HTML field	If present or true, enables HTML sanitization for the selected HTML or Translated HTML field. By default, performs HTML Sanitization on all HTML and Translated HTML fields. Set this attribute to false to disable sanitization.
html_sanitize_config	name of custom sanitizer configuration file	any HTML or translated HTML field	If present, performs sanitization using the specified configuration file instead of the default platform sanitizer. For example, the Embedded Help [sys_embedded_help_content] table uses a specified file (EmbeddedHelpSanitizerConfig) for the help **Content** field.
i18n_locale_text_match	true/false	any string field	If true, enables case and accent (diacritic) sensitivity for text search of the column. If false, text search of the column is case and accent insensitive. The default behavior is false. This attribute can't be set to true when i18n_session_language_sortable is true on the same column. To learn more see Set case and accent sensitivity on a per-column basis.
i18n_session_language_sortable	true/false	any string field	If true, enables sorting the column by the user's session language. If false, sorting by the user's session language is disabled and the column is sorted according to the English alphabet. This attribute can't be set to true when i18n_locale_text_match is true on the same column. To learn more see Sorting according to the session language

Name	Value	Target Element	Description
icons	name of JavaScript class	any workflow field	Specifies a JavaScript class that produces workflow icons.
ignore_filter_on_new	true/false	any field	If true, prevents the fields on a form from populating with values from a filtered list.
image	relative path of image file	any table	Specifies an image file to use when a module or BSM map uses this table. This specification overrides the icons that would otherwise be used for the table.
include_container_types	true/false	any internal_type field	Causes the field to render with container (split) types as well other types.
ip_data_control	• none • canonical • expanded • canonicalize_when_possible (default value)	field type on any table	Checks whether the data should be normalized through the *ip_data_control* attribute. • If the attribute is none, no conversion happens and data is inserted as-is. • If the attribute is canonical, values are inserted in their smaller canonical form. • If the attribute is expanded, values are inserted in the larger expanded form to facilitate comparisons. • If the attribute is canonicalize_when_possible, values are inserted in canonical form when it is a valid IP or as-is when it is not.
isOrder	true/false	any field	Sets the field as the default field that is used for the sort order in lists. Overridden by the **ORDERBY** URL parameter, or the user's sort preferences.
iterativeDelete	true/false	any table	If present or true, forces all row deletes to execute iteratively. Otherwise, you can perform some deletes using a more efficient bulk method.
json_view	true/false	any table	if a JSON object is associated with the field, places an icon next to a field that, when you click it, displays the data interchange information.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
knowledge_custom	name of JavaScript function	any field	Specifies a JavaScript function to implement a custom knowledge search (see *knowledge_search*).
knowledge_search	true/false	string fields	If present or true, causes a knowledge search icon (a small book) to appear next to the field. Clicking this icon launches a pop-up window for searching the knowledge base, unless a custom knowledge search function has been specified. To learn more, see *knowledge_custom*.
largeTable	true/false	any table	If present or true, marks this table as "large" to preventing table locking with specific MySQL database operations (adding/removing a column/index, compacting a table). Without this attribute (or the *smallTable* attribute), the *glide.db.large.threshold* property, or the default value of **5,000**, determines whether a table is large.
listen	true/false	any field	If present or true, calls a JavaScript function named *<tableName>_<fieldName>Listen*, or *globalListen* if that function does not exist. It calls the function with arguments (*tableName*, *fieldName*, *oldValue*, *newValue*).
live_feed	true/false	any field	If present or true, creates a toggle option on the activity formatter header for incidents, tasks, and problems. The toggle provides a choice between the **Live Feed** for that record (also known as a document feed) or the activity formatter fields already in use. To learn more, see Activity formatter for more details.
long_label	true/false	any reference field	Long or short labels refer to the label that appears for reference fields on a form. For example, if the reference field contains the caller's email address, the long label would be Caller Email, while the short label would be Email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			• Usually the placement of the reference field on the form makes it clear what the field represents. • It uses the global property (*glide.short.labels*) to specify the type of labels that appear for all reference fields on any form. • You can override the global property for any reference field by setting the *short_label=true* or *long_label=true* attribute in the dictionary for the reference field.
maintain_order	true/false	any glide_list	If present or true, the up/down arrow order buttons appear to the right of the list of selected items. **Note:** You need to use the **Add multiple** button to see the order buttons.
mode_toggler	true/false	any composite_name field	If present or true, causes a name mode toggle icon (a small right-pointing triangle) to appear to the right of the label. Clicking this icon causes the field's rendering to change from a text field that accepts <tablename>.<fieldname> to a pair of reference choice boxes (one for the table, the other for the field). The latter is the default.
model_class	binary Java class name	any field of type glide_var	Specifies a model variable within the Java code. The model must have a class that implements the IVariablesModel interface.
model_field	see description	any field of type glide_var	Identifies a reference field in the record that has the model defined for it. For example, a workflow activity is associated with an activity definition. The activity definition has a related list of questions that make up the model for that activity definition. By using the activity_definition as the model_field for the activity, it builds the workflow activity model by reading the questions that are defined for the referenced activity definition.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
nibble_size	positive integer	any table affected by the table cleaner	Specifies the maximum number of records that the table cleaner can delete in a single operation. The default value for this attribute is **250**.
nibble_sleep	true/false	any table affected by the table cleaner	If false, causes the table cleaner to perform cleanup operations without a pause between each operation.
no_add_me	true/false	any table	If present or true, hides the display of the Add Me icon that appears next to certain fields, such as the **Watch List** field.
no_attachment	true/false	any table	If present or true, prevents the attachment icon (a paperclip) from appearing on the form header.
no_attachments	true/false	any table	If present or true, attachments are not checked for and deleted when a record from this table is deleted. Meant for high-activity tables that never have attachments.
no_audit	true/false	any table	If present, this field is not audited, even if the table is being audited. The true or false value is ignored.
no_audit_delete	true/false	any table	If present or true, a sys_audit_delete record is never created when you delete a record from this table. Meant for high-activity tables that never need sys_audit_delete information.
no_auto_map	true/false	any table	If true, this field is not mapped during an import set. Primarily used for LDAP imports.
no_email	true/false	any glide_list field referencing sys_user	If present or true, the email box is removed from the glide_list field like the **Watch list** field.
no_multiple	true/false	any glide_list field	Hides the select multiple icons.
no_optimize	true/false	any table affected by the table cleaner.	If present or true, prevents the MySQL table compaction operation from running on the specified table. The table compaction operation typically runs after the table cleaner deletes at least 50 percent of the data in the specified table.
no_separation	true/false	any table	If present or true, marks this table as not participating in domain separation. To learn more, see Domain separation for service providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
no_text_index	true/false	any field on a text indexed table, or any child table of a text indexed table	If a table is text indexed, the *no_text_index* field attribute prevents this field or child table from being included in the text index.
no_truncate	true/false	any string field	In a list view, shows the entire text value of the multitext value in a list, without truncating it. Without this attribute, the string is truncated based on the UI property **Number of characters displayed in list cells** which is **40** by default.
no_update	true/false	table	True for tables in which records are inserted or deleted but not updated. Prevents the system from creating sys_mod_count, sys_updated_by, sys_updated_on fields in the table when created. Does not stop updates of the table. This attribute setting is used to save space on high volume system tables, such as syslog and sys_audit.
no_view	true/false	any glide_list field	Hides the view-selected item icon.
omit_sys_original	true/false	price and currency type fields	When true, avoids retrieving the original value of a field during calculations. Omitting the sys_original value from being referenced during calculations can reduce performance issues when dealing with currencies or prices.
onlineAlter	true/false	any table	Tables with the *onlineAlter* attribute perform MySQL database operations using online schema changes. • Online schema changes provide a lock-free table upgrade when adding, modifying, or removing columns and when adding or dropping indexes. Without online schema changes, these changes to the database lock write access during execution. • Online schema changes use additional system resources. Oracle databases do not lock tables by default and do not use online schema changes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
order	numeric value	model variable fields	Used internally only (for model variables).
pop-up_processor	binary Java class name	any field or table	Specifies a custom pop-up processor for processing the field (or all fields in a table).
readable	true/false	any conditions field	When true, causes rendering of the conditions field in any list view as a human-readable condition (instead of the encoded query that is stored in the database).
ref_ac_columns	list of field names separated by semi-colons	any reference field with an auto completer (see ref_auto_completer)	Specifies the columns whose display values should appear in an auto completion list, in addition to the name. To learn more, see the cmdb_ci field (**Configuration Item**) on the Incident form for a working example.
ref_ac_columns_search	true/false	any reference field with an auto completer (see ref_auto_completer)	Causes auto-complete to work with all fields that are specified in the *ref_ac_columns* attribute. This attribute overrides the default behavior, which searches only the display value column. To learn more, see Configure auto-complete to match text from any reference field.
ref_ac_display_value	true/false	any reference field with an auto completer (see ref_auto_completer)	Causes the reference field to hide the display value column so that the auto-complete function only matches the text from the columns that are listed in the *ref_ac_columns* attribute. This feature requires the use of the *AJAXTableCompleter* class and the *ref_ac_columns*, *ref_ac_columns_search*, and *ref_ac_display_value* attributes. To learn more, see Remove the display value column. **Note:** The ref_ac_display_value function does not work with Catalog Item variables.
ref_ac_order_by	field name	any reference field with an auto completer (see ref_auto_completer)	Specifies the column that is used to order the auto completion list.
ref_auto_completer	JavaScript class name	any reference field (can be applied to a	Specifies the name of a JavaScript class (client side) that creates the list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Value	Target Element	Description
		table to affect all reference fields on the table.)	auto completion choices. Valid class values include: • *AJAXReferenceCompleter*: Matching auto-complete choices appear as a list. Only the Display values column of the reference table appears. If there is no other auto-completion class specified, reference fields automatically use this class. • *AJAXTableCompleter*: Matching auto-complete choices appear as rows in a table. The display value column of the reference table appears, with any columns listed in the *ref_ac_columns* attribute. • *AJAXReferenceChoice*: Displays matching auto-complete choices as a list. Only the display value column of the reference table, and up to 25 matching choices, appear. If there are more than 25 auto-complete choices, the choices for the *AJAXTableCompleter* class appear for the reference field instead. For more information, see Auto-complete for reference fields.
ref_contributions	UI Macro name list, separated by semicolons (";")	any reference field	When the field renders on a form, it invokes the named UI macro.
ref_decoration_disabled	true/false	any reference field	When set to `true`, disables the display of the reference icon on a selected field.
ref_list_label	label text	any table	Specifies the title to use in a list banner.
ref_qual_elements	field name list, separated by semicolons (";")	any reference field with a reference_qual field	Specifies a list of fields to send back to the server to get an updated reference.
ref_sequence	list of fields in referenced table, separated by top hats ("^")	any reference field	Specifies the fields in the referenced table that are used to order the list. This attribute works like an ORDER BY clause in SQL, with each element in ascending order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
reference_types	list of valid reference types that are clickable separated by semicolons (";")	field_name field	Limits the reference fields that appear in the tree to the specified types.
remoteDependent	name of database and table (like "model.matcher")	any script field	Defines the remote (such as in another database) table that the script depends on.
repeat_type_field	field name	a repeat count field for schedule rotation	Specifies the field that contains the repeat type (daily, weekly, monthly, or yearly).
ro_collapsible	true/false	any multiline field	If present or true, causes an icon (either a "+" or a "-") to appear next to the field label, allowing the field itself to be expanded or collapsed.
saver_exempt	• exempt_always= field will be skipped from writing to xml for all install contexts. • exempt_never= field will not be skipped from writing to xml (Default). • exempt_vcs_only= field will be skipped from writing to xml only in source control context.	Fields of metadata records	When present, determines if the field is written to the xml representation of the record. An absence of the attribute is equivalent to exempt_never. When exempt_always, the field is skipped from writing to xml when exporting (publish, commit to source control, update set). When exempt_vcs_only, the field is skipped from writing to xml only in the source control context.
scale	integer	decimal field	Sets the number of decimal places to use on a Decimal field type. The default is 2. This attribute is applied to the max length attribute setting for the field. The decimal places for a field are a combination of the max length attribute setting and the scale attribute. For example, if you want four decimal places for the field, you need a max length attribute setting of 4, plus the default of 15 or 19. You would set the scale attribute to 4 to indicate the number of decimal places. Six decimal places require a max length

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			setting of 21, a scale attribute setting of 6, and so on. **Note:** Increase the max length attribute to a value greater than 15 to increase this attribute.
script	a function that returns the contents of the field	any slushbucket field	Enables you to write a script to define what is loaded into the slush bucket field.
short_label	true/false	any reference field	Long or short labels refer to the label that appears for reference fields on a form. For example, if the reference field contains the caller's email address, the long label would be Caller Email, while the short label would be Email. • Usually the placement of the reference field on the form makes it clear what the field represents. • The global property (*glide.short.labels*) specifies the type of labels that appear for all reference fields on any form. • You can override the global property for any reference field by setting the *short_label=true* or *long_label=true* attribute for the reference field in the dictionary
show_all_tables	true/false	document ID fields	Enables users to select documents from system tables. For example, sys_script or sys_user. By default, users cannot select records from system tables.
show_condition_count	true/false	condition fields	Enables or disables the condition count widget to preview how many records are a set of conditions. To learn more, see Add the condition count to a condition field.
skip_root	true/false	table_name field	If present or true, removes the base table from the list. To learn more, see base_table.
sla_basis	list of table names separated by semicolons (";")	any field of date type (glide_date_time, glide_date,	Defines the tables for which this field determines the start (open) time of an SLA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
		due_date, date, or datetime)	
sla_closure	list of table names separated by semicolons (";")	any field of date type (glide_date_time, glide_date, due_date, date, or datetime)	Defines the tables for which this field determines the ending (close) time of an SLA.
slushbucket_ref_no_expand	true/false	any reference field	If present or true, prevents users from expanding the field from a form or list slush bucket.
smallTable	true/false	any table	If present or true, marks this table as Small (that is, not large) for querying purposes. Without this attribute (or the *`largeTable`* attribute), the *`glide.db.large.threshold`* property, or a default value of **5,000** determines whether the table is large.
start_locked	true/false	any glide_list field	Determines whether the field is locked or unlocked by default. Set the value to false to unlock the field by default.
staticDependent	name of table	any script field	Specifies the table that the script depends on.
strip_html_in_pdf	true/false	any field	Attempts to remove HTML tags from a field when that field is exported to a PDF. This attribute is most useful on HTML fields.
synch_attachments	true/false	any table	Similar to *`update_synch`* but writes the file attachments of the record to update sets. To learn more, see Index attachments on a table.
table	name of table	field_name field	Displays the specified table fields.
tableChoicesScript	name of script include	table_name field	Specifies the name of a script include whose *`process()`* method returns an array of table names from which to select.
target_field	percent_complete_target decimal field name	any percent complete field any decimal field	Works in combination with the target_threshold_colors attribute to define thresholds for percent complete fields. See the description for target_threshold colors. Example: `target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			Specify an additional target_field attribute to compare the actual completion percentage of a task with a target percentage in a different decimal field that specifies where the task should be at this point. Use the column name of the decimal field. Example: `target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen,target_field=u_expected_completion` If you do not specify an additional target_field, a target value of 100 is used, allowing you to use the color thresholds with a single field value. See Target threshold colors attribute.
target_form	name of form	any table	Specifies the alternative form to be used when this table is referenced through a pop-up window on a reference field.
target_threshold_colors	threshold limit:color	any percent complete field with the target_field attribute	Works in combination with the target_field attribute to define thresholds for percent complete fields. See the description for target_field.
text_index_filter_junk	true/false	any table	Sets the value to false to Enable or disable the Zing junk filter for the table. • By default, Zing does not index or search for two-digit numbers and single character words (unless they are Chinese or Japanese characters). • Regenerate the index after disabling the junk filter. This attribute results in a larger table index. • For optimal performance, do not apply it unless it is required.
text_search_only	true/false	table_name field	Limits the tables listed to those tables that are searchable by text.
text_index_translations	true/false	any table	If present or true, forces indexes to be recalculated when translated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			strings are added. You must have a sys-admin role to modify this attribute. This one is automatically set for indexed fields that are translated, and to fields that have a translation and are being indexed. The *glide.i18n.force_index system* property, which defaults to true, overrides this attribute.
time_zone_field	name of field containing the time zone	any schedule date/time field	Specifies the field in the parent record that contains the reference time zone for this field.
timeDimension	true/false	any field of date type (glide_date_time, glide_date, due_date, date, or datetime) in a table subclassed from the task table	If present or true, enables the production of time dimension data for use by OLAP (to produce reports based on quarters, weeks, or other time periods). **Note:** OLAP functionality has been deprecated.
track_record_for_unauthenticated_user	true/false	any table	Enables record tracking within Web Embeddables components. This attribute is set as needed through the Web Embeddables capability.For more information about how Web Embeddables are configured and used, see Configure Web Embeddables.
tree_picker	true/false	reference field to a hierarchical table	Displays the hierarchy of reference values in a tree display (such as locations). **Note:** The tree display hierarchy does not appear in reference fields when you are using mobile applications.
ts_weight	integer value	any field	Controls the relative importance of a match in the field for a text search. To learn more, see Set the relative weight of a field.
types	list of valid element types separated by semicolons (";")	field_name field	Limits the display of fields to the specified types.
update_exempt	true/false	any field from a table that has update_synch set to true	If present or true, you can change this field without skipping updates to the rest of the record. During software upgrades, the value of this field is preserved, while the rest of

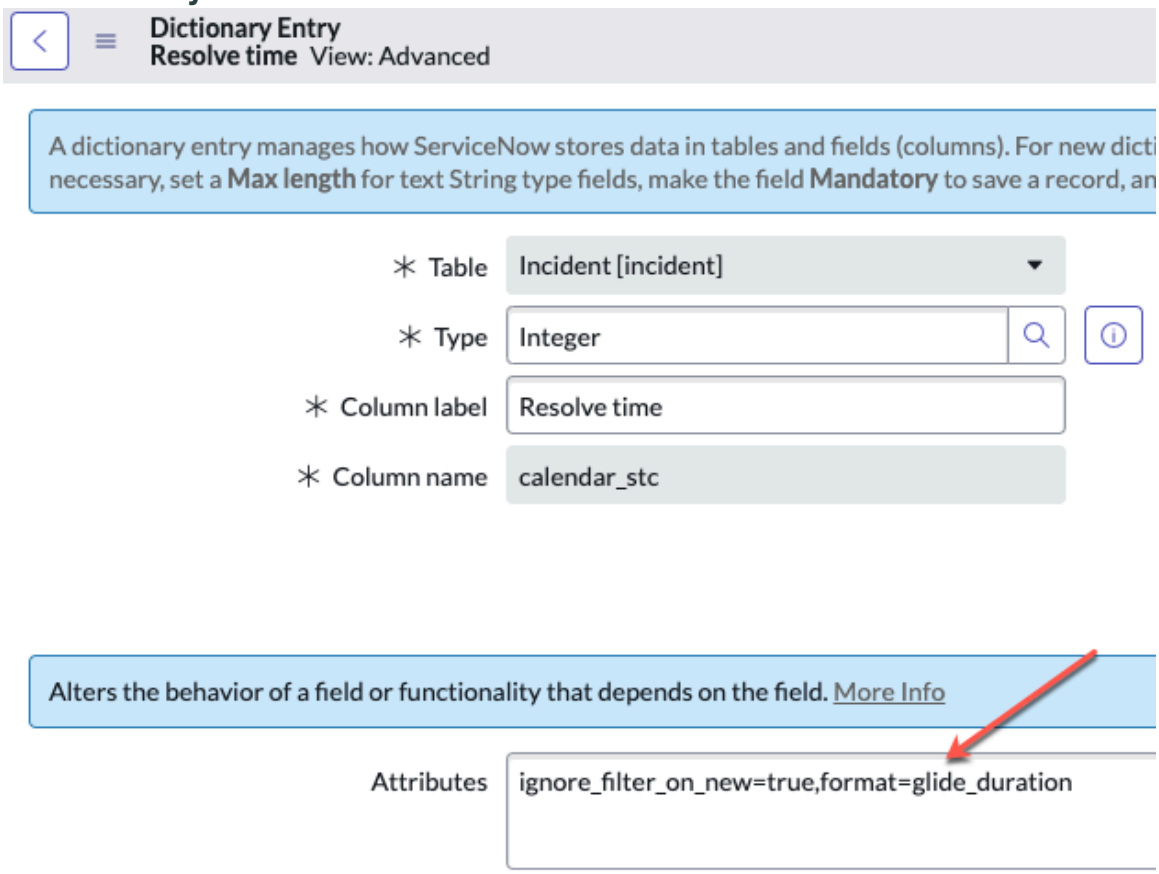
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Value	Target Element	Description
			the record receives upgrades. By default, the Active field on a tracked table is treated as update_exempt even if the attribute is not present.
update_synch	true/false	any table	Indicates that changes in the table are tracked in update sets. Administrators cannot modify this attribute. To migrate data, use an Importing from another ServiceNow instance.
use_document_viewer	true/false	any table	If present or true, enables users to open supported attachments in a document viewer within the platform, rather than downloading the files directly to their own file system.
use_workflow	true/false	any table that has delivery plans or uses workflow	If present or true, causes a workflow to be used instead of delivery plans.
user_preference	true/false	any field	If present or true, causes any user preferences to be used instead of the normal default value.
vertical_layout	true/false	radio buttons	If true, displays the radio buttons vertically.



Modify the Glide durations format

To convert fields that are displayed in milliseconds (such as 'Resolution Time' on the Incident table) to a duration format (Months/Days/Hours/Seconds), populate the attribute field on the dictionary with: `format=glide_duration`.

Now the value is displayed as a duration in lists and can be utilized in the Configure Calculations functions. This may be useful to illustrate ITIL KPIs such as Mean Time To Repair.

Dictionary overrides

Dictionary overrides provide the ability to define a field on an extended table differently from the field on the parent table.

For example, for a field on the Task [task] table, a dictionary override can change the default value on the Incident [incident] table without affecting the default value on Task [task] or on Change [change].

Administrators can override these aspects of a field:

- Reference qualifiers
- Dictionary attributes
- Default values
- Calculations
- Field dependencies
- Default column display values
- Mandatory and read-only status

Define a dictionary override

Use a dictionary override to allow a field in a child table to have a different value or behavior than the same field in a parent table. For example, a dictionary override changes the default value of the priority field from 4 in the parent table to 5 in the Incident table.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Dictionary overrides are only available for tables that support table extension.

Dictionary overrides are inherited by extended tables, so it may be necessary to define additional overrides to change the value of fields on extended tables. For example, if you define the default value of cmdb_ci.install_status to be 3, and create an override for the same field on cmdb_ci_hardware to be 5, all tables extended from the Hardware table will also default to 5. So if you want the default cmdb_ci_computer.install_status to be 3, you will need another override.

You can add a dictionary override in a scoped app, but you must add the override while working in the scoped app context and you can only select child tables from within that scope. Open the scoped app, edit the field's dictionary entry, add a new dictionary override, select the child table, and then provide the override details.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the record for the field.
3. In the **Dictionary Overrides** related list, click **New**.
4. Fill in the fields on the form, as appropriate (see table).

Dictionary overrides table fields

Field	Description
Application	The application scope to which the record belongs.
Base table	The parent table containing the field to override.
Table	Select the extended table to which the dictionary override applies. **Note:** The list shows only tables and database views that are in the same scope as the dictionary override.
Override reference qualifier	Select the check box to display the **Reference qualifier** field, which overrides the Reference qualifiers for the field on the extended table.
Override dependent	Select the check box to display the **Dependent** field, which overrides the field on which the current field depends.
Override attributes	Select the check box to display the **Attributes** field, which overrides the dictionary attributes for the field on the extended table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Any attributes defined on the base table are ignored. If there are attributes on the base table that should still apply to the extended table, make sure to include them in this field.
Override default value	Select the check box to display the **Default Value** field, which overrides the default value for the field on the extended table.
Override calculation	Select the check box to display the **Calculation** field, which overrides the calculation of the value for the field on the extended table.
Override mandatory	Select the check box to display the **Mandatory** field, which overrides whether the field on the extended table must contain a value to save a record.
Override read only	Select the check box to display the **Read only** field, which overrides whether a user can change the field value on the extended table.
Override display value	Select the check box to use this field as the display value on the extended table. For example, the Story [`rm_story`] table uses the short description as the display value in reference fields instead of the number, as defined in the Task [`task`] table. **Note:** Only fields that exist at the task table can be used as display value overrides.

5. Click **Submit**.

Table flattening

Table flattening stores a hierarchy of related tables as one table in a relational database.

Extension models

The system offers these extension models to store a table hierarchy on a relational database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available extension models

Extension model	Flattens tables?
Table per class	No
Table per hierarchy	Yes
Table per partition	Yes

Table per class

The Table per class extension model stores each table of the hierarchy in its own physical table on the relational database. Each physical table uses the table prefix of the source table each stores a different class of records. An example of the Table per class extension model is the Asset [alm_asset] table, and its child tables: Hardware [alm_hardware], Consumable [alm_consumable], Facility [alm_facility], and Software License [alm_license]. The parent table of the hierarchy, Asset, stores a copy of every record in its descendant tables.

To find records in the Table per class extension model, the system queries records from multiple tables and joins the results. For example, when searching for hardware in a related facility, the system must join results from the Hardware, Facility, and Asset tables.

Table joins cause a performance bottleneck on relational databases. The more classes a query includes, the worse the query performance. Therefore any query for records from the top of the table hierarchy has the worst performance because it requires joining all descendant tables.

The system uses the Table per class extension model by default when creating tables. Most system tables also use the Table per class extension model as there is no performance benefit from flattening them.

Table per hierarchy

The Table per hierarchy extension model stores an entire table hierarchy in a single flat physical table on the relational database. The physical table is named after the parent table of the hierarchy, such as Task. The physical table contains all records of the table hierarchy and assigns a class name column value to each descendant table of the hierarchy. The system uses the name of the source table as the class name value. For example, Task records can have class names such as Change, Incident, or Problem.

To find records in a table hierarchy, the system queries the physical table and uses the class name column to constrain the results. Since such queries do not require joining results from multiple tables, the system provides better search performance.

The system uses the Table per hierarchy extension model for the Task table hierarchy on MySQL databases. Other tables use the Table per class extension model because there is no performance benefit to flattening them. To use Table per hierarchy on an Oracle database, contact Technical Support.

Table per partition

The Table per partition extension model stores an entire table hierarchy in a single flat logical table on the relational database. Each logical table can have multiple physical storage tables called partitions supporting it. Each partition optimizes the database resources available to a physical table such as the column count, index count, and row size. The system adds a partition whenever the logical table needs additional relational database resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each logical table is named after the parent table of the hierarchy, and each supporting physical partition consists of the logical name plus a partition name. For example, the Base Configuration Item [cmdb] table starts as a logical table with no partitions. Suppose your hardware configuration items consume enough database resources that the system creates a partition called **cmdb$par1** to store them. Later, computer configuration items could consume enough database resources to warrant the system creating a second partition called **cmdb$par2** to store these records.

Within each logical table, the system assigns a class name column value to each descendant table of the hierarchy. For example, within the Base Configuration Item logical table there are records with class names for Application, Computer, and IP Router. The system also assigns a two-digit class path value to each descendant table of the hierarchy. The class path is based on the table location in the hierarchy. For example, the parent class Hardware might have a class path such as **/!!/!D** and the child class Computer might have a class path such as **/!!/!D/!!**.

To find records in the Table per partition extension model, the system queries the logical table and its partitions and uses the class path column to constrain the results. Since these queries do not require joining results from multiple tables, the system provides better search performance. In addition, the class path reduces the total number of records to search, which further improves search performance.

The system uses the Table per partition extension model for the Base Configuration Item [cmdb] table hierarchy on MySQL databases. To use Table per partition on an Oracle database, contact Technical Support.

View a table hierarchy and the extension model

Determine the extension model used by a table.

Before you begin

Role required: admin

About this task

The extension model used by a table is not immediately apparent. While a hierarchy can use a single physical table, the platform displays tables as if each logical table has a unique physical table. For example, when specifying a table for a workflow, you can select Change [change_request] or Incident [incident] even though the parent table, Task [task], uses a single physical table.

Administrators can view the status of flattened table hierarchies, but cannot flatten additional hierarchies. You can configure the form to add the **Extension model** field if necessary.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select a table record.
3. Review the **Extension model** field value, which indicates whether the table hierarchy uses multiple unique tables or a single flat table.
   - **None**: Indicates that the table uses the table per class model. Defines a unique physical table per logical table in a hierarchy. For example, there are separate physical tables for the Asset [alm_asset] table, and its child tables: Hardware [alm_hardware], Consumable [alm_consumable], Facility [alm_facility], and Software License [alm_license].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Note:** If a table has an empty Extension Model field, it is not necessarily a Table Per Class table. If the table extends another table, it actually inherits the model from any parent tables it is extending, and only when none of the parents have a defined extension model is the table's extension model Table Per Class. This can be seen on many tables that extend the Task table. Incident is a logical table that extends Task and is physically located on Task, but by default has a blank Extension Model value.
>
> When a table doesn't extend anything at all, and has a blank Extension Model field, it is a Table Per Class table.

- **Table per hierarchy**: Defines a single physical table per logical table hierarchy. For example, there is a single Task [task] table on the MySQL database that contains all the Task, Incident, Problem and Change records. This single physical table is represented as separate logical tables.

Viewing table references and extensions

View table relationships in a visual manner using the schema map.

The schema map displays the details of tables and their relationships visually, allowing administrators to view and easily access different parts of the database schema.

The schema map can also be printed directly from a browser.

Table relationships depicted in the schema map

Relationship type	Color used
Referenced by	Red
Referencing	Orange
Extended by	Green
Extending	Blue

By default, each type of relationship is displayed. However, you can view or hide each type as needed.

Generate a schema map

Generate a schema map to view different parts of the database schema.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables & Columns**.
2. In the **Table Names** pane, select a table.
3. Click **Schema map**.

   The schema map for the selected table opens in a separate tab or window.

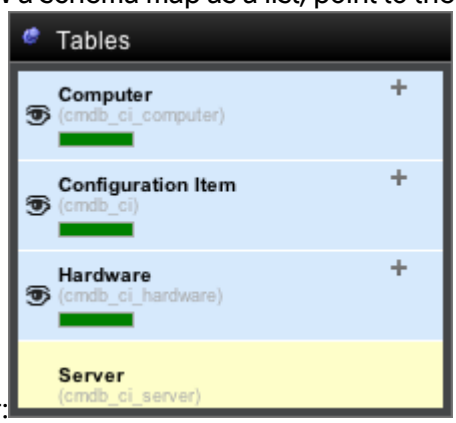
   If required, you can print this map from the browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Analyzing table relationships

The schema map shows the selected table in yellow, typically centered, and all tables related to that table, typically shown at the sides.

Example schema map



From this map:

- The check boxes at the top allow you to control which relationships to display. Select or clear a relationship type to display or hide tables with that relationship to the selected table.
- Each related table has a colored bar indicating the relationship to the selected table.
- You can point to the connector lines to display the details of a relationship between the two tables.

Note: Since relationships are shown as single lines for simplicity, the diagrams rendered are not entity relationship diagrams.

Using the Table Selector:

To view a schema map as a list, point to the table selector in the right corner:

You can:

- Click a table in the list to scroll the schema map to that table.
- Click the eye icon beside a listed table to hide or show that table in the schema map.
- Click the pin icon in the selector to keep the list open.

Using Related Tables:

Right-click a table node header to display a context menu with these functions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Focus on this table**: Make the selected table the new focus table and redraw the schema map based on the new selection.

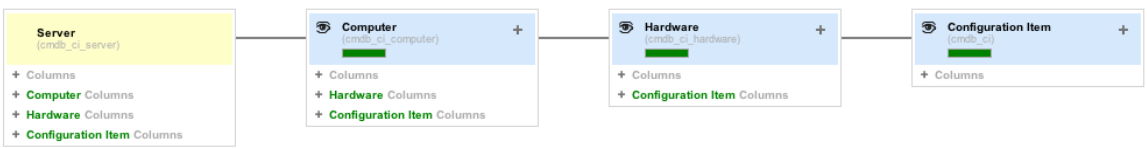
  The new focus table is added as a breadcrumb at the top, allowing you to return to the previous table at any time.

- **Go to list**: Display the list of records for the table.
- **Go to dictionary**: Display the system dictionary, filtered for the selected table.

To hide a related table from view, click the eye icon in the node header (the node can be made visible again with the table selector).

For tables that are part of their own derivation hierarchy, click the expand button (**+**) in the node header to add their derivation hierarchy to the schema map.

Viewing More Information



Click the expand button (**+**) beside **Columns** to expand the table fields.

Columns -

Business resolve time:	integer
Caller:	reference to User
Category:	string
Caused by Change:	reference to Change Request
Change Request:	reference to Change Request
Child Incidents:	integer
Close code:	string
Incident state:	integer
Notify:	integer
Parent Incident:	reference to Incident
Problem:	reference to Problem
Reopen count:	integer
Resolve time:	integer
Severity:	integer
Subcategory:	string

The reference fields show a red notation of the table they refer to.

If any tables extend from a table, their columns are displayed in reverse derivation order. For example:

Here, the Server `[cmdb_ci_server]` table extends from Computer `[cmdb_ci_computer]`, Hardware `[cmdb_ci_hardware]`, and Configuration Item `[cmdb_ci]`, and displays the columns from those tables.

Similarly, the Computer table displays the columns from the Hardware and Configuration Item tables.

Create a table index

Build indexes to access the data held in your tables more easily.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Note: Constructing an effective index requires specialized knowledge in database architecture. If you don't have this expertise, consult with a database administrator.

Creating an index on a large table can significantly affect system performance. A large table in this case is generally considered to be any table around 1 TB in size. Therefore, consider creating indexes on larger tables only during off-peak hours. For example, avoid adding an index to a CMDB table while a discovery job is running, as this can lead to increased load and potential delays.

Procedure
1. Access the Index creator in one of the following ways.

Option	Steps
Tables & Columns module	**a.** Navigate to **All** > **System Definition** > **Tables & Columns**. **b.** In the list, find the table you want and select its label. **c.** Navigate to the Index creator.
Database Indexes related list	**a.** Navigate to **All** > **System Definition** > **Tables**. **b.** In the list, find the table you want and select its label. **c.** Navigate to the **Database Indexes** related list. **d.** Select **New**.

2. Select the fields you want included in the index.
   The order in which you select the fields affects how the index works. If you do not have expertise in database design, you should consult someone who does.
3. To create a unique index, select the **Unique Index** check box.
4. Select **Create Index**.
   The **Table Name** field is there for your reference only. Overriding the default has no effect.
5. Select an index type.
   - **btree**

     The default index type.
   - **Columnstore (RaptorDB Pro)**

     Optimize data storage and retrieval by creating a columnstore index. Columnstore indexes store data in a compressed, column-oriented format that can improve query performance, especially when querying large datasets. Available with RaptorDB Professional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Drop a custom index

Remove a custom index by dropping it from a table.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select the table that contains the custom index you want to drop.
3. On the **Table** form, select the Database Indexes related list.
4. In the list, select the custom index that you want to drop.
5. On the Database Indexes form, select **Drop**.

Result
The custom index is dropped from the table.

Create a many-to-many table relationship

Create a bi-directional relationship between two tables, so that the related records are visible from both tables in a related list.

Before you begin
Role required: admin.

About this task
Many-to-many relationships allow a list to point to a list of entries, rather than to single field.

If a knowledge base article points to a list of related configuration items, it uses a related list. Not all lists can be used as related lists, however. For a list to be related to another list, a many-to-many relationship that refers to both tables must exist.

The Many to Many Definitions `[sys_m2m]` table allows administrators to create custom many-to-many relationships.

Many-to-Many tables aren't considered custom tables and don't count toward your custom table allotment.

Procedure

1. In the navigation filter, enter `sys_m2m.list`.
2. Click **New**.
3. In the **From table** field, specify a parent table.
4. In the **To table** field, specify a child table.
   The Many-to-Many form automatically populates the other fields with suggested values.
5. **Optional:** Edit other field values, if appropriate.

> **Note:** Many-to-Many table names cannot exceed 30 characters.

Related topics

Reference default many-to-many relationships

Reference default many-to-many relationships

Some many-to-many relationships are defined by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To reference many-to-many relationships that are available in the base system, administrators can enter `sys_collection.list` in the navigation filter.

Note: Only use this table to view many-to-many relationships in the base system. To create a new relationship, always use the Many-to-Many Definitions table.

Working with the Task table

The Tasks [task] table is one of the core tables provided with the base system.

The Tasks [task] table provides a series of standard fields used on each of the tables that extend it, such as the Incident [incident] and Problem [problem] tables. In addition, any table that extends the Tasks [task] table can take advantage of task-specific functionality for driving tasks.

The Planned Task plugin provides the Planned Task [planned_task] table, which extends the Tasks [task] table to provide more fields for tasks to measure duration and effort.

Creating tasks

The Tasks [task] table provides means for creating and completing tasks, as well as tracking their workflow in your instance.

Tasks aren't created directly on the Tasks [task] table. Instead, tasks are created on task child tables. To create a record in a task child table, access the Tasks [task] table by entering `task.list` in the navigation filter, and then select **New**. In the Task Interceptor, select the desired task child table.

Tools for completing tasks

These tools can be run on any table which extends Task.

- Approvals

  Approvals can be generated to a list of Approvers, either manually or automatically, according to Approval Rules. Approvals can be incorporated into workflows or can stand alone. For more information, see Process approvals.

  Approvals can be used on tables that do not extend Task.

- Assignments

  Assignment rules can automatically assign tasks to users or groups, ensuring that the most appropriate team members handle the tasks. For more information, see Defining Assignment Rules.

- Service levels

  Service level agreements can track the amount of time that a task has been open, to ensure that tasks are completed within an allotted time.

- Inactivity monitors

  Inactivity monitors ensure that tasks do not fall by the wayside by notifying users when tasks have been untouched for a predefined period of time. For more information, see Set an inactivity monitor.

- Workflow Studio

  A process owner can design a flow for tasks that meet certain conditions. After a task is created that meets the conditions, the flow applies an automated process to the task. The process is defined in Workflow Studio. For more information, see Flow Designer.

Modifying the Task table

Modifications made to the Tasks [task} table are applied to all child tables.

Be sure that changes are appropriate for all the child tables. Adding fields is a low-impact change, because you can hide fields on tables that don't need them. However, if the fields are being used across tables, deleting fields may cause unwanted data loss.

Note: When adding choice list entries to a choice list on the Tasks [task] table, make sure that the entry value is unique.

You can use dictionary overrides to change some parts of a field definition in a way that does not to not apply to all child tables.

Tasks workflow

An administrator can specify a specific workflow process to apply to tasks that meet certain conditions.

Once a task is created that meets the conditions, the workflow applies the process to the task, asking for approvals, notifying users, generating other tasks, running scripts, and so on.

Task table structure

The Task table structure provides a framework to organize and store task-related data, and includes extensive customization options.

Important Task table fields

The Task table is a base class that provides fields for the core ITSM applications such as Incident, Problem, and Change Management. All applications that extend the Task table share these fields in common.

Label	Name	Type	Description
Active	active	boolean	Specifies whether work is still being done on a task or whether the work for the task is complete. By default, only application-specific business rules set the value of this field. For example, the *incident autoclose* business rule closes resolved incidents that have not been updated for one day.
Additional comments	comments	journal_input	Displays and allows the entry of comments about the task record. Each comment is inserted into the **Activity** field. For more information, see Journal field type.
Approval History	approval_history	journal	Displays the history of approvals for the record. For more information, see Tools for completing tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Label	Name	Type	Description
Assigned To	assigned_to	reference	Specifies the user assigned to complete the task. By default, this field uses a Reference qualifiers to only display users with the itil role. Some applications override the parent reference qualifier to display relevant users. For example, the Service Order and Project Task tables filter users based on their skills.
Created	sys_created_on	glide_date_time	Displays the date and time when the task record was created.
Description	description	string	Displays and allows the entry of a multi-line description of the work to be done.
Escalation	escalation	integer	Indicates how long the task has been open. Escalations are dynamically populated using service level agreements, which specify how long a task remains in each escalation state. Escalation states go from **Normal** to **Moderate** to **High**, and finally to **Overdue**. Record lists color code each task by escalation state.
Number	number	string	Displays an identifying number for each task record. This field is the display value for the Task table. The system generates this number when the task is created. To manage number generation, see Record numbering.
Opened	opened_at	glide_date_time	Displays the date and time when a human opened the task record for the first time.
Priority	priority	integer	Specifies how high a priority the task should be for the assignee. By default, the *calculatePriority* business rule calculates this value based on the **Impact** and **Urgency** values. Record lists color code each task by degree of priority.
Short Description	short_description	String	Displays and allows the entry of a short description of the task, which is a human-readable title for the record.
State	state	Integer	Displays a choice list for status of the task: • Pending • Open • Work in Progress • Closed Complete

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

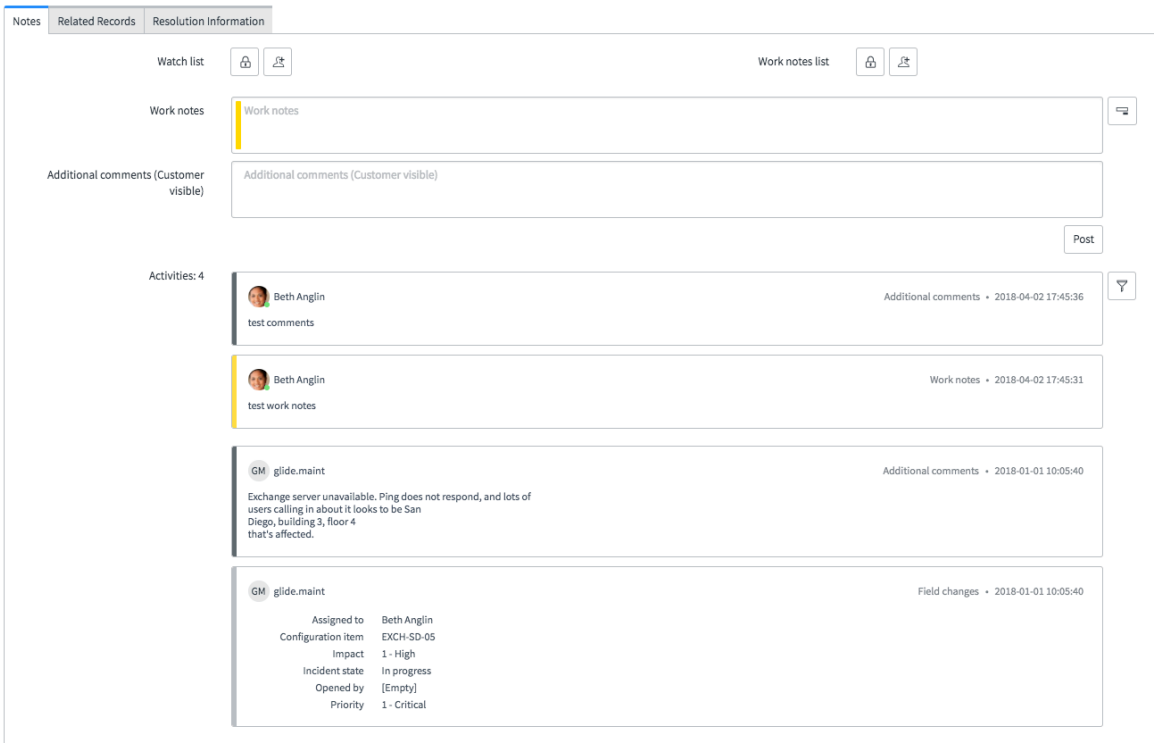
Label	Name	Type	Description
			• Closed Incomplete • Closed Skipped Applications typically use Dictionary overrides to display application-specific states.
Sys ID	sys_id	GUID	Displays the Unique record identifier (sys_id).
Task Type	sys_class_name	sys_class_name	Specifies the type of task, which corresponds to the child class. The system populates this value when a record is created on a child table.
Time Worked	time_worked	timer	Display a timer which measures how long a record is open in the form view.
Watch list	watch_list	glide_list	Specifies users who receive Email and SMS notifications when the record is updated. By default, only the Incident, Change, and Service Catalog applications notify users listed in this field. For other Task-based applications, you must create custom email notifications sent to the users listed in this field. For information about addming more users to the watch list, see Add users to a watch list.
Work notes	work_notes	journal_input	Displays and allows the entry of comments viewable only by ITIL users. Each comment is inserted into the **Activity** field. For more information, see Journal field type.
Work notes list	work_notes_list	glide_list	Specifies users who receive Email and SMS notifications when work notes are added to the record. By default, only the Change, Problem, and Service Catalog applications notify users listed in this field. For other Task-based applications, you must create custom email notifications sent to the users listed in this field.

Journal fields

Journal fields work together to create a log of changes and comments as tasks are worked on.

Note: Journal fields are shown regardless of the table audit enabled/disabled setting.

Fields of the journal_input type are multi-line text boxes which, upon save, add the comments into the Activity field with a notation. The most common types of journal fields are work notes and additional comments.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields that accept input into the journal

Field	Description
Additional comments	Any user can update.
Work notes	ITIL users can update.

These comments, as well as any changes to the record or email notifications sent out because of the record, are displayed in the activity formatter, which can be added to the form like a field.

Activity formatter for journal fields

Reminder table

The Reminder [reminder] table provides a way to auto-generate reminders for a task.

Any table that extends the Task table, such as the Incident [incident] table, can use the Reminder [reminder] table.

You can add Reminders as a related list to the Incident form by opening the form context menu, navigating to **Configure** > **Related Lists**, and then adding **Reminders->Task**.

By default, only an administrator can create or modify a Reminder record. To enable non-administrators to create reminders, you must add create and read ACL rules to the Reminder [reminder] table and specify the user's role.

Note: You can only create reminders for active task records.

To access the Reminder table, type `reminder.do` in the filter navigator.

Reminder table

Field	Description
Task	Refers to the parent task record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reminder table (continued)

Field	Description
User	Specifies the user who has logged in to the system.
Remind me	Specifies the time before which the reminder must be sent. Available values are: **15 minutes**, **30 minutes**, **1 hour**, and **2 hours**. You can add values to this field as required. **Note:** Internally in the system, the value is always converted to minutes and then stored in the **Remind me** field.
Before	Refers to a date field on the parent task record. **Note:** The **Activity due** and **SLA due** fields are legacy fields with an **UNKNOWN** value that you can't use. You can only use the **Due date** and **Follow up** fields. Note the following details about using the **Before** field. • The parent task record must have a value in the field you specify. For example, if you select **Due date**, the parent task record must have a value in **Due date** before you can save the reminder. • You can use a date field other than **Due date** or **Follow up** by performing the following steps: 1. Select either **Due date** or **Follow up**in the **Before** field. 2. Save the reminder. 3. Find the reminder in a list view using one of the following methods: ▪ In the parent task record, configure the form, and then add Reminders as a related list. ▪ Navigate to `reminder.do` and search for the reminder. 4. In the list view, change the **Before** field value to a different date field from the parent task. Use the field name and make sure the field has a value. For example, enter `work_start` to use the **Actual start** field instead. Note that you can't make additional changes on the reminder form without changing the **Before** field value back to either **Due date** or **Follow up**.
Using	Specifies the method by which the reminder must be sent. Available options are: **Send an Email** and **Outlook Calendar**.
Subject	Specifies the subject or the reason of the reminder. Maximum number of characters allowed on this field is 100.
Notes	Provides a space where you can enter your comments regarding the reminder. Maximum number of characters allowed on this field is 8000.

Defining assignment rules

The instance can automatically assign a task to a user or group based on pre-defined conditions by using data lookup rules and assignment rules.

Assignment rules module

The Assignment rules module allows you to automatically set a value in the assigned_to and assignment_group fields when a set of conditions occurs.

You can modify and create assignment rules by navigating to **All** > **Routing and Assignment** > **Assignment Rule**. An assignment rule must also meet these additional criteria to run:

- The task record has been created or updated. Assignment rules do not apply to unsaved changes on a form.
- The task record must be unassigned. The record cannot have an existing value for either the *assigned_to* or *assignment_group* fields. Assignment rules cannot overwrite existing assignments (including assignments set by a default value or a previously run assignment rule).
- The assignment rule is the first rule that matches the table and conditions. If more than one assignment rule matches the conditions, only the rule with the lowest order value runs.

Data lookup rules

Data lookup rules offer a generic way to change any field value, not just assignment fields.

Data lookup and record matching support offer the following improvements over the *Assignment* module:

- Ability to change any field value not just an assignment field
- More options to define when a rule runs:
  - On form change (Allows assignment rules to apply to unsaved changes on a form)
  - On record insert
  - On record update
- Option to replace existing values (including default values)

Note: You can define data lookup and *Assignment* rules at the same time. The system ignores any duplicate rules after an incident has been assigned unless you are using a data lookup definition option to replace existing values.

Related topics

Precedence between data lookup, assignment, and business rules

Precedence between data lookup, assignment, and business rules

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

Note: Client-based code that executes in the browser, using Ajax or running as JavaScript, executes before the form submission to the server.

The order of execution is as follows:

1. Before business rules: Scripts configured to execute before the database operation with an order less than 1000.
2. Before engines. The following aren't executed in any specific order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Approval engine (for task and sys_approval_approver tables)
- Assignment rules engine (for task tables)
- Escalation engine
- Data policy engine
- Field normalization engine
- Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
- Execution plan engine (for task tables)
- Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
- Data lookup engine inserts or updates
- Workflow engine (for default workflows)

3. Before business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. Database operation: The system performs the insert, update, or delete operation on the database.
5. After business rules: Scripts configured to execute after the database operation with an order less than 1000.
6. After engines. The following aren't executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Workflow engine (for deferred workflows)
   - Trigger engine (for all Workflow Studio flows).
7. Email notifications: The following are executed based on notification weight:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications
8. After business rules (active records only): Scripts configured to execute after the database operation with an order greater than or equal to 1000.

Note: Like After business rules, Async business rules execute their logic after a database operation occurs. Unlike After business rules, Async business rules execute asynchronously, running in the background simultaneously with other processes. Async business rules run after the user submits the form and after the scheduler runs the scheduled job created from the business rule. The system creates a scheduled job from the business rule after the user submits the form but before any action is taken on the record in the database.

Workflow assignments

An alternative to creating data lookup or assignment rules is to create one or more workflow tasks that assign a task record as part of a workflow.

Consider using Task workflow activities for assignment if your process includes multiple steps or conditions such as requiring a particular group approve a request.

When using a workflow to manage task assignments, add a brief Timer workflow activity to the start of the workflow. Without this timer activity, the workflow runs before the parent record, the current record, is inserted into the database. After the timer activity completes, the workflow resumes using the parent record information from the database instead of the original current. Pausing a workflow in this way does not change a default workflow to a deferred workflow. For more information on how the workflow engine interacts with the database, see Workflow engine operation order.

Baseline assignment rules example

A baseline instance contains certain assignment rules.

Baseline instance rules

Name	Table	Conditions	Assigned to user, Assigned to group, or Script
Networking	incident	Category is Network	User: System Administrator Group: Network
Database or Software	incident	Category is one of Request, Inquiry / Help, Software, Hardware	User: System Administrator Group: Software
SC Item fulfillment - Field Services	Ticket	Parent.Task type is Request item	Group: Field Services
Release Planning	release_phase	Name is Plan	Script: `current.release.product.service.assigned_to;`
IT Hardware	sc_req_item	Approval is Approved and Item.Category is Request Computers and Hardware	User: System Administrator Group: Hardware
Service Desk	incident	Active is true	Group: Service Desk

Create an assignment rule

Automatically assign a record according to one or more conditions in an assignment rule. Assignment rules are designed to run at the time you open a record.

Before you begin

Role required: assignment_rule_admin or admin

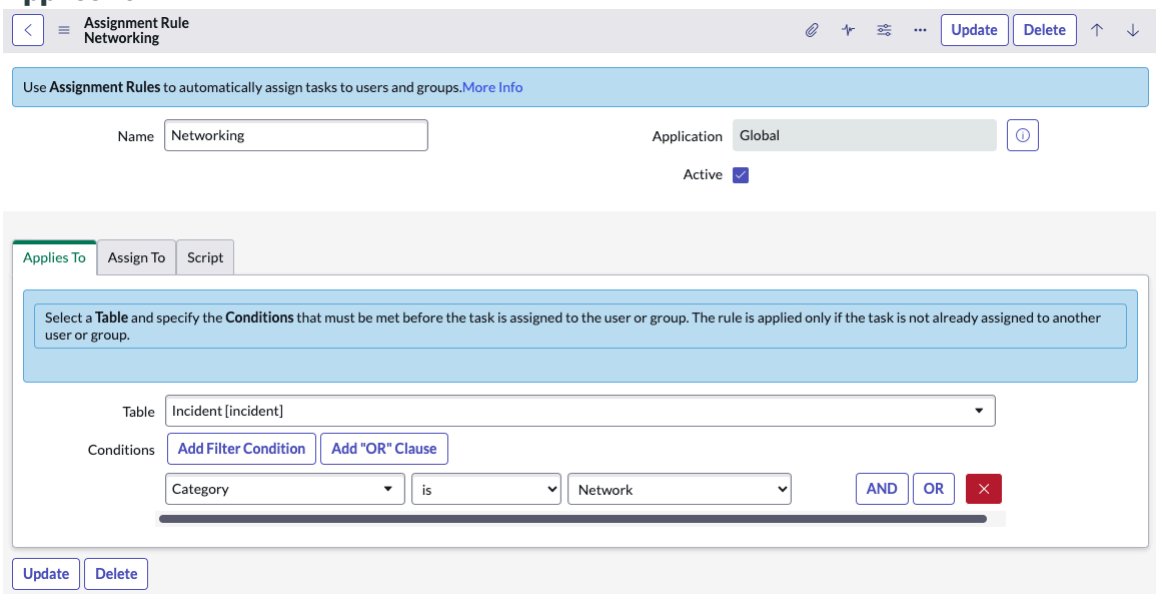
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Assignment**.
2. Select **New**.
3. On the form, fill in the fields.

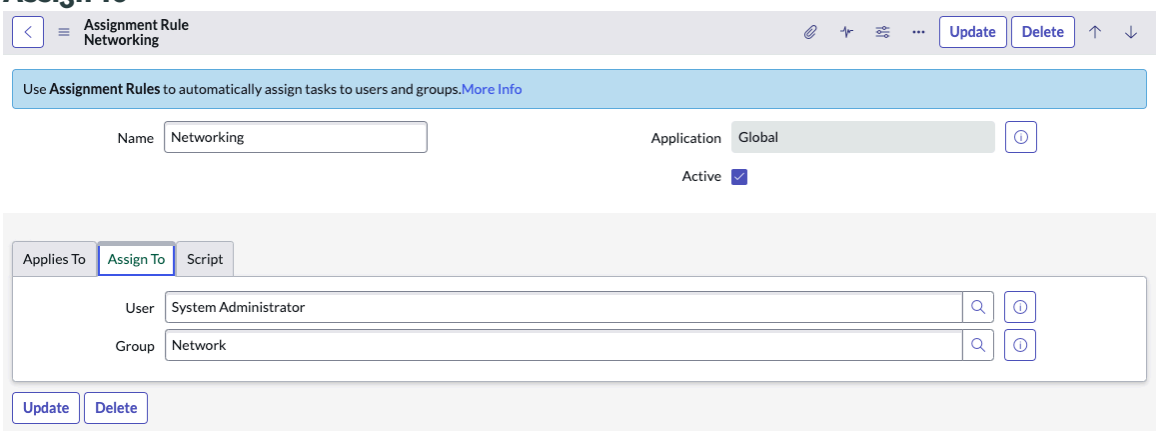
Assignment rule form

Field	Description
Name	The descriptive name for the assignment rule.
Active	Option to activate the assignment rule.
Applies to	
Table	The table with the records that the assignment rule applies to. The list shows only tables and database views that are in the same scope as the assignment rule. If you select a custom table that extends the task table, and for the assignment rule to work properly, you must clear the instance cache by navigating to https://<instance_name>.service-now.com/cache.do. **Important:** Clearing the system cache can affect overall performance, and degrade system response times. Do not run cache flushes during business hours, and do not trigger cache flushes automatically.
Conditions	The conditions under which the assignment rule applies.
Assign to	
User	The user the event is assigned to.
Group	The group the event is assigned to.
Script	
Script	A script to specify advanced assignment rule functionality. The script should evaluate to the sys_id of a user or user group. The `current.variable_pool` set of variables is available. **Note:** Make sure the input in the script is correct, and that the input type matches the field type in the Assignment Rule script. For example, if the assignment rule script sets the value of an Integer field, and the value in the script is set to String, the assignment rule may yield unexpected results.
Optional fields	
Match conditions	**Any** If any of the conditions are met, assignment rule applies. **All** If all the conditions are met, assignment rule applies.
Execution Order	The order in which the assignment rule is processed. If assignment rules conflict, a rule with a lower-order value takes precedence over a rule with a



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	higher value. If the order values are set to the same number, the assignment rule with the first matching condition takes precedence over the others. Only the first assignment rule with a matching condition runs against a record.



Example: Condition editor

In this example, the condition statement automatically assigns any incident opened in the Network category to the system administrator in the Network assignment group.

Applies To

Assign To

Create an assignment data lookup rule

Automatically assign a record using Data Lookup and Record Matching.

Before you begin

Role required: assignment_rule_admin or admin

Procedure

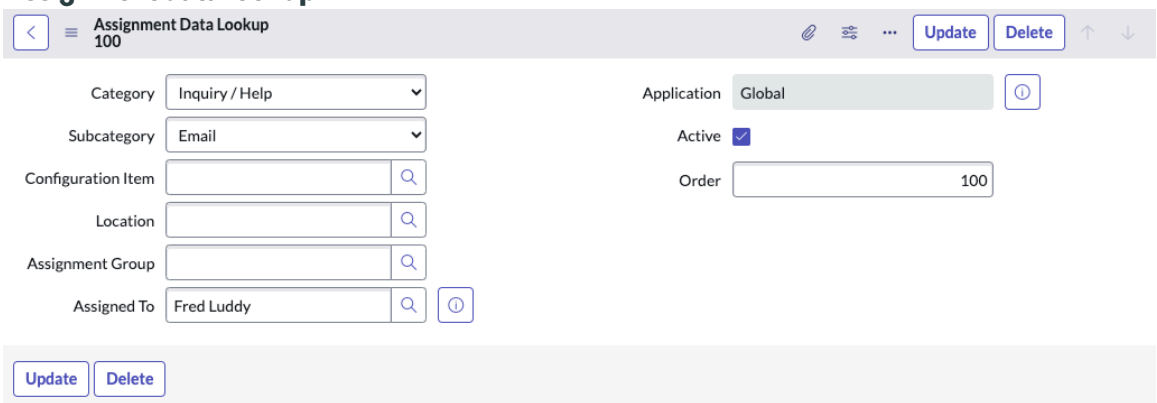
1. Navigate to **All** > **System Policy** > **Rules** > **Assignment Lookup Rules**.
2. Select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment Data Lookup fields

Field	Description
Category	The category the data lookup matches against.
Subcategory	The subcategory the data lookup matches against.
Configuration item	The configuration item the data lookup matches against.
Location	The location the data lookup matches against.
Assignment group	The assignment group to assign the incident to.
Assigned to	The user to assign the incident to.
Active	Option to run the rule or deactivate the rule.
Order	Order in which the rule runs compared to other rules on the same table. The Data Lookup Plugin runs the rule with the lowest order and matching values.

4. Select **Submit**.



Result

The rule assigns incidents to the values in the *Assignment Group* and *Assigned To* fields based on the values selected in the **Category**, **Subcategory**, **Configuration Item**, or **Location** fields. A valid assignment lookup rule requires at least one matcher field and one setter field.

Example: Assignment Data Lookup

In this example, the Assignment Data Lookup rule automatically assigns any incident with the Category of Inquiry/Help and Subcategory of Email to Fred Luddy.

Assignment data lookup

Extending the Task table with Planned tasks

The Planned Task plugin provides a Planned Task `[planned_task]` table that extends the Task `[task]` table.

The Planned Task plugin cannot be activated independently. It gets activated when activating the Project Management plugin (through PPM Standard plugin).

Planned tasks provide additional fields for tasks pertaining to time and effort as part of a planned, multi-stage process. You can create a planned task by entering `planned_task.list` in the navigator filter and selecting **New** from the planned task list.

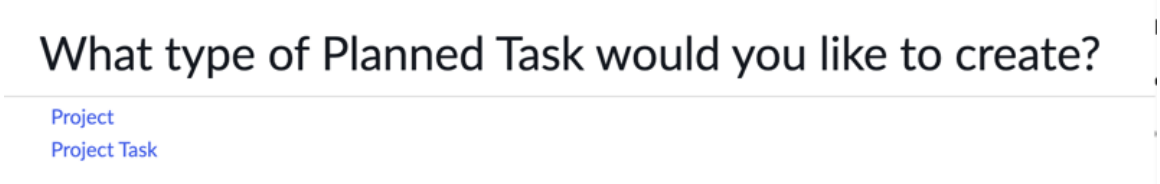
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the Planned Task_v2 (`com.snc.planned_taskv2`) plugin is active when you upgrade to the Geneva or later releases, the system adds the Task column to the Planned Task [planned_task] table. The Task column is of type Composite Field, and stores the Short Description and Number of the task. During the upgrade, the system updates all records in the Planned Task table.

Modify a Planned Task Interceptor

Customize the Planned Task Interceptor to control what type of planned task record users can create and what choices they see when creating new planned tasks.

Before you begin



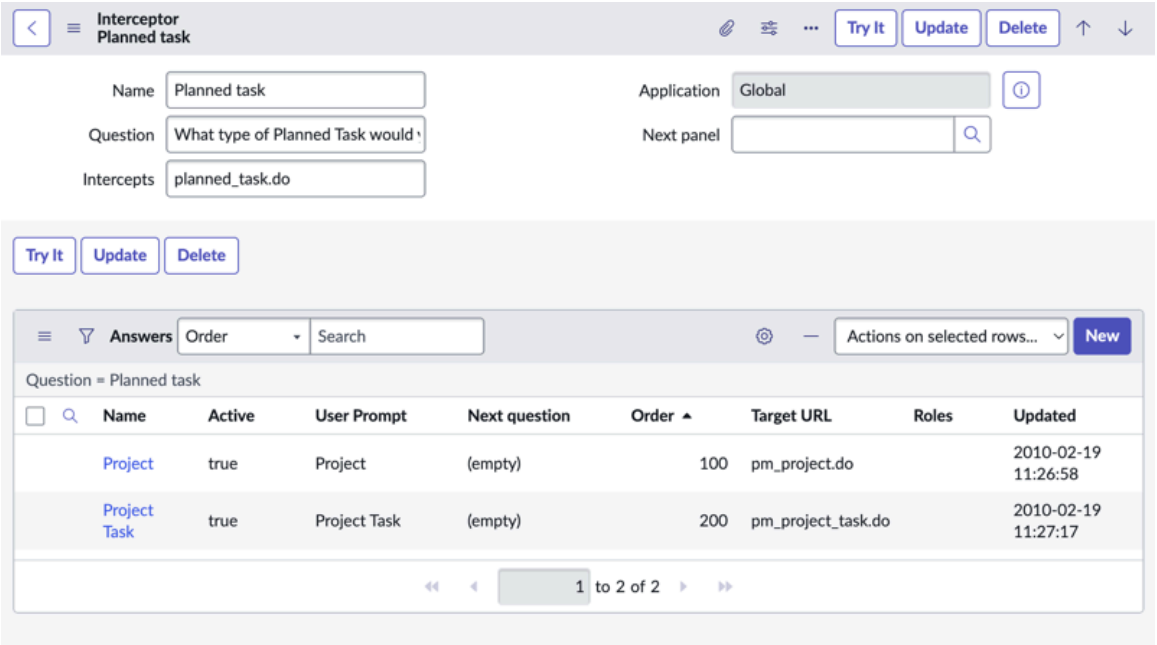
The Project Management plugin must be activated. For more information, see Extending the Task table with Planned tasks.

Role required: admin.

About this task

An Interceptor helps decide what type of record should be created when it isn't clear what the correct record type is. The Interceptor prompts users to make additional choices that determine the correct type of record.

By default, the Planned Task Interceptor prompts users to choose whether a new planned task is a planned project task, or a planned project. The answers can be modified or added to as needed.



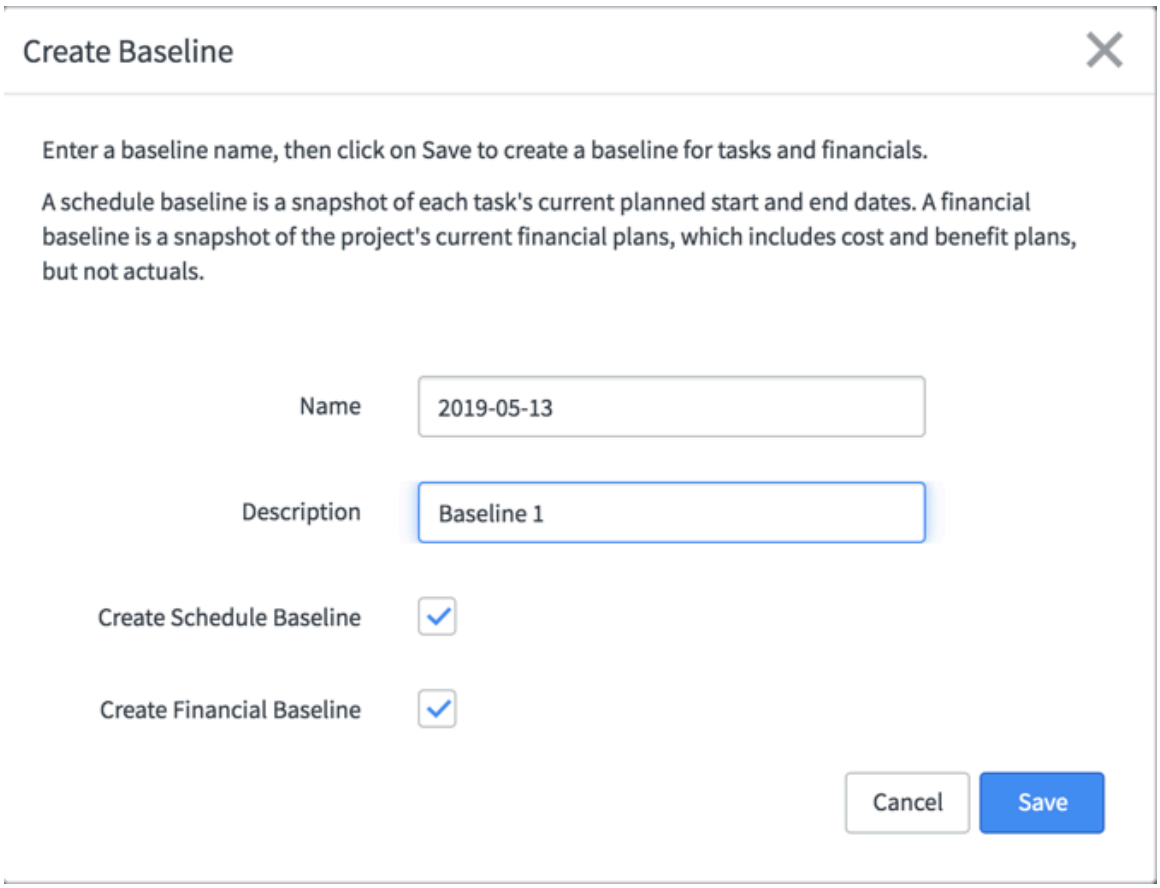
Procedure

1. Navigate to **All** > **System Definition** > **Interceptors**.
2. Select the **Planned Task** Interceptor.
3. Modify the **Answers** related list as desired.

   The **Answers** related list specifies what choices are presented, and where the user is redirected after selecting the choice. You can modify the preexisting answer records, or use **New** to create an answer based on what kind of prompt you want to give the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

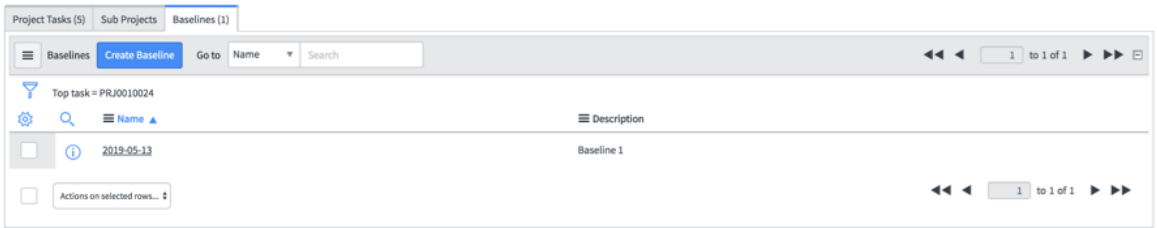
You can modify answers by adding scripts. For more information about scripting in the ServiceNow AI Platform, see Exploring scripting.



Create a baseline

A Planned Task Baseline is a record of the start and end times of the planned task at a particular moment in time.

To create a baseline, navigate to the form of the top planned task and select the **Create a Baseline** related link:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create baseline

To view the baseline, configure the related lists to add a related list of baselines:

Baselines tab

The baseline can be viewed on a Gantt Chart using the related link.

Measure time and effort

The Planned Task [planned_task] form provides standard fields for tracking duration and effort.

Duration measures the time from start to end date. Effort measures the hours of work exerted on the project. Both duration and effort are measured with fields in the Dates section of the Planned Task record.

Duration

- Planned duration: The projected length of time for the planned task. You can enter this value manually.
- Actual duration: The actual length of time so far for the planned task. This value is calculated based on the amount of time elapsed since a task enters the open state.
- Remaining duration: The Planned duration minus the Actual duration, which represents the projected length of time left.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Effort

- Planned effort: The projected amount of time that will be spent on the planned task. You can enter this value manually.
- Actual effort: The actual amount of time that has already been spent on the planned task. You can enter this value manually.
- Remaining effort: The Planned effort minus the Actual effort, which represents the amount of project work left.
- Percent complete: For the parent task, the percent complete field is not editable and is rolled up from the percent completion of child tasks using the following formula:

  Percent complete of parent task = sum (planned duration of child tasks * percent complete of child tasks) / sum (planned duration of child tasks)

  For a child task, the percent complete is entered manually.

Date Calculation: All planned dates and actual dates of the child tasks are rolled up to the parent task automatically. Planned end date for a child task is calculated based on the planned start date and planned duration. If actual start is present, then planned end date is calculated from actual start date and planned duration.

Important planned task table fields

The Planned Task table has these fields.

Important Planned Task Table Fields

Label	Name	Type	Description
Actual cost	`work_cost`	currency	The actual cost of the planned task, to be compared with the Estimated cost.
Actual duration	`work_duration`	glide_duration	The actual length of time (from start time to end time) of work on the planned task, to be compared with the Planned duration.
Actual effort	`work_effort`	glide_duration	The actual time spent working, to be compared to the Planned effort.
Critical Path	`critical_path`	boolean	
Estimated cost	cost	currency	An estimation of the cost of the planned task, to be compared with the actual cost.
HTML Description	`html_description`	html	A description field that accepts HTML mark-up.
Percent Complete	`percent_complete`	decimal	A percentage of the completed effort. Generated using the Planned effort and Actual effort fields.
Planned duration	duration	glide_duration	The estimated length of time (from start time to end time) of the planned task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important Planned Task Table Fields (continued)

Label	Name	Type	Description
Planned effort	effort	glide_duration	The estimated amount of time spent working on the planned task.
Planned end date	`end_date`	glide_date_time	The estimated date and time for the planned task to end.
Planned start date	`start_date`	glide_date_time	The estimated date and time for the planned task to start.
Remaining duration	`remaining_duration`	glide_duration	The difference in planned and actual duration, representing the time left for the planned task.
Remaining effort	`remaining_effort`	glide_duration	The difference in planned and actual effort, representing the amount of work time left for the planned task.
Rollup	rollup	boolean	Read-only field managed by the system that identifies the task as having child tasks. A rollup task has several its fields calculated from the children so those fields are read-only.
Time constraint	`time_constraint`	string	A description of time constraints that apply to the planned task.
Top Task	`top_task`	reference (planned_task)	When different planned tasks are stacked in a hierarchy, this field populates with the highest-level parent task. For example, if Project A has a child Project B, and Project B has a child Project C, then the Top Task for Project C is Project A. The Top Task field for Project A is blank.
Actual start date	`work_start`	glide_date_time	The actual date when the work starts on the planned task.
Actual end date	`work_end`	glide_date_time	The actual date when the work ends on the planned task.

Planned task scripts

Several business rules and one script include determines the dynamic calculation of crucial Planned Task fields.

Planned Task Scripts

Business Rule	Description
Set actual work start value	Sets the Actual Start Date of the planned task when State is set to the default work state.
Set close data on inactive	Sets the close data of the planned task when task becomes inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Planned Task Scripts (continued)

Business Rule	Description
Recalculate	Recalculates the planned task schedule fields when one of the schedule fields changes.
Planned task global events	Raises global event for every insert or update of planned task record. For more information, see Global events.
Update parent actual effort	Rolls up actual effort from child task to parent task.
Update parent effort	Rolls up planned effort from child task to parent task.
Update parent percent complete	Rolls up percent complete from child task to parent task.
Validate duration	Validates the value in the planned duration field is not 0 or negative.
Validate percent complete	Validates the value in the percent complete field is between 0 and 100.
Validate work end before work start	Validates that the actual end date is not earlier than the actual start date.
Set top task	Sets top tasks to maintain hierarchy of tasks.
Set top task on children	Sets top tasks on child tasks to maintain hierarchy of tasks.

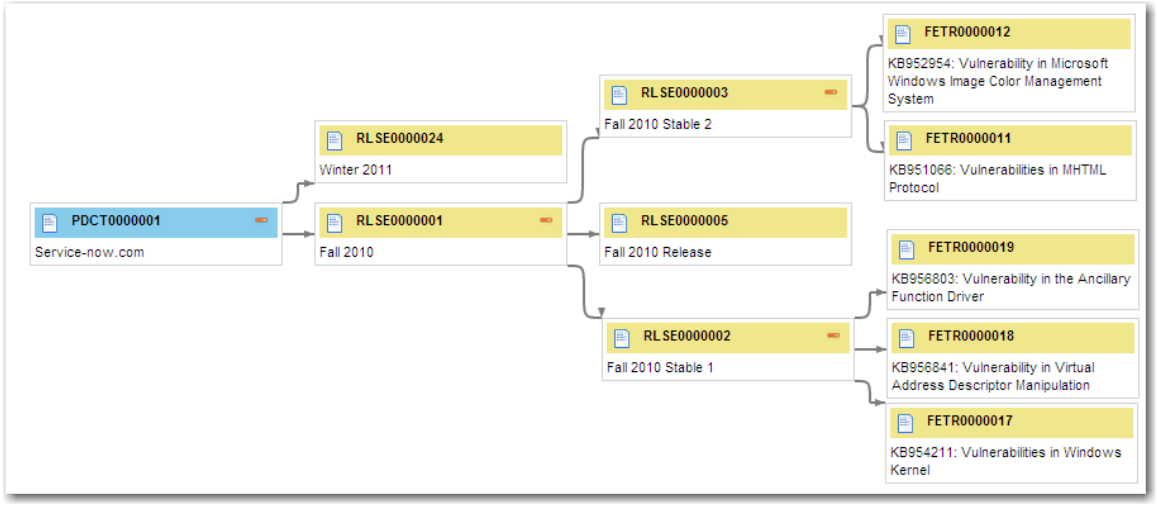
Planned task hierarchy

The **Task Hierarchy** tool available for Planned Task displays the relationship between parent and child planned tasks.

Before you begin

Role required: admin

About this task



Out-of-box, the **Task Hierarchy** tool is available in both Project and Release Management.

Different **Planned Task** tables have different UI actions to launch the task hierarchy:

- To view the hierarchy of a Project, navigate to the use the **Task hierarchy** context menu action.
- To view the hierarchy of a Product in Release v2, navigate to the product and click the **Product hierarchy** related link.
- To view the hierarchy of a Release in Release v2, navigate to the release and click the **Release hierarchy** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rm2 Hierarchy

The Task Hierarchy can be added to any planned task table by:

Procedure

1. Navigating to **System UI** > **UI Actions**.
2. Selecting one of the existing Task Hierarchy UI Actions (for example, **Task hierarchy** if Project Management is activated).
3. Change the table to the desired table and rename the UI Action if appropriate, and insert.

   The hierarchy should now be available as a UI Action on the form of the new table.

Configure rollup for planned task fields

You can configure the planned task fields to roll up the field values in the parent entity.

Before you begin

Role required: admin

About this task

By default the following fields are configured to roll up for any planned task and planned task derivatives:

Cost, **Budget**, **Effort**, **Actual date**, **Planned date**, **Duration**, **Percent Complete**

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Open the **Planned task rollup** table.
3. In the Related links, click **Show List**.
4. Click **New**.
5. Fill out the Planned task rollup form (see table).
6. Click **Submit**.

Planned task rollup form fields

Field	Description
Child	Select the table you want to include or exclude.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Field	Select the column name you want to include or exclude.
Navigator	The reference column of the parent to which the value must be rolled up.
Parent	Select the parent table.
Application	Auto-generated value.
Rollup	Select the check box to allow roll up. Leave the field unchecked to exclude the field from rollup.

Creating many-to-many task relations

By default, tasks can be related to each other using a parent/child relationship, such as a Problem with a group of child Incidents or a Catalog Request with a group of child Catalog Tasks.

However, it may prove useful to record exactly the nature of the relationship between the task records. When activated, the Many-to-Many Task Relations plugin allows administrators to define relationships between different tasks.

Request many to many task relations

The Many to Many Task Relations plugin (com.snc.task_relations) is included with several plugins. You can request activation of the plugin by itself.

Before you begin

Role required: admin

About this task

- Planned Task
- Field Service Management
- Project Management
- Governance, Risk, and Compliance

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Plugin manifest

When the plugin is activated, the Task Relationships application is available with certain modules.

Task relationships

Module	Description
Knowledge Relation Types	Contains the definitions for the possible types of relationships between knowledge articles and tasks.
Knowledge Relationships	Displays all the defined relationships between existing tasks and knowledge articles.
Relationship Types	Contains the definitions for the possible types of relationships between tasks.
Relationships	Contains all the defined relationships between existing tasks.

The following Relation Types are available by default:

- Solution is documented in::Documenting solution for
- Caused by::Causes
- Contains::Task of
- Documenting Solution for::Solution is documented in
- Investigated by::Investigates
- Permanent correction for::Permanently corrected by
- Related to::Related to
- Requesting::Requested by
- Solved by::Solves

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define a relationship type

Create type codes that define the relationship between parent and child tasks.

Before you begin

Activate the Many to Many Task Relations plugin (com.snc.task_relations) first. See Request many to many task relations.

Role required: admin

Procedure

1. Navigate to **All** > **Task Relationships** > **Relation Types** and select **New**.
2. Populate the *Parent Descriptor* and *Child Descriptor* fields with a short description of the relationship between the two tasks, such as a parent descriptor of *Caused By* and a child descriptor of *Causes*.
3. Select and hold (or right-click) the form header bar and select **Save**.
   The *Name* field automatically populates with the Parent and Child descriptors.

Define a task relationship allowed from the task relationship type record

Define the Task Relationships Allowed from the Task Relationship Type record.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Task Relationships** > **Relationship Types**.
2. Select a Task Relationship Type record.
3. In the Task Relationship Allowed related list, select **New**.
4. Populate the parent and child tables to define which tables are able to accept the relationship.
5. **Optional:** Define scripts to run in the *Parent* and *Child* script fields.

   (Optional) These scripts are run when a parent or child record is run to automatically generate the other task (child or parent). These scripts use the current value of the new record, as opposed to the source record which triggered the script.
6. Select **Submit**.

Modify the displayed field

The list view of the Reference Lookup defines the fields displayed in the Task Relations field and editing interface.

Before you begin

Role required: admin

Procedure

1. Navigate to a form that has a reference to the table whose display values you would like to modify within Task Relations field.
2. Click the magnifying glass to display the Reference Lookup list view.
3. Right-click the list header and select **Configure** > **List Layout**.

   The selected List layout is used as the display value for records within the Task Relations field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mark as Solution button

The **Mark as Solution** button is added to the KB popup view and displayed when you search the knowledge base from a task record.

Selecting **Mark as Solution** creates a record in the Task / KB Relationships `[task_rel_kb]` table to associate the KB article with a task. You can disable this button by marking the active field false on the 'solution_button' UI macro.

Task relationships with UI actions

After defining task relationships, you can use UI Actions to define the task relationship when a new task is being created from an old task.

Below are a few examples.

Warning: These examples may not work on all instances. They are provided as illustrative examples.

UI Actions examples

Cause an incident

This UI Action allows the change management team to log an incident directly from the change request and records that the change caused the incident.

Create a UI Action on the Change Request [change_request] table and place the following into the script:

```
var inccaus =new GlideRecord("incident");
inccaus.short_description= current.short_description;
inccaus.comments= current.comments.getHTMLValue();
// inccaus.parent = current.sys_id;
inccaus.insert();
CauIncident();

gs.addInfoMessage("Incident "+ inccaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(inccaus);

function CauIncident(){
var m2m =new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= inccaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```

Cause a problem

This UI Action allows the change management team to record a problem from a change request and record that the change caused the problem.

Create a UI Action on the Change Request [change_request] table and paste the following script:

```
var probcaus =new GlideRecord("problem");
probcaus.short_description= current.short_description;
probcaus.comments= current.comments.getHTMLValue();
// probcaus.parent = current.sys_id;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
probcaus.insert();
CauProblem();

gs.addInfoMessage("Problem "+ probcaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(probcaus);

function CauProblem(){
var m2m =new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= probcaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```

Fix a problem

This UI Action allows a change request to be generated from a problem, recording that the change fixes the problem.

Create a UI Action on the Problem [problem] table, and paste the following code:

```
var fixchg =new GlideRecord("change_request");
fixchg.short_description= current.short_description;
fixchg.comments= current.comments.getHTMLValue();
// fixchg.parent = current.sys_id;
fixchg.insert();
FixChange();

gs.addInfoMessage("Change "+ fixchg.number+" created");
action.setRedirectURL(current);
action.setReturnURL(fixchg);

function FixChange(){
var m2m =new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= fixchg.sys_id;
m2m.type.setDisplayValue("Fixes::Fixed by");
m2m.insert();}
```

Time Card Management

The Time Card Management feature enables time card users such as task assignees to report and track their time for the assigned tasks.

https://player.vimeo.com/video/1107432259?h=08347ba78f&badge=0&autopause=0&player_id=0&app_id=58479

Watch this three-minute video to learn about setup of the time tracking feature, entering time and approvals.

Time Card Management works with the Task table to record time worked on various task types, such as projects, incidents, problems, and change requests.

With the Time Card Management feature:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The time card users can record the time worked on a task using time cards and time sheets. They can submit their time cards and time sheets for approval.
- Time cards and time sheets are routed for approval based on the **Non-project time approver** and **Project time approver** fields in the user time sheet policy. User managers with time card approver role can also log time and submit the time sheet of their resources
- The time card approvers can perform the following tasks:
  - Review and approve or reject the time cards in a submitted time sheet.
  - Recall the approved time sheets or time cards to return them to the users for corrections.
  - Use dashboards to view reports of time card and time sheet exceptions, and categorize time reported by the users.
  - Delegate another time card approver to process time sheets from your resources when you might not have time or will be unavailable. Note the following points for delegation:
    - You cannot delegate approval only for an individual resource.
    - The delegated time card approver cannot further delegate your time sheet approvals.

  The project_manager and the resource_manager roles contain the timecard_approver role in the base system. However, the timecard_approver role can also be used independently without these roles.
- The time card admin can create and manage time sheet policies, and can also approve or reject by exception and process the time sheets. Time card admin can also create or edit time cards of any users if the time cards are in Pending or Rejected state.

Note: The Time Card Management plugin is required to use time cards. Some of the procedures require the project management feature, which activates time cards automatically. For more information, see Project Management (com.snc.financial_planning_pmo).

Assign a time card user to a project or project task

A user who has only the timecard_user role, and no project role such as it_project_user, can be selected in the **Assigned to** field of a project or project task. This behavior is intentional and lets the user submit time against the assigned task from the Time Sheet Portal.

Being assigned to the record gives the time card user read-only access to it. The user can't edit, close, or reassign the project or project task unless they also have a project role such as it_project_user.

Note: The Business Stakeholder role includes the timecard_user role. As a result, a user who has the Business Stakeholder role can also be selected in the **Assigned to** field of a project or project task, with the same read-only access. To stop time card users from appearing in the **Assigned to** field, override the reference qualifier on the **Assigned to** field of the project or project task table.

Domain separation in Time Card Management

Domain separation provides complete data isolation for domain-specific users. Time card Management is domain separation compliant at the **Data only** level.

Activate Time Card Management

Administrators can activate the Time Card Management plugin (com.snc.time_card). The plugin also activates the Performance Analytics - Content Pack - Project Portfolio Suite Dashboards

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

plugin (com.snc.pa.time_card). However, you need a Performance Analytics license to use the dashboards.

Before you begin
Role required: admin

About this task
Note: The Time Card Management plugin also gets activated as part of PPM Standard plugin (com.snc.financial_planning_pmo).

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Time sheet policies
Time sheet policies contain the policies to which a time sheet, or a time card must adhere.

By default, the Default time sheet policy is available with the system. As a Time card admin, you can create multiple time sheet policies based on different requirements and workflows in your organization. For example, specify a time sheet policy for each department or team and assign appropriate users to them.

Time sheet policies also provide an ability to specify appropriate approval workflow for project and non-project tasks.

A time sheet policy can be set as a default policy. The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy. Only one time sheet policy can be set as a default policy.

Navigate to **Time Sheets** > **Administration** > **Time Sheet Policies** to view the list of timesheet policies.

Create a time sheet policy
As a time card administrator, you can create a time sheet policy to define the requirements for time card users to record their time worked. The time card approvers must review and process time sheets under the applicable time sheet policy.

Before you begin
Role required: timecard_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Time Sheet Policies**.
2. Click **New**.
3. On the form, fill in the fields.

Time Sheet Policy form

Field	Description
Name	Unique name of the policy.
Allow blank time cards	Option to enable submission of blank time cards for approval. By default, this option is not selected.
Auto create time card on planned task update	Option to create a time card automatically when you update a planned task, if the following conditions are true: ○ You are a time card user ○ You are assigned to the task through **Assigned to** or **Additional assignee list** field ○ The task is not in a pending state. By default, this option is not selected.
Auto fill time card with time worked entries	Option to fill in time cards automatically when you enter time in the **Time worked** field on the Task form. If a time card does not exist for the task, one is created when the time worked is updated if the following conditions are true: ○ You are a time card user. ○ You are assigned to the task through the **Assigned to** or **Additional assignee list** field. By default, this option is not selected.
Auto create time cards every week	Option to generate time cards automatically every week through a scheduled job for all users assigned to the time sheet policy. The time cards are generated based on the planned task assignments and hard-allocated resource plans of the users. By default, this option is selected.
Update actual hours and cost in resource plan/reports	Option to update actual hours and actual cost of the associated resource plan based on the hours entered in the approved time card. When selected, you can associate a resource plan related to the selected task with the time card in the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ If the task has multiple resource plans, you can select the appropriate plan. ○ If the task has one resource plan, that plan is selected by default. The hours from the time card entry and the hourly resource rate are used to update the **Actual hours** and **Actual cost** values of the associated resource plan. **Note:** If the task has no resource plan, the associated records update the corresponding project. By default, this option is not selected.
Allow recall	Option to enable the recall action on a time sheet or time card after it is approved and processed. By default, this option is selected.
Recall period allowed (days)	Number of days within which you can recall a time sheet or time card. This field appears when the **Allow recall** option is selected. The default value is 30.
Week starts on	Start day of the week for the time sheet. The default value is Sunday. **Note:** For more information on filtering Time Sheets using this field, see KB0852458 article in Now Support Knowledge Base.
Maximum hours per day	Maximum number of hours that can be entered each day in a time sheet. The default value is 24. Setting this field to -1 enables the resource to enter: ○ A value from 0 through 24 for the hours worked each day ○ A negative value, to correct the previously entered timecards.
Maximum hours per week	Maximum number of hours allowed in a week in a time sheet. The value for total hours for a week in a time sheet is the sum of hours entered per day of that week. If set to -1, the total hours per week allowed is up to 168 (24 x 7) hours. The default value is 40.
Non-project time approver	Type of approval required when you submit a time card that has a non-project task assigned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Auto**: Time card is auto-approved when submitted. ○ **User Manager**: Time card is routed to the user manager for approval when submitted. The user manager has the time card approver role and is also selected as the manager of the time card user on the User form. ○ **None**: A user with the timecard_admin role can approve time cards when submitted.
Project time approver	Type of approval required when you submit a time card that has the project task. ○ **Auto**: Time card is auto-approved when submitted. ○ **Project Manager**: Time cards for a project task are routed to the respective project manager for approval when submitted. The project manager is picked from the task against which you are submitting time. ○ **User Manager**: Time cards are routed to the user manager for approval when submitted. ○ **Both**: Time cards are routed to both the user manager and project manager for approval when submitted. A time card remains in the Submitted state when only one of the approvers approves the time card. ○ **None**: A user with the time_card admin role can approve time cards. **Note:** ○ The project manager and the user manager can view only those time cards that are routed to them for approval. ○ If the user manager or the project manager changes while the time card is still not approved, the system automatically updates the approver of the time card. ○ If the name of the project manager or the user manager is not populated on the respective form, a user with the time_card admin role can approve time cards.
Allow multiple rate types	Option to provide a rate type in a time card to be used during expense line generation. When this option is selected, the **Rate type** field displays on the Time Card form to enable the selection of a rate type. For more information, see Rate type in labor rate card.
Default rate type	Rate type used by default for the time card. If you select none, the Standard rate type option is used. This field appears when the **Allow multiple rate types** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Default Policy	Option to set the time sheet policy as the default. The default policy is a global time sheet policy that applies to all users who are not assigned to any other time sheet policy. Only one time sheet policy can be set as the default. A time sheet policy set as the default policy cannot be deleted. You must first set another policy as the default policy.

4. Click **Submit**.

What to do next

- Set the time sheet policy as the default policy, if required.
- Assign the time sheet policy to users.

Set a time sheet policy as default policy

As a time card administrator, you can set a time sheet policy as the default policy. The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy.

Before you begin
Role required: timecard_admin

About this task
Only one time sheet policy can be set as a default policy.

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Time Sheet Policies**.
2. Open the time sheet policy record.
3. Click the **Set as default** related link.

> **Note:** The related link appears only for a time sheet policy which is not already set as the default policy.

Result
The **Default Policy** option on the record form is selected to indicate that the current time sheet policy is set as the default policy. The **Default Policy** option on the earlier default time sheet policy is cleared.

You cannot delete a default time sheet policy. You must first mark another policy as the default policy to delete the current default policy.

Assign a time sheet policy to a user

As a time card administrator, you can assign a time sheet policy to a user.

Before you begin
Role required: timecard_admin

About this task
You can assign only one time sheet policy to a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Time Sheet Policies**.
2. Open the time sheet policy record.
3. In the **Users** related list, click **Edit**.
4. On the Edit Members form, move the users to the **User List**.
5. Click **Save**.

Result

The selected users appear on the **Users** related list. The time sheet policy is assigned to the selected users.

Create a rate type

You can create rate types using the Rate Types feature.

Before you begin

Role required: timecard_admin

About this task

The rate type functionality is used to categorize different types of work. For example, Standard versus Overtime. It can also instruct down-stream, third-party product about the nature of the work performed.

For example:

- A user works extra time during the day and must differentiate standard time from overtime.
- A technician may be paid at a higher rate based on different types of work involved in the execution of a task.
- An appliance repair task may be billed at one rate for the first hour and a different rate for the remaining hours.
- A service call may last four hours during which specialized equipment is used for one hour. The company must capture the use of the specialized equipment for purposes ranging from additional billing to legal compliance or warranty tracking.

Procedure

1. Navigate to **All** > **Time Sheets** > **Administration** > **Rate Types**.
2. Click **New** and fill the form.

Field	Description
Name	Provide a suitable name for the rate type.
Description	(Optional) Summarize the purpose of the rate type.
Active	Deselect the check box to mark the rate type as inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

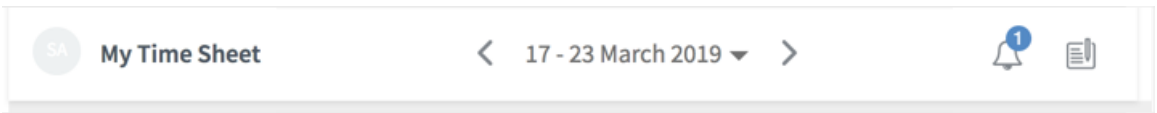
Field	Description
	Note: Inactivating a rate type does not remove it from records where it exists. When time card processing encounters an inactive rate type on the time card, no matching labor rate card is found. In this case, the system rate is used for generating the expense line.

3. Click **Submit**.

Result

- The rate type is displayed in the **Rate Types** list.
- The rate type if active is also displayed in the **Rate Type** field in the Labor Rate Cards form, Time Worked form, Time Card form, and Time Sheet Portal.

Time Sheet Portal



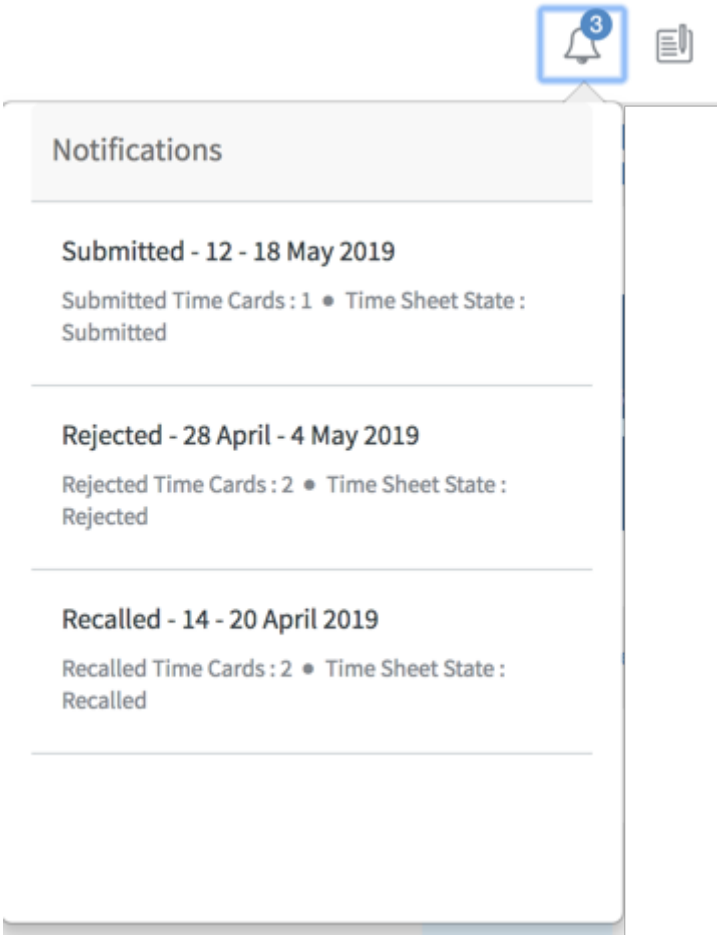
Time Sheet Portal categorizes and displays all your assigned tasks in a single view for a given week. The portal enables you to record time spent on tasks on a day-to-day basis and submit the time sheet in a single action.

Time Sheet Portal works with the Task table to record the time that you spend on various task types, such as projects, incidents, problems, and change requests. It provides a complete breakdown of the time you enter for the task, task categories, and days in a week. It enables you to:

- Generate time cards for assigned projects or project tasks.
- Copy time cards from a previous time sheet.
- Search and create a time card for a task that is not displayed in the assigned tasks list.
- Edit, delete, or add notes to a time card.
- Submit, approve, reject, and recall a time sheet.
- View notifications for the submitted, rejected, and recalled time sheets or time cards.

Time Sheet Portal comprises of the following sections:

Header



The Time Sheet Portal header:

- Displays a date range of the time sheet for the selected week and provides options to navigate to the time sheet of previous or next week.
- Provides a calendar along with the date range. Clicking a date in the calendar displays the time sheet for the week of the selected date.
- Provides a link to navigate to the time sheet for the current week when a different time sheet is being viewed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Provides an option under **My Time Sheet** that enables you to open and edit the time sheets of your resources. The option is available only for a user manager.
- Provides an option to view the time sheet in the Form view using time sheet form view icon ( ).
- Displays the notifications for the submitted, rejected, and recalled time sheets under the show notifications icon ( ). Each entry displays the number of time cards and their state. Click on a notification item to open the time sheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

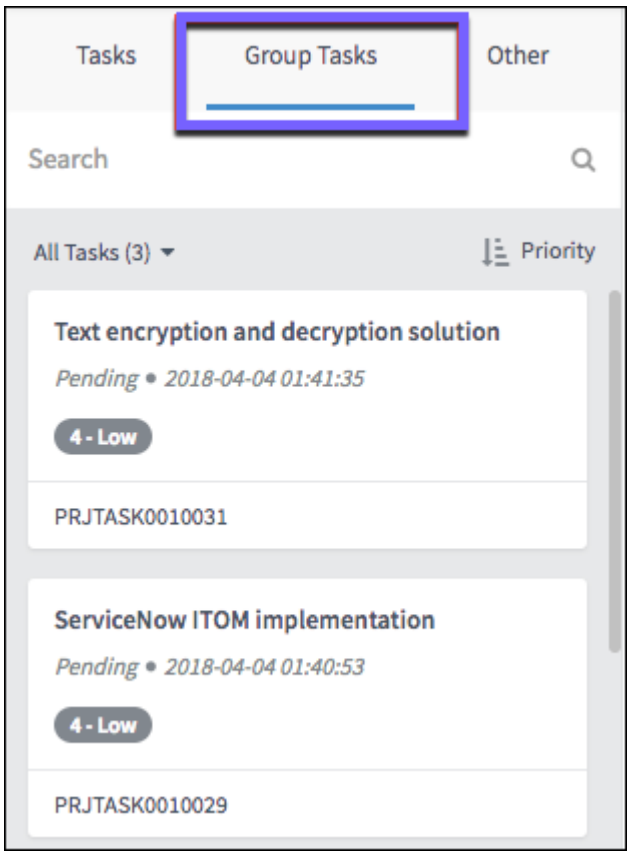
Tasks

The **Tasks** tab displays your assigned tasks as cards. Each card provides information about a task, such as short description, state, last updated date and time, and priority. Tasks are derived from the following filter conditions:

- All your assigned incidents, problems, or change requests that are active.
- All your assigned incidents, problems, or change requests that are closed in the selected week.
- All tasks for which you are hard-allocated during the selected week.
- All your assigned projects or project tasks that are active during the selected week. Project or project tasks are derived from the following conditions:
  - A project or project task that has started and its actual start date is before the end of the selected week.
  - A project or project task has closed and its actual end date is after the week has begun.
  - When there are no actual dates for a project, planned dates of the project must occur within the selected week.
- All active stories assigned to you.
- All active scrum tasks assigned to you or closed in the selected week.
- All active test plans assigned to you.
- All active defect and enhancements assigned to you or closed in the selected week.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If the Customer Service Management plugin (com.sn_customerservice) is activated, your assigned tasks that are active and closed in the selected week are also derived from the following tables:

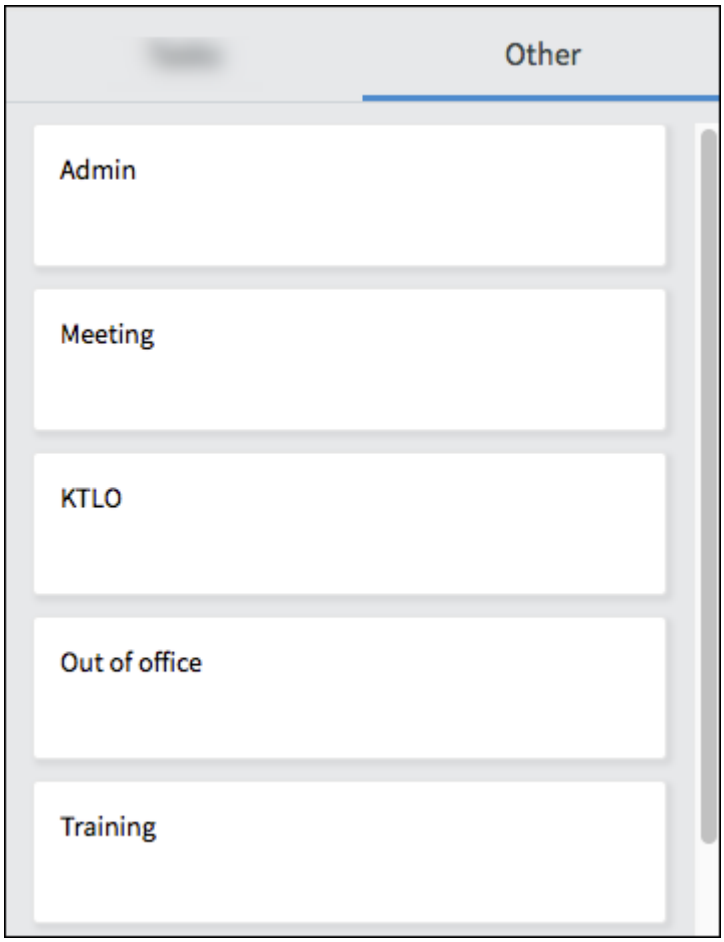


- Case [sn_customerservice_case]
- Work Order [wm_order]
- Work Order Task [wm_task]

On the **Tasks** tab, you can perform the following operations:

- Type a keyword in the search field to view only cards with details that match the keyword.
- Sort cards in ascending or descending order based on priority, irrespective of the task type.
- View cards based on a category, such as projects, project tasks, incident, problem, change, defect, enhancement, test plans, and scrum tasks.
- Create time cards for assigned tasks. See Create time cards and log time through Time Sheet Portal.

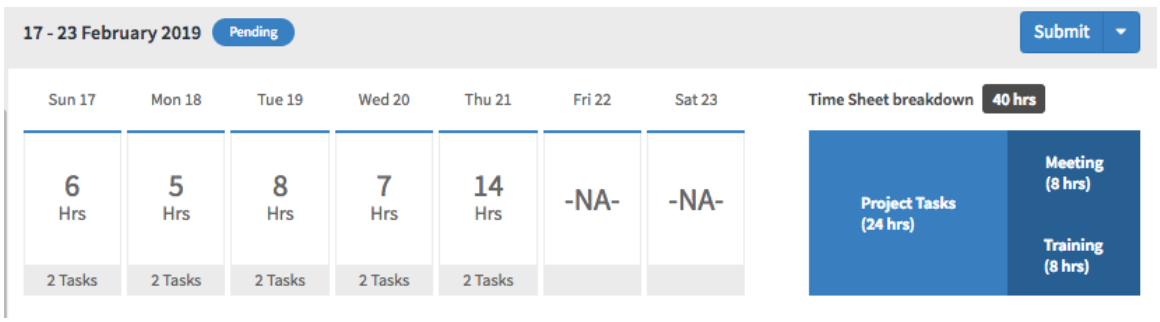
Note: Time sheet policies apply when you create or edit a time card.



Group Tasks

The **Group Tasks** tab displays the tasks assigned to your **Assignment group**. The group tasks are displayed as cards in the tab. A card provides information about the task, such as short description, state, last updated date and time, and priority.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

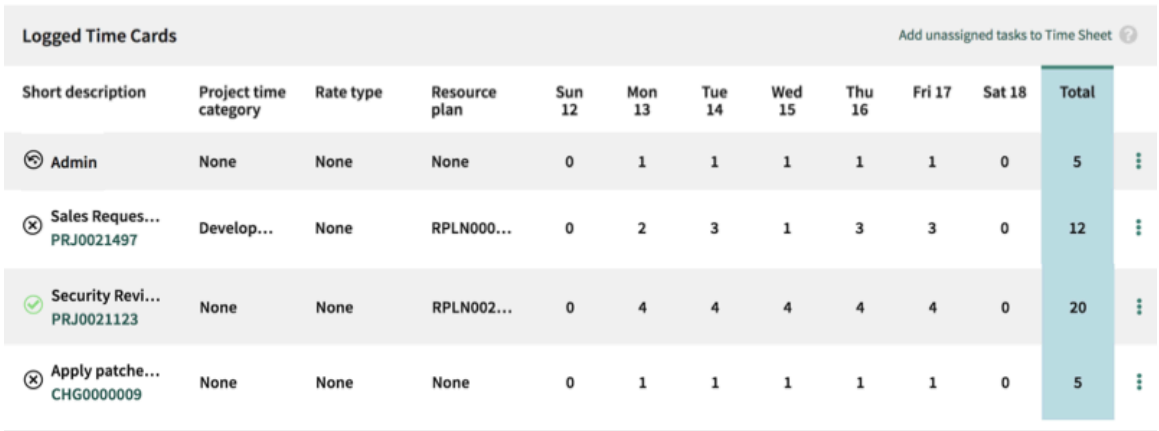


Other

The **Other** tab displays cards used to log time for operational work, such as administration, meeting, and KTLO.

Note: The list of categories in the time card controls the list of cards displayed on the **Other** tab. If an administrator marks any of the categories as inactive in the time cards, those categories are not displayed on the **Other** tab.

Time Sheet



Starting Brazil release, time cards and time sheet portal supports resource assignments. Users can select a specific resource assignment while creating time cards and submitting a time card via time sheet portal. Your system administrator can enable the resource assignment column in time sheet portal. For more information on how to add resource assignment column to time sheet, see the Knowledge Base for KB1649389.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Time Sheet section:

- Displays the date range of the time sheet for the selected week.
- Indicates the state of the time sheet being viewed.
- Displays the total number of tasks and hours that you have entered for each day in a week. When you click a day in the time sheet, the column for that day is highlighted in both the **Time Sheet** and **Logged Time Cards** sections. The first day displayed in the Time Sheet section is based on the value specified in the **Week starts on** field in the users Time Sheet Policy. For example, if the **Week starts on** field is set to Friday, the Time Sheet section starts with Friday.
- Indicates the total number of hours that you entered in the time sheet. Time Sheet breakdown also displays a breakdown of user-entered hours in different work categories, such as project tasks, admin, meeting, follow on tasks, or change requests.
- Provides options that enable you to submit a time sheet and copy time cards from a previous time sheet. For an approver, options to approve or reject a submitted time sheet and recall a processed time sheet are available.

Logged Time Cards

Short description	Project time category	Rate type	Resource plan	Sun 12	Mon 13	Tue 14	Wed 15	Thu 16	Fri 17	Sat 18	Total
Admin	None	None	None	0	1	1	1	1	1	0	5
Sales Reques... PRJ0021497	Develop...	None	RPLN000...	0	2	3	1	3	3	0	12
Security Revi... PRJ0021123	None	None	RPLN002...	0	4	4	4	4	4	0	20
Apply patche... CHG0000009	None	None	None	0	1	1	1	1	1	0	5

Each row in the Logged Time Cards section represents a time card entry for a given week. It has details such as icon for state of the time card, short description of the task, project time category, rate type, resource plan, and logged time. Each row of the time card contains options that enable you to edit, delete, or add notes to a time card. For more information, see Create time cards and log time through Time Sheet Portal.

Note:

- The **Rate type** column is visible only when the **Allow multiple rate types** option in the time sheet policy of the user is selected.
- The **Resource plan** column is visible only when the **Update actual hours and cost in resource plan/reports** option in the time sheet policy of the user is selected.

The icon beside the short description of a row indicates a time card state. The merge icon ( ) in a time card row indicates that a duplicate time card for the same task exists in the time sheet and provides option to merge them into a single time card.

When there are no time cards, the Logged Time Cards section displays the **Generate Time Cards** and **Copy from previous time sheet** buttons to create time cards.

Note: Time Sheet Portal is not designed for use on mobile devices, and may not appear as shown in this document.

Create time cards and log time through Time Sheet Portal

After you create time cards in Time Sheet Portal, log time in the time cards.

Before you begin

- Time sheet portal supports resource assignments created using Project Workspace. Once the time cards are approved, Project Managers can view the planned vs actual hours for an assignment in Project Workspace and Resource Management Workspace heatmap view.
- Role required: timecard_user

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Create time cards in the **Logged Time Cards** section using any of the following options.

Option	Steps
Generate time cards for as signed projects or project tasks	**a.** Click choice list next to **Submit**. **b.** Select **Generate Time Cards**. The option also appears in the **Logged Time Cards** section when a user has no time cards for the selected week. **Note:** ▪ If a time card exists for a project task during the se lected week, a duplicate time card is not created. ▪ Time cards are generated only for those project tasks that are in progress or planned for the select ed week. ▪ The **Allow time card reporting on** field on the project form determines the level at which the time cards are created for project tasks.
Copy time cards from a pre vious time sheet	**a.** Click choice list next to **Submit**. **b.** Select **Copy from previous Time Sheet**. The option also ap pears in the **Logged Time Cards** section when a user has no time cards for the selected week. **Note:** ▪ Time cards for all the project tasks that are in progress or planned in the current week are copied from the selected time sheet. If a time card for a project task exists, a duplicate time card is not creat ed while copying. ▪ Time cards for all the non-task categories, such as meetings and trainings, are copied from the select ed time sheet. If a time card for a non-task category exists, a duplicate time card is created while copy ing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Create a time card from the Tasks, Group Tasks, or Other tab	**a.** On the **Tasks**, **Group Tasks**, or **Other** tab, point to a task (card) that you want to create a time card for. **b.** Click **Add to Time Sheet**. **Note:** **Add to Time Sheet** creates a time card with the default rate type of the user, if it exists.
Create multiple time cards from the Tasks tab	**a.** On the **Tasks** tab, select multiple tasks that you want to create time cards for. **b.** Click **Add selected to Time Sheet**.
Create a time card for unassigned task	**a.** In the **Logged Time Cards** section, click **Add unassigned tasks to Time Sheet**. **b.** Enter the task number or short description of the task you worked on during the selected week.

Based on the **Allow time card reporting on** field settings in the **Preferences** tab of a project, the **Add to Time Sheet** and **Add selected to Time Sheet** options are displayed in Time Sheet Portal.

If a duplicate time card exists for a time card, you can merge both time cards to become a single one, except for time cards in the processed, approved, or recalled state. A duplicate time card is identified by comparing the values in the **Short description**, **State**, **Task**, **Category**, **Rate Type**, **Resource Plan**, or **Project Time Category** fields in the time card.

3. In the **Logged Time Cards** section, log time in a time card.

Option	Steps
Through inline editing	**a.** Select a row and press **Enter**. You can also double-click a row. **b.** Edit the values as required.
Through time card form	**a.** Point to a row and click the more actions icon . **b.** To open the Time Card form, click **Open Form View**. **c.** Enter hours on the time card form. **d.** Click **Save**.
Add notes to time cards	**a.** Point to a row and click the more actions icon. **b.** To add a note, click **Add Note**.

Result
Your time cards are created and time is logged for the selected week.

What to do next
If you encounter issues with time card creation or time logging, try the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Time cards not generating: Verify that your project tasks are in progress or planned for the selected week, and that the **Allow time card reporting on** field is configured on the project.
- Missing tasks in the portal: Ensure you are assigned to the project tasks and that the task dates overlap with the selected time sheet week.
- Duplicate time cards: Use the merge option to combine duplicate time cards. Duplicates are identified by matching Short description, State, Task, Category, Rate Type, Resource Plan, or Project Time Category fields.
- Incorrect rate type: Verify your default rate type on your user profile. Contact your time card administrator (timecard_admin role) to update rate type settings.

For issues you cannot resolve, contact your system administrator or the user with the timecard_admin role in your organization.

Submit time sheet through Time Sheet Portal

Once you update the time sheet with time worked for a given week, submit it for approval.

Before you begin

Role required: timecard_user

About this task

When you submit a time sheet, time cards are verified against the assigned time sheet policy. If there is no time sheet policy assigned, time cards are verified against the default time sheet policy. Business rules prevent you from submitting a time sheet in case any violation is found.

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Click **Submit**.
   The time sheet moves to the Submitted state.

Log time and submit time sheets of your resources

As a user manager, you can log time and submit the time sheet of your resources.

Before you begin

A user manager must have time card approver role to create and edit time cards, and submit the time sheet of other time card users. The user manager has either of the required roles and is the one listed as the manager of the time card users.

Role required: timecard_approver

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheet Portal**.
2. Click **My Time Sheet** choice list and select the user for whom you want to approve or reject time sheet for under **My Resources**.

   The **My Resources** section lists the time card users reporting to you.

   Note: The choice list with **My Time Sheet** is available only for a user manager.

3. Create time cards and log time through Time Sheet Portal as required.
4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The time sheet of the selected user moves to the Submitted state. The time sheet policy assigned to the time card user is used for validation when you submit the time sheet.
- All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.
- The **Approve** and **Reject** buttons appear in the Time Sheet section. The two buttons appear only for a user manager.

What to do next

Once you have submitted the time sheet for your resource, you can click **Approve** or **Reject** to approve or reject it. Only the time cards that are routed to the user manager, are approved or rejected. The routing for approval happens based on the **Non-project time approver** and **Project time approver** fields in the time sheet policy of the time card user.

Time Sheets

A time sheet groups all the time cards for a user for the given week.

With time sheets:

- Time card users can submit all the time for their work week in a single step by using a time sheet.
- Time card approvers can approve all the time cards in a time sheet for a user in a single step by approving the time sheet. They do not need to approve multiple time cards for a given user individually.
- Track the activities of a time sheet, such as who submitted or approved a time sheet, in the Activities section on the Time Sheet form. This time sheet activity audit is useful for tracking when you delegate responsibility for your time card processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it is not already enabled. For more information, see Include a table field in auditing.

A time sheet can have any of the following states:

Pending

A time sheet has been created, but the user is still making changes before submitting it.

Submitted

A time sheet has been submitted for approval. The approver can approve or reject it.

Approved

A time sheet has been approved. If the time sheet isn't automatically updated to Processed, this means there was no task associated with the time sheet.

Processed

A time sheet has been processed by the system. After a time sheet is approved, the after business rule Create expense from approved time card is triggered. This business rule creates an expense line for the associated task, and then updates the state to Processed.

Rejected

A time sheet has been sent back to the submitter for changes.

Recalled

A time sheet has been recalled by the submitter for modification.

Create a time sheet

As a time card user, you can create a time sheet to group all your time cards for the given week and submit them in a single step.

Before you begin

Role required: timecard_user

About this task

A user can create only one time sheet per week.

Note: When a user creates a time card for a week, a time sheet is also automatically created for that week.

Procedure

1. Create the time sheet with one of these options.

Option	Steps
From the time sheet menu	Navigate to **Time Sheets** > **My Time Sheets** > **Current (This Week)**. The time sheet form for the current week opens.
From the time sheet list	**a.** Navigate to **Time Sheets** > **My Time Sheets** > **All** > **New**. **b.** Click **New**.

2. On the form, fill in the fields.

Time Sheet form

Field	Description
Week starts on	Starting date of the week for which the time sheet is created. **Note:** The time sheet policy **Week starts on** controls the start day of the week.
Total Hours	Number of hours the user has worked in that week. This field is automatically populated from the hours recorded for the associated time cards.
User	Name of the user for which time sheet is created.
State	Current state of the time sheet. All new time sheets begin as Pending. Default states: Pending, Submitted, Approved, Processed, and Rejected, Recalled.
Comments	Comments related to the time sheet.
Notes	Any additional information.

3. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Add time cards to the time sheet. You can use the related links and related list to add time cards. You can also add time cards using the Time Sheet Portal.

Time sheet form related links

Field	Description
Generate Time Cards	Link to generate time cards for the assigned project tasks.
Copy from previous time sheet	Link to open the **Copy Time Sheet** window for you to copy the time cards from previous time sheets.
Time Sheet Portal	Link to open the Time Sheet Portal to view and manage the time sheet.

Time sheet form related lists

Field	Description
Time Cards	List of the time cards that are part of the time sheet. To create a time card, click **New**.

Submit a time sheet

Once the time sheet is updated with time worked, you can submit the time sheet for the week to submit all the time cards for the week together.

Before you begin
Role required: timecard_user

About this task
When a user submits a time sheet, the time sheet policy assigned to the user is used for validation. If there is no time sheet policy assigned to the user, the default time sheet policy is used. Business rules prevent a user from submitting a time sheet in case any violation is found.

Note: You can also perform this task from the Time Sheet Portal.

Procedure
1. Navigate to the time sheet using one of the following options:
   - To submit a time sheet in the Pending state, navigate to**Time Sheets** > **My Time Sheets** > **Pending**.
   - To submit the time sheet for the current week, navigate to **Time Sheets** > **My Time Sheets** > **Current Time Sheet**.
   - To submit a time sheet in the Rejected state, **Time Sheets** > **My Time Sheets** > **Rejected**. You can make required changes as suggested in the rejection comments to resubmit a rejected time sheet.
2. To submit in the Time Sheets list, open the time sheet.
3. Add comments, if required.
4. Click **Submit Time Sheet**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The time sheet moves to the Submitted state.
- All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.

Approve or reject a time sheet

View, approve, or reject time sheet or time cards for your user, for the given week, in a single step.

Before you begin
Role required: timecard_approver or timecard_admin

About this task
A user manager is the one who has either of the required roles and is selected in the **Manager** field on User form of the time card user.

During out-of-office time, the user manager can Delegate time sheet approvals to another user with the required roles as the time sheet approver. For the specified time period, the delegated user also receives all the time sheets submitted by the time card users to process.

Note:

- You can also approve or reject the time cards within a time sheet selectively by selecting one or more time cards and approving or rejecting them.
- If a time sheet is rejected, all the associated time cards in the Submitted state are also rejected automatically. The time cards in the Approved and Processed state for the time sheet remain unaffected.
- If all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.
- If a time card in a time sheet is in the Rejected state, then irrespective of the state of other time cards in the time sheet, the time sheet also moves to the Rejected state.

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Sheets** > **Pending Approval**.
2. In the Time Sheets list, open the time sheet to approve or reject.
3. If required, add comments.
4. Click **Approve** or **Reject**.

Result
The time sheet moves to the Approved or Rejected state.

- If a time sheet is rejected, it gets listed in the notifications for the rejected time sheets under the show notifications icon () on Time Sheet Portal and is moved back to the submitter to adjust the corrections and resubmit it. For more information, see Submit a time sheet.
- Once a time sheet is approved, all the time cards associated with the time sheet are also approved or rejected automatically.
- If any time cards in the time sheet are pending approval by one of the approvers as defined by the time sheet policy, the time sheet remains in the Submitted state.

Time cards

Time cards are used to record the time worked on a task by a task assignee.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The time card management feature works with the Task table to record time worked on Projects, Incidents, Problems, and Change Requests.

Task assignees can record time worked in the *Time worked* field on a task record or enter hours directly into their time card. Some tables support automatic time card creation based on start and end date fields.

Track the activities of a time card, such as who submitted or approved a time card, in the Activities section on the Time Card form. This time card activity audit is useful for tracking when you delegate responsibility for your time sheet processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it isn't already enabled. For more information, see Include a table field in auditing.

You can associate time cards for the project tasks and other task categories, such as meeting and training, with relevant resource plans.

When you approve a time card, the time logged in the time card is saved day-wise in the Time Card Daily [time_card_daily] table. Using daily time logged data, you can generate time card reports by days for any period irrespective of the time sheet period to which the time cards belong. For example, you can create a monthly time card report that includes time cards from the first day to the last day of the month.

Time cards also have an optional approval mechanism for project managers to approve the time cards. Administrators and time card approvers can see all the time cards for the week. All users who are in a role that is responsible for working on tasks also can access their personal time cards. A time card can have any of the following states:

Time Card states

State	Description
Pending	A Time card that isn't submitted for approval.
Submitted	A time card submitted for approvals.
Approved	An approved time card.
Processed	An approved time card with an expense line for the associated task.
Rejected	A rejected time card.
Recalled	An approved time card recalled for any required adjustments.

Create a time card

You can create time cards to log time against the work you have done.

Before you begin

Role required: timecard_user

About this task

Starting Brazil release, users can select a resource assignment to associate it with time cards to calculate the actual efforts and tag them to the respective projects.

The **Allow time card reporting on** field on the project form determines the level at which the time cards for the project tasks can be created.

Note: Time Cards created from Project form do not populate Resource plans automatically to avoid random allocations. For more information, see KB0814884 article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Time cards can be created automatically or manually.

- *Automatic*: Use the following options to automatically generate the time cards:
  - *By updating task*:

    Auto create time card on task update

    Configure time cards to be created when a user updates a task record. The **Auto create time card on task update** setting in the assigned time sheet policy controls this behavior and is set to false by default.

    Auto fill time card with time worked entries

    Configure time cards to be created when a user records **Time worked**. A time card is created if a time card does not exist for the task. The time sheet policy **Auto fill time card with time worked entries** controls this behavior and is set to false by default.

    In **Project Task**, **Incident**, **Problem**, and **Change** records, the **Time worked** field does not appear by default and must be configured on the form.

  - *By scheduled job*: Configure time cards for the project tasks to be generated automatically for users through a scheduled job. Only the admin can configure a scheduled job.

Note: Time cards cannot be created automatically when you use the mobile interface. Use the desktop interface if you want to use the automatic time card feature.

- *Manual*: Create a time card for each task and enter the time manually.

Procedure

1. Create the time card using one of the following options.

Option	Steps
From the Time Sheet Portal	**a.** Navigate to **Time Sheets** > **Time Sheet Portal**. **b.** Open the week on the **Calendar** for which you want to create the time card.
From a Time sheet related list	**a.** Open the time sheet that you want to create the time card for. **b.** In the **Time Cards** related list, click **New**.
From a Time sheet related link	**a.** Open the time sheet for which you want to create the time card. **b.** Click any of the following related links: ▪ **Generate Time Cards**: This option generates the time cards for all project tasks assigned to the user for the time sheet week. With this option, time cards are generated only for the project tasks that are in progress or planned in that week.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	▪ **Copy from previous time sheet**: This option copies all the time cards (for project and non-project tasks) from a selected time sheet. **Note:** When using the related links for creating time cards: ▪ If a time card exists for a project task for the time card week, a duplicate time card is not created. ▪ Time cards are generated only for those project tasks that are in progress or planned in that week.

2. On the form, fill in the fields.

Time card form

Field	Description
Week starts on	Starting date of the week of the time sheet. **Note:** The time sheet policy **Week starts on** controls the start day of the week. A message is displayed when you try to associate a resource plan with a time card when the week on which the time card starts is outside the resource plan dates.
State	Current state of the time card. All new time cards begin in the Pending state. Different states of a time card are Pending, Submitted, Approved, Processed, Rejected, and Recalled.
Category	Type of task for which the time card is created.
Task	Task that is associated to the time card.
Project time category	Type of activity in the project that time is reported for. This field appears when you select **Project/Project Task** or **Task work** in the **Category** field.
User	Name of the user that the time card is created for.
Resource assignment	Select a resource assignment assigned to the user. When the time card is approved, the actual hours are used to view the planned vs actual hours in the heatmap view in Project Workspace and Resource Management Workspace. A resource assignment is associated with the time card in the following ways: ○ If the user has multiple resource assignments, you can select the appropriate assignment. ○ If the user has only one resource assignment, that plan is selected by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

3. Click **Submit**.

Result

- The time card is created for the selected time card period.
- If the time sheet for the week does not exist, a time sheet is created for the time card week.

What to do next

After the time card is created, the hours for that task can be incremented automatically from the **Time worked** field in the task record. The time sheet policy **Auto fill time card with time worked entries** controls the way the time is updated in time cards. The policy is set to *false* by default. If automatic updates for time worked are not configured, the user must manually update the time card.

Related topics

Map a time card category with operational work types

Copy time cards from a previous time sheet

Another option for creating time cards is to copy them from an existing timesheet, which copies all the time cards (for project as well as non-project tasks) from a selected time sheet.

Before you begin

Role required: timecard_user

About this task

You can also perform this task from the Time Sheet Portal.

Procedure

1. Open the time sheet record that you want to create the time cards for.
2. Click the **Copy from previous time sheet** related link.
3. In the **Select Time Sheet** field, select a previous time sheet that you want to copy the time cards from.
4. **Optional:** You can copy the time logged for the tasks in the previous time sheet, select the **Copy time logged** check box.
5. Click **OK**.

Result

Time cards for project tasks

Time cards for all the project tasks that are in progress or planned in the current week are copied from the selected time sheet. If a time card for a project task exists, a duplicate time card is not created during copying.

Time cards for non-task category

Time cards for all non-task category such as meetings and trainings are copied from the selected time sheet. If a time card for a non-task category exists, a duplicate time card is created during copying.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If the previous time sheet has rate types and the time sheet policy of the user allows rate types, then rate types are also copied into the current time sheet.
- If the previous time sheet has rate types, but the time sheet policy of the user no longer allows rate types, then rate types are not copied to the current time sheet.
- If the previous time sheet has a rate type that is inactive, that rate type is not copied. If necessary, the user can enter a different rate type before saving the individual time cards.

Auto-generate time cards

As an admin, you can configure a scheduled job to generate time cards automatically for project tasks assigned to time card users.

Before you begin

Role required: admin

About this task

In addition to the manual option **Generate Time Cards**, a scheduled job can be run to automatically generate the time cards for project tasks. A job can be scheduled to run every week, for example, on every Sunday to generate time sheets for all users for the next week. You can configure when to run the scheduled job based on the business process of the organization. By default, the scheduled job is turned off. For more information, see Schedule a script execution .

Note: The scheduled job auto-generates time cards only for those users who have the **Auto create time cards every week** option set to true in their assigned time sheet policy.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. In the Scheduled Jobs list, select **Auto Generate Time Cards**.
3. Configure the following parameters in the script as per the business requirements:
   - run for (CURRENT_WEEK, NEXT_WEEK, LAST_WEEK)
   - Group Name (includeGroups, excludeGroups)

Note:

- If a time card exists for a project task for the time card week, a duplicate time card is not created.
- Time cards are generated only for those project tasks that are in progress or planned in that week.
- The **Allow time card reporting on** field on the project form determines the level that the time cards for the project tasks are created at.

Example:

The following example script is executed when a scheduled job is run to generate time cards for the `Current week` for the `Database` and `Hardware` groups:

```
// Clone this schedule job to run separately for different
 groups at different times
// One of the following values
// TimeCardConstants.CURRENT_WEEK
// TimeCardConstants.NEXT_WEEK
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// TimeCardConstants.LAST_WEEK
var runFor = TimeCardConstants.CURRENT_WEEK;

// Comma separated group sys ids or group names.
 TimeSheet/TimeCards will be auto generated for time card users
 in the given groups.
var includeGroups = [Database,Hardware];
var excludeGroups = [];

var generator = new TimeCardGenerator();
generator.generateFromConfig(runFor, includeGroups,
 excludeGroups);
```

Submit a time card

As a time card user, once a time card for the week is updated with the time worked, you can submit the time card individually.

Before you begin

- A time card in the Pending or Rejected state can be submitted.
- Role required: timecard_user

About this task

When a user submits a time card, the time sheet policy assigned to the user is used for validation. If there's no time sheet policy assigned to the user, the default time sheet policy is used. Business rules help prevent a user from submitting a time card in case any violation is found.

Procedure

1. Navigate to **All** > **Time Sheets** > **My Time Sheets** > **All**.
2. Select the time sheet that you want to submit the time card for.
3. In the Time Card related list, open the time card to submit.
4. Select **Submit Time Card**.

> **Note:** Submit multiple time cards by selecting **Submit Time Card** from the actions on selected rows menu.

Result

- The time card moves to the Submitted state.
- The time card is submitted to an approver based on the **Project time approver** and **Non-project time approver** field values in the assigned time sheet policy.

> **Note:** If the project or user manager is changed after submitting the time card, the time card is automatically redirected to the new project or user manager for approval.

Approve or reject a time card

As a time card approver, you can view and approve or reject a submitted time card.

Before you begin

Role required: timecard_approver or timecard_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can view only those time cards that are submitted to you for approval or you have been delegated as the time card approver by one of the other user managers. The time sheet policy assigned to the user governs the approval process.

Procedure

1. Navigate to **All** > **Time Sheets** > **Time Cards** > **Pending Approval**.
2. Select the time card to approve or reject.
3. Click **Approve** or **Reject**.

Result

- The time card moves to the Approved or Rejected state.
- Expense line is created for an approved time card.
- For an approved time card, a Time Card Daily record is created.

Note:

- A user manager can also approve the time cards within a time sheet by selecting one or more time cards and approving them. When all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.

  A user manager is one who is selected in the **Manager** field on User form of the time card user.

- If a time card is in the Rejected state, the associated time sheet also moves to the Rejected state irrespective of the state of other time cards in the time sheet.

  Note: If a time sheet is rejected, it gets listed in the notifications for the rejected time sheets under notifications icon on Time Sheet Portal.

- If **Project time approver** is set to **Both** in the assigned time sheet policy, the time card is in the Submitted state only if both approvers approve it. If one of the approver rejects, the time card state is set to Rejected and the **Approved by** field is cleared, requiring approval of both approvers on resubmission.

Record time worked

The time card retrieves time accrued on a project or spent working on any record in the Task table from the **Time worked** field.

This field does not appear by default on the Project Task, Incident, Problem, and Change forms and must be added by personalizing the form. Time recorded in this field is used to populate an existing time card or to create a new time card if one does not exist. A time sheet policy controls this behavior.

Note:

When time worked is updated, a time card is created only if:

- the user is a time card user, AND
- the user is assigned to the task through **Assigned to** or **Additional assignee list** field.

The *Time worked* field has a counter that acts like a stopwatch for the duration of the time spent in the record. A button in the field can stop and start the counter. By default, the *Time worked*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

counter is enabled and begins recording the elapsed time when the record is opened. Stop the counter with the stop button and restart it with the play button.

If you are creating time cards from time worked entries, you can ask your admin to add the **Time Worked** related list to display the time worked records on the time card form. You will also notice an informational message on the time card to let you know that changes to time worked records overrides values in the time card. This is displayed using a Create a formatter and add it to a form, which can be added or removed by configuring the form.

Manage costs

When the cost management feature is enabled, time cards can be used to manage the cost of labor in the Cost Management application.

When a time card for a project task is approved, an expense line is generated for the corresponding labor cost associated with the project. If the project has a Rate Models associated, then the hourly rate for calculating labor cost for the expense lines is derived from the rate model. If no rate model is associated to the project, the rate listed in the *Labor Rate Card* is considered. If no Labor Rate Cards is applicable, the property `com.snc.time_card.default_rate` defines the default hourly rate.

Roles

The timecard_admin role enables users to approve, modify, and delete the time cards of other users.

Activate Cost Management

Domain separation and Time Card

Domain separation is supported in Time Card. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

For more information about using domain separation with Time Card, see https://community.servicenow.com/community?id=community_article&sys_id=616d706edbb318d066f1d9d9689619c1.

Working with database views for reporting

A database view defines table joins for reporting purposes.

For example, a database view can join the Incident table to the Metric Definition and Metric Instance tables. This view can be used to report on incident metrics and may include fields from any of these three tables.

Several useful database views are installed with the Database View plugin and the Database Views for Service Management plugin. These database views cover most metric reporting needs and greatly reduce the need to define new ones.

Any user who can create a report can use database views as the report source. Access control follows this hierarchy:

1. If ACLs exist on the database view itself, those ACLs are evaluated and take precedence.
2. If no database view ACLs exist, the system honors ACLs from the underlying tables.

By design, database view ACLs override table-level ACLs.

Note:

- The accumulated impact on performance grows as the number of tables that are included in the view and the number of records that those tables contain increases. To maximize the performance of the database view, ensure that the 'where' clauses that are defined in the database view are based on indexed fields.
- A database view is not treated like a custom table, so there is no licensing impact.
- Database view tables are not included in FTP exports.
- Database views evaluate the ACLs of the parent table of a table included in the database view.

Limitations

- Database views cannot be created on tables that participate in table rotation.
- It is not possible to edit data in the database view output.
- Database view tables cannot be added as a data preserver in clone requests.
- You can reference a table or database view from a different application scope in a Table Name field. However, if the field belongs to a table that extends sys_metadata, the table or database view must belong to the same application scope as that table.

ACLs and database views

You don't need to create ACLs on fields in the view. If field-level ACLs exist, the system evaluates them.

To require that read ACLs be added to the database views, set the *glide.security.expander.view.legacy* property to **true**. On upgraded instances, add this system property and set it to **true**.

When *glide.security.expander.view.legacy* is **true**, underlying table ACLs are ignored. When the property is **false** (the default), the underlying table ACLs are used if there are no database view ACLs.

You can still create additional ACLs on the database views. These ACLs are evaluated last and are always honored.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Database view reserved words

Using the terms may cause unintended or undesirable performance. For more information, see the MySQL reserved words document.

Joining tables using database views

Join tables into a single view and then create a report based on that view.

Use the **Database Views** module to create a database view that joins tables to create a pseudo-table that combines data from each table in the view. You can create a report on this data by adding the database view as a table in a report. Accessing the database view does not require database access.

Create a database view

Create the database view.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select **New**.
3. Name the view as you would name a new table.
   The application converts capital letters to lower case and spaces to underscores.
4. Provide a label and a plural.

   The **Label** and **Plural** fields define how the database view is labeled in lists and forms. For example, give a database view with the label Duplicate installation the plural `Duplicate installations`.
5. **Optional:** Provide a description of the database view so that other users know its purpose.
6. Select **Submit**.

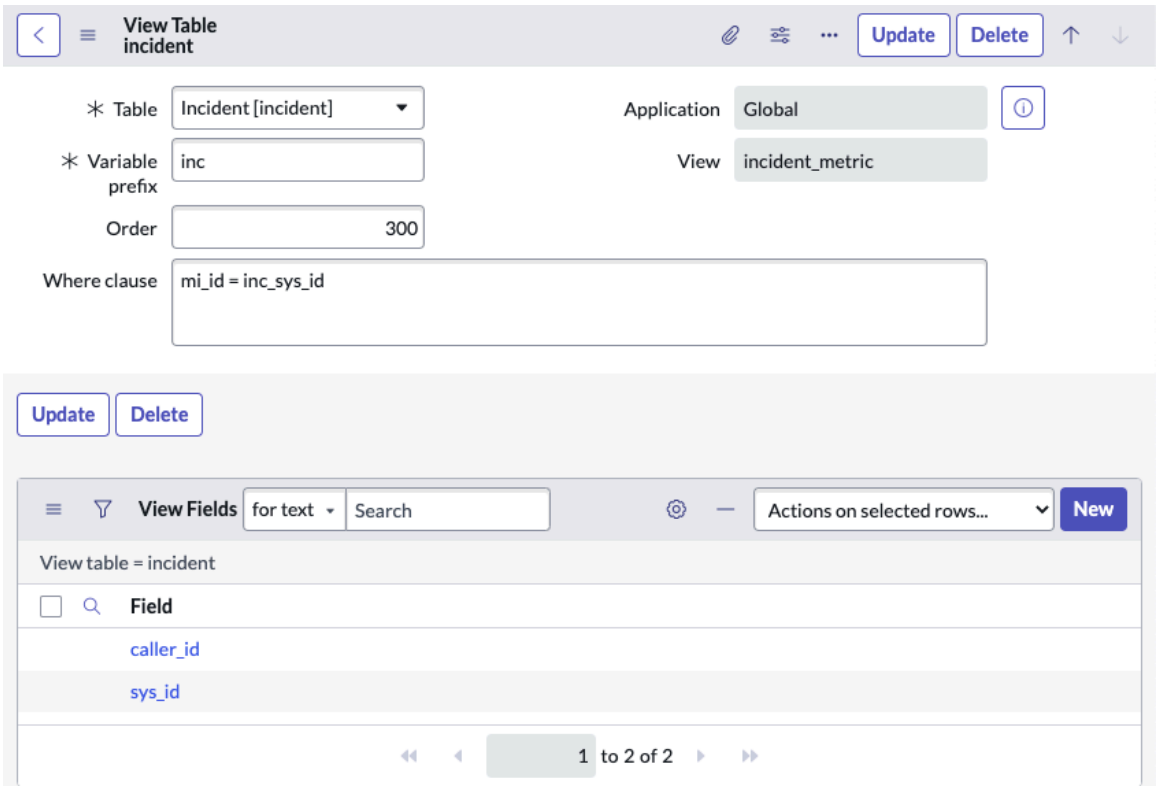
Result
The database view is created and accessible from the **Database Views** module.

What to do next
Add a table to the database view

Add a table to the database view

Specify the table to join to the database view.

Before you begin
Role required: admin.



About this task
The **Table** field in the View Table form specifies the table to join to the database view. The **Variable prefix** is used by the **Where clause** to define the conditions for the join. These conditions can refer to any field, but typically define the join by matching a field in the table to a field in another table in the database view.

Note: The Variable prefix field is mandatory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you write the **Where clause**, add the field name to the **Variable prefix** of its table with an underscore. In the following example, **mi_id** refers to the **id** field in the Metric Instance [metric_instance] table (mi) and **inc_sys_id** refers to the **sys_id** field in the Incident [incident] table (inc).

Database View Table form

Note:

- Database views cannot be created on tables that participate in table rotation.
- Use only lowercase characters in the **Variable prefix**. Using uppercase characters may prevent you from viewing the database view in a list.

To see an example of using left joins to create a view, see Example left join in creating a database view.

The **Where clause** supports these JavaScript conditional operators:

- =
- !=
- <
- <=
- >
- >=
- &&
- ||

There is no support for LIKE or CONTAINS conditions in the **Where clause** clause of a database view. Link tables based on the sys_id using the = operator to work with the full dataset when filtering lists, running glide queries, or running reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

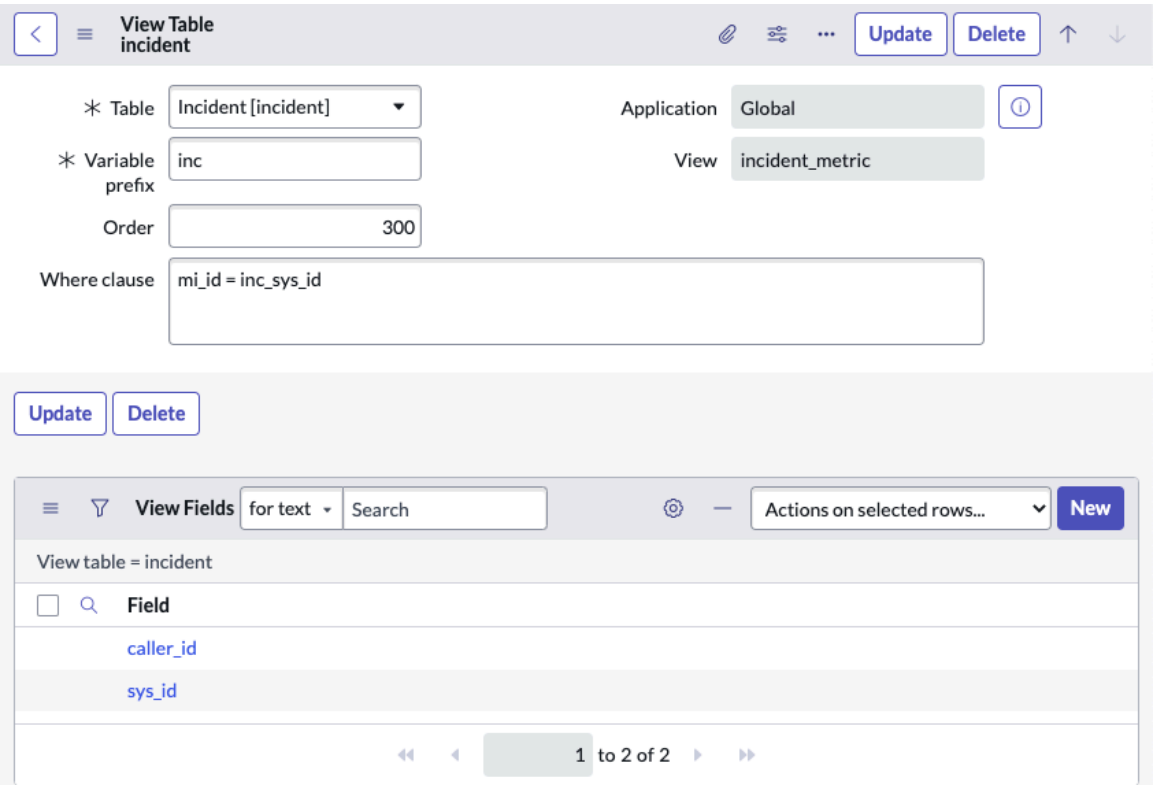
Procedure

1. From the Database View form, select **New** on the View Tables related list.
2. Configure the form and add the **Left join** field (a check box) to the form.
3. Select **Save**.
4. Complete the form and select the **Left join** check box.
   - Selecting **Left join** causes the left-hand table in the database view to display all records, even if the join condition does not find a matching record on the right-hand table. Select this check box to view tables that specify a **Where clause**. Selecting **Left join** for view tables without a **Where clause** does not affect the query.
   - Joined tables are ordered left to right from lowest to highest **Order** values.
5. Select **Submit**.
6. Personalize the **View Tables** related list to show the **Left join** column.
   The **Left join** field is **true**.
7. Select a record to view a table.
8. To add an OR to your Where clause, use ||.

   For example, to query all incidents related to RFCs OR all incidents that are the parent of a change request, use the syntax: `inc_rfc = chg_sys_id || chg_parent = inc_sys_id`.

Example left join in creating a database view

This example shows the proper settings when using left-joins to add tables to a database view.



Before you begin

Role required: admin

About this task

The following procedure shows how to create a database view that includes a list of Catalog Tasks and their parents. Most of the steps take place on the View Table form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select the view you want to edit.
   The Database View page appears. In the View Tables related list, specify the tables you want in the database view.
3. In the **View Tables** related list, select **New**.
4. Add a **Left join** check box to the form by Configuring the form layout.
5. Add the Catalog Task [sc_task] table to the database view by filling in the form with the following data and then select **Submit**. Joined tables are ordered left to right from lowest to highest **Order** values.

Field	Value
Table	Catalog Task [sc_task]
Variable prefix	cat
Order	100
Where clause	Leave blank

   The Database View page appears with the Catalog Task table in the View Tables table.
6. In the **View Tables** table, select **New** and add the Requested Item [sc_req_item] table to the database view by filling in the form with the following data and then selecting **Submit**. Joined tables are ordered left to right from lowest to highest **Order** values.

Field	Value
Table	Requested Item [sc_req_item]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Variable prefix	item
Order	200
Where clause	cat_parent=item_sys_id
Left join check box	True

The Database View page appears with the Requested Item table in the View Tables table.

7. In the **View Tables** table, select **New** and add the Request [sc_request] table to the database view by filling in the form with the following data and then selecting **Submit**.

Field	Value
Table	Request [sc_request]
Variable prefix	req
Order	300
Where clause	cat_parent=req_sys_id
Left join check box	True

The Database View page appears with the Request table in the View Tables table.

8. In the **View Tables** table, select **New** and add the User [sys_user] table to the database view by filling in the form with the following data and then selecting **Submit**.

Field	Value
Table	User [sys_user]
Variable prefix	user
Order	400
Where clause	cat_opened_by=user_sys_id
Left join check box	False

   - The Database View page appears with the User table in the View Tables table.
   - If the parent record of Catalog Task is a Requested Item, all the fields in the Request table will be blank.
   - If the parent record is a Request, all the fields in Requested Item will be blank.
   - Because of the two left joins, the Catalog Task record returns even if the parent is empty or is not a Requested Item or Request.
   - Because User is not a left join, there must be a matching user in sys_user for the row's Opened By field for the Catalog Task row to return.

9. **Optional:** Perform the following steps to experiment and learn more about how left joins impact database views.
   If you make the left join in:
   - User true, rows that have an empty **Created By** return.
   - Requested Item false, only Catalog Tasks that have a Requested Item as a parent return.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Request false, only Catalog Tasks that have a Request as a parent return.
- Requested Item and Request false, no rows return because nothing can have a Requested Item and a Request as parents.

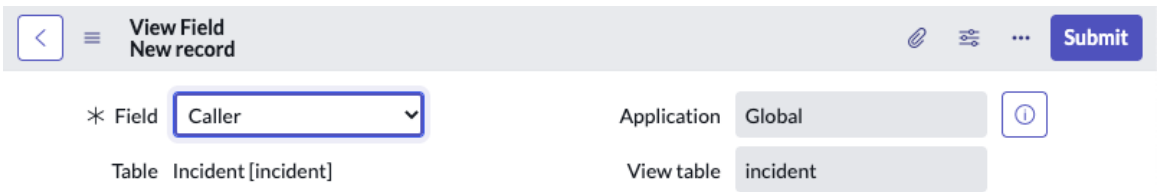
Specify a field to return

Restrict or specify a field that you want returned by the joined table.

Before you begin

Role required: admin

About this task



You can restrict the fields displayed in the database view output by adding fields to the View Tables related list.

When you restrict fields, you must create a View Field record for the join field from the *Where clause* in the parent record. If you omit a record for this field, it cannot be returned, and the join fails.

Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select the database view you want to add a field to return to.
3. In the database view record, select a view table, and then select **New** in the View Fields related list.
4. In the View Field form, select the field you want to display in the database view output.
   If no fields are defined in the View Fields related list, all fields are returned. If any fields are defined, then only those fields are returned. For example, you can restrict the display if there are fields that should not be viewable to all users.

View Field form

   In this example, the *Where clause* uses the *sys_id* field from the Incident table to establish the join. For the join to succeed with a restricted field list, you must include a record for the *sys_id* field in the View Fields related list.

What to do next

Verify your changes using the **Try It** related link in the database view record. See Test the database view.

Relabel a column

Sometimes, two different tables may have fields of the same name that are both important (such as two tables with a sys_updated_on field). For clarity, relabel one of the fields.

Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To create clear reports, relabel the fields on the Database View [sys_db_view] table without changing the names of the fields.

Procedure

1. Navigate to **All** > **System Definition** > **Language File**.
2. Select **New**.
3. Fill in the form as follows:

New language file fields

Name	Description
Table	Name of the database view
Label	Display label
Plural	Plural form of the display label
Element	Name of the field on the database view in the format variable prefix_fieldname. For example, you may enter inc_name to indicate the Name field on the Incident table. **Variable prefix** is a required field when you define the tables in a database view.

4. Select **Submit**.

Configuring the number of records to return

Specify the number of records to return for a database view when the view is used in a script.

A property called *glide.db.max_view_records* controls the maximum number of rows returned when running a GlideRecord query in a script. The default value for this property is 10000. To change this value, add the property to the System Property [sys_properties] table and edit the property's **Value** field, which determines the number of rows to return.

This property only applies when querying a database view table in a script. When the database view table is used in a list or report, this property doesn't apply. Reports or lists based on the database view use all rows in the view.

Test the database view

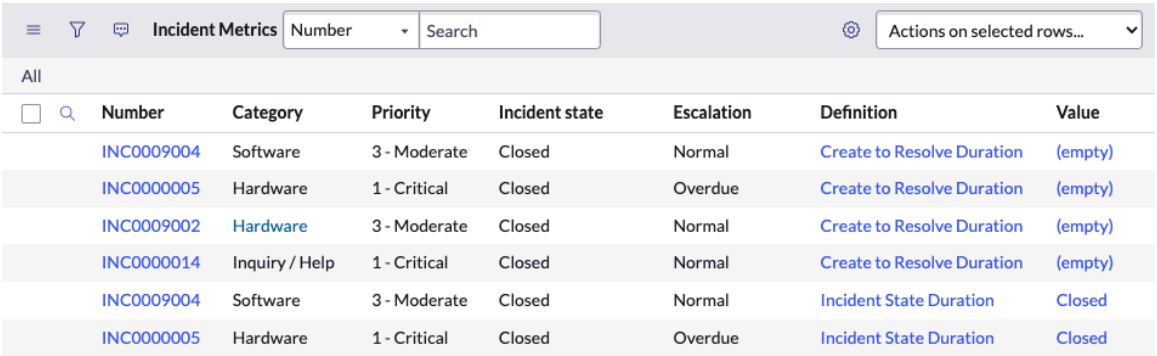
Verify that the database view works correctly.

Before you begin

Role required: admin.

About this task

Procedure

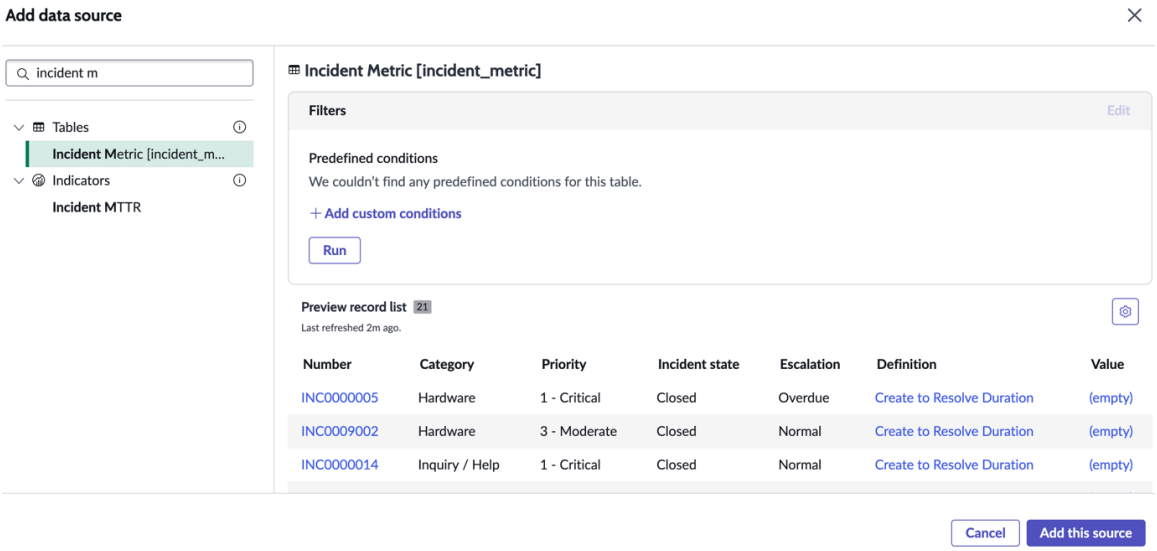


1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select the database view that you want to test.
3. Test the view by clicking the **Try It** related link.

> **Note:** If you do not see the *Try It* link, the tables necessary for the view do not exist. If this problem occurs, it is possible that you did not activate the necessary plugins to create the supporting tables.

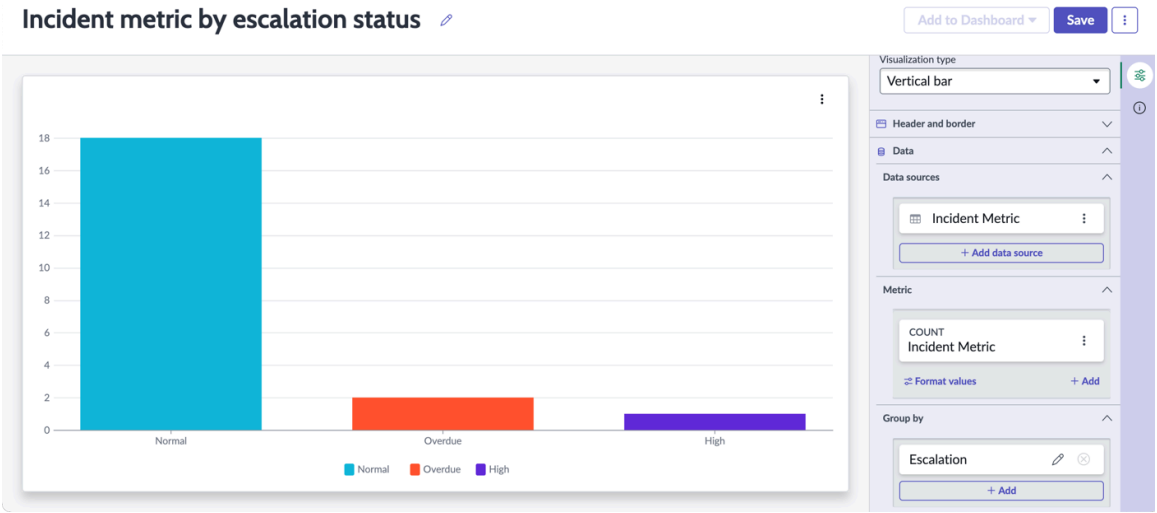
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The database view runs and a list of items is displayed. If you have specified fields in the **View Fields** related list for each table, the output is limited to those fields. If you specified view fields and the view does not display correctly, review the **View Fields** related list for each table and ensure that you include fields from the **Where clause**.



Example: Output of the sample Incident Metrics database view

Number	Category	Priority	Incident state	Escalation	Definition	Value
INC0009004	Software	3 - Moderate	Closed	Normal	Create to Resolve Duration	(empty)
INC0000005	Hardware	1 - Critical	Closed	Overdue	Create to Resolve Duration	(empty)
INC0009002	Hardware	3 - Moderate	Closed	Normal	Create to Resolve Duration	(empty)
INC0000014	Inquiry / Help	1 - Critical	Closed	Normal	Create to Resolve Duration	(empty)
INC0009004	Software	3 - Moderate	Closed	Normal	Incident State Duration	Closed
INC0000005	Hardware	1 - Critical	Closed	Overdue	Incident State Duration	Closed



What to do next

To use the database view in a data visualization, select it from the data sources. Database views are listed under tables.

You can create any visualization type using the database view. This example shows the database view visualized as vertical bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Displaying function results in a database view

Enhance the display of a database view by adding a function field to the output to display function results.

Function fields perform common database transformations and calculations on fields in the system. Function fields do not store any data, but rather display the results of a database query when the function is executed.

For example, you could identify incidents with ineffective descriptions of fewer than 10 characters by adding a function field that calculates the length of the **Short description** field.

Create a function field to perform a database function

Create a function field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation.

Before you begin

Role required: admin

You can either select a function field from a physical table or create a function field directly on the database view.

If you create a function field directly on the database view, you must use the variable prefixes from the database view in the function definition to identify the columns. Before you create the function field, take note of the variable prefixes in your database view.

For example, if the variable prefix for the Incidents table is `inc2` and you want to return the length of the description field, the function definition would be `glidefunction:length(inc2_description)`. If the variable prefix for the Metric Instance table is `mi` and you want to concatenate the Definition and Value fields, the function definition would be `glidefunction:concat(mi_definition.name,' ',mi_value)`.

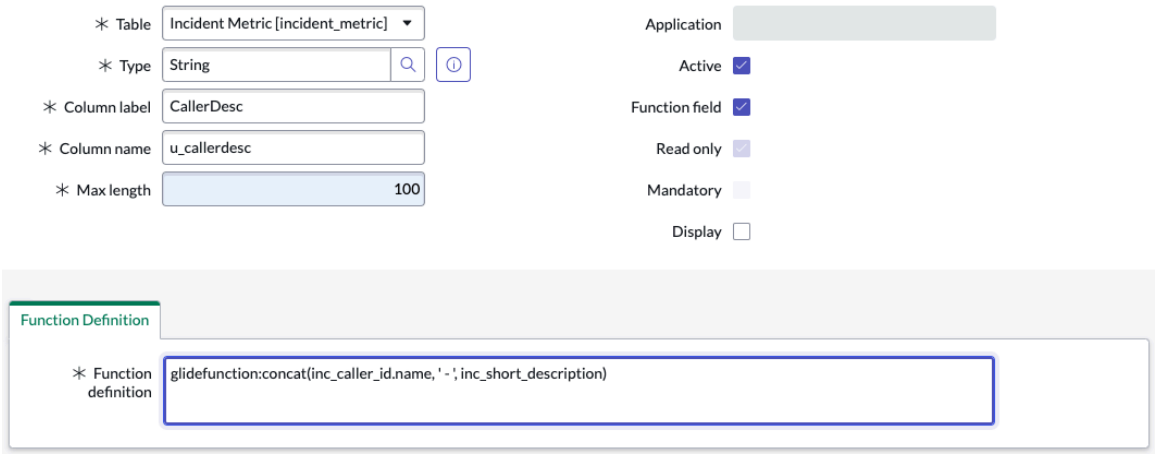
For information on supported functions, see Report on function fields.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Select **New**.
3. Select **Function field**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Function fields form



Field	Description
Table	The table or database view to which the function field is added. If you select a database view, you must include the database view's variable prefixes in the **Function definition** field.
Type	The type of field: string, number, date, and so on.
Column label	The label for the column.
Column name	The name of the column. This field is automatically set to the value of the **Column label** field.
Max length	The maximum length of the return value.
Function field	If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Once the new function record is saved, you cannot clear the check box to make the field a regular field.
Function definition	The function that the field performs. The format for functions starts with `glidefunction:`, followed by the operation to be performed (for example, `concat`), followed by function parameters. Constants must be enclosed in single quotes. **Important:** If you create the function field on a database view and not a physical table, you must include the database view's variable prefixes in the **Function definition** field.

5. Select **Submit**.

Example: Create a Function field on the Incident Metric database view

In this example, a new Function field, CallerDesc, is added to the Incident Metric database view. The field concatenates the caller name, a hyphen, and the short description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The variable prefix `inc` is included because the function field is defined on the Incident Metric database view and not on a physical table. The prefix is necessary to distinguish which short_description and caller_id columns to use from the tables that are part of the database view.

What to do next

Display function results in a database view

Display function results in a database view

Add a function field to the output of a database view to see function results.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Database Views**.
2. Select a database view.
3. Select the **Try it** related link.
4. Add the function field to the database view output.
   See Configure items on forms or in lists using a list collector.
5. Review the function definition if the expected value is not returned or a returned value indicates the function definition is invalid.
   - If the message **Invalid function** is returned, the function definition is invalid for string field types.
   - If an empty value is returned, the function definition is invalid for other field types.
   - If an unexpected value is returned, review the field definition in the function definition.

Result

The function field operation is executed and the results appear in the database view output.

Using disjunctions in complex queries

ServiceNow performs conjunction (AND) statements before disjunction (OR) statements in a query.

When you create a complex query that combines AND and OR conditions, you must use parenthesis around disjunctions to ensure proper grouping of query elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

Find all closed incidents (state = 6) that are either Priority 1 or Priority 2.

- Correct query (with parentheses):

```
(priority = 1 || priority = 2) && state = 6
```

  This query returns all closed incidents where the priority is 1 OR 2.

- Incorrect query (without parentheses):

```
priority = 1 || priority = 2 && state = 6
```

  Without parentheses, this query is evaluated as: priority = 1 OR (priority = 2 AND state = 6). This returns ALL Priority 1 incidents regardless of state, plus only the closed Priority 2 incidents.

Comparison

Query	Evaluated as	Result
`(priority = 1 || priority = 2) && state = 6`	(P1 OR P2) AND Closed	Closed P1 and P2 incidents only
`priority = 1 || priority = 2 && state = 6`	P1 OR (P2 AND Closed)	ALL P1 incidents + only closed P2

Always use parentheses around OR conditions when combining them with AND conditions. This ensures your query returns the expected results.

Database views in the base system

Certain views are included in the base system with the Database Views and Database Views for Service Management plugins.

Database views

Name	Description	Label
change_request_metric	Join change to metric definition to metric instance, creating a view that can be reported on for things like: Changes that were closed by category.	Change Metric
change_request_sla	Join change_request to sla(task_sla), creating a view that can be reported on for things like change request resolved by sla per change category.	Change Request SLA
change_task_metric	Join change task to metric definition to metric instance, creating a view that can be reported on for things like: Change tasks that were closed by change state	Change Task Metric

Building hierarchical queries

Simplify and build more efficient queries by leveraging hierarchical relationships in the condition builder.

Key benefits

- Filter table data in the condition builder based on a record hierarchy.
- Search through an entire hierarchy with a single condition.
- Streamline query building with less ongoing maintenance.

Crafting queries in condition builder can become cumbersome when you need to search through each level of a hierarchical relationship using multiple OR conditions. Hierarchical queries streamline this process by allowing you to specify a single node and search down the hierarchy from there, saving time and effort.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record hierarchies

By default, the following record hierarchies are included with your instance:

- The Department Hierarchy on the Department [cmn_department] table
- The Location Hierarchy on the Location [cmn_location] table
- The Manager Hierarchy on the User [sys_user] table

You can view these predefined record hierarchies by navigating to **All** > **System Definition** > **Record hierarchy**.

Each record hierarchy is based on a reference field that contains parent-child relationships between records in the same table.

- The Department Hierarchy is based on the Parent reference field in the Department [cmn_department] table.
- The Location Hierarchy is based on the Parent reference field in the Location [cmn_location] table.
- The Manager Hierarchy is based on the Manager reference field in the User [sys_user] table.

For example, the Location Hierarchy on the Location [cmn_location] table uses the Parent reference field. Each location has a parent, which is another record in the Location [cmn_location] table. For example, the Chicago and Springfield location records have the Illinois location record's sys_id value in their parent field. Street addresses have sys_id locations for the cities they belong to in their parent field.

You can use the Location Hierarchy in the condition builder to create targeted queries. For example, you can specify a starting point in the Location Hierarchy and query down the hierarchy to retrieve all assets associated with locations throughout that portion of the hierarchy.

Hierarchical paths

Each record that belongs to a record hierarchy stores its hierarchical information in a path field. The path field is used for searches throughout the hierarchy in the condition builder.

Paths for each predefined record hierarchy are automatically generated by the ServiceNow AI Platform and stored in the path field on the Department [cmn_department], Location [cmn_location], and User [sys_user] tables.

- The path for departments is stored in the Parent HP1 field in the Department [cmn_department] table.
- The path for locations is stored in the Parent HP1 field in the Location [cmn_location] table.
- The management path is stored in the Manager HP1 field on the User [sys_user] table.

For example, the ServiceNow AI Platform automatically builds the hierarchy path for each location record in the Location [cmn_location] table. This creates a nested structure where each location can have sub-locations, forming a tree-like hierarchy. The ServiceNow AI Platform also updates these paths when records are added, changed, or removed.

Many other tables contain self-referential fields, indicating a parent-child relationship between records. However, hierarchical paths aren't generated by the ServiceNow AI Platform in those tables until you define a hierarchy in the Record Hierarchy [sys_record_hierarchy] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

The Department [cmn_department], Location [cmn_location], and User [sys_user] tables contain reference fields with parent-child relationships by default.

Department Hierarchy

Search for assets associated with departments in your company using the `Department Hierarchy` record hierarchy.

Each department record contains a hierarchical path, allowing you to create queries in the condition builder based on the department hierarchy. Since asset records have a Department reference field, you can query assets that belong to a specific department.

- Find all assets that belong to the IT department using a query like:

  [Department] [is in hierarchy] [Department Hierarchy] starting at [IT] which is [Included]

  In this example, searching the hierarchy returns assets associated with the IT department, including assets associated with departments that are part of the IT department, and so forth.

- Find all departments under the IT department by filtering directly on the Departments [cmn_department] table using a query like:

  [Parent] [is in hierarchy] [Department Hierarchy] starting at [IT] which is [Included]

Location Hierarchy

Search for records according to location using the `Location Hierarchy` record hierarchy.

Each location record contains a hierarchical path, allowing you to create queries in the condition builder based on the location hierarchy. Since incident records have a Location reference field, you can search for incidents based on a caller's location.

- Find all incidents from callers based in Illinois using a query like:

  [Location] [is in hierarchy] [Location Hierarchy] starting at [Illinois] which is [Included]

  This query returns incidents where the caller's location is Illinois, any city in Illinois, or a street address in any city in Illinois.

- Find incidents for cities and street addresses in Illinois, but not incidents where the caller location is simply Illinois using a query like:

  [Location] [is in hierarchy] [Location Hierarchy] starting at [Illinois] which is [excluded]

- Find all incidents based on your location as the logged-in user using a dynamic filter in a query like:

  [Location] [is in hierarchy (dynamic)] [Location Hierarchy] starting at [My Location] which is [included]

Manager Hierarchy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search for records throughout the management chain in your organization using the `Manager Hierarchy` record hierarchy.

Each user record contains a hierarchical path, allowing you to create queries in the condition builder based on the management hierarchy. Querying any table and selecting a reference field that points to the Users [sys_user] table enables you to search through the management chain.

- Find all incidents assigned to users who report to Bud Richman using a query like:

  [Assigned to] [is in hierarchy] [Manager Hierarchy] starting at [Bud Richman] which is [Included]

  In this example, searching the hierarchy returns incidents assigned to Bud Richman, including incidents assigned to users who report to Bud and their direct reports, and so forth.

- Find all incidents assigned to you and users in your own organization using a dynamic query like:

  [Assigned to] [is in hierarchy (dynamic)] [Manager Hierarchy] starting at [Me] which is [included]

- View the management chain itself by filtering directly on the Users [sys_user] table using a query like:

  [Manager] [is in hierarchy] [Manager Hierarchy] starting at [Bud Richman] which is [included]

- View the users who report to you by filtering directly on the Users [sys_user] table using a dynamic query like:

  [Manager] [is in hierarchy (dynamic)] [Manager Hierarchy] starting at [Me] which is [included]

Overview of building a record hierarchy

In addition to the predefined record hierarchies that are included with your instance, you can build a record hierarchy on a table of your choice.

Building a hierarchy between related records in the same table requires a self-referencing field. When building the hierarchy, you can either use an existing reference field that already defines parent-child relationships or create a self-referencing field and populate it with the appropriate values for each record.

1. Identify a table that contains parent-child records that you want to use for building hierarchical queries. For example, to build queries based on related assets, you can define a record hierarchy based on the Asset [alm_asset] table.
2. Determine which reference field in the table defines the relationships between records. For example, the Parent field in the Asset [alm_asset] table describes the parent asset of an asset.
3. Create a hierarchy in the Record Hierarchies [sys_record_hierarchy] table and specify the table and reference field that you want to use. The ServiceNow AI Platform automatically adds hierarchical path information to each record in the table.
4. Create hierarchical queries in the condition builder by selecting the hierarchy that you created. Use operators to search through the hierarchy.

Create a record hierarchy

Build a record hierarchy between records in the same table.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Record Hierarchy**.
2. Select **New**.
3. On the form, fill in the fields.

Record hierarchy form

Field	Description
Label	Label used for displaying the record hierarchy.
Name	Internal name for the record hierarchy.
Table	The table with records that you want organize into a hierarchy.
Reference Field	The self-reference field that defines parent-child relationships between records in the selected table.

4. Select **Submit**.

Result

A record hierarchy based on the specified reference field is created. The ServiceNow AI Platform automatically builds the hierarchy paths that define the relationships between records in the hierarchy.

What to do next

Build queries in condition builder using the [is in hierarchy] or [is in hierarchy (dynamic)] operators. See Operators available for filters and queries.

Data Management

Manage your instance data by configuring data management policies to archive and delete data from the tables in your primary database.

Exploring Data Management

Learn about Data Management capabilities and how they help you manage table data in the ServiceNow AI Platform.

Data Management overview

The Data Management capabilities enable you to manage the growth of data in your instance using data management policies.

- Define and access a set of data management rules for a table using a data management policy.
- Visualize a summary of storage consumption on your instance.
- Manage the growth of data on your instance by archiving and cleaning table data.

Data Management users

Users

User	Description
Instance admin	The instance admin monitors growth and storage of data on the instance. The instance admin configures data management policies to archive and delete older records.

Data Management workflow

This infographic depicts how an administrator uses a data management policy to configure data management rules for a table and monitor data usage on an instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing data on your instance

1. The instance admin monitors cloud storage entitlements and data usage at the account-level in Subscription Management.
2. The instance admin finds that one instance is consuming a greater amount of storage than expected and decides to investigate.
3. The instance admin logs in to the instance and analyzes which tables are consuming the most data by viewing the Data Management Console. The instance admin notices that two tables are consuming more data than expected.
4. The instance admin reviews the data management policies for the tables in question. One of the tables has never been archived or cleaned before, so the instance admin creates a data management policy for this table.
5. The instance admin determines that older records in one of the tables can be moved to an archive table. The instance admin creates multiple archive rules using different criteria to move data from the primary table to an archive table.
6. The instance admin decides that older records in the other table aren't needed after a certain date. The admin adds a table cleaner rule to the data management policy that deletes records from the table periodically as the records age out.
7. After the archive and table cleaner jobs are finished, the instance admin continues to monitor the Data Management Console to verify that data consumption is reduced and continues to monitor the top 10 tables.

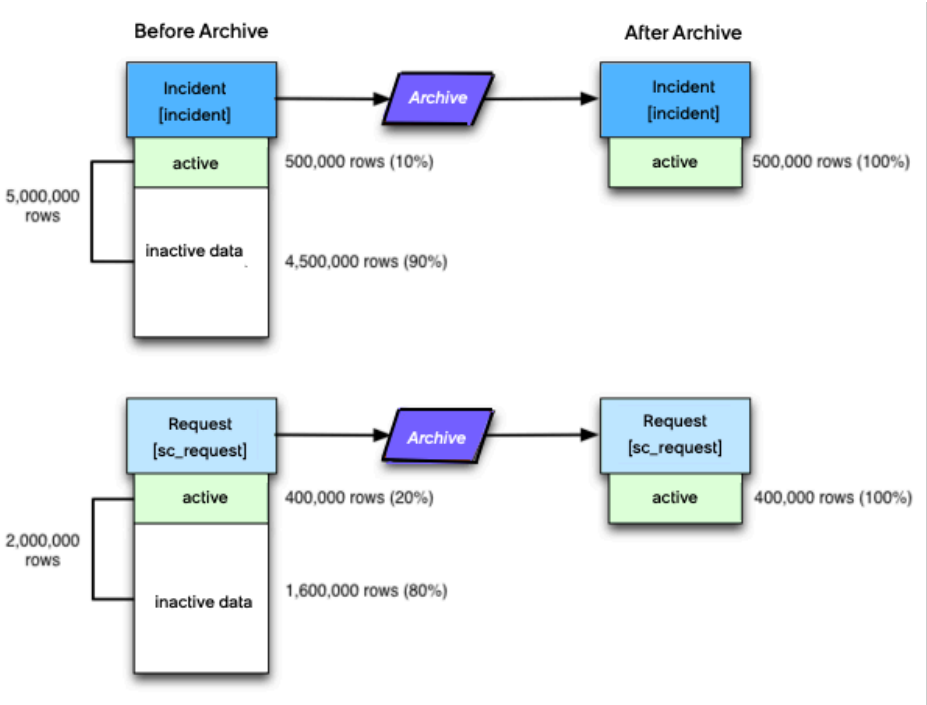
System Archive

System Archive enables you to manage table growth by moving inactive records out of primary tables into dedicated archive tables within the same instance.

System Archive is a platform feature that's available on all the ServiceNow instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Key benefits

- Releases system resources, which improves query and report performance.
- Preserves data for auditing or historical purposes.
- Deletes archived data after a specified period using a destroy rule.

Note that System Archive does not reduce primary storage usage or move data to a separate storage tier. For information about moving records off the primary database to an object storage, see Live Archive with RaptorDB Professional V2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Archive rules

During archiving, records that meet the defined archive rules are moved to a corresponding archive table prefixed with `ar_`. For more information, see Viewing table rules and Viewing rule activities.

Use cases

- Instances that have been running for a long time and have accumulated data that is no longer relevant. For example, task records from two years ago are typically less relevant than currently active tasks. This old data can eventually cause performance issues by consuming system resources and slowing down queries and reports. You can archive records in core tables such as the Task [task] table and records in custom tables that you create on the ServiceNow AI Platform.
- The Incident [incident] table on your instance has grown and users are reporting that queries against the table are slow. You can create an archive rule with conditions like **[Closed] [relative] [on or before] [150] [Days] [ago]** and **[Active] [is] [false]** to move records to the Archived Incidents [ar_incident] table when they're closed for more than 150 days.
- Archive related records together to maintain data integrity for compliance and auditing requirements. This approach archives records from a primary table along with any dependent records in other tables that reference them. For example, when archiving records from the Problem [problem] table, you can include incidents that reference those problem records in the **Problem in incident** field.

For information about using the System Archive feature, see Archiving records in Core UI.

Live Archive with RaptorDB Professional V2

Live Archive (formerly Data Archiving) moves records and attachments to object storage, freeing up space in the primary database while keeping data accessible for compliance and reporting. This capability improves query performance and provides scalable storage for large archives.

When you upgrade to RaptorDB Professional V2 and install Live Archive, you can migrate archived records and attachments from the primary instance to a dedicated object storage. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

archived data remains accessible in the same way as regular tables. This capability is exclusive to RaptorDB Professional.

Object storage doesn't require additional configuration beyond plugin installation.

During the migration to object storage, data management processes that interact with archive tables are temporarily paused. However, no downtime is required for the upgrade itself. For more information about upgrading to RaptorDB Professional, contact your account representative.

Key benefits

- Moves data to object storage in a compressed columnar format, freeing up primary storage.
- Improves query performance on active data by reducing the primary database size.
- Reuses existing archive rules without requiring changes.
- Retains closed records for compliance and audit purposes.
- Provides scalable storage capacity for larger archives without impacting primary database performance.
- Keeps archived data accessible and searchable to users on the ServiceNow AI Platform so historical data can be queried and reported on as needed.
- Applies the same security controls, ACLs, and role-based access to archived records as to live records.
- Enables you to monitor live and archive table volumes in the Data Management Console.

Live Archive architecture

Live Archive extends the existing archive rules framework. When records match the archive rule conditions, they move from primary tables to archive tables.

S3 facade

To keep archived data accessible even if a datacenter is unavailable, Live Archive uses an S3 facade, which is a communication layer between RaptorDB Professional and object storage. It handles authentication, routing, and resilience.

Live Archive automatically creates two S3 facade endpoints, one per datacenter in your instance's datacenter pair. If one datacenter is unavailable, the other endpoint keeps the archived records remain accessible. The S3 facade is verified during Live Archive installation.

Archiving with S3 facade

Archive rules

Use archive rules to define which records should be archived. Time-based conditions are common. For example, to archive incidents closed more than two years ago. However, any field-based condition is supported.

Existing archive rules operate without changes or migration. For guidance on creating and managing archive rules, see Create an archive rule in Core UI.

When an archive rule runs, records and attachments move from live tables to archive tables through the S3 facade.

Monitoring storage

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Track object storage volume in the Data Management Console. Storage stats refresh once daily and reflect compressed sizes.

Data appears in the console only after an archive table exceeds 512 MB or 2 million rows.

Primary database space reclamation

As records move to object storage, RaptorDB reclaims space in the primary database.

The primary database might not shrink immediately in absolute size, especially when new records continue to be created, but archiving slows primary database growth and reduces the volume of data processed on every query. The performance and operational benefits of archiving appear in faster query times and instance responsiveness.

Security

Live Archive maintains all ServiceNow AI Platform security controls. ACLs, role-based access, and row-level security apply to archived records the same way as live records. Users without access to live records cannot access the corresponding archived records.

Object storage data is encrypted at rest and in transit without requiring additional configuration.

To install Live Archive after upgrading to RaptorDB Professional V2, see Install Live Archive.

Table cleaner

Prevent tables from growing to an unmanageable size by deleting records automatically.

Key benefits

- Improve query performance by deleting records you no longer need.
- Delete older, expired, or unwanted records from tables automatically.
- Prevent data from growing exponentially.

Accessing table cleaner rules

You can define and access table cleanup rules for a table by navigating to **All** > **System Data Management** > **Data Management Policies** and selecting the data management policy for the table.

Use cases

- Delete closed incidents that haven't been updated in 30 days. In this scenario, you define a table cleanup rule on the Incident [incident] table using sys_updated_on as the match field and you specify 2,592,000 as the age in seconds. You specify the condition State is Closed to only delete closed incidents.
- Manage data growth in tables used by Virtual Agent and Conversational Interfaces by activating table cleanup rules for the following tables:
  - Chat Server [sys_cs_analytics]
  - Conversations [sys_cs_conversation]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Message Last Reads [sys_cs_message_last_read]
- Ci Analytics [sys_ci_analytics]

- Conversation-related tables can increase in size and end up affecting system performance. Limit data growth by cleaning records in tables related to Advanced Work Assignment. See .

For information on using table cleaner, see Deleting older or unwanted records in Core UI.

Configuring Data Management

Set up and configure Data Management.

Configuration overview

Data Management is a ServiceNow AI Platform capability that is active by default. You can take advantage of object storage for archive records and attachments by upgrading to RaptorDB Professional V2 and installing Live Archive.

Install Live Archive

Install Live Archive to archive data in object storage.

Before you begin

Role required: admin

Requirement	Details
Entitlement	Check your entitlements to determine whether you have access to RaptorDB Professional v2.
Platform release	At least the Australia release.
RaptorDB version	At least RaptorDB Professional version 35.1.

About this task

Consider the following aspects of Live Archive migration before starting the installation:

- Archive rule processing is paused during the migration, so plan installations around any time-sensitive archiving schedules.
- Existing archived data is converted to columnar storage format.
- Converted data is moved to the object storage as the migration progresses.
- Archive rule processing resumes after the migration completes.

Migration duration depends on the volume of data in the archive tables. Large archives require longer migration windows. Non-archived data and standard instance operations remain unaffected during the migration.

Procedure

1. Navigate to **All** > **Application Manager**.
2. Search for live archive and select **Live Archive**.
   The Live Archive plugin [com.glide.db.columnar.archive] is automatically downloaded with the product.
3. Select **Install** and review the installation instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Install Now**.
5. **Optional:** Confirm the installation.
   a. Select the **Installed** tab.
   b. In the **Search your licensed applications and plugins** field, enter `Live Archive` and press **Enter**.
   c. Verify whether Live Archive appears in the results.
6. **Optional:** Verify that S3 facade endpoints have been created in each datacenter in the instance's datacenter pair.
   a. Navigate to **All** > **Filter** and search for `sys_service_endpoint_list.do`.
   b. In the **Name** column, enter `s3_facade`.
   c. Confirm that the two endpoints are listed, each with **Active** status set to **true**.
7. **Optional:** Verify whether a new **Object Storage** tile is available by navigating to **System Data Management** > **Data Management Console** and checking the summary section.
   It might take up to 24 hours for data to appear in the tile.

Analyzing data usage on your instance

View a summary of storage consumption and analyze data usage on your current instance over time in the Data Management Console.

Overview of analyzing data usage

- Monitor cloud capacity in Subscription Management

  View a summary of your cloud storage entitlements and track storage capacity across all the instances associated with your account in Subscription Management.

- Data Management overview

  Monitor the current size of the instance and track cloud storage consumption. For example, if you purchased shared storage for your instances, you can determine how much storage is consumed from the pool by your current instance and which tables are consuming the most amount of data.

- Viewing all tables

  Access a list of the tables on your instance and gain insight into the growth of these tables over the last thirty days. View the number of active data management rules that are configured on these tables.

- Viewing data usage by table

  Access a summary of data usage over time for specific table. Determine which tables are driving volume to the current table and how much volume the current table is contributing to associated tables.

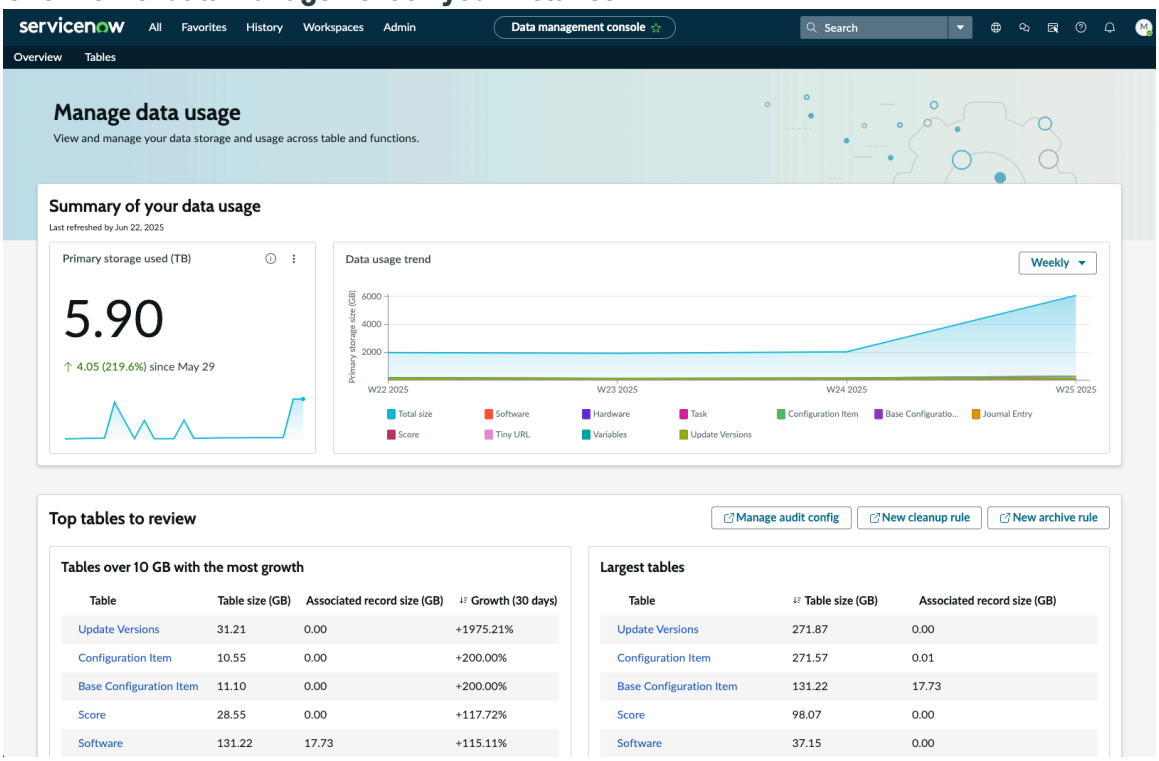
- Viewing table rules

  Track the backlog of records in a table that meet the requirements of a data management rule but haven't been processed yet. View a summary of rule execution history on a table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Viewing rule activities

  Analyze a specific rule configured on a table. Track the backlog of records that meet the rule's conditions but haven't been processed yet, and view a detailed summary of the rule's execution history.



Data Management overview

View a summary of your data usage and manage the growth of data on your instance.

Key benefits

- View a summary of primary storage used on your instance and monitor data usage over time.
- Determine which tables are consuming the most amount of storage on your instance.
- Manage the growth of data on your instance directly from the Data Management Console.

Overview of data management on your instance

Required ServiceNow AI Platform roles

The admin role is required to view the Data Management Console.

Accessing overview information in the Data Management Console

Access overview information on the **Overview** tab in the Data Management Console by navigating to **All** > **System Data Management** > **Data Management Console**.

Primary storage used

View a summary of primary storage used on your instance. Note that efforts to reduce the amount of primary storage used on your instance might not be reflected until the system completes synchronization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the total amount of primary storage used on your instance.
- Track storage usage on your instance over time by viewing the percentage increase or decrease since a specific date.

Data usage trend

Monitor the top ten tables consuming the most amount of storage on your instance over time.

- Determine if usage has increased or decreased over time in a weekly or monthly view.
- Compare the total amount of primary storage used on your instance to the total amount of storage used by the largest tables on your instance.
- Compare usage between the top ten largest tables on your instance over time.

Top tables to review

To effectively manage the growth of data on your instance, review the tables that are currently growing the most in size and monitor the size of the largest tables on your instance.

In addition, you can gain a more comprehensive understanding of a table's impact on your instance's overall storage usage by monitoring the size of its associated records.

- A table that contributes to the size of an associated table is considered a driver table.
- Associated tables store attachments, audit records, and journal entries that are generated when records are created in the driver table.

Review the top tables on your instance in terms of growth and table size, and then combine that information with the associated record size to determine where to focus your data management efforts first.

Tables over 10 GB with the most growth

View the tables that are currently growing the most in size. Only tables larger than 10 GB appear in the list.

- View the size of tables with the most growth by checking the Table size (GB) column.
- Monitor the size of records from associated tables by checking the Associated record size (GB) column. To reduce the size of associated records, consider creating archive or cleanup rules in the driver table that's contributing to the growth of the associated tables.
- View the tables with the most growth over the last 30 days by checking the Growth (30 days) column. For tables that are growing at a faster rate than expected, consider creating a new cleanup rule or a new archive rule.
- View a table-level summary of data usage by selecting a table in the list.

Largest tables

View a list of the largest tables on your instance.

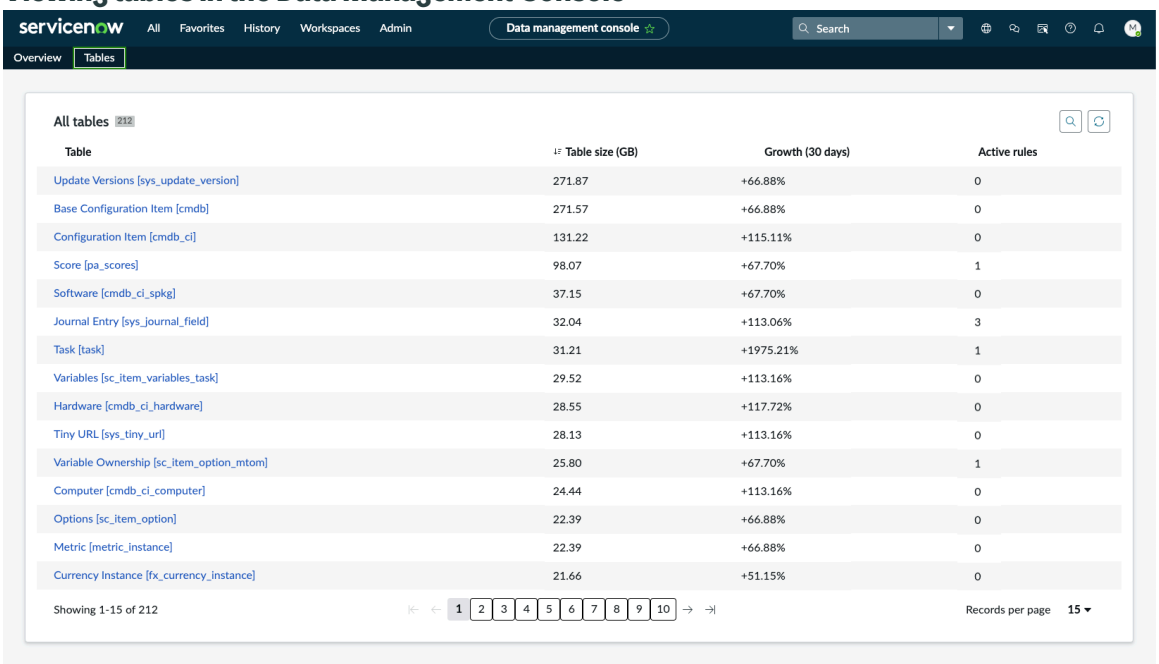
- View the largest tables on your instance by checking the Table size (GB) column.
- Monitor the size of records from associated tables by checking the Associated record size (GB) column. To reduce the size of associated records, consider creating archive or cleanup rules in the driver table that's contributing to the growth of the associated tables.
- View a table-level summary of data usage by selecting a table in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After reviewing the top tables, start managing the growth of data on your instance.

- Manage the growth of audit records from the audit management console by selecting **Manage audit config**.
- Delete older or unwanted records by selecting **New cleanup rule**. See Create a table cleanup rule in Core UI.
- Move data that's no longer needed to an archive table by selecting **New archive rule**. See Create an archive rule in Core UI.

Viewing all tables



View a list of all tables on your instance and the number of active data management rules configured on each table.

Key benefits

- View tables on your instance in terms of size by checking the **Table size (GB)** column.
- Determine which tables have grown the most in size over the last thirty days by checking the **Growth (30 days)** column.
- Determine how many archive, cleanup, and one-time delete rules are active for each table by checking the **Active rules** column.

By default, the list of tables is filtered to show tables over 100 MB in size.

Viewing tables in the Data Management Console

Required ServiceNow AI Platform roles

The admin role is required to view the Data Management Console.

Accessing the Tables view in the Data Management Console

Access table information in the Data Management Console in one of the following ways: You can also access the **Tables** tab by selecting View additional tables on the Overview tab.

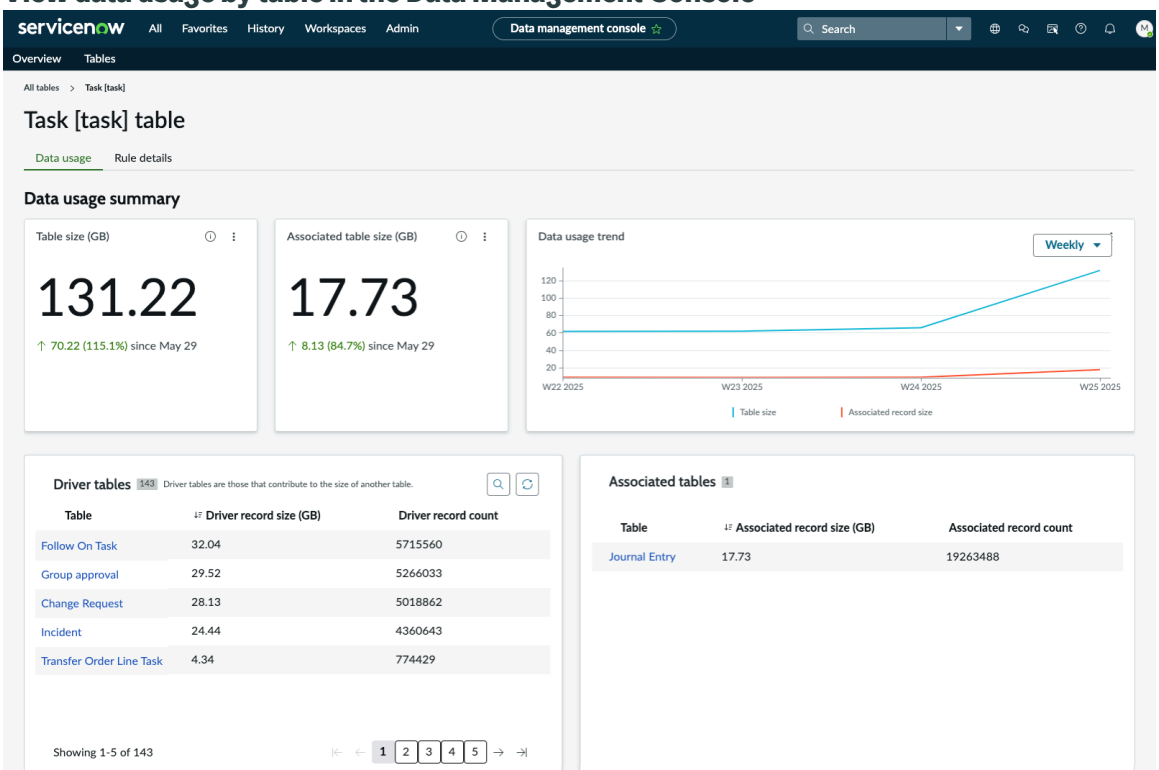
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Navigate to **All** > **System Data Management** > **Data Management Console** and select the **Tables** tab.
- Navigate to **All** > **System Data Management** > **Data Management Console**. On the **Overview** tab, select **View additional tables**.

Use cases

- Monitor data usage for physical tables, including the Task [task] table.
- Monitor data usage for logical tables, including the Incident [incident], Problem [problem], and Change Request [change_request] tables.
- Access data usage and rule details by selecting a table in the list. See Viewing data usage by table.

Viewing data usage by table



View a summary of data usage for an individual table.

Key benefits

- Analyze data usage at the table-level.
- Monitor data usage for a specific table over time.
- Access a comprehensive view of a table's impact on storage usage by checking the size and record count of driver tables and associated tables.

Details on this page are refreshed once daily.

View data usage by table in the Data Management Console

Required ServiceNow AI Platform roles

The admin role is required to view the Data Management console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing data usage by table in the Data Management Console

Access data usage for a specific table in the Data Management Console by navigating to **All** > **System Data Management** > **Data Management Console** > **Tables** and selecting the table.

Table size (GB)

View the total amount of storage used by the current table. If you've made significant changes to your data recently, it might take up to 24 hours for changes to appear.

Track storage usage over time by viewing the percentage increase or decrease since a specific date.

Associated table size (GB)

Associated tables contain records that don't have a lifespan of their own. Examples include attachments, audits, and journals.

- View the total amount of storage used by associated tables.
- Track the rate of storage usage by viewing the percentage change since a specific date.
- Address growth in associated tables by creating data management rules on the current table.

Data usage trend

Monitor data usage for the current table over time.

- Track the size of the current table over weeks or months.
- Compare data usage between the current table and associated tables over time.

Driver tables

Driver tables are those that contribute to the size of another table. For example, the Incident [incident], Problem [problem], and Change Request [change_request] tables contribute to the growth of the Task [task] table, which makes them driver tables.

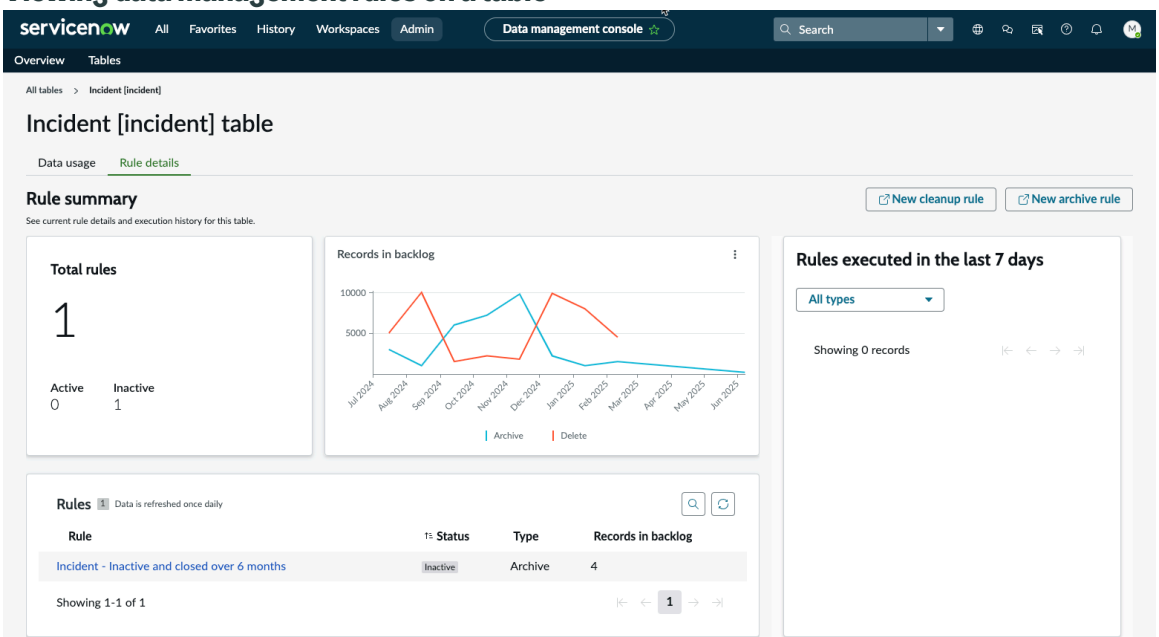
- Determine which tables are driving volume to the current table.
- View the size of each driver table and the total record count in each driver table.
- Address growth in the current table by creating data management rules in the driver tables.

Associated tables

Associated tables store records like attachments, audit records, and journal entries that don't have a lifespan of their own. For example, the Sys Audit [sys_audit], Attachment [sys_attachment], and Journal Entry [sys_journal_field] are tables associated with the Incidents table, which contributes volume to these tables.

- Determine how much volume the current table is contributing to associated tables.
- View the size of associated records and the total record count in each associated table.
- Address growth in associated tables by creating data management rules on the current table.

Viewing table rules



View a summary and execution history of the data management rules that have been created on a table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

- View the current number of active and inactive data management rules on the table.
- Track the backlog of records that meet the requirements of a data management rule but haven't been processed yet.
- View rule execution history for the last seven days.
- View a detailed list of the table's data management rules. Select a rule to view a detailed summary.

Viewing data management rules on a table

Required ServiceNow AI Platform roles

The admin role is required to view the Data Management Console.

Accessing table rules in the Data Management Console

Access rules for a specific table in the Data Management Console by navigating to **All** > **System Data Management** > **Data Management Console** > **Tables**, selecting the table, and then selecting the **Rule details** sub-tab.

Rules

View a list of the data management rules on the current table.

- Determine whether a rule is active or inactive by checking the **Status** column.
- View the types of rules that are configured by checking the **Type** column.
- Monitor the number of records that meet the conditions for a rule but haven't been processed yet by checking the **Records in backlog** column. Data in this column is refreshed once daily.
- View a summary of records in the backlog and rule execution history by selecting a rule in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Total rules

View the total number of data management rules created on the current table, including the number of active and inactive rules. Manage the growth of data in the current table by creating data management rules or adjusting current rule conditions.

- Create a table cleaner rule to delete older or unwanted records by selecting **New cleanup rule**. See Create a table cleanup rule in Core UI.
- Create an archive rule to move data that's no longer needed every day to an archive table by selecting **New archive rule**. See Create an archive rule in Core UI.

Records in backlog

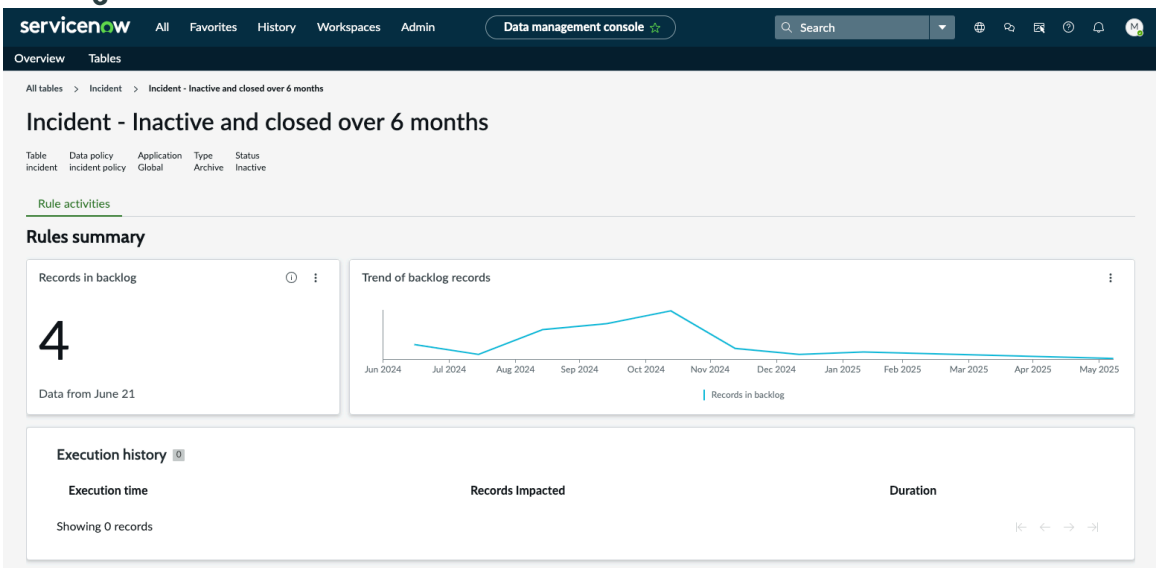
Track the count of records in the current table that meet the requirements of a data management rule but haven't been processed yet.

- Track the progress of different types of data management rules over time.
- Monitor data management rule efficiency and consider adjusting the conditions based on the trend in the backlog record count.
- Check for bottlenecks that indicate a large number of records in the backlog waiting to be processed.
- Look for spikes in the backlog across different types of data management rules. Consider scheduling rules at different times to avoid an influx of backlog records.

Rules executed in the last 7 days

View a list of recent rule activities on the current table. Filter the list by rule type and view the number of affected records for each executed rule.

Viewing rule activities



View a summary of records in the backlog and the execution history for a specific rule on the table in context.

Key benefits

- View details for a specific data management rule.
- Track the backlog of records that meet the rule's conditions but haven't been processed yet.
- View a detailed summary of the rule's execution history.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing rule activities

Required ServiceNow AI Platform roles

The admin role is required to view the Data Management Console.

Accessing rule activities in the Data Management Console

Access recent activity for a specific rule in the Data Management Console by navigating to **All** > **System Data Management** > **Data Management Console** > **Tables**. Select a table, select the **Rule details** sub-tab, and then select a specific rule.

Rule details

View basic information about a data management rule including the following details:

Table

The table to which the data management rule applies.

Data policy

The data policy to which the data management rule belongs.

Application scope

The application scope of the table.

Type

The type of data management rule, such as archive, cleanup, or one-time delete.

Status

The current status of the data management rule.

Records in backlog

View the total number of records that meet the conditions for the rule but haven't been processed yet. The count is updated once a day.

Trend of backlog records

Track the backlog of records that meet the conditions for the rule but haven't been processed yet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Track the progress of the rule over time.
- Monitor data management rule efficiency and consider adjusting the conditions based on the trend in the backlog record count.
- Check for bottlenecks that indicate a large number of records in the backlog waiting to be processed.

Execution history

View a detailed summary of the rule's execution history.

- View the date and time a rule was executed by checking the **Execution time** column.
- Determine how many records were archived or deleted by checking the **Records impacted** column. Consider adjusting the rule's conditions if the number of records isn't sufficient.
- Determine how long the rule took to complete by checking the **Duration** column.

Managing data growth in Data Management Console

Manage the growth and storage of data on your instance by creating data management rules in the Data Management Console.

Overview of managing data growth

Create and manage Data Management rules directly from the Data Management Console.

- Archiving records in Data Management Console

  Move records in a primary table to an archive table, including any records in other tables that reference those records.

- Deleting older or unwanted records in Data Management Console

  Prevent data from growing exponentially by implementing table cleanup rules.

- Previewing and deleting records in Data Management Console

  Safely delete records from a table without using scripts and without deleting the table.

- Restore archived records and related records

  Restore one or more archive records and any related records back into the primary table.

Archiving records in Data Management Console

Manage table size growth and improve query performance by archiving records.

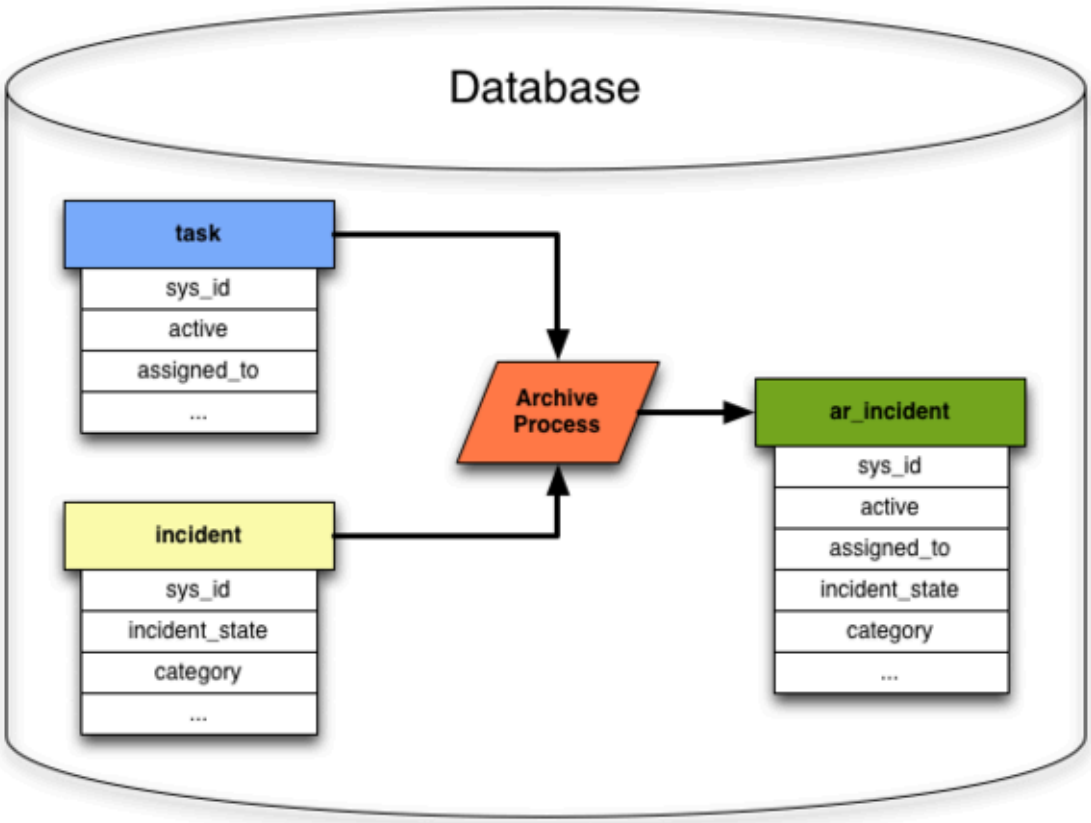
You can archive records in core tables such as the Task [task] table and records in custom tables that you create on the ServiceNow AI Platform using archive rules.

- To archive Configuration Management Database (CMDB) CI records, use the CMDB Data Manager. See Working with CMDB Data Manager.
- To archive emails, activate the Email retention plugin and use the archive and destruction rules that come with the plugin. Don’t use the archive feature to create your own archiving rules on the email table.

Archive activation

When you activate an archive rule, the system performs the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Creates the archive table in the database. The archive table has the same name as the primary table with an "ar_" prefix. For example, if you archive the Incident `[incident]` table, the archive table is `[ar_incident]`.
- Stores an XML version of each archived record in the sys_archive_log table. This archive log is the same table for all archive rules, and you can't alter this behavior. It's also the only place where the sys_id is stored together with the display value for reference fields.

  For example, for ar_incident `<assigned_to>Fred Luddy</assigned_to>`, the sys_archive_log record is as follows:

```
<assigned_to display_value="Fred
 Luddy">5137153cc611227c000bbd1bd8cd2005</assigned_to>
```

- Converts multiple joined tables into a single flat-file archive table. The archive table no longer consists of a base table and extended tables.

Conversion of Multiple Joined Tables into a Flat Archive Table

- Converts reference field values (values set by references to records in other tables) into string values. The archive record contains the display value of the reference field at the time of the archive.
- Adds a module to the **Archive Tables** list in the **System Archiving** application. The module name is a combination of the word "Archive" plus the display name for the archived table. For example, the archive module for the Attachment `[sys_attachments]` table is **Archive Attachment**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Creates a list of the archive table using the default list view.
- Creates a form for the archive table using the default form view. The form excludes any dot-walking fields such as **Caller ID.Email**.

Reference values converted to strings

Archived data is stored as a flat file with no reference fields to other tables. The archive process converts any references to other tables to string values.

In the case of a reference field, the string uses the display value such as the caller's user name. For example, the **Caller** reference field in an incident would display the string *ITIL User*. If the reference was a document ID and the archive rule included the option to archive related document IDs, the string is the document ID of the related record.

Future changes to reference values aren't reflected in archived records. For example, if you change the user name for "John Smith" to "John A Smith", all active incident records automatically show the caller as "John A Smith" because of the reference between the Incident and User tables. However, all archived incident records display the user name that existed at the time of the archive. Likewise, if you delete a user from the system, current incidents no longer display the deleted user as a caller. However, archived incidents still display the string "John Smith" because that value was used when the record was archived.

Querying archived data

Archived tables aren’t optimized for ad hoc queries. They only contain index entries for the display value, creation date, and the primary key of sys_id.

Avoid making on-demand queries against an archived table, like searching for all priority 1 archived incidents. Instead, only search against the indexed fields. For example, search for incident INC100001 or incidents created on a specific date.

Archive tables and ACLs

By default, archive tables use the ACLs for the unarchived table of the same name. For example, the archived Incident `[ar_incident]` table uses the ACLs defined for the unarchived Incident `[incident]` table.

You can manage access to archive tables explicitly by creating ACLs for specific archive tables and setting the *`glide.security.enable_archive_table_acls`* property to **true**. The system then follows one of two paths:

1. If one or more active ACLs are defined for an archive table, those ACLs control access to the archive table.
2. If no ACLs are defined for an archive table, the system reverts to default behavior and uses the ACLs for the unarchived version of the table.

Note: The two paths are mutually exclusive: If archive table ACLs deny access, the system doesn't attempt to revert to the default behavior.

The read operation is the only operation evaluated, and other operations are prevented.

The Execution Plan UI is aware of this logic and presents information accordingly. For example, adding the first ACL to an archive table shows that the archive table ACL is "masking" ACLs on the unarchived (original data) table.

If you have existing ACLs on archived tables, they’re ignored unless you set the *`glide.security.enable_archive_table_acls`* property to **true**. Those newly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

activated ACLs may possibly cause access issues. To prevent this occurrence, the system sets the *glide.security.enable_archive_table_acls* property as follows:

- Instances without the *glide.security.enable_archive_table_acls* property use the default value of **false**.
- Upgraded instances don't install the property. The property must be added manually and set to **true** to enable the archive table ACL behavior.
- Zbooted instances install the property and set it to **true**.

Setting the language of archived strings

On internationalized instances, the archive process uses the language of the SYSTEM user to select the display value strings.

If there's no SYSTEM user, the instance uses the default language setting to select the display value strings. You can either create a SYSTEM user with a specific language setting or set the system default language to select the language of archived strings.

Create an archive rule in Data Management Console

Define a rule for archiving records.

Before you begin
Role required: admin

About this task
Because you can define multiple archive rules for a table, verify any existing archive rules to avoid potential conflicts. For example, if there's a rule for archiving records older than six months, creating another rule to archive records older than three months could cause a conflict. In such cases, either rule could potentially run, each archiving records under different conditions.

Procedure
1. Access the create rule wizard in the Data Management Console in one of the following ways.

Option	Steps
Overview tab	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Overview tab, select the table with records that you want to archive. **c.** Select **Create rule**.
Rules tab	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Tables tab, select the table with records that you want to archive. **c.** On the table details page, select the Rules tab. **d.** Select **Create rule**.

2. Define the archive rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the Define your rule page, select **Archive** as the rule type.

b. Enter a name and description for the rule.
The name is used as the display value for references to this rule.

c. Select **Save and continue**.

Define archive rule conditions

Define one or more conditions that identify the records to be archived.

Before you begin
Role required: admin

About this task
Use the condition builder to specify filter conditions that define the records to be archived. For example, you might archive inactive records older than a certain date.

Make sure that the correct records are selected by testing the conditions in a list view before you activate the archive rule. For example,

- To archive records closed more than two years ago from today, use the relative operator in a condition like **[Closed] [relative] [before] [2] [Years] [ago]**.
- To archive records for the current year and the prior year, and not two years ago from today's date, use a condition like **[Closed] [on] [Last 2 years]**.

Procedure

1. On the Define conditions page, limit the number of records by adding one or more conditions that records must meet.

   a. Select a field, operator, and field value.

      Example
      For example, **[Category] [is] [Software]**.

   b. **Optional:** Use the OR and AND operators to add conditions.

   c. **Optional:** Select **Add condition set Criteria** to add another set of conditions.

2. Estimate the number of records to archive by selecting **Calculate archive estimate**.
   The estimate only includes primary records and excludes any related records added to the archive rule. The estimate helps you determine if the archive rule affects the number of records you expect it to. If the estimate is too high or low, change the archive rule conditions accordingly.
3. Automatically send restored records back to the archive after a set time period.
   a. Select **Auto-rearchive**.
   b. Enter the time interval in years, days, and hours before the restored record is automatically archived.
4. Select **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define destroy rule conditions

Delete archived records after a specified amount of time by configuring optional destroy rule conditions.

Before you begin
Role required: admin

About this task
Optionally, use the condition builder to specify filter conditions that define the archive records to be destroyed. For example, you might delete archive records older than five years.

Skip this page and advance to the next one if you don't want to configure a destroy rule now.

Procedure

1. On the Destroy archived records page, select **Destroy archived records**.
2. Specify the amount of time that records stay in the archive table before the system deletes them by entering a value for the archive duration in years, days, and hours.
   The default archive duration is one year.

   Important: Archive records are destroyed immediately if all **Archive Duration** fields are empty or set to 0.

3. **Optional:** Automatically destroy related records associated with the archived records by selecting **Destroy related records**.

   Note: Associated records, which include records in the Journal Entry [sys_journal_field], Attachment [sys_attachment], and Sys Audit [sys_audit] tables are deleted automatically, even if you decide to preserve related records.

4. **Optional:** Estimate the number of archived records marked for deletion by selecting **Recalculate Destroy Estimate**.
5. **Optional:** Activate the destroy rule by selecting **Activate archive destroy rule**.
6. Select **Save and continue**.

Result
After the archive destroy rule is activated, records that have been archived longer than the archive duration value are destroyed when the scheduled job runs. You can verify the progress by checking the archive destroy log.

Manage related records

Archive, clear, or delete related records when an archive rule runs.

Before you begin
Role required: admin

Procedure

1. On the Manage related records page, select **+ Add records**.
2. Select which action to take on related records in the **Action** list.

Action	Description
Archive	Archive records that reference the archived record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Clear	Remove the reference to the archived record. The record no longer references the archived record and doesn't appear as a related record in future archives.
Cleanup	Delete records that reference the archived record.

3. Select the related records that you want to archive, clear, or delete by selecting a relationship in the **Reference** list.
   The **Reference** list contains all the relationships that exist to the archived table. There are two types of relationships in the list.

   Reference fields

   The list contains reference fields in other tables that refer to the archived table.

   For example, you create an archive rule on the Problem [problem] table. You can include related incident records by selecting the **Problem in Incident** field reference field on the Incident [incident] table.

   - The **Archive** action archives any incident record that references an archived problem.
   - The **Clear** action updates any incident record with a reference to the archived problem record by clearing the reference. If the reference is a many-to-many relationship, the related record rule deletes the reference instead of clearing the reference.
   - The **Delete** action deletes any incident record that references the archived problem record.

   Document ID fields

   The list contains document ID fields in other tables that point to the archived table. Document ID relationships display an asterisk (*) character at the end of the selection name.

   For example, you create an archive rule on the Problem [problem] table. You can include related attachment records by selecting the **Table sys ID Attachment(sys_attachment)*** reference.

   - The **Archive** action updates the attachment record to change the **Document ID** to refer to the archived table record.
   - The **Clear** action removes the **Document ID** reference to the archived record. The record no longer references the archived record and doesn't appear as a related record in future archives.
   - The **Delete** action deletes any attachment record that references the archived primary record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can't select references from some internal system tables or from peripheral tables. For example:

- Sys Audit [sys_audit]
- Audit Deleted Record [sys_audit_delete]
- Audit Relationship Change [sys_audit_relation]
- Attachment [sys_attachment]
- Journal Entry [sys_journal_field]

4. **Optional:** Apply an archive rule to the related records that you're archiving by selecting a rule in the **Reference table rule** list.
   For example, if you already have an archive rule for the Incident [incident] table, select the existing incident archive rule when archiving records related to incidents records.

   Note: You control the cascade depth by specifying an archive rule in the **Reference table rule** field. Related records without a specified archive rule aren't cascaded.

   - Prior to the Washington DC release, if an archive rule was defined in the system for a related record's table, the system would automatically cascade and process that archive rule and the related records associated with it.
   - Beginning in the Washington DC release, even if an archive rule exists for a related record's table, you must declare that rule in the **Reference table rule** field to achieve that cascading behavior. If you have multiple related records on multiple tables, you can decide which of those records you want to include in the cascade by specifying the reference table rule.

5. Select **Add**.
6. **Optional:** Add or delete more related records entries as needed.
7. Select **Save and continue**.

View a summary of your archive rule and activate it

View a summary of your archive rule and decide whether to activate it.

Before you begin

You must activate the archive rule and its corresponding data management policy for the archive rule to run.

Role required: admin

Procedure

1. On the Rule summary page, review the archive rule conditions and settings.
2. **Optional:** Activate the rule by selecting **Activate the rule upon creation**.

Result

Records that meet the archive rule criteria are archived during the next archive run.

Deleting older or unwanted records in Data Management Console

Delete older, expired, or unwanted records from tables automatically.

Delete older, inactive records in core tables such as the Task [task] table and records in custom tables that you create on the ServiceNow AI Platform using table cleanup rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are several table cleanup rules included in the base system by default.

- You can view a list of all the table cleaner rules in the Auto Flush [sys_auto_flush] table by entering `sys_auto_flush.list` in the filter navigator. The Auto Flush table displays rules for base system tables and their corresponding record ages.
- You can view a list of table cleaner rules defined on a single table by navigating to **All** > **Data Management Policies** and selecting the data management policy record for the table, if it exists. The system automatically creates a data management policy record for any table that has an archive rule or table cleaner rule.

Slow rule handling

The table cleaner scheduled job runs once per hour (by default). When the table cleaner job runs, each table cleaner rule runs several queries as part of the process. If there's no index on a rule's match field or on significant portions of its condition, rule processing can be slow because its queries are running inefficiently on large amounts of data.

If a table cleaner rule has a query that takes longer than 30 seconds to complete, the entire table cleaner job is stopped. By default, table cleaner waits two days before including that rule in the table cleaner job again, which enables the table cleaner job to run without disruption in the meantime. You can configure the duration of the waiting period by adding a system property. See Table cleaner properties.

Disabling table cleanup

You can prevent an administrator from creating a table cleanup rule or running the table cleaner on a specific table by adding the Disable Table Cleaner attribute to the table's dictionary record. Some internal system tables have the Disable Table Cleaner attribute added by default.

Table cleanup limitations

- As of Xanadu patch 5, table cleaner rules defined in the Auto Flush [sys_auto_flush] table are supported for extension and shard tables. However, table cleaner rules aren't supported for tables configured with table rotation.

  When using the GlideTableCleaner scriptable directly, table cleaner rules aren’t supported for tables configured with table rotation or table extension. Some tables in your instance might have legacy table cleaner rules that were established before table rotation was enabled. These legacy rules can be safely ignored.

- Performance depends on the size of the table and the conditions that you specify. For example, if you use a custom column without an index in a large table, performance is severely degraded. Performance also depends on the number of rows to be deleted.
- Table cleaner spends a maximum of 20 minutes to delete records from a single table. If queries are slow, the volume of records deleted in the 20-minute period may be small.
- Table cleaner doesn't call `DBDelete.setWorkflow()`. This means `DBDelete` objects run with `workflow=false` (false is the default value for a Java Boolean). As a result, business rules, workflows, and flows that you expected to trigger on record deletion won’t trigger in the context of table cleaner. This is important to consider if you have business logic that depends on this type of functionality.

Create a cleanup rule

Define a rule for deleting records from a primary table on a recurring basis.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Create a cleanup rule to delete records on a recurring basis. To delete records as a one-time operation, see Create a one-time delete rule.

Procedure

1. Access the create rule wizard in the Data Management Console in one of the following ways.

Option	Steps
Overview tab	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Overview tab, select the table with records that you want to clean up. **c.** Select **Create rule**.
Rules tab	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Tables tab, select the table with records that you want to clean up. **c.** On the table details page, select the Rules tab. **d.** Select **Create rule**.

2. Define the cleanup rule.

   a. On the Define your rule page, select **Cleanup** as the rule type.

   b. Enter a name and description for the rule.
   The name is used as the display value for references to this rule.

   c. Select **Save and continue**.

Define cleanup rule conditions

Define one or more conditions that identify the records to be deleted.

Before you begin

Role required: admin

About this task

Use the condition builder to specify filter conditions that define the records to be deleted. For example, you might specify that only records where 'active = false AND state =closed' are deleted.

Procedure

1. On the Define conditions page, select the Date/Time field that you want to use for monitoring duration in the **Date field**.
2. Specify the amount of time that the system must wait before deleting records by entering a duration (in years, days, and hours).
3. Limit the number of records by adding one or more conditions that records must meet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select a field, operator, and field value.

Example
For example, **[Active] [is] [false]**.

b. **Optional:** Use the OR and AND operators to add conditions.

c. **Optional:** Select **Add condition set Criteria** to add another set of conditions.

4. Select **Save and continue**.

Select associated records to delete

Specify which associated records to delete when the cleanup rule runs.

Before you begin
Role required: admin

Procedure

1. On the Clean up associated records page, select which associated records to delete when the cleanup rule runs.

Associated records	Description
Attachments	Selected by default. Associated attachments are always deleted.
Journals	If selected, related records in the Journal En try [sys_journal_field] table are also deleted. If cleared, the system deletes records from the target table, but not any related journal records in this table.
Audits	If selected, related records in the following au dit tables are also deleted: ○ Sys Audit [sys_audit] table ○ Audit Relationship Change [sys_audit_rela tion] table **Note:** Audit records that are created by table cleaner in the Audit Deleted Record [sys_audit_delete] table are pre served. If cleared, the system deletes records from the target table, but not any related audit records in these tables.

2. **Optional:** Delete all matching records plus any records referring to them by selecting **Cascade delete**.
   If this option is cleared, the system deletes matching records, but not records referring to them.
3. Select **Save and continue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View a summary of your cleanup rule and activate it

View a summary of your cleanup rule and decide whether to activate it.

Before you begin

You must activate the cleanup rule and its corresponding data management policy for the cleanup rule to run.

Role required: admin

Procedure

1. On the Rule summary page, review the cleanup rule conditions and settings.
2. **Optional:** Activate the rule by selecting **Activate the rule upon creation**.

Result

The table cleanup rule runs automatically and deletes records when they meet the specified record age and any conditions that you set for them.

Previewing and deleting records in Data Management Console

Safely delete records from a table without using scripts and without deleting the table by creating one-time delete rules.

Overview of deleting records using one-time delete rules

1. Create a one-time delete rule

   Define a rule for deleting records now or at a later date.

2. Define one-time delete rule conditions

   Define one or more conditions that identify the records to be deleted.

3. Select associated records to delete

   Specify which associated records to delete when the one-time delete rule runs.

4. Schedule or execute a one-time delete rule

   Schedule a date and time to execute a one-time delete rule or execute it after you finish creating it.

5. View a summary of your one-time delete rule

   View a summary of your one-time delete rule and decide whether to activate it.

If you must delete a large number of records from a table rather than a selection of records, use the table cleaner option. For details, see Deleting older or unwanted records in Data Management Console.

Create a one-time delete rule

Define a rule for deleting records now or at a later date.

Before you begin

Role required: admin

About this task

Create a one-time delete rule to delete records once. To delete records on a recurring basis, see Create a cleanup rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Access the create rule wizard in the Data Management Console in one of the following ways.

Option	Steps
Overview tab	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Overview tab, select the table with records that you want to delete. **c.** Select **Create rule**.
Rules tab	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Tables tab, select the table with records that you want to delete. **c.** On the table details page, select the Rules tab. **d.** Select **Create rule**.

2. Define the one-time delete rule.

   a. On the Define your rule page, select **One-time delete** as the rule type.

   b. Enter a name and description for the rule.
   The name is used as the display value for references to this rule.

   c. Select **Save and continue**.

Define one-time delete rule conditions

Define one or more conditions that identify the records to be deleted.

Before you begin
Role required: admin

About this task
Use the condition builder to specify filter conditions that define the records to be deleted.

> **Important:** Deleting records can cause unexpected cascade deletion. Preview the number of records that will be affected before activating the rule and change the conditions as needed.

Procedure

1. On the Define conditions page, limit the number of records by adding one or more conditions that records must meet.

   a. Select a field, operator, and field value.

   Example
   For example, **[Category] [is] [Software]**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Optional: Use the OR and AND operators to add conditions.

c. Optional: Select **Add condition set Criteria** to add another set of conditions.

Note: Limiting the number of records that are added to the one-time delete job can help prevent the table from being locked when the job is executed.

2. **Optional:** View the records that match the conditions by selecting **Preview affected records**. The list of records appears in a new browser tab.
3. On the Define conditions page, select **Save and continue**.

Select associated records to delete

Specify which associated records to delete when the one-time delete rule runs.

Before you begin
Role required: admin

About this task
Deleting records in a table also deletes records from tables that extend or reference the source table. Preview the affected records before you execute a delete job and learn about other tables that are impacted.

Up to three levels of cascaded records are deleted when the job is executed. For example, if the preview identifies incidents that match the conditions, it will also delete any problems that reference those incidents, defects that reference those problems, and test records that reference the defects. If sys_attachment and sys_attachment_docs table records are associated with the incidents, those records might not appear in the preview but they are deleted as well.

Procedure

1. On the Delete associated records page, view the count of records from the source table that match the conditions in the one-time delete rule by selecting **Preview cascade**.
   The **Preview cascade delete records** dialog displays the estimate. Counts for records in other tables that reference those source records are listed as well, although those counts are only close estimates.
2. Review the count of affected records by table to ensure that the records are safe to delete.
3. Note that a rollback context is created by default.

Important: If you need to restore records deleted by accident, you have up to fourteen days to execute the rollback job.

4. **Optional:** Run predefined business rules after records are deleted by selecting **Run business rules and engines**.
5. Select **Save and continue**.

Schedule or execute a one-time delete rule

Schedule a date and time to execute a one-time delete rule or execute it after you finish creating it.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Consider scheduling the one-time delete rule to run during non-business hours to minimize the potential performance impact on your users. Deleting all records in a table temporarily locks the table, which prevents inserts and updates. If you want to delete all records from a table, use a cleanup rule instead. For more information, see Deleting older or unwanted records in Data Management Console.

Procedure

1. On the Set up schedule page, schedule the one-time delete rule to run now or at a later date.

Option	Description
Schedule later	Set up a schedule at a later time.
Execute upon creation	Run the one-time delete rule immediately af ter you finish creating it.
Run at	Select a date and time to run the one-time delete rule. **Note:** Scheduling at a later date and time might affect a different number of records.

2. Select **Save and continue**.

View a summary of your one-time delete rule

View a summary of your one-time delete rule and acknowledge the deletion.

Before you begin

You must activate the one-time delete rule and its corresponding data management policy for it to run.

Role required: admin

Procedure

1. On the Rule summary page, review the one-time delete rule conditions and settings.
2. Read and verify the deletion by selecting the acknowledgment statement.

Result

The one-time delete rule runs based on the chosen schedule and deletes records when they meet the conditions that you set for them.

Restore archived records and related records

Restore one or more archive records and any related records back into the primary table.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the table with archived records that you want to restore in one of the following ways.

   a. Navigate to **All** > **System Data Management** > **Data Management Console**.

   b. Select the **Tables** tab.

   c. Find the table with records that you want to restore.
   Tables with archived records have the Archive value in the Status column.

2. Select **View records**.
3. Select one or more records that you want to restore.
4. Restore the selected records using one of the following options.
   - Select the **Restore All Records Matching Conditions** related link.
   - Open the **Actions on selected rows...** drop-down, and then select **Restore Selected**.
5. In the Bulk Restore Request Success confirmation dialog box that appears, select **OK**.

Result

One or more records are restored to the primary table. The corresponding archive records are deleted from the archive table.

What to do next

View the restore date and time in the **Restored** column in the Archive Log related list.

Managing data growth in Core UI

Manage the growth and storage of data on your instance by creating data management rules in Core UI.

Overview of managing data growth

Create and manage Data Management rules in Core UI.

- Create a data management policy in Core UI

  Create a data management policy for any table that accumulates data that you want to archive or delete periodically.

- Archiving records in Core UI

  Move records in a primary table to an archive table, including any records in other tables that reference those records.

- Deleting older or unwanted records in Core UI

  Prevent data from growing exponentially by implementing table cleanup rules.

- Updating records safely in Core UI

  Update several records simultaneously without using scripts by creating and executing a batch update job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Deleting records safely in Core UI

  Safely delete records from a table without using scripts and without deleting the table by creating and executing delete jobs.

Create a data management policy in Core UI

Define a set of rules for managing table data on your instance.

About this task

Data management policies streamline administration by allowing you to define multiple archive and table cleaner rules for a table within a single policy record. Additionally, you can easily activate or deactivate all rules simultaneously from the data management policy record.

After upgrading to Xanadu or higher, data management policies are automatically created for any table with an archive rule or table cleaner rule. If a data management policy doesn't exist for a table on your instance, you can create one manually.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Data Management** > **Data Management Policies**.
2. **Optional:** Determine if a data management policy exists for the table that you want to manage by searching the **Tablename** column.
   If the table already has a data management policy record, use that record instead of creating one.
3. Select **New**.
4. On the form, fill in the fields.

Data Management Policy form

Field	Description
Name	The name of the data management policy that typically includes the table name.
Tablename	The table that you want to manage to use a data management policy.
Description	An optional summary of the data management policy and its rules.
Active	Option to activate the data management policy. You must activate the data management policy for any of its rules to be activated. Clear this option to deactivate all the rules under the data management policy.

5. Select **Update**.

Result

A data management policy is established for the designated table. You can now create multiple data management rules for the table directly from the data management policy record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Define archive and cleanup rules for the table by creating rules in the data management policy.

- Create an archive rule in Core UI
- Create a table cleanup rule in Core UI

Archiving records in Core UI

Manage table size growth and improve query performance by archiving records.

You can archive records in core tables such as the Task [task] table and records in custom tables that you create on the ServiceNow AI Platform using archive rules.

Overview of archive rules in Core UI

Create and manage archive rules in Core UI.

- Create an archive rule in Core UI

  Define the criteria for archiving records by creating an archive rule.

- Archive related records in Core UI

  Archive, clear, or delete related records from an archive rule.

- Managing archived data in Core UI

  Change the schedule for an archive rule, stop the archive rule from running, or restore your archived data.

Create an archive rule in Core UI

Define the criteria for archiving records by creating an archive rule.

Before you begin

Because you can define multiple archive rules for a table, verify any existing archive rules to avoid potential conflicts. For example, if there's a rule for archiving records older than six months, creating another rule to archive records older than three months could cause a conflict. In such cases, either rule could potentially run, each archiving records under different conditions.

Role required: admin

Procedure

1. Access the new archive rule form in one of the following ways.

Option	Steps
Using the Data Management Console	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Overview tab, select **New archive rule**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Using a data management policy	**a.** Navigate to **All** > **System Data Management** > **Data Management Policies**. **b.** Select the data management policy for the table with records that you want to archive. **c.** In the Archive Rules related list, select **New**.
Using the Archive Rules module	**a.** Navigate to **All** > **System Archiving** > **Archive Rules**. **b.** Select **New**.

2. On the form, fill in the fields.

Archive Rule form

Field	Description
Name	Name that identifies the rule. Used as the display value for references to this archive rule.
Table	The table with records that you want to archive. ○ You can't change the table in an existing archive rule. To archive records in a different table, create a new archive rule. ○ You can't select a table in a different application scope. ○ You can't create an archive rule for a table where *update_synch* is set to true in the dictionary entry for the table. ○ You can't create archive rules for some internal system tables or peripheral tables. For example: ▪ Sys Audit [sys_audit] ▪ Audit Deleted Record [sys_audit_delete] ▪ Audit Relationship Change [sys_audit_relation] ▪ Attachment [sys_attachment] ▪ Journal Entry [sys_journal_field]
Retain references	Option to keep the sys_id for a reference field instead of storing the display name as a string in the archive table. **Important:** The **Retain references** check box becomes read only after you select it and save the archive rule. When you enable this option on a table with archived records, the system automatically reprocesses all existing archive records and enables references. This process can take time to complete for larger archive tables. You can track the status by viewing the Archive Rule Reference Migrations [sys_archive_ref_migration] table. For details on manually retaining references, see Migrating non-reference fields to reference fields.
Description	Description of the archive rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Conditions	Condition builder for specifying filter conditions that define the records to be archived. For example, you might archive inactive records older than a certain date. Make sure that the correct records are selected by testing the conditions in a list view before you activate the archive rule. For example, ○ To archive records closed more than two years ago from today, use the relative operator in a condition like **[Closed] [relative] [before] [2] [Years] [ago]**. ○ To archive records for the current year and the prior year, and not two years ago from today's date, use a condition like **[Closed] [before] [Last 2 years]**.
Auto Rearchive	Option that enables a restored record to be automatically rearchived after a set time period.
Auto Rearchive Duration	The time interval before the restored record is automatically archived.

3. **Optional:** Estimate the number of records to archive by selecting the **Recalculate Archive Estimate** related link.
   The estimate only includes primary records and excludes any related records added to the archive rule. The estimate helps you determine if the archive rule affects the number of records you expect it to. If the estimate is too high or low, change the archive rule conditions accordingly.
   The updated count appears in the **Record estimate** field.
4. Select **Submit**.

Activate an archive rule

Preview the records that you want to archive, and then activate an archive rule.

Before you begin

Role required: admin

About this task

You must activate the archive rule and its corresponding data management policy for the archive rule to run.

The sample archive rules are inactive by default.

Procedure

1. Access the archive rule that you want to activate in one of the following ways.

Option	Steps
Using a data management policy	**a.** Navigate to **All** > **System Data Management** > **Data Management Policies**. **b.** Select the data management policy for the table with records that you want to archive. **c.** In the Archive Rules related list, select the archive rule that you want to activate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Using the Archive Rules module	**a.** Navigate to **All** > **System Archiving** > **Archive Rules**. **b.** Select the archive rule that you want to acti vate.

2. **Optional:** Estimate the number of archive records by selecting the **Recalculate Archive Estimate** related link.
   The estimate only includes primary records and excludes any related records added to the archive rule. The estimate helps you determine if the archive rule affects the number of records that you expect. If the estimate is too high or low, change the archive rule conditions accordingly.
   The updated count appears in the **Record estimate** field.
3. Activate the archive rule by selecting the **Active** check box.
4. **Optional:** Archive records immediately by selecting the **Run Archive Now** related link.
   The **Run Archive Now** related link is only available if the corresponding data management policy is activated.

Result
Records that meet the archive rule criteria are archived during the next archive run.

What to do next
View the archived records by navigating to **All** > **System Archiving** > **Archive Tables** and selecting the module for the archived table, for example, **Archive Incidents**.

Create a destroy rule

Delete archived records and related records after a specified amount of time.

Before you begin
Role required: admin

About this task
You can associate a destroy rule with any archive rule in a data management policy.

If you need to amend the destroy rule properties running against your archived data, see System properties.

Procedure
1. On the archive rule form, select **Create Destroy Rule**.
2. In the Destroy Rule tab, fill out the fields.

Field	Description
Active	Option to activate the destroy rule.
Destroy Related Records	Option to automatically destroy related records associated with the archived records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Peripheral records, which include records in the Journal Entry [sys_journal_field], Attachment [sys_attachment], and Sys Audit [sys_audit] tables are deleted automatically, even if you decide to preserve related records.
Archive Duration	Specify the amount of time that records stay in the archive table before the system deletes them. **Important:** Archive records are destroyed immediately if the **Archive Duration** field is empty or set to 0.

3. **Optional:** Estimate the number of archived records marked for deletion by selecting the **Recalculate Destroy Estimate** related link.
4. Select **Submit**.

Result
Records that have been archived longer than the archive duration value are destroyed when the scheduled job runs. You can verify the progress by checking the archive destroy log.

Archive related records in Core UI

Archive, clear, or delete related records from an archive rule.

Before you begin
Role required: admin.

Procedure
1. Access the archive rule that you want to configure in one of the following ways.

Option	Steps
Using a data management policy	**a.** Navigate to **All** > **System Data Management** > **Data Management Policies**. **b.** Select the data management policy that contains the archive rule. **c.** In the Archive Rules related list, select the archive rule that you want to configure. **d.** In the **Archive Related Records** related list, select **New**.
Using the Archive Rules module	**a.** Navigate to **All** > **System Archiving** > **Archive Rules**. **b.** Select the archive rule that you want to con figure. **c.** In the **Archive Related Records** related list, select **New**.

2. Select which action to take on related records in the **Action** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
Archive	Archive records that reference the archived record.
Clear	Remove the reference to the archived record. The record no longer references the archived record and doesn't appear as a related record in future archives.
Delete	Delete records that reference the archived record.

3. Select the related records that you want to archive, clear, or delete by selecting a relationship in the **Reference** field.
   The **Reference** field lists all the relationships that exist to the archived table. There are two types of relationships in the list.

   Reference fields

   The list contains reference fields in other tables that refer to the archived table.

   For example, you create an archive rule on the Problem [problem] table. You can include related incident records by selecting the **Problem in Incident** field reference field on the Incident [incident] table.

   - The **Archive** action archives any incident record that references an archived problem.
   - The **Clear** action updates any incident record with a reference to the archived problem record by clearing the reference. If the reference is a many-to-many relationship, the related record rule deletes the reference instead of clearing the reference.
   - The **Delete** action deletes any incident record that references the archived problem record.

   Document ID fields

   The list contains document ID fields in other tables that point to the archived table. Document ID relationships display an asterisk (*) character at the end of the selection name.

   For example, you create an archive rule on the Problem [problem] table. You can include related attachment records by selecting the **Table sys ID Attachment(sys_attachment)*** reference.

   - The **Archive** action updates the attachment record to change the **Document ID** to refer to the archived table record.
   - The **Clear** action removes the **Document ID** reference to the archived record. The record no longer references the archived record and doesn't appear as a related record in future archives.
   - The **Delete** action deletes any attachment record that references the archived primary record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can't select references from some internal system tables or from peripheral tables. For example:

- Sys Audit [sys_audit]
- Audit Deleted Record [sys_audit_delete]
- Audit Relationship Change [sys_audit_relation]
- Attachment [sys_attachment]
- Journal Entry [sys_journal_field]

4. **Optional:** Apply an archive rule to the related records that you're archiving by selecting a rule in the **Reference table rule** field.
   For example, if you already have an archive rule for the Incident [incident] table, select the existing incident archive rule when archiving records related to incidents records.

   Note: You control the cascade depth by specifying an archive rule in the **Reference table rule** field. Related records without a specified archive rule aren't cascaded.

   - Prior to the Washington DC release, if an archive rule was defined in the system for a related record's table, the system would automatically cascade and process that archive rule and the related records associated with it.
   - Beginning in the Washington DC release, even if an archive rule exists for a related record's table, you must declare that rule in the **Reference table rule** field to achieve that cascading behavior. If you have multiple related records on multiple tables, you can decide which of those records you want to include in the cascade by specifying the reference table rule.

5. Select **Submit**.

Managing archived data in Core UI

Change the schedule for an archive rule, stop the archive rule from running, or restore your archived data.

Change an archive schedule in Core UI

Modify the system-scheduled job if you need to change the archive interval.

Before you begin
Role required: admin

About this task
All active archive rules are executed by a system-scheduled job set to run every 60 minutes.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. Open the **Archive** record.
3. Modify the **repeat** value.

Stop an active archive rule in Core UI

Stop archiving by deactivating, deleting, or canceling an archive rule.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Access the archive rule that you want to stop in one of the following ways.

Option	Steps
Using a data management policy	**a.** Navigate to **All** > **System Data Management** > **Data Management Policies**. **b.** Select the data management policy with the archive rule that you want to stop. **c.** In the Archive Rules related list, select the archive rule that you want to stop.
Using the Archive Rules module	**a.** Navigate to **All** > **System Archiving** > **Archive Rules**. **b.** Select the archive rule that you want to stop.

2. Stop the archive rule from running.
   - Deactivate the archive rule by clearing the **Active** check box. The *`Archive - Handle archive chunks`* business rule updates the state of the corresponding record in the Archive Job Execution Chunks [sys_archive_run_chunk] table from **waiting** to **not-needed**.
   - Contact Customer Service and Support to delete the archive rule.
   - Cancel the archive rule by calling *`GlideArchiver().cancel()`* from **System Maintenance** > **Scripts - Background**. This automatically changes the chunks in the Archive Job Execution Chunks [sys_archive_run_chunk] table from **running** to **cancelled**.

Result
No additional chunks are processed.

Restore archived records and related records in Core UI

Restore an archive record and optionally any related records back into the primary table.

Before you begin
Role required: admin

Procedure

1. Navigate to the archived record that you want to restore in one of the following ways.

Option	Steps
Using a data management policy	**a.** Navigate to **All** > **System Data Management** > **Data Management Policies**. **b.** Select the data management policy that contains the archive rule. **c.** In the Archive Rules related list, select the archive rule that archived the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
	d. In the Archive Run related list, select the archive run that was executed. **e.** In the Archive Log related list, select the archived record that you want to restore.
Using the Archive Log module	**a.** Navigate to **All** > **System Archiving** > **Archive Log**. **b.** Select the archived record to restore.

2. In the Archive Log form, select the applicable related link:
   - **Restore Record**
   - **Restore Record and Related Records**

Warning: Don't delete archive record log entries. Deleting an archive log entry prevents you from restoring the data for the archived records.

Result
The record is restored to the primary table. The archive record is deleted from the archive table.

What to do next
View the restore date and time in the **Restored** column in the Archive Log related list.

Deleting older or unwanted records in Core UI

Delete older, expired, or unwanted records from tables automatically.

Delete older, inactive records in core tables such as the Task [task] table and records in custom tables that you create on the ServiceNow AI Platform using table cleanup rules that you create in Core UI.

Overview of table cleaner rules in Core UI

Create and manage table cleaner rules in Core UI.

- Create a table cleanup rule in Core UI

  Define the criteria for deleting unwanted records in a table cleanup rule.

- Manage table cleaner resource usage

  Control the system resources used table cleaner by updating the table cleaner job.

Create a table cleanup rule in Core UI

Define the criteria for deleting unwanted records in a table cleanup rule.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Access the new Auto Flush form in one of the following ways.

Option	Steps
Using the Data Management Console	**a.** Navigate to **All** > **System Data Management** > **Data Management Console** > . **b.** On the Overview tab, select **New cleanup rule**.
Using a data management policy	**a.** Navigate to **All** > **System Data Management** > **Data Management Policies**. **b.** Select the data management policy for the table with records that you want to delete. **c.** In the Table Cleanup Rules related list, select **New**.

2. On the form, fill in the fields.

Auto Flush form

Field	Description`
Tablename	The name of the target table.
Matchfield	The Date/Time field in the target table that is used to monitor duration. Defaults to sys_created_on, which deletes records based on the amount of time since their creation date.
Age in seconds	The amount of time the system waits before deleting records. When the **Matchfield** value becomes older than the **Age in seconds**, the record is deleted.
Active	Option to activate or deactivate table cleaning for this table.
Application	The application scope to which this table cleaner job applies.
Clean journals	If selected, related records in the Journal Entry [sys_journal_field] table are also deleted. If cleared, the system deletes records from the target table, but not any related journal records in this table.
Clean audit	If selected, related records in these audit tables are also deleted: ○ Sys Audit [sys_audit] table ○ Audit Relationship Change [sys_audit_relation] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description`
	Note that the audit records that are created by table cleaner in the Audit Deleted Record [sys_audit_delete] table are preserved. If cleared, the system deletes records from the target table, but not any related audit records in these tables.
Cascade delete	If selected, this option deletes all matching records plus any records referring to them. If cleared, the system deletes matching records, but not records referring to them.
Conditions	Condition builder for specifying filter conditions that define the records to be removed. For example, you might specify that only records where 'active = false AND state =closed' are deleted.

3. Select **Submit**.

Result
The table cleanup rule runs automatically and deletes records when they meet the specified record age and any conditions that you set for them.

Manage table cleaner resource usage

Control the system resources used table cleaner by updating the table cleaner job.

Before you begin
Role required: admin

About this task
By default, the table cleaner job runs asynchronously with multiple producer threads creating chunks of records for deletion and multiple consumer threads processing the chunks and deleting records.

You can mitigate the impact to system performance by starting a table cleaner run using a smaller dataset, checking resource usage as it runs, and then adjusting the number of producer and consumer threads as necessary to complete the job with minimal impact to your users.

Procedure

1. Open the DMJobs [sys_dm_job] table by entering `sys_dm_job.list` in the filter navigator.
2. Select the DMTableCleaner job record.
3. **Optional:** Contact ServiceNow Support to change the number of producers or consumers devoted to creating or deleting chunks of records.
4. Select **Update**.

Result
Table cleaner begins the next run using the updated DMTableCleaner job configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Check the status of the next table cleaner run by checking the values in the Chunks Errored column in the DMJob Runs [sys_dm_run] table. If a problem occurs, determine whether the issue occurred in all chunks or a single chunk. View the status of the individual chunks in the DMJob Chunks [sys_dm_chunk] table by checking the values in the Message and State columns.

Updating records safely in Core UI

Update several records simultaneously without using scripts by creating and executing a batch update job.

Overview of updating records safely

1. Mark records for updating

   Determine which records to update by creating an update job. Preview the number of affected records before you schedule or execute the job. For example, you might want to update the Assigned to value for multiple incidents on a test instance without running a script.

2. Schedule or execute a job to update records

   Schedule the job to run later or execute the job immediately.

3. Rollback an update job

   Use the rollback option in the update job if you need to restore the updated records to their previous state.

Mark records for updating

Mark records for updating according to one or more criteria by creating an update job.

Before you begin

Role required: admin

Procedure

1. Either choose to mark specific records for updating or mark all records in a list for updating.
   - To mark only specific records for updating, navigate to **All** > **System Data Management** > **Update Jobs**.
   - To mark all records in a list for updating, in any list of records, right-click a column heading, and then select **Data Management** > **Update All with preview**.
2. Select the table that contains the records you want to update.
3. **Optional:** Limit the number of records in the update job by adding a condition or conditions that records must meet.

   a. Select a field, operator, and field value.

   Example
   For example, **[Category] [is] [Software]**.

   b. **Optional:** Use the OR and AND operators to add conditions.

   c. **Optional:** Select **New Criteria** to add another set of conditions.

   Note: Limiting the number of records that are added to the update job can help prevent the table from being locked when the job is executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** View the number of records that match the conditions.
   a. Select **Preview**.
   b. Select the link with the number of matching records.
5. In the Fields & values lists, select the field that you want to update and a new value.
6. **Optional:** Select additional fields and values to update more fields.
7. Select **Continue**.

Result
The job is saved and the form provides options to schedule the job or execute it now.

What to do next
Schedule or execute a job to update records

Schedule or execute a job to update records

Schedule a date and time to execute an update job or execute the job immediately.

Before you begin
Role required: admin

About this task
Consider scheduling the update job to run during non-business hours to minimize the potential performance impact on your users. Updating a large number of records can degrade performance depending on the size of the table. On instances running MariaDB, UPDATE operations affecting a majority of rows may trigger gap locks, escalating to a full table lock until the update completes. INSERT operations are not affected by this locking behavior.

Procedure
1. Navigate to **All** > **System Data Management** > **Update jobs**.
2. Select an update job record.
3. Determine whether to schedule the update job for a later time or run it right away.

Option	Description
Schedule the update job	**a.** Select the calendar icon in the **Run at** field. **b.** Enter the date and time you want the up date job to run. **c.** Select **Update**. Note that you must select **Update** to successfully schedule the job.
Run the update job now	**a.** Select **Execute Now** to run the update job immediately. **b.** When prompted, select **Proceed** to update the records now. **c.** On the Progress page, select **Cancel** to stop the job from continuing to run. **d.** Select **Check execution results** to return to the update job form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The records are scheduled for update or updated immediately. If you want to revert the updates to the records, see Rollback an update job.

Rollback an update job

Rollback a completed update job to revert the updates to the records.

Before you begin
Role required: admin

About this task
If you want to revert the updates to records made through an update job, execute a rollback operation.

Procedure
1. Navigate to **All** > **System Data Management** > **Update jobs**.
2. Select an update job that has been executed.
3. Select the **Rollback** related link to revert the updated records.
4. When prompted, confirm that you want to rollback the delete job.

Result
The rollback job is executed immediately and the updated records are reverted to their prior versions. If you want to update the records again, create an update job using the same conditions, and then schedule the update job or execute it immediately.

Deleting records safely in Core UI

Safely delete records from a table without using scripts and without deleting the table by creating and executing delete jobs.

Overview of deleting records safely

1. Mark records for deletion

   Determine which records to delete by creating a delete job.

2. Preview affected records for deletion

   Preview the affected records before you schedule or execute the job. For example, you might want to preview a set of incident records that will be deleted before you delete them.

3. Schedule or execute a job to delete records

   Schedule the job to run later or execute the job immediately.

4. Rollback a delete job

   Use the rollback option in the delete job If you need to restore deleted records after the job has run.

If you must delete a large number of records from a table rather than a selection of records, use the table cleaner option. For details, see Deleting older or unwanted records in Core UI.

Mark records for deletion

Mark records for deletion according to one or more criteria by creating a delete job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Either choose to mark specific records for deletion or mark all records in a list for deletion.
   - To mark only specific records for deletion, navigate to **All** > **System Data Management** > **Delete Jobs**.
   - To mark all records in a list for deletion, in any list of records, right-click a column heading, and then select **Data Management** > **Delete All with preview**.
2. Select the table that contains the records you want to delete.
3. **Optional:** Limit the number of records in the delete job by adding one or more conditions that records must meet.

   a. Select a field, operator, and field value.

   Example
   For example, **[Category] [is] [Software]**.

   b. **Optional:** Use the OR and AND operators to add conditions.

   c. **Optional:** Select **New Criteria** to add another set of conditions.

   Note: Limiting the number of records that are added to the delete job can help prevent the table from being locked when the job is executed.

4. **Optional:** View the records that match the conditions.
   a. Select **Preview**.
   b. Select the link with the number of matching records.
   The list of records appears in a new browser tab.
5. Return to the Delete Job tab.
6. Select **Continue** to save the current job information.

Result
The job is saved and the form displays options to schedule the job or execute it now.

What to do next
Preview affected records for deletion.

Preview affected records for deletion

Before you run a delete job, preview the count of affected records to see the impact of executing the delete job.

Before you begin
Role required: admin

About this task
Deleting records in a table also deletes records from tables that extend or reference the source table. Preview the affected records before you execute a delete job and learn about other tables that are impacted.

Up to three levels of cascaded records are deleted when the job is executed. For example, if the preview identifies incidents that match the conditions, it will also delete any problems

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

that reference those incidents, defects that reference those problems, and test records that reference the defects. If sys_attachment and sys_attachment_docs table records are associated with the incidents, those records might not appear in the preview but they are deleted as well.

Procedure

1. Navigate to **All** > **System Data Management** > **Delete jobs**.
2. Select a delete job record.
3. Select the **Preview Cascade** related link to view the count of records from the source table that match the conditions in the delete job.
   The record count appears in the **Preview record count** column. Counts for records in other tables that reference those source records are listed as well, although those counts are only close estimates.
4. Review the count of affected records by table to ensure that the records are safe to delete.

What to do next

Schedule or execute a job to delete records

Schedule or execute a job to delete records

Schedule a date and time to execute a delete job or execute the job immediately.

Before you begin

Role required: admin

About this task

Consider scheduling the delete job to run during non-business hours to minimize the potential performance impact on your users. Deleting all records in a table temporarily locks the table, which prevents inserts and updates. If you want to delete all records from a table, use the table cleaner option instead. For more information, see Deleting older or unwanted records in Core UI.

Procedure

1. Navigate to **All** > **System Data Management** > **Delete jobs**.
2. Select a delete job record.
3. Determine whether to schedule the delete job for a later time or run it right away.

Result

The records are scheduled for deletion or deleted immediately. If you want to restore the deleted records, see Rollback a delete job.

Rollback a delete job

Rollback a completed delete job to restore the deleted records.

Before you begin

Role required: admin

About this task

If you want to restore records deleted through a delete job, execute a rollback operation.

Procedure

1. Navigate to **All** > **System Data Management** > **Delete jobs**.
2. Select a delete job that has been executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Rollback** related link to restore the deleted records.
4. When prompted, confirm that you want to rollback the delete job.

Result

The rollback job is executed immediately and the deleted records are restored. If you want to delete the restored records, create a delete job using the same conditions, and then schedule the delete job or execute it immediately.

Migrating non-reference fields to reference fields

Manually preserve sys_ids in reference fields instead of storing the display name as a string.

Determining tables to migrate

To begin the data migration process, run the following background script. This script creates migration records for both direct table extensions and related archived records in the Archive Rule Reference Migration [sys_archive_ref_migration] table, ensuring that only valid tables are processed.

```
var tables =
 GlideDBObjectManager.get().getAllExtensions(current.table);
    for (i = 0; i < tables.size(); i++) {
        var gr = new GlideRecord('sys_archive_ref_migration');
        gr.addQuery('table', 'ar_' + tables.get(i));
        gr.query();
        if (!gr.next()) {
            if (GlideTableDescriptor.isValid('ar_' +
 tables.get(i))) {
                var gr2 = new GlideRecord("sys_archive_ref_migration");
                gr2.initialize();
                gr2.setValue('rule', current.sys_id);
                gr2.setValue('table', 'ar_' + tables.get(i));
                gr2.setValue('reference_migration_progress', 'waiting');
                gr2.insert();
            }
        }
    }
    //Also get insert related records tables as well
    var map = new GlideRecord('sys_archive');
    map.addQuery('table', current.table);
    map.query();
    if (map.next()) {
        var id = map.getValue('sys_id');
        if (!(id === undefined)) {
            var related = new GlideRecord('sys_archive_related');
            related.addQuery('archive_map', id);
            related.addQuery('action', 'archive');
            related.query();
            while (related.next()) {
                if (!GlideTableDescriptor.isValid('ar_' +
 related.getValue('table'))) {
                    gs.log('Related Record table: ' +
 related.getValue('table') + ' not created yet');
                    continue;
                }

                var gr3 = new GlideRecord("sys_archive_ref_migration");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                gr3.initialize();
                gr3.setValue('rule', current.sys_id);
                gr3.setValue('table', 'ar_' +
 related.getValue('table'));
                gr3.setValue('reference_migration_progress', 'waiting');
                gr3.insert();
            }
        }
    }
```

Copying archive references

For each table that goes through the migration process, the Archive Reference Copy (RefCopyJob) job identifies the sys_id of the reference fields and updates the display value to be the correct sys_id. The job configures 10k records at a time unless there are more than 10k records with the same timestamp. The migration progress relies on the archived timestamp.

Changing field types from string to reference

After the tables associated with an archive rule completely migrate, the ArchiveRefJob job executes. This job changes the sys_dictionary types of the archive table from string to reference.

Fixing node failures for RefCopyJob and ArchiveRefJob

If node failure occurs while these jobs are running, it leaves the status of the data migration in an improper state. If the *RefCopyJob* fails, it can leave a table in a migrating status. You can verify this condition by checking if rows in the sys_archive_ref_migration are stuck in **migrating** status for an extraordinary amount of time. Update the specific row status from **migrating** to **waiting** and the *RefCopyJob* continues the data migration on the table when the job runs again.

The node can also fail when the *ArchiveRefJob* terminates prematurely. Check if tables have fields that are reference fields and some that are still string type fields. The job might have stopped in the middle of changing the field types. You can resolve this condition by setting up a trigger job to execute in a background script, which starts the process over again:

```
GlideRecord trigger = new GlideRecord('sys_trigger');
trigger.initialize();
trigger.setValue('state', 0);
trigger.setValue('trigger_type', 0);
trigger.setValue('next_action', new GlideDateTime());
trigger.setValue('job_context', 'fcRuleId=' + ruleId);
trigger.setValue('name', 'Job Reference Migration' + ' Node - ' + new
 GlideClusterSynchronizer().getSystemID());
trigger.setValue('trigger_class', 'com.glide.db.auxiliary.job.ArchiveRefJob');
trigger.insert();
```

Applying database rotation techniques

Manage table size growth, archive data, and boost query performance by configuring database rotation.

Instance data grows quickly, and as these tables grow in size they require management. Database rotation preserves instance performance and averts risk associated with querying growing data sets utilizing three techniques. These techniques are based on the concept of managing large quantities of data by separating whole sets into individual tables. After this task is performed, each technique handles data in a different manner:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Table Rotation works by rotating among a small set of tables, and deleting and reusing the old tables for new data.
- Table Extension works by periodically starting a new table and allowing old tables to be easily archived and removed from the system.
- Table Sharding works by enabling records to be grouped in a single table by document ID.

Database Rotation

Functionality	Tables applied to

Table Rotation	`syslog`
	`sys_querystat`
	`ecc_queue`
	`ecc_event`
	`cmdb_metric`
	`sysevent`

Table Extension	`sys_email`

Activate database rotation

Learn how to activate database rotation.

Before you begin

Role required: admin

About this task

There are two database rotation plugins.

- The Database Rotations (com.snc.db.rotation) plugin activates Table Rotation and Table Extension without any tables automatically included.
- The Database Rotations Default Tables (com.snc.db.rotation_default_tables) plugin applies Table Rotation and Extension to specific tables.

> **Note:** Deployment of this plugin should be executed in partnership with a ServiceNow representative.

For new instances, database rotation is active by default. If you are upgrading from a previous version, users with the admin role can activate the Database Rotations (com.snc.db.rotation) plugin if it isn't already active.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

Do not activate the Database Rotations Default Tables (com.snc.db.rotation_default_tables) plugin. Instead, specify the tables manually, after consulting a ServiceNow representative.

Table rotation

Optimize performance and manage data lifecycle by rotating tables, allowing older data to be systematically archived while maintaining system efficiency.

Table rotation preserves instance performance and averts risk associated with querying growing data sets. This feature uses the sys_created_on field to separate data sets into multiple tables based on date.

Functionality

The administrator specifies the time parameter (duration) of the process and the number of tables (rotations) within. After the rotation writes the last table in a rotation, the rotation overwrites the first table in the rotation.

Examples:

- The query `Records created between 2015/12/10 08:49 and 2015/12/09 07/34 where topic=SystemCommand` is translated to a SQL query on a single table, because the clause on **sys_created_on** targets a single shard.
- The query `Records updated between 2015/12/10 08:49 and 2015/12/09 07/34 where topic=SystemCommand`, or without a date range, needs to target all shards and therefore is translated as a union query on all shards.

Advantages

- Allows deletion of old data without affecting current data (for example, to drop or truncate a table).
- Ensures tables only grow to a reasonable size.
- Reduces working set of data when date is known for query.

Disadvantages

- Queries that do not use the table rotation date (for example, by using the **sys_created_on** field), force an inefficient union query to query time ranges that span multiple tables and can be extremely slow if the number of sub-tables is large.

  To improve performance, it is recommended that the query includes a window of created dates.

- Users can't dot-walk to a rotated table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use table rotation for sequentially-written tables or for insert-only tables. You cannot use table rotation for sys_import tables or tables that extend the Task [task] table.

Apply table rotation

Preserve instance performance by applying table rotation.

Before you begin

Determine the type of table you have and whether you can apply table rotation yourself.

- You can apply table rotation to custom tables that begin with a u_ prefix at your own discretion.
- Do not apply table rotation to scoped tables that begin with an x_ prefix without consulting ServiceNow or the third-party plugin developer first.
- Do not apply table rotation to out-of-the-box tables that begin with a sys_ prefix. Contact Customer Service and Support for help with these tables.

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Table Rotations**.
2. Select **New**.
3. On the form, fill in the fields.

Table Rotation Group form

Field	Description
Name	The name of the table.
Type	The type of rotation. Select *`Rotation`*.
Rotations	The number of tables to maintain through the duration.
Duration	The days and hours during which data is written to each shard.
Clean base rotation	The date to clean (truncate) the base table.

4. Select **Submit**.

Result

A schedule is created and new data is written to one of the tables in the rotation group. The group includes the original table plus several additional tables.

Note: Deleting a rotation deletes the additional tables and all the data. Do not delete the rotation if you still need the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: New table rotation group

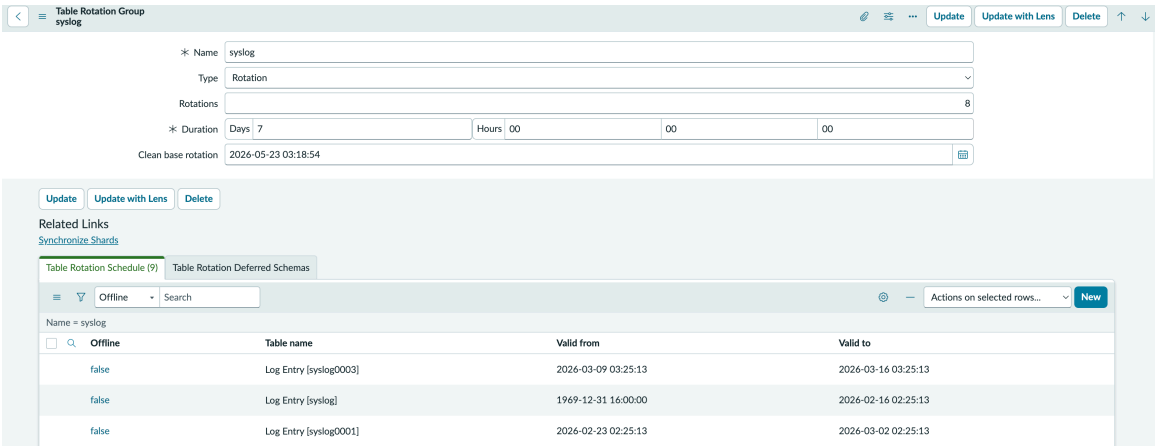


Table extension

Partition and preserve data sets for extended periods without overwriting.

Table extension is based around a base table and a number of shards. The shards are given a duration which determines the period of time across which data is written to each shard. Shards in a table extension don't rotate. Instead of the oldest shard being truncated and re-used, an extension creates new shards indefinitely. This way, data remains logically separated across shards due to creation date and no data is ever deleted.

An advantage of table extension is to partition data across tables. It also allows you to archive data while ensuring that tables stay reasonably-sized. The working set of data is reduced when a date is known for the query.

The disadvantage is that table extension requires a union query when you query for a time range that spans multiple tables. Union queries are less efficient than queries against a single table.

Consider using table extension when you have sequentially-written tables or insert-only type tables (there are exceptions to this parameter). Table extension is also useful in tables where data is needed for long periods of time.

Apply table extension

Preserve data sets using table extension.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Table Rotations**.
2. Select **New**.
3. On the form, fill in the fields.

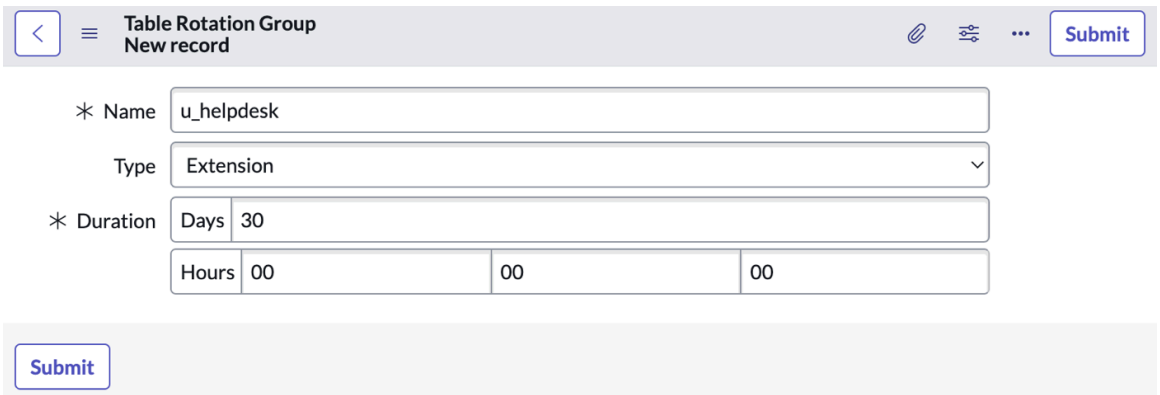

Table Rotation Group form

Field	Description
Name	The name of the table.
Type	The type of rotation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select *Extension*.
Duration	The days and hours during which data is written to each shard.

4. Select **Submit**.

Result
A schedule is created and new shards are added indefinitely to preserve data.

Note: Deleting a rotation deletes the additional tables and all the data. Do not delete the rotation if you still need the data.

Data Management reference

Reference topics provide information about system properties and data limits.

System properties

These system properties control the behavior of the Data Management capabilities.

Archive rule and destroy rule properties

Rules to prevent the archive process from consuming too many system resources have been automated. You can manually change the system behavior.

The archive process uses a producer and consumer model. Records are queued for archiving in the Archive Job Execution Chunks [sys_archive_run_chunk] table in batches.

- The ArchiveProducerJob creates chunks of sys_ids records that need to be archived. Each chunk contains records pertaining to a single archive rule. The maximum number of records in a chunk is specified by the property *glide.db.archive.chunk_size*. The maximum number of records for a single rule across all chunks is specified by *glide.db.archive.max.rule.records*.
- The producer starts up 4 (default) ArchiverJob consumers. The exact number of consumers is specified by *glide.db.archiving.max_consumer_workers*.
- Consumers read and process chunks of sys_ids. The number of chunks each consumer processes is specified by *glide.db.archive.max.batches*. The chunks processed by each consumer may be from different archive rules.
- Consumers repeat reading chunks of sys_ids until none remain or the limit of chunks a consumer can process (specified by *glide.db.archive.max.batches*) is reached, after which it shuts down and schedules another consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If a chunk remains in the running state longer than what's specified in *glide.db.archive.chunk.max.process.time*, the system assumes that the consumer abruptly terminated, and it changes the chunk's status to error. This doesn't stop or end any running consumers.

Note: The archive and destroy properties listed in the table are not used if the Archive Job Execution Chunks [sys_archive_run_chunk] table is deleted.

To manually control how many records the archive rule and destroy processes at one interval, you can change these default settings by adding the following system properties.

Archive System Properties

Name	Description	Type	Default Value
glide.db.archive.chunk_size	Number of unique identifiers added to each record in the Archive Job Execution Chunks [sys_archive_run_chunk] table. The record is formatted as CSV values in the keys field of the Archive Job Execution Chunk (sys_archive_run_chunk.do) form.	Integer	1000
glide.db.archive.chunk.max.process.time	Number of milliseconds a record can remain in the Active state in the Archive Job Execution Chunks [sys_archive_run_chunk] table. The time is the difference between the system time and the value of the **Start** field in the Archive Job Execution Chunks [sys_archive_run_chunk] table.	Integer	600000
glide.db.archive.max.rule.records	Maximum number of records to batch per consumer, per rule.	Integer	10000
glide.db.archive.debug	Option that enables verbose logging when copying the column definitions	true | false	false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Archive System Properties (continued)

Name	Description	Type	Default Value
	from the original table to the archive table.		
glide.db.archive.max.batches	Number of chunks, which are records from the Archive Job Execution Chunks [sys_archive_run_chunk] table, processed by a consumer before it shuts down and schedules another consumer.	Integer	10
glide.db.archiving.max_consumer_workers	The maximum number of concurrent consumers cluster-wide.	Integer	4

Table cleaner properties

To set table cleaner system properties, navigate to the System Properties [sys_properties] table and add the property.

System properties

Property	Description
Configure the number of days table cleaner must wait before attempting to reprocess a slow rule. `glide.db.tablecleaner.days_before_slow_rule_reattempt`	When a table cleaner rule has a query that takes longer than 30 seconds to complete, the entire table cleaner job is stopped. By default, table cleaner waits two days before including that rule in the table cleaner job again. You can change the default waiting period by adding this property. • Type: integer • Default value: 2
Configure a time limit for a table cleaner rule. `glide.db.tablecleaner.chunk_delete_max_time_spent`	Limits how long the cleaner spends trying to batch-delete records per rule during a single run. The value is given in seconds and defaults to 1200 (20 minutes), which means the table cleaner runs hourly for a maximum of 20 minutes. You can change the default time limit by adding this property.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System properties (continued)

Property	Description
	• Type: integer • Default value: 1200

Archive table size limits

There are constraints to the size of the table you use to archive your instance data.

Limits on data archive tables

There is a limit on the size of an archive table you can create to store data. The limit is based on the size of the data, not the record count. If you receive an error that an archive table could not be created, it might be related to this size limitation.

Archive table size limits

Table Attribute	Size
Static row size limit	65535 bytes
Row size limit	8126 bytes
Columns	1000 for Oracle 1011 for others

Review the custom columns on the table being archived. Also review the custom fields on the tables the table extends from. Determine if those columns are no longer needed and are not being used by current customizations. If you identify unused columns, you can remove them. Doing this might reduce the row size of the table being archived. If that is unsuccessful, contact ServiceNow® Customer Service and Support to see what other alternatives are available.

Unique record identifier (sys_id)

A unique 32-character GUID (Globally Unique ID), called a Sys ID (sys_id) identifies each record in an instance.

When created within the application, sys_id values are unique. The ServiceNow AI Platform and database should manage all operations on sys_id values. The same sys_id value is never generated twice, which ensures that every record created in every table in every instance in the world has a unique identifier. If two records have the same sys_id value, it occurs as a result of the following situations:

- If a record with the sys_id was copied to the other at the database level outside of the ServiceNow AI Platform.
- If a record with the sys_id was copied using an Update Set or via XML, its sys_id is the same.

Note: A new record has a sys_id of -1, and once inserted, it is assigned a new sys_id. The sys_id is not meant to show as a field on a form or as a column in a list. To learn more, see the Users are unable to add the sys_id field to a form or list view [KB0690876] article in the Now Support Knowledge Base.

You can access the sys_id from a record URL or by using a script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To access the sys_id from the URL, navigate to any record, right-click the header bar, and select **Copy URL**. The sys_id is inside of the URL, after the parameter sys_id=.
- To access the sys_id using a script, use one of the following options.
  - Find the sys_id of a record in a business rule (or any other server-side JavaScript) by dot-walking from the GlideRecord.

    ```
    var id = current.sys_id;
    ```

  - Find the sys_id of a record in client-side JavaScript using g_form.getUniqueValue().

    ```
    function onLoad() {
        var incSysid = g_form.getUniqueValue();
        alert(incSysid);
    }
    ```

Domain separation and Data Management

Domain separation is supported in Data Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- There is business logic to ensure data goes into the proper domain for the application's service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer's message, the client must be able to see my response.

Overview

Data archiving supports Domain separation for service providers. For example, incidents that belong to a domain keep their domain designation even after they are archived.

Domain separation for service providers

Data Management roles

Data Management includes the following roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Data Management tools admin [data_mgt_tools_admin]

The data_mgmt_tools_admin role is a granular admin role designed to provide more targeted permissions for data management tasks, reducing the need to grant full admin access.

Contains Roles

List of roles contained within the role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Granting data_mgmt_tools_admin alone is not sufficient for most data management operations. To enable full functionality for the data_mgmt_tools_admin role, you must also assign the following roles:

- delegated_developer: Required for access to tables, columns, and application scopes
- events_admin: Required to write trigger data for scheduling jobs
- context_rollback_executor: Required to roll back records that have been updated or deleted

These roles are not embedded within data_mgmt_tools_admin by default. You must assign these additional roles to the user explicitly.

After assigning these roles, also add roles that provide CRUD (Create, Read, Update, Delete) access to data tables (for example, itil and itil_admin). For example, adding the itil_admin enables an ITIL administrator to archive or update records in the associated ITIL tables (incident, problem, change, and so on) depending on configuration. If these roles aren't assigned, some or all data management functionality will be limited or unavailable.

Exporting data

Export data from the ServiceNow AI Platform in a variety of formats.

Key benefits

- Export an individual record to a PDF or XML file directly from a form. See Export data from a record.
- Export multiple records to a CSV, Excel, PDF, XML, or Google Sheets file directly from a list. See Export data from a list.
- Export multiple records from a table using the CSV, Excel, PDF, or XML processor in a URL with optional parameters. See Export directly from a URL.

You can also export data from your instance using the following options:

- Export multiple records from a table via a web services request. For example, you can create an external application or process to automate the retrieval of data from an instance via web services such as REST or SOAP. For more information, see Web services.
- Push all the data that you want to export to an external file by creating an export set. For more information, see Export sets.

Associated roles

You can export form data to PDF or XML, depending on your role.

- The PDF options are available to all users.
- The XML option is only available to users with the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can export records in a list to Excel, CSV, XML, JSON, PDF, or an Export Set depending on your role.

- The Excel, CSV, JSON, PDF, and Google Sheets options are available to all users.
- The XML option is only available to users with the admin role.
- The Export Set option is only available to users with the export_set_admin or admin role.

Export formats

Available export formats

Export format	Description
CSV	Export table records as a comma-separated value text file. Use this option to export the currently displayed fields in the list or form as a text file. Configure the list or form to add or remove fields from the export. When exported to CSV, dot-walked fields appear using their full field name, such as u_assignment_group.parent. **Note:** By default, ServiceNow exports all CSV files in Windows-1252 encoding. If you need to export translated data, set the *glide.export.csv.charset* system property to UTF-8.
Excel	Export table records as a Microsoft Excel spreadsheet. Use this option to export the currently displayed fields in the list or form as an Excel spreadsheet. Configure the list or form to add or remove fields from the export.
XML	Export table records as an XML document. Use this option to export all data from a table or all data for a particular record. The XML file has an XML element for each column in the table. See Exporting and importing data via XML. **Note:** Image field data is not preserved when exporting to XML.
PDF	Export table records as a Portable Document Format file. Use this option to export the currently displayed fields in the list or form as a PDF file. Configure the list or form to add or remove fields from the export. **Note:** The PDF export processor prints data from left-to-right, which can produce rendering errors when displaying right-to-left language data.
JSON	Export the table records as a JSON string. The JSON file has an element for each column in the table.
Google Sheets	Export table records directly to cloud-based spreadsheets in Google Drive without going through extra steps. The exported file retains the structure of the original table, including rows and columns. You can view, edit and share these Google Sheets online in real time.

Column headers

The file type you export to, such as CSV or PDF, determines how column headers are exported. In general, formats meant for human consumption such as PDF display the column label, whereas formats meant for machine use, such as CSV, use the database field_name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header format by file type

File type	Column header format
Excel	Label
PDF	Label
CSV	field_name
XML	field_name
JSON	field_name

Export data from a record

Export a record to PDF or XML.

Before you begin
Role required: none for exporting to PDF. Exporting to XML requires the admin role.

About this task
When exporting to PDF, any field hidden by UI scripts (UI policies, UI actions, client scripts) and any fields visible from the current view are exported. When exporting to XML, all fields are exported, regardless of the view.

A PDF is generated only if the form has been submitted. An unsubmitted form generates an empty page.

Procedure
1. Navigate to the record that you want to export.
2. Select the Additional actions menu ( ).
3. Select an export option.

   Note: For export to PDF, when the accessibility property is enabled, users will get a pop up when they export to PDF where they can specify whether to create an accessible PDF or not. For more information, see PDF generation and accessibility.

   - To export the form data to PDF in portrait mode, select **Export** > **PDF** > **Portrait**, select **Export**.
   - To export the form data to PDF in landscape mode, select **Export** > **PDF** > **Landscape**, select **Export**.
   - To export all fields in the record to XML, select **Export** > **XML (This Record)**.

   When exporting to XML, the system prompts you to save the file, or the browser automatically saves the file to the downloads folder specified in the browser preferences.

Export data from a list

Export a list of records to a variety of file formats.

Before you begin
Role required: none. Exporting to XML requires the admin role.

About this task
Note the following important details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data exported from a list may be different from what a user sees in the list view. This generally happens when a table has ACLs that are dependent on the user's current session. To avoid blocking user activity on the browser, list export is executed from a background thread and doesn't have access to user session data.
- To export records in an embedded list, export the record containing the list. See Export data from a record.
- To control how line breaks appear in exported CSV data, use the glide.csv.export.line_break system property. See glide.csv.export.line_break.
- To remove unwanted HTML tags from list data, see the blog Rendering HTML in Exported Lists by a ServiceNow employee in the ServiceNow Community.
- The platform provides a default upper limit for data exports. See Export limits.

Procedure

1. Navigate to the list of records that you want to export.
2. Select and hold (or right-click) any column header in the list.
3. Select an export option.

   Note: For export to PDF, when the accessibility property is enabled, users will get a pop up when they export to PDF where they can specify whether to create an accessible PDF or not. For more information, see PDF generation and accessibility.

   - To export the list to Excel, select **Export** > **Excel (.xlsx)**.
   - To export the list to CSV, select **Export** > **CSV**.
   - To export the list to XML, select **Export** > **XML**
   - To export the list to JSON, select **Export** > **JSON**.
   - To export the list to PDF in portrait mode, select **Export** > **PDF** > **Portrait** > **Export**
   - To export the list to PDF in landscape mode, select **Export** > **PDF** > **Landscape** > **Export**
   - To export the list and the associated form for each record in portrait mode, select **Export** > **PDF** > **Detailed PortraitExport**.
   - To export the list and the associated form for each record in landscape mode, select **Export** > **PDF** > **Details Landscape** > **Export**.
   - To export the list to a file using an export set, select **Export** > **Export Set**.
   - To export the list to a Google spreadsheet, select **Export** > **Google Sheets**.

   For details on using export sets, see Export sets.
4. When the export completes, select **Download**.

Export directly from a URL

Dynamically export data from a script or web service by building a URL query.

Before you begin

Role required: None

Note: ServiceNow enforces basic authentication for direct URL access. The data extracted from the URL contains only the fields to which the currently authenticated user has read access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can use URL queries to generate filtered lists of records programmatically before exporting them. URL queries are useful for scripts that generate a list of records or when no user can manually add the filter from the UI.

You must be familiar with the ServiceNow table and column names to export data directly from the URL. See Navigate to a record or a module using a URL.

You can control whether to export the display value or raw value of fields and the field label or field name for headers using query parameters or system properties.

- For details on using query parameters, see Query parameters for display value and header.
- For details on using system properties, see System properties for display value and header.

Query parameters, if present, override system properties.

Procedure

1. Specify the instance URL.
   For example:

```
https://<instance name>.service-now.com/
```

2. Specify the table form or list to export.
   For example:

```
incident_list.do
```

3. Specify the export format processor to use for the export.
   You can specify CSV, XLS, JSON, XLSX, or XML. For example:

```
?CSV
```

   Note: The XML processor in a URL export doesn't export attachments or journal fields. To export attachments and journal fields like the **Work Notes** or **Additional Comments** fields, export the records from a list by using the **Export** > **XML** option in the context menu.

4. **Optional:** Query for specific records by adding the *sysparm_query* parameter.
   The required syntax is `sysparm_query=[column name][operator][value]`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?XML&sysparm_query=prior
ity=1
```

   Note: All queries use a column name, an operator, and a value. See Condition Builder for a list of available operators.

5. **Optional:** Sort the records by column name using the *sysparm_orderby* parameter.
   The required syntax is `sysparm_orderby=[column name]`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?XML&sysparm_query=prior
ity=1&sysparm_orderby=assigned_to
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can sort by only one column using *sysparm_orderby*. To sort by multiple columns, use multiple orderby entries. For example:

```
sysparm_query=ORDERBYassigned_to^ORDERBYpriority
```

6. **Optional:** Export fields from a specific view using the *sysparm_view* parameter. The required syntax is `sysparm_view=[view name]`. For example:

```
https://<instance
 name>.service-now.com/incident.do?CSV&sysparm_view=ess
```

This URL exports incident fields visible from the Self Service (ess) view.

- By default, exporting data from a list exports only the fields that are visible from the current view. If you want to export fields from another list view, you can switch views from the UI. See View management.
- If you're exporting CSV or Excel data and don't specify a view, the export uses the default list view.
- If you're exporting XML data, all fields are exported by default unless you specify a particular view.

7. **Optional:** Export specific fields from the table using the *sysparm_fields* parameter. The required syntax is `sysparm_fields=[field1],[field2]`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?CSV&sysparm_fields=sys_
id,number
```

8. **Optional:** Export all fields from the table, including the sys_id, using the *sysparm_default_export_fields* parameter. The required syntax is `sysparm_default_export_fields=all`. For example:

```
https://<instance
 name>.service-now.com/incident_list.do?CSV&sysparm_default_exp
ort_fields=all
```

The *sysparm_default_export_fields* parameter has no effect on XML exports unless you include the *sysparm_view* parameter to specify a non-default view.

Example: Sample URLs

URL	Description
https://<instance name>.service-now.com/incident_list.do?CSV	Export all incidents to a comma-separated value text file.
https://<instance name>.service-now.com/incident_list.do?CSV&sysparm_query=sys_id%3E%3Db4aedb520a0a0b1001af10e278657d27	Export a particular incident to a comma-separated value text file.
https://<instance name>.service-now.com/incident_list.do?CSV&sysparm_orderby=sys_id	Export all incidents to a comma-separated value text file and sort the list by sys_id.
https://<instance name>.service-now.com/incident_list.do?XML&sysparm_query=priority=1&sysparm_orderby=assigned_to	Export a list of all priority 1 incidents to an XML file and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL	Description
	sort the list by **Assigned to** field.

Call URL export programmatically

Dynamically export data from a script or web service by calling a URL export from any programming language.

Before you begin

Role required: none

About this task

The following procedure includes code samples that demonstrate calling a URL export in C# for a .Net framework call:

Procedure

1. Add the following Imports:

```
using System.Net;
using System.IO;
```

2. Call the Download method:

```
static void Main(string[] args)

     {
        // Call to DownloadFile method supplying the URL and
 location to save CSV file locally
        int read =
 DownloadFile("https://
<instance>.service-now.com/incident_list.do?CSV&sysparm_query=p
riority=1&sysparm_orderby=assigned_to",
                     "c:\\test\\incident.csv");
    }
```

3. Create a Download method as follows:

```
public static int DownloadFile(String url,
                                       String localFilename)
    {
        // Function will return the number of bytes processed
        // to the caller. Initialize to 0 here.
        int bytesProcessed = 0;
        // Assign values to these objects here so that they can
        // be referenced in the finally block
        Stream remoteStream = null;
        Stream localStream = null;
        WebResponse response = null;
        // Use a try/catch/finally block as both the WebRequest
 and Stream
        // classes throw exceptions upon error
        try
        {
            // Create a request for the specified remote file
 name
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            WebRequest request = WebRequest.Create(url);
            // Create the credentials required for Basic
Authentication
            System.Net.ICredentials cred = new
System.Net.NetworkCredential("user_name", "password");
            // Add the credentials to the request
            request.Credentials = cred;
            if (request != null)
            {
                // Send the request to the server and retrieve
the
                // WebResponse object
                response = request.GetResponse();
                if (response != null)
                {
                    // Once the WebResponse object has been
retrieved,
                    // get the stream object associated with
the response's data
                    remoteStream =
response.GetResponseStream();
                    // Create the local file
                    localStream = File.Create(localFilename);
                    // Allocate a 1k buffer
                    byte[] buffer = new byte[1024];
                    int bytesRead;
                    // Simple do/while loop to read from stream
until
                    // no bytes are returned
                    do
                    {
                        // Read data (up to 1k) from the stream
                        bytesRead = remoteStream.Read(buffer,
0, buffer.Length);
                        // Write the data to the local file
                        localStream.Write(buffer, 0,
bytesRead);
                        // Increment total bytes processed
                        bytesProcessed += bytesRead;
                    } while (bytesRead > 0);
                }
            }
        }
        catch (Exception e)
        {
            Console.WriteLine(e.Message);
        }
        finally
        {
            // Close the response and streams objects here
            // to make sure they're closed even if an exception
            // is thrown at some point
            if (response != null) response.Close();
            if (remoteStream != null) remoteStream.Close();
            if (localStream != null) localStream.Close();
        }
        // Return total bytes processed to caller.
```

```
        return bytesProcessed;
    }
```

Break up a large export

If the number of records to be exported exceeds the actual export limit, you may want to break the export into smaller increments that do not place a significant performance load on the platform.

Before you begin
Role required: none

Procedure

1. Create a filtered list of records that you want to export by following the steps in Export directly from a URL.
2. Write down the number of records returned.
3. If the record number is higher than the defined threshold, issue a *sysparm* query for the first 10,000 records using the following syntax:

   ```
   https://<instance
    name>.service-now.com/syslog_list.do?XML&sysparm_orderby=sys_i
   d&sysparm_record_count=10000
   ```

   This exports the first 10,000 records in order, sorted by the *sys_id* number.

4. Find the next record in order, such as 10,001.
   You can find the next Sys ID value by creating a database view on the table and adding the sys_id column to the view. You don't need to specify a where clause. After you create the database view, view the records and their Sys ID values by selecting **Try it**. You can sort by the sys_id column and enter 10,001 to skip to that row.
5. Right-click the row and copy the sys_id of the next record you want to export.
6. Access the next series of records with a *greater than or equal to* query run against the *sys_id* of record 10,001.

   The following example shows a query that uses a sys_id of b4aedb520a0a0b1001af10e278657d27. Use the syntax shown in this query to export the next set of records.

   ```
   https://<instance
    name>.service-now.com/syslog_list.do?XML&sysparm_query=sys
   _id%3E
   %3Db4aedb520a0a0b1001af10e278657d27&sysparm_orderby=sys_id&sysp
   arm_record_count=10000
   ```

   Note: URL queries use typical percent encoding. In this example, the greater than sign (>) is encoded as %3E and the equal sign (=) is encoded as %3D.

7. **Optional:** Continue issuing this query, using the starting sys_id for the next set of records until you have exported all the necessary records.

Exporting and importing data via XML

Migrate data from one instance to another by exporting and importing XML files.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

- Directly export records as XML from any list or form.
- Transfer all fields and values exactly from one instance to another.
- Perform unscheduled data imports as needed.
- Save time by not building import sets or transform maps.

Use cases

- Export smaller batches of records on an infrequent basis by exporting and importing data via XML.
- Export and import data using XML files for records created in a development instance that must be migrated with an update set as part of a migration procedure. Examples of these records include lookup tables, unit test records, and other information required to support production. Typically, this information is only migrated once and the overhead of an import set is not justified.

Important considerations

- The XML export preserves all record field values including system generated field values such as:
  - Sys ID
  - Creation date
  - Update date
- Image field data is not preserved when exporting to XML.
- The XML import directly inserts records into the target table. During the import the system:
  - Ignores any business rules that normally apply to the table.
  - Does not provide any opportunity to transform incoming data.
  - Automatically matches a reference field's display value to the local Sys ID for some tables.
- Data export and import via XML is helpful for copying records from one system to another but does not remove the need to know the relationships between tables. If you need validate or transform data or reconcile the sys ID values of reference fields, use an XML import set instead. See Export sets.

Export data to XML

Export data from a source instance to an XML file.

Before you begin
Role required: admin

Procedure

1. Log in to the source instance (the instance that should send the data).
2. Export a record or a list of records to XML.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Export a record to XML	**a.** Navigate to the record that you want to ex port. **b.** Select the Additional actions menu (). **c.** Select **Export** > **XML This Record)**.
Export a list of records to XML	**a.** Navigate to the list of records that you want to export. **b.** Select and hold (or right-click) any column header in the list. **c.** Select **Export** > **XML**. **d.** When the export completes, select **Down load**.

What to do next
Import data from XML

Import data from XML

After you have successfully exported data from the source instance to XML, import the XML file directly to the target instance.

Before you begin
Role required: admin

About this task
Importing XML doesn't trigger business rules or update the instance cache.

Procedure

1. Log in to the target instance (the instance that should receive the data).
2. Navigate to any list in the system.
   Any list can be used because the XML file contains the destination table name for the records.
3. Select and hold (or right-click) any column title and select **Import XML**.
4. In the Import XML form, select **Choose File** and select the previously exported XML file.
5. Select **Upload**.

Result
Data is imported into the target instance.

Trouble?
If the data doesn't import, navigate to **System Definition** > **Tables & Columns** and verify that the table from which the data was exported also exists in the target instance. If the table doesn't exist, you can move it using an update set. For details on using update sets, see Get started with update sets.

Automatic matching of display values

During the import of XML records, the system attempts to match some reference field display values to a local sys_id value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the system finds an existing record with a matching display value on the local instance, the import uses the sys_id of the existing record rather than the sys_id of the imported record.

For example, suppose you export an incident record that is assigned to the user John Smith. In the exported XML file there is an entry such as:

```
<incident>
 ...
 <assigned_to display_value="John
 Smith">7712173d2ba80200c5244f74b4da159a</assigned_to>
 ...
</incident>
```

This user already exists on the target instance but has a different sys_id value such as:

```
<sys_user><name>John Smith</name>
 ...
 <sys_id>18cab8de2be80200c5244f74b4da15f7</sys_id>
 ...
</sys_user>
```

Since the display value matches an existing record, the system uses the local instance's existing sys_id value for the reference field such as:

```
<incident>
 ...
 <assigned_to display_value="John
 Smith">18cab8de2be80200c5244f74b4da15f7</assigned_to>
 ...
</incident>
```

The system can match display values for the following tables.

- User [sys_user]
- Group [sys_user_group]
- Role [sys_user_role]
- Group Roles [sys_group_has_role]

Exporting currency fields to Excel

Exporting currency fields to Excel applies Account formatting and can be configured to convert all values to US dollars or to export values in the user's session currency.

When exporting currency fields to Microsoft Excel, the cells containing currency data use Accounting formatting. This formatting allows you to perform numeric operations on those values as well as view the currency symbol, such as $ or €.

When exporting currency fields the type of currency, such as $ or €, is preserved by default. The conversion rates for non-USD currencies are stored on the Exchange Rates [fx_rate] table.

You can choose to export all currency values either in US dollars or in the user's session currency.

- To export all currency values in US dollars, set the property *glide.excel.fixed_currency_usd* to **true**.
- To export all currency values in the user's session currency, set the property *glide.excel.convert_to_user_currency* to **true**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If both *glide.excel.fixed_currency_usd* and *glide.excel.convert_to_user_currency* are set to **true**, *glide.excel.fixed_currency_usd* overrides *glide.excel.convert_to_user_currency*.

Currency export behavior and symbols

The behavior of the currency field in Excel depends on the **Symbol** of the currency.

- When the currency symbol is $, the Excel cell type is set as **Currency**.
- When the currency symbol is 1 character (such as ¥ or ¢) or more than 1 character (such as KR), the Excel cell type is set to **Custom**.

Enable export debug logging

When the property *glide.export.debug* is true, the instance logs export processing including database query time and the time taken to write data to the file.

When the property *glide.export.debug* is *true*, the instance logs export processing including database query time and the time taken to write data to the file. Debug logs are indicated by the text *Export API*. Prolonged use of this property can affect performance, so it is best to use it while debugging export processing, and then set the property back to *false*.

Data export reference

Reference topics provide details on exporting data.

Default values for column headers and column values

Default values are used for column headers and column values, unless overridden by query parameters, Export Set fields, or system properties.

The following table describes the default values used if you do not use query parameters, Export Set fields, or system properties to control output format.

Output format	Column headers	Column values
CSV	**Use field name**	**Use raw value** if *glide.export.csv.raw.value* set, otherwise **Use display value**.
Excel	**Use field label**	**Use display label**
JSON	N/A	**Use raw value**
XLSX	**Use field label**	**Use display value**
XML	N/A	**Use raw value**

Field types affected by export controls

Different field types are affected differently by export controls.

The following table describes how different field types are affected by export controls.

Field type	Display value	Raw value
Date/Time	CSV: User timezone date/time with user format.	CSV: UTC timezone date/time with system format.
	Excel/XLSX: User timezone date/time with user format if *glide.excel.use_user_date_format* set, otherwise system format.	Excel/XLSX: UTC timezone date/time with user format if *glide.excel.use_user_date_format* set, otherwise system format.
Date	Date with user format.	Date with system format.
	Excel/XLSX: Date with user format if *glide.excel.use_user_date_format* set, otherwise system format.	Excel/XLSX: Date with user format if *glide.excel.use_user_date_format* set, otherwise system format.
Time	CSV: Time with user format.	CSV: UTC time, assuming 1970-01-01 as the date with system format.
	Excel/XLSX: User timezone time with user format if *glide.excel.use_user_date_format* set, otherwise system format.	Excel/XLSX: UTC time, assuming 1970-01-01 as the date with user format if *glide.excel.use_user_date_format* set, otherwise system format.
References	Display value of the referenced record.	Sys_id of the referenced record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field type	Display value	Raw value
Choice	Label of the selected choice.	Value of the selected choice.
Currency	Value with the currency symbol.	USD value without the currency symbol.
Price (calculated)	Value with the currency symbol.	USD value without the currency symbol.
Price (fixed)	Value with the currency symbol.	USD value without the currency symbol.

System properties for display value and header

Use system properties to export the display value or raw value of fields and the field label or field name for headers.

System properties control the output for the CSV, Excel, JSON, and XLSX file formats. System properties define default behavior if overrides such as query parameters are not specified. System properties apply to exported files downloaded with URL parameters, exported from list view, or generated by export sets.

The following table describes each of the system properties that control display values and headers.

Format	Property	Default Value
CSV	*glide.export.csv.raw.value*	**false** **Note:** Setting the property as false also crops the value's string to 32000 characters.
	glide.export.csv.column_header_label	**false**
Excel	*glide.export.excel.display_value*	**true**
	glide.export.excel.column_header_label	**true**
JSON	*glide.json.return_displayValue*	**false**
XLSX	*glide.export.xlsx.display_value*	**true**
	glide.export.xlsx.column_header_label	**true**

Example: CSV

Example:

glide.export.csv.raw.value = **false** (default)

glide.export.csv.column_header_label = **false** (default)

Query parameters for display value and header

Use query parameters to export the display value or raw value of fields and the field label or field name for headers.

Query parameters control the output for CSV, XLS, JSON, XLSX, and XML file formats. Query parameters, if present, override system properties.

The following table describes each of the query parameters that control display values and headers.

Query parameter	Description
sysparm_display_value	Exports the display value (**true**) or raw value (**false**) for the CSV, XLS, XLSX, and XML file formats. See Field types affected by export controls for more information.
displayvalue	Exports the display value (**true**), raw value (**false**), or both (**All**) for the JSON file format. See Field types affected by export controls for more information.
sysparm_export_column_header_label	Exports the CSV, XLS, and XLSX file formats with the field label (**true**) or field name (**false**).

Example: sysparm_display_value

Example: *sysparm_display_value* **= true**

Number	Opened	Short description	Caller	State	Assignment group	Assigned to
INC0000060	2016-12-12 07:19:57	Unable to connect to email	Joe Employee	Closed	Network	David Loo

Export limits

The platform provides a default upper limit for data exports.

The purpose of the upper limit is to avoid creating performance issues when a table is excessively large. If you must export more records than the threshold permits, Break up a large export into separate manageable chunks.

Export limit properties

You can set the number of records to return during an export using the *sysparm_record_count* URL parameter.

However, the system analyzes the following settings to determine whether an export limit should be applied.

1. First, the platform checks the property that defines the format-specific export limit. Each format can have a different limit. Although this property can be set to any value, exceeding the default export limit can impact system performance. You may want to set the property at or below the default limit and have users Break up a large export to export large amounts of data.
2. If the format-specific property is not set, the system checks the property for the general export limit. This property can also be set to any value, but exceeding the default export limit can impact system performance.
3. If both the format-specific export limit and the general export limit property aren't set, the system enforces the default export limit.

Important: To set these properties, navigate to **System Properties** > **Import Export**.

Default export limit

Format	Format-specific export limit	General export limit	Default export limit
XML	glide.xml.export.limit	glide.ui.export.limit	10,000
CSV	glide.csv.export.limit	glide.ui.export.limit	10,000
EXCEL (XLSX)	glide.xlsx.export.limit	glide.ui.export.limit	10,000

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default export limit (continued)

Format	Format-specific export limit	General export limit	Default export limit
EXCEL (XLS)	glide.excel.export.limit	glide.ui.export.limit	10,000
EXCEL (XLSX)	glide.xlsx.max_cells	N/A	500,000
EXCEL (XLS)	glide.excel.max_cells	N/A	500,000
PDF	glide.pdf.max_detail_pages **Note:** The number of rows can be set from 0 to 250. If no value is specified, the default is 250. If a value greater than 250 is specified, the default value of 250 is used.	250	250
PDF	glide.pdf.max_rows **Note:** The number of rows can be set from 0 to 5,000. If no value is specified, the default is 1,000. If a value greater than 5,000 is specified, the default value of 1,000 is used.	N/A	1,000
PDF	glide.pdf.max_columns **Note:** Only 25 header labels fit on a page.	N/A	25
JSON	glide.json.export.limit	glide.ui.export.limit	10,000

A warning threshold property called *glide.ui.export.warn.threshold* controls how the records are exported. When you export enough records from a list to exceed the threshold, a choice dialog appears. You can choose to wait for the export to complete or email the exported records as an attachment. The warning threshold can be changed in the system property. The email attachment must not exceed the maximum Email size limits.

Export limit examples

Example	Property	Breaking export limits
Exporting to CSV	• glide.csv.export.limit = 20,000 • glide.ui.export.limit = 10,000 • com.glide.processors.XMLProcessor.max_record_count = 20,000 • Default export limit for CSV = 10,000	If you export 30,000 records, the number of records returned from the database is 20,000. The number of records specified for export exceeds the value set in the *glide.csv.export.limit* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export limit examples (continued)

Example	Property	Breaking export limits
Exporting to Excel (XLSX)	• glide.xlsx.export.limit = no entry • glide.ui.export.limit = no entry • Default export limit for Excel (XLSX) = 10,000	If you export 30,000 records, the number of records returned from the database is 10,000. The number of records specified for export exceeds the default export limit for Excel.
Exporting to PDF	• glide.pdf.max_rows = 1,000 • Default export limit for PDF = 1,000 • Maximum export limit for PDF = 5,000	If you export 5,000 records, the number of records returned from the database is 1,000. The number of records returned is limited because the number of records specified for export exceeds the default value in the *glide.pdf.max_rows* property.

Excel export threshold

Excel exports are intended for relatively small exports with fewer than 500,000 cells. CSV can handle larger exports.

If an exported spreadsheet has more than 500,000 cells, the export process stops. You receive the Excel file at that point. The following message displays in the bottom row: `Export stopped due to excessive size. Use CSV for a complete export.`

The Excel export cell threshold is customizable using the *glide.xlsx.max_cells* integer property (or *glide.excel.max_cells* if using XLS).

Note: Increasing this threshold may cause a memory issue in your instance. The threshold is set at an appropriate level to prevent resource issues.

The export puts the information into the Excel document with 32,000 rows per spreadsheet. You can customize this limit by setting the following properties:

Rows per sheet limit

Property	Maximum export limits
glide.export.xls.max.rows.per.sheet	64,000
glide.export.xlsx.max.rows.per.sheet	1,000,000

Exporting your table records to Google Sheets

Integrate your ServiceNow instance and Google Cloud Console so that you can export table records directly to the cloud-based Google Sheets in Google Drive. With this integration, you can view, share, and work on data outside the platform by using spreadsheets.

In the Google Cloud Console, enable the Google Sheets API to authenticate the requests from your ServiceNow instance through an OAuth application.

Note: OAuth enables you to grant access to your data and files to third parties without sharing usernames or passwords.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you can do the integration, you must set up the OAuth application so that you can authenticate the requests from your ServiceNow instance. For more information on how to do the setup, see Set up the OAuth application on the Google Sheets API at https://console.developers.google.com/.

Next, you register the Google Drive application in your ServiceNow instance to enable OAuth authorization for exporting your table records directly to Google Sheets.

Then, you configure the connection and credential aliases to authenticate the integration between your ServiceNow instance and Google Drive.

Note: Aliases help keep credentials separate from the integration logic, making it easier and safer to manage sensitive information.

The connection and credentials record contains the information that the Google Sheets API needs to authenticate the requests from your ServiceNow instance. It includes the user credentials and connection type, which are required for your instance to communicate with Google Cloud.

Set up the OAuth application on the Google Sheets API

Set up the OAuth application on the Google Sheets API so that you can authenticate requests from your ServiceNow instance to access Google Sheets.

Before you begin

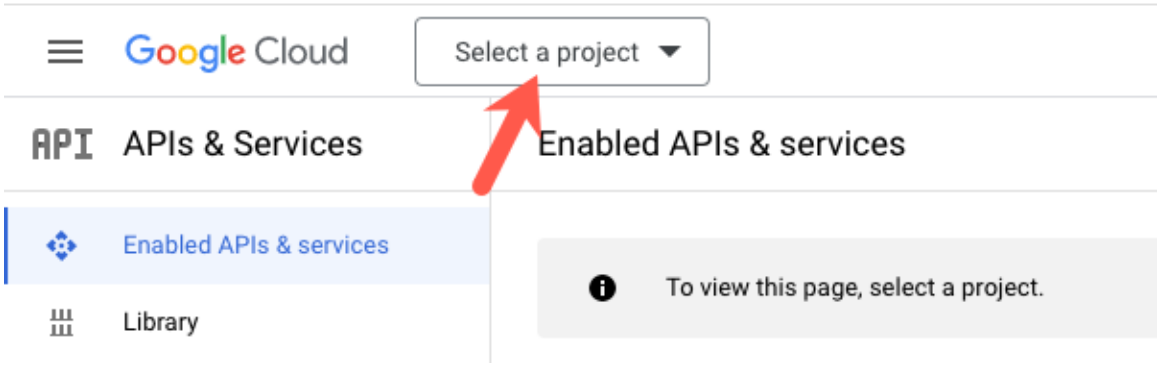
- Create a business account on https://console.developers.google.com/.
- Create a domain and an email address that is associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com.

  Note: You can register only one email address per domain in Google Workspace.

- Role required: admin

About this task

Setting up the OAuth application on the Google Sheets API enables you to access and update spreadsheets securely from your instance. For example, if you're exporting incident records from the ServiceNow instance to a Google Sheet, OAuth ensures that the system has permission to create or update the sheet on your behalf, without needing you to log in manually each time.



Procedure

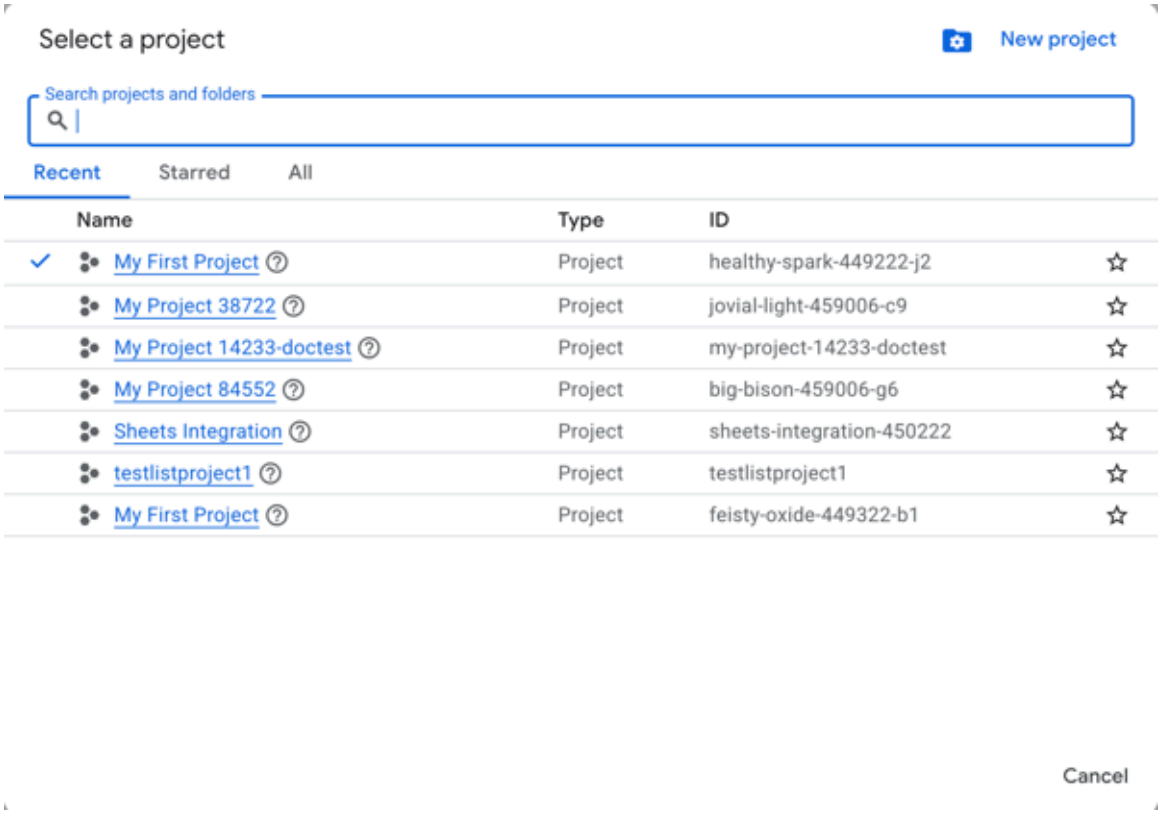
1. Navigate to Google Workspace and set up a project.
   The project includes the details of the OAuth application and the API permissions, if applicable.

   a. Log in to https://console.developers.google.com/ with the same domain email ID and password as mentioned in the prerequisites.

   b. In the Google Cloud Console, select **Select a project**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Search projects and folders** field, select **New project**.

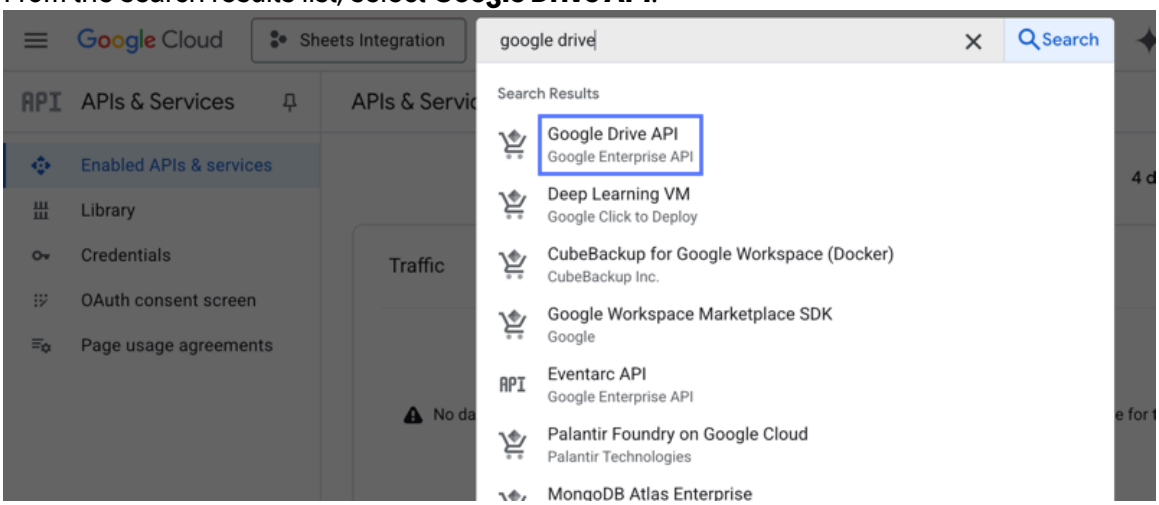


d. In the **Project name*** field, enter a unique name for the project.

e. In the **Location*** field, select **Browse** and then select an organization.

f. Select **Create**.
The project is created and appears in the Notifications box.

2. Enable the Google Sheets API.

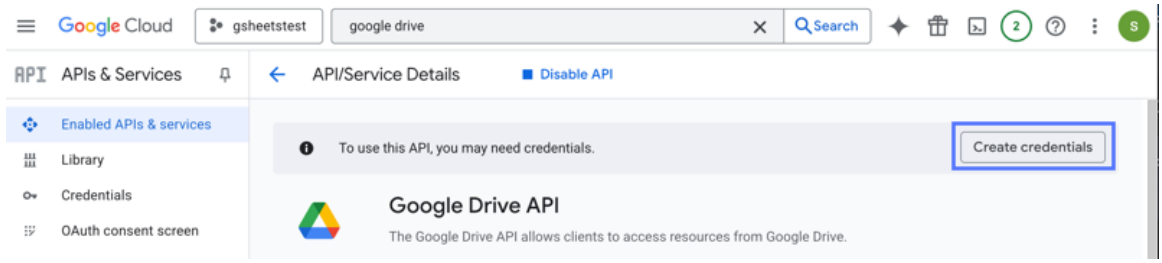


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

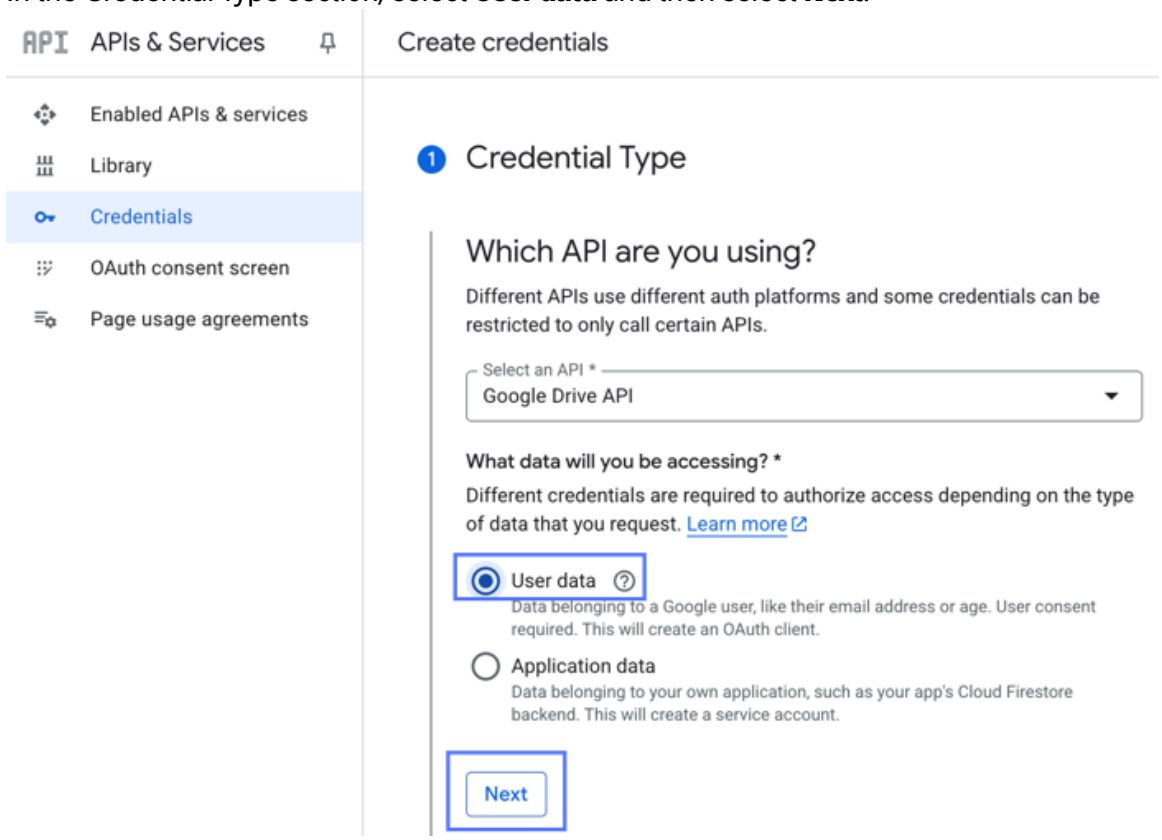
a. Open the project that you created in step 1.
The API and services dashboard page opens for the selected project.

b. In the search box, enter `Google Drive`.

c. From the search results list, select **Google Drive API**.



d. Select **Enable**.
The Google Drive APIs are enabled on your project.



3. Create the OAuth app and credentials.

a. In the Enabled APIs & services dashboard, select **Create credentials**.
The Create credentials page is displayed.

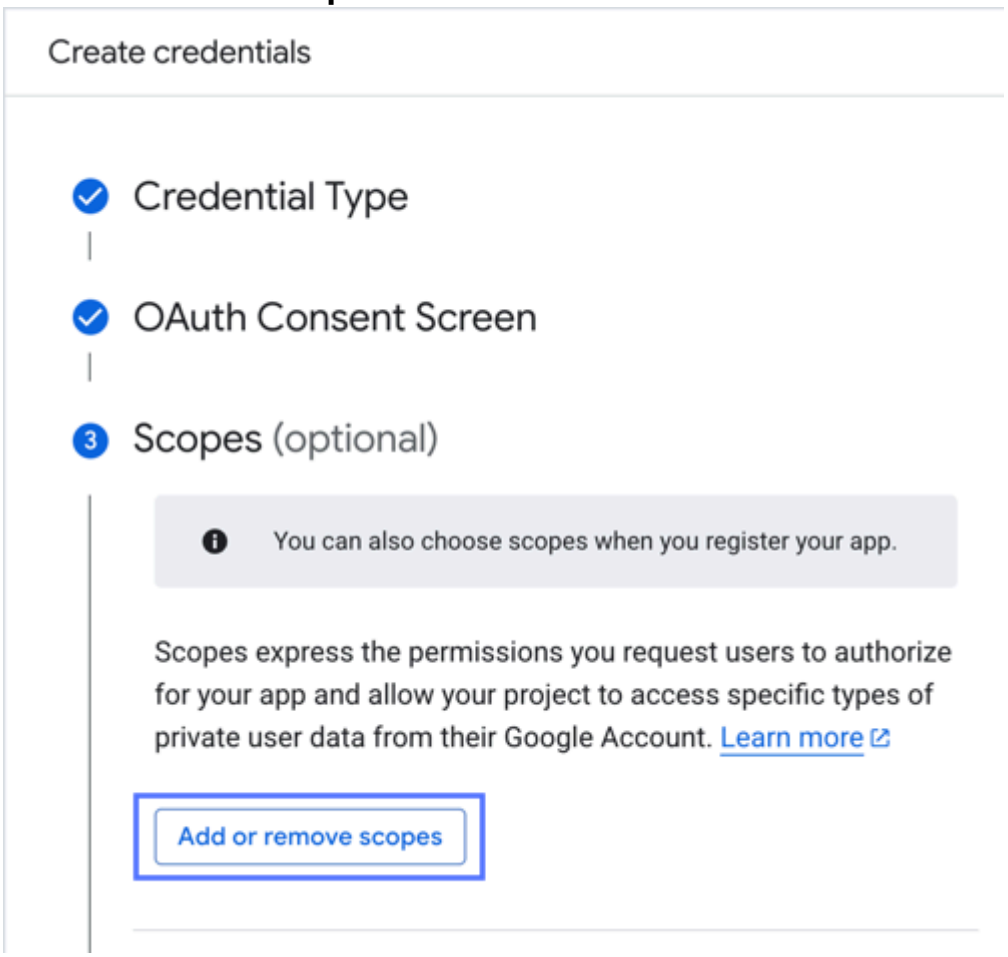
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. In the Credential Type section, select **User data** and then select **Next**.

c. On the form in the OAuth Consent, fill in the fields.

OAuth Consent Screen form

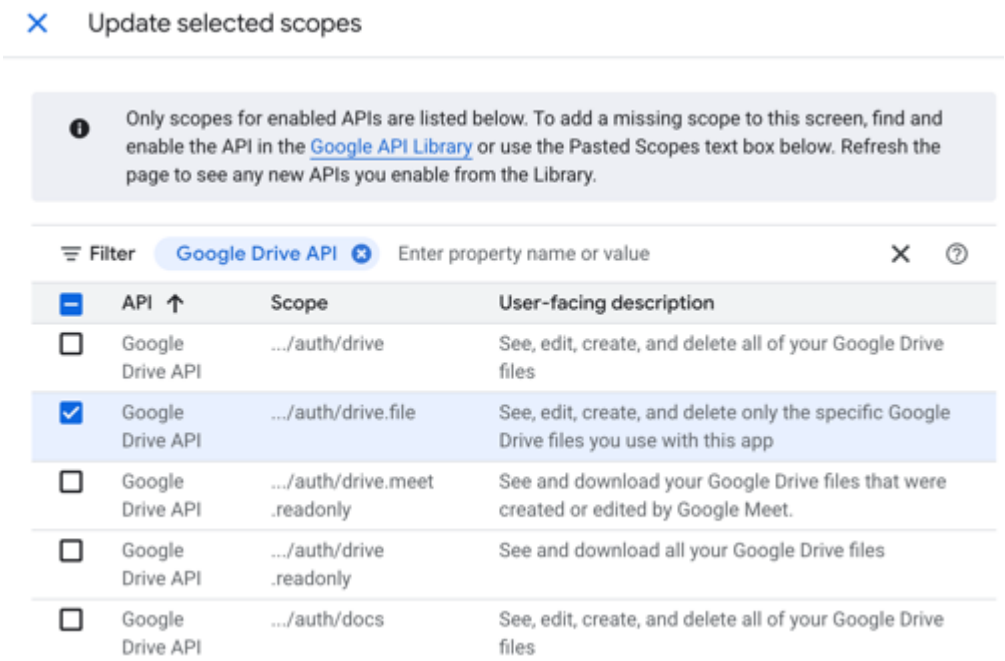
Field	Description
App name	Name of the OAuth app.
User support email	Email at which users can send queries to you about their consent.
Logo file to upload	Logo representing the OAuth app.
Developer contact information	Developer to contact for changes to the project.



d. Select **Save and continue**.

4. In the Scopes section, define the API scopes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

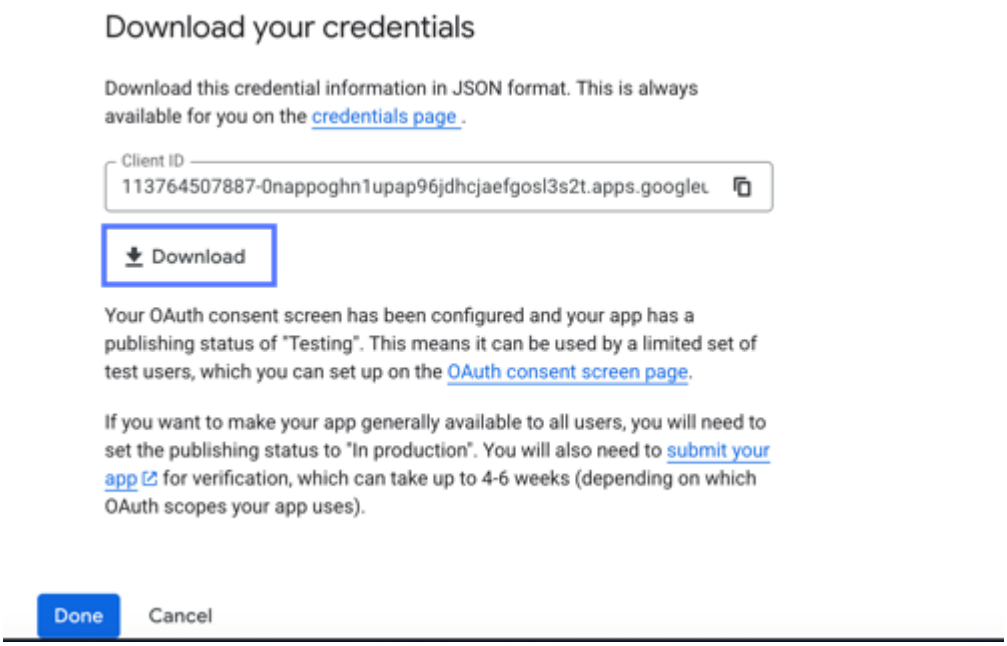


API scopes enable you to select specific APIs. For example, the /auth/spreadsheets scope enables you to create, edit, or remove spreadsheets.

a. Select **Add or remove scopes**.

b. In the Update selected scopes list, search for Google Drive API, and then select the `.../auth/drive.file` scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select **Update** and then select **Save and continue**.

The API scope is selected.

5. In the OAuth Client ID section, create the OAuth client ID.
   a. From the Application type* list, select **Web application**.
   b. In the **Name*** field, enter a unique name for the OAuth client.
6. On the Authorized redirect URIs heading, select **+ ADD URI**.
7. In the **URI** field, enter the redirect URI in the following format: `https://instance.service-now.com/oauth_redirect.do`.
8. Select **Create**.
   The OAuth details are generated in a JSON file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: Select **DOWNLOAD** to download the JSON file for later reference.

9. Select **Done**.
   The OAuth application on Google Workspace is created.
10. Configure the audience allowed to access Google Sheets API.
    For example, your audience is the ServiceNow instance.
    a. In the APIs & Services dashboard menu, select **OAuth consent screen** and then select **Audience**.
    b. In the User type section, select **External** and add the user that you want to give access to the instance.

Result
The OAuth application is enabled to authenticate the access of Google Sheets from your instance.

What to do next
To enable OAuth authorization for exporting table records to Google Sheets, register the Google Drive application in your instance. For more information, see Create an application registry for Google Sheets on a ServiceNow instance.

Create an application registry for Google Sheets on a ServiceNow instance

Register the Google Drive application in your ServiceNow instance to enable OAuth authorization for exporting table records directly to Google Sheets.

Before you begin
Role required: admin

About this task
An Application Registry is a record that defines how your ServiceNow instance can connect to an external application, such as Google Sheets, using OAuth.

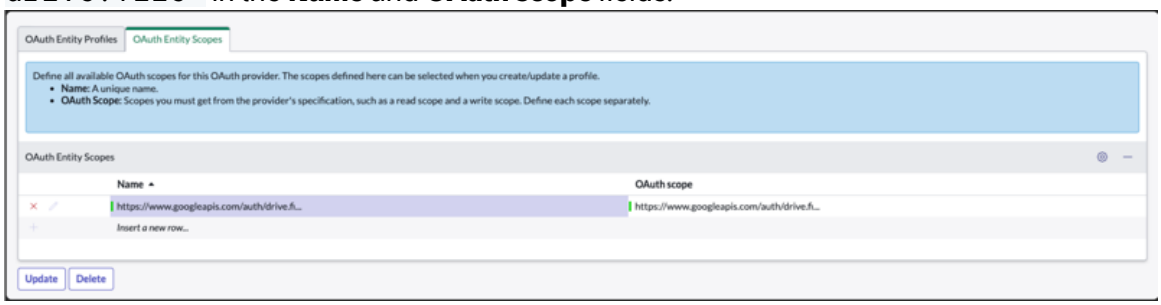
It includes the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Client ID and Client Secret: Credentials for the external application.
- Authorization and Token URLs: Web addresses used to log in and get access.
- Redirect URL: Where the OAuth server sends the user after authorization.
- Scopes and Profiles: Define what areas of ServiceNow the external application is allowed to access.

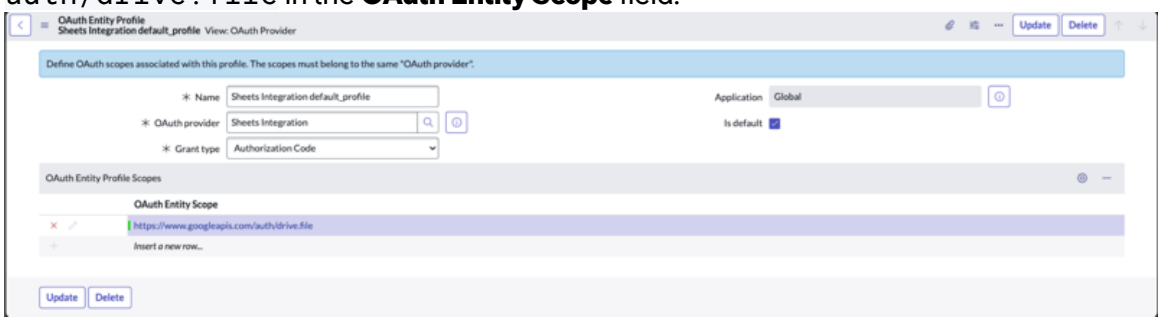
Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
3. From the list of OAuth application types, select#**Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.



Application Registries form

Field	Description
Name	Name to uniquely identify the record. For example, Sheets Integration.
Client ID	Client ID of the Google Drive application that you registered in Google Workspace. You can find the Google Client ID in the downloaded OAuth credentials JSON file. For more information, see Set up the OAuth application on the Google Sheets API.
Client Secret	Client secret that was generated when you registered the app in Google API Console. You can find the Google client secret in the downloaded OAuth credentials JSON file. For more information, see Set up the OAuth application on the Google Sheets API.
OAuth API Script	Script to customize the request and response. For example, OAuthGoogleSheetExport.
Default Grant Type	Grant type that was used to establish the token.
Authorization URL	URL that the OAuth application at Google provides to seek authorization to access the Google resource server. The URL format that you enter includes the tenant ID of your app: `https://accounts.google.com/oauth2/v2.0/{API version}/authorize`. You can find the Authorization URL in the downloaded OAuth credentials JSON file. For more information, see Set up the OAuth application on the Google Sheets API.
Token URL	URL to obtain the access token. The format that you enter for the URL is `{yourgoogleaccount}.com/oauth2/{API version}/token`.
Redirect URL	Redirect URL that includes the instance URL with the format `https://<your-instance>.service-now.com/oauth_redirect.do`.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Update the <instanceURL> value with your instance URL.
Token Revocation URL	URL that is provided by the OAuth authorization server that enables a client application to request the revocation or cancellation of access tokens and refresh tokens that were previously issued. The format is https://{yourgoogleaccount}.com/{API version}/oauth2/revoke

5. Select **Submit**.
6. On the Application Registries page, search and select the application registry that you created.
7. In the OAuth Entity Scopes related list, enter `https://www.googleapis.com/auth/drive.file` in the **Name** and **OAuth scope** fields.

8. In the OAuth Entity Profiles related list, select **Sheets Integration default_profile**.
9. In the OAuth Entity Profile Scopes related list, enter `https://www.googleapis.com/auth/drive.file` in the **OAuth Entity Scope** field.

10. Select **Update**.

Configure ServiceNow connection and credential aliases for Google sheets

Configure connection and credential aliases to authenticate an integration between your ServiceNow instance and Google Drive.

Before you begin

Role required: admin

About this task

The connection and credential aliases record is used to manage the secure connection of your ServiceNow instance with Google Sheets. A connection alias tells the system how to connect to Google Sheets. It defines the endpoint URL of the Google Drive API and tells the system who is connecting. For example, it stores the authentication details, such as the OAuth token and API keys.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.

   a. Select **New**.

   b. On the form, fill in the fields.

Connection & Credential Aliases form

Field	Description
Name	Name of the alias. An alias can only contain alphanumeric characters and underscores. For example, Sheets_Alias. During an upgrade, the tag in the credential record migrates to a Connection & Credential alias. If the credential tag contains special characters other than alphanumeric characters and underscores, it preserves the tag name after the upgrade. You can still use this migrated alias, but you can't update the alias until you change the name to meet the naming restrictions.
ID	Unique identifier for the Connections & Credentials alias, based on the format `scope_name.alias_name`. ▪ If the scope is Global, the ID is the alias name. For example, if you create a Sheets alias in the global scope, it sets the ID to `sheets`. ▪ If you create a workday alias in the HR app scope, it sets the ID to `x_hr_app.sheets`.
Parent Alias	Connection and credential alias record of the Google Drive.
Type	Type that is either Credential or Connection and Credential. The default is Connection and Credential.
Connection type	Name of the connection type, either Basic, HTTP, JDBC, JMS, or Kafka. The default is HTTP.
Support Multiple Active Connections	Option that indicates whether the alias supports multiple active connections. You can add connections by using the Connections [sys_connection] table. You can associate the connections to the alias by using the Connections related list.
Default Retry Policy	Retry policy for the alias. For more information, see Retry policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Configuration Template	Configuration template to use to create a connection and credential record.

c. Select **Submit**.

A connection and credential alias record is created.

2. Create an OAuth 2.0 credential to use in the connection and credential alias record.

a. Navigate to **All** > **Connections & Credentials** > **Credentials**.

b. Select **New**.

c. From the list of credential types, select **OAuth 2.0 Credentials**.

d. On the form, fill in the fields.

OAuth 2.0 Credentials form

Field	Description
Name	Unique name of the credential to differentiate it from the default credentials that are provided by the application. For example, Sheet credentials.
Active	Option to activate the credential.
OAuth Entity Profile	Default OAuth entity profile that was generated when you performed the application registry in Create an application registry for Google Sheets on a ServiceNow instance.
Applies to	Option to specify if the credential record is applicable for all MID Servers, or a specific MID Server. If specific, add the MID Servers as necessary.
Order	Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number means that the higher in the list this credential appears.

e. Select **Submit**.
The OAuth 2.0 credential record is created.

f. Open the OAuth 2.0 credential record from the Credentials list.

g. From the Integration Type list, select **Personal**.

3. Create a connection record for your alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **Connections & Credentials** > **Connections**.

b. Select **New**.

c. From the list of connection types, select **HTTP(s) Connection**.

d. On the form, fill in the fields.

HTTP(s) Connection form

Field	Description
Name	Name of the connection. This field must be unique on the table. For example, Sheets credentials.
Credential	Credential to use with this connection. For example, select the OAuth 2.0 credential record created in step 2.
Connection alias	Connection alias that resolves your connection and credentials at run time. Only one connection is active per connection alias at any one time.
Active	Option to make this connection active.
Domain	Domain that the action or activity runs in.
URL builder	Option to use the system to build a URL that is based on the inputs, such as host, port, and base path.
Connection URL	URL that the MID Server uses to connect to the specified weblink. If URL builder is not selected, enter the connection URL in this field. For example, `https://www.googleapis.com/upload/drive/v3/files?uploadType=multipart&fields=id`.
Mutual authentication	Option to enable authentication by using a protocol profile. **Note:** If the mutual authentication is selected, a connection URL is built: Protocol + :// + host:port +URL. If a mutual authentication isn't selected, a connection URL is built: Protocol profile + :// + host:port +URL. This field appears only when **URL builder** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Use MID server	Option to define the fields in the Advanced MID Server Configuration section. If a successful connection doesn't occur during this time, the connection request times out. Leave this field empty to use the system default connection timeout value. **Note:** Avoid setting the **Connection Timeout** value to zero, because doing so may cause a stale connection.
Connection timeout	Number of seconds that the system waits for a successful host connection.

e. Select **Submit**.

The connection record is created.

4. Copy the sys_id of the alias record.

Note: This sys_id is required when setting up the **export to sheets alias** system property.

a. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.

b. From the Connection and Credentials Aliases list, select and open the alias that you created in step 1.

c. Right-click the header of the alias page and select **Copy sys_id**.

5. Configure the **export to sheets alias** system property.

a. In the navigation filter, enter `sys_properties.list`
The entire list of properties in the System Properties [sys_properties] table appears.

b. Select **New**.

c. On the form, fill in the fields.

System Property form

Field	Description
Name	Name of the property that you're creating. In this case, `glide.oauth.export.to.sheets.alias`.
Description	Brief, descriptive phrase that describes the function of the property.
Type	Data type. In this case, `string`.
Value	Value for the property. In this case, paste the sys_id that you copied from the alias record in step 4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Submit.**

Note: If the **Ignore cache** check box is selected, the system flushes the server cache when the parameter is changed.

Result
The connection and credential alias record is configured to connect your ServiceNow instance with Google Sheets.

Roll back and delete recovery

With rollback contexts, you can roll back certain actions such as a patch upgrade, plugin activation, and background script executions, and you can recover record deletions and all related changes.

The roll back and delete recovery features are available on instances that use MySQL and MariaDB databases. Instances that use Oracle databases only support roll back. Instances that use SQL Server do not support roll back or delete recovery.

Roll back and delete recovery database support

Database type	Roll back	Delete recovery
MySQL	yes	yes
MariaDB	yes	yes
Oracle	yes	no

Deleted Records module

This module works on records in audited tables. Recovery of cascaded deleted records must be done within seven days of the record deletion. After seven days, only data records and references on tables that audit deletions can be recovered, which is the same functionality as prior releases.

To find this module, navigate to **System Definition** > **Deleted Records**.

Delete Recovery module

This module works for any deleted record. This recovery must be done within seven days of the record deletion.

To find this module, navigate to **Rollback & Recovery** > **Delete Recovery**.

Script Execution History module

This module works on scripts executed using the **Scripts - Background** module. This history only includes seven days of script executions.

To find this module, navigate to **Rollback & Recovery** > **Script Execution History**.

Rollback contexts

Rollback contexts contain everything necessary to roll back a software upgrade or plugin activation. They include deleted records, patch updates, Scripts-Background script executions,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

database actions, and plugin activations. A rollback context is created for each patch upgrade within a family, and each plugin activation, provided that the plugin supports rollback contexts.

To use rollback contexts, activate the Restore Deleted Records (com.snc.undelete) and Delete Recovery (com.glide.delete_recovery) plugins.

Rollbacks are typically performed on pre-production instances where functionality must be restored before you can find the root cause of a problem in the upgrade. Rolling back deletes data, which can often make it hard if not impossible to discover the problem that made the rollback necessary.

A rollback context is created when:

- `GlideRecord.delete()` or `GlideRecord.deleteMultiple()` delete records.
- There is a patch upgrade.
- You activate a plugin that supports rollback contexts.
- A script executes using the **Scripts-Background** module, and rollback was enabled by selecting the **Record for Rollback?** check box.

Rollbacks do not impact other database activities. If a database activity modifies a record that is part of a rollback context, the rollback does not affect that record.

Because rollback contexts contain a significant amount of data, rollback contexts are deleted after 10 days. Therefore, rollbacks must occur within 10 days of the latest upgrade or plugin activation. If you need to retain a rollback context for more than 10 days, you can do so by adding a system property. See Rollback context properties.

Note: Do not roll back a rollback context until checking with Customer Service and Support. A roll back deletes data and may remove evidence of the upgrade or activation issue preventing debugging of the problem.

To find this module, navigate to **Rollback & Recovery** > **Rollback Contexts**.

If any of the following operations occur during a rollback, a rollback context is not created:

- Tables or columns are dropped from the schema.

  Note: Index drops are okay.

- A table is truncated.
- A table or column is renamed.
- A column is re-parented or promoted.
- A column type changes.
- A column width is decreased.

The rollback process on Now Support does the following:

- Updates the reported WAR to the rolled-back version and the assigned WAR remains set to the version before the rollback.
- Sets the property *glide.war.no_upgrade* on the instance is set to the version before the rollback.
- Displays the message, "Desired war matches reverted war specified by property [*glide.war.no_upgrade*]. Upgrade script will NOT run".
- Changes the state to **Expired** and the rollback purges all stored data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roll back patch upgrades or plugin activations

Use the **Rollback Contexts** module to roll back patch upgrades and plugin activations.

Before you begin

Role required: admin

Review this information and requirements before performing rollback:

- Rolling back is possible only between patches in the same software release. For example, Rolling back is possible from Orlando patch 2 to patch 1, but not from Orlando to New York.
- The rollback must be done within 10 days of the most recent upgrade or plugin activation. If you need to retain a rollback context for more than 10 days, you can do so by adding a system property. See Rollback context properties.
- You can only roll back to the previous version.

  For example, rolling back from patch 3 to patch 1 requires two rollbacks.
- You must have the Restore Deleted Records (com.snc.undelete) and Delete Recovery (com.glide.delete_recovery) plugins activated.
- You can only roll back one active instance at a time.

  Rolling back contexts on multiple nodes is not supported.
- A rollback deletes data and may remove evidence of an upgrade or activation record, which makes it difficult to debug the problem that made the rollback necessary.
- To roll back to a patch version before the Assigned WAR, submit a request for Customer Service and Support to do the rollback.

Procedure

1. Navigate to **All** > **Rollback & Recovery** > **Rollback Contexts**.
2. Select the context that you want to rollback.
3. Roll back by selecting the **Rollback** related link.
4. Confirm the rollback.
   An indicator appears showing the progress of the rollback. *`glide.war`* updates to the rolled-back version. The log shows the stages of the rollback process.
5. After the rollback is complete, log out of your instance and log back in again.
6. Open a new tab and see if the context state changed to **Rolled back**.
   If not, contact Customer Service and Support.

Use the Deleted Records module to restore a deleted record

You can recover deleted records that are in audited tables.

Before you begin

Role required: admin

About this task

The instance can track deletions on any table, and references on audited tables, with a few exceptions. Record deletions are not tracked in these circumstances:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Record deletions are not tracked on tables with the `no_audit_delete=true` dictionary attribute.
- Not all tables with a sys prefix track deletions by default. You can Enable auditing for a system table.
- References are restored only if the reference field is on an audited table and the Restore Deleted Record plugin is activated.
- References that use an **Image** field type are not restored.

Procedure

1. Navigate to **All** > **System Definition** > **Deleted Records**.
2. Open the deleted record that you want to restore.

   Note: You can only restore one deleted record and its associated references at a time.

3. Do one of the following to restore the record.

Option	Description
Undelete With Related	Recovers the record and all cascaded deletes and other database actions that resulted from the delete. This option appears when a rollback context is available for the delete.
Recover entire operation	If this record was deleted as part of another delete, all records from the parent delete are recovered including all cascaded deletes and other database actions that resulted from the parent delete. If this is the top level delete, then this is the same as **Undelete with Related**. This option appears when a rollback context is available for the delete.
Undelete Record	Recovers only this record. **Important:** The undelete operation performs an insert, which can trigger business rules. This might lead to additional inserts and updates on related records in other tables, potentially resulting in unexpected outcomes. For guidance on avoiding this behavior, contact Customer Service and Support.

   An instructions page appears, explaining the process and its limitations.

4. Click **Restore deleted record**.
   A Progress page shows the progress of the restore process, and shows a count of the references restored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
When the process completes, a Restore Summary itemizes the changes and provides links for viewing the restored record or returning to the deleted records list.

Use the Delete Recovery module to restore a deleted record

You can recover a deleted record and all related changes. The recovery must be done within seven days of the record being deleted.

Before you begin
Role required: admin

About this task

Procedure

1. Navigate to **All** > **Rollback & Recovery** > **Delete Recovery**.
2. Click the item from the **Delete Recoveries** list to be recovered.
   The **Delete Recovery** form is shown.
3. Under Related Links, click **Rollback...**.
4. In the **Rollback entire operation** form, enter `yes`, and click **OK**.
   A Progress page shows the progress of the restore process, and shows a count of the references restored.

Result
When the process completes, a **Restore Summary** itemizes the changes and provides links for viewing the restored record or returning to the **Delete Recoveries** list.

Use the Script Execution History module to roll back a Scripts-Background execution

You can roll back the database actions of a script executed using the Scripts-Background module.

Before you begin
Role required: admin

About this task
When you executed the script using the Scripts-Background module, the **Record for Rollback?** item must have been checked.

If you are still in the **Scripts-Background** module after executing a script, you can use the **Script execution history and recovery available here** link to get to the **Script Execution History** form.

Procedure

1. Navigate to **All** > **Rollback & Recovery** > **Script Execution History**.
2. Click the script execution to be rolled back.
3. In the **Related Links**, click **Rollback Script Execution**.

Rollback context properties

Change the default expiration period for different types of rollback context records.

Because rollback contexts contain a significant amount of data, they're deleted after 10 days by default. The Clean Expired Rollback Contexts scheduled job runs daily to delete expired records in the Rollback Context [sys_rollback_context] table. If you need to retain a rollback context for more than 10 days, you can do so by adding a system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To add a system property, navigate to the System Properties [sys_properties] table and add a property for the type of rollback context record that you want to preserve. You can determine which property to add for a given rollback context by matching the property name to the Type column on the Rollback Context [sys_rollback_context] table.

Rollback context properties

Property	Description
The number of days to retain the rollback context for an app install `glide.rollback.expiration_days_app.install`	By default, you have 15 days to roll back an application installed from the ServiceNow® Store before the rollback context expires. You can extend the expiration period by updating this property. • Type: integer • Default value: 15
The number of days to retain the rollback context for a batch app install `glide.rollback.expiration_days_batch_app.install`	By default, you have 10 days to roll back apps installed using the Batch Installation feature before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for demo data `glide.rollback.expiration_clean_demo_data`	By default, you have 10 days to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for recorded delete operations `glide.rollback.expiration_days_delete`	By default, you have 10 days after a delete operation completes to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context created for validating Workflow Studio flow execution before and after an upgrade `glide.rollback.expiration_days_flow`	By default, you have 10 days to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rollback context properties (continued)

Property	Description
The number of days to retain the rollback context for IRE changes recorded from CMDB Integration Studio. `glide.rollback.expiration_days_inst_preview`	By default, you have 10 days after IRE changes are recorded from CMDB Integration Studio to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain rollback contexts in which the Type is set to Other. `glide.rollback.expiration_days_other`	By default, you have 10 days to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for a plugin activation `glide.rollback.expiration_days_plugin`	By default, you have 15 days to roll back plugins activated in Application Manager before the rollback context expires. You can extend the expiration period by updating this property. • Type: integer • Default value: 15
The number of days to retain the rollback context for an anonymization job. `glide.rollback.expiration_days_redact`	By default, you have 10 days after data is redacted by a Data anonymization job to roll back before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for a background script execution `glide.rollback.expiration_days_scripts_bg`	By default, you have 10 days to roll back script execution before the rollback context expires. The rollback context tracks all INSERT, DELETE, and UPDATE statements executed by the script and recovers the data by undoing the SQL statements. You can extend the expiration period by updating this property. • Type: integer • Default value: 10
The number of days to retain the rollback context for changes recorded during test executions	By default, you have 10 days after test execution to roll back before the rollback context expires. You can change the expiration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rollback context properties (continued)

Property	Description
`glide.rollback.expiration_days_test`	set or extend by adding this property and setting a new value. • Type: integer • Default value: 10
The number of days to retain the rollback context for an upgrade `glide.rollback.expiration_days_upgrade`	By default, you have 10 days after the latest upgrade to roll back the upgrade before the rollback context expires. You can change the expiration period by adding this property and setting a new value. • Type: integer • Default value: 10
The number of additional days to retain rollback contexts that are stuck, beyond the normal expiration period. `glide.rollback.stuck_expiration_days`	By default, rollback contexts that are stuck are retained for an additional 30 days beyond the normal expiration period. You can change this retention period by adding this property and setting a new value. The total retention period for stuck rollback contexts is calculated by adding the value of `glide.rollback.stuck_expiration_days` to the normal expiration period defined by `glide.rollback.expiration_days_delete`. By default, the normal expiration period is 10 days, so if `glide.rollback.stuck_expiration_days` is set to 30, stuck rollback contexts will be retained for a total of 40 days (10 + 30). The `glide.rollback.stuck_expiration_days` property is valid for all rollback types, not just for delete. • Type: integer • Default value: 30

Instance Clone

Clone copies data and metadata from one ServiceNow instance (source instance) to another ServiceNow instance (target instance).

https://player.vimeo.com/video/1006365658?h=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479https://player.vimeo.com/video/1006365658%3Fh=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479https://player.vimeo.com/video/1006365658%3Fh=e210d21863&badge=0&autopause=0&player_id=0&app_id=58479

Exploring Instance Clone

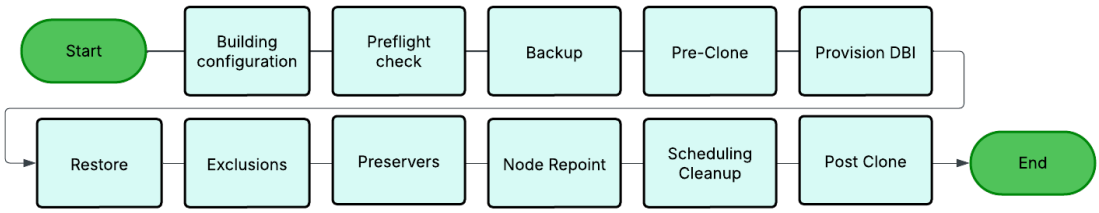
Explore how to use a clone to copy everything in a database from one instance to another.

Instance Clone overview

Clone copies data and configuration from a source instance to a target instance, overwriting the target. After a clone, your environment closely resembles the source instance and allows you to safely test changes. Sub-production instances drift from production over time; clone resets that divergence.

Common use cases include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Validating upgrades
- Testing new applications
- Testing new capabilities

Clone data is sourced from the most recent daily backup of the source instance.

For clone terminology and definitions, see Clone terminology.

Instance Clone workflow

Instance Clone workflow diagram

1. Clone build configuration: Basic definitions, configurations, and profile options are prepared. Data to be included, excluded, or preserved is verified.
2. Preflight checks: The clone checks the source and target instances to verify that they are in a healthy state before proceeding with the clone.
3. Backup: Uses the latest daily backup. If there were major recent changes, a new backup is created. You can also trigger a new backup manually by selecting **On-demand backup** in the **Clone Admin Console**.
4. Pre-Clone: Prepares space for the new database before restoring it.
5. Provision database instance (DBI): A new target instance is set up to receive the restored data.
6. Restore: The backup data is restored to the new target instance.
7. Exclusions: Tables marked for exclusion are deleted.
8. Preservers: Data is preserved from the old target (pre-clone instance) and is copied to the new target instance.
9. Node repoint: The system switches from the old target to the new clone without user disruption.
10. Scheduling scripts: Cleanup scripts run in the global scope. Cleanup scripts are defined on the source instance. Make any changes to them before the Restore phase starts so the changes apply to that clone request.
11. Post Clone: The post-clone phase sets up the target instance after the clone completes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. Cleanup Scripts: Cleanup scripts run on the target instance after the Post Clone phase is Completed and the clone is fully complete. To view script status, go to the Clone Status page on the source instance with Multi-Instance View enabled, or select **View on target instance** from the same Clone Status page. For more information, see Monitor cleanup script execution.

Instance Clone users

User	Description	Applies to
Clone Administrator	Users with the *clone_admin* role can request, cancel, or schedule clones, and manage clone profiles.	Source
OAuth Administrator	Users with the *oauth_admin* role on the target instance perform the one-time OAuth setup required to register that instance for cloning. After OAuth setup is complete, users submitting clones to that target instance only require the *clone_admin* role. Reconfiguration is not required unless OAuth authorization is reset.	Target
SOAP user	Users with the *soap* role can perform all SOAP operations using basic authentication. The identity type for basic authentication is machine.	Source and target

Instance Clone benefits

Benefit	Feature
Tidy up data with exclusions and preservers for specific clone scenarios.	
Establish consistent clone outcomes with clone profiles and registered instances.	Configuration
Copy data from a production instance to a non-production instance or to copy data between non-production instances.	Request a clone

Instance Clone use cases

Clone to a different version

You can clone between instances that are on different family release versions. During a clone, the source version replaces the target version. For example, if you clone from Source (Zurich) to Target (Yokohama) the target will match the source after the clone and be on Zurich release.

Clone from a backup

The clone uses data from the most recent, daily backup of the source instance when cloning. Backups that are used for cloning are a maximum of 36 hours old. A clone from backup starts only at the date and time processing that it's scheduled to start.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the source and target instances are on different versions of the ServiceNow AI Platform, the target instance is modified to match the source instance version during this time.

When starting a clone from a backup, the Clone log displays the date and time the backup was taken. Periodic progress messages also appear in the Clone log at the bottom of the clone status page.

Clone over production instances

As long as the system property *glide.db.clone.allow_clone_target* is TRUE, an instance can serve as a clone target. Ensure the property *glide.db.clone.allow_clone_target* is set back to FALSE after a production instance has served as a clone target. This prevents accidental clones over production in the future.

Note: Beginning with the Australia release, users attempting to access the legacy Instance Clone page, *clone_instance.do*, are redirected instead to the Clone Admin Console. To view clone history for clones prior to the Australia release, view the legacy Clone History [clone_instance] table.

For more information about using Clone Admin Console instead of the legacy Instance Clone, see KB1425858: Clone Admin Console: Quick Start Guide & Instructions.

Clone Admin Console

The Clone Admin Console is the user interface where administrators can manage, request, and monitor their instance clones.

Clone Activity

The Clone Activity tab is the default view when you open the Clone Admin Console. This tab displays a table of clone requests sorted by most recent, showing:

- **CHG** — Change request number
- **Source Instance** — The instance being cloned from
- **Target Instance** — The instance being cloned to
- **State** — Clone status (WIP, Complete, Error, Canceled, etc.)
- **Scheduled Date/Time** — When the clone is scheduled to run
- **Started** — When the clone began
- **Completed** — When the clone finished
- **Duration** — How long the clone took
- **Profile Name** — The clone profile used

Use the search bar to locate a specific clone. Filter options enable you to locate clones based on their status. To view a list of statuses, see Clone states.

The **Request Clone** button in the upper right allows you to initiate a new clone request.

Instance Overview

The Instance Overview tab lists all your instances and the date each instance was last cloned. Unlike Clone Activity, which lists every clone request, Instance Overview shows each instance only once, with the last clone date in a column. Use this page to quickly identify stale environments and prioritize refreshes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Help

The Help tab provides access to Now Assist for Clone, links to clone-related knowledge base articles, and the installed version of the Clone Admin Console app. Now Assist for Clone is available starting with the Australia Patch 2 release. For more information, see Clone help resources.

Configuration

The Configuration tab consolidates all clone-related settings in a single menu, including:

- **Overview** — Summary of clone instances and clone profiles
- **Exclusions** — Tables not copied during a clone
- **Preservers** — Data protected from being overwritten on the target instance
- **Cleanup Scripts** — Automated post-clone tasks
- **Clone Profiles** — Reusable templates for clone settings
- **Clone Instances** — Registered instances and their URLs
- **Multi-Instance View** — Consolidated clone activity across linked instances

For more information, see Configuration.

Request a clone

The clone request page contains guidance and explanations for how the various clone settings affect your clone. You can use the scheduling calendar to help prevent timing conflicts with ServiceNow maintenance windows.

The **Request Clone** button allows you to initiate a new clone request.

To learn more about how to request a clone see Request a clone.

Configuration

Use the Configuration menu to access all clone-related settings, including exclusions, preservers, cleanup scripts, clone profiles, and clone instances.

In the Clone Admin Console, all clone-related settings are consolidated under a single Configuration menu.

Note: The Definitions tab has been deprecated and consolidated into the Configuration tab. If you are upgrading from an earlier version, use the Configuration menu instead.

Before you begin

- You can add external email addresses to receive clone notifications.
- Some default items can't be removed from the exclusions, preservers, or scripts list.

Overview page

The Overview page displays a summary of all the configuration options in your instance.

Exclusions

The Exclusions page lists the tables that aren't copied during an instance clone. When excluding a table, the clone automation truncates the entire table including its child tables. The clone

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

process excludes (or removes) data from both the parent and the child tables. The child tables, however, aren't individually added to the list of excluded tables. Only the parent table is listed.

To view child tables of a table, you can go to the following link and input their table: *[instance].service-now.com/now/nav/ui/classic/params/target/generic_hierarchy_erd.do*.

By default, the system excludes tables for logging, auditing, notifications, workflow contexts, and license usage. To configure additional exclusions, see Exclude a table from cloning.

For information on guidelines when adding exclusions see General guidelines for excluding a table from cloning.

Preservers

The Preservers page displays a list of available data preservers, which are defined on the source instance. Preservers protect data on the target instance from being overwritten.

Preservers work differently compared to exclusions. When preserving a table, the clone automation doesn't automatically preserve the child tables. Therefore, the child tables must be individually added to the preserver list. To create a preserver see Create a clone preserver.

Note: Starting with RaptorDB, when you preserve a table, the clone automatically preserves the hierarchy and descendant tables. If you previously added child tables to preservers, they process normally. This automatic preservation applies only to RaptorDB instances.

Cleanup Scripts

The Cleanup Scripts page displays a list of all of your available scripts. Cleanup scripts automate post-clone tasks.

Set an order number on each script, to set the order that the active scripts run, with lower numbers having a higher priority. To run some scripts in parallel, you can assign the same order to them.

All cleanup scripts run in the global scope irrespective of the scope in which you have configured the cleanup script.

Post-clone cleanup scripts examples

Script	Description
Bad MID Server credentials after clone	Runs a script include called *BadMIDCredentialAfterClone* on a cloned instance to detect bad MID Server user credentials. This script include creates scheduled jobs that log MID Servers in the **Down** state to the MID Server Issue [ecc_agent_issue] table after an instance clone.
Clear scheduled job node association	Resets any scheduled jobs that were active on the source instance to the **Ready** state. This script also clears the value of the **System ID** and **Claimed by** fields on all scheduled jobs.
Configure Email Accounts	Migrates email accounts that existed on the source instance to the target instance if they aren't enabled there. This script also migrates the email properties to the target instance.
Disable emails	Disables email on the target instance. A default data preserver maintains other email settings from the target instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Post-clone cleanup scripts examples (continued)

Script	Description
Install deactivated plugin	Enables the Domain Separation plugin for instances that use this feature.
Regenerate all text indexes	Rebuilds text indexes on the target instance after a clone. Text indexes aren't cloned from the source to the target instance.

Note: Verify that any custom scripts have error-handling logic. By default, if one script encounters an error, the rest of the ordered scripts don't execute. Starting with the Australia Patch 5 release, you can view a link to cleanup script status. Any changes to cleanup scripts, which are defined on the source, must happen before the Restore phase of a clone to be processed within that clone request.

To create a cleanup script see Create cleanup scripts.

Clone Profiles

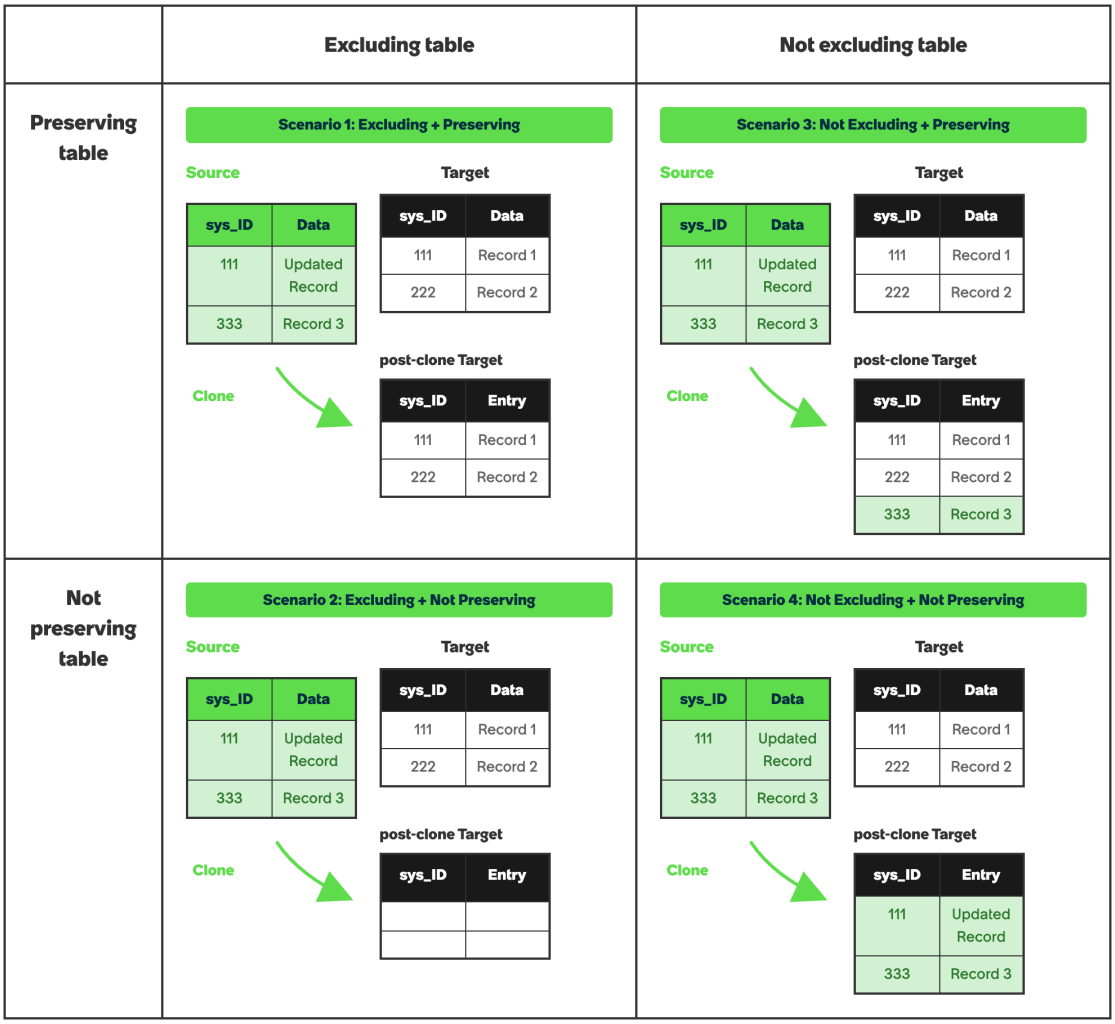
Clone Profiles display all available profiles. Clone profiles are reusable templates for clone settings and can be saved and reused to achieve consistent outcomes with each of your clones. To learn more about Clone Profiles, see Create a custom clone profile.

The profile System Profile is available by default and can't be modified. Custom profiles use the default Exclusions, Preservers, and Scripts from the System Profile. When creating a custom profile, all existing custom exclusions and preservers are automatically added.

You can create as many custom clone profiles as you'd like and edit them as needed. To change the definitions of a clone profile, such as exclusions, preservers, or cleanup scripts, select the number under the definition and select the **Edit** button on the page.

Clone Instances

The Clone Instances page displays registered instances and their URLs. You can use instances added to this list as a clone source or clone target for your clones. To add your non-production instance to your clone instances list, select **New**.



Multi-Instance View

The Multi-Instance View provides consolidated clone activity across linked instances. Multi-Instance View is included in Instance Clone.

Clarifying exclusions and preservers combinations

Clone exclusions and preservers are both useful for managing your data. The graphics help to identify the expected outcome of the following combinations of preservers and exclusion combinations. For more information, see the February 2025 Platform Fundamentals Academy session on Clone Admin Console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exclusion and preserver combinations

Scenario	Result
Scenario 1: Excluding + Preserving	Records on the target instance remain the same.
Scenario 2: Excluding + Not preserving	Records from the source instance aren't copied over and records on the target instance are removed. The table is empty but usable after the clone.
Scenario 3: Not excluding + Preserving	Records on the target instance remain the same and records from the source instance are copied over.
Scenario 4: Not excluding + Not preserving	Records from the source instance replace records on the target instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: During a clone, data from the source instances replaces data from the target instance. Therefore, any in-progress development work on the target instance is overwritten. For example: Work-in-progress update sets, scoped apps that only exist on the target instance but not on the source instance. If you have in-progress update sets, you must export them before the clone and re-import them after the clone is finished. Custom applications that aren't yet deployed to the source instance must be reinstalled after the clone is completed.

To learn more about clone and app development tips, see the Leveraging System Clones for Seamless Development and Deployment Whitepaper.

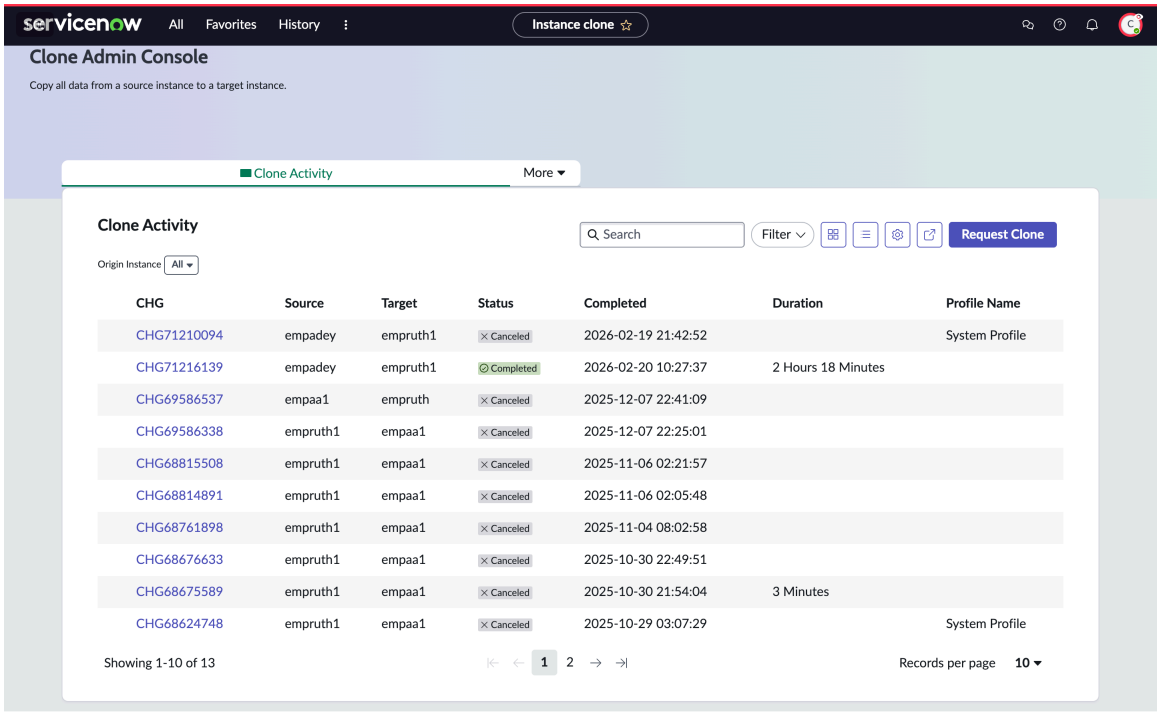
Multi-Instance View

Multi-Instance View enables you to monitor and manage clone operations across multiple linked instances from a single primary instance. Use it to view clone status, track refresh history, and view cleanup script status without logging into each instance separately.

Instance Clone Multi-Instance view

Use Instance Clone Multi-Instance View to manage clones centrally across multiple linked instances. Instead of logging into each instance individually, administrators submit clone requests, monitor status, and manage configurations from a primary instance.

Note: Connected instances require Australia Patch 2 or later on both the source and target instances.



Some of the key benefits of using Multi-Instance View are:

- View all clone requests across instances on the Clone Admin Console
- See which instances were last cloned and how recently

Consider enabling Multi-Instance View if you need:

- Centralized visibility into clone status and history across all instances
- Quick identification of stale instances needing data refresh
- View cleanup script status without logging into each instance separately, starting with the Australia Patch 5 release, when Multi-Instance View is enabled on both instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Once the Multi-Instance View feature is set up, you can view clone records from other instances from the **Origin Instance** option on the Clone Activity page and the **Instance Overview** page.

Clone help resources

The Help page in the Clone Admin Console provides access to clone documentation, Now Assist, and app version management.

Why Clone

Instance Clone is the out-of-the-box workflow for copying production configuration, code, and data to non-production instances. This provides a safe environment to develop and test new capabilities or upgrades before deploying to production.

Learn more

The Help page includes the following curated links to clone resources:

- Clone Basics
- Clone Tips and Tricks
- Clone FAQs
- Product Documentation

Now Assist for Clone

Select the Now Assist icon in the top right corner of the page to ask clone questions and get answers on clone setup, configuration, and more. If the icon isn't visible, visit the Now Assist KB or contact your ServiceNow account team.

To use Now Assist for Clone, the following are required:

- Now Assist license activated on your instance
- Australia Patch 2 or later

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: If you purchase a Now Assist license after initially installing the Clone Admin Console, you must reinstall the Clone application from the store to enable the Clone FAQ Agent skill. This is a one-time step that loads the clone-specific skill into Now Assist.

Check for update

The Help page displays the current version of the Clone Admin Console app and whether it is up to date. Select **Check for updates** to check for a newer version. The page also shows the date and time of the last sync with the store.

Note: The **Check for updates** option applies only to the Clone Admin Console app. It doesn't check for or apply the family upgrade for the instance.

OAuth 2.0 authentication for clone targets

OAuth 2.0 authenticates clone requests to target instances without requiring a local admin account, enabling you to use your existing login credentials.

Why OAuth 2.0 replaces basic authentication

Previously, Instance Clone used basic authentication to confirm access to a target instance. This required maintaining a local admin account specifically for cloning and entering those credentials for each clone request.

The OAuth 2.0 Authorization Code Flow enhances security and convenience by providing the following benefits:

- No local admin account required - use your existing login credentials, including SSO.
- One-time target instance registration.
- Automatic token generation and expiration for each clone request.

How it works

The source instance acts as the OAuth client, and the target instance acts as the OAuth authorization server. Authentication happens once per target instance during setup and repeats only if the session expires or is revoked.

During setup, the target instance generates a Client ID that uniquely identifies the source instance as an authorized OAuth client. Administrators copy this Client ID and return it to the source instance to complete registration.

After setup is complete, Instance Clone uses a short-lived JSON Web Token (JWT) access token to authenticate each clone request to the target. The source instance obtains this token automatically before each clone operation.

The clone_admin role is required on the source instance to request clones. The oauth_admin role is required on the target instance during initial setup only.

Token lifecycle

The JWT access token has a short time-to-live (TTL) and expires automatically after each use. If a token expires, the system automatically redirects the user to reauthorize on the target instance from the Clone Admin Console before a clone can be requested.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic Auth fallback

Basic Auth is available only as a fallback when the OAuth flow fails. Because of recent platform-wide authentication changes, using Basic Auth to authenticate the clone target requires that the target-instance user have:

- the clone_admin role
- the soap role
- identity_type set to machine on the user record

Warning: Users with **identity_type** = machine can no longer log in to the instance UI. This configuration supports Basic Auth for automated and integration traffic only. The **identity_type** field may not appear on the User form by default. If it isn't visible, add it temporarily using Form Layout.

One-time setup per target instance

OAuth setup is required once per target instance. No re-registration is required for routine clone requests. If a token expires, the system prompts you to select **Authorize** on the target instance before you can place a clone request.

For more information, see Set up OAuth authentication for a clone target.

Configuring Instance Clone

Register your instance for cloning and create a custom clone profile.

Configuration overview

1. Register an instance for cloning before requesting your clone.

   A clone target record specifies the instance URL and credentials used for cloning.

2. Create a custom clone profile.

   Clone profiles enable you to select the correct exclusions and preservers for your clone.

3. Create a clone preserver.

   Create clone preservers to protect data on the target instance from being overwritten.

4. Exclude a table from cloning.

   Exclude a table to create an empty but usable table on the target instance.

5. .

   Use cleanup scripts to automate post-clone steps or to modify data after your clone.

Register an instance for cloning

Register your target instance before requesting your clone. OAuth authentication is the recommended method and requires a one-time setup per target instance.

Before you begin
Role required: clone_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:

For OAuth-based registration (recommended), the target instance must run an OAuth-capable version of the Clone Admin Console. OAuth clone target authentication requires Australia Patch 5 or later on both the source and target instances. This registration method does not require admin credentials for each clone request.

About this task

You can register a target instance from the Clone Admin Console or during a clone request. Registration creates a connection profile that identifies the target instance for cloning.

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Home**.
2. Navigate to **Configuration** > **Clone instances**.
3. Select **New**.
4. In the **Target Instance** field, enter the target instance URL and select **Continue**.
   The system runs a version compatibility check to determine which authentication method to use.
5. Choose an authentication method:
   - **OAuth (recommended):** Select **Setup OAuth on Target** and follow the OAuth setup workflow. See Set up OAuth authentication for a clone target for detailed steps.
   - **Basic authentication (fallback):** If the target instance does not support OAuth, enter credentials for a user account with the clone_admin and soap roles. Ensure the user's identity_type is set to machine on the user record.
6. Select **Save** or **Add Target** (depending on authentication method).
   The target instance is registered and ready for clone operations.

Result

The target instance is configured and registered for cloning.

What to do next

To submit a clone request to the registered target, see Request a clone.

Register target instance (legacy)

A clone target record specifies the instance URL and credentials used for cloning.

Before you begin

Role required: clone_admin
If an error occurs while registering a target instance see Troubleshooting for registering target instance.

Procedure

1. Navigate to **All** > **Instance Clone** > **Clone Targets**.
2. Select **New**.
3. Enter the URL for the receiving instance (target).

   The system validates the instance enables clone targets and that High Availability Cloning is active.

4. Enter the basic authentication credentials for a user account with the admin role on the target instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To clone multiple targets from one source, you must raise separate clone requests for each target.

The system validates the user credentials have `clone_admin and soap` access to the target instance.

5. Select **Submit**.
   The system checks connectivity and validates the user credentials against the target instance.

Set up OAuth authentication for a clone target

Complete a one-time OAuth setup to register a target instance for cloning. This process generates a Client ID on the target instance and authorizes the connection from the source instance.

Before you begin

Both the source and target instances must be on Australia Patch 5 or later to use OAuth target authentication.

Roles required:

- Source instance: clone_admin
- Target instance: clone_admin and oauth_admin

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Home**.
2. Navigate to **Configuration** > **Clone instances**.
3. Select **New**.
4. In the **Target Instance** field, enter the target instance URL and select **Continue**.
   The system runs a version compatibility check.

   Trouble?

   If the target instance doesn't support OAuth authentication, the system falls back to basic authentication. The target-instance user must have:

   - the clone_admin role
   - the soap role
   - identity_type set to machine on the user record

   Warning:

   The **identity_type** field may not appear on the User form by default. If it isn't visible, add it temporarily using Form Layout.

   Users with identity_type = machine can no longer log in to the instance UI. This configuration supports Basic Auth for automated and integration traffic only.

   recommends using OAuth for cloning. For more information, see Troubleshooting for registering target instance.

5. Select **Setup OAuth on Target**.
   The target instance opens in a new browser tab.
6. On the OAuth setup page, select **Set up OAuth**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The page generates a Client ID.

Trouble?
If the Client ID is not generated, verify that you have the oauth_admin role on the target instance and that the page loaded completely before selecting **Set up OAuth**.

7. Copy the **Client ID**.
8. Return to the source instance browser tab.
9. In the **Client ID** field on the Add Clone Target form, paste the Client ID.
10. Select **Add Target**.
    The browser redirects to the target instance to complete authorization.
11. Select **Allow** to grant consent.
    If your session has expired, log in to the target instance before granting consent.
    The browser redirects to the source instance.

Trouble?
If the browser doesn't redirect to the source instance, return to the Clone Admin Console and select **Reset OAuth or Retry** to restart the authorization.

Result
The target instance is registered and authorized for clone requests.

What to do next
- To submit a clone request to the new target, see Request a clone.
- To reset or re-authorize OAuth for this target, see .

Reset OAuth for a clone target

Reset OAuth authentication for a clone target if you receive an authentication error on the clone request form.

Before you begin
The target instance must run an OAuth-capable version of the Clone Admin Console.

Roles required:

- Source instance: clone_admin
- Target instance: clone_admin and oauth_admin

About this task
If you receive an authentication error on the clone request form, the Clone Admin Console displays an Authenticate dialog with the option to reset OAuth. Resetting OAuth reauthorizes the target instance.

Procedure
1. In the Authenticate dialog, select **Reset OAuth**.
   The target instance opens in a new browser tab and displays the OAuth setup dialog.
2. Select **Set up OAuth**.
   The page generates a new client ID.

Trouble?
If the client ID is not generated, verify that you have the oauth_admin role on the target instance and that the page is loaded completely before selecting **Set up OAuth**.

3. Copy the client ID and return to the source instance browser tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Paste the client ID in the **Client ID** field.
5. Select **Complete Setup**.
   The Authorization Required dialog is displayed.
6. Select **Proceed**.
   The browser redirects to the target instance to complete authorization.
7. Select **Allow** to grant consent.
   If your session has expired, log in to the target instance before granting consent.
   The browser redirects to the source instance to submit the clone request.

Result
The target instance is reauthorized.

What to do next
To submit a clone request to the reauthorized target, see Request a clone.

Create a custom clone profile

Clone profiles act as reusable clone templates to establish consistent clone outcomes. Clone profiles enable you to set up exclusions, preservers, and cleanup scripts for specific clone scenarios.

Before you begin
Role required: clone_admin or clone_profile_admin

Here are a few basics about clone profiles:

- Clone profiles can be duplicated via the clone admin console when opening any clone profile.
- The system profile is provided by default and can't be changed.
- You can choose to prepare different profiles for individual use cases. For example, a different profile for upgrades, dev testing, IT app testing, HR app testing and so on.

Procedure
1. Navigate to **All** > **Clone Admin Console** > **Home**.
2. Navigate to **Configuration** > **Clone Profiles**
3. Select **New**.
4. Fill in the new clone profile form.

Create a custom clone profile (legacy)

Clone profiles enable you to set up exclusions, preservers, and cleanup scripts for specific clone scenarios.

Before you begin
Role required: admin

About this task
If you leave the clone profile field empty when requesting a clone, the system uses the exclude tables, data preservers, and cleanup scripts configured under **Clone Admin Console** > **Clone Definition**.

Procedure
1. Navigate to **All** > **Clone Admin Console** > **Clone profiles**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Complete in the form.
   For field information, see Clone options.
4. Select **Submit**.
   If you create a data preserver, exclusion, or cleanup script, it isn't automatically added to your clone profiles.
5. **Optional:** To add a preserver, exclusion, or cleanup script to a clone profile.
   a. Navigate to **Additional actions** > **Configure** > **Form Layout**.
   b. Add the preserver, exclusion, or cleanup script to the selected list.

Create a clone preserver

Create clone preservers to protect specific data on the target instance from being overwritten during a clone operation. Preservers allow you to retain existing target data while cloning source data for other tables.

Before you begin

Role required: `clone_admin`

Preserving large amounts of data can significantly increase your clone duration. When creating a preserver, use conditions to preserve only the data that you need. See General guidelines for excluding a table from cloning for optimization strategies.

Tip:

If you have custom applications, you must also manually preserve unpublished application content separately.

About this task

The **Preservers** tab displays a list of all available data preservers. Each preserver defines a table and optional conditions that protect specified data on the target instance from being overwritten during a clone.

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Home**.
2. Select **Configuration** from the secondary navigation bar.
3. On the **Preservers** page, select **New**.
4. Enter a descriptive label in the **Name** field to identify this preserver.

   Use a descriptive name that clearly identifies the table and its purpose. For example: "Firewall Devices CMDB" or "User Preferences Data". This name appears in the Preservers list for easy identification.

   Note: The data preserver must have a table selected before it can be submitted.

5. Select the **Table** to be preserved.
6. Select the **Theme** check box if the data being preserved is a UI property.
7. Define the data to be preserved using the **Condition builder**, and select **Save**.
   The preserver is created and saved. A success message confirms the creation.

Result

The clone preserver is now active and will protect the specified data from being overwritten during any future clone operations that target this instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
To view all active preservers, return to the **Preservers** tab. To use this preserver in a clone request, it will be automatically applied based on your clone profile configuration.

Preserve data during an instance clone

Data preservers copy specified data to a target instance.

Before you begin
Database views can't be preserved.
Role required: clone_admin

About this task
Where to perform this task: You must define data preservers on the **source instance** before initiating a clone. The preserved data is extracted from the source instance and restored on the target instance after the clone completes.

Data preservers retain system settings and themes, such as instance-specific authentication settings from the source instance. Don't use data preservers to transfer large sets of data, such as user groups. If you must preserve table data such as users, groups, and roles, consider exporting the records to a file and importing it after the clone is complete.

Warning:

If you attempt to create a preserver on the target instance instead of the source instance, the configuration will not work as intended. No data will be preserved during the clone. Always verify you are working on the source instance before proceeding with these steps.

Procedure
1. On the source instance, navigate to **All** > **Clone Admin Console** > **Clone Definition** > **Preserve Data**.

   Tip:

   Verify you are on the source instance (the instance you are cloning FROM, not cloning TO). You can confirm this by checking the instance name in the top-right corner or in the URL.

   You are now on the Clone Data Preservers page on the source instance.
2. Select **New**.
3. Enter a descriptive **Name** for the preserver.
   Use a descriptive name that identifies the table and its purpose. For example, use "User Preferences" for the `sys_user_preference` table or "Firewall Devices CMDB" for a custom table. This name helps you identify the preserver in the list. The data preserver must have a table name or it can't be submitted.
4. Select the **Table** to be preserved.
   The data preserver must have a table selected or it can’t be submitted.
5. Select the **Theme** check box if the data being preserved is a UI property.
6. Define the data to be preserved using the Condition Builder.
   Use conditions to define records to preserve during a clone. For example, to preserve specific system properties, add conditions for each property name to preserve.

   Note: The condition to match regular expressions [match regex] isn't supported.

7. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to delete the data preserver later, make sure not to modify or delete the following data preserver records:

- Core Instance Properties
- Semaphores
- Email Accounts

Result
The data preserver is created on the source instance and will be applied to future clone operations. The preserved data will be retained and restored to the target instance after the clone completes.

What to do next
After creating data preservers on the source instance, you can now request a clone. See Request a clone for information on submitting a clone request. The configured preservers will be automatically applied based on your clone profile.

Exclude a table from cloning

Exclude a table to create an empty but usable table on the target instance.

Before you begin
Role required: clone_admin
For information on excluding a table from cloning, see General guidelines for excluding a table from cloning.

Procedure
1. Navigate to **All** > *Clone Admin Console* > **Clone Home**.
2. Select the **Configuration** tab.
3. Select **Exclusions**.
4. Select **New**.
5. Enter the table **Name**.

   Note: Entering a parent table results in the clone process also excluding its child tables. For example, excluding the task table would also exclude the Change, Incident, and Problem tables.

6. Select **Save**.

Exclude a table from cloning (legacy)

Exclude a table to create an empty but usable table on the target instance.

Before you begin
Role required: clone_admin

For information on excluding a table from cloning, see General guidelines for excluding a table from cloning.

About this task
Data is removed during the exclusion substage before the node repoint. The data is removed before the instance becomes available to users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Definition** > **Exclude Tables**.
2. In the Clone Exclude Tables page, select **New**.
3. Enter the table name in the **Name** field.

   Note: Entering a parent table results in the clone process also excluding its child tables. For example, excluding the task table would also exclude the Change, Incident, and Problem tables.

4. Select **Submit**.

Create cleanup scripts

Use cleanup scripts to automate post-clone steps or to modify data after your clone.

Before you begin

Role required: admin

Verify that custom scripts have proper error handling to avoid issues. Without proper error handling, failing customized scripts can help prevent subsequent scripts from executing.

Note: After your clone completes, you can monitor the execution status of each cleanup script on the target instance. See Monitor cleanup script execution.

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Home**.
2. Select **Configuration** from the secondary navigation.
3. Select the **Cleanup scripts** tab.
4. Select **New**.
5. Enter a name for your script.
6. Select the order number for your script.
7. Check **Active** when your script is ready.
8. Enter your script in the **Script** field, and select **Save**.

Example: Disable emails

To create a cleanup script to disable emails, do the following.

- Select **New** on the cleanup scripts tab.
- Add the name `Disable emails`.
- Check **Active**.
- In the script field, add

```
gs.setProperty("glide.email.read.active",
 false);gs.setProperty("glide.email.smtp.active", false);
```

.

- Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
After your clone completes, go to the target instance to monitor cleanup script execution and retry any failed scripts. See Monitor cleanup script execution.

Monitor cleanup script execution

Monitor the execution status of cleanup scripts after a clone and retry any scripts that encountered errors.

Before you begin
A clone must have completed before cleanup script execution data is available.

Both the source and target instances must be on Australia Patch 5 or later to use OAuth target authentication and view cleanup script status.

Role required: clone_admin

About this task
You can monitor cleanup script execution directly from the source instance using Multi-Instance View. This approach enables you to view cleanup script status without logging in to the target instance.

You can also view the execution status on the target instance.

Procedure
1. Enable Multi-Instance View on the source instance to view cleanup script execution across linked instances.
   For information about enabling Multi-Instance View, see Configuration.

   Alternatively, log in to the target instance and navigate to **Cleanup Script Execution**.
2. Navigate to the Clone Status page for the completed clone request.
   In the Clone Admin Console, select the clone request from the Clone Activity tab to open its Clone Status page.
3. Select **Show cleanup scripts** to expand the Post-clone Cleanup Scripts section.
   The Post-clone Cleanup Scripts section displays the status of cleanup scripts running on the target instance after the clone.
4. Select **View on target instance** to open the Cleanup Script Execution page on the target instance.
   The page displays a list of all cleanup scripts and their current execution state.
5. Review the **State** column for each script.
   For a description of each state, see Clone states.
6. If one or more scripts show a state of **Error**, select **Resume all remaining scripts** to re-run all failed scripts and continue with any remaining scripts.
   A confirmation modal displays: "This will re-run all failed scripts and continue with remaining scripts. After scripts start, they can't be canceled from the user interface."

   Trouble?
   If **Resume all remaining scripts** is not available, verify that at least one script has a state of **Error**.
7. Select **Resume all remaining scripts** in the confirmation modal to confirm.
   Failed scripts return to **Executing** state. The **Runs** column increments by 1 for each retried script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Cleanup scripts resume execution. Monitor the **State** column to confirm scripts reach **Completed** state.

What to do next
To persist fixes for future clones, update the cleanup script on the source instance where it is defined. See .

Set up Multi-Instance View

Configure Multi-Instance View to see consolidated activity across all connected instances.

Before you begin
Role required: clone_admin on primary instance.

Procedure
1. Navigate to **All** > **Clone Admin Console** > **Clone Home** > **Configuration**.
2. Select **Multi-Instance View** link.
3. Enable the **Multi-Instance View** option to view consolidated activity across all connected instances

   Clear the option to disable the Multi-Instance View feature. Re-enabling Multi-Instance View feature will restore your previous settings without losing your configuration.

Request a clone

Request a clone to copy data from a production instance to a non-production instance or to copy data between non-production instances.

Before you begin
Role required: clone_admin

Note:

Configure a clone profile. See Create a custom clone profile.

For self-hosted customer instances that use an Oracle database, see https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB0563847 .

About this task
The ServiceNow AI Platform uses data from the most recent, daily backup of the source instance when cloning. Backups that are used for cloning are a maximum of 36 hours old. The initial preparation begins, including selecting the latest backup to use, only at the date and time processing is scheduled to start.

Procedure
1. Navigate to **All** > **Clone Admin Console** > **Request Clone**.
2. On the form, fill in the fields.

Clone request form

Field	Description
Source instance	The original database where data is copied from.
Target instance	The new location where the data is copied to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can add an instance or select an existing instance without leaving the page.
Clone Profile	Apply a clone profile that you created previously. All exclusions, preservers, and scripts you added to the profile are applied to the clone request. If clone profile is left empty the system will pull in all available preservers, exclusions and cleanup scripts **Note:** If **default** is checked on the clone profile, the clone request loads this profile every time you open the clone request page.
Lock settings at the time of clone request	If you use a clone profile, this option locks the settings and options at the time of the clone request. Any subsequent changes to the clone profile, regardless of when the clone runs, don't affect the clone request.
Clone Scheduled Start time	The start time to begin cloning your instance. After you select a start time, the form displays the estimated duration and estimated completion time of the clone. See Schedule recurring clones. **Note:** You may schedule multiple clones to the same target instance as long as they are scheduled at least five days apart. If two clone requests for the same target fall within a five day window, the system will return an error to prevent overlap. If a time you need is unavailable, check for any scheduled maintenance, upgrades, or existing clone requests affecting the relevant instances.
○ Email updates about this clone ○ External email address	The email or emails to be notified of the clone process and clone completion.

3. Select the hyperlinked number under each item in the definitions section to review your exclusions, preservers, and cleanup scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the options to configure for your clone.

   Note: For information on all available options see Clone options. For information on general guidelines to expedite your clone request see General guidelines for optimizing your clone duration.

5. Select **Continue**.
6. Review your clone request summary.
   If other clone requests involve the same target instance within 30 days, they appear highlighted in yellow. Review these requests for potential conflicts before submitting.
   The Clone request summary page displays the estimated clone duration, based on the scheduled start time and the size of the data to be copied to the target instance. For a new source-target pair, the estimate may be higher than expected and becomes more accurate after additional clones between the same instances.
7. Select **Confirm and Submit Clone Request**.

Managing Instance Clone

You can use Instance Clone to request, cancel, schedule, or modify clones.

Cancel a clone

You can cancel a clone that is scheduled, requested, or in progress until the Node Repoint state. Canceling a clone retains the target instance as-is in its pre-clone state with its original data.

Before you begin

Role required: clone_admin

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Home**.
2. Select the tile of the clone that you must cancel.
3. Select the **Cancel** option on the page.
4. Select a reason for the cancellation.
5. Select **OK**.
   The system stops any current clone activities and sets the **State** to **Canceled**.

Cancel scheduled clones (legacy)

Scheduled clones can't be modified, you must cancel scheduled clones and resubmit the clone schedule.

Before you begin

Role required: clone_admin

Procedure

1. Select **Instance Clone** > **Active Clones** > **<one-of-your-clones>**.
2. In the **Related Links**, select **Cancel Clone**.
   Clones can only be canceled up to Node Repoint stage. The clone can be rolled back once it completes.
   The system stops any current cloning activities and sets the **State** to **Canceled**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Handling a large amount of in-progress update sets

Batch in-progress update sets before a clone to preserve active development work across source and target instances.

Before you begin

Role required: clone_admin

Procedure

1. On your target instance, which has the work in progress (WIP) update sets, filter to obtain a list view with all your WIP update sets.
2. In a separate window/tab, create an update set.
3. How to mass-update: Hold down the shift key + selecting the whole column with your mouse device.
4. Double select any of the fields in the selected column and enter the desired value to update all of them to that value.
5. Set the parent field on your list of WIP update sets to the new batch update set.
6. Update the parent update set to "Completed" and give it an identifiable name, such as `"CLNREQ_DATE"`.
7. Export the parent update set.
8. On your source instance, retrieve the update set.

   Important: Don't commit!

   The parent update set is added to the retrieved update sets on your source instance.
9. Wait 24 hours until your update set is captured by the daily backup.
   You can also select an on-demand backup on the Clone Admin Console.
10. Perform the clone as usual from your source instance to target instance.
    Because your parent update set has been retrieved in the backup. Your target instance will have your parent update set along with your dev work that is in flight after the clone.
11. On the target instance, set the parent update set back to work in progress, and unparent it.
    Removing the parent update set enables you to continue only importing and exporting your in-progress work.
12. On the source instance, the retrieved parent update set can be cleaned up or deleted.

Roll back a clone

Roll back a clone to remove the latest cloning updates on a cloning target if a mistake was made or an error has occurred.

Before you begin

Role required: clone_admin

You can only roll back the updates made with the last clone. Rollbacks must occur no more than seven days after the clone. If the instance is sharded, rollbacks must occur no more than two days after the clone.

Procedure

1. Navigate to **All** > *Clone Admin Console* > **Clone Home**.
2. Select the tile of the clone that you must roll back.
3. Select the **Rollback** option on the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule recurring clones

Schedule recurring clones to keep your cloned instances up to date.

Before you begin
Role required: clone_admin

About this task
Instead of manually cloning instances, you can schedule cloning that happens automatically. You create a cloning schedule in the same interface that you use to create a clone.

Note: The system limits the number of future clones you can schedule at once. The following are the maximum allowed scheduled clones by frequency:

- Every 4 weeks: 7 occurrences
- Every 2 weeks: 13 occurrences
- Weekly: 25 occurrences

Procedure

1. Select **Clone Admin Console** > **Request Clone**.
2. Select your source instance and target instance for the clone.
3. Select a clone profile.
4. Select the calendar icon ( ).
5. Select a time slot for your instance to be cloned.
6. Select **Schedule**.
7. In the clone frequency option, select the frequency for your clone.
8. Enter the total number of clones to occur.
9. Finish filling out the request form and select **Continue**.

View the clone history page (legacy)

You can view the status and history of any instance clone request.

Before you begin
Role required: clone_admin

About this task
The `clone_instance` table stores records for all previously and currently scheduled clones.

Procedure

1. Navigate to **All** > **System Clone (legacy)** > **Clone History (legacy)**.
   Clone history also displays the **State** for current and past clones. Clones in the **Draft** state don't appear on the clone history table. For more information see Clone states.

   The **System Clones** list opens. Requests submitted from the Clone Admin Console appear on the **Clone Home** page instead.
2. Select a clone ID to view its history.

View clone status (legacy)

View the status of a legacy clone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: clone_admin

Procedure

1. Navigate to **All** > **Instance Clone** > **Live Clones** > **Active Clones**.
   The system displays the list of currently active clones.
2. Select a clone.
3. Under **Related Links**, select **Check Clone Status**.
   The system updates the **State** field and produces a log entry in the **Clone Log** that shows the status of the clone.

   If an error occurs, you might roll back clone and schedule recurring clones. For more information see Clone states.

Manage Multi-Instance View

Manage a consolidated view of clones across all your instances and clone status

Before you begin
Role required: clone_admin. Multi-Instance view is enabled.

Procedure

Navigate to **All** > **Clone Admin Console** > **Clone Home**.

Result
The Clone Activity section displays all instances in your Multi-Instance View configuration.

Filter and sort instances

Filter and sort the instance list to find specific instances and customize the display format.

Before you begin
Role required: clone_admin. Multi-Instance view is enabled.

Procedure

1. Filter instances by source using the **Origin Instance** list.
   Use the **Origin Instance** drop-down to view instances by their clone source.
2. Filter instances by status using the filter icon.
   Use the **filter** icon to view instances by their status.
3. Sort the instance list by selecting any column header.
   Default sort is Most Recent to show most recently cloned instances first.
4. Change the instance display format using the view icons.
   - Select the **grid** icon to view the instance list as a grid.
   - Select the **list** icon to view the instance list as a list. The list view allows customizing the columns displayed. Select the **gear** icon to configure the columns.

Result
The Instance List shows each instance with the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance list columns

Column	Description
CHG Number	Change request associated with the clone request
Source Instance	Which instance serves as source for the clone operation
Target Instance	Which instance is cloned to
State	The current status of the clone activity
Scheduled Date/Time	The scheduled timestamp of the clone activity
Clone start time	The starting timestamp of the clone activity
Estimated End Time	The estimated end timestamp for completing the clone activity
Duration (for completed actions)	The duration taken for the clone activity

Add an instance to Multi-Instance View

Manage Instance Clone operations across multiple linked instances.

Before you begin
Role required: clone_admin

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Home** > **Configuration**.
2. Select **Multi-Instance View** link.
3. Select **Add Instance** in the Instances list.
4. Select the instance from the drop-down of available instances linked to your account.
5. Select **Add**.
   The instance is now included in your centralized view. It will appear on your Clone Homepage with its status.
6. Select **Set Up Trust** to set up a trusted relationship between the instances.
7. Select **Done** to complete adding the instance.

Result
The instance is now included in your centralized view. It will appear on your Clone Homepage with its status.

Remove a connected instance from Multi-Instance View

Remove a connected instance from Multi-Instance View

Before you begin
Role required: clone_admin

Procedure

1. Navigate to **All** > **Clone Admin Console** > **Clone Home** > **Configuration**.
2. Select **Multi-Instance View** link.
3. In the **Connected Instances** section, click **Remove Trust** from the instance you want to remove from Multi-Instance View.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The instance is removed from your centralized view. This does not delete the instance itself; you can add it back later if needed.

Preserving data from target instances during clones

You can use data preservers to protect data on the target instance from being overwritten. If you have custom applications, you must also manually preserve unpublished application content.

Data preservers

Sometimes, it is necessary to preserve some data on an instance targeted for cloning. For example, if the target is a MID Server, you must not overwrite the MID Server [ecc_agent] table. Preserved data is reapplied to the target instance after exclusions are completed.

Warning: You must define data preservers on the source instance. Defining them on the target instance does not preserve the data.

Data preservers typically preserve system settings and themes, such as:

- Instance-specific authentication settings
- Bookmark [sys_ui_bookmark]
- Recent Selection [sys_ui_recent_selection]
- User Preference [sys_user_preference]

Note: A clone does not support preserving data from a database view.

Preserving a parent table also preserves all of its child tables. For clones between MariaDB instances, child tables aren't automatically preserved and must be manually added to the preserver list.

Don't use data preservers to transfer large sets of data, such as user groups. If you must preserve table data, such as users, groups, and roles, consider exporting the records to a file and importing them after cloning.

Data preservers for Multi-SSO

The system automatically creates the necessary data preservers for cloning when you activate Multiple Provider Single Sign-On integration.

Name	Table	Conditions
Certificate	X.509 Certificates [sys_certificate]	None
Core Instance Properties	System Property [sys_properties]	• [OR] [Name] [is one of] [glide.authenticate.external, glide.authenticate.external.logout_redirect] • [OR] [Name] [starts with] [com.snc.integration.saml_esig] • [OR] [Name] [is one of] [glide.smtp.port, glide.smtp.auth, glide.smtp.encryption] • [OR] [Name] [starts with] [glide.authenticate.multisso] • [OR] [Name] [is] [glide.authenticate.sso.redirect.idp]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Table	Conditions
		Note: The properties *glide.smtp.port*, *glide.smtp.auth*, and *glide.smtp.encryption* are deprecated.
Digest Properties	Digest Properties [digest_properties]	None
Identity Providers	Identity Providers [sso_properties]	None
SAML2 Update1 Properties	SAML2 Update1 Properties [saml2_update1_properties]	None

Note: Although you can modify these data preservers, it is good practice not to. The Digest Properties [digest_properties], Identity Providers [sso_properties], and SAML2 Update1 Properties [saml2_update1_properties] tables are required for multiple source, single sign-on (SSO) to function properly. If multiple source, single sign-on is disabled on the target instance, you can safely remove all three data preservers. Remove them at the same time, as the system terminates the clone with an error message when you attempt to clone with one or two of these tables being preserved.

Preservation of unpublished applications

You can't use data preservers to save unpublished applications. Instead, application developers must choose how they want to preserve unpublished applications.

The cloning process does not preserve version differences for applications in development. Instead, the system clone only copies the application version installed on the source instance onto the target instance. If the target instance had a development version of the same application, the application is editable after the clone, but maintains the version installed on the source instance. If the application was missing from the source instance, the cloning process deletes the application from the target instance.

Instance Clone reference

Reference topics provide information about clone options, clone states, and terminology.

Clone options

A reference topic that contains various configurations for your data when requesting a clone.

Clone options when requesting a clone

Field	Description
Lock settings for this clone request	If you use a clone profile, this option locks the settings and options at the time of the clone request. Any subsequent changes to the clone profile, regardless of when the clone runs, don’t affect the clone request. This option isn’t selected by default.
Amount of data copied from the Task table	Limits the number of days of historical data for the task table and its child tables (for example Incident, problem, and change tables). Options are Full or Last 90 days. The default is Full.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clone options when requesting a clone (continued)

Field	Description
	To reduce clone time, consider excluding large tables altogether. When excluding tables, your target instance has the same table schema and hierarchy (empty usable tables) as the source instance. The default setting is to clone all data from the task table and its child tables to the target instance.
Clone frequency	This option enables you to schedule recurring clones from your source to your target instance. It enables you to define the clone frequency and the maximum number of occurrences. By default, the clone frequency is set to None. • None • Weekly • Every 2 weeks • Every 4 weeks
Backup options	Specifies which backup the clone request uses. • Most recent: The clone uses the latest nightly backup, unless an upgrade or a major change to the instance occurred. • On-demand backup: The backup begins at your specified clone start time. Your clone will only begin after the backup completes, pushing back the time at which the cloning process can start.
Exclude tables specified in Exclusion List	Helps to prevent cloning records from tables on the source instance, which are listed under#**Clone Admin Console** > **Configuration** > **Exclude Tables**. If a table is on the Exclusion List, the clone excludes the records on the table as well as records on the child tables. When excluding tables, their table schema and hierarchy are still cloned to your target instance. As a result, your target instance will have empty but usable tables after the clone. **Note:** Default table exclusions are still excluded and aren't affected by this setting. Including tables containing auditing, license usage, logging, and notifications. If you need the data from your excluded tables, you can choose to disable this setting. The default setting is that tables specified in the Exclusion List are excluded from a clone.
Exclude audit and log data	Helps to prevent the cloning of audit and log records from the source instance. This exclusion creates empty but usable audit and log tables on the target instance. **Note:** If you exclude audit and log data from your clone, the activity stream for records doesn't match the source instance. The activity stream relies on the audit table to generate the history.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clone options when requesting a clone (continued)

Field	Description
	The default setting is that audit and log data are excluded from a clone.
Exclude attachment data	Helps to prevent the cloning of certain files from the sys_attachment table, such as: • Video files • Image files • Other large binary files **Note:** Default attachments and other system-relevant files (for example catalog item images, theme images, and icons) aren't affected by this setting. The following default attachments and other system-relevant files aren't affected by this setting and aren't excluded from a clone: • Table name values that start with ZZ_. • Table names: sys_certificate, sc_cat_item,sys_upgrade_manifest, ecc_agent_jar, ecc_agent_mib, sys_store_app, or invisible.sys_store_app. The default setting is to exclude attachment data.
Preserve theme	Preserves the theme and CSS elements on the target instance. As a result, your target instance will keep its theme, its look and feel after a clone. The default setting is to preserve the theme on the target instance.
No. of days of In-progress Global Update Sets to be preserved	Preserves the last 90 days of in-progress update sets in the global application scope. This option enables you to keep in-progress, global update sets created within the last 90 days on your target instance. **Note:** This option doesn't preserve your in-progress scoped update sets. Update sets that are older than 90 days aren't saved. Review and commit your update sets before cloning. The default isn't to preserve update sets.

Clone states

A reference topic displaying the various states of a clone.

Clone state	Description
Requested	The clone was requested and is awaiting approval.
Scheduled	The clone is ready to begin at the scheduled time and date.
Active	The clone is running.
Completed	The clone completed successfully.
Canceled	The request is canceled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Clone state	Description
Hold	The server rejected the clone request. The clone wasn't ready to proceed by the scheduled time or because additional clone requests were submitted before the first one completed.
Error	The clone encountered an error while running. Contact technical support for help resolving this issue.
Draft	The clone is scheduled to be created. This state never appears in the Clone History table.
Rollback requested	The clone is requested to roll back to a previous state.
Rollback failure	The request to roll back the clone has failed.
Rolling back	The clone is in the process of rolling back to a previous state.
Rolled back	The clone request to roll back to a previous state is complete.

Cleanup script execution states

After a clone completes, each cleanup script on the target instance displays one of the following states. The normal progression is: Ready to schedule → Scheduled → Executing → Completed, Error, or Not executed.

State	Description
Ready to schedule	The script is queued and will run when its turn comes. Shown before and during clone execution for scripts that have not yet started.
Scheduled	The script has been scheduled to run.
Executing	The script is actively running.
Completed	The script finished successfully.
Error	The script encountered an error. The error message is shown in the **Error message** column. See Monitor cleanup script execution to retry failed scripts.
Not executed	The script was intentionally skipped due to conditional logic. The reason is shown in the **Error message** column.

Note: If a script is retried after an error, the state returns to **Executing** and the **Runs** column increments by 1.

Clone terminology

Key terms and definitions used in instance clone documentation and the Clone Admin Console.

Terminology

Term	Description
Preflight Check	A stage in the clone process that verifies the source and target instances are in a healthy state before the clone proceeds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminology (continued)

Term	Description
Provision DBI	A stage in the clone process where a new target database instance (DBI) is set up to receive the restored data.
Source Instance	The original database where data is copied from.
Target Instance	The new location where the data is copied to.
Data Preservers	Specified data from the target instance that is retained on the target instance during the clone. Preservers are defined on the source instance.
Table Exclusions	Data that is not cloned to your target instance.
Client ID / OAuth	An authentication method used to preserve OAuth credentials on the target instance during a clone. The identity type for OAuth is human. The *oauth_admin* role is required to manage OAuth credentials preserved during a clone.
Cleanup Scripts	Automated steps that run after cloning, such as changing data or settings.
Clone Profiles	Reusable template for clone settings, exclusions, preservers, and scripts.
Multi-Instance View	A feature in the Clone Admin Console that enables administrators to monitor and manage clone operations across multiple linked instances from a single primary instance, without logging in to each instance separately.
Node Repoint	A stage in the clone process where the system switches traffic from the old target instance to the newly cloned instance. Node Repoint is a clone stage, not a clone state.
Clone Admin Console	The Clone Admin Console is the default user interface that enables you to manage and track the cloning process.
On-Demand Backup	With on-demand backup enabled, clone takes a fresh on-demand differential backup at the specified clone start time. Clone uses this backup during the restore phase of the clone.
Clone Chaining	You can divide your clone operation into 2 steps. **1.** Cloning from production to your test (non-production) environment. **2.** Cloning from test to all your other environments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminology (continued)

Term	Description
	You can save time if you're dealing with multiple instances and experience long clone durations. Using this strategy, you perform lengthy operations such as post-clone cleanup scripts or excluding Task data older than 90 days only once. The clones in step 2 have a lighter footprint and complete faster.

General guidelines for optimizing your clone duration

A reference topic that includes general guidelines to optimize your clone duration when requesting a clone.

Configuring additional settings for your clone request can significantly increase your clone completion time.

When creating a clone request, consider the following guidelines.

- Set the amount of data copied from the task table to `Full`. This option clones all data from the task table and its child tables to the target instance.

  Note: The `Last 90 days` option can increase duration, as it takes longer to remove records from the task table that are older than 90 days after restoration.

- Selecting Exclude Attachment Data on the clone request form can add to your clone duration.
- Don't preserve large amounts of data in your request. If you must preserve table data, such as users, groups, and roles, consider exporting the records to a file and importing them after cloning.
- Add conditions to the preservers configured for the clone request to only preserve the data that you need.
- Use clone chaining to split up your request, see Clone terminology.

Troubleshooting for registering target instance

A reference topic that includes troubleshooting to try to resolve errors that occur while registering a target instance.

When registering a target instance, consider the following guidelines.

Credentials error

Troubleshoot a credentials error that occurs while registering a target instance.

Condition

The credentials for the target instance are incorrect preventing the target instance from being registered.

Cause

Starting with Australia Patch 5, clone requests can redirect authentication requests to a single sign-on identity provider. This applies when both the source and target instances are on Australia Patch 5 or later.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For instances on earlier releases, the target instance credentials must exist in the `sys_user` table. The credentials can be a user record or part of a Lightweight Directory Access Protocol (LDAP) integration.

Remedy

- Provide credentials for the target instance for a user with the admin role.
- If using OAuth authentication, verify that the OAuth configuration is correct and that the OAuth provider is accessible from both instances.

System property error

Troubleshoot a system property error that occurs while registering a target instance.

Condition

By default, `glide.db.clone.allow_clone_target` is enabled on instances whose name ends in Dev, Test, Stage, UAT, or QA. An error occurs if the property isn't set to `True`.

Note: If it's a production instance, set this property back to `False` to avoid accidental clones over production in future.

Cause

The `glide.db.clone.allow_clone_target` system property is set to `False`.

Remedy

Procedure

1. Navigate to **All** > **System properties** > **All properties**.
2. Search for `glide.db.clone.allow_clone_target` in the system properties list.
3. Select the property.
4. If the value is set to `False`, set the value to `True`.
5. Select **Update**.

IP authentication error

Troubleshoot a IP authentication error that occurs while registering a target instance

Condition

A failure to authenticate an IP address prevents the target instance from being registered.

Cause

The IP address for the target instance is outside of the IP range.

Remedy

If the target instance uses IP range based authentication, it must enable the IP range `10.0.0.0/10.255.255.255` to communicate on a local network. See IP range based authentication.

General guidelines for excluding a table from cloning

A reference topic that includes general guidelines to exclude a table from cloning.

Workflow context data

Excluded workflow context data includes records stored in the wf_context table, and in related tables with names starting with a prefix of wf_. If workflow contexts were included, this process helps to prevent the occurrence of workflow timer syncing issues. Issues can occur due to the length of the cloning process.

Excluding child tables of the task table

When excluding child tables of the task table, which use the table per hierarchy extension model, child tables are excluded. You don't need to exclude the parent Task table together with the child table.

Using wildcards

You can use wildcards to exclude several tables from cloning with one entry. For example, sys_script.* excludes all tables starting with sys_script.

Note: The wildcard has to include the dot '.' before the asterisk.

Excluding or preserving related tables

To preserve or exclude related tables, you must preserve and exclude the following tables. If any of the tables are missed, the customer may not be able to log in to the instance after a clone.

- sys_user
- sys_user_role
- sys_user_group
- sys_user_grmember
- sys_group_has_role
- sys_user_role_contains
- customer_contact (if the Customer Service Management plugin is active)

Tables that can't be excluded

sys_db_object and sys_db_object.* can't be added to the exclusions.

ServiceNow AI Platform® forms, fields, and lists

Data collection is easy with the ServiceNow AI Platform. Customize your forms with personalization, templates, tailored UI, file attachments, and more.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Form administration	Field administration	List administration
		
Configure forms and customize their functions to best suit your enterprise demands.	Create and maintain individual data items in your records on the ServiceNow AI Platform.	Control who views and uses data in your instance, and how they use it, with ServiceNow administrative options.

Form administration

Create and modify forms with a wide variety of tools on the ServiceNow AI Platform. Give users roles to configure forms with Form Personalization. Include supplemental info with Annotations, Attachments, and Formatters. Populate forms automatically with Form Templates, to add data based on configurable settings. Form UIs are fully customizable, with desired UI actions, UI policies, and more advanced form configuration options.

Field administration

Fine-tune every detail of your data collection. Field administration includes the ability to create individual pieces of data, modify them as needed. Parent-to-child field relationships and vice-versa are automatically maintained and updated as you make changes in your tables. Multiple Field types reference are available on the ServiceNow AI Platform, to tailor records on your instance as needed.

List administration

Give users controlled access to data with List administrative tools by ServiceNow. Delegate read-only or read-and-write privileges to users, and set up or modify UI controls for data in your lists.

ServiceNow AI Platform® form administration

Administrators can change the layout of forms and related lists. Administrators can also configure several settings that control form functionality.

You change aspects of a form such as showing or hiding fields, embedding lists, and adding sections and annotations. This video highlights form layout and design.

Get started

Configure	Administer
	
Design and configure form layout.	Define how forms behave and create UI policies.

Configuring forms on the ServiceNow AI Platform®

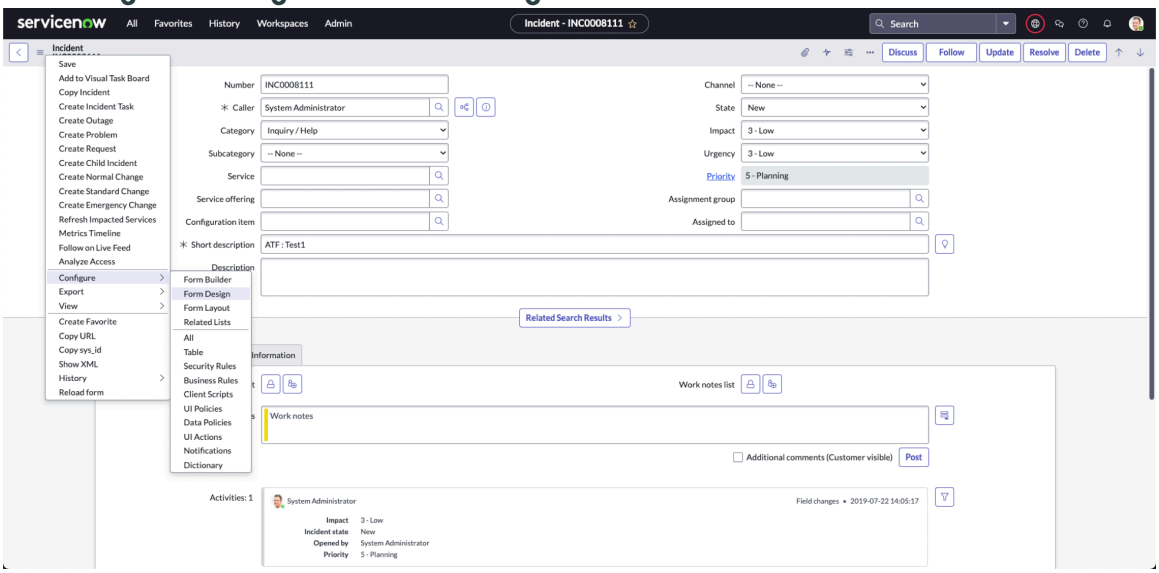
Form configuration involves changing the form layout and the related list layout. The form layout changes what appears on the form and the related list layout changes which related lists appear at the bottom of the form.

Important: Try configuring your forms with Form Builder instead. Form Builder has all of the Form Designer and Form Layout options. It also has other robust features that help you configure each aspect of the form. For more information, see Accessing Form Builder.

Using the form designer

Administrators or users with the personalize_form role can use the form design feature to quickly create new or change existing form views.

Important: Starting with the Australia release, form designer is being prepared for future deprecation. Try configuring your forms with Form Builder instead. Form Builder has all of the Form Designer and Form Layout options. It also has other robust features that help you configure each aspect of the form. For more information, see Accessing Form Builder.



With form design, you can accomplish the same tasks that you can with form layout in a graphical tool called the form designer. You can also access field properties and add information from macros or previously scripted UI elements.

Form design is an alternative to configuring forms that combines several configuration options into one tool. It is available by default for new instances and requires Core UI . Administrators who upgrade from a previous version must activate the Form Designer (com.glide.ui.ng.fd) plugin to use the feature.

Access Form Designer by opening an existing form, selecting the Additional actions icon ( ), and then navigating to **Configure** > **Form Design**.

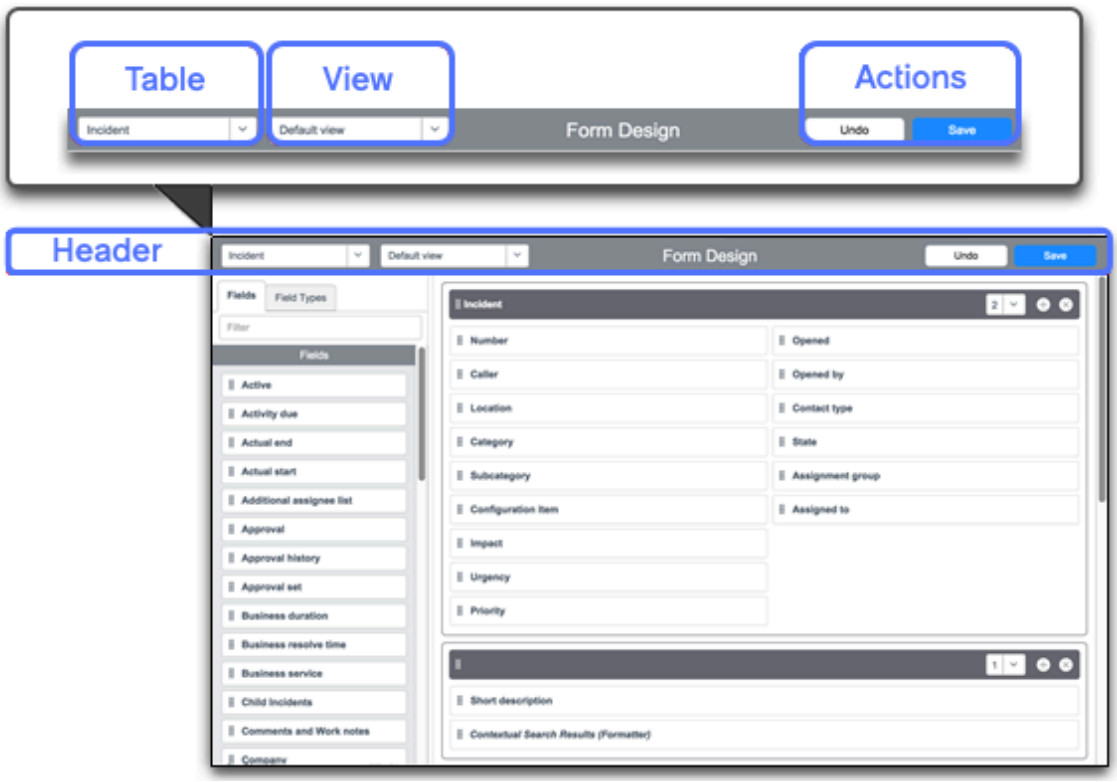
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

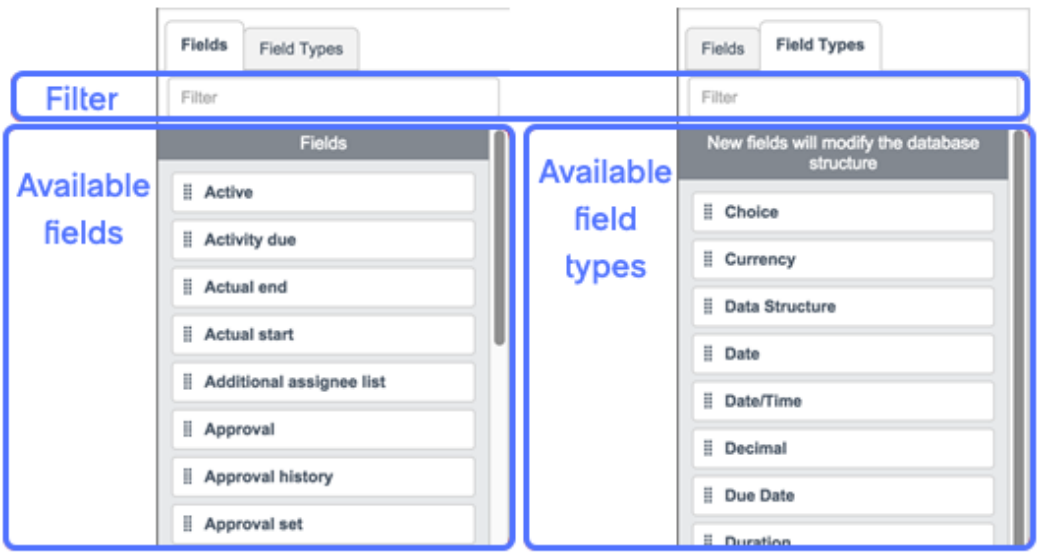
Accessing Form Designer from an existing form



Parts of the UI form design interface

The page header

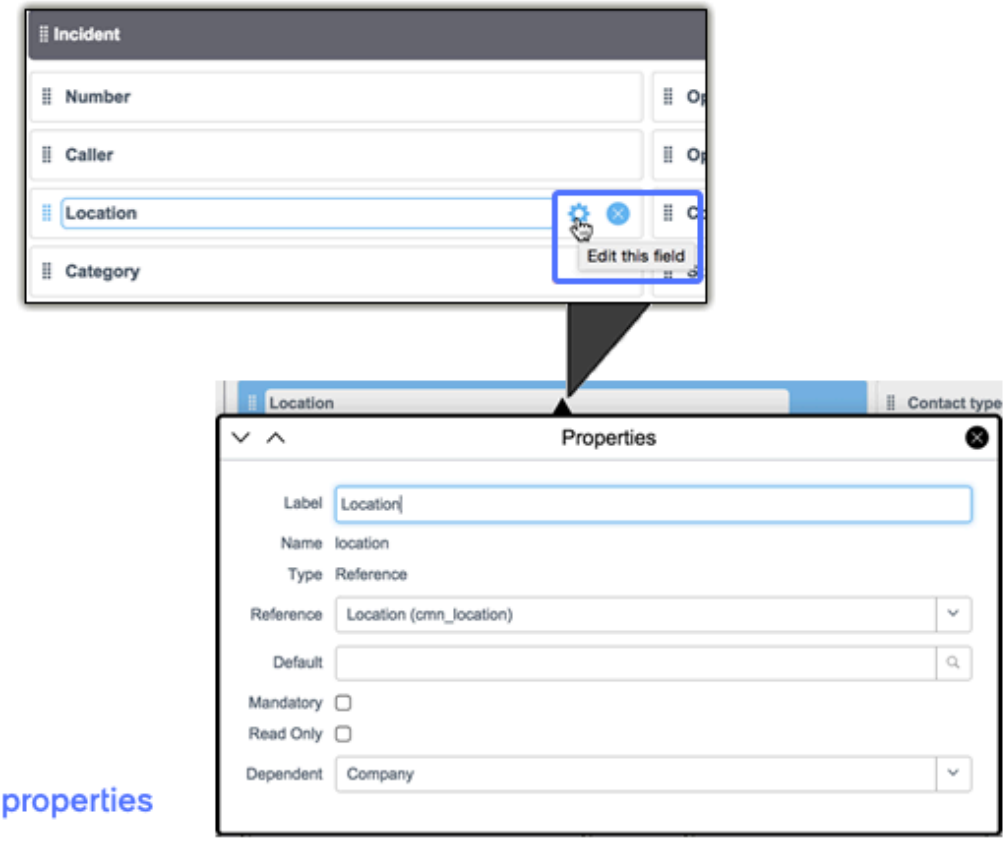
The page header displays the current table and view being designed. Each form is tied to a unique table and view combination. For example, there can only be one form for the incident table default view. Select a different view to modify different form layouts for a table.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The field navigator

The field navigator allows you to manage fields on the form. It contains the following elements:



- **Filter**: Allows text search on the currently selected tab.
- **Fields**: Displays a list of existing fields you can add to the current form.
- **Field Types**: Displays a list of field types you can add to the current form. Adding a field type to the form layout creates fields in the selected table when the form layout is saved.

Field Navigator

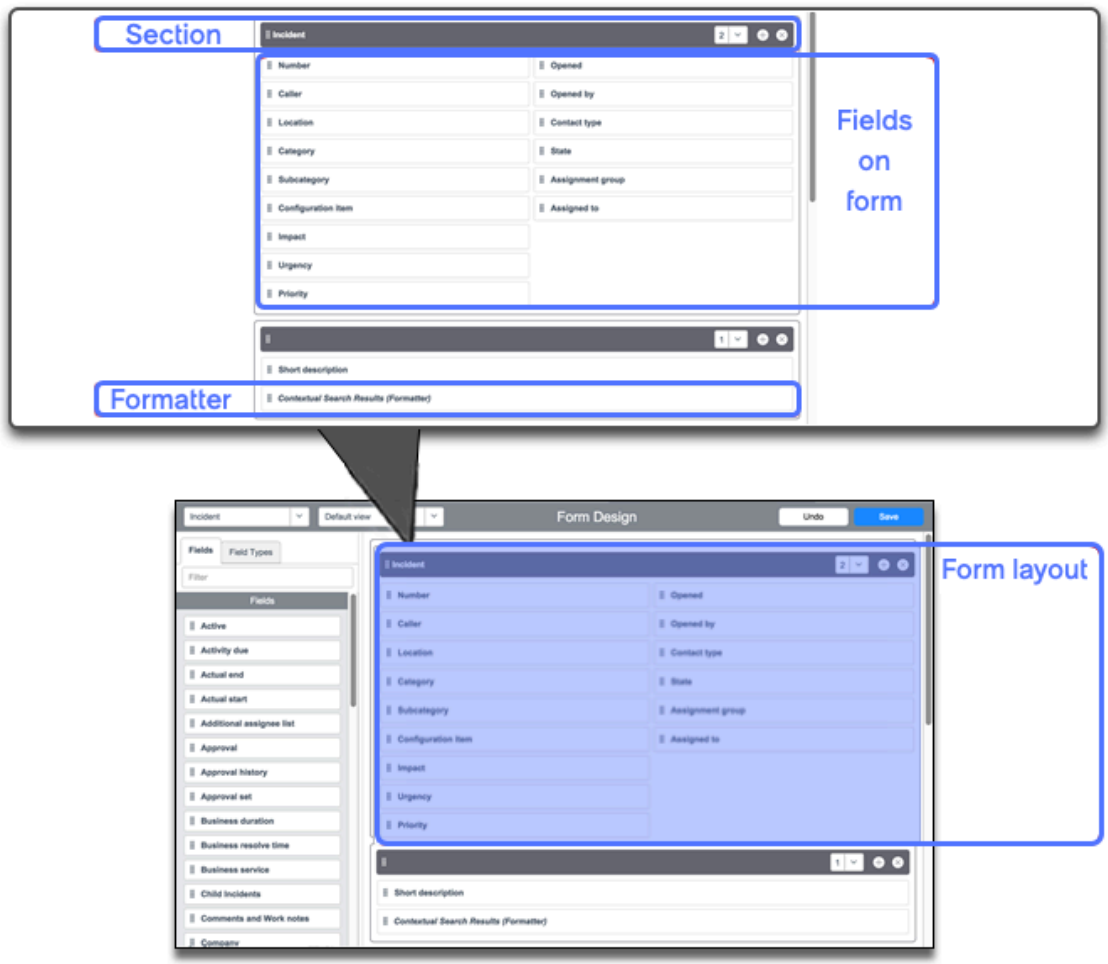
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field properties are accessed by clicking the gear icon that appears when you point to a field in the form layout.



Field properties

Form layout

The form layout displays a separate cell for each field, section, annotation, UI element, and related list that is on the form. Each cell has an identifying label and a handle icon to aid in selecting and moving it. The location of the cell in the form layout represents its relative position on the form. Only fields visible on the form layout are displayed on a form.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Form layout

Show or hide fields with the form designer

You can move fields to and from the form workspace to display the fields on the form.

Before you begin

Role required: personalize_form

About this task

Use the filter to quickly find fields in the field navigator.

Procedure

1. Navigate to the form designer.
2. From the list of fields in the **Field Navigator**, select the field you want to display from the list of available fields.
3. Drag the field to the form layout.
4. Drag the field to the location you want it to be on the form.
5. To remove a field from the form layout, select the field and click the **Remove this field** (X) button beside the field label.
6. Click **Save**.

Add a form annotation with the form designer

Use annotations to provide instructions or additional information about fields on a form.

Before you begin
Role required: personalize_form

Procedure

1. Navigate to the form designer.
2. Click the **Field Types** tab.
3. Select the **Annotations** field type.
4. Drag the annotation to the appropriate location on the form.
5. Point to the **Annotations** field and click the gear icon to open Properties dialog box.
6. In the Properties dialog box, enter a value for **Annotation Text**.
   You can use HTML tags to format the annotation text.
7. Click **Save**.

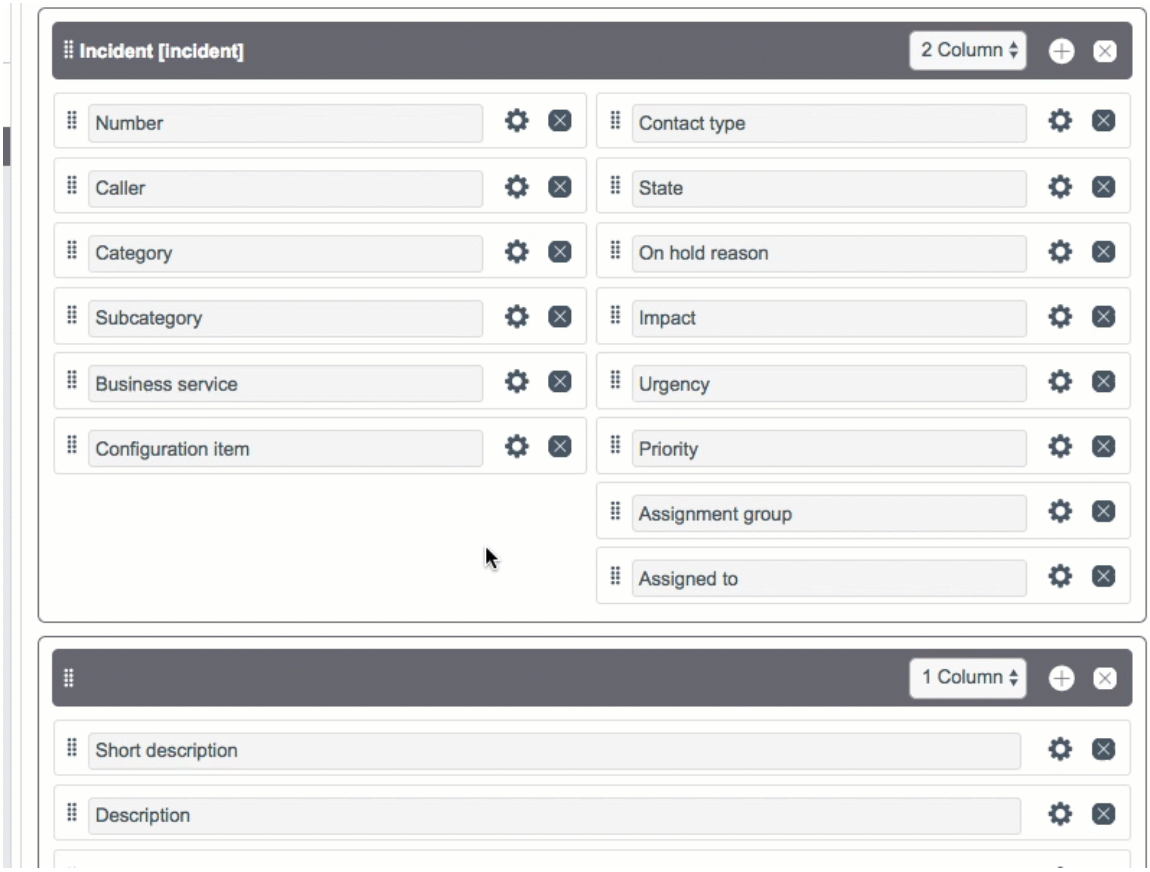
Administering form annotations

Add a new section with the form designer

Move sections to and from the form layout to display or remove the sections on the form.

Before you begin
Role required: personalize_form



About this task
Sections can have a one- or two-column layout.
By default, the first section on a form is always a read-only section displaying the label of the table. You cannot remove this section.

Procedure

1. Navigate to the form designer.
2. Select an existing section.
3. Click the (+) button beside the section label to add a section.
4. Enter a label for the section.
5. Drag sections to reorder them.
   The label for the first section on the form designer is displayed as the form title.
6. To delete a section, click the (x) button beside the section label.
7. Click **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following GIF shows how you would use form designer to add and then delete a form section.

Add a formatter with the form designer

Use formatters to add information from macros or previously scripted UI elements to a form.

About this task

Formatters are used to add information from macros or previously scripted UI elements to a form.

Procedure

1. Navigate to the form designer.
2. Click the **Fields** tab.
3. In the filter, enter the string `Format`.
4. Select the formatter you want to add to the form.
5. Drag the formatter to the location you want it to be on the form.
6. Click **Save**.

Add a new field with the form designer

You can add a field to a form and the associated table.

Before you begin

Role required: personalize_form

About this task

Adding a field creates a dictionary entry for the new column in the current table. You can create a custom table and then use the form designer to add fields to the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the filter to quickly find field types in the field navigator.

Procedure

1. Navigate to the form designer.
2. Click the **Field Types** tab.
3. Select the cell for the field type to create.
4. Drag the field type to the location you want it to be on the form.
5. Enter a label for the field.
6. **Optional:** Point to a field in the form design area and click the gear icon to access properties.
7. Click **Save**.

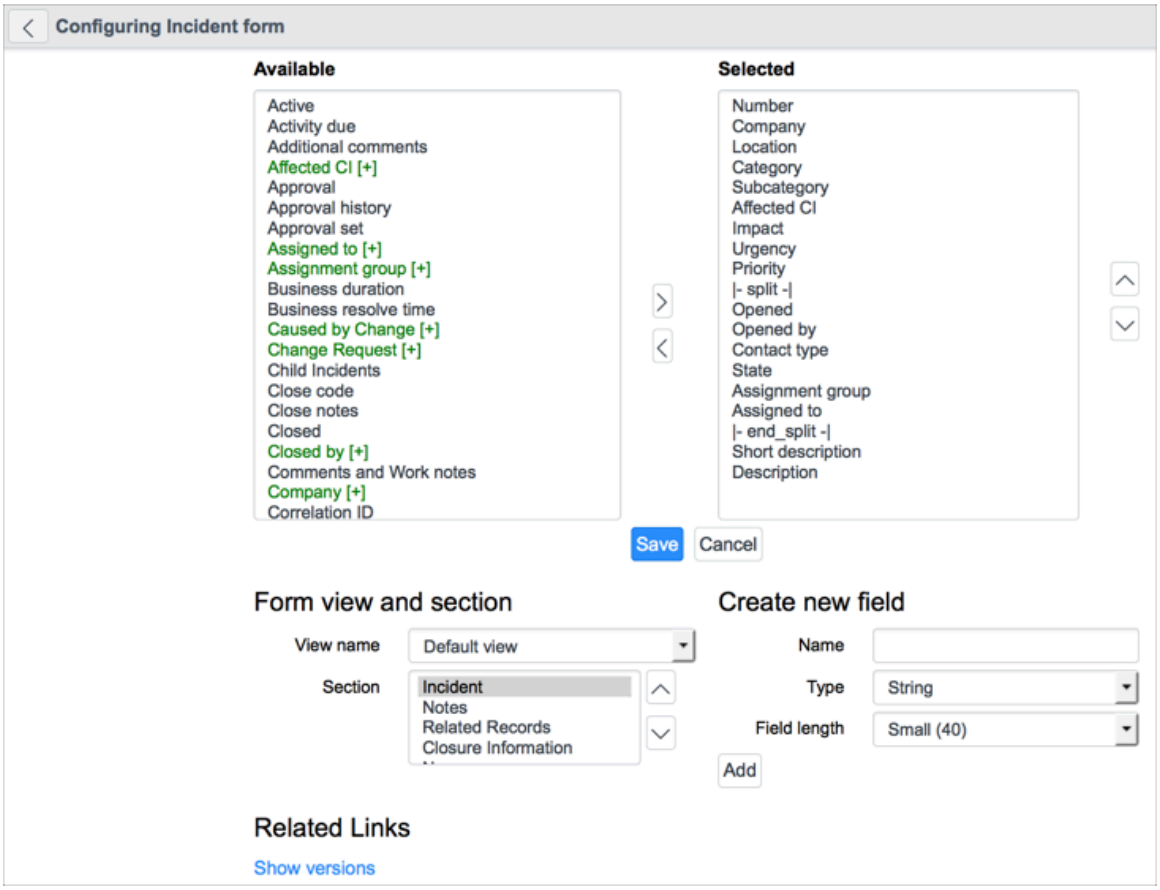
Configuring the form layout

Administrators or users with the personalize_form role can configure the form and related list layout.

Important: Try configuring your forms with Form Builder instead. Form Builder has all of the Form Designer and Form Layout options. It also has other robust features that help you configure each aspect of the form. For more information, see Accessing Form Builder.

Show or hide fields on a form

Configure form layout to change what appears on the form. You can perform tasks like changing what fields are visible, embedding lists, and adding sections and annotations.



Before you begin

Role required: personalize_form

Procedure

1. Navigate to a form.
2. Select the form context menu icon ( ) and select **Configure** > **Form Layout**.
3. Move the fields that you want to be visible from the Available list to the Selected list, and reorder them as needed within the Selected list.
   Available items that appear in green followed by a plus (+) sign represent related tables. To access fields on these tables, use dot-walking.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In Core UI, Form Layout is not responsible for the order of the Additional Comments and Work Notes fields. For more information on how to determine the order of these fields, see Customize activities.

4. Select **Save**.

> ⚠ **Warning:** Do not add the same field to more than one section of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.

What to do next

Through form configuration, you can also add new fields to the form, which creates columns to the table that underlies the form. See Add and customize a field in a table for more information.

Add a related list to a form

You can configure related lists to appear on forms and in hierarchical lists.

Before you begin

Role required: personalize_form

About this task

Related lists display records in another table that have a relationship with the current record.

Procedure

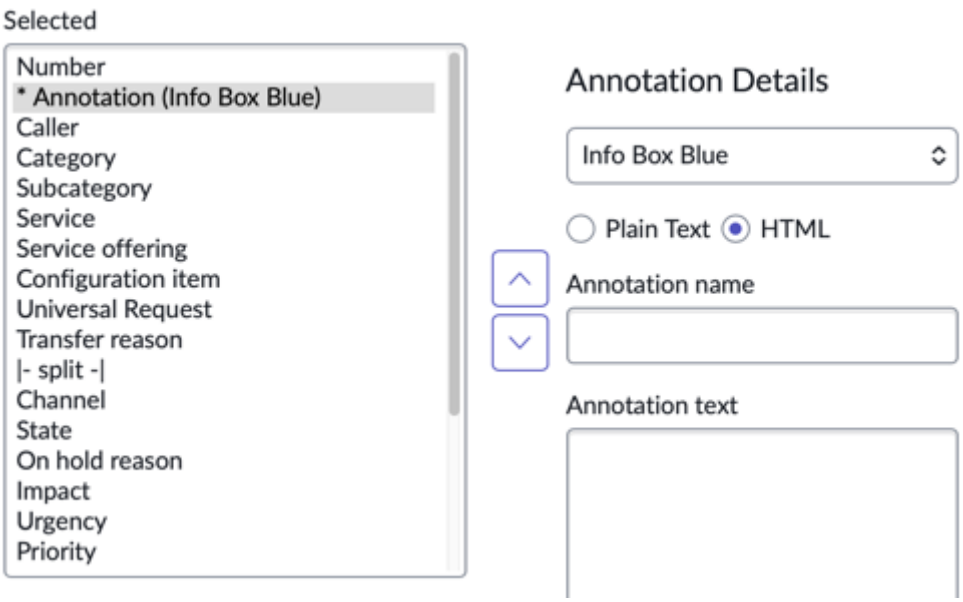
1. Navigate to a form.
2. Select the form context menu icon ( ), and select **Configure** > **Related Lists**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Move the related list you want to display from the Available list to the Related list.
4. Select **Save**.
   Related lists appear at the bottom of the form.

Add an annotation to a form

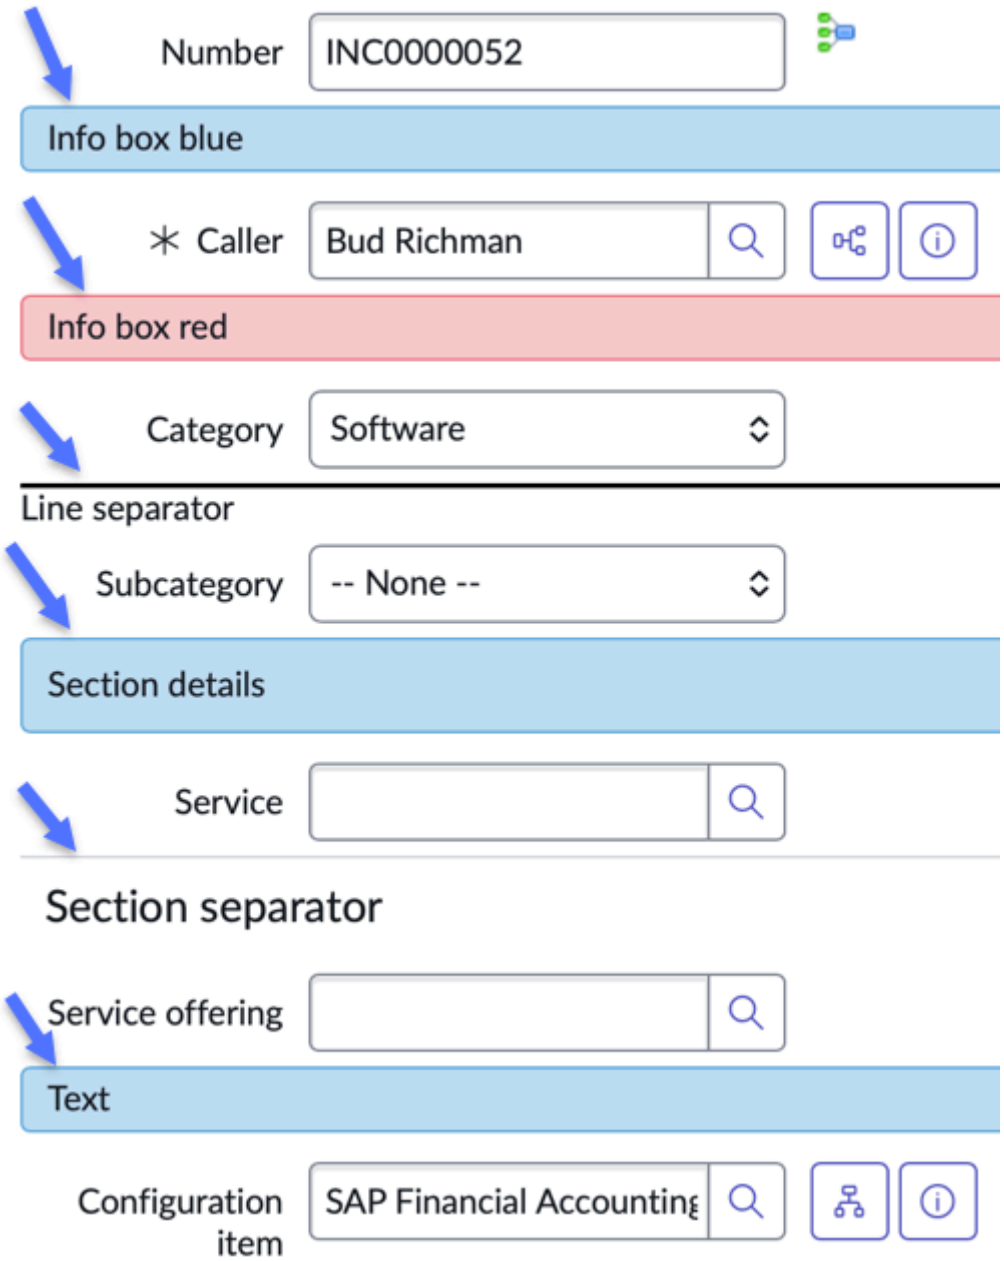
Highlight form elements by displaying blocks of colored text or separators between form elements.



Before you begin

Role required: personalize_form

Procedure



1. Navigate to a form.
2. Select the form context menu icon ( ) and select **Configure** > **Form Layout**.
3. Under **Form view and section**, select a section.
4. Move *** Annotation** from the Available list to the Selected list.

   The Annotation Details section displays.

5. In the Selected list, move the *** Annotation** item above the field you want to annotate.
6. In the Annotation Details section, select the type of annotation.
   The available types of annotations include **Info Box Blue**, **Info Box Red**, **Line Separator** (any text you add appears beneath the line), **Section Details**, **Section Separator**, and **Text**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select either **Plain Text** or **HTML** for the data type, and enter the annotation in the text box.

   All valid HTML tags are supported.

   For example, select the **Text** annotation type, the **HTML** data type, and enter `<span style="color:red">Select the primary location:</span>`. The text appears red on the form.

8. Select **Save**.

Toggle annotations

Users can toggle annotations on a form in Core UI . The *glide.ui.show_annotations* user preference controls the visibility of annotations for each user.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

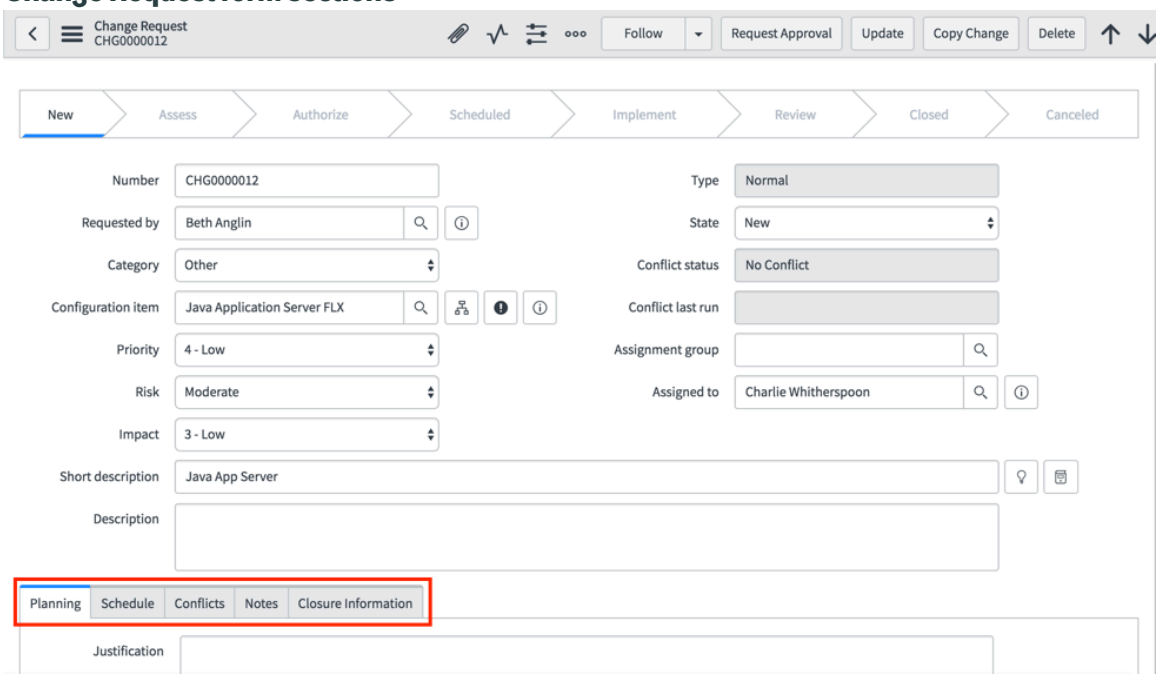
1. Navigate to a form.
2. Select the more options icon (•••) to see the annotations icon.
   The icon is light gray and cannot be toggled when no annotations are available.

Related topics

User preferences

Create a form section

Create sections on forms to help group related fields together.

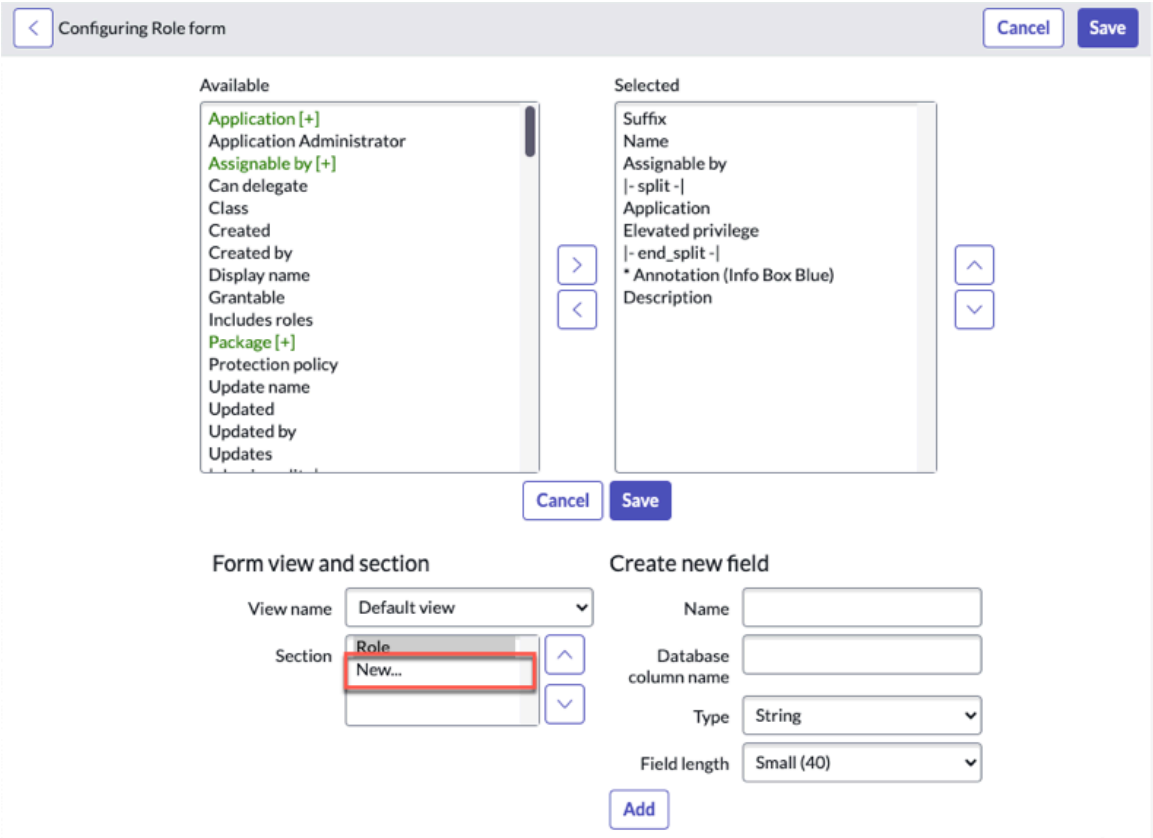


Before you begin

Role required: form_admin

About this task

Users can expand or collapse form sections to show or hide the fields they need. If you have tabs enabled, each form section appears on a separate tab. The default Change Request form is an example of a form with multiple sections as shown in the following image.



Change Request form sections

Procedure

1. Navigate to a form.
2. Select the form context menu icon ( ) and select **Configure** > **Form Layout**.
3. In the **Form view and section** area (below the Available list), select **New...** from the **Section** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Section caption** field, enter a title for the new section, and then select **OK**.
5. Select a form section name and use the up or down arrow to change the section order.

   Note: The caption for the first section on the form becomes the form title.

6. Add fields to the new section by moving fields from the Available list to the Selected list.
7. Select **Save**.
   The new section appears on the form with the fields you selected. If you do not add any fields to a section, the section stays empty.

   If you want to delete the form section later, do the following:

   a. Navigate to **System UI** > **Form Sections**.
   b. Filter for the table that contains the section you want to delete. For example, the Incident table. The name of the form section to be deleted is displayed in the **Caption** field.
   c. Select the check box beside the form section to delete, and then select **Delete** from the **Actions on selected rows** menu.
   d. Select **OK** to confirm the deletion.

Related topics

Configure items on forms or in lists using a slushbucket

Move form splits

Change the place where fields split on a form by moving the split section indicators.

Before you begin

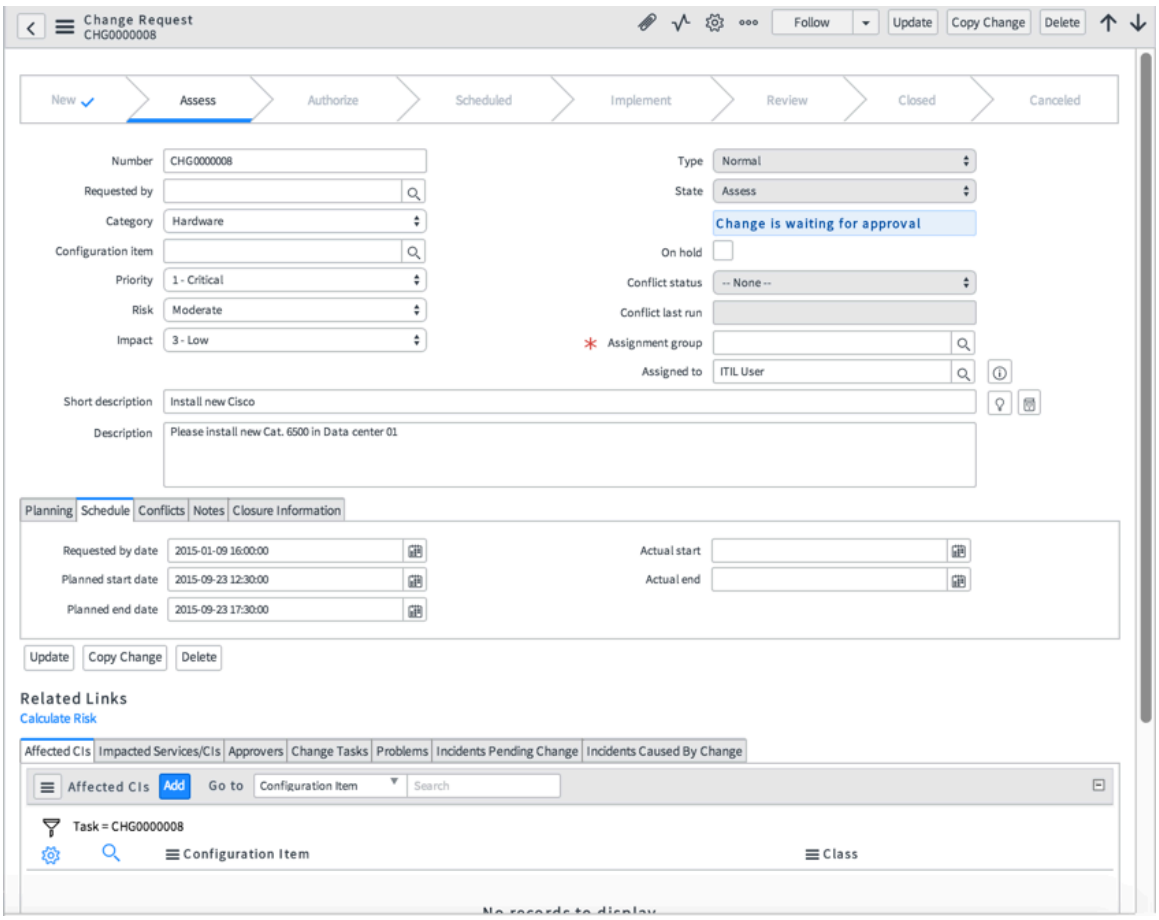
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to a form.
2. Select the form context menu icon ( ) and select **Configure** > **Form Layout**.
3. Within the Selected list, move any of the following split section indicators using the up and down arrows:
   - **|- begin_split -|**
   - **|- split -|**
   - **|- end_split -|**
4. Select **Save**.

Display tabbed forms



Tabbed forms offer a useful way to make forms and related lists take up less space by reducing the scrolling that must be done to navigate the form.

Before you begin

Role required: personalize_form

About this task

Tabbed forms

Form sections and related lists are tabbed separately, each with their own tab line. A user always sees the first form section. All sections after that can be tabbed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tabbed forms are enabled by default for new instances. A system user preference with the name **tabbed.forms** specifies whether the tabbed interface is used by default for all users. Users can change this preference as described in this procedure.

Procedure

1. Select the **User Menu (** **)** > **Preferences** > **Display**
2. Adjust the **Organize form sections and related lists into tabs in classic forms** toggle switch to turn the preference on or off.
3. Close the dialog box.

Embed a list within a form

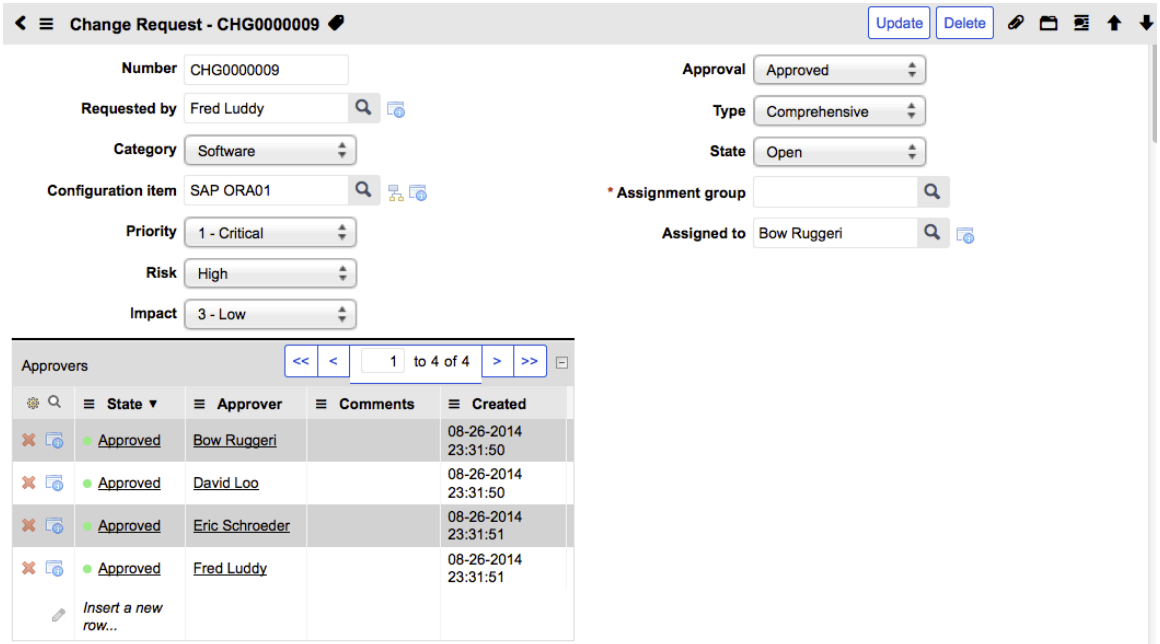
You can embed lists within a form. When a list is embedded in a form, any changes made to the contents of the list are saved when the form is saved.

Before you begin

Role required: personalize_form

About this task

This allows the embedded list to be treated just like another element on the form. In addition, users can create records in the list view. After a row is added to the list, double-click any cell in the list to edit its value. You can add the same lists to a form as embedded lists or as related lists, depending on the path selected in the form context menu.



You can also modify embedded list controls, such as the name of the related list and the roles required to create records in the embedded list.

Procedure

1. Select a record from the list.
2. Right-click the form header and select **Configure** > **Form Layout**.
   The slushbucket shows the available fields and the lists that can be embedded in the form. Lists appear in red at the bottom of the **Available** list.
3. Select a list and move it to the **Selected** column.
4. Use the up and down arrow buttons to position the list in the form.
5. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lists adjust to fit the frames of the adjacent fields.

Related topics

Configure list control settings for the list editor

Configure customer updates indicator

You can configure the indicator for customer updates, which are changes that update sets, scripts, service catalog items, and other configuration tables track.

Before you begin

Role required: admin

About this task

The customer updates indicator icon ( ) may appear on the header of forms that have customer updates. Clicking the customer updates indicator opens the update set records for the item.

You can configure this indicator to appear for all or for specific administrators using the *owned_by_indicator.form* user preference.

Procedure

1. Navigate to **All** > **User Administration** > **User Preferences**.
2. Perform one of the following actions.

Option	Description
Enable the indicator for all administrators	Set the *owned_by_indicator.form* preference to **true**.
Enable the indicator for an individual administrator	**a.** Make sure the *owned_by_indicator.form* system user preference is set to **false**. **b.** Create a user preference with the following values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	▪ **Name:** `owned_by_indicator.form` ▪ **User:** Select the administrator for which to enable the preference. ▪ **Value:** `true`

Add a chart to a form

Add a chart to a form to show your users graphical data related to the form. For example, you could show an incident SLA-related chart on the Incident form so your users can see how well service level agreements are being met.

Before you begin

Role required: personalize_form

About this task

Note: The following report types are not supported on forms: List, Pivot, Multilevel Pivot, Calendar, and Single Score.

Procedure

1. Navigate to **All** > **System UI** > **Forms**.
2. Select the form you want to configure.
3. Click the form context menu icon ( ) and select **Configure** > **Form Layout**.
4. Using the slushbucket, select *** Chart**.
5. Enter a **Label** in the chart details.
6. Click **Save** to return to the form.
7. Click **Configure chart**.
8. Select a chart in the **Report** field and configure other options as desired.
9. Click **Update**.

Administering forms on the ServiceNow AI Platform®

Administrators can configure several settings that control form functionality.

Form personalization

Control how users configure forms. You can also change the role that is necessary to configure a form and disable the form configurations that specific users already made.

See Administering form personalization for instructions.

Form annotations

Choose the types of annotations that are available on forms and save localized versions of form annotations.

See Administering form annotations for instructions.

Attachments

Control several aspects of form attachments, such as attachment size, allowed file extensions, and the roles that are allowed to attach files.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See Administering attachments for instructions.

Formatters

Create and edit formatters, such as the activity formatter, which displays information on the form that is not a field in the record. You can also configure formatter settings such as the maximum number of formatter entries.

See Using formatters for more information.

Form templates

Create templates that automatically populate form fields based on settings you configure.

See Using form templates for more information.

UI actions

Add buttons, links, and context menu items on forms to the UI more interactive, customizable, and specific to user activities.

See Defining UI actions for more information.

UI policies

Configure the policies that dynamically change information on a form.

See Create a UI policy for more information.

Other advanced options

Configure advanced form features, such as form focus, form splits, and derived fields.

See Advanced form configuration for instructions.

Administering form personalization

Administrators can configure several aspects of form personalization, which allows users to customize the layout for any form view.

Administrators can manage this function using the following options.

- Activate or deactivate form personalization globally.
- Control user access to form personalization based on roles.
- Manage the personalized forms of users.

Note: Personalizing a form in this way modifies the form for you only. To make changes to a form that are visible to all users, you must configure the form.

Activate form personalization

Form personalization is activated for new instances. To activate form personalization for upgraded instances, an administrator must activate the Form Personalization (com.glide.ui.personalize_form) plugin.

Before you begin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Form Personalization (com.glide.ui.personalize_form) plugin using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Change form personalization role requirements

By default, the itil role is required to personalize forms, but you can change this requirement with a system property.

Before you begin

Role required: admin

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Locate the *`glide.ui.personalize_form.role`* property in the System Properties list.
3. In the **Value** field, specify the roles that can access form personalization.

Related topics

Personalize a form

Manage personalized forms

When a user personalizes a form, the system stores the customizations as a user preference record. You can view and manage the user preferences.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **User Preferences**.
2. Filter the list by **[Name] [contains] [personalize]**.
   There is a user preference for each form view each user personalizes. The name format combines the word personalize with the name of the table and the name of the view. For example, if a user personalizes the default view of the Asset [alm_asset] form, the user preference is called *`personalize_alm_asset_default`*.
3. Delete a user preference to remove the customizations for the user.

Related topics

Personalize a form

User preferences

Disable form personalization

If you do not want your users to customize forms, you can disable form personalization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Activating the Personalize Forms plugin sets the *glide.ui.personalize_form* property to true. You can disable form personalization.

Procedure
1. Enter `sys_properties.list` in the navigation filter.
2. Locate the *glide.ui.personalize_form* property in the System Properties list.
3. Set the **Value** field to `false`.

Related topics
Personalize a form

Administering form annotations
Form annotations are additional pieces of information on a form, such as a line or paragraph of text. Use form annotations to provide on-screen instructions to your users.

Form annotations are enabled by default in the base system. To disable them, set the `glide.ui.form_annotations` system property to false.

Support multiple languages for a form annotation
You can store multiple translations of form annotation text.

Before you begin
Role required: admin

About this task
To support multiple languages, use message records to translate annotation text.

Procedure
1. Navigate to **All** > **System UI** > **Messages**.
2. Create a message record for each language you support.
3. On the Message form, set the **Key** field to a unique identifier for the annotation text.
   The annotation text is a good key. The key must be the same for each translation message for the annotation.
4. Select the appropriate **Language**.
5. In the **Message** field, enter the translated annotation text.
6. Edit the form annotation and reference the message key with a *gs.getMessage* call.
   For example, if the message key is **Message key text**, enter `${gs.getMessage("Message key text")}` in the form annotation.

Administer form annotation types
You can define the form annotation types to control their appearance.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System UI** > **Form Annotation Types**.
2. Set the **Active** field to **false** for any types you do not want to use.
3. Click **New** to add a type.

Administering attachments

Administrators can configure system properties for how files are uploaded and attached to records. Uploading, viewing, and deleting file attachments triggers a single event that can be used for notifications or in scripts.

Attachment tables

When you store an attachment to any table, a record is created in the Attachment [sys_attachment] table that contains attachment metadata. The file data is stored in the Attachment Document [sys_attachment_doc] table, in 4k chunks. For example, if you attach a 12k file called **My_attachment.pdf**, then there is an Attachment entry with three related Attachment Document entries.

To learn how to upload attachments to records, see Add and manage attachments.

Activity stream thumbnail scaling

The *glide.ui.activity_stream.scale_images* property scales large images down and creates thumbnails for the activity stream view of the images. This property is active by default. It applies to images retroactively, so any attachments included in an activity stream in the past also see the effects.

- Maximum dimensions for thumbnails using this property are 525 pixels width by 350 pixels height. The system favors the pixel height first, so you can end up with images that are wider than 525 pixels.
- Attaching image files over 5 MB can create an out of memory error and cause the instance to restart. An out of memory error and restart occur when the system generates the thumbnail when you attach a new image. The error and restart can also occur the first time you load existing images on a record.
- The administrator can add the *com.glide.attachment.max_get_size* system property to control the maximum image scaling dimensions.

Enter the following information into the [sys_properties.list] table:

Field	Description
Name	com.glide.attachment.max_get_size
Type	integer
Value	5242880

The value field represents the size in bytes.

- The base system value is 5242880 bytes (5 MB). You can change the value as necessary.
- With this property set, images that are larger than 5 MB are not scaled and the system creates a link instead. Images smaller than 5 MB are scaled down.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the max image size property for Activity Streams

When attaching an image in an Activity Stream, the system controls the maximum size of the image. Use the *com.glide.attachment.max_get_size* property to control the maximum image scaling dimensions.

Attachment events and logging

A script action or notification can process attachment events. Only one event is created when action is taken on a record with attachments, even when the record has multiple attachments. The following events are provided.

Only one event is created when action is taken on a record with attachments, even when the record has multiple attachments. The following events are provided.

Attachment events

Event	Description
attachment.read	An attachment has been read or downloaded.
attachment.uploaded	An attachment has been uploaded. If multiple attachments are uploaded to a record at one time, only one event is created.
attachment.deleted	An attachment has been deleted. This event is also triggered when the record containing the attachment is deleted. If a record is deleted that contains multiple attachments, a separate event is triggered for each attachment in the deleted record.
attachment.renamed	An attachment has been renamed.

Attachment logging

When an attachment is downloaded, the *attachment.read* event record is written, and you can do something with this event. For example, you can record when and by whom certain attachments are downloaded. For this functionality, **current** is a sys_attachment record, and the event record uses the following parameters:

- **parm1:** File name
- **parm2:** Table name

Debug attachment indexing

To change debugging options for attachment indexing, add these system properties.

- *glide.ts.index.attachment.debug*: When the value is set to **true**, enables log messages for exceptions that occur when indexing attachments (default is **false**).

  You can leave this property enabled during normal operations to capture stack trace information about any exceptions.

- *glide.ts.index.attachment.list_terms.debug*: When the value is set to **true**, logs all indexed terms when an attachment is indexed (default is **false**).

  [Recommended] For optimal performance, set this property to **false** during normal operations. Only enable this property when you are actively debugging an issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To learn more about the properties that affect attachments processing, see Attachments (instance security hardening) in Instance Security Hardening Settings.

Configure attachment system properties

You can disable the drag-and-drop feature. (Users can still upload attachments by browsing to the file.) You can also limit the attachment file size, restrict who can upload attachments, and restrict what file extensions can be uploaded.

Before you begin

Role required: admin

Note: To learn more about the properties that affect attachments processing, see Attachments (instance security hardening) in Instance Security Hardening Settings.

Procedure

1. To disable the drag-and-drop features, navigate to **System Properties** > **UI Properties**.
2. Clear the check box for the **Allow attachment drag and drop in supported HTML5 browsers** property.
3. Click **Save**.

Limit attachment file size

You can specify the maximum size allowable for attachments to avoid issues with the user's active session on the instance. The maximum attachment size for email attachments is configured separately.

Before you begin

Role required: Admin.

About this task

Note: The maximum attachment size for email attachments is configured separately.

Procedure

1. Navigate to **All** > **System Properties** > **Security**.
2. Enter a value in the **Maximum file attachment size in megabytes** property.
   The system only allows attachment sizes up to 1 GB. By default, this field is blank. If you leave this field blank, the system uses the default maximum limit of 1 GB.
3. Click **Save**.

Require a role to attach files

You can restrict who can upload attachments.

Before you begin

Role required: Admin.

Procedure

1. Navigate to **All** > **System Properties** > **Security**.
2. In the **Attachment limits and behavior** section, locate the **List of roles (comma-separated) that can create attachments** property (*`glide.attachment.role`*).
3. Enter one or more roles separated by commas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only roles listed in this property are able to upload attachments to a record. If no roles are entered, then all roles can upload attachments.

4. Click **Save**.

Restrict attachment file extensions

The *glide.attachment.extensions* property restricts the file extensions that users can upload as attachments.

Before you begin
Role required: Admin.

About this task
Restrict attachment file extensions to prevent users from uploading invalid file types and file types that may be more likely than others to contain viruses or malware.

Note: This property does not restrict attachments based on the actual file type, only based on the extension. To enable MIME type validation, which validates that the MIME type of a file matches the file extension and can block attachments that do not pass this validation, see .

Procedure

1. Navigate to **All** > **System Properties** > **Security**.
2. In the **Attachment limits and behavior** section, locate the **List of file extensions (comma-separated) that can be attached to documents via the attachment dialog** property.
3. Enter the file extensions and click **Save**.
   If no extensions are specified, then all extensions are allowed. However, if any extensions are specified, all unlisted extensions are restricted. Listed extensions should not include the dot (.) prefix or spaces after commas. For example, enter `xls,xlsx,doc,docx`.

Disable attachments on a table

You can prevent users from adding attachments to records on a specific table.

Before you begin
Role required: admin

Procedure

1. Open a record in the table.
2. Right-click the form header and select **Configure** > **Dictionary**.
3. In the list of dictionary entries, select the first record in the list (the record with no **Column name** entry).
4. Add `no_attachment` to the **Attributes** field, separated by commas from any existing attributes.
   See Altering tables and fields using dictionary attributes for more information.

Index attachments on a table

You can enable attachment indexing for a table so text searches can return matches from the record and its file attachments.

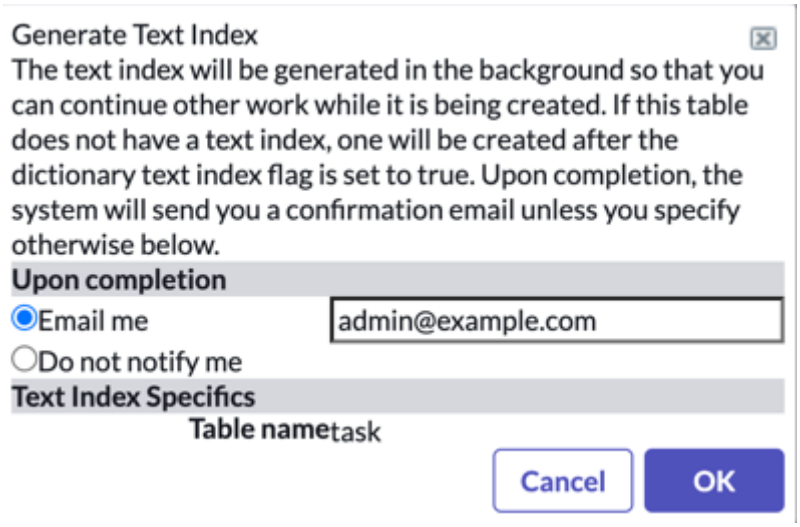
Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, attachment indexing is enabled for the Knowledge Base. You can enable attachment indexing for other tables. Enabling attachment indexing causes the platform to reindex the selected table, its parent table, and any children of the parent table. For large tables, such as the Task table, reindexing can take several hours and slows down the system until complete. Reindexing is best performed during non-peak times.

Procedure



1. Navigate to **All** > **System Definition** > **Text Index Configurations**.
2. Edit the record for the table that you want to enable attachment indexing for.
3. In the Text Index Table Attribute Maps related list, select **New**.
4. On the Text Index Table Attribute Map form, fill in the fields.

Field	Value
Table	<table name>
Attribute name	Attachment index
Value	true

> **Note:** The attachment index attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, enabling indexing of attachments on the Task table does not enable indexing of attachments on the Incident table. Not all file types are supported for attachment indexing. For a list of supported file types, see Zing can include attachments in search results.

5. Select **Submit**.
   A message appears indicating that the attachment index attribute change will not take effect until you reindex the selected table.
6. Dismiss the reindexing message by selecting **OK**.
7. On the Text Index Configuration form, select the **Generate Text Index** related link.
8. In the confirmation window, perform one of these two steps:
   - To receive an email notification from the system when text indexing for the table is complete, enter your email address and select **OK**.
   - If you do not want to receive an email notification, select **Do not notify me**, then select **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Dismiss the confirmation message by selecting **OK**.

Result

The system begins text indexing for the table. When it is complete, attachments can be searched on that table.

Hide the attachment [view] link

Users can open an attachment by clicking either the file name or the **[view]** link. The **[view]** link opens the file from within the browser, which executes JavaScript code as part of the attachment. You can hide the **[view]** link. Users can still view attachments by clicking the file name.

Before you begin

Role required: Admin.

Procedure

1. Add the *glide.ui.disable_attachment_view* and *glide.ui.attachment_popup* properties.
   For instructions on adding properties to the platform, see Add a system property.
2. For the *glide.ui.disable_attachment_view* property, set the **Type** to **true/false** and set the **Value** to **true**.
3. For the *glide.ui.attachment_popup* property, set the **Type** to **true/false** and set the **Value** to **false**.
4. To return to the default behavior (enable the link), set the *glide.ui.attachment_popup* property **Value** to **true**.

Configure attachment icons

Configure the icon that appears beside an attachment of a particular file type.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Determine the path of the image file or upload a new image.

   To view the images available for attachment icons, navigate to `https://<instance-name>.service-now.com/image_picker.do` in your browser. Hover over the icons to see their paths in the tooltips.

   You can also store your own icons and use them as attachment icons. See Storing images in the database.

2. Navigate to **System UI** > **Attachment Icon Rules**.
3. Open an existing rule or select **New** to create a new rule.
4. Enter the rule details.

Field	Description
Select icon by	Select **MIME Type** or **File Extension**. **Note:** If a file type has an icon specified by **MIME Type** and a different icon specified by **File Extension**, the **MIME Type** icon takes precedence.
MIME type	If **Select icon by** is **MIME Type**, enter the MIME type and subtype to associate with the icon, separated by a slash (example: `application/pdf`).
File extension	If **Select icon by** is **FIle Extension**, enter the file extension to associate with the icon beginning with the period (example: `.pdf`).
Icon	Enter the path to the icon image file (example: `images/icons/attach_pdf.gifx`)

5. Click **Submit** or **Update**.

Using formatters

A formatter is a form element used to display information that is not a field in the record. Add formatters to a form by configuring the form.

Examples of formatters in the base platform

Formatter	Description
Activity formatter	Displays the list of activities, or history, on a task form. For an example of an activity formatter, see Activity formatter.
Process flow formatter	Displays the different stages in a linear process flow across the top of a record. For an example of a process flow formatter, see Process flow formatter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples of formatters in the base platform (continued)

Formatter	Description
Parent breadcrumbs formatter	Provides breadcrumbs to show the parent or parents of the current task. For an example of a parent breadcrumbs formatter, see Parent breadcrumbs formatter.
Approval summarizer formatter	Displays dynamic summary information about the request being approved. For an example of an approval summarizer formatter, see Approval summarizer formatter.
CI relations formatter	Displays on the CI form a toolbar for viewing the relationships between the current CI and related CIs. For an example of CI relations formatter icons, see CI relations formatter.

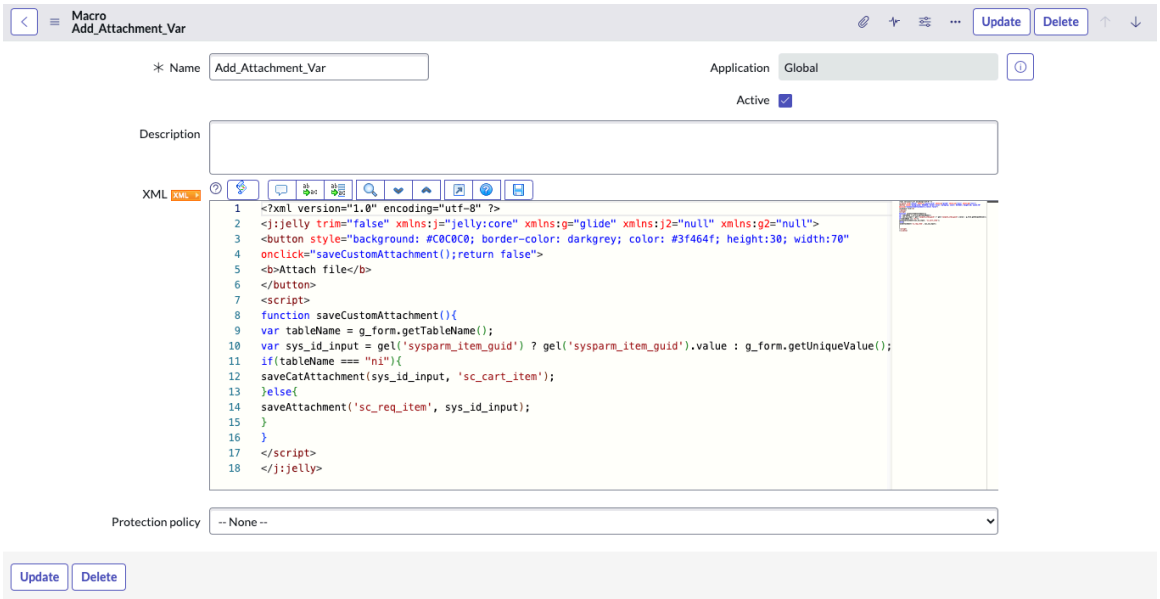
Note: Formatter elements cannot be exported to PDF. When exporting PDF data from a form, any formatter elements added to the form are not displayed in the PDF output.

To create a custom formatter, create a UI macro to define content for the formatter, then create a formatter that refers to the UI macro. You can then add the formatter to a form.

Create a UI macro for a formatter

Create a UI macro to define the content that the formatter displays.

Before you begin



This functionality requires knowledge of Jelly script.
Role required: ui_macro_admin

Procedure

1. Navigate to **All** > **System UI** > **UI Macros**.
2. Click **New**.
3. Complete the form.
4. In the **XML** script field, enter Jelly script to define the content to be displayed by the formatter.

Note: The UI Macro for the formatter represents a row in the UI. It must begin and end with `<TR></TR>` tags.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This Jelly script is reproduced below in plain text that you can copy into the Macro form as a basis for your macro script.

```
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide"
 xmlns:j2="null" xmlns:g2="null">
<button style="background: #C0C0C0; border-color: darkgrey;
 color: #3f464f; height:30; width:70"
onclick="saveCustomAttachment();return false">
<b>Attach file</b>
</button>
<script>
function saveCustomAttachment(){
var tableName = g_form.getTableName();
var sys_id_input = gel('sysparm_item_guid') ?
 gel('sysparm_item_guid').value : g_form.getUniqueValue();
if(tableName === "ni"){
saveCatAttachment(sys_id_input, 'sc_cart_item');
}else{
saveAttachment('sc_req_item', sys_id_input);
}
}
</script>
</j:jelly>
```

5. Click **Submit**.

Create a formatter and add it to a form

Create the formatter after creating the UI macro that defines the content.

Before you begin

Role required: ui_macro_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

With the UI macro in place, create the formatter that references it, and add it to the form.

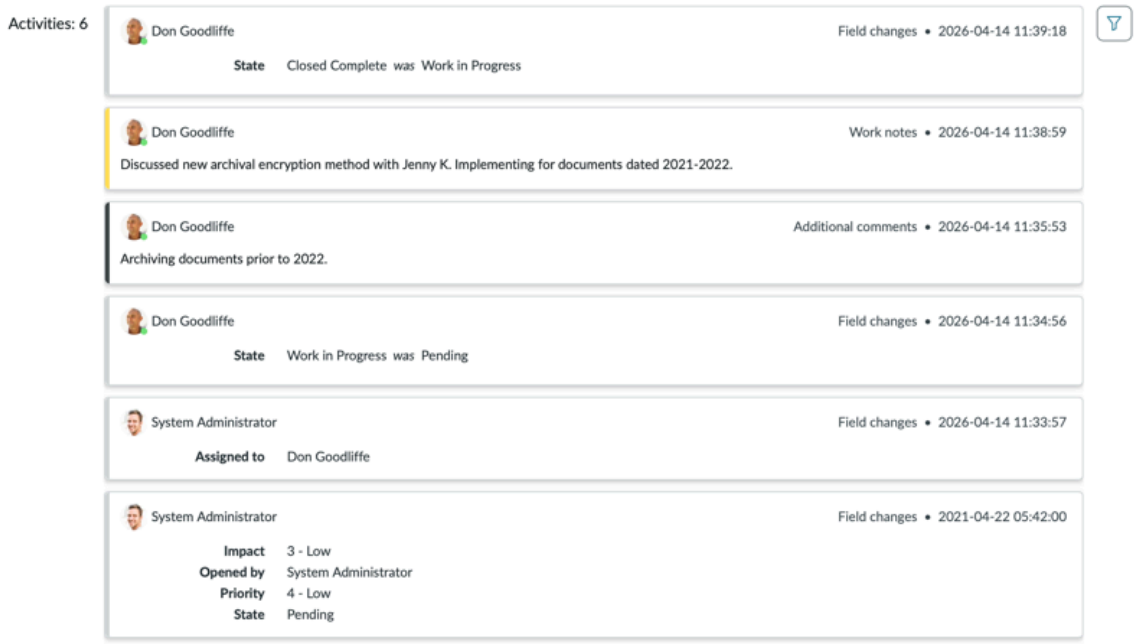
Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Click **New**.
3. In the **Name** field, enter a descriptive name for the formatter.
4. In the **Formatter** field, enter the name of the UI macro with `.xml` appended to it.
5. In the **Table** field, select the table in which the formatter will be used.
6. In the **Type** field, select **Formatter**.
7. Click **Submit**.
8. To add the formatter to a form, configure the form design and add the formatter.
   The formatter appears on the form according to your selections.

Activity formatter

The activity formatter provides an easy way to track items not saved with a field in the record, for example, journal fields like comments and work notes.

The activity formatter is enabled by default on the Task [task] table and other tables that extend the Task table, such as the Incident [incident] table. It is also enabled on the Approvals [sysapproval_approver] table.



You can filter the content that appears on the activity formatter and participate in the record feeds on the record. You can create an activity formatter for any form and configure properties that control what fields appear in the formatter. The number next to activities indicates the number of entries in the record feed. The number updates when users use the filter.

Activity type and a time stamp display in the top of each entry.

In Core UI, the activity formatter shows updates in real time so you can see the latest information without refreshing the form. User presence enables you to see when other users are entering comments.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Core UI activity formatter

Related topics

User presence

Create an activity formatter

You can create an activity formatter for any audited table.

Before you begin

Role required: ui_macro_admin

Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Click **New**.
3. Enter a name for the formatter, such as `Activities (task)`.
4. Select a **Table**.
5. Enter `activity.xml` in the **Formatter** field.
6. Leave the **Type** as **Formatter**.
7. Click **Submit**.

Result

Note: You can create more than one activity formatter for a table, however, the system does not allow you to add more than one activity formatter to a form.

What to do next

Add the new activity formatter to forms as needed.

Add the activity formatter to a form

Add an activity formatter to any form to track journal fields on the form.

Before you begin

Role required: personalize_form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

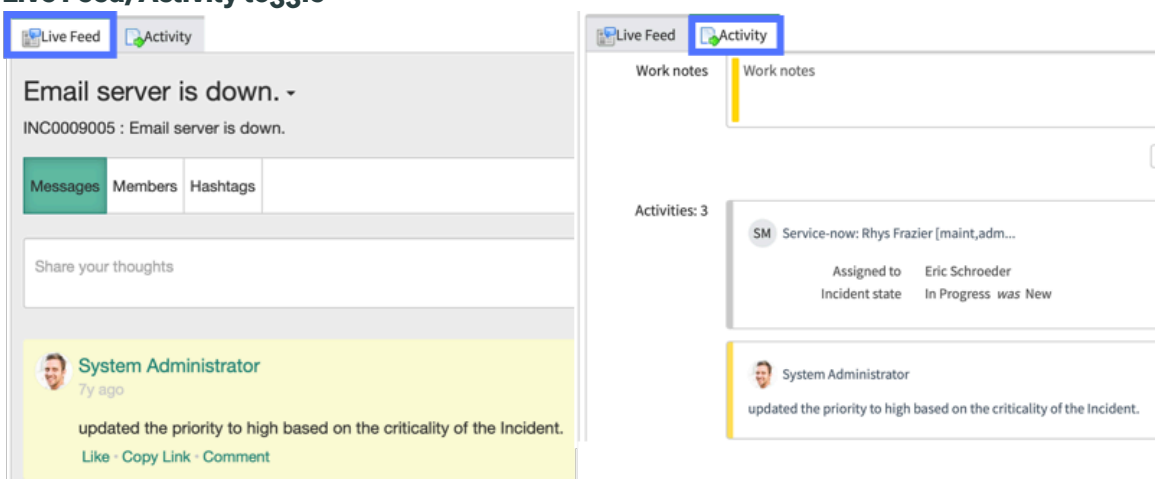
1. Verify that the table associated with the form is audited.
2. Configure the form layout to add **Activities (filtered)**.

> **Note:** In Core UI, you cannot place another field in between a journal field and the activities formatter. The Activity Stream is built to keep journal fields stacked on top of the activity formatter.
>
> Field styles are not applied to comments and work notes fields used with the activity formatter. Styles for these fields can be set using the `glide.ui.activity_stream.style.comments` and `glide.ui.activity_stream.style.work_notes` system properties located on the sys_properties table.

Enable the Live Feed-Activity toggle

Enable the Live Feed-Activity toggle, which allows users to switch between the activity feed and the document feed for a record.

Before you begin



The Live Feed-Activity toggle is only supported in the Core UI. To enable it, the system property *`glide.ui.polaris.experience`* must be set to "false."

Role required: admin.

About this task

Use live feed to interact with other users on a record by posting messages and adding attachments to the feed. Use the activity formatter to see an overall summary of activity for the record.

Live Feed/Activity toggle

Procedure

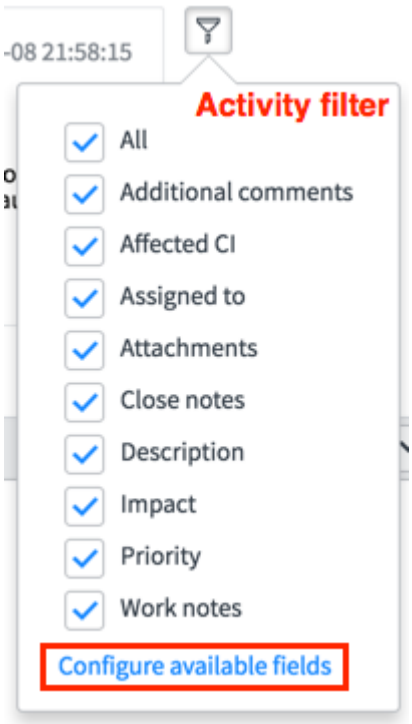
1. Navigate to **All** > **System Properties** > **All Properties**.
2. Find the *`glide.ui.show_live_feed_activity`* property and set it to "true."

Result

Form activity formatters include a Live Feed-Activity toggle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customize activities



You can customize which fields appear in the activity formatter. You can add or remove fields from the list of activities that users can select when they open the activity filter.

Before you begin

Role required: personalize_form and personalize_list

About this task

Customize the fields that appear in the activity filter

Procedure

1. Select the activity filter icon ( ).
2. At the bottom of the list, select **Configure available fields**.
3. In the slushbucket, select the desired fields in the **Available** column and move them to the **Selected** column.
   The activities appear in alphabetical order, regardless of the order in the **Selected** column.

   Note: In Core UI, **Configure available fields** is responsible for the order of the Additional Comments and Work Notes fields.

4. Select **Save** to add them to the activity formatter and the filter.

What to do next

Administrators can also modify the system property **Incident activity formatter fields**(*glide.ui.incident_activity.fields*). Access this property through **System Properties** > **UI Properties**. The system automatically synchronizes the values in the system property and the selections you made.

Configure roles for viewing emails in the activity formatter

The system property *glide.ui.activity.email_roles* enables you to control which roles can see emails in the activity formatter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
In the activity formatter, users see activity only for fields they have permission to read. For example, self-service users might see the activity formatter on the self-service view of the Incident form, but they do not see work notes, unless security rules have been customized to allow this.

If the **Emails-autogenerated** or **Emails-correspondence** field is included in the activities list, all users see all emails. No determination is made whether an end user, for example, should see an email containing work notes. Configure this property to restrict this capability to specified roles.

Note: Email does not appear as an activity until it is sent. If email properties are not configured for outbound delivery, the message can be found by navigating to **System Mailboxes** > **Outbox**.

Procedure
1. Navigate to **System Properties** > **UI Properties**.
2. Locate the property labeled **List of roles (comma separated) that can view emails in the Activity Formatter when "Emails-autogenerated" or "Emails-correspondence" are included.**
3. Add roles to the property, separated by commas.
   These are the only roles that can see email in the activity formatter. All other roles are prevented from seeing email. If no roles are listed, all users can see email. The itil role is on the list by default.
4. Click **Save**.

Configure the max activity size property

Use the glide.max_activity_size property to increase the amount of content that can be visible in the Activity Formatter.

Before you begin
Role required: admin

About this task
The default size for an activity is 100 * 1024, which causes large amounts of content to be hidden in the Activity Formatter. You can change the default value by adding the glide.max_activity_size property.

Procedure
1. Type `sys_properties.list` in the Application Navigator.
2. Select **New** and enter the following values.

Field	Description
Name	glide.max_activity_size
Type	integer
Value	102400

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Use this field to increase the number of content allowed in the Activity Formatter. This value should be in bytes, for example 100 * 1024, or 102400.

Enable the email reply button for the activity formatter in Core UI

The *glide.ui16.emailStreamResponseActions* system property determines whether a user can reply to email using the email reply button in the activity stream in Core UI.

Before you begin
Role required: admin

Procedure

1. In the navigation filter, type `sys_properties.list`.
2. Add the following system property.
   For more information on adding a system property, see Add a system property.

Field	Description
Name	*glide.ui16.emailStreamResponseActions*
Description	Add the email reply button to the activity stream.
Type	true | false
Value	Set the value to **true**. The default value if this property is not configured is false.

3. Select **Submit**.

Configure activity formatter colors

Use the glide.ui.activity_stream.style.comments and glide.ui.activity_stream.style.work_notes properties to change the color-coding in the Activity Formatter.

Before you begin
Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Add a system property for the **Additional comments** field.

   a. Select **New**.

   b. Enter the following values.

Field	Description
Name	`glide.ui.activity_stream.style.comments`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	string

c. Select **Submit**.

3. Change the color of the **Additional comments** field.

a. In the System Properties list, select the glide.ui.activity_stream.style.comments record.

b. Enter the color that you want to use.
For example, enter `LightGreen`. The default value is transparent.

c. Select **Update**.

4. Add a system property for the **Work notes** field.

a. Select **New**.

b. Enter the following values.

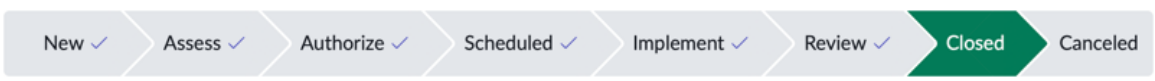
Field	Description
Name	`glide.ui.activity_stream.style.work_notes`
Type	string

5. Change the color of the **Work notes** field.

a. In the System Properties list, select the glide.ui.activity_stream.style.work_notes record.

b. Enter the color that you want to use.
For example, enter `Blue`. The default value is gold.

c. Select **Update**.



Process flow formatter

The process flow formatter provides a graphical summary of the stages in a process. The formatter is typically shown at the top of forms that are part of a process.

Each record on the Flow Formatter [sys_process_flow] table represents a process stage and can have a different condition applied to it. When specified conditions are fulfilled, the formatter highlights the current stage and places a check mark next to all previous stages.

These examples show a workflow in Core UI interface.

Core UI process flow for a change request

When any formatter stages are defined for a table, they appear on the form associated with that table in the order specified, assuming the formatter has been added to the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the process flow formatter

You can activate the Process Flow Formatter plugin.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Create a process flow formatter

You can create a process flow formatter stage.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Process Flow**.
2. Click **New**.
3. Complete the form, as appropriate.

Field	Description
Table	Select a table for this process flow formatter.
Name	Enter a name to identify the formatter.
Label	Enter the name to be displayed in the form configuration slushbucket.
Active	Select the check box to ensure that the formatter stage is active. When the check box is cleared, the formatter stage does not appear in the flow display.
Order	Enter a number to indicate where in the process flow the formatter will be displayed. Formatters are arranged with the lowest number on the left and the highest number on the right.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

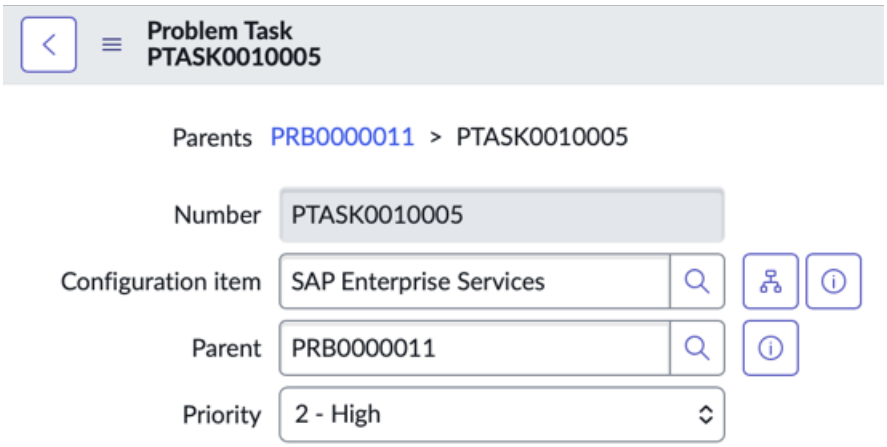
Field	Description
Condition	Use the condition builder to set the conditions under which the formatter is highlighted as current. Any field available in the condition builder, such as SLA or Impact, can be used to trigger a process flow stage.
Description	Describe the process flow formatter. This description does not appear on the actual formatter.

4. Repeat as necessary for each stage.

Parent breadcrumbs formatter

The parent breadcrumbs formatter on the Task table provides breadcrumbs that show the parent or parents of the current task. This formatter can be used also on any table that extends Task.

Before you begin



Role required: personalize_form

About this task

To add the parent breadcrumbs formatter to a form, configure the form and add **Parent Breadcrumbs** to the desired location. The breadcrumbs show only six levels of parents. If more levels exist, the breadcrumbs display an ellipsis ("...").

The **Parent** reference field also has to contain a value for the breadcrumbs to appear. You may need to configure the form to contain the **Parent** field as well.

Breadcrumbs

Customize the parent breadcrumbs formatter

You can customize the parent breadcrumbs formatter to control what breadcrumbs appear.

Before you begin

Role required: ui_macro_admin

Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Select **Parent Breadcrumbs**.
3. Click **View UI Macro for this Formatter** to view or modify the underlying formatter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the breadcrumb uses the default display field, **gr.getDisplayValue(),** as the link in the breadcrumb. To customize this, add the following line, replacing the **fieldName** parameter with the desired field name (not the field label):

```
pc.setLabelField("fieldName")
```

If a user points to a breadcrumb, the short description for that record appears as a hint by default. To display alternate hints for the breadcrumb, add the following line, replacing the **fieldName** parameter with the desired field name (not the field label):

```
pc.setTitleField("fieldName")
```

Be sure to add these lines in the proper location, as shown in the following example:

```
//parent crumb functions - script include
var pc = new ParentCrumbs(now_GR);
pc.setLabelField("short_description");

//override the default display field to be used for label
pc.setTitleField("number");

//override default short_description hover text
var crumbs = pc.getCrumbs();
```

Use the parent breadcrumbs formatter on non-Task tables

The parent breadcrumbs formatter can be used on non-Task tables as long as the table has a reference to itself through a field called **parent**.

Before you begin

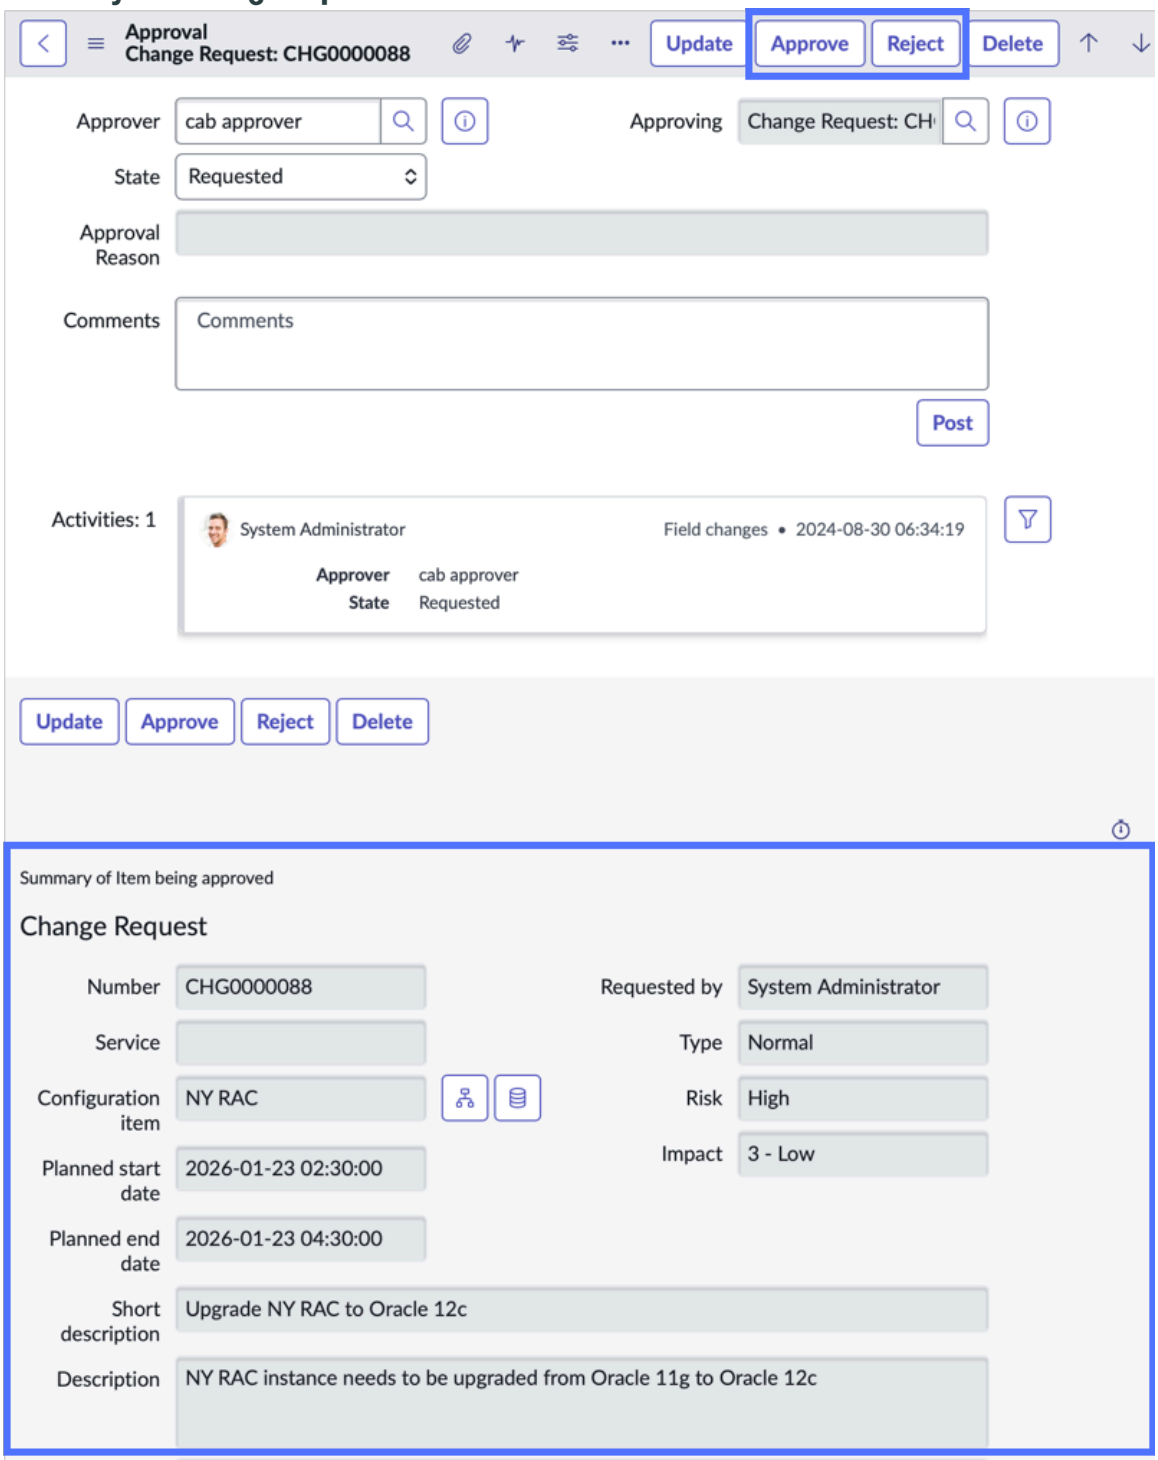
Role required: ui_macro_admin

About this task

To make the formatter available for a different table, duplicate the formatter used by the Task table:

Procedure

1. Navigate to **All** > **System UI** > **Formatters**.
2. Select **Parent Breadcrumbs**.
3. Set the **Table** field to the appropriate table.
4. Right-click the form header and choose **Insert**.
5. Add the new formatter to the appropriate form.



Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form.

The approval summarizer displays full information for the record used to request approval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary of a change request

The **Reject** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.

Note: When the overall request is approved, you must ensure this **Reject** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the **Accept** button on requested items should only appear before the overall request is approved or rejected.

Override a formatter with macros

The system uses formatters to handle complex rendering of specific form elements.

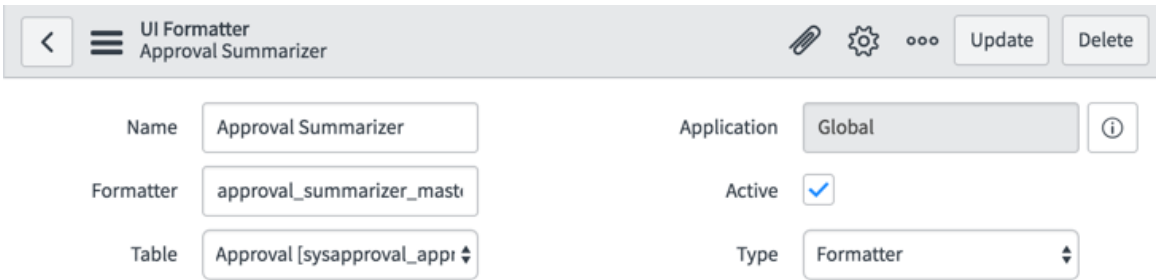
Before you begin

Role required: ui_macro_admin

About this task

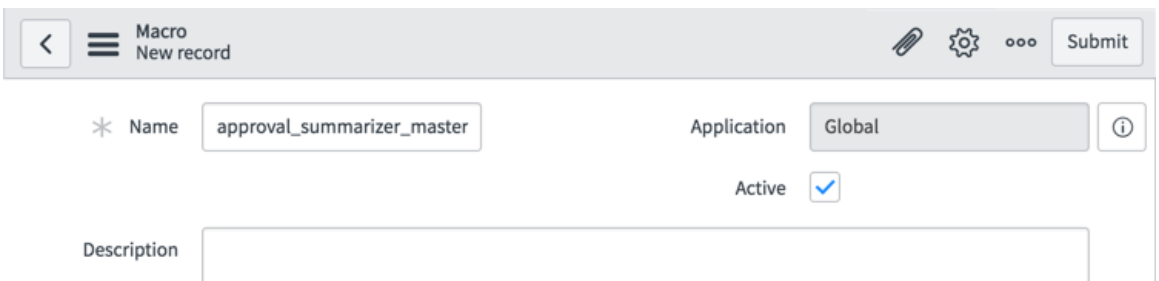
Examples of form elements rendered by formatters in the base platform are:

- Activity formatter: Displays the list of activities, or history, on a task form.
- Process flow formatter: Displays the different stages in a linear process flow across the top of a record.
- Task parent breadcrumbs formatter: Provides breadcrumbs to show the parent or parents of the current task.
- Approval summarizer formatter: Displays dynamic summary information about the element being approved.



A UI macro can override formatters provided in the base system.

Procedure



1. Navigate to **All** > **System UI** > **UI Macros**.
2. Click **New**.
3. In the **Name** field, enter the same name as the formatter you want to override, but omit the .xml extension.
4. Complete the remaining fields on the form.
5. Click **Submit**.

Example:

This example shows the form that defines the existing approval summarizer formatter:

Here is the form for the UI macro that overrides the approval summarizer formatter:

Limit the number of activity stream entries

You can set a system property to limit the number of entries allowed in an activity stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Enter `sys_properties.list` in the Navigation filter.
2. Search for the property *`glide.history.max_entries`*.
3. Edit the **Value** property to set the maximum number of entries that users can view in an activity stream.

Note: New entries do not count towards the max number until the form is refreshed.

Option	Description
Name	glide.history.max_entries
Description	Maximum number of entries allowed to display in an activity stream. The default number is 250. New entries do not count towards the max number until the form is refreshed.
Type	integer
Default value	250

Using form templates

Templates simplify the process of submitting new records by populating fields automatically.

To use a template, populate the most-used fields for a specific table, save it as a template, and then make the template accessible to your users. Users can manually apply a template when creating records, or an administrator can define scripts to apply templates automatically.

Create templates for the forms that you use frequently, such as incident, problem, and change. There is no limit to the number of templates that you can create or access, but having many templates for each form makes the templates more complex to manage.

You can create table-level access controls to restrict template creation. When applied, a user creating a new record from a template must satisfy the save_as_template access control for every field modified by the template.

Automatically applied templates

You can make a template that automatically applies to new, user-created records on a specific table. To create this kind of template, set the template name to match the name of the table to which the template applies.

For example, imagine you want to apply a template automatically when a user creates a record on the Windows Server [cmdb_ci_win_server] table. Set the **Name** field to **cmdb_ci_win_server** and the **Table** field to **Windows Server [cmdb_ci_win_server]** on the Template form.

Automatic templates are always global. They do not honor the **User** and **Groups** fields on the Template form. Automatic templates do not apply to records created by the system, such as those records generated by business rules, UI actions, or workflows.

Create a template using the Template form

Create a template record for any table to populate certain fields automatically.

Before you begin

Role required: template_editor_global or admin

About this task

https://player.vimeo.com/video/1162317177?h=489f4b73c5&badge=0&autopause=0&player_id=0&app_id=58479%22

Templates enable users to more quickly and uniformly complete records.

Procedure

1. Navigate to **All** > **System Definition** > **Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Template form

Field	Description
Name	Name of this template. **Note:** The template name can't match an existing table name.
Table	Table that this template applies to. Select **Global** to make the template available for use with all tables. **Note:** The table list shows only the tables and database views that are in the same scope as the template.
Active	Option for making the template available for use. A template must be active to be used.
User	User who can configure and apply the template. If you define a user, no other users can see the template unless you select the **Global** option.
Groups	Group whose members can configure and apply the template. If you define a group, no other groups can see the template unless you select the **Global** option.
Global	Option to enable any user who can access the templates to view and apply this template.
Short description	Description of the template. **Note:** Adding content to this field doesn't add that content to the **Short description** field of the forms that use this template.
Template	Content that automatically populates records that are based on this template. Select a field from the specified table in the left column and then enter the data to populate automatically in the right column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Even though you can select dot-walked fields in the template, they don't apply to fields that are on the form.
Link element	Template that links a child table with the template for the parent table. In the template for the child table, set the value to the field that references the parent table. After you set the value, the child template is explicitly linked to the parent table. **Note:** This field doesn't appear by default. Configure the template form to add the field.

4. Select **Submit**.

Create templates for related task records

Administrators can create a template for a Task table record that also creates one or more related records in the child Task table.

Before you begin

Role required: admin

About this task

Administrators must understand the parent-child relationships between Task tables. For example, the Change Task table is a child of the Change table and the Incident Task table is a child of the Incident table.

Note: Child templates can only be applied automatically if you first apply the parent template from a module.

Procedure

1. From the parent Task table template, configure the form layout to add these fields.
   - **Next Related Child Template**
   - **Next Related Template**
   - **Link element**
2. Create a template for the parent Task table.
   For example, create this template for the Change table.

Sample Change template

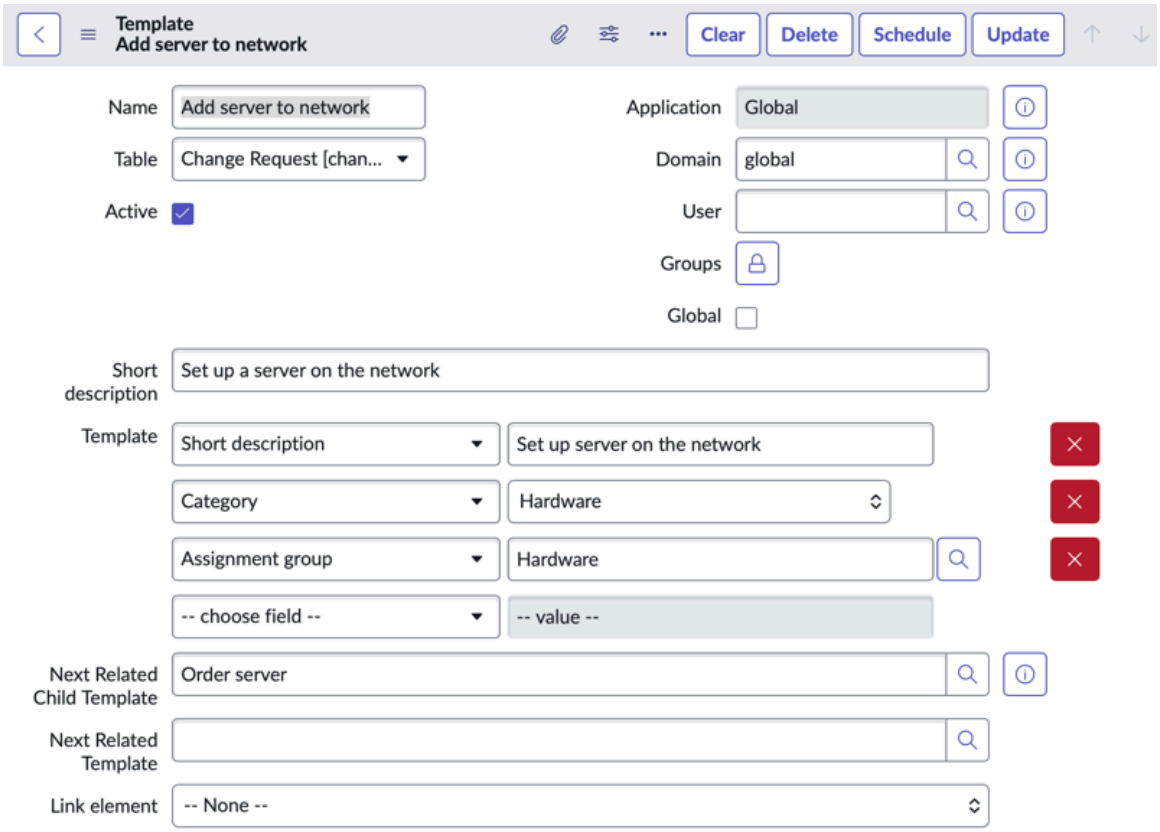
Field	Value
Name	Add server to network
Table	Change [change_request]
Short description	Set up a server on the network
Template	○ [Short description][Set up server on the network] ○ [Category][Hardware] ○ [Assignment group][Hardware]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create a template for the first related task.
   For example, create this template for the Change Task table.

First sample Change Task template

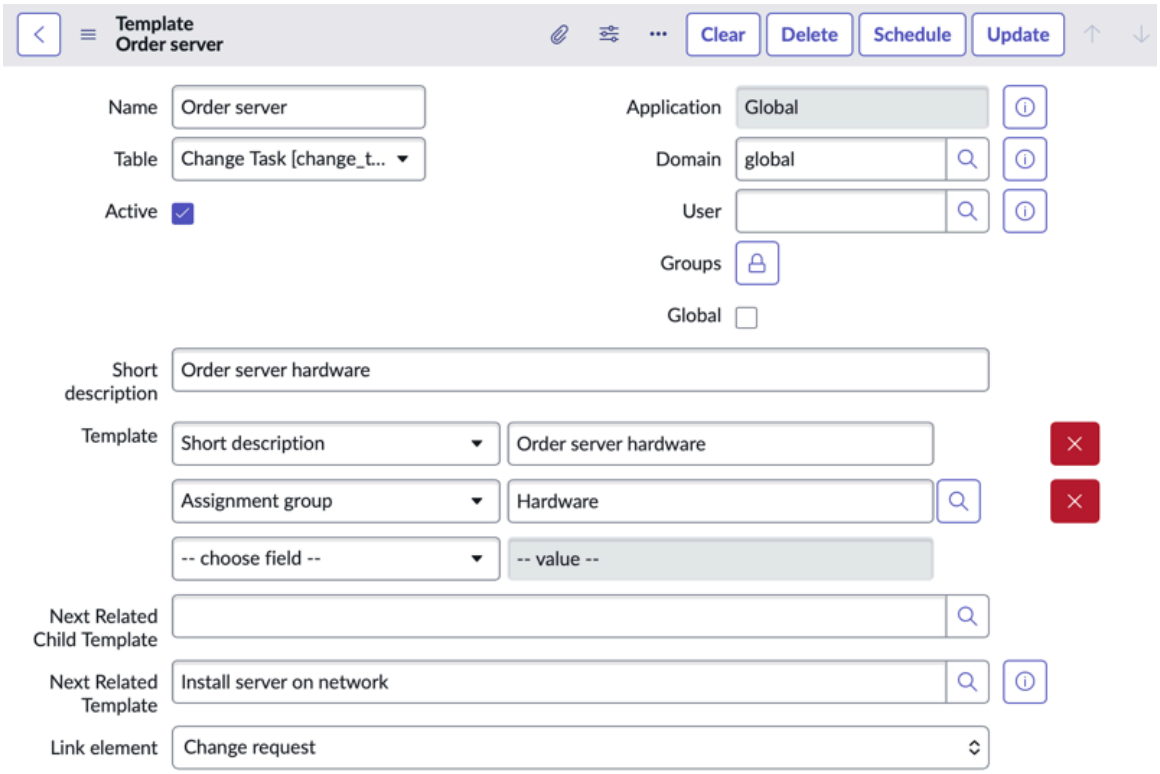
Field	Value
Name	Order server
Table	Change Task [change_task]
Short description	Order server hardware
Template	○ [Short description][Order server hardware] ○ [Assignment group][Hardware]
Link element	Change request



4. Create a template for each additional related task.
   For example, create one additional template for the Change Task table.

Second sample Change Task template

Field	Value
Name	Install server on network
Table	Change Task [change_task]
Short description	Install server on network
Template	○ [Short description][Install server on network] ○ [Assignment group][Hardware]
Link element	Change request



5. From the parent Task table template, set **Next Related Child Template** to the first related child task.
   For example, in the Add server to network template, select `Order server` in the **Next Related Child Template** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. For each child related task, set **Next Related Template** to the next related task template. For example, in the Order server template, select `Install server on network` in the **Next Related Template** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

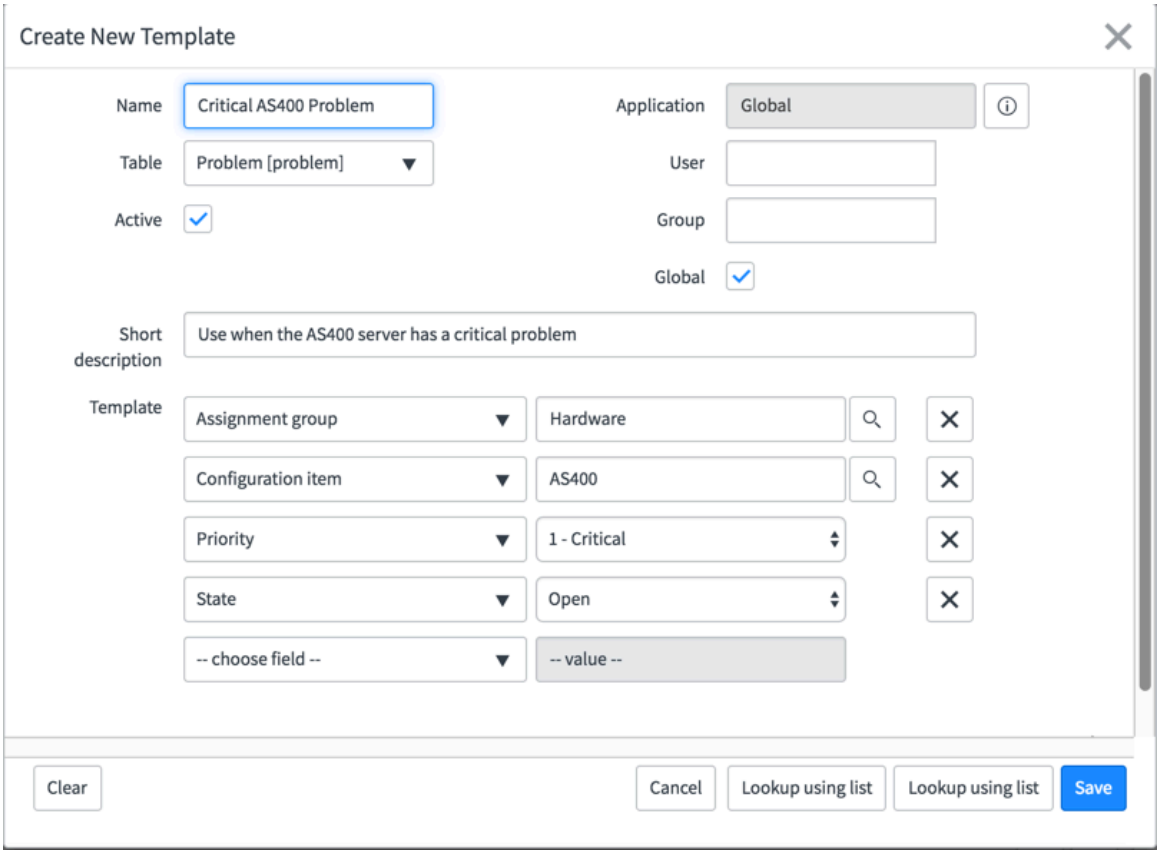
Note: The last related task template does not have a value for **Next Related Template**. For example, the **Install server on network** template does not have a value in **Next Related Template**.

What to do next

Create a module for the parent Task table template so that child templates can be applied to related task records. For example, create a module for **Add server to network**.

Create a template by saving a form

Save a populated form as a template.



Before you begin

Toggle the template bar so it is visible on forms.
Role required: admin

Procedure

1. Navigate to a form.
2. Complete the form as it should appear when a user applies the template.
3. In the template bar, click the plus icon (+).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter a descriptive name to make it easy for a user to select the correct template.
5. Make any additional changes as needed.
6. Click **Save**.

Schedule record creation from a template

You can create and schedule a scheduled job to create records based on a template. For example, you can regularly create a populated task record to perform a weekly backup.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Templates**.
2. Select a template record.
3. Click **Schedule**.
   The Scheduled Entity Generation form appears.
4. In the **Run** choice list, select how frequently to create a record.
5. Complete the schedule information.
6. Click **Submit**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a module for a template

You can create a module to open a form with pre-populated template data.

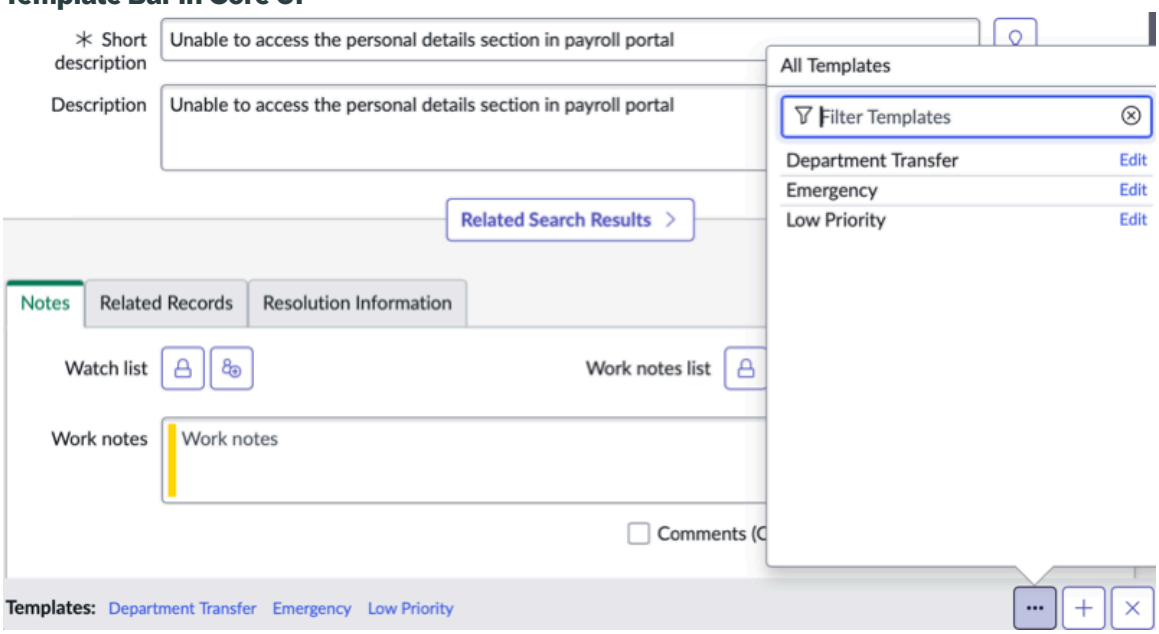
Before you begin

Role required: admin

About this task

Child templates are only applied if the parent template is applied from a module. Child templates are not applied by applying a template to a new form.

Procedure



1. Point to the application menu, such as **Self-Service**, and select the edit application (pencil) icon.
2. In the **Modules** related list, select **New**.
3. Fill in the **Title** and **Order** fields as appropriate.
4. In the **Link Type** field, select **URL (from Arguments)**.
5. In the **Arguments** field, enter `<table_name>.do?sys_id=-1&sysparm_template=<template_name>`
   The `<table_name>` is the name of the table you selected for the table field, for example `incident`. The `<template_name>` is the name of the template you want to use to pre-populate the form, for example `Incident_call_type`.
6. Select **Submit**.
7. Refresh the application navigator to view the new module.

Template bar

Use the template bar to apply, edit, and create templates.

When toggled, the template bar appears at the bottom of the form. Select a template title to apply the template to the form. Use the buttons at the bottom-right to add, edit, and access the complete list of templates.

Template Bar in Core UI

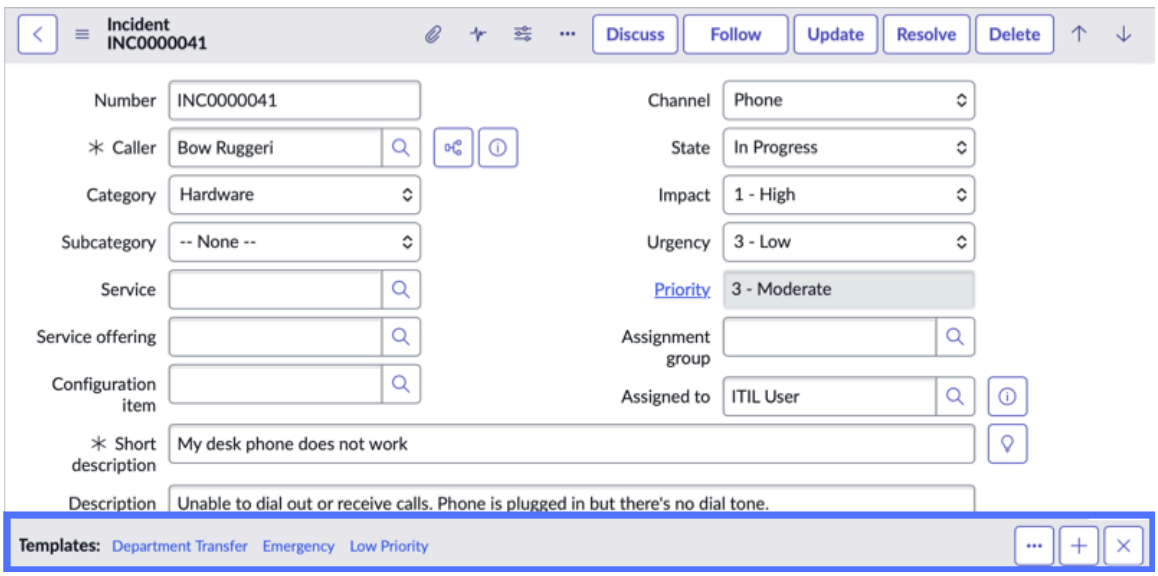
Template Bar Elements

Element	Description
Templates	Available templates appear in blue text on the template bar. Click a template to apply it to the form.
All Templates button (...)	Toggles the All Templates window.
Create New Template button (+)	Displays the Create New Template window.
All Templates popup	This window displays when the **All Templates** button is selected. The window displays a filterable list of all available templates. Click the **Edit** button to the left of any template to edit that template.
Disable Template Bar button (×)	Disables the template bar. To display the bar, see Toggle the template bar

For non-admins, see KB0711956 for more information on enabling the Edit button.

Toggle the template bar



The template bar appears at the bottom of forms. It provides shortcuts to apply, edit, and create templates.

Before you begin

Role required: none

About this task

You can toggle the template bar, which hides or shows it for all forms. The template bar is shown by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to a form.
2. Click the more options icon (⋯) in the form header.
3. Select **Toggle Template Bar**.

Scripted templates

You can apply an active template to a record using JavaScript.

Apply a template to current

To apply a template, use the *applyTemplate* method.

```
current.applyTemplate("<templatename>");
```

Apply a template to a GlideRecord

To apply the template to a record other than current, change current to a GlideRecord variable. When using a GlideRecord variable, you may need to initialize it after declaring the variable.

```
var rec1 = new GlideRecord("incident");
rec1.initialize();
rec1.applyTemplate("my_incident_template");
```

Apply a template from a UI action

The following script demonstrates a possible customization to the *Create Change* UI action on the Problem form. After you add this script to the UI action, a user can select the UI action to create a change record with information from both the problem record and the change template.

```
var change = new GlideRecord("change_request");
change.initialize();
change.short_description = current.short_description;
change.description = current.u_details;
change.cmdb_ci = current.u_service;
change.priority = current.priority;
change.requested_by = current.caller_id;
change.assignment_group.setDisplayValue('Change & Release');
change.u_status = 'New';
change.parent = current.number;
change.applyTemplate("standard_rfc");
current.rfc = change.insert();
current.comments = 'Change ' + change.number + ' created.';

var mySysID = current.update();

gs.addInfoMessage("Change " + change.number + " created");
action.setRedirectURL(change);
action.setReturnURL(current);
```

Script a template with child templates

When using *applyTemplate* with a template that has one or more child templates, the system creates the parent record before applying the child templates. This behavior ensures that any references or dot-walked fields from the child record to the parent have a valid target.

For example, if a template for the Change Request table has a child template for the Change Task table, applying the Change Request template inserts a Change Request record into the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

database. It assigns this record as the Change request for the Change Task record, then applies the child template to the Change Task record.

Apply a template using a sys_id instead of a name

To apply a template using a sys_id, use the following method.

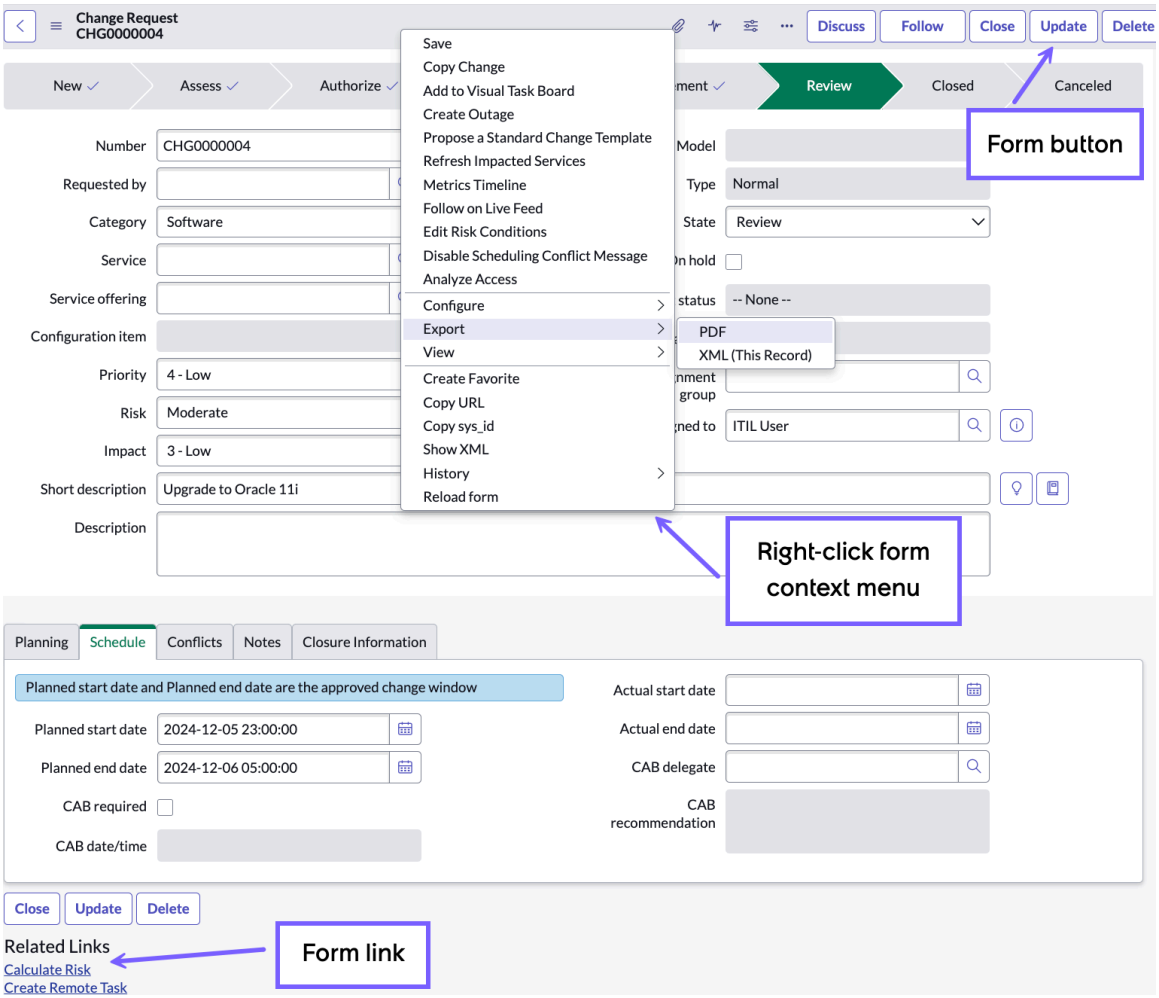
```
GlideTemplate.get(template.sys_id).apply(GlideRecord)
```

Defining UI actions

UI actions include the buttons, links, and context menu items on forms and lists. Configure UI actions to make the UI more interactive, customized, and specific to user activities.

Administrators and users with the ui_action_admin role can define UI actions.

UI action controls



You can create a UI action to provide any of these controls:

- A button on a form.
- A context menu item on a form that appears when you open the form context menu or right-click the form header.
- A related link in a form.
- A button in the banner on top of a list.
- A button at the bottom of a list.
- A context menu item on a list that appears when you open the list context menu or right-click the list header.
- A menu item for the action choice list at the bottom of a list.
- A related link at the bottom of a list.

Note: To hide or restrict the **New** or **Edit** UI action on the related list, use list control.

Create a UI action

You can create a new UI action or edit an existing one.

Before you begin

Role required: ui_action_admin or admin

About this task

You can add UI actions to tables and database views that are in the same scope as the UI action and tables that allow UI actions from another application scope to run on them.

Procedure

1. Navigate to **All** > **System Definition** > **UI Actions**.
2. Click **New** or open an existing record.
3. Define the UI action by completing the fields.
   You may need to configure the form to see all the fields.

UI action fields

Field	Description
Name	The text that appears on the button, link, or context menu item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the Action name and Name fields are both exactly the same in two different UI actions, they will be de-duplicated at runtime to prevent users from seeing two of the same actions.
Table	The table on which the UI action is available. By default, the UI action also appears on tables that extend the selected table (for example, Task actions appear on the Incident table). Select **Global** to make the action available on all tables.
Order	The order in which the UI action appears. The order applies to buttons from left to right and to menu actions from top to bottom.
Action name	A unique name to use when referencing the UI action in scripts. **Note:** If the Action name and Name fields are both exactly the same in two different UI actions, they will be de-duplicated at runtime to prevent users from seeing two of the same actions.
Active	An option to enable the UI action when selected. To disable a UI action, clear the check box.
Show insert	An option to show a button on new records that have not been inserted.
Show update	An option to show a button on existing records.
Client	An option for the UI action to execute its script in the user's browser, not on the server. When enabled, the **Onclick** field appears above the Condition field.
Form button	An option to put a button on a form.
Form context menu	An option to put an item in a form context menu (right-click the form header).
Form link	An option to put a link in the Related Links section of a form.
Form style	○ Primary—Colors the UI Action blue. ○ Destructive—Colors the UI Action red. ○ Unstyled—Does not color the UI Action.
List banner button	An option to put a button in the banner of a list. **Note:** List banner buttons are not intended to support record-specific conditions, so only the first row is considered when the condition is evaluated to determine whether the button will show for the list. Do not use record-specific conditions (e.g., current.getValue('state') === 'closed') in list banner button UI Actions.
List bottom button	An option to put a button at the bottom of a list. **Note:** List bottom buttons show regardless of condition and are evaluated per record on execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
List context menu	An option to put an item in a list field context menu (right-click a cell in a list).
List choice	An option to put an item in the action choice list at the bottom of a list. **Note:** List bottom buttons, like list choice actions, show regardless of condition and are evaluated per record on execution.
List link	An option to put a link in the Related Links section at the bottom of a list.
List style	○ Primary—Colors the UI Action blue. ○ Destructive—Colors the UI Action red. ○ Unstyled—Does not color the UI Action.
Overrides	A UI action that this UI action overrides.
Messages	Text strings that the UI action can use as a key to look up a localized message alternative from the Message [sys_ui_message] table. Each message key is on a separate line in the Messages field. The instance looks for a localized message string anytime the UI action makes a getMessage(msg) call where the msg string matches a key in the Messages field.
Comments	Descriptive content regarding this UI action.
Hint	The text that appears when a user points to the UI action control.
Onclick	The name of the JavaScript function to run when the UI action is executed. The function is defined in the **Script** field.
Condition	A JavaScript conditional statement that restricts when a UI action appears. Conditions always run on the server. **Note:** ○ The current object is not available for conditions on a list context menu. If the **List context menu** option is selected, any use of *`current`* on these actions is ignored. ○ You can reference the parent record for the UI action conditions on a related list button. For example, to disable the **New** and **Edit** buttons on the Affected CIs related list for closed changes, copy the global m2m UI actions to the task_ci table and add a condition of *`parent.active`*. ○ If you leave one of the fields empty that you specify in your condition statement, that condition defaults to **true**.
Script	The script to run when the UI action is executed. Function names must be unique.
Workspace	
Workspace Form Button	An option to make the UI action appear on the list of UI actions in a workspace.
Workspace Form Menu	An option to make the UI action appear as a list item in the menu associated with UI actions in a workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Format for Configurable Workspace	An option to use the UI action in a Configurable Workspace. If cleared, the UI action applies in Legacy Workspaces.
Workspace Client Script	A script to run when the UI action is executed in workspaces.
Requires role	
Role	The roles required for the UI action to apply. Users must have at least one of the roles for the UI action to apply.
Related lists on the form view	
UI Action Visibility	The views of the form that the UI action applies to. Use this option to restrict the UI action to form views that you specify. A UI action is available for the specified view according to the following rules: **a.** If there are no visibility rules, the action appears on all views. **b.** Any exclude rule on a given view means that the action does not appear on that view. **c.** If there is at least one include rule, then the action appears only on views that are specifically included.
Versions	All versions of the UI action. Use this list to compare versions or to revert to a previous version.

4. Click **Submit** or **Update**.

Note: If the UI action is enabled to run on the client side, wrap it in a function. Otherwise, the contents of the **Script** field runs when the page loads.

Example:
As part of a UI action script, you can redirect a user to a URL. For example, you might add links to a form or open a new record after it is created from a UI action. To redirect a user to a URL from a UI action, use this syntax in the **Script** field to define the redirect link:

```
action.setRedirectURL ( '');
```

To direct a user to a record, use this syntax, where *new_record* is the variable name for the GlideRecord:

```
action.setRedirectURL (new_record );
```

Override a UI action for an extended table

You can override or remove a UI action for a table that is extended from another table.

Before you begin
Role required: ui_action_admin or admin

Note: This is not applicable to domain separated instances.

About this task
When a UI action is defined for the Task table, it applies to all tasks, including incidents, changes, problems, and any other tables that extend the Task table. Similarly, a global UI action applies to every table. However, you can override a UI action for a specific table. This example demonstrates how to override or remove a UI action on the Task [task] table for only the Incident [incident] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Complete the following steps to override a UI action on the Task table for just the Incident table.

   a. Create a UI action on the Incident table with the same **Action name**.
   If the **Action name** is not defined, update both the new UI action and the UI action to be overridden with the same **Action name**.

   b. Enter a script that is specific to the Incident table.

2. Complete the following steps to remove a UI action on the Task table for the Incident table.

   a. Navigate to the UI action definition for the Task table.

   b. Add the condition `current.getRecordClassName() !='incident'`.

Using UI policies

UI policies dynamically change the behavior of information on a form and control custom process flows for tasks.

For example, you can use UI policies to make the number field on a form read-only, make the short description field mandatory, and hide other fields. Basic UI policies do not require any scripting, however for more advanced actions, use the **Run scripts** option.

You can also use client scripts to perform all of these actions, but for faster load times use UI policies when possible.

Create a UI policy

Create a UI policy to define custom process flows for tasks.

https://player.vimeo.com/video/1206601204?h=7327a4c7ee&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin
Role required: ui_policy_admin

About this task
A UI policy condition evaluates all fields even if they are not visible on the form. This function removes the requirement that a field must be on a form for it to be evaluated.

Note:

- Policies carried over from versions prior to Fuji are evaluated differently. Fields that previously were not evaluated are evaluated.
- UI policies are not supported on search screens.
- UI Policies also apply to forms and lists displayed within Content Management System application.

Procedure

1. Navigate to **All** > **System UI** > **UI Policies**.
2. Click **New**.
   The UI Policy [Advanced view] form opens
3. To change the view, in **Related Links** click **Default view**.
4. Complete the form, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You may need to configure the form to see all the fields.

UI policy fields

Field	Description
Table	The table for the form to be modified.
Active	The active status of the UI policy. Only active UI policies are applied.
Short description	Short summary of the UI policy.
Order [Advanced view]	The processing sequence, from the lowest to highest number. If two policies conflict, the UI policy with the higher number executes. For inherited UI policies, the extended (child) table's UI policies are executed first. Then the base table UI policies are executed; both from lowest to highest specified value.
When to Apply	
Conditions	The conditions which, if fulfilled, cause the UI policy to be applied. Conditions are built with the condition builder. To set conditions using a script, use a client script instead. Conditions are only rechecked if a user manually changes a field on a form. If the change is made by a UI action, context menu action, or through the list editor, it is not evaluated.
Global [Advanced view]	Option for specifying whether the UI policy applies to all form views. If this check box is cleared, the UI policy is view-specific. By default, the Global UI policy applies to all form views. However, a UI policy can be specific to a view. For example, you can define a UI policy for only the itil view of a form. Use the **View** field to accomplish this.
View [Advanced view]	Option for indicating which form view the UI policy applies to. This field is visible only if **Global** is not selected. If Global is not selected and the View field is left blank, the script applies the default view. For more information on form views, see View management.
Reverse if false [Advanced view]	Option for specifying that the UI policy action is undone when the conditions of its UI policy evaluate to false. In other words, when the conditions are true, the specified actions are taken and when they are false, the actions are undone.
On load [Advanced view]	Option for specifying that the UI policy behavior should be performed OnLoad as well as when the form changes. You can check or clear the **On load** check box in a UI policy to control whether it runs every time a form is loaded when the conditions are satisfied. In this example, an administrator does not want an incident to enter the **Awaiting user info** state unless the user provides an explanation to the customer. The administrator creates a UI policy with the following settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ In the When to Apply section, adds the condition **[State] [is] [Awaiting user info]** and clears the **On load** check box. This condition means that the UI policy applies only when the state is changed to **Awaiting user info**. ○ In the **UI Policy Actions** related list, creates a record that makes the **Additional comments** field mandatory when the condition is met.
Inherit [Advanced view]	Option for specifying whether extended tables inherit this UI policy. When a child table has an inherited UI policy from its parent table, the UI policy on the child table always runs first. This event is true regardless of the **Order** of the UI policies. Consider the following example: ○ A child table has a UI policy with **Order** value **500** that shows the **Urgency** field when its conditions are met. ○ Its parent table has a UI policy with the same conditions that hides the **Urgency** field. The parent table UI policy has **Order** value **100**. ○ Although the parent table **Order** field has a lower value, the child UI policy runs first and then the parent UI policy runs. When the conditions are met, the **Urgency** field is hidden.
Script	
Run scripts [Advanced view]	Option for specifying whether advanced behavior can be scripted for both true and false conditions.
Execute if true [Advanced view]	A script that executes when the conditions of the UI policy are fulfilled. ○ This field is available only if **Run scripts** is selected. ○ This feature is not available outside the scope or in global scope.
Execute if false [Advanced view]	A script that executes if the conditions of the UI policy are not fulfilled and the **Reverse if false** option is selected. ○ This field is available only if **Run scripts** is selected. ○ This feature is not available outside the scope or in global scope.
Other fields	
Run scripts in UI type	The UI type for this UI policy: Desktop, Mobile / Service Portal, or Both.
Related List: UI Policy Actions	
Table	[read-only] Field the UI policy action applies to.
Field name	Field on the selected table to which the UI policy performs an action if true. **Note:** If the specified field is not found on the form, the UI policy performs the action on the variable with the same name.
Mandatory	Choice list for specifying how the UI policy affects the mandatory state of the field. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Leave alone ○ True ○ False
Visible	Choice list for specifying how the UI policy affects the visible state of the field. Choices are: ○ Leave alone ○ True ○ False
Read only	Choice list for specifying how the UI policy affects the read-only state of the field. Choices are: ○ Leave alone ○ True ○ False
Related Links	
Default view or Advanced view	Changes the form view to the default or advanced view. The fields change based on the view.

5. Click **Submit**.

Related topics

Client scripts

Example: creating a UI policy

Create a UI policy to implement controls in the Incident form when the state changes to **Resolved**.

Before you begin

Role required: ui_policy_admin

About this task

This example demonstrates how to implement the following controls.

- Make a **Close Notes** field mandatory.
- Hide the **Opened by** field.
- Make the **Priority**, **Severity**, and **Urgency** fields read-only.
- Run a client script that displays an alert message.

Procedure

1. Navigate to **All** > **System UI** > **UI Policies**.
2. Click **New**.
3. Supply the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New UI policy

Name	Input
Table	Incident
Conditions	[Incident state] [is] [Resolved]
Reverse if false	Select this check box. If the incident state is not **Resolved**, the UI policy is reversed.
On load	Select this check box to perform the actions when the form is loaded or when the condition changes.

4. Right-click the form header and select **Save** from the context menu.
   The **UI Policy Actions** related list appears.
5. In the related list, click **New**.
6. Provide the following information.

New UI policy actions

Name	Input
Field name	Close notes. This UI action makes the Close notes field mandatory.
Mandatory	True
Visible	Leave alone
Read Only	Leave alone

7. Click **Submit**.
8. Repeat the process to create UI policy actions to hide the **Opened by** field, and to make the **Priority**, **Severity**, and **Urgency** fields read-only.

Client scripts for UI policies

Any scripts you create for UI policies run on the client side.

You can use different options in the UI Policy form to control when and how the UI policy is applied. These options include client scripts, OnLoad execution, and view-specific UI policies. Administrators can use the UI Policy form to create client scripts that run *onChange* when the UI policy conditions are met (**Execute if true**) or not met (**Execute if false**).To display these scripting fields in the UI Policy form, in the Script section, select the **Run scripts** check box.

For example, to display an alert to the user when the incident **State** field changes to **Resolved**, create the following script in the **Execute if true** field.

```
function onCondition(){
alert('You changed the "Incident state" to Resolved. Please
 enter your comments in the "Close notes" field.');
}
```

Service catalog UI policies control the behavior of catalog item forms. Service catalog UI policies can be applied to a catalog item or a variable set. For more information about using UI policies for service catalog items, see Service catalog UI policy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced form configuration

Administrators can configure advanced form features, such as form focus, form splits, and derived fields.

- Allow insert options on task records to let users insert a new task record, such as an incident or change request, from the task record they are currently viewing.
- Turn off focusing on the first writable field of a form if you want to prevent the cursor from hopping to the first writable field on a form.
- Deactivate form submission with the Enter key if you want users to be able to press the Enter key for reasons other than submitting the form.
- Enable multiple form splits, which organizes the fields into multiple columns, if you want to design forms with more than the default two column layout.
- Define required fields to prevent users from removing them when they configure the form.

Allow insert options on task records

The **Insert** and **Insert and Stay** options are disabled by default for task records such as incidents and change requests. You can set a system property to show these options for task records.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the property **Allow the use of the "Insert" and "Insert and Stay" options on task derived tables** (*glide.ui.task.insert*).
3. Select the check box to enable or clear the check box to disable (default) the options for tasks.
4. Click **Save**.

Turn off focusing on the first writable field of a form

Switch the focus on a form to the first element on the page instead of the first writable field to make the form more accessible to users who use screen readers.

Before you begin
Role required: admin

About this task
By default, forms set focus on the first writable field on the form. With first-field focus turned off, the form focuses on the first element on the page instead. Focusing on the first element, instead of the first writable element, helps orient users who use screen readers so they can find all the elements on a form.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Set the property *glide.ui.focus_first_element* to **false**.

Hide the template bar for a table

Administrators can hide the template bar for a table by creating a system property.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Creating a table-specific property and setting it to false prevents users from displaying the template bar on a record for the specified table.

Procedure
1. Navigate to `sys_properties.list`.
2. Add a system property with the following settings.

Property	Value
Name	glide.ui.show_template_bar.<TABLENAME>
Type	true | false
Value	false

3. Click **Submit**.

Deactivate form submission with the Enter key

By default, when you press the `Enter` key in a simple one-line text field, a choice list, or a Boolean field, the form is submitted.

Before you begin
Role required: admin

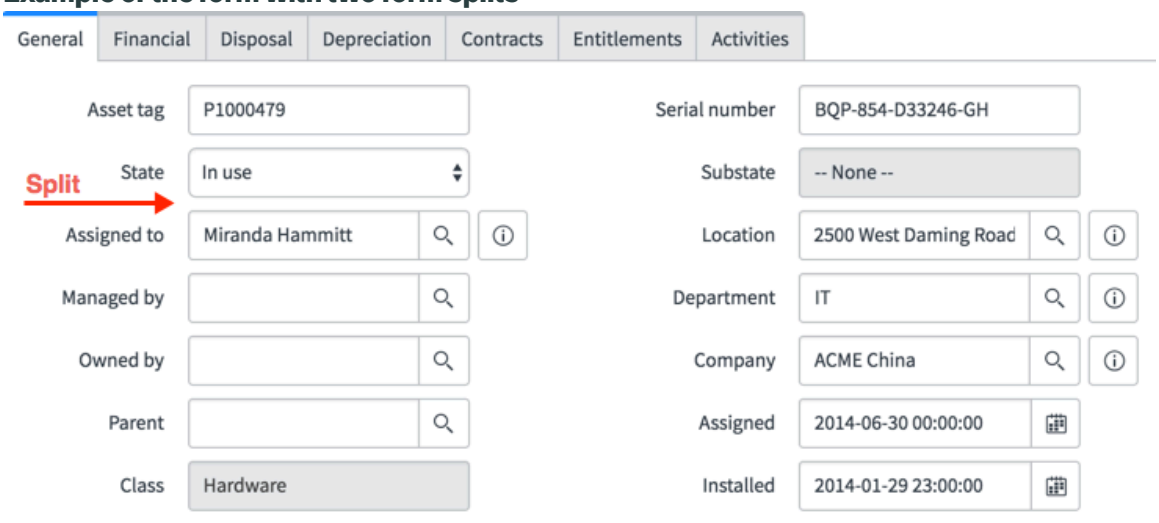
About this task
You can use a system preference to deactivate this feature if you do not want the `Enter` key to submit the form.

Procedure
1. From the left navigation pane, select **User Administration** > **User Preferences**.
2. Select the **enter_submits_form** preference.
3. Set the value to **false**.
4. Click **Update**.
   The change does not take effect until user preferences are reloaded either at login or when a session is created.

Enable multiple form splits

Form splits enable you to organize fields on a form into columns. Administrators must add a property to enable form splits.

Before you begin
Role required: admin



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Configuration of two form splits

```
|- begin_split -|
Asset tag
State
|- split -|
Serial number
Substate
|- end_split -|
|- begin_split -|
Assigned to
Stockroom
Reserved for
Managed by
Owned by
Parent
Class
|- split -|
Location
Department
Company
Assigned
Installed
|- end_split -|
Comments
```

Example of the form with two form splits

When you organize fields in this manner and the user is viewing the form on a small mobile device, the fields within the first split are listed before the fields in the second split. In this example, the **Asset tag**, **State**, **Serial number**, and **Substate** field are listed before any of the fields below them. You can also create elements that span the form at the top of the form.

Procedure

1. Enter `sys_properties.list` in the Navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. If the property does not exist, click **New**.
3. Enter the following information.

Option	Description
Name	glide.ui.form_multiple_splits
Description	Enable multiple form splits
Type	true | false
Value	true

4. Click the form context menu icon and select **Save**.
   The **Categories** related list appears.
5. Click **Edit** and move **UI** to the **Categories List**.
6. Click **Save**.
   The System Property form reopens and the new property appears in the UI Properties page.

Define required fields

You can specify which form fields are required in forms. This action prevents users with the personalize_form role from removing the field by configuring the form layout.

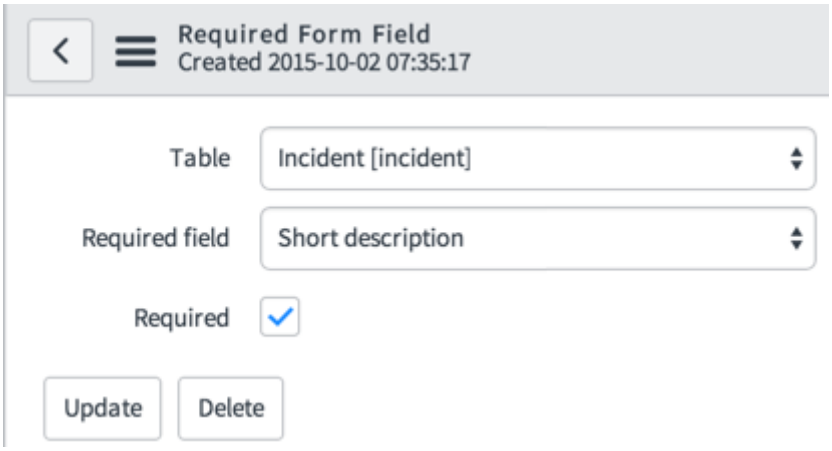
Before you begin

Role required: admin
The Required Form Fields plugin must be active.

About this task

If present on a form, only an administrator can remove required fields. When you configure a form, required fields appear in a gray color and have a tooltip indicating they are required. Required fields are defined in the Required Form Fields [sys_ui_element_required] table.

The expected (although not the only) use case for this feature is as part of a delegated administration scheme. For example, you can grant branch offices the rights to modify forms by granting the personalize_form role, but not allow them to remove certain fields which are critical to overall business processing.



Procedure

1. Navigate to `sys_properties.list`.
2. Locate the property named *`glide.ui.form.enforce_required_fields`* and make sure it is set to true.
3. Navigate to **System UI** > **Required Form Fields**.
4. Click **New**.
5. Select the table and field, and then select the **Required** check box.

Example

The following example sets the **Short description** field on the Incident form to be required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you decide later that you do not want to make the field required, clear the **Required** checkbox. This action is preferable to deleting the record.

6. Click **Submit**.

Result

If the table specified has extension tables, then the Required Form Field record applies to forms of all extended tables. For example, if an administrator specifies that the **Short description** field is required for the Task table, then this configuration applies to the Incident form, Change Request form, Problem form, and so on.

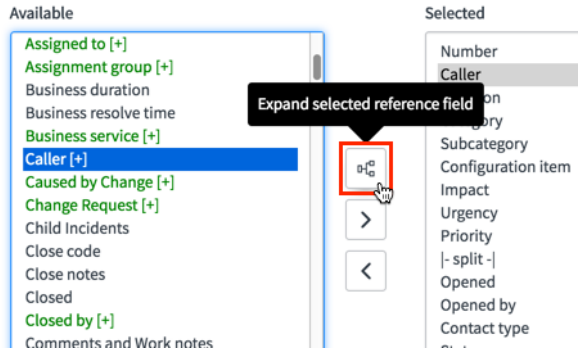
An extended table can override the Required Form Field rule of its base table. For example, if the **Short description** field is required for the Task table, but not required for the Incident table, it is required for all Task tables except Incident.

Control the label type for derived fields

You can configure the type of label that appears for derived fields.

Before you begin

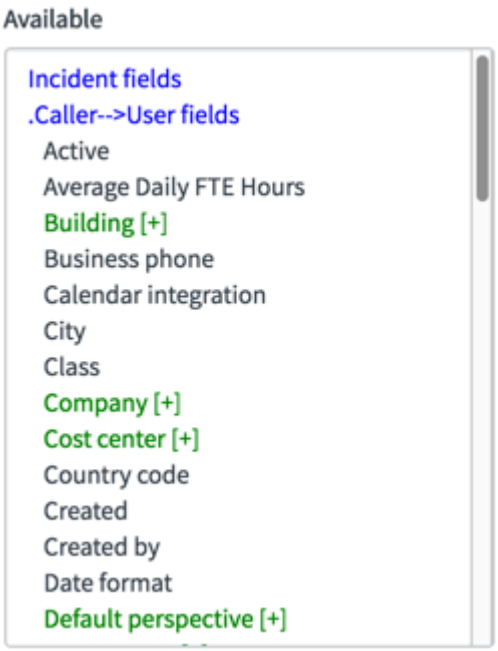
Role required: admin



About this task

An example would be displaying the email address for the caller when looking at an incident record. The email address is not stored in the Incident table, but is obtained by following the caller reference from the incident to the User table. You control the label type by setting a system property. For example, the field label for an incident email address can be either of the following strings.

- **Caller Email**, which represents the complete label to uniquely identify this field as the email from the caller user record. If you display the email address for the person the ticket is assigned to, its label would be **Assigned to Email**.
- **Email** which is the label for the target field. This label is not unique on the form if, for example, you are also displaying the email address of the person assigned to the incident. However, usually the placement of the field on the form makes it clear what the field represents.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available table fields

Choose the **Caller** field and click the expander icon.

Caller fields

Select the available fields associated with the **Calle** field.

Procedure

1. Navigate to **All** > **System Properties** > **System**.
2. Locate the **Use short labels for all fields. For example, if a form contains the caller's email address, use the "Email" label rather than the full label of "Caller Email"** (*glide.short.labels*) property.
   The default value is **true**, meaning that the short label is displayed in all forms.
3. If you want to display the complete label in forms, clear the check box.
4. Click **Save**.

ServiceNow AI Platform® field administration

The individual pieces of data in a record are called fields. You enter data in fields on the form or by using the list editor. Administrators can create new or modify existing fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started

Explore  Learn about fields on the ServiceNow AI Platform.	Customize  Add and customize fields in a table.
Administer  Administer data normalization and policy in your fields.	Reference  Information about supported field types.

Exploring field administration

You can enter data in fields by using the list editor or by using a form. In form view, fields appear as fields in the form, and in list view they appear as columns of data in the table. Administrators can create new fields or change the type of existing fields.

Field administration considerations

- If you edit a field on a child table that is present on the parent table, it's also changed in the parent table and all other child tables.
- Kanji characters aren't currently supported. If a table column identifier is created using Kanji characters, it's ignored in any update or insert operation from a form.
- When you create a custom field, use one of the supported field types described in Field types reference. Other field types, such as User Input, are for internal use only and aren't supported for custom fields.
- The Field Name and Table Name field types have a built-in dependency relationship. For example, Field Name fields don't exist independently; they require a Table Name field. Also, Field Name fields always contain a value, which is sys_id by default. You can't set the value for a Field Name field to None, even if you apply the attribute allow_null=true.
- If you need to change the data type for a field, create a new column using the new data type, copy the data from the old column to the new column via a background script, and then rename the original column label.

Customizing fields on the ServiceNow AI Platform®

Administrators can add and customize fields in a table, as well as make fields mandatory, highlight list fields, specify default values, and assign record numbering.

Add and customize a field in a table

Administrators can add new fields to a table to store and display data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Note: Certain ServiceNow AI Platform subscriptions include custom table entitlements. You can create custom tables for any purpose, up to the entitlement limit in the subscription. To learn more about how your usage administrator maps the custom tables that you create to subscriptions, see Map custom tables to a product subscription in Subscription Management.

Be aware of these database limitations:

- The system can only have a maximum of 1000 columns per table. Although 1000 columns is a specified limit, this limit doesn't mean you can physically have 1000 columns within a table. The number of columns within a table is defined by the database used in the ServiceNow datacenter, not by the ServiceNow AI Platform.
- Every table, regardless of storage engine, has a maximum row size of 65,535 bytes. Storage engines may place additional constraints on this limit, reducing the effective maximum row size.
- The system can't have more than 10 medium-length or longer **String** fields to a single table. Attempting to save a large number of characters in 11 or more String fields can result in the following error: Syntax Error or Access Rule Violation detected by database [Row size too large (> `8126`)].
- When you create fields, the u_ prefix is automatically added to the column name. If the column label that you enter contains leading numeric characters, they are replaced by the u_ prefix.

For more information on database limitations and general questions on tables in your ServiceNow instance, see KB0749585.

Procedure
1. Navigate to any form.
2. Right-click the form header and select **Configure** > **Form Layout**.
3. In the **Create new field** section, fill in the following fields

Option	Description
Name	Enter the name of the field as you want it to appear on forms and lists.
Type	Select a field type.
Field length	Select a field length. This field is visible only for certain field types.

4. Click **Add**.
5. Use the slushbucket to place the field in the desired location on the form.
6. Click **Save**.
   The field now appears on the form in the designated location.

Make a field mandatory

Fields can be marked as mandatory, meaning they must contain a value before the record can be saved. Mandatory fields are marked with a field status indicator before the label.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: personalize_dictionary

About this task
A mandatory field that is pre-populated by the platform with default data, such as a value from a client script, does not display the indicator. If you delete this value from the field, however, the indicator appears. The color of the indicator depends on the field state.

Using a dictionary entry to make a field mandatory does not work when using web services or background scripts. You can use a data policy instead. For more information on data policies, see Data policy.

Procedure
1. Right-click the field's label in the form and select **Configure Dictionary**.
2. In the **Dictionary** form, select the **Mandatory** check box.
3. Click **Update**.

   The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory. If the mandatory field is pre-populated for any reason, the mandatory field indicator does not appear.

   Mandatory fields are global. The field is marked as mandatory everywhere it appears in a form.

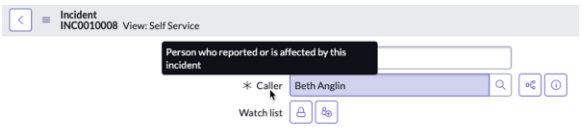
   Making a **True/False** mandatory will have no effect. **True/False** fields are always considered to have a value. A selected check box has a value of true and an unselected check box has a value of false. Either of these values satisfies the requirement of a mandatory field.

   A form can be saved with an empty mandatory field if that field is a reference field, and if the parent field is also blank. However, if the mandatory reference field shows a value from the parent field, then the form cannot be saved if this value is deleted. If the value in the referenced field is changed, the value for that field is changed everywhere it appears.
4. **Optional:** Use *`dictionary override>override mandatory`* to make a field that is mandatory only in the child table and not the parent table.

Related topics
Set a CI field to be mandatory

Define a dictionary override

Change the field label or hint



You can change a field's label or the text that appears as a hint when you point your mouse device to the field.

Before you begin
Role required: personalize_dictionary

Procedure
1. Navigate to the form the field appears on.
2. Select and hold (or right-click) the field label and select **Configure Label**.
3. Update the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Changing the Field Label or Hint

Field	Description
Table	The table the label appears on.
Label	The label that the field displays. You can enter up to 80 characters for the label, but not all databases support this many characters. The recommended maximum is 30 or fewer characters. HTML in field labels isn't supported.
Plural	The plural version of the field label.
Element	The dictionary name of the field.
Help	Helpful text stored in the record.
Hint	A short description of the field that displays when a user hovers over it. HTML in field hints isn't supported, but line breaks are allowed. 
URL	A URL link that displays on the label if this field isn't empty.
URL target	This field should be left empty, as it's no longer used.

4. Select **Update**.

Related topics

Add help to a field label on a form

Delete a field from a table

You can delete custom fields that you created. Custom fields begin with **u_**. It is recommended that you remove the field from forms and lists instead of deleting it.

Before you begin

Role required: admin

About this task

You cannot delete base system fields. In addition, any missing base system fields are recreated when the instance is upgraded.

Procedure

1. Navigate to a form that contains a custom field to delete.
2. Right-click the field label and select **Configure Dictionary**.
3. Click **Delete Column** in the form header, and then click **OK**.
4. To delete multiple custom fields, complete the following steps.

   a. Navigate to **System Definition** > **Dictionary**.

   b. Locate the custom fields to delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
For example, search for column names that start with `u_`.

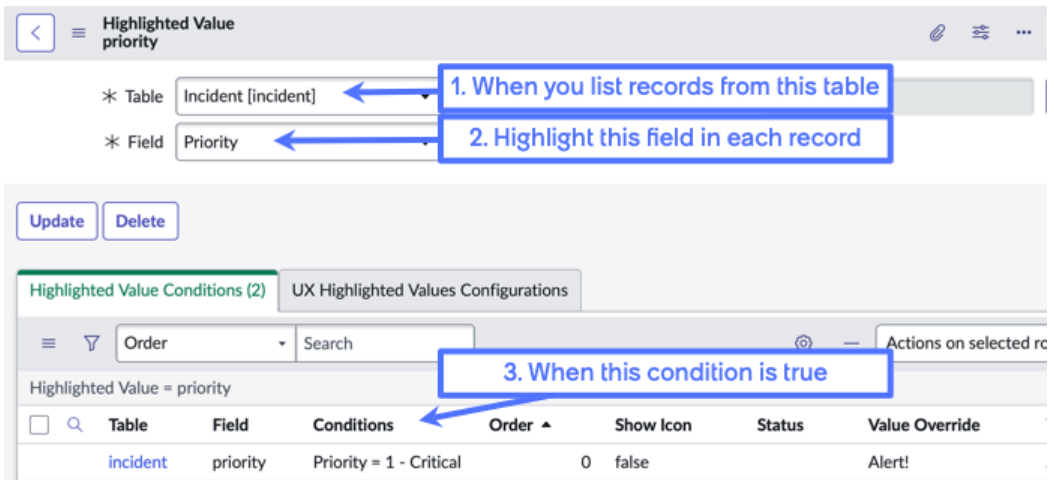
c. Check the boxes next to the fields to delete and select **Delete** from the action list below the list.
A confirmation dialog opens and reminds you that this may result in deletion of related records. If there are dependencies for the selected fields, they are listed.

d. To proceed, click **Delete**.

Highlight list fields

Color fields in lists to call an agent's attention to them.

Before you begin



Role required: admin

About this task

Highlighted fields in lists appear colored and optionally, have a leading bullet.

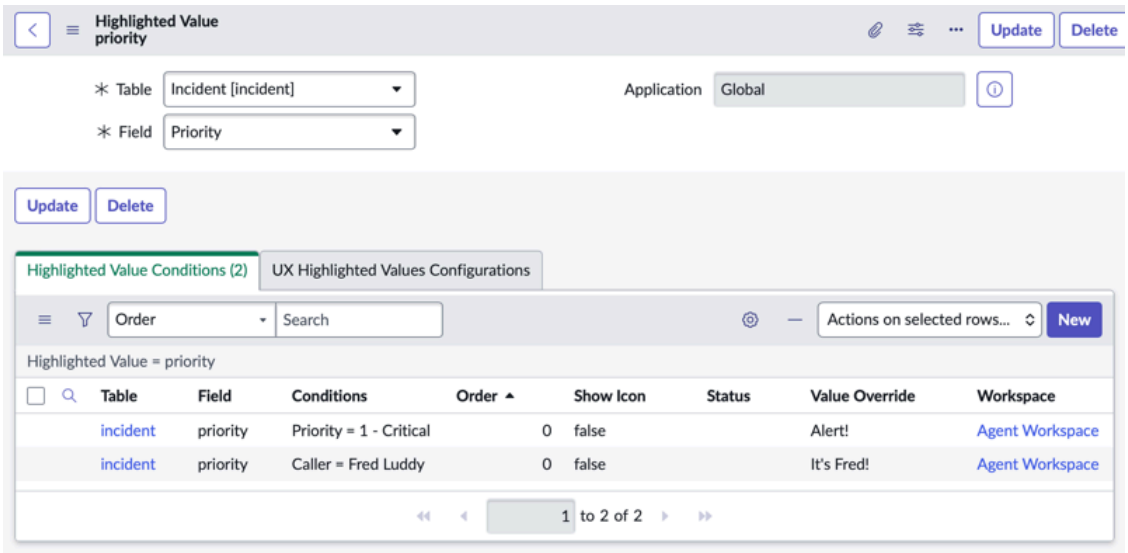
Number	Opened	Short description	Caller	Priority ▲	Category	State
INC0000002	2018-01-11 15:07:12	Network file shares access issue	Fred Luddy	1 - Critical	Network	On Hold
INC0000051	2018-03-29 13:48:32	Manager can't access SAP Controlling application	Joe Employee	1 - Critical	Software	In Progress

The set up involves specifying the fields that gets highlighted and the conditions that trigger the highlighting.

You cannot highlight the following field types:

- Reference
- URL
- Document IDs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **Workspace Experience** > **Administration** > **Highlighted Values** and click **New**.
2. On the form, fill in the fields.

Highlighted Value

Field	Definition
Table	Name of the table that contains the fields you want to highlight.
Field	Name of the field you want to highlight if the triggering conditions are met.
Application	Scope of applications this highlighting pertains to.
Workspace	The workspace this highlighting applies to.

The **Field** value can be unrelated to the condition that triggers the highlighting. In the following example, if the **Caller** is Fred Luddy, Workspace highlights the **Priority** field, not the **Caller** field.

3. Right-click the header and click **Save**.
   You've specified the field where the highlights appear. Now, it's time to specify the conditions that trigger the highlighting.
4. In **Highlighted Value Conditions**, click **New**.
5. In the Highlighted Value Condition form, fill in the fields.

Field	Description
Conditions	Conditions that trigger the highlighting. The condition can be different from the field that gets highlighted. For example, you might highlight the **Priority** field in a record if the **Caller** in that record is Fred Luddy. A simpler example is highlighting the **Priority** field if the priority value is **critical**.
Status	The highlighting color.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show Icon	Toggle to display (selected) or hide the leading bullet when highlighting.
Value Override	Text that replaces the field values from the table. If you don't supply a **Value Override**, Workspace highlights the field value from the table. If you supply a value, Workspace replaces the field value with your text and highlights that.
Application	Scope of applications this highlighting pertains to.
Order	The order in which to evaluate the conditions. When you have multiple conditions for highlighting the same field, they are evaluated in order from lowest to highest. If any of the conditions are True, Workspace highlights the field.

6. Click **Submit**.

   In the following example, the highlighting was triggered on the **Priority** field because the priority value was critical.

Number	Opened	Short description	Caller	Priority ▲	Category	State
INC0000002	2018-01-11 15:07:12	Network file shares access issue	Fred Luddy	1 - Critical	Network	On Hold
INC0000051	2018-03-29 13:48:32	Manager can't access SAP Controlling application	Joe Employee	1 - Critical	Software	In Progress

7. **Optional:** Click **New** on the **Highlighted Value Conditions** Related List and create another condition for highlighting the same field.
   For example, highlight the **Priority** field associated with the Incident table when the **Priority** value is "critical," or when the **Caller** value is "Fred Luddy." The conditions are ranked according to the **Order** value. Workspace evaluates the lowest value first.

Conditions	Order ▲	Show Icon	Status	Value Override
Priority = 1 - Critical	30	true	Critical	Alert!
Caller = Fred Luddy	50	true	Critical	It's Fred!

8. **Optional:** Remove all highlighting from a filtered list that would otherwise have highlighting. When setting up highlighting for a table, all filtered lists associated with the table display highlighted fields unless you disable highlighting for specific, filtered lists.

   a. Navigate to `sys_aw_list.list`.

   b. In the **Name** column, enter the name of the table with highlighted fields, for example, Incident.
   All filtered lists associated with the table appear.

   c. Click the filtered list you want to remove highlighting from.

   d. On the Workspace List form, if Global is the current application, click **here** in **To edit this record click here.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select the **Ignore Highlight in List**check box and click **Update**.
Now, regardless of the conditions, Workspace will not highlight any fields in the specified filtered list. This option does not work, however, for filtered lists in **My Lists**, which are the filtered lists agents create.

Modify string field length

You can modify the maximum character limit for a string field.

Before you begin
Role required: personalize_dictionary

About this task
The URL type field hides the Max Length field on the Dictionary form by default. Browsers support URL length up to 2,083 characters. The URL field is a String field.

Procedure

1. Navigate to a form that contains the field that you want to modify.
2. Right-click the field label in the form and select **Configure Dictionary**.
3. Change the **Max length** field to the desired length.

   Note: You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.

4. Click **Update**.
   The system cancels any length change that results in data loss due to truncation.

Field types reference

Specify a default field value

A default value populates a value in a field when a new record is created.

Before you begin
Role required: personalize_dictionary

About this task
The default value populates the field on the blank form for a new record, and also subsequently when the new record is submitted if the field is empty. Default values can be specified as either a constant or generated through script.

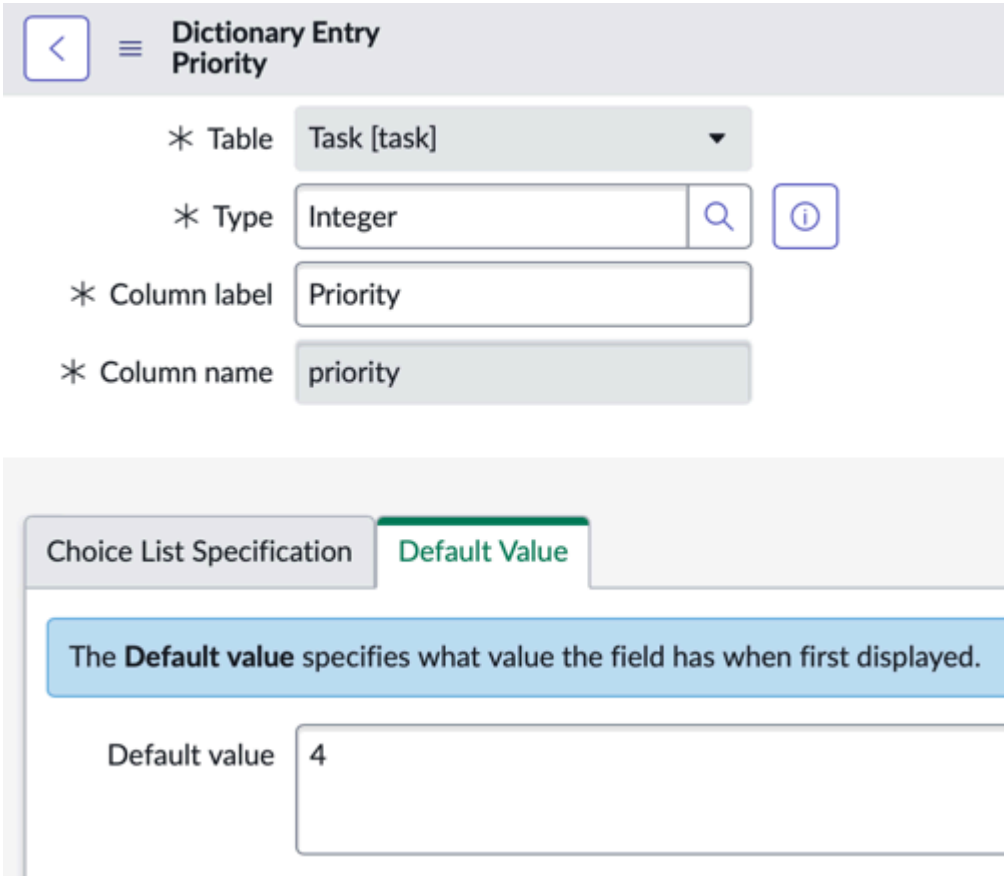
Procedure

1. Right-click the field's label in the form and select **Configure Dictionary**.
2. Enter the default value in the **Default value** field.

   To set a constant value, type it into the **Default value** text box field. To assign a default value using a more complex formula, use JavaScript to output a default value.

   Note: The default value should be the underlying value that would be present in the field, not the label. For example, in a choice list field, use the **value** of the choice as the default value, not the choice's name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Default field value examples

Review the following examples about specifying default field values.

Example: Constant default values

Here is an example that sets a default value for the **Priority** field.

Default value constant

Example: Javascript default values

To view out-of-box examples of JavaScript default values, navigate to **System Definition** > **Dictionary** and enter this filter: **[Default value] [starts with] [javascript]**. Open some of the records and view the default value javascript entries.

Example: Set a default value for assignment_group

The following example sets a default value in a [sys_user_group] reference field by getting the ID from the name of a group.

```
javascript:GetIDValue('sys_user_group', 'Development');
```

Example: Set a default value for assigned_to if user has the itil role

This example for the Task [task] table describes how to configure the default value for the [assigned_to] user equal to the current user id if the user has a role of itil.

- Column label: **Assigned to**
- Column name: **[assigned_to]**
- Reference Specification section

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reference: **User** [sys_user]
- Reference qual condition: **[Roles] [is] [itil]**

- Default value script:

```
javascript:if (gs.hasRole("itil"))current.assigned_to =
 gs.getUserID();
```

Example: Set a default value for a duration field

To set a default value for a duration field, use the following in the **Default value** field of the duration field's dictionary entry:

```
javascript:current.duration_field.setDisplayValue('3 04:30:14');
```

Avoid hard-coding a particular date-time. If the system date-time format changes, the value becomes invalid. Instead, select the **Use dynamic default** check box and assign a dynamic filter option. For more information on dynamic filters, see Create a dynamic filter option .

Make a field dependent

A choice or reference field can be declared dependent on another field on the same table to limit the values available to select based on the value of the dependent field.

Before you begin

Role required: personalize_dictionary or admin

About this task

If a required dependency does not function as expected, as might happen if there is a many-to-many relationship between the fields, consider using reference qualifiers to accomplish the goal.

Note:

- Fields cannot be made dependent on derived fields.
- When you create a dependency between reference fields (similar to assignment group and assigned to), you must add `_group` to the name of the field on which the other is dependent on to get the expected behavior. See KB0998861: Dependent field does not work as expected on task "Assigned to" field for more information.

Procedure

1. Navigate to a form that contains the field that you want to make dependent on another field.

   Example
   For example, to configure a field in the Incident [incident] table, navigate to **All** > **Incident** > **All** and select **New**.
2. Right-click the field label in the form and select **Configure** > **Dictionary**.
3. From the Dependent field tab, select **Use dependent field** and select the name of the field that this field will depend on.

   Note: For some field types, you may only need to enter the name of a field in the same table on which the field depends.

4. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Dependent field

In the example below, the Subcategory field is made dependent upon the Category field. On an incident form, the value selected for the Category field determines which options appear for the Subcategory field.

Related topics

Reference qualifiers

Require unique values for a field

The system allows you to require that a field's values be unique. When this is done, the system will not let two records have the same value for that field.

Before you begin

Role required: personalize_dictionary

About this task

By default, fields are created without this constraint. A field can have unique values only if there aren't already duplicate values in the database for that field. The system doesn't allow you to make a field unique while there are duplicate values in the table.

The system also doesn't allow you to add a unique index if a non-unique index already exists. In this scenario, you can't select the **Unique** check box on the form; instead, the system directs you to the **Tables & Columns** module, so you can drop the non-unique index, and then create the unique index.

Procedure

1. Verify that no records in the table for the field have values, or that they all have the same value.
2. Right-click the field label in the form and select **Configure Dictionary**.
3. Configure the form to add the **Unique** field if it does not already appear.
4. Select the **Unique** check box.
5. **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring the form layout

Define field styles

Field styles enable you to declare individual CSS styles for a field in a list or form.

Before you begin

Role required: personalize_styles or admin

About this task

The CSS lets you change the following attributes of a field.

- Change the color.
- Change the font attributes (bold, italics, underline).
- Change the padding and alignment of text.

You can define field styles for tables and database views in the same scope as the field style. You can also define field styles for other tables that have at least one field in the same scope. Field styles defined for a table don't apply to database views that include the table. Create separate field styles for database views.

Note: Field styles aren't applied to comments and work notes fields used with the activity formatter. Background color for these fields can be set using the *glide.ui.activity_stream.style.comments* and *glide.ui.activity_stream.style.work_notes* system properties located in the sys_properties table.

Procedure

1. Navigate to the list of styles for the field in one of the following ways.
   - Right-click the field label on the form and select **Configure Styles**.
   - Navigate to **System UI** > **Field Styles**, and locate the field to apply a style (admin only).
2. Select **New**, or select the style to modify.
3. Complete the form.

Field	Description
Table	Table that contains the field. **Note:** The list shows only tables and database views that meet the scope protections for field styles.
Field name	The field to which the style applies.
Value	The exact value or script-based-condition required to apply the style. **Note:** Leave the **Value** field empty to apply field styles to UI16 forms. Specify a value in the **Value** field to apply field styles to UI16 lists. Field styles aren't supported for Workspaces.
Style	The CSS style to apply.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	For example, to make the background of the Incident Category fields red in record lists, with a 24-px font size and white text color, enter the following code.
	`background-color:red;`
	`font-size:24px;`
	`color:white;`

You can use a script-based-condition with the syntax `javascript:<script>` in the **Value** field to determine whether the system should apply a style to a field in the list. If the evaluated script returns true, the system applies the style to the list item.

The script has access to the *current* script object, which enables you to build conditions based on the field values of the current record. For example, this script checks for overdue items based on a field value:

```
javascript:gs.dateDiff(gs.now(),
current.u_datefield.getDisplayValue(), true) < 0
```

Note: In this example, `current.u_datefield` refers to the name of a custom date field.

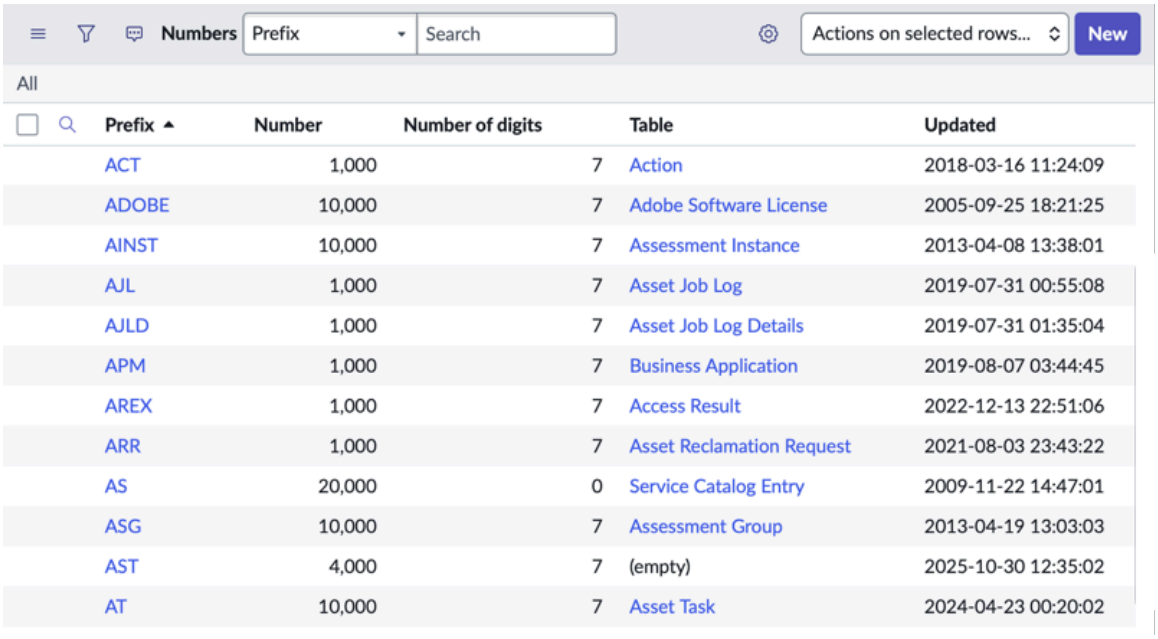
The system only supports one `javascript:<script>` entry in a **Value** field. If you want to enter multiple JavaScript conditions, consolidate the conditions into one statement. For example, instead of this invalid entry:

```
javascript: current.state == "Completed" javascript:
 current.error_tables > 0
```

Consolidate the conditions into one statement such as:

```
javascript: current.state == "Completed" &&
 current.error_tables > 0
```

4. **Optional:** To add alternative text for a style, configure the form to add the alternative text field. For styles like the VIP style icon, you can add alternative text so that screen readers can differentiate between the style and the text.
5. Select **Submit** or **Update**.



Record numbering

In the base system, several tables are numbered, including Incident, Problem, Change Request, and Knowledge. You can also use these numbers anywhere that script is present, for example to generate watermarks for emails. Records in tables can be numbered automatically.

Administrators can manage record numbering by navigating to **System Definition** > **Number Maintenance**. The current number format for a table, including the prefix (such as **INC** for incidents or **CHG** for changes), is stored in a record on the Number [sys_number] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Number table

Prefix	Number	Number of digits	Table	Updated
ACT	1,000	7	Action	2018-03-16 11:24:09
ADOBE	10,000	7	Adobe Software License	2005-09-25 18:21:25
AINST	10,000	7	Assessment Instance	2013-04-08 13:38:01
AJL	1,000	7	Asset Job Log	2019-07-31 00:55:08
AJLD	1,000	7	Asset Job Log Details	2019-07-31 01:35:04
APM	1,000	7	Business Application	2019-08-07 03:44:45
AREX	1,000	7	Access Result	2022-12-13 22:51:06
ARR	1,000	7	Asset Reclamation Request	2021-08-03 23:43:22
AS	20,000	0	Service Catalog Entry	2009-11-22 14:47:01
ASG	10,000	7	Assessment Group	2013-04-19 13:03:03
AST	4,000	7	(empty)	2025-10-30 12:35:02
AT	10,000	7	Asset Task	2024-04-23 00:20:02

You can renumber auto-incremented tables that extend the task table or manage numbering with a database field named **Number this field**.

Note: If you reset numbering in Number Maintenance, it only renumbers new records. It leaves the numbering as-is for existing records in system tables.

Add auto-numbering records in a table

You can define one number format per table in the system.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Number Maintenance**.
2. Select a table name to view the number record for that table, or click **New**.
3. Define the number format by completing the fields (see table).
4. Select **Submit** or **Update**.

   If an auto-numbered field does not already exist, a new field is automatically created on the table with the following values:

   - Label: Number
   - Name: u_number
   - Default value:

```
javascript:getNextObjNumberPadded();
```

Note: This script renumbers records when the **Number of digits** is updated. To use a script that does not renumber records when the **Number of digits** is updated, open the dictionary entry for the **Number** field and enter the following script in the **Default value** field.

```
javascript:getNextObjNumber();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-numbering records in a table

Field	Description
Table	Select a table.
Prefix	Enter a prefix for every number in the table (for example, **INC** for Incident).
Number	Enter the base number for this table (default value is 1000). Record numbers are automatically incremented, and the next number is maintained in the Counter [sys_number_counter] table. If you set the base number to a value higher than the current counter, the next record number uses the new base number. Otherwise the next record number uses the current counter. The counter does not reset to a base number lower than itself. To see the current counter, click the **Show Counter** related link.
Number of digits	Enter the minimum number of digits to use after the prefix (default value is 7). ○ Leading zeros are added to auto-numbers, if necessary. For example, **INC0001001** contains three leading zeros. ○ The number of digits can exceed the minimum length. For example, if **Number of digits** is **2** and more than 99 records are created on the table, the numbers continue past 100 (such as **INC101**). ⚠ **Warning:** Changing this field may update all number values for existing records on a table. Take care when changing this field on a production instance.

When moving some applications these records may not be automatically included. Take care to ensure that all necessary records are present when moving applications.

Note: To change the default values for new number formats, change the **Default value** field on the system dictionary record for the **Number** or **Number of digits** field. These fields are on the Number table.

Prepare to left-pad number fields in custom tables

Before you configure left padding of number fields on a custom table or a table that does not extend the task table, you must prepare business rules and script includes.

Before you begin

Role required: admin

Procedure

1. Duplicate the base system business rule named *Pad Numbers*: Click **Insert and Stay**. If **Insert and Stay** is not available on your instance, create a new business rule and manually copy all field values from Pad Numbers.
2. Give the business rule a new name and change the script field to read as follows:

```
padCurrentCategory();
function padCurrentCategory() {
var target = new GlideRecord(current.category+"");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if (!target.isValidField("u_number") ||
 target.isValidField("number")) return;
var nm = new UNumberManager();
nm.padTableNumbers(current.category, current.maximum_digits);
};
```

3. Save the changes.
4. Duplicate the base system script include named *NumberManager*.
5. Change the following two lines as indicated:

```
105: currentNumber = records.u_number.toString();
117: records.u_number = prefix + currentNumber;
```

6. Name the new script include `UNumberManager` and save your changes.
   You can now continue with the process of configuring left-padding and renumbering records.

Configure left padding of a system number in a table

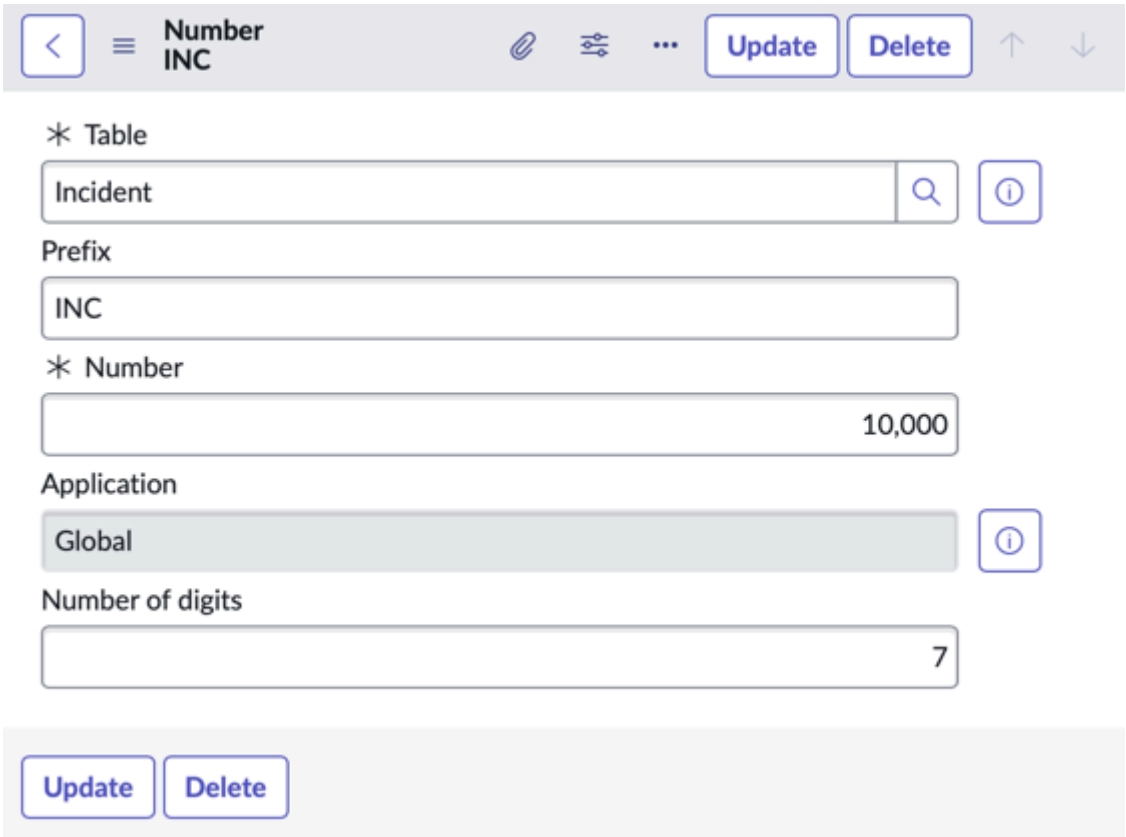
You can configure the left padding of the system numbers on a table. For example, pad the **Number** field on an Incident, Problem, or Change Request.

Before you begin

If you are configuring numbers on a custom table or a table that does not extend the task table, then, before performing the following procedure, you must prepare business rules and script includes. For more information, see Prepare to left-pad number fields in custom tables.

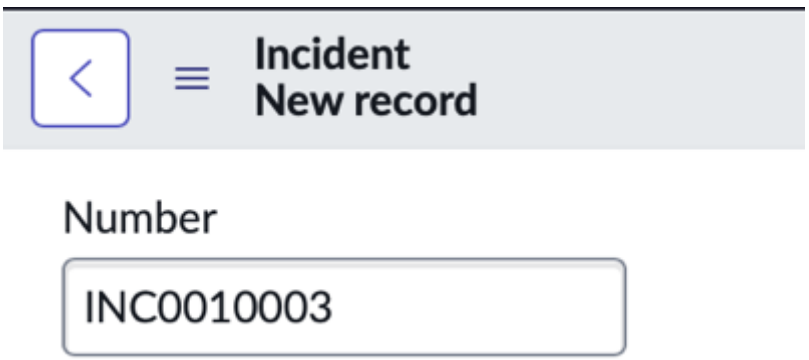
Role required: admin

Procedure



1. Navigate to the form, then right-click the **Number** field and select **Configure Dictionary**.
2. Enter the following script in the **Default value** field and click **Update**.

```
javascript:getNextObjNumberPadded();
```



3. Navigate to **System Definition** > **Number Maintenance**.
4. Open the table record.
5. Enter a value in the **Number of digits** field.
6. Click **Update**.

   Number padding is applied to both existing and new records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The result of the configuration in the image is an Incident number that is left padded.

Prevent numbering gaps

By default, numbers are generated every time a new record is created.

Before you begin

Role required: admin

About this task

When records are created but not saved, a gap in the numbering is created. You can prevent these numbering gaps by generating numbers only when records are saved.

Procedure

1. Navigate to **All** > **System Properties** > **System**.
2. Set the property **Assign a task number only upon insert (prevents unused numbers)**, `glide.itil.assign.number.on.insert`, to **true**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If an insert is aborted, it still consumes a new task number, leading to gaps in the sequence.

3. Click **Save**.

Enforcing unique numbering

Although duplicate numbers are rare, numbering does not enforce uniqueness, by default.

To enforce uniqueness, you can:

- Create a before business rule on insert only to check for duplicate values and replace duplicates with the next available number.
- Enable a unique index on the table. For more information, see Create a table index.

Note: While unique indexes ensure data integrity they also prevent any insert involving a duplicate number. This may cause unexpected errors during data entry.

Sample business rule

This sample script can be used as part of a before business rule on insert only to check for duplicate numbers and replace them with the next available number. The following script references a script created in Configure left padding of a system number in a table.

```
var curNum = current.number + '';

if(curNum) {

  var recordClass = current.getRecordClassName();
  var now_GR = new GlideRecord(recordClass);
  now_GR.addQuery('number', curNum);
  now_GR.setLimit(1);
  now_GR.query();

  if(now_GR.getRowCount() > 0) {
    var newNum = getNextObjNumberPadded();
    gs.addInfoMessage("The number " + current.number + " was already used
by another " +
     recordClass + ". The " + recordClass + " number has been changed to " +
 newNum);
    current.number = newNum;
  }
}
```

Administering field data on the ServiceNow AI Platform®

Use normalization, data policies, data lookup, and dynamic schema to maintain the integrity of your data on the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administration overview

- Field normalization and transformation

  Field Normalization includes normalization and transformation, which are two different ways to alter field values for increased data integrity and reduced duplication.

- Data policy

  Data policies enable you to enforce data consistency by setting mandatory and read-only states for fields.

- Data lookup and record matching support

  The data lookup and record matching feature enables administrators to define rules that automatically set one or more field values when certain conditions are met.

- Dynamic Schema

  Define a hierarchy of categories, groups, and attributes and enable users to select groups of attributes on a record.

Field normalization and transformation

Field Normalization includes normalization and transformation, which are two different ways to alter field values for increased data integrity and reduced duplication.

Normalization

Normalization searches for variations of the same field value and converts them into a single preferred value. By consolidating multiple variations of the same value into a single simple recognizable value, the system eliminates duplicate records and provides better search results. When a process or a user enters a value in a normalized field, the system determines whether to replace it with a normal value. Normalization also automatically adjusts queries to return normalized results and normalizes values in scripts.

While normalization is available for every field in the platform, it works best for descriptive values such as names or standard units of measurement. For example, you might create normalization rules to:

- Set the CPU type of a computer CI to a standard model name such as Xeon.
- Set the suffix used for the names of corporations to a standard format such as ServiceNow, Inc..

Transformation

Transformation converts raw field input values into standardized values that are more meaningful to an organization. Administrators control when transformation happens by defining rules and conditions for specific fields. For example, you might create transformation rules to:

- Remove suffixes from user names such as Jr. and II.
- Round computer CI RAM sizes to the nearest whole number such as rounding 4112 MB to 4000 MB.

Transform records make up the rules that define how a field transformation is executed. Order values determine the order in which each rule is evaluated. A check box on each transform enables an administrator to determine where processing stops when a rule evaluates to true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enabling normalization and transformation by field type

Field type records specify which data types are available for normalization and transformation. By default, the system supports normalization and transformation for these field types.

Field type	Use to normalize	Use to transform
Decimal	false	true
Float	false	true
Integer	false	true
Numeric	false	true
String	true	true
URL	true	true

A field type entry applies to all fields whose dictionary entry data type matches the field type entry. Administrators can create additional field type records for other data types as needed.

Warning: Avoid creating field type records for fields that store a Sys ID value such as a reference field, field name field, or a table name field. Directly altering a Sys ID value is more likely to produce data corruption and broken references than to produce meaningful standard values. Instead, normalize or transform the display value associated with the Sys ID. For example, normalize the user name instead of the Sys ID of a specific user.

Identifying normalized fields

The system displays the normalization icon on fields with an associated normalization or transformation record. Users with the normalizer role can click the icon to access the associated normalization or transformation record. Users without the normalizer role instead see a help page. Administrators can configure who sees the normalization icon with a preference called *`Restrict to roles`*.

Activate Field Normalization

Activate the Field Normalization [com.snc.field_normalization] plugin to install demo data and activate related plugins if they are not already active.

Before you begin
Role required: admin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Related topics

Installed with field normalization

Several components are installed with Field Normalization.

The following preferences (**Field Normalization** > **Administration** > **Preferences**) control features for normalization and transformation:

Field Normalization preferences

Preference	Description
Enable field normalization	This preference enables or disables the Field Normalization functionality, including transformations.
Enable field normalization auditing	This preference enables or disables auditing of field normalization tables.
Logging	Select the maximum level of logging detail desired. For example, select Error to log only errors and Information to log errors, warnings, and information.
Decoration URL	Enter the URL for the help/information link associated with the Field Normalization decoration. This link opens the page presented to users who do not have rights to see the normalization or transformation record. The default link opens a ServiceNow Wiki page with a general explanation of Field Normalization. The purpose of this page is to explain to normal users why a field value they entered was changed automatically.
Restrict decorations to roles	Use this preference to define the user roles that can view the reference icon (decoration) adjacent to a normalized field. This decoration displays transformation and normalization records to users with the normalizer role. For all other users, it opens the URL specified in the Decoration URL preference. If this preference does not specify any roles, then all roles can see the decoration.

Field Normalization business rules

The following business rules were created for this plugin:

- Ensure Rules Application Job
- Ensure Transform Application Job
- Ensure Rules and Alias Jobs
- Ensure Transform Application Job
- Ensure Decoration Attribute
- Cleanup on field or table change
- Prevent duplicates in class hierarchy

- Handle potential duplicates
- Run job
- Ensure Pending Value Collection Job
- Ensure name changer job
- Flush forms when activating

Field Normalization script includes

Name	Description
FieldNormalizationAjax	Provides AJAX services for the Field Normalization plugin.
FNEnsureJob	Ensures that a job record exists for a particular extant data job target.
FNExtantDataJobChoices	Generates a list of tables for use in document_id field of the fn_extant_data_normalization table.
FNExtantDataJobUtil	Determines whether an extant data job is allowed to run.
FNFields	Returns valid fields for normalization.
FNTransformChooserUtil	Provides support for the fn_transform_chooser UI page.
Position	Finds a position within a given string.
Round	Rounds numbers with various rounding modes and intervals.

Field Normalization UI pages

Name	Description
aliases	Creates the slushbucket with pending values for choosing aliases for a normal value.
fn_transform_chooser	Displays available transforms. Invoked by the New button on the fn_transform related list.

Field Normalization roles

Role	Description
normalizer	Person authorized to manage field normalization and transformation.
normalization_tester	Person authorized to create test records for normalizations and transformations. Only records opened by users with this role are available for testing normalization and transformation rules in Test mode.

Enable a field type for normalization or transformation

Create or modify a normalization field type record to enable a specific field data type for use with normalization or transformation.

About this task

To normalize or transform a value in a reference field, apply the processing to the field in the target table.

Procedure

1. Navigate to **All** > **Field Normalization** > **Administration** > **Normalization Field Types**.
2. Select **New** in the record list.
3. Enter a **Name** for the field type that clearly describes the type in the dictionary.
   This value is for reference only and is not used in any processing. For example, you might enter **IP Address** for the field type of `ip_address`.
4. Enter the **Type** from the dictionary.
5. Select the appropriate check box to use this field type to normalize or transform fields.
   In the base system, only the **String** field type is used for normalization.
6. Select and hold (or right-click) in the header bar and select **Save** from the choice list.
   The **Transform Categories** related list appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. If this field type is being used for transforms, select **Edit** to associate an existing Transform Category with this field type.

   Note: If you create a custom field type that is used for normalizations only, a link to a transform category is not necessary.

   The relationship of a field type to a category, and the category to a list of transformation definitions, is completely configurable.

   The String field type is associated with the Text Transform Category, which contains these transform definitions. Any of these associations are configurable.

Create a raw field

A raw field is a custom field created by an administrator to show the original (raw) input in a field on a form after it has been normalized or transformed.

Before you begin

Role required: admin

Procedure

1. In the form containing the field that is being normalized or transformed, select and hold (or right-click) in the header bar.
2. Select **Personalize** > **Form Layout**.
3. Complete the Create new field form at the bottom of the page, and then select **Add**.
   - **Name**: Type the field label. In this case, use Raw + <field label>.
   - **Type**: Select a data type from the list for this field.
   - **Field length**: Select the character limit for this field. The default is 40.
4. Move the new field adjacent to the normalized field using the direction arrows.
5. Select **Save**.

Normalization and transformation data jobs

The system uses data jobs to change field values during normalization and transformation.

Administrators must manually start data jobs that apply field changes. All transformation records open in Test mode by default, which blocks administrators from running manual data jobs that apply changes to existing data. Most data jobs have a roll back option to revert changes after the job completes. By default, the system provides these data jobs.

Note:

If the Field Normalization plugin is active, the normalization engine executes on insert of records into a table according to normalization rules. To learn more about this plugin, see Activate Field Normalization.

If the Field Normalization plugin is not active, a data job runs to normalize the values. The data job saves the previous values in the rolled back fields to revert them if necessary.

Name	Used for	Description
Pending value collection	Normalization	The system runs this job to collect field values that will change during the next field normalization run. The system

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Used for	Description
		runs this job whenever you insert or update a field normalization record. Since this data job does not change any field values, there is no roll back option.
Normal value change	Normalization	Run this job to rerun field normalization and update field values when you change a normal value. The system creates this job whenever you change a normal value. Roll back the data job to revert the normalized fields to the previous normal value.
Alias application	Normalization	Run this job to normalize all field values that match an alias. The system creates this job whenever you create or update an alias. Roll back the data job to revert normalized fields to their previous values.
Rule application	Normalization	Run this job to normalize all field values that match a rule. The system creates this job whenever you create or update a rule. Roll back the data job to revert normalized fields to their previous values.
Coalesce too normal	Normalization	Run this job to normalize the reference field values by replacing references to multiple duplicate records with one reference to a normalized record. The system creates this job whenever you change a normal value that applies to a reference field. Roll back the data job to restore the duplicate records as valid options. The rollback does not restore references to the previous records.
Transform application	Transformation	Run this job to transform all field values that match the transformation conditions. You cannot start this job while the Transformation record is in **Test** mode. The system creates this job whenever you create or update a transformation record. Roll back the data job to revert transformed fields to their previous values.

Run a single data job

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run a single data job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.
2. Open the Transformation record and switch the **Mode** to **Active**.
3. Select the **Data Jobs** Related List.
4. Run the data job using one of the following methods.

   - In the list of data jobs, select the check box of the jobs you want to run, and then select **Start** from the **Actions** menu.

   - Click the link in the Created column to open the data job, and then click the **Start** Related Link.

   The **State** of the jobs turns to **Queued** as it runs and to **Completed** when it finishes successfully.

Run multiple data jobs

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run data jobs for multiple field transformations.

Procedure

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.
2. Navigate to **Field Normalization** > **Data Jobs** > **All**.
3. Select the check boxes for the jobs you want to start.

   Note: These jobs must have the **Mode** set to **Active**.

4. Select **Start** from the **Actions** menu.

   Note: The platform only runs data jobs from Active transformations. The Action menu indicates the number of Active data jobs that can run. For example, the menu might display Start (3 of 4).

Rollback a data job

Use rollback to revert changes made by a normalization or transformation data job.

Before you begin
Role required: admin or normalizer

About this task
You can only rollback completed data jobs.

Procedure

1. Navigate to **Field Normalization** > **Data Jobs** > **All**.
2. Select the completed data job to rollback.
   The system displays the data normalization job record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. From **Related Links**, select **Rollback**.
   The values in the **Pending Values** Related List are removed and the data job **State** indicates that it was rolled back.

Normal values

A normal value replaces similar but ambiguous field values with one standard value.

Field value variations

Records values can come from multiple sources such as:

- Automated entries made by Discovery.
- Automated entries made by importing records from external systems or files.
- Manual entries made by users.

Each of these sources may describe the same field value in several different forms. For example, the **CPU Type** field on a computer CI form might display any of the following similar values:

- **E3350 (Intel) 4.5.2234**
- **Intel Xeon 5.4.554**
- **Xeon L3350**
- **L3350**

Without normalization, these variant field values results in:

- Duplicate CPU types
- Poor search results
- Complex queries and conditions to apply business logic

Creating a normal value record solves these issues by consolidating on one standard value such as `Xeon`.

Identifying variations with aliases and rules

Each Normal value record specifies how to identify variations of a normal value using a combination of aliases and rules.

Aliases

Aliases are known variations of an input value that normalization converts to the normal value. Use aliases when there is a short list of variant values.

For example, you could create a normal value `Xeon` that has these aliases.

- **E3350 (Intel) 4.5.2234**
- **Intel Xeon 5.4.554**
- **Xeon L3350**
- **L3350**

Whenever a normalization data job or normalized query sees a field value matching an alias, it automatically replaces the field value with the normal value. Normalization data jobs and queries process aliases before rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Aliases are logically equivalent to rules using the **[is]** operator in a condition where **[Field name][is][Alias value]**. For example, the sample aliases are equivalent to these rules: **[CPU Type][is][E3350 (Intel) 4.5.2234] OR [CPU Type][is][Intel Xeon 5.4.554] OR [CPU Type][is][Xeon L3350] OR [CPU Type][is][L3350]**

Rules

Rules specify the conditions under which normalization replaces an input value with the normal value. Use rules when there are a large number of possible variant values, or when you must create complex conditions.

For example, the normal value `Xeon` could have this rule.

[CPU Type][matches regex][.*\bxeon\b.*]

Whenever a normalization data job or normalized query sees a field value matching a rule, it automatically replaces the field value with the normal value. Normalization data jobs and queries process rules after aliases.

Rules and aliases can be combined to normalize a field. Make sure to test your normalization methods before applying them to all the existing records in the database.

Normalized queries

An administrator can configure normalization to apply to queries issued against normalized fields in lists. Select the **Normalize query** check box on the Normalization form to enable this functionality. In a list containing normalized values, Filters and breadcrumbs using the original (raw) value for the normalized field in the query condition.

The filtered list returns records with the normal value substituted for the raw value. However, the breadcrumbs for the filter display the original query conditions.

Scripting and normalization

Scripts that update or insert records into the database (GlideRecord) are normalized automatically when field normalization is applied. For example, if a script to insert a CI record contains a CPU type of **Xeon L3350**, the script is normalized to insert the CI with a CPU type of **Xeon** instead. Scripts that query the database for normalized field values (using the conditions of equals or not equals) can be configured to return the normal value (such as **Xeon**) rather than the original (raw) value.

Related topics

GlideRecord

Create the normalization record

Regardless of the normalization method selected, all field normalization requires a list of existing variants and a normal value that is configured to replace these variants in forms and in queries.

About this task

Normalize a field by selecting aliases for a normal field value or by creating rules that use condition statements to match field variants with a normal value.

Note: Users must have the normalizer role to create and manage normalization records.

Special Cases

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reference fields cannot be normalized. To normalize values appearing in reference fields, normalize the field in the target table. Examples of this would be normalized values for the **Name** fields in the Company [core_company] and Location [cmn_location] tables, which are referenced by other tables in the platform. The normalized names are available to all fields that reference these tables.
- Fields in a choice list can be normalized if they are of a type **string**.

Procedure

1. Activate the Field Normalization plugin.
2. Navigate to **Field Normalization** > **Configurations** > **Normalizations**.
3. Click **New**.
4. Create a normalization record.

Normalization record fields

Field	Input value
Name	Unique name for this normalization record. This value is for reference only and is not used in any processing.
Table	Select the ServiceNow table for the field being normalized.
Field	Select the field to normalize.
Mode	The three available modes are Off, Test, and Active. All normalization records are created in the test mode by default. If you are planning to select aliases for your normal values, change the Mode to Active. If you intend to normalize the field using rules, be sure to leave this record in the Test mode. To disable this normalization, switch the mode to Off.
Normalize query	Select this check box to apply the field value normalized by this record to all queries involving this field. Queries formed with the raw (original) field value return records displaying the normal value. Queries issued by a script using the conditions equals or not equals return normalized values. See Normalized Queries for details.
Coalesce each normal	Select this check box to normalize reference field values. This option resets all references to records containing an alias field value to the record using the normal value. See Coalesce Normal Values for details.
Raw field	Select the field to use to display the original (non-normalized) input values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see Creating a Raw Field.

After the normalization record is submitted, the platform runs the Pending value collection job in the **Data Jobs** related list automatically to gather all the current values (Pending Values) for the field being normalized.

Click the **Pending Values** related list to view values for the normalized field that have been entered manually, imported into the platform, or created by Discovery.

Create a normal value

A normal value is a simplified, generic value for a field that replaces all the possible variants of that value that exist in the database.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin or normalizer

About this task
Normal values should be clear and unambiguous.

After the platform runs the data job, the **Pending Values** related list on the Data normalization jobs form is populated with all the unique values for the field in the database. Examine the values in the list and decide which normalizing method is best for the existing data. For example, define an alias for a small pool of values and a rule for a large pool of values..

Procedure

1. Navigate to **All** > **Field Normalization** > **Normalizations**.
2. Open the appropriate normalization record.
3. Click the **Normal Values** related list.
4. Click **New**.
5. In the Normal Value form, create normal values for the variants in the **Pending Values** related list.
   Pending values are used to replace the variants configured as aliases.

Create aliases

Aliases are the variants of a field value in the instance that will be replaced by the normal value.

Before you begin
Role required: admin or normalizer

About this task
The list of potential aliases is the contents of the **Pending Values** related list. After creating a normal value, assign aliases to this value if the pool of pending values is small. A normalized field can have a combination of aliases and rules.

Procedure

1. Navigate to **All** > **Field Normalization** > **Configurations** > **Normalizations**.
2. Open a normalization record.
3. Click the **Normal Values** related list.
4. Select one of the values.
5. In the normal value record, click the **Aliases** related link.
6. Select aliases for this normal value from the available (pending) values that appear in the slushbucket, and then click **OK**.

   The aliases for this normal value now appear in the **Aliases** related list.

What to do next
Apply the aliases by running the associated data jobs.

Apply aliases

After testing, aliases can be normalized in all new records or in existing records when they are updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Each time an alias is created for a normal value, a data job is created. The alias is not applied to values in the entire database until its data job is started manually. Run each job separately or run the jobs together to apply all aliases at once.

Procedure

1. In a normalization record, ensure that the Mode is set to **Active**.

   Data jobs cannot run in the **Test** mode.

2. Click the **Normal value** related list.
3. Select a value from list.
4. In the Normal Value record, select the **Data Jobs** related list.

   A data job is listed for each alias configured for this normal value.

5. Run the extant data jobs to replace the aliases with the normal value in all existing records in the database.
   a. Select the check box next to a job, and then select **Start** from the Actions menu.
   b. To run all data jobs at once, select all the check boxes, and then select the **Start** action.
   c. Refresh the list to check the progress of the data jobs to ensure that they complete normally.

Create rules

The use of rules to normalize a field is intended for large lists of variant field values.

About this task

Always test your rules before applying them to all the existing records in the database. Prior to creating the rule, make sure to generate the list of Pending Values and create a normal value for the field. A normalized field can have a combination of aliases and rules.

Procedure

1. In a Normalization record, open the **Normal Values** related list.
2. Open a Normal Value record.
3. Open the **Rules** related list in the Normal Value form, and then click **New**.

   The Field Normalization Rule form provides the following fields:

Field normalization rule fields

Field	Description
Name	Unique name for this rule. For example, this name might be Xeon CPU Type.
Order	Order in which this rule should be evaluated. The platform parses the rules in the order configured until it finds one that evaluates to true.
Active	Enables or disables this rule. By default, new rules are active (true)
Make alias	If this check box is selected, and the rule evaluates to true, the rule makes an alias automatically from a pending value. If this check box is not selected, and the rule evaluates to true, the platform automatically changes the value for the named field in the record to the normal value, but does not create an alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Case sensitive	All pending values for the named field must match the case of the same value in a rule to be normalized.
Rule	Use the ServiceNow rule builder to construct the rules for normalizing fields. Rules automate the transformation of large numbers of pending field values into aliases.

4. Create a set of rules to incorporate all the possible variants of the pending values.

   For this example, the rules might be:

   - **Intel Xeon**: CPU type matches pattern *Intel*Xeon*. This rule normalizes all variants in which **Intel** precedes **Xeon**, including **Intel Xeon**, **Intel(R) Xeon(TM) CPU 2.80GHz**, and **Intel(R) Xeon(TM) CPU 3.00GHz**.
   - **Xeon**: CPU type contains Xeon
   - **L3350**: CPU type contains L3350
   - **E3350**: CPU type contains E3350

   For every rule that is created, the platform generates a **Rule applier** data job. In the testing mode, the **Start** controls are not available, and the job cannot be run until the mode is changed to **Active**.

5. Test all the rules before making the normalization record **Active**.

   Testing Rules

   Note: Users must have the normalization_tester role to create test records.

   Field normalization records are created in the **Test** mode by default, enabling administrators to test normalization rules thoroughly before applying them to the existing records in the database. In the testing mode, the **Start** controls are not available for the **Rule applier** data job. The job can be run only when testing is complete and the **Mode** has been changed to **Active**. In the testing mode, only records that have been created or updated by a user with the normalization_tester role are normalized. The normalizer and normalization_tester roles can be combined for a single user or granted separately.

Coalesce records on a normal value

Coalescence enables an administrator to redirect references to multiple records containing variants of the same field value to point to a single record, based on a normal value.

Before you begin
Role required: admin

About this task
An example of this is the Company table that might have multiple variants of a company name, such as Hewlett-Packard, Hewlett-Packard, Inc., Hewlett-Packard Incorporated, HP, and so on. Potentially, thousands of records might reference each of these duplicate company records. Using the variants of the Hewlett-Packard name as aliases, coalescence unifies all these references into a single record that normalizes the **Name** field in the Company record to a normal value such as **HP**.

Note: Coalescing normal values changes the record values permanently. If a rollback is performed, records will be returned to the table, but the normalized values will not be rolled back to the original variants.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the references are fixed, all table fields directly corresponding to sys_dictionary get fixed. The secondary references are not fixed. If you have filter conditions that has the old, pre coelesced company names, they aren't fixed either.

Procedure

1. Navigate to **All** > **Field Normalization** > **Configuration** > **Normalizations**
2. Select a normalization record.
3. Enable **Coalesce each normal**.
   The system adds the **Coalesce to** field to the Normal Value form.
4. Create one or more normal value records for this normalization record.
   Create related aliases and rules as needed.
5. For each normal value record, set **Coalesce to** by selecting the record that contains the normal value.

   Example
   For example, suppose your Company table contains several variations of the name ServiceNow. When you create the Normal Value record, you select the Company record for ServiceNow, Inc.. During normalization, the system updates any references to variant records to instead refer to the normal record.
   The system updates any references to records that match aliases and rules to instead point to the normal record. The system also deletes the duplicate records from the table.
6. Start all the **Alias application** data jobs to replace the aliases with the normal value in existing records in the database.
   The system starts the **Coalesce to normal** data jobs for each alias.

Transforms

Transforms update field values by applying a transformation definition to the field contents such as replace text, change case, or round value.

Transform definitions

Transform definitions define the transformation actions available for a given field type. Administrators select a definition when they transform a field, and then provide the definition with the specific parameters that are applied to the transformation. For example, a definition can round up an integer or insert a value at a defined position in a string.

The system provides a number of definitions that are designed to meet the needs of most organizations, but administrators can create new definitions as needed. Transform definitions can be associated with existing Transform Categories or to new categories.

Transform categories

Transform categories are used to group the transform definitions together appropriately to present to users when creating new field transforms. You can create new categories for existing definitions or change the default associations of categories to definitions.

Transform categories are associated with normalization field types to present the correct definition option list for the field being transformed. The base system provides two transform categories: Text and Numeric.

Text

Definitions in the Text category transform string type field values. Included in the Text category are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Left
- Right
- Constant
- Trim
- Prefix
- Suffix
- Change Case
- Delete
- Insert
- Substring
- Replace

Numeric

Definitions in the Numeric category arithmetically manipulate integer type field values. Included in the Numeric category are:

- Limit
- Round
- Constant

Transformation testing mode

Transformation is a powerful tool that can cause data issues if used incautiously. Test all transformations before committing the changes to the CMDB.

All transformation records open in **Test** mode by default, which blocks administrators from running manual data jobs that apply changes to existing data. Only users with the normalization_tester role can transform data when a record is in the **Test** mode. This is limited to new records opened by the tester or records in which the transformed field is updated by the tester.

To apply transformations to the CMDB after testing, change the mode to **Active** in the transformation record and run the appropriate data job. For information on testing transforms, see Test a transform.

Transform a field

Transform the contents of field using a set of rules and conditions.

Before you begin

Role required: admin or normalizer

Procedure

1. Create a transformation record.
2. Create one or more related transform records.
3. Test the transform.
4. Runs data jobs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

If you want to also show what the original (raw) input value was prior to transformation, create a raw field to store this value.

Create a transformation record

Creating a transformation record is the first step in transforming a field.

Procedure

1. Activate the Field Normalization plugin.
2. Navigate to **Field Normalization** > **Configurations** > **Transformations**.
3. Click **New**.
4. Create a transformation record.

Transformation record fields

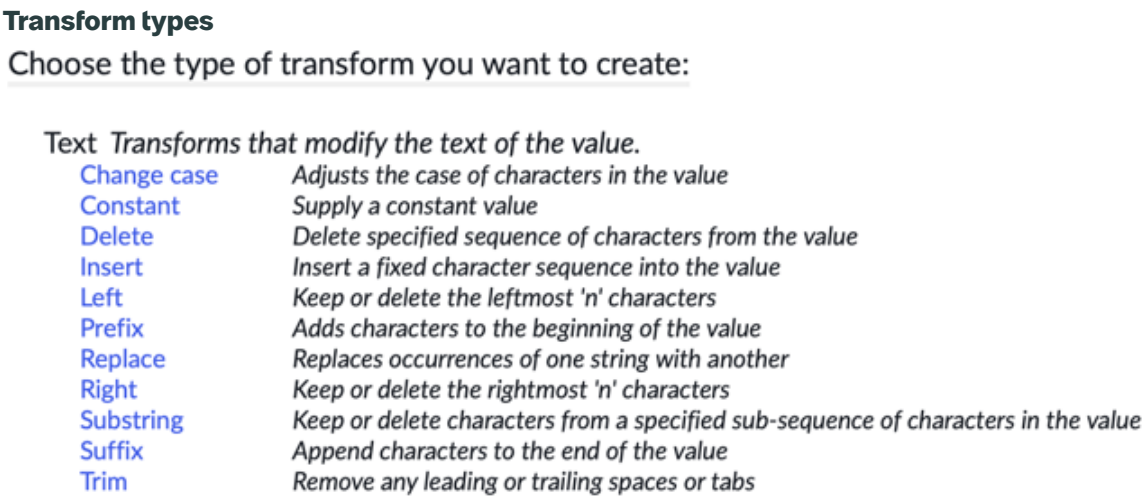
Field	Description
Name	Unique name for this transformation record. This value is for reference only and is not used in any processing.
Table	Select the ServiceNow table containing the field being transformed. It is important to understand the table hierarchy when setting up a field transform. For example, if you configure transformation for a field in the Computer [cmdb_ci_computer] table, that field will be transformed for all workstation machines, Windows servers, Linux servers, and UNIX servers.
Field	Select the field to transform. The list presented contains only those field types (integer and string) from the table selected that can be transformed. **Note:** The sys_user record that initiates the transform process must have its date format set to the default format of "yyyy-MM-dd." Any other date format causes an error during transformation. This problem is only specific to transforming **TO TARGET** fields of type Date/Time. This problem is not an issue if the target field type is of type String or if the field mapping for the date field is changed to the same date format as the transformation process.
Mode	The three available modes are **Off**, **Test**, and **Active**. All transformation records are created in the test mode by default. Do not change the mode until you have thoroughly tested the transformation. When testing is complete,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	change the mode to **Active**. To disable this transformation, switch the mode to **Off**.
Normalize query	Select this check box to apply the field value transformed by this record to all queries involving this field. Queries issued with the raw (original) field value will be edited to use the transformation value.
Raw field	Select the field to use to display the original input (non-normalized) values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see Create a raw field.

5. Click **Submit**.

   The **Transforms** and **Data Jobs** Related Lists appear on the form.



Create one or more related transform records

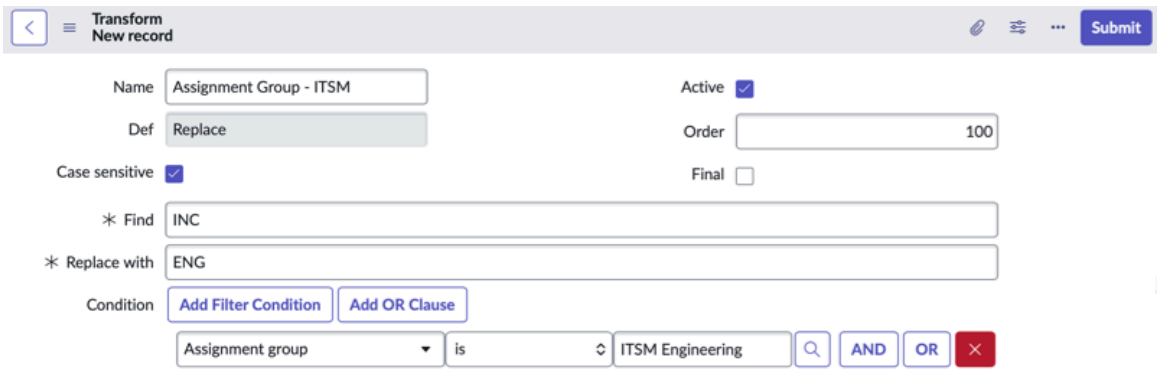
Each related transform record performs a specific transformation type such as adding characters to the beginning of the value or replacing one string for another. You may need to create multiple related transform records to generate a preferred output field value.

Procedure

1. In the Transformation record, select the **Transforms** Related List.
2. Click **New**.

   A selection list of transform types appears, displaying only those transformations appropriate for the field type selected.

3. Select a transform type and provide the appropriate parameters.
4. Select an **Order** number for this transform.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The conditions for the transforms are executed according to the order numbers assigned.

5. Select the **Final** check box to stop processing with this transform if the condition evaluates to true.
6. Select the **Case sensitive** check box to force case sensitivity in the condition statement.

   The following transform example replaces the *INC* at the beginning of an incident number with the string *ENG* if the assignment group is *ITSM Engineering*.

Transformation record

7. Click **Submit**.

   The new Transform appears in the Related List of the Transformation record.

   When the Transform is created, a Transformation application data job is also created. This data job applies this transform to appropriate records in the entire database and should not be run until testing is complete.

8. **Optional:** Repeat steps 2 through 8 until the output value meets your desired criteria.

Test a transform

Verify the transform changes the field value as desired before applying them to existing records in the database.

About this task

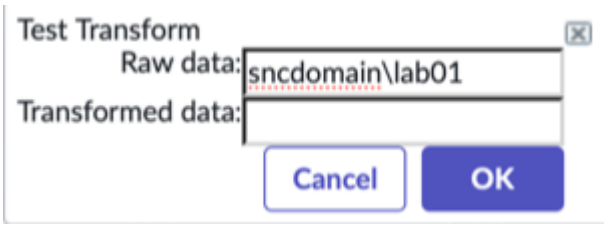
Note: Users must have the normalization_tester role to create test records.

New transformation records open in the **Test** mode by default, enabling administrators to test transforms thoroughly before applying them to the existing records in the database. In the test mode, the **Start** controls are not available for the **Transform application** data job. There are two methods, listed below, for testing transforms before committing the transformations to existing data.

Procedure

- Manually create or update test records.

  In the test mode, only records that have been created or updated by a user with the normalization_tester role are transformed. Grant the normalizer and normalization_tester roles to the same user or grant them to separate users.



- Use the Test transforms utility to enter a raw value and see the resulting transformed value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This feature enables a normalization tester to transform field values on the fly without opening or updating records. This utility tests all the transforms configured for this field.

1. Open a Transformation record.
2. Click the **Test transforms** Related Link.

   A dialog box appears for testing field values.
3. Enter a value to transform in the **Raw data** field.

4. Click **OK**.

   The platform transforms the raw value in the **Transformed data** field.

5. Enter new raw data to test other transforms.
6. Click **Cancel** to end the test.
7. When testing is complete, change the **Mode** to **Active** and run the data job.

Default transform definitions

The system offers default transform definitions for fields containing text, text numeric, and numeric values.

Transform Definitions

Transform Type	Category	Description	Parameters
Change case	Text	Changes the case of the characters in the field value.	*Mode*: Select one of the following modes: • *Upper*: Converts the value to all upper case characters • *Lower*: Converts the value to all lower case characters • *Proper*: Converts the value to title case, with the first character in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
			each string in upper case, and the remaining characters of the string in lower case. • *Formal*: Converts the value to a string in which only the first letter of the first word is in upper case.
Constant	Text Numeric	Converts the value in this field to a constant.	*Constant*: The constant with which to replace the value in this field.
Delete	Text	Delete a specified sequence of characters from a field value.	• *Starting position*: Specifies the first character in a sequence of characters to delete from a string. See the discussion of position modes at the beginning of this section for details. • *Ending position*: Specifies the final character in a sequence of characters to delete from a string. See the discussion of position modes at the beginning of this section for details.
Insert	Text	Insert a fixed character sequence into a field value.	• *Position*: The character position at which to insert the new value. See the discussion of position modes at the beginning of this section for details. • *Insert*: The value to insert into this field.
Left	Text	Deletes or keeps a specified number of characters from the left side of this field value.	• *Position*: Specifies the number of characters to keep or delete from the left side of the value. See the discussion of position modes at the beginning of this section for details. • *Mode*: Select the mode for this transform: *Keep* or *Delete*.
Prefix	Text	Adds characters to the beginning of a field value.	*Prefix*: Defines the characters to add to the beginning of the transformed field value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
Replace	Text	Replaces occurrences of one string with another string. The special characters backslash (\) and dollar sign ($) in the replacement string can cause the transform to be different than if the replacement string were being treated as a literal replacement string. Use a regular expression to replace a string or parts of a string.	• *Find*: Enter the string or regular expression to replace. • *Replace with*: Enter the replacement string.
Right	Text	Retains or deletes a specified number of characters from the right side of a field value.	• *Position*: The number of characters to delete or keep from the right side of this transformed field. See the discussion of position modes at the beginning of this section for details. • *Mode*: Select the mode for this transform: *Keep* or *Delete*.
Round	Numeric	Rounds integers to a configured rounding interval using specific criteria. The interval must be appropriate to the value being transformed, such as an interval of 12 for a value expressed in dozens or 0.01 for decimal values expressed in hundredths.	• *Interval*: Select the rounding interval that is appropriate to the units of the field value. For example. an interval of 256 is appropriate for expressing RAM values in megabytes, but does not work for Disk space expressed in gigabytes. The rounding interval for the examples below is 1 • *Mode*: Criteria for applying the rounding interval. ○ *Half up*: Always round up a value that is exactly half way between two intervals. For example, 3.5 is always rounded up to 4, and -3.5 is always rounded up to -3.

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
			○ *Half down*: Always round down a value that is exactly half way between two intervals. For example, 3.5 is always rounded down to 3, and -3.5 is always rounded down to -4. ○ *Half away from zero*: Always round an integer that is half way between the specified interval away from zero. For example, 3.5 is always rounded to 4, and -3.5 is always rounded to -4. ○ *Half toward zero*: Always round an integer that is half way between the specified interval toward zero. For example, 3.5 is always rounded to 3, and -3.5 is always rounded to -3. ○ *Half to even*: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is even. For example, 3.5 is always rounded to 4, and 4.5 is always rounded to 4. ○ *Half to odd*: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is odd. For example, 3.5 is always rounded to 3, and 4.5 is always rounded to 5. ○ *Up*: Always round an integer up by the specified rounding interval. For example, 3.4 is always rounded to 4 by a rounding interval of 1.0. ○ *Down*: Always round an integer down by the specified rounding interval. For example, 4.6 is always rounded to 4 by a rounding interval of 1.0. ○ *Away from zero*: Always round an integer away from zero by the specified rounding interval. For example, 3.3 is

Transform Definitions (continued)

Transform Type	Category	Description	Parameters
			always rounded to 4, and -3.3 is always rounded to -4 by a rounding interval of 1.0. ○ *Toward zero*: Always round an integer toward zero by the specified rounding interval. For example, 3.3 is always rounded to 3, and -3.3 is always rounded to -3 by a rounding interval of 1.0.
Substring	Text	Keep or delete characters from a specified sub-sequence of characters in the field value.	• *Starting position*: Specifies the first character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details. • *Ending position*: Specifies the final character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details. • *Mode*: Select whether to *Delete* the sub-sequence selected or *Keep* only those characters defined.
Suffix	Text	Appends characters to the end of a field value.	*Suffix*: Defines the suffix to add to the end of the field value.
Trim	Text Numeric	Removes blank spaces from the field value.	No parameters

Create a transform definition

The following example describes the procedure for creating a new transform definition. In this example, we create a definition that transforms a number field to an odd or even integer. The transform category is **Numeric** and the normalization field type is **Integer**.

Procedure

1. Navigate to **All** > **Field Normalization** > **Administration** > **Transform Definitions**.
2. Click **New** in the record list.
3. Enter a name for this definition.

Note: In this example, we enter `Odd/Even`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter a brief description of the action, such as, `Transforms an integer to an odd or even value`.

   This information appears in the definition choice list when a user selects a new transform.

5. Right-click in the header bar and select **Save** in the context menu.

   Two Related Lists appear in the form.

   - Transform Categories: Click **Edit** and select **Numeric** as the category to which this definition belongs. Currently, field transformation supports two categories: **Numeric** and **Text**. The **Integer** normalization field type is already associated with this category.
   - Transform Variables: Define any variables required by this transform definition to perform an action on a field value. Variables are not necessary if a script can perform the action alone.

Create a transform variable for a transform definition

Transform variables enable an administrator to apply the same definition to different fields in different ways.

About this task

Transform variables contain values used by a script to perform a field transformation. Scripts and variables can be created in either order, but the script must use the transform variables. Transform variables are populated with values when a user configures a transform type.

Procedure

1. In the Transform Definition record, click **New** in the **Transform Variables** Related List.
2. Complete the form.
   Important considerations for completing a form:
   - The Column name is an entry in the fn_transform_var table for this variable. This becomes the variable in the script, in the form of variables.<variable name>. For example, `odd_even`.
   - The value in the Label field appears as the variable field label in the Transform form. For example, `Odd/Even`.
   - The field Type defines the field type of the variable value. Because the values for the variables used are **even** and **odd**, this is a type of string.
   - The Order of the variables controls the order in which they are displayed in lists and records.
   - This variable has a choice list with two options: **Even** and **Odd**. Select **Dropdown without - None** as the format for the list in the Choice field and define a Default value of **even** when the list is displayed.
   - Create a Hint that becomes a tooltip for the variable in the Transform record.
3. Right-click in the header bar and select **Save** from the context menu.

   The **Variables Choice List** Related List appears.

4. Click **New** in the Variables Choice List and define the list options.
5. Create records for **Even** and **Odd**.

   Note: The **Element** value is the same as the **Column** name in both selections for the choice list.

6. Save the choice list variables and return to the transform definition form to create the script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a script for a transform definition

Create the script at any time during the configuration of a definition.

About this task

The script can perform a transform action without using a variable, but the action of the definition will be the same for all fields. Variables create more flexibility for the definition, enabling an administrator to use the same definition in different ways in different places. If a variable is defined, the script must reference the variable using the correct format.

There are three arguments in the script:

- Variables: Contains the variables using the format variables.<variable name>.
- Value: Contains the un-transformed value
- Parameters: Special objects that set debug messages.

All position parameters (such as Starting position and Ending position) have three modes that apply to all the transform types that use this variable.

Position parameters

Positive positions	If the position is expressed as a positive integer, the platform calculates the starting position beginning from the left side of the field value. For example, in the string ABCDE, a position of 3 places the starting point of the action after C.
Negative positions	If the position is expressed as a negative integer, the platform calculates the position beginning from the right side of the field value. For example, in the string ABCDE, a position of -3 places the starting point of the action before C.
Regex	If the position value starts with /regex/, everything after that is a regular expression that is used to calculate the starting position. For example, in the string ABCDE, a position of /regex/B.*D places the starting point of the action after C (B and all the characters between B and D).

Procedure

1. Open the **Odd/Even** record in the Transform Definitions module.
2. Enter the following script to pass values with the odd_even variable.

```
function(variables, value, parameters) {
 var odd = ('odd' == variables.odd_even);
 var val = value - 0;
 var val_odd = ((val & 1) == 1);
 if (odd != val_odd)
  val++;
 return '' + val;
 }
```

   The script references the variable in the form variables.odd_even.

3. Update the record to complete the configuration.

   The Odd/Even transform definition is now ready to use in a field transformation.

Create a transform category

Create a transform category to group the transform definitions together.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Field Normalization** > **Administration** > **Transform Categories**.
2. Click **New** in the **Transform Categories Related List**.
3. Enter the **Name** of this category and a description.
4. Select an **Order** for this category and save the record.
   The order determines the display order of categories in lists and forms. Two Related lists appear:

   - **Field Types**: Click **Edit** to select an existing field type for this category or click **New** to create a new field type. The normalization field types provided are:
     - Decimal
     - Float
     - Integer
     - Numeric
     - String
     - URL
   - **Transform Definitions**: Click **Edit** to select the transform definitions that are included in this category.

Regular expressions and patterns in field normalization rules

Field Transformation definitions support the use of regular expressions (referred to in the platform as **regex**) and pattern matching for determining the position of characters in a string.

After identifying the target characters, field transformation can replace or delete the identified characters or insert other characters at that position.

Regex

Regular expressions can be used in transform parameters and in condition statements to determine which characters in a field value are transformed.

Regular expressions used as parameters to locate characters in transformed field values must begin with `/regex/`. Everything after that is a regular expression that is used to calculate character position.

Example

The computer names in an organization's Windows network are expressed as domain\machine name, such as **development\devlab01**. The network administrator wants to simplify these names by removing the domain name and backslash. He creates a transformation record for the Computer [cmdb_ci_computer] table and selects the **Name** field to transform.

The network contains several domains, and each domain contains numerous computers. The only character common to each name is the backslash. To delete the domain name, the administrator decides to use a regular expression to replace the entire raw value in the field with the characters that appear after the backslash (the actual machine name). He creates a new Transform using **Replace** as the Transform Type and enters the following values:

- Find:**/regex/.*\\(.*)**
- Replace with:**$1**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The regular expression **.*\\(.*)** represents the entire raw value in the **Name** field - in this example **development\devlab01**. The first part of the expression, **.***, represents everything before the backslash (the **development** domain name). The backslash by itself is the escape character in regular expressions and requires special syntax to retain its function in the computer name. The administrator must escape it by using another backslash (\\ means \). The part of the expression after the backslash, **(.*)**, represents the computer name (**devlab01**) and is grouped within parentheses for reference. The value in the **Replace with** field, **$1**, references this group and replaces the entire raw value of the field with the contents of the group, **devlab01**.

The administrator clicks **Test transforms** in the transformation record and enters `development\devlab01` in the **Raw data** field. He then clicks **OK** to apply the transform to the test value. The transform replaces **development\devlab01** with **devlab01**.

When the transforms for this field are tested successfully, the administrator changes the **Mode** in the transformation record to **Active** and runs the Transformation application data job to apply this transformation to existing records in the database.

Pattern matching

Pattern matching in Field Normalization uses special characters differently from regular expressions to create patterns that the platform recognizes when transforming field values.

Pattern matching can be used only in condition statements. When using pattern matching characters in a condition statement, make sure to select the **matches pattern** operator.

Use the following special characters to create patterns for searches.

- The asterisk in a search string (*) matches any number (including zero) of any character.
- The question mark (?) in a search string matches one of any character.
- Everything else in a search string matches itself.

Examples

- **the story** matches **the story** but not **that story**.
- ***story** matches **the story** and **that story**, but not **that story is the best**.
- **st?ry** matches **story** and **stxry**, but not **my story** or **stairy**.
- ***b?gus*** matches **bogus**, **my bogus story**, and **His bagus machine**, but not **my bgus story** or **my baigus story**.

Domain separation and Field Normalization

Domain separation is unsupported in Field Normalization. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Related topics

Domain separation for service providers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data policy

Data policies enable you to enforce data consistency by setting mandatory and read-only states for fields.

Data policies are similar to UI policies, but UI policies only apply to data entered on a form through the standard browser. Data policies can apply rules to all data entered into the system, including data brought in through import sets or web services and data entered through the mobile UI.

For example, suppose that you are configuring a web service that allows users from outside the platform to update problems on the ServiceNow instance. Since these problems are not updated through the instance UI, they are not subject to the UI policies on the problem form. To ensure that the **Close notes** field is completed before a problem is marked **Closed/Resolved**, you can create a data policy that applies to server-side imports. Data that does not comply with this data policy produces an error. You can also apply the policy on the browser by selecting the **Use as UI Policy on client** check box in the data policy record.

Since UI policies can also manage the visibility of fields on a form, you may want to augment UI policies with data policies rather than replace them.

By default, data policies are applied to all GlideRecord operations including those used in Scripted REST APIs, and the REST Table API. You can opt out of applying the data policy to:

- Target records of SOAP web services
- Import sets
- Client-side UI policies

The admin role is required to edit data policies.

Note: Defining a data policy enforces the policy when a record is submitted from the UI. This behavior cannot be changed.

Installed with data policy

Data policy includes several components that are installed on the instance.

Tables

Table label	Table name
Data Policy	sys_data_policy2
Data Policy Rule	sys_data_policy_rule

Data Policy Module

The **System Policy** > **Data Policies** module displays a list of all data polices and where they apply.

Roles

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Data Policy Administrator [data_policy_admin]

Access and maintain data policies to specific users. Grant this role access to the System Policy application

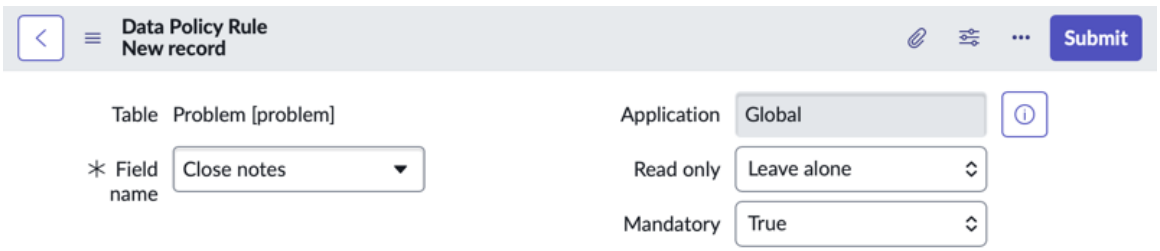
Create a data policy

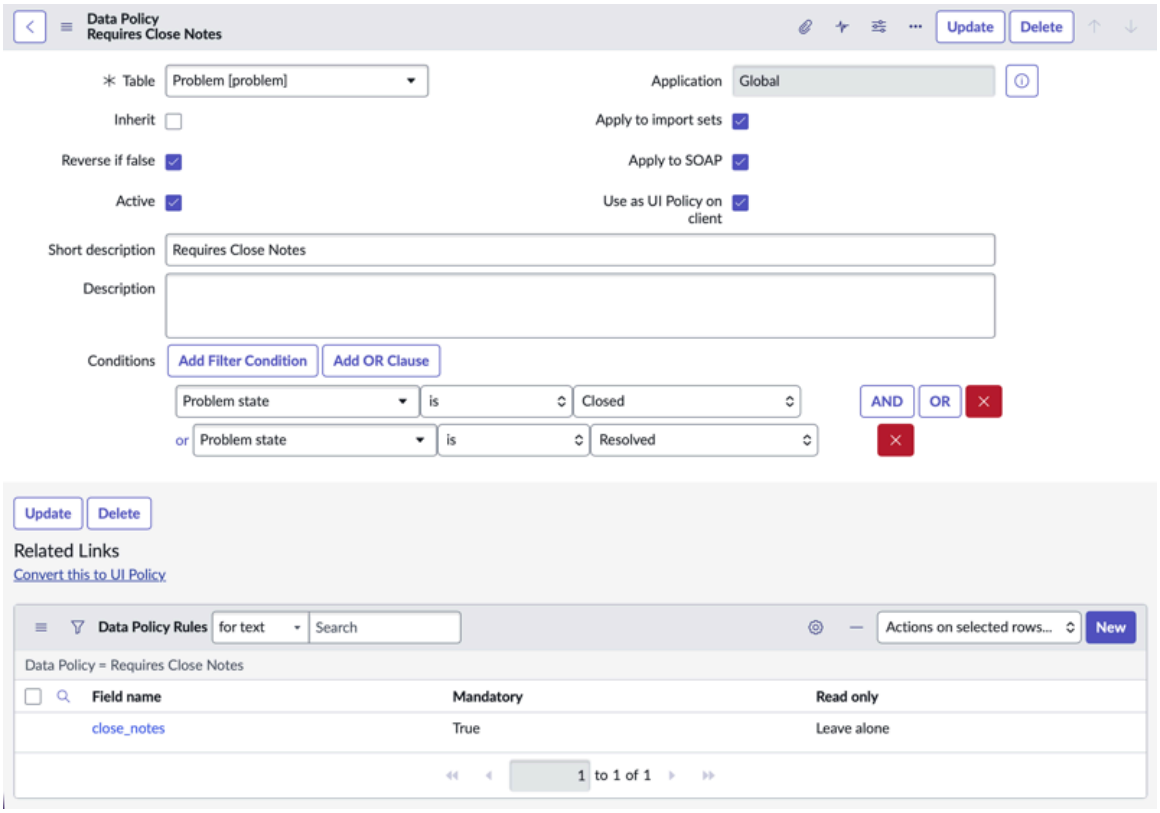


You can create a new data policy to define data rules for a table.

About this task

Create data policies to enforce consistency. You can create data policies only for tables and database views that are in the same scope as the data policy and for other tables that have at least one field in the same scope as the data policy. For tables that are in a different scope from the data policy record, you can create data policy rules only for fields in the same scope as the data policy and you cannot make a field mandatory.

Procedure



1. Navigate to **Data Policies** by completing one of the following actions.
   - Navigate to **System Policy** > **Rules** > **Data Policies**.
   - From any form header, right-click the header bar and select **Configure** > **Data Policies**.
   - In List v2, open any column context menu and select **Configure** > **Data Policies**.
   - In List v3, open the list title menu and select **Configure** > **Data Policies**.
2. Click **New**.
3. Select any options for the data policy.
4. Create the condition that must exist for the platform to apply this policy.
   For example, your conditions might include **[Problem state] [is] [Closed/Resolved]**
5. Right-click the header and select **Save**.
   The **Data Policy Rules** related list appears.
6. Click **New** in the related list and create the record that identifies the field and the policy to apply.

   It is possible to have multiple rules on a single field, but it is not recommended.

7. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** Add more rules by repeating steps 6 and 7.

Data policy fields

These fields appear on the Data Policy form and related forms.

Data policy fields

Field	Description
Table	The table to which this policy applies. **Note:** The list shows only tables and database views that are in the same scope as the data policy.
Application	Application that contains this data policy.
Inherit	If selected, applies this data policy to tables that extend the specified table. For example, incident, problem, and change tables all extend the task table, therefore selecting Inherit on a data policy defined for task would apply the data policy to them as well.
Reverse if false	If selected, the data policy action is reversed when the conditions evaluate to false. For example, when the conditions are true, then actions are taken and when they change to false, the actions are reversed.
Active	If selected, the data policy is used.
Short description	A short description that identifies the policy.
Description	A detailed description of the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data policy fields (continued)

Field	Description
Apply to import sets	If selected, the data policy applies to data brought into the system from import sets. This option also applies to web service import sets.
Apply to SOAP	If selected, the data policy applies to data brought into the system from a SOAP web service. Scripted SOAP web services are not affected. This field does not affect data policy interaction with REST web services.
Use as UI Policy on client	If selected, enforces the data policy on the UI using the UI policy engine.

Data policy rule fields

Field	Description
Table	The table on which the data policy action applies.
Field name	The field from the specified table to which the data policy will apply.
Read Only	How the data policy affects the read only state of the field. Choices are: • Leave alone • True • False
Mandatory	How the data policy affects the mandatory state of the field. Choices are: • Leave alone • True • False **Note:** For tables that are in a different scope than the data policy record, you cannot make a field mandatory.

Convert a UI policy to a data policy

To make a UI policy the default setting, convert the UI policy to a data policy.

Before you begin

Role required: ui_policy_admin

About this task

You can also apply a UI policy to import sets or to data imported by SOAP web services when you convert it to a data policy. Converting a UI policy to a data policy deactivates the UI policy. To retain the policy in the UI, ensure that the **Use as UI Policy on client** check box is selected on the data policy record.

For a UI policy to be eligible for conversion to a data policy, the following conditions must be met on the UI Policy form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Run scripts** check box must be cleared.
- The **Global** check box must be selected.
- None of the UI policy actions can have **Visible** set to **True** or set to **False**. **Visible** must be set to **Leave Alone**.

Procedure

1. Navigate to **All** > **System UI** > **UI Policies**.
2. Open an existing UI policy.
3. Under **Related Links**, click **Convert this to Data Policy**.
   A new data policy record is created.
4. Edit the fields on the data policy record as necessary.

Related topics

Data policy

Convert a data policy to a UI policy

Convert a data policy to a UI policy if a data policy already exists but needs to apply only to records created or updated in the browser.

Before you begin

Role required: admin

About this task

Converting deactivates the data policy. The new UI policy is applied only at the UI layer only and not to import sets or data imported from SOAP web services.

Note: An alternative to converting from a data policy to a UI policy is to select the **Use as UI Policy on client** checkbox on the data policy record. This field extends the data policy to the UI. The main difference between converting and using the **Use as UI Policy on client** checkbox is that converting provides the Visible field on the UI policy record. Use the **Visible** field to select how the UI policy affects the visible state of the field.

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Data Policies** and click an existing data policy.
2. Under **Related Links**, click **Convert this to UI Policy**.

   A new UI policy record appears.

3. Edit the fields on the UI policy record as necessary.
   For details about the fields, see Create a UI Policy.

Data policy debugging

Debug messages can help administrators identify and resolve data policy problems.

Debug messages can help you identify and resolve data policy problems. To view data policy debugging messages at the bottom of the screen, navigate to **System Diagnostics** > **Session Debug** > **Debug Data Policies**.

Data lookup and record matching support

The data lookup and record matching feature enables administrators to define rules that automatically set one or more field values when certain conditions are met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data lookup rules allow administrators to specify the conditions and fields where they want data lookups to occur. For example, on Incident forms, there are priority lookup rules for the sample data that automatically set the incident **Priority** based on the incident **Impact** and **Urgency** values.

Note: Activating the Data Lookup and Record Matching Support plugin replaces the *calculatePriority* business rule with a priority data lookup definition, but does not transfer any custom logic. If you manually activate the plugin, you must recreate any custom business logic that uses the priority lookup rules.

The following codes will be removed by manually activating the *com.glide.data_lookup* plugin:

- sys_script_18105ab0c61122750127a49c9055d29f
- sys_script_client_2bbac34da9fe1561000d89c04779a30c
- sys_script_client_2bc0bf4fa9fe15610019c5c8a8461647
- sys_script_client_ac0081210f030000b12e6903cfe012ac
- ys_script_d1b7d4af4655e7c2001be4c18b99215a
- sys_script_include_9e1904840a0a0b7d00d5ee8d0e2d89ef

Create custom data lookups

Creating custom data lookups involves adding a lookup value, creating the definition, and activating data lookup.

Create a custom data lookup table

Create a custom table to store lookup data.

The custom table must extend the Data Lookup Matcher Rules `[dl_matcher]` table. For example, this custom lookup table stores information about VIP callers and incident assignments.

Custom data lookup table

Field	Sample value
Label	VIP Caller Lookup
Table name	u_vip_caller_lookup
Extends base table	dl_matcher
Create new module	True
Add module to menu	System Policy

Add a data lookup value to the data lookup table

The columns of a data lookup table contain both matcher and setter field data.

Before you begin

Role required: admin

About this task

Each data lookup is a query that searches for a row containing values that match the matcher fields. The data lookup then returns the value listed in the setter fields. For example, this Priority

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Lookup [dl_u_priority] table lists the combinations of impact and urgency (matcher fields) that produce a particular priority value (setter field).

Lookup table

Matcher fields		Setter field
Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

Procedure

1. In the navigation filter, enter the name of the new custom lookup table.
   For example, `u_vip_caller_lookup.list`.
2. Configure the list and create new fields.

   For this example, create the new fields in the following table.

   New fields

Name	Type	Field length or Table to reference
Caller	Reference	User [sys_user]
Priority	Integer	
Assignment Group	Reference	Group [sys_user_group]

   For more information, see Configuring lists on the ServiceNow AI Platform.
3. From the table list, select **New** and enter appropriate matcher and setter field values.

   For example:

   New matcher and setter field values

Matcher field	Setter fields	
Caller	Priority	Assignment Group
Beth Anglin	2	VIP Issues
Fred Luddy	1	VIP Issues

Note: Each row in a data lookup table must be unique.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a data lookup definition record

Data lookup requires a definition record that specifies how to set one or more field values when specified conditions are met.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Data Lookup Definitions**.
2. Select **New**.
3. Select **Data Lookup Rule**.
4. Complete the Data Lookup Rule form using the following table.

Data lookup definitions fields

Field	Description
Name	Enter a unique name to identify the definition record.
Source Table	Select the table containing the fields you want to automatically update with lookup values. Data Lookup Definitions are not inherited by extension tables. For example, a Data Lookup Definition on the Task table cannot match values on the Incident table.
Matcher Table	Select the table containing the lookup values. This table should always start with a u_ prefix. This table can be any table within the current scope containing the lookup values. **Note:** The list shows only tables and database views that are in the same scope as the catalog data lookup definition.
Active	Select this check box to run this data lookup rule. Clear the check box to ignore this data lookup rule.
Run on form change	Select this check box to automatically look up values whenever a user or onChange client script changes a field value on a source table form. **Note:** This does not include changes automatically made by other data lookup rules, such as the Priority Lookup Rules.
Run on insert	Select this check box to automatically look up values whenever a user creates a new record.
Run on update	Select this check box to automatically look up values whenever a user saves or updates a record.

5. Select and hold (or right-click) the form header and select **Save**.
6. From the **Matcher Field Definitions** related list, click **New**.
7. Complete the Matcher Field Definitions using the following table.

A data lookup only occurs on fields with matcher field definitions. The data lookup uses the values of the source table fields to look up one or more values from the matcher table. Note that data lookup does not work with **Journal** type fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Matcher field definitions fields

Field	Description
Data Lookup	Displays the name of the parent data lookup definition record.
Source table field	Select the field from the source table that contains the data to match.
Matcher table field	Select the field from the matcher table that contains the data to match. This table can be any table within the current scope containing the lookup values.
Exact lookup match	Select this check box to require the matcher table to contain a matching row for every possible combination of values (including empty values). Clearing this check box means that any empty values in the matcher table match any value. For example, suppose the Priority field is empty in the matcher table. When this check box is selected, there is a match only when the Priority value is empty in the source table row. When this check box is cleared, the empty matcher field value matches any value in the source table field. **Note:** If the lookup does not require an exact match, matcher table rows containing empty values are treated as wild cards, matching all values.

8. Select **Submit**.
9. From the **Setter Field Definitions** related list, click **New**.
10. Complete the Setter Field Definitions form using the following table.

Setter field definitions fields

Field	Description
Data Lookup	Displays the name of the parent data lookup definitions record.
Source table field	Select the field from the source table that the data lookup updates.
Matcher table field	Select the field from the matcher table that provides the new value for the update.
Always replace	Select this check box to replace any existing value with a value from the data lookup. Clear this check box to ignore the update if the field has an existing value.

11. Select **Submit**.
12. Select **Update**.

Create a data lookup module

You can create a module for data lookup so it appears in the instance application navigator.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Application Menus**, then select an application to add the module to.
2. In the Modules related list, select **New**.
3. Configure a module for the data lookup table you created using the following properties.

Module properties

Property	Required value
Table	Select the data lookup table you created in Step 2. For example u_vip_caller_lookup.
Link type	List of Records

4. Select **Submit**.

Troubleshooting data lookup

If the custom data lookup definition rules are not behaving as expected, check for certain conditions.

- Verify that the data lookup definition is set to run on the appropriate events.
- Verify that the matcher field is not read-only. Because users cannot change read-only fields, user interactions cannot trigger an on form change event for read-only fields.
- Verify a client script is not changing a field value. Client scripts can trigger *`Run on form change`* events even on read-only fields.
- Verify that the data in the matcher table is correct.
- If the lookup requires an exact match, verify that there is a matcher table row for each possible combination (including blank values). The lookup fails if cannot find a matching value.
- Verify that you have not created a recursive rule, such as:

  If Field A = 1, then Field B =2. If Field B = 2, then Field A = 2.

Dynamic Schema

Define a hierarchy of categories and enable users to describe a record using one or more attributes.

Key benefits

- Organize and define metadata in a flexible schema instead of adding new columns to a table.
- Capture data dynamically using different attributes per record.
- Define a structured framework of dynamic categories and dynamic attributes.
- Define dynamic categories and dynamic attributes once and reuse them across multiple tables using dynamic namespaces.

Dynamic Schema elements

Dynamic Schema is composed of the following elements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic attributes

Name-value pairs that describe a record. You can either formally define dynamic attributes or create them on the fly as transient attributes in a dynamic attribute store field.

Dynamic categories

Containers for organizing dynamic attributes. A dynamic category can inherit dynamic attributes from its parent category.

Dynamic attribute store

A field type for storing one or more dynamic attributes and their values. When you create a dynamic store field, a dynamic namespace is automatically created and associated with that store field.

After creating a store field, you can start storing values for attributes without defining them, or you can specify attribute definitions in the dynamic namespace to take advantage of additional functionality.

Dynamic namespace

A scoped collection of dynamic attributes and dynamic categories. Each dynamic attribute store field automatically receives its own dynamic namespace or you can configure multiple dynamic attribute store fields that share a dynamic namespace.

Implementation options

You have flexibility when deciding how to implement Dynamic Schema.

- You can add attributes directly to a dynamic attribute store field without creating formal definitions first. These attributes are considered transient and are treated as having string values in scripts and queries. You can provide a definition for the attribute and modify its type at any time. Modifying the type of an attribute doesn't affect the stored data but changes how the system interacts with that data. See Working with attributes transiently.
- You can take advantage of additional platform support and reuse for attributes by defining them in a dynamic namespace. Defining a dynamic attribute record enables you to specify its type, set choice options, organize it into dynamic categories and more. See Working with Dynamic Schema.
- You can create a dynamic namespace independently. You can add dynamic attributes and dynamic categories to that namespace, and then associate that namespace with one or more dynamic attribute store fields. This enables you to reuse attributes across multiple store fields. See Create a dynamic namespace.

Use cases

- Capture attribute-value pairs that describe products sold in a large department store by defining a dynamic schema for your products. Store the attributes and their data in a dynamic attribute store field.

  For example, assume you have a custom Products table that stores records for different types of products like televisions, sunscreens, pillows, and shirts. You can create dynamic attributes for each type of product (like screen type, UPC, color, or size). You can organize the dynamic attributes into dynamic categories (like Electronics, Health and Beauty, Home Goods, and Clothing). Users can add records to your Products table and capture different attributes in each product record.

- Describe a record by capturing one or more transient attributes, with values stored as string objects in a dynamic attribute store field. You can also capture transient attributes on a record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

by adding a dynamic attribute store field to a table and populating the field with string data using the *GlideRecord* API.

- Filter Workspace lists using dynamic schema elements in the condition builder. For example, you can define dynamic categories and attributes for product offerings and use them to search for transactions using the condition builder in the Sales Order Management Workspace.

APIs

Dynamic Schema also provides global APIs that enable you to access and manage dynamic attributes in your tables using JavaScripts. The following lists the APIs and methods that support dynamic attributes.

- GlideAggregate - Global

  The following *GlideAggregate* methods support the usage of dynamic attributes:

  - addAggregate()
  - addHaving()
  - getDynamicAttributeValue()
  - getDynamicAttributeDisplayValue()
  - getValue()
  - groupBy()
  - orderBy()
  - orderByAggregate()
- GlideDynamicAttributeStore - Global
- GlideElementDynamicAttributeStore - Global
- GlideDynamicNamespace - Global
- GlideRecord - Global

  The following *GlideRecord* methods support dynamic attributes:

  - addQuery()
  - getDisplayValue()
  - getDynamicAttribute()
  - getDynamicAttributeDisplayValue()
  - getDynamicAttributeValue()
  - getValue()
  - orderBy()
  - orderByDesc()
  - setDisplayValue()
  - setDynamicAttributeDisplayValue()
  - setDynamicAttributeValue()
  - setDynamicAttributeValues()
  - setValue()

Working with attributes transiently

Start adding attributes and values to records without formally defining a full schema.

Implementing Dynamic Schema is a flexible process. To get started, you can simply add attributes and values to a dynamic attribute store field, which helps describe your records without the need for additional table columns. You can add more attributes as needed and start querying and working with them right away.

Getting started

Implement attributes transiently using the following process.

1. Create a dynamic attribute store field

   Get started by creating a dynamic attribute store field for storing attributes on a record.

2. Add transient attributes to a record

   After creating the dynamic attribute store field, describe your records by using transient attributes and string values.

Additional implementation options

When you add attributes to a store field without formally defining them as dynamic attribute records, Dynamic Schema is functional, but limited.

- Transient attribute values are saved as strings, which limits querying and sorting options.
- Transient attributes aren't organized into logical categories.
- Transient attributes don't support choice sets, which give you control over attribute values and where they can be used.

Instead, you can specify additional data types, organize attributes into categories, create dynamic choice sets, and reuse attributes in multiple store fields by formally defining your attributes in a dynamic namespace. When you're ready to take advantage of these capabilities, see Working with Dynamic Schema.

Create a dynamic attribute store field

Create a dynamic attribute store field for storing transient attributes on a record.

Before you begin

Role required: admin

About this task

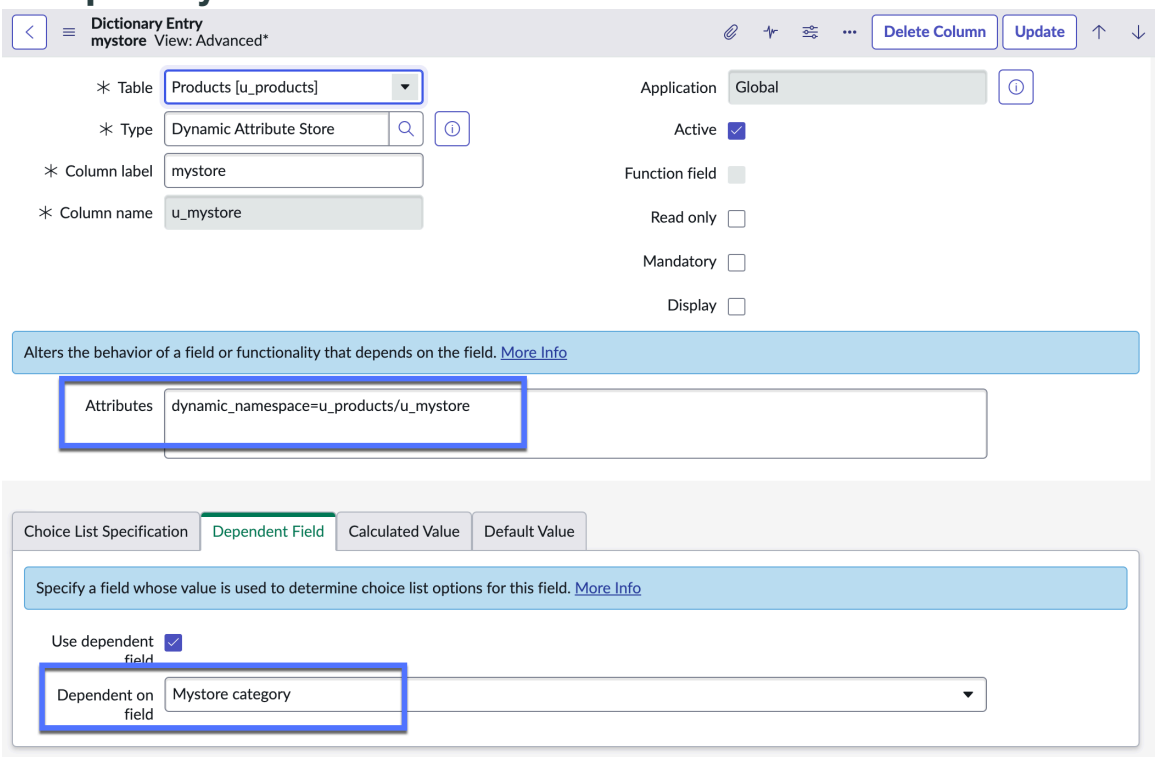
You can create a dynamic attribute store field to store one or more transient attributes that describe a record. When you create a dynamic attribute store field, the following schema changes occur automatically.

- A dynamic namespace is automatically created and associated with the dynamic attribute store field. The namespace associated with a store field can be modified at any time.
- A dynamic category reference field is automatically added to the same table. You can store any dynamic attribute that you want in the store field, but the dynamic category reference field can help users determine which attributes to store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select the table that you want to use for storing attributes.
3. In the Columns related list, select **New**.
4. In the Type field, select **Dynamic Attribute Store**.
5. Complete the form by entering a Column label.
6. Select **Submit**.



Result

- A dynamic attribute store field is added to the table. An associated dynamic namespace is created with the following naming format:

```
<table_name>/<dynamic_attribute_store_column_name>
```

- A dynamic category reference field is added to the table. A dependency relationship is established between the category reference field and the dynamic attribute store field.

Example: A dynamic attribute store field is added to the Products table

What to do next

Populate the dynamic attribute store field with one or more attributes. See Add transient attributes to a record.

Add transient attributes to a record

Store transient attributes and their values on a record.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To add attributes to a dynamic attribute store field, you must have write access to the table where the store field is located.

About this task

After creating a dynamic attribute store field on a table, you can immediately start adding attributes to a record without having to define a dynamic attribute record for each attribute. Attributes without a definition are considered transient and are treated as having values of type string when used in scripts and queries.

Procedure

1. Navigate to the table that holds your dynamic attribute store field.
2. Create a record by selecting **New**.
3. Add one or more attributes directly on the form using JSON or via the API.

Option	Description
Enter JSON on the form	**a.** In the category reference field, select the dynamic category that contains the dynamic attributes that you want to use. **b.** Enter one or more attributes and their values. For example: `"screen_resolution":"2160p", "screen_size":"75","screen_type":"OLED"`
Call setValue()	Call *setValue()* in the *GlideRecord* API and send data to the dynamic attribute store field.For example: `var gr = new GlideRecord('products'); gr.setValue('television_specs->screen_resolution', '2160p'); gr.setValue('television_specs->screen_size', '75'); gr.setValue('television_specs->screen_type', 'OLED'); gr.insert();`

Result

One or more transient attributes are added to the store field, with each value stored as a string. Users can query or search for records using the values captured in the dynamic attribute store field. For example:

```
var gr = new GlideRecord('products');
gr.addQuery('television_specs->screen_type', 'OLED');
gr.query();
```

What to do next

Decide whether to create formal definitions for each attribute. Providing a formal definition makes the attribute non-transient and allows you to modify its behavior. To provide this definition, navigate to the dynamic namespace record the store field is configured with and create a dynamic attribute record using the name of the attribute you wish to modify. See Create a dynamic attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note that modifying the definition of an attribute doesn't modify any data stored for that attribute. Rather, it simply modifies how the system interacts with that data. For example, attributes defined as strings sort differently than when defined as integers.

Sorting age values as strings:

```
11
19
2
25
3
```

Sorting age values as integers:

```
2
3
11
19
25
```

Any saved data that might be invalid for its defined type is treated as having a nil value appropriate for the type. For example, storing a value of "dog" for an attribute, and then formally defining it as an integer will effectively use 0 in all queries and calculations that attribute is used in, even though the data stored for the attribute remains as “dog".

Working with Dynamic Schema

Extend Dynamic Schema capabilities by defining dynamic attributes and dynamic categories in a dynamic namespace.

After planning your metadata strategy, you can start building out your schema by creating dynamic attribute records in the dynamic namespace. Formally defining attributes provides several key benefits.

- Ensure data integrity, optimize queries, and improve sorting by defining dynamic attributes with appropriate types. For example, you can define attributes as strings, integers, or dates to enforce type-specific behavior.
- Organize dynamic attributes and enable inheritance by adding them to dynamic categories. For example, you can define dynamic attributes in a parent category, and automatically access them in child categories that inherit those attributes.
- Define a fixed set of values for an attribute by creating a dynamic choice set. For example, you can control which values are available in an attribute, which categories or namespaces they appear in, and override the values in specific cases.
- Reuse dynamic attributes across multiple dynamic attribute store fields. For example, you can define a dynamic attribute in a dynamic namespace, and then use that attribute in any store field that belongs to that namespace.

Implementing Dynamic Schema

Implement Dynamic Schema using the following process.

1. Create a dynamic attribute store field

   Get started by creating a dynamic attribute field for storing your dynamic attributes.

2. Create a dynamic attribute

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define one or more dynamic attributes in the dynamic namespace that's associated with the dynamic store field.

3. Create a dynamic category

   Define one or more dynamic categories in the dynamic namespace.

4. Include dynamic attributes in a dynamic category

   Organize your dynamic attributes using the dynamic categories that you defined.

5. Create a dynamic choice set

   Define a fixed set of choices for an attribute and create choice overrides as needed.

6. Add dynamic attributes to a record

   Populate the dynamic attribute store field using the `GlideRecord setValue()` method or by entering attributes and values as JSON.

Create a dynamic attribute store field

Store dynamic attributes on a record using a dynamic attribute store field.

Before you begin

Role required: admin

About this task

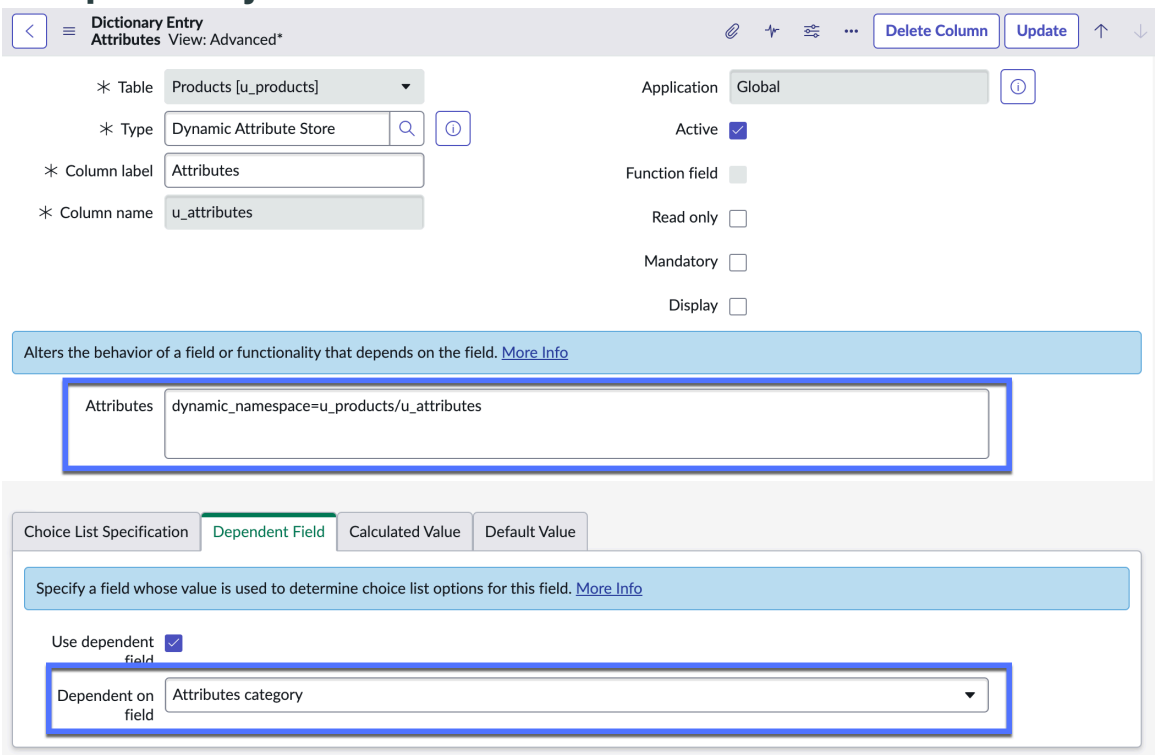
You can create a dynamic attribute store field to store one or more dynamic attributes that describe a record. When you create a dynamic attribute store field, the following schema changes occur automatically.

- A dynamic namespace is automatically created and associated with the dynamic attribute store field. Dynamic attributes, dynamic categories and other items defined in the dynamic namespace become available to the store field. You may modify the namespace of a store field at any time without affecting data stored for that field. The system will begin interacting with that data using definitions provided by the new namespace.
- A dynamic category reference field is automatically added to the same table and associated with the store field. This category reference field provides additional metadata for the store field to guide users when deciding which attributes to add.

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Select the table that you want to use for storing dynamic attributes.
3. In the Columns related list, select **New**.
4. In the Type field, select **Dynamic Attribute Store**.
5. Complete the form by providing a Column label.
6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Result

- A dynamic attribute store field is added to the table. An associated dynamic namespace is created with the following naming format:

```
<table_name>/<dynamic_attribute_store_column_name>
```

- A dynamic category reference field is added to the table. A dependency relationship is established between the category reference field and the dynamic attribute store field.

Example: New dynamic store field on the Products table

What to do next

Develop your dynamic schema by creating dynamic attributes and dynamic categories. You can build out the schema using either of the following methods:

- Add dynamic attributes and dynamic categories to the dynamic namespace that's currently associated with the store field you created. Refer to the following topics:
  - Create a dynamic attribute
  - Create a dynamic category
- Add dynamic attributes and dynamic categories to a new dynamic namespace and then associate that namespace with the store field that you created. Refer to the following topics:
  - Create a dynamic namespace
  - Associate a dynamic attribute store with a different namespace

Create a dynamic attribute

Define one or more dynamic attributes that describe a record.

Before you begin

You can define each of the dynamic attributes that describe your records in a dynamic namespace that's associated with a dynamic attribute store field. You can create a dynamic namespace the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

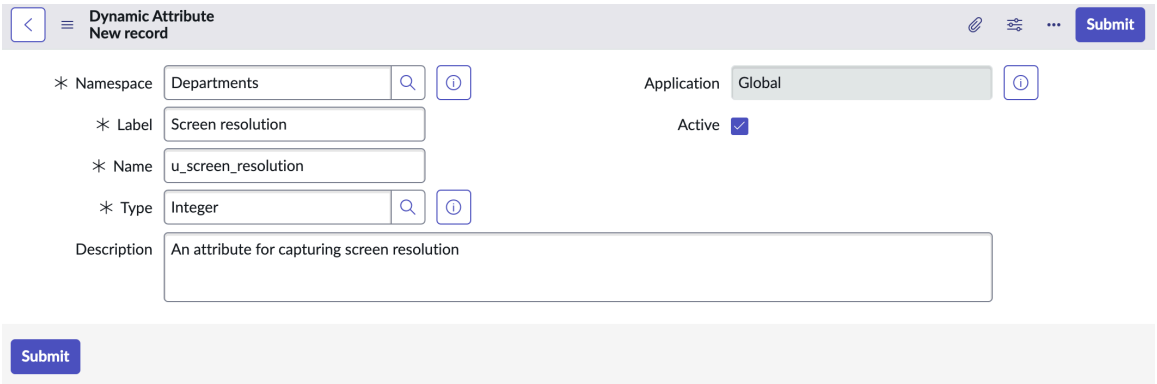
- Create a dynamic attribute store field. When you create a dynamic attribute store field, a dynamic namespace is automatically created and associated with the store field. See Create a dynamic attribute store field.
- Create a dynamic namespace manually. See Create a dynamic namespace.

Role required: dynamic_schema_writer

Procedure

1. Navigate to **All** > **Dynamic Schema** > **Dynamic Namespaces**.
2. Select the dynamic namespace that you want to update.
3. In the Dynamic Attributes related list, select **New**.
4. On the form, fill in the fields.

Dynamic Attribute form



Field	Description
Namespace	Dynamic namespace that contains this attribute.
Label	Label used for displaying the dynamic attribute.
Name	Internal name for the dynamic attribute.
Type	Data type of the attribute. ○ To define the attribute using a choice set, select String. ○ To define the attribute as a reference to a record in another table, select Reference. Defining the attribute as a reference maintains accuracy by automatically reflecting changes from the linked record. This simplifies maintenance when related information changes. For example, a Covered Vehicle attribute in a policy record can reference a vehicle in the Vehicle table so updates to vehicle details appear in the policy without manual edits.
Choice Set	Fixed set of values defined in a choice set. For example, if you created a choice set for Colors with choices for red, green, and blue, you can select the Colors choice set to limit the attribute's values to the color choices defined in the choice set. See Create a dynamic choice set. This option only appears when you select String in the **Type** field.
Description	A brief summary of what the attribute stores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to activate the dynamic attribute.

5. Select **Submit**.

Example: Add a dynamic attribute for screen resolution

What to do next

Add more dynamic attributes to the dynamic namespace as needed. For example, when defining metadata for products in the Electronics category, you might add dynamic attributes that describe screen size, screen type, and watts.

Create a dynamic category

Create a container for organizing dynamic attributes.

Before you begin

Role required: dynamic_schema_writer

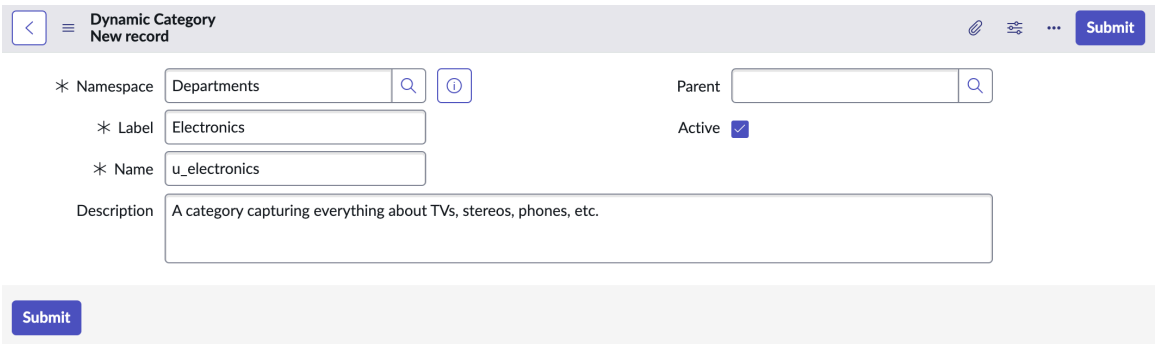
About this task

After defining your dynamic attributes, you can organize them into categories.

Dynamic categories inherit the dynamic attributes of their extended hierarchy. For example, a Televisions category could inherit the volts, amps, and watts attributes associated with its parent category, Electronics.

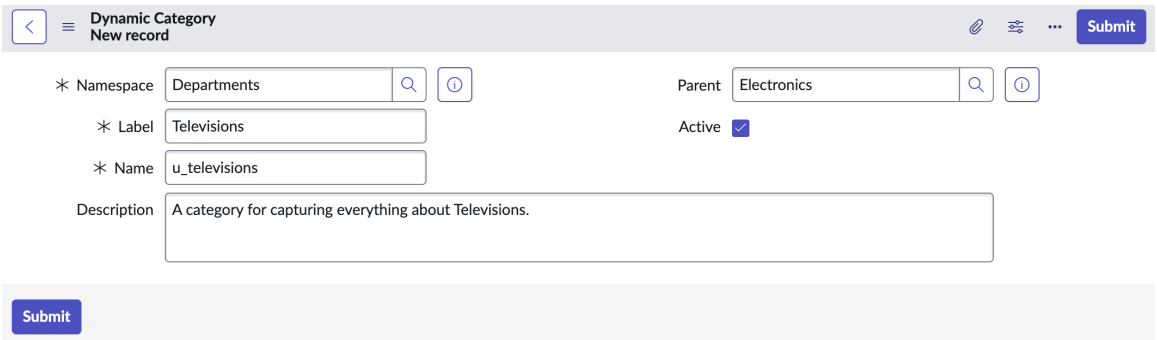
Procedure

1. Navigate to **All** > **Dynamic Schema** > **Dynamic Namespaces**.
2. In the Dynamic Categories related list, select **New**.
3. On the form, fill in the fields.



Dynamic Category form

Field	Description
Namespace	Namespace to which the dynamic category belongs.
Label	Label used for displaying the dynamic category.
Name	Internal name for the dynamic category.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	A brief summary of what the category contains.
Parent	Parent category from which this category extends.
Active	Option to activate the dynamic category.

Example: Create a dynamic category for capturing everything about electronics

Example: Create a dynamic category called Televisions that extends from the Electronics dynamic category

What to do next

Add more dynamic categories as needed. For example, you might add parent categories for store departments like Health and Beauty, Automotive, and Sporting Goods and child categories for Body Soap, Shampoo, Motor Oil, and Fishing Poles.

If you determine that you need dynamic attributes for multiple products in different dynamic categories, you can define the dynamic attributes in a broader, parent dynamic category. When you add attributes to a parent, they're automatically inherited by a child category.

For example, you might need attributes for capturing Volts, Amps, and Watts in a product record. You can add these attributes to the Electronics category. When you create the Televisions category and select Electronics as the parent category, the Volts, Amps, and Watts attributes are automatically inherited by the Televisions category.

Include dynamic attributes in a dynamic category

Categorize specific dynamic attributes by relating a dynamic attribute to a dynamic category.

Before you begin

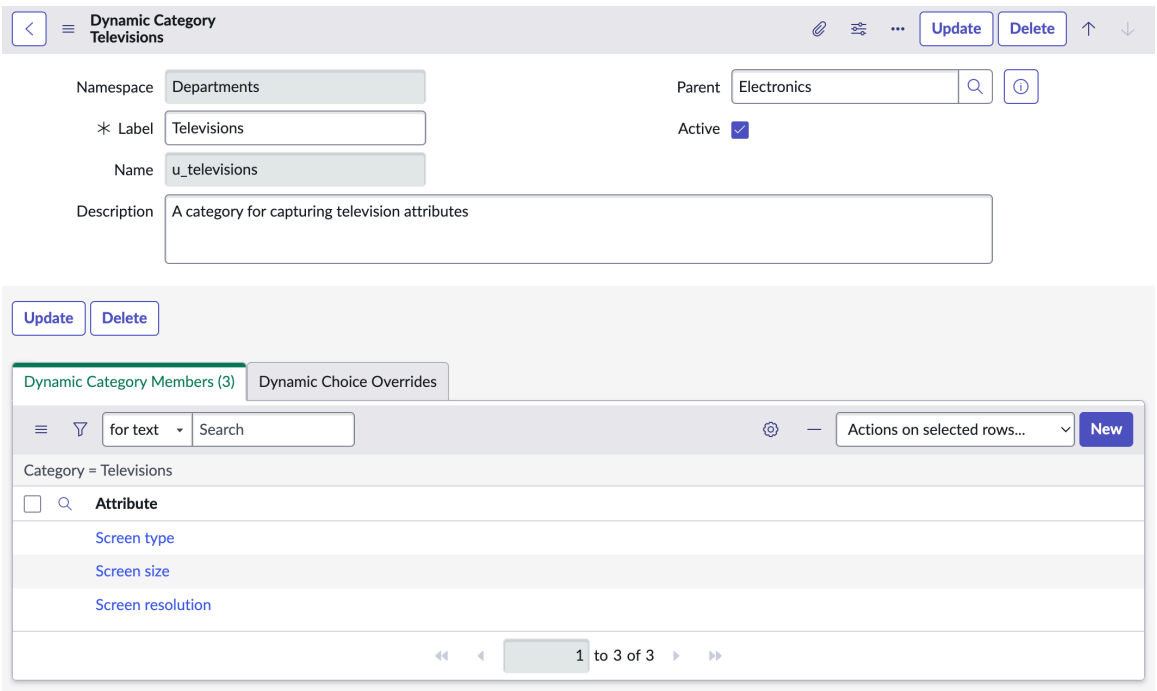
Role required: dynamic_schema_writer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

After creating dynamic attributes, you can build out your taxonomy by including the dynamic attributes in a dynamic category.

Procedure



1. Navigate to **All** > **Dynamic Schema** > **Dynamic Categories**.
2. Select a dynamic category that you want to update.
3. In the Dynamic Category Members related list, select **New**.
4. On the form, fill in the fields.

Dynamic Category Attribute Member form

Field	Description
Category	Category that contains the dynamic attribute.
Attribute	Dynamic attribute to associate with the dynamic category.

5. Select **Submit**.

Example: Dynamic attributes added to a dynamic category

What to do next

Add more dynamic attributes to the dynamic category as needed.

Create a dynamic choice set

Define a fixed set of values for an attribute.

Before you begin

Role required: dynamic_schema_writer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

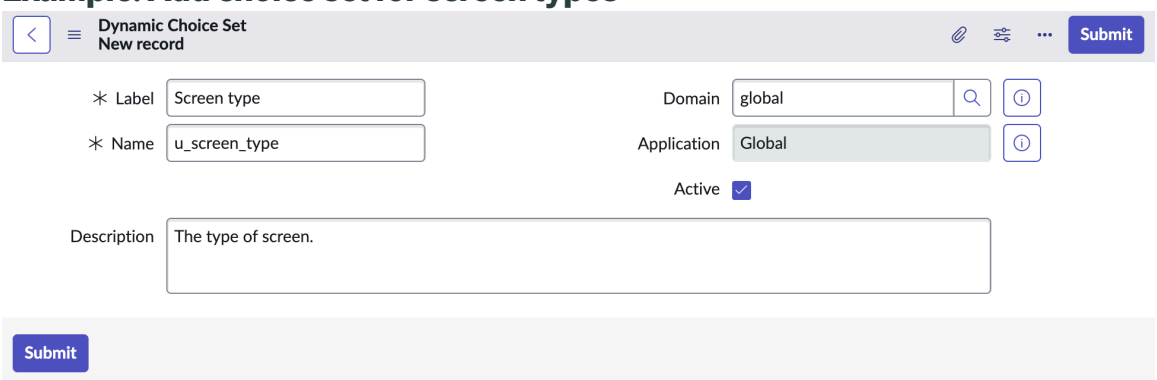
About this task

For some dynamic attributes, you might want to limit the possible values that are accepted. You can define a choice set that holds a fixed set of choices, and then create a dynamic attribute whose values are limited to the choices defined in the choice set.

Dynamic choice sets aren't associated with a specific namespace. After you define a dynamic choice set, you can use it in any dynamic namespace.

For example, you can define a choice set for colors, with red, blue, and green as the choices. You can select this choice set in the bike_color dynamic attribute in one namespace and use it again in the paint_color dynamic attribute in a different namespace.

Procedure



1. Navigate to **All** > **Dynamic Schema** > **Dynamic Choice Sets**.
2. Select **New**.
3. On the form, fill in the fields.

Dynamic Choice Set Form

Field	Description
Label	Label used for displaying the dynamic choice set.
Name	Internal name for the dynamic choice set.
Description	A brief summary of what the choice set stores.
Active	Option to activate the dynamic choice set.

4. Select **Submit**.

Example: Add choice set for screen types

What to do next

Add choices to a dynamic choice set

Add choices to a dynamic choice set

Build out a dynamic choice set by defining the choices that belong to it.

Before you begin

Role required: dynamic_schema_writer

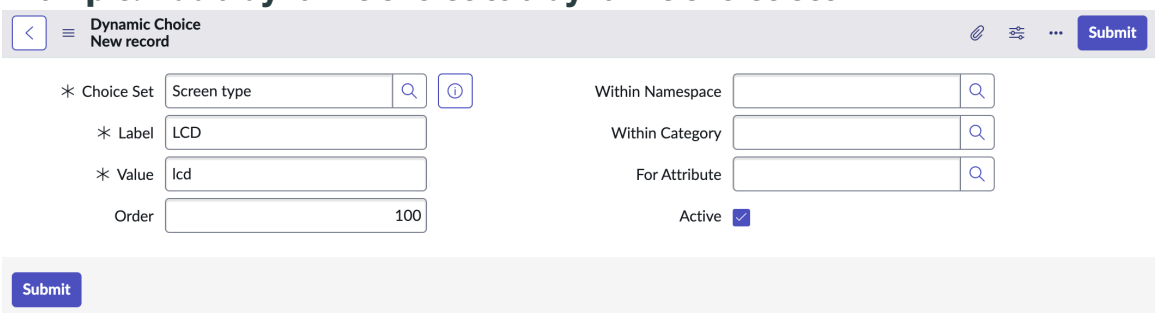
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Dynamic Schema** > **Dynamic Choice Sets**.
2. Select the dynamic choice set that you want to update.
3. In the Dynamic Choices related list, select **New**.
4. On the form, fill in the fields.

Dynamic Choice form

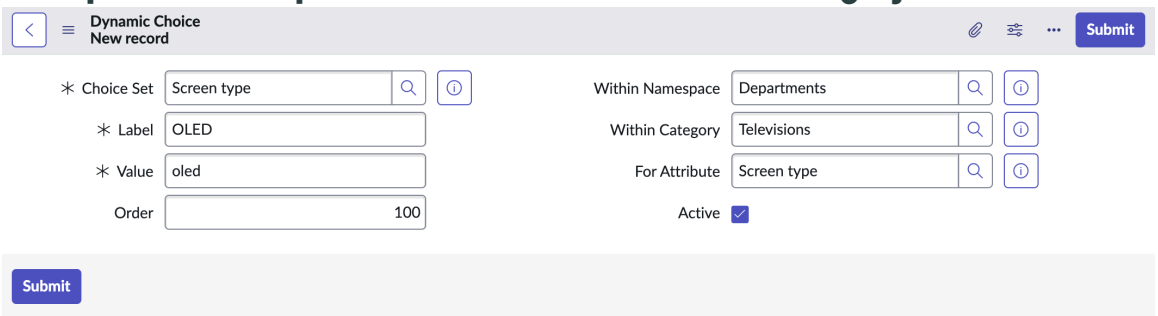
Field	Description
Choice Set	The dynamic choice set that contains this choice.
Label	Label used for displaying the dynamic choice.
Value	Internal name for the dynamic choice.
Order	Value that determines the choice's order in a list.
Active	Option to activate the choice in the dynamic choice set.



5. **Optional:** Limit the availability of the choice that you want to add.
   - Restrict the choice to a specific namespace by selecting that namespace in **Within Namespace**.
   - Restrict the choice to attributes in a specific category by selecting a namespace in **Within Namespace** and the category in **Within Category**.
   - Restrict the choice to one attribute in a namespace by selecting the namespace in **Within Namespace** and selecting the attribute in **For attribute**.

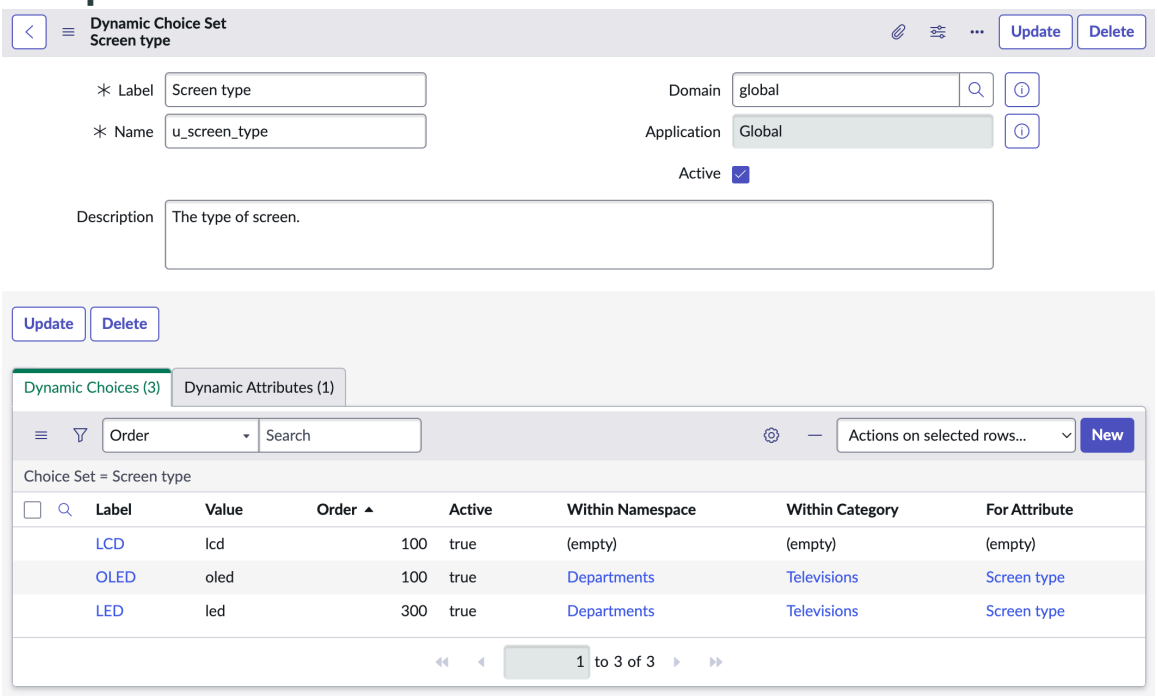
   The choice is only available in the dynamic attribute store field that belongs to the namespace you selected in **Within Namespace**. Further restrictions might apply if you selected a category or a specific attribute.
6. Select **Submit**.

Result



A dynamic choice is added to the dynamic choice set.

Example: Add a dynamic choice to a dynamic choice set



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Define a specific choice in the Televisions category

Example: Choices defined in choice set

What to do next

Add more choices as needed. Create a dynamic attribute whose values are derived from the dynamic choice set.

Override a dynamic choice

Make a choice appear differently in a specific dynamic namespace by creating a dynamic choice override.

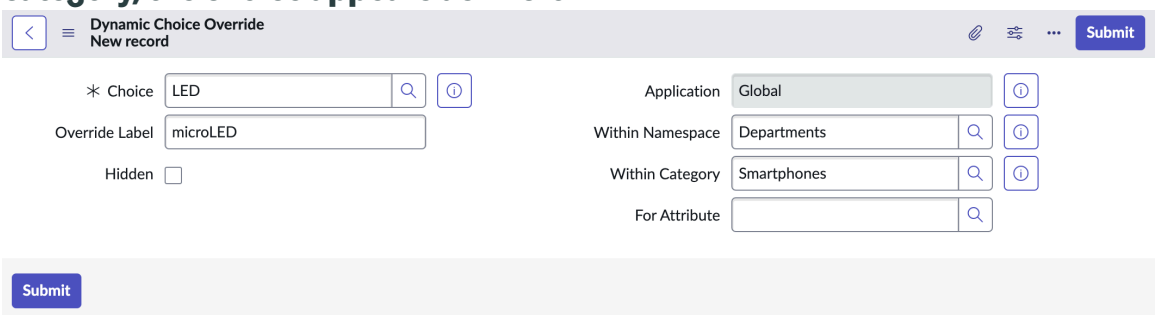
Before you begin

Role required: dynamic_schema_writer

Procedure

1. Navigate to **All** > **Dynamic Schema** > **Dynamic Namespaces**.
2. Select the dynamic namespace that you want to update.
3. In the Dynamic Choice Overrides related list, select **New**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Dynamic Choice Override form

Field	Description
Choice	The choice that you want to override.
Override Label	Optional label to use instead of the original choice label.
Hidden	Option to hide the choice.

5. **Optional:** Define where the choice override applies in your dynamic schema.
   - Restrict the override to a specific namespace by selecting that namespace in **Within Namespace**.
   - Restrict the override to attributes in a specific category by selecting a namespace in **Within Namespace** and the category in **Within Category**.
   - Restrict the override to one attribute in a namespace by selecting the namespace in **Within Namespace** and selecting the attribute in **For attribute**.
6. Select **Submit**.

Result
The choice is overridden in the dynamic namespace that you selected in **Within Namespace**. Further restrictions might apply if you selected a category or a specific attribute.

Example: An override is defined for the LED choice. In the Smartphones category, the choice appears as microLED

Add dynamic attributes to a record

Store dynamic attributes and their values on a record.

Before you begin
Role required: none

To add attributes to a dynamic attribute store field, you must have write access to the table where the store field is located.

About this task
Once you create a dynamic attribute store field and set up the dynamic categories and dynamic attributes for its namespace, you can use one or more of the dynamic attributes to describe your records.

Procedure

1. Navigate to the table that holds your dynamic attribute store field.
2. Create a record by selecting **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** In the category reference field, select the dynamic category that contains the dynamic attributes that you want to use.
4. Capture one or more dynamic attributes in the dynamic attribute store field by entering JSON or using the API.

Option	Description
Enter JSON	Enter one or more attributes and values in the dynamic store field. For example: `{ "watts: 50" , "screen_size": "75", "screen_type" : "OLED" }`
Use the API	Call *`setValue()`* in the *`GlideRecord`* API and send data to the dynamic attribute store field. For example: `var gr = new GlideRecord('products'); gr.setValue('televisions->watts', '50'); gr.setValue('televisions->screen_size', '75'); gr.setValue('televisions->screen_type, 'OLED'); gr.insert();`

Result

One or more dynamic attributes and their values are stored in the record. Users can query for records that have some value for an attribute. For example:

```
var gr = new GlideRecord('products');
gr.addQuery('televisions->screen_type', 'OLED');
gr.query();
```

Create a dynamic namespace

Define categories and attributes once and reuse them across multiple tables and dynamic attribute store fields.

Before you begin

Role required: dynamic_schema_writer

About this task

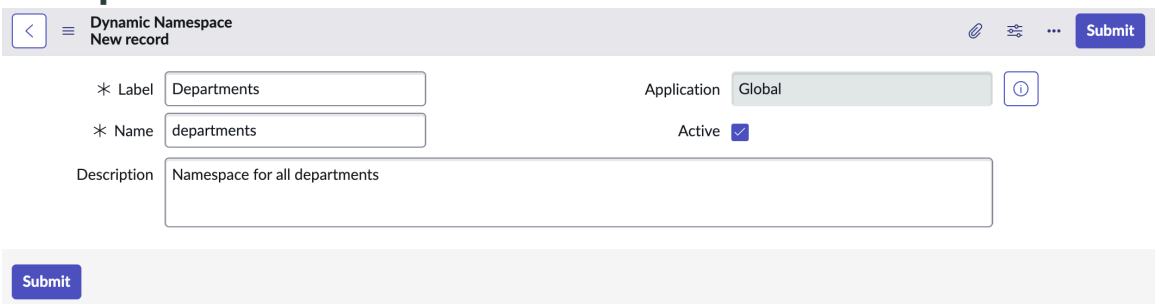
All dynamic categories and dynamic attributes belong to a dynamic namespace that you can associate with one or more dynamic attribute store fields.

A dynamic namespace is automatically created when you create a dynamic attribute store field. However, you can also create a dynamic namespace manually, and then associate it with one or more store fields. You might create a dynamic namespace this way in the following scenarios:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You created a dynamic attribute store field for storing transient attributes, which automatically created an associated namespace, but now you want to associate the store field with a different namespace that contains a different set of dynamic categories and dynamic attributes.
- You created multiple dynamic attribute store fields on one or more tables, and you want them all to share the dynamic categories and dynamic attributes that you defined in a new namespace.

Note that changing the namespace associated with a dynamic attribute store field doesn't modify any saved data in the store field, but can affect how the system interacts with that data.



Procedure

1. Navigate to **All** > **Dynamic Schema** > **Dynamic Namespaces**.
2. Select **New**.
3. On the form, fill in the fields.

Dynamic Namespace form

Field	Description
Label	Label used for displaying the dynamic namespace.
Name	Internal name for the dynamic namespace.
Description	A brief summary of what the namespace contains.
Active	Option to activate the dynamic namespace.

Example: Create a dynamic namespace for capturing everything about products in a department store

What to do next

- Create a dynamic attribute
- Create a dynamic category
- Include dynamic attributes in a dynamic category
- Create a dynamic choice set
- Associate a dynamic attribute store with a different namespace

Associate a dynamic attribute store with a different namespace

Use a different set of dynamic attributes in a dynamic attribute store field by changing its associated namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: dynamic_schema_writer

About this task
You can reuse the dynamic attributes and dynamic categories that you define in a dynamic namespace across multiple store fields by updating the namespace specified in the store field's dictionary record.

Changing the namespace associated with a store field can modify the type of an attribute that's captured in the store field. Modifying the type of an attribute doesn't affect any data stored for it, but can change how the system interacts with that data.

Procedure
1. Navigate to **All** > **System Definition** > **Tables**.
2. Select the table that contains your dynamic attribute store field.
3. In the Columns related list, select the dynamic attribute store column that you want to update.
4. In the Attributes field, enter the name of the dynamic namespace that you want to use after the equals sign.

   For example, change:

   `dynamic_namespace=u_products/u_attributes`

   To:

   `dynamic_namespace=departments`
5. Select **Update**.

Result
All the dynamic attributes and dynamic categories that belong to the dynamic namespace that you entered are available to the dynamic attribute store field.

What to do next
Associate the dynamic namespace with other dynamic attribute store fields by updating the Attributes field in the dictionary entry in each store field.

After each update, delete the dynamic namespace record that was automatically created for the dynamic attribute store field.

Field types reference

These field types are available to administrators when creating fields or changing the type of existing fields.

Field types

Field type	Platform name	Supported in configurable workspace	Description
approval_rules	Approval Rules	No	
audio	Audio	No	Audio field for uploading and embedding `.mp3` or `.ogg` audio files.
auto_increment	Auto Increment	Yes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
auto_number	Auto Number	Yes	
boolean	True/False	Yes	True/False field that holds a true or false value, typically displayed as a check box.
bootstrap_color	Bootstrap Color	No	
breakdown_element	Breakdown Element	No	
calendar_date_time	Calendar Date and Time	No	
catalogue_preview	Catalog Preview	No	
char	Char	Yes	
choice	Choice	Yes	Choice field that restricts values to a list of options, which is ideal for fields with a limited set of valid entries. For example, a priority field or a category field.
collection	Collection	No	Collection field type that applies any changes made to the assigned field also to the entire table For example, changes such as attributes or the **Read only** check box that are applied to a table entry with this field type are applied to the table rather than a specific field. This entry is automatically created when a table is created. There shouldn't be more than one entry for a table of this type.
color	Color	No	String field that accepts CSS color declarations,including hex or RGB notation, and displays a preview. For more information on CSS color declarations, go to the Mozilla developer web docs. See the "<color>" article. https://developer.mozilla.org/en-US/docs/Web/CSS/color_value.
color_display	Color Display	No	
composite_field	Composite Field	Yes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
composite_name	Composite Name	No	
compressed	Compressed	No	Compressed field that stores large binary data in a compressed format, reducing database storage requirements. It's used for files like images or documents, automatically compressing and decompressing data to optimize performance. This field type helps maintain efficient storage and database performance, especially when handling large volumes of data.
condition_string	Condition String	Yes	Text field that accepts a plain JavaScript condition statement that is validated automatically for correctness before an update.
conditions	Conditions	Yes	Field that adds the condition builder to a form. You must specify a dependent field that references the table name.
counter	Counter	No	
css	CSS	Yes	
currency	Currency	Yes	Decimal field with four digits after the decimal point. When displayed on a form, a **Currency** field also includes an additional list of choices for selecting the currency type. If there isn't a default value for the field, then empty **Currency** fields use the reference currency. Adding a value causes the field to use the session currency of the active user. See Change default currency decimal places for how to use two fraction digits. **Note:** After you assign this field type to a field, you can't change it to the **FX Currency** field type.
currency2	FX Currency	Yes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
data_array	Data Array	No	
data_object	Data Object	No	
data_structure	Data Structure	No	Data structure field where you can select one of the following data structures and enter values to organize particular information in the record: • String • Boolean • Integer • Decimal • Object • Array
date	Other date	Yes	Field used to store date and time values without requiring a time zone. Unlike glide_date_time, which is converted to UTC in the database, this field retains the date and time exactly as entered, without any conversion.
datetime	Date/Time	Yes	
day_of_week	Day of Week	No	
days_of_weeks	Days of Week	Yes	
decimal	Decimal	Yes	Number field with up to two digits after the decimal points. For example, 12.34.
document_id	Document ID	Yes	Document ID field that references a record on a table.
documentation_field	Documentation Field	Yes	Documentation field used by admins to add the label during table or field creation.
domain_id	Domain ID	Yes	Domain ID field that contains a reference to the domain.
domain_path	Domain Path	Yes	String field that contains a domain path, which is a series of three-character codes separated by a slash delimiter that uniquely identifies a domain. For more information on domain paths, see Domain

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			Separation- Advanced Concepts and Configurations [KB0716268] article in the Now Support Knowledge Base.
due_date	Due Date	Yes	Date field that stores a date and time.
email	Email	Yes	
email_script	Email Script	Yes	Field used to create dynamic email templates. It provides the ability to use field name notation (`${fieldname}`) to represent the dynamic value of variable. This field is a combination of text area and variable picker.
expression	Expression	No	
external_names	External Names	No	
field_list	Field List	Yes	
field_name	Field Name	Yes	Reference field for a field name in the table that is selected in a **Table Name** field type. Make this field dependent on the **Table Name** field.
file_attachment	File Attachment	Yes	File attachment field that can hold one file. All file types are supported.
float	Floating Point Number	Yes	Floating Point Number fields use a default scale of 7, and the maximum length can't be set below 7 to ensure values can be stored and displayed correctly.
formula	Formula	No	
geo_point	Geo Point	No	Geo point field for holding longitude and latitude coordinates.
glide_action_list	Action List	No	
glide_date	Date	Yes	
glide_date_time	Date/Time	Yes	
glide_duration	Duration	Yes	
glide_list	List	Yes	
glide_precise_time	Precise Time	No	
glide_time	Time	Yes	
glide_utc_time	UTC Time	Yes	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
glide_var	Var	No	
glyphicon	Glyph Icon	No	
graphql_schema	GraphQL Schema	No	
GUID	Sys ID (GUID)	Yes	
html	HTML	Yes	String field with a built-in HTML editor. It supports formatted text with rich text editor and is useful for descriptions that need enhanced readability.
html_script	HTML script	Yes	HTML script field that provides the ability to add variables in the form of field name notation (`${fieldname}`) via a variable picker within the HTML editor. This field is used to create rich text content that also has dynamic values.
html_template	HTML template	No	
icon	Icon	No	String field that provides the user access to an icon picker in a form. By default, the favorites icon set is used.
image	Image	No	Image field used for uploading and embedding images.
index_name	Index Name	No	
insert_timestamp	Insert Timestamp	No	
int	Int	Yes	
integer	Integer	Yes	Number field with zero decimal points. **Note:** To search for an integer, input `=` followed by the integer in the search bar. For example, if you want to search for an Order of 100, input `=100`.
integer_date	Integer date	Yes	The int field type is used to store alphanumeric values similar to string field type.
integer_time	Integer time	Yes	Field used to store time values, similar to glide_time, but with a few key differences:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			• The glide_time field stores the time as a fully formatted string (e.g., 1970-01-01 16:04:32), whereas the integer_time field stores it as a 6-digit string in a 24-hour format (e.g., 160432). • glide_time supports time zones, meaning the displayed value changes based on the user's time zone settings. In contrast, integer_time does not support time zone adjustments and always displays the same time regardless of the user's location.
internal_type	Internal Type	No	
ip_addr	IP Address (Validated IPV4, IPV6)	Yes	
ip_address	IP address	Yes	Variable character field that stores IPv4 and IPv6 addresses. See IP address field type for more information.
journal	Journal	No	Journal field that accepts text entries and displays previous entries with a user name and timestamp.
journal_input	Journal Input	Yes	Journal input field that accepts text entries but doesn't display previous entries.
journal_list	Journal List	No	Journal list field that displays the contents of journal fields. You must specify the journal fields as the dependent fields. If a journal list field depends on more than one journal field, the entries are displayed chronologically.
json	JSON	Yes	
json_translations	JSON Translations	No	
language	Language	No	
long	Long	Yes	Long field that stores large whole numbers, which can be useful for high-value data. This field handles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			values that exceed standard integer limits, which is essential in high-volume contexts like serial numbers or counting operations. This field ensures that numeric data is stored accurately without overflow.
longint	Longint	Yes	Longint field that stores large whole numbers, which can be useful for high-value data. This field handles values that exceed standard integer limits, which is essential in high-volume contexts like serial numbers or counting operations. This field ensures that numeric data is stored accurately without overflow.
mask_code	Mask code	No	
metric_absolute	Metric Absolute	No	
metric_counter	Metric Counter	No	
metric_derive	Metric Derive	No	
metric_gauge	Metric Gauge	No	
mid_config	Mid Config	No	
month_of_year	Month of Year	No	
multi_small	Multi Small	Yes	Text area field that stores shorter texts like short descriptions and notes.
multi_two_lines	Two Line Text Area	Yes	
name_values	Name-Value Pairs	No	Name-value pairs field that maps text values. Each mapping is one-to-one, but a single **Name-Value Pairs** field can contain multiple mappings. Each mapping must use a unique name, and the name can't be empty. For example, you can use a **Name-Value Pairs** field to hold header information for a web service request. In this example, the name of each mapping is the header such as `Content-Type` and the value is the header value, such as `Application/json`. For information on scripting **Name-Value**

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			Pairs fields, see Name-value pairs field type.
nds_icon	NDS Icon	No	
nl_task_int1	NL Task Int1	No	
order_index	Order Index	Yes	Order index field that defines the display order of records in lists or hierarchies. By assigning a numeric value to each record, it enables admins to control the visual sequence, which is helpful for logically organizing tasks, categories, or items. This field type helps improve user experience by making the interface intuitive and orderly.
password	Password (1 Way Encrypted)	Yes	Text field that stores passwords with one-way encryption. One-way encryption stores the password as a secure hash value that can't be decrypted.
password2	Password (2 Way Encrypted)	Yes	Text field that stores passwords with two-way encryption. Two-way encryption stores the password as a secure encrypted value that can be decrypted programmatically within the instance. You can use Password 2 encryption with form variables. To encrypt text fields on forms, see Password2 encryption with KMF. The length for password2 field values must be at least 255 characters.
percent_complete	Percent Complete	Yes	Decimal field that renders a percent complete bar in lists. You can convert any existing **Decimal** field to a **Percent Complete** field.
ph_number	Phone Number	Yes	
phone_number	Phone Number (Unused)	Yes	
phone_number_e164	Phone number (E164)	Yes	String field that provides E164-compliant formatting and validation for telephone numbers.
price	Price	Yes	Currency field that enables control over conversions and display. See Price fields for more information.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
properties	Properties	No	
radio	Radio	Yes	Radio field that displays mutually exclusive options as radio buttons, letting users select only one choice. It's suitable for simple, definitive decisions, like priority level or yes/no responses. This field type helps improve usability by presenting clear options for single-selection inputs. As of the Zurich release, radio buttons can be displayed both horizontally and vertically in the form view.
records	Records	No	
reference	Reference	Yes	Query field that displays records from another table, which is crucial for relational data structures.
reference_name	Reference Name	No	
related_tags	Related Tags	Yes	Field used to categorize and organize records by assigning tags. In the record page, The tags are editable using the option on the form and the same tags get reflected on the related_tags field type in a read only mode.
reminder_field_name	Reminder Field Name	No	
repeat_count	Repeat Count	No	
repeat_type	Repeat Type	No	
replication_payload	Replication Payload	No	
schedule_date_time	Schedule Date/Time	No	
schedule_interval_count	Schedule Interval Count	No	
script	Script	Yes	Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting. It also provides a list of fields and server APIs. You must specify a dependent field that

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			references the table name for the list of fields.
script_client	Script Client	No	
script_plain	Script (Plain)	Yes	Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting.
script_server	Script Server	No	
short_field_name	Short Field Name	No	
short_table_name	Short Table Name	Yes	Text field that stores a compact version of a table name, often used for efficiency in system configurations, URLs, or logs. It helps map the full table names to shorter identifiers, mainly for internal system use rather than direct user interaction.
simple_name_values	Name-Value Pairs	Yes	
slushbucket	Slushbucket	Yes	
snapshot_template_value	Snapshot Template Value	No	
source_id	Source ID	No	
source_name	Source Name	No	
source_table	Source Table	No	
string	String	Yes	String field that holds a string of characters. Strings of up to 255 characters appear in a single-line text box. Anything 256 characters or over appears as a multi-line text box. **Note:** The database may translate the value that you provide in the **Max length** field to the closest matching database field type. For example, a max string length of 80 maps to the nearest database field type of VARCHAR(100).

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			For Oracle instances, users aren't able to increase the max length of a string field to a value greater than 4000 through the application UI. Changes greater than 4000 require the CLOB data type in Oracle. If you require a field to be larger than 4000 characters, log an incident to request the change.
string_boolean	String Boolean	No	
string_full_utf8	String (Full UTF-8)	Yes	String field that contains UTF-8 character encoding. This field type is restricted to the same maximum length that can be defined within the application UI as the String data type. Emojis are supported in the String (Full UTF-8) field type.
structure	Structure	No	
sys_class_name	System Class Name	Yes	System field that holds the table name.
sys_class_path	System Class Path	No	
sysevent_name	System Event Name	No	
sysrule_field_name	System Rule Field Name	No	
table_name	Table Name	Yes	String field that lets you select a table. If you use the **Field Name** field type, add this field type and make the **Field Name** field dependent on the **Table Name** field. If you're in a scoped application, you can view only the tables of that scope.
template_value	Template Value	Yes	
time	Time	No	Time field that stores a time in the database as a **Date/Time** field, but only the time part of this field is used.

© 2026 ServiceNow, Inc. All rights reserved.

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			Note: This field stores the date as 1970-01-01, which doesn't fall within the dates for Daylight Savings Time (DST). As a result, the time isn't adjusted automatically for DST. If a custom feature uses time as a start time, the feature must adjust for DST, if necessary.
timer	Timer	Yes	
translated	Translated	No	
translated_field	Translated Field	Yes	
translated_html	Translated HTML	Yes	HTML text field that displays translations based on the user's language.
translated_text	Translated Text	Yes	Text field that displays translations based on the user's language.
tree_code	Tree Code	No	
tree_path	Tree Path	No	
url	URL	Yes	String field that is a selectable URL field when locked. When configuring, there's an option to allow/disallow links with or without HTTPS. **Note:** In the mobile UI, this field appears as a multi-line text field. The field saves as a single line with the line breaks removed.
user_image	Image	Yes	
user_input	User Input	Yes	User input field that captures input provided by users, typically in the context of workflows, surveys, or other interactive processes. This field enables users to enter text, select options, or provide other types of input that can then be processed or stored for further use. The data collected through **User Input** fields is often used to guide decision-making in workflows or

Field types (continued)

Field type	Platform name	Supported in configurable workspace	Description
			to gather information for reporting and analysis. It's a flexible field type that can be customized to fit various use cases where user interaction is required.
user_roles	User Roles	Yes	
variable_conditions	Variable Conditions	No	
variable_template_value	Variable Template Value	No	
variables	Variables	No	
version	Version	Yes	
video	Video	No	Video field for uploading and embedding video.
week_of_month	Week of Month	No	
wide_text	Wide Text	Yes	
wiki_text	Wiki	Yes	String field with a built-in wiki text editor that accepts a simplified version of standard wiki text formatting.
wms_job	WMS Job	No	
workflow	Workflow	Yes	List field that displays a stage in a workflow.
workflow_conditions	Workflow Conditions	No	
xml	XML	Yes	

Address (Simple) field type

The Address (Simple) field type provides real-time address suggestions as you enter text to reduce manual entry errors.

You can add the Address (Simple) field type to any form in both Core UI and Workspace experiences. When a user enters text in the Address field, closely matched addresses appear for selection. It helps you add accurate addresses without manual entry errors.

The Address (Simple) field type uses an external address suggestions API to retrieve matching addresses for suggestion. The following system properties control the API connection:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Address field type properties

Property	Description
glide.ui.address.suggestions.api.host.url	Specifies the host URL of the third-party address validation API. For example, Google Places API.
glide.ui.address.suggestions.api.host.apikey.encrypted	Stores the encrypted API key for the third-party address validation API specified in host URL. For example, Google Places API key.

Note: You must configure both system properties so that the Address field can return address suggestions.

Configuring Address field type

To configure the Address field to a form, complete the following setup:

1. Add the Address (Simple) field to a table to store and display data.

   For more information, see Add and customize a field in a table.

2. Configure the address suggestions API in system properties.

   For more information, see Configure address suggestion properties.

Configure address suggestion properties

Configure the address suggestion system properties so that the Address (Simple) field retrieves matching addresses as you enter text.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System properties** > **All properties**.
2. Search for and select the *glide.ui.address.suggestions.api.host.url* system property.
   a. In the **Value** field, enter the host URL of the address suggestions API.
   For example, https://places.googleapis.com/v1/places
   b. Select **Update**.
3. Search for and select the *glide.ui.address.suggestions.api.host.apikey.encrypted* system property.
   a. In the **Value** field, enter the API key of the host URL.
   b. Select **Update**.

Result
The address suggestions API displays closely matched addresses as you enter text in the Address (Simple) field.

Choice list field type

A choice list is a type of field that lets the user select from a pre-defined set of choices.

Administrators can define the available choices and customize the behavior and appearance of choice lists.

Incident state choice list

Note: Choice lists do not support a one to many relationship. Only one choice from a choice list can be selected at a time.

Choice list security

You can use the personalize_choices security role to enable non-administrators modify Choice elements options on all tables.

If more granular control is desired, you can also create a custom ACL (security rule) governing the personalize_choices operation either for a particular field or for all fields (*) on a particular table. However, access to the personalize_choices operation on a particular field does not confer the ability to add new choices for that field.

To be able to create new choices for a particular field, an ACL that grants personalize_choices access for that field is required. For example, to give the hris_admin role the ability to personalize only the Category field for Human Resources KB articles, you need an ACL granting personalize_choices access to the hris_admin role on the Category field of the Knowledge (kb_knowledge) table.

There are predefined ACLs granting both types of access to the personalize_choices security role, for all fields on all tables. The personalize_choices security role also has read, write, and delete access to the sys_choices table. However, this additional access is not required when making just the Personalize Choices functionality available on a granular basis.

Values to associate with choice labels for scripting

When you write a script that references a choice list, you need to know the value that is associated with each choice.

For example, to check whether the incident_state field is active, you could not use the condition `current.incident_state == "active"` because the value associated with the choice labeled **Active** is the integer **2**. Instead, you would use the condition `current.incident_state == 2`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Type** field on the choice list dictionary entry determines the data type of the values.

To determine the value associated with a choice, right-click the field label and select **Show Choice List**, and then locate the choice for which you need to know the value.

The **-- None --** option may not have a sys_choice record associated with it. A choice list field set to **-- None --** evaluates to these values, depending on the script context as listed below.

- For client-side scripts,such as client scripts: "" (empty string)
- For server-side scripts, such as business rules: "0" (string of the number zero)

System dictionary

Integer values for default choice lists

Choice provide four default values.

Some common choice lists use integer values that do not match the string labels. For example, the Problem table uses these default values for the **State** field.

State field default values

Value	Label
1	Open
2	Known Error
3	Pending Change
4	Closed/Resolved

These integer values are also used in several default business rules. For example, a business rule on the Incident table sets the active flag to false when the **State** field changes to **7**, which is the default value for the **Closed**. If you change the values of your Incident state options, this business rule may no longer behave as desired or expected.

On the Incident table, the **Active**, **State**, and **Incident state** fields are affected by the following default business rules.

Default business rules

Business rule	Description
mark_closed (incident)	If the incident_state changes to **7** (**Closed**), the **Active** field is set to false
incident reopen (incident)	If the incident_state is less than **7** (**Closed**) and the **Active** field is false, the **Active** field is set to true
mark closed (task)	If the state changes to either **3** (**Closed Complete**) or **4** (**Closed Incomplete**), the **Active** field is set to false
task closer (task)	If the **Active** flag changes from true to false and the state is neither **3** (**Closed Complete**) nor **4** (**Closed Incomplete**), the state is set to **3** (**Closed Complete**)
task reopener (task)	If the **Active** field changes from false to true and the state is either **3** (**Closed Complete**) or **4** (**Closed Incomplete**), the state is set to **1** (**Open**)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Notice that these business rules do not change incident_state based on a change to either the **Active** field or the **State** field. Changes to incident_state drive the other two fields, not the other way around.

Configure state field choice values

State fields are a subset of choice list fields. Keep the following information in mind when you configure choice values for the state field.

- Use a negative value to add a new active state field.
- Search for and study the business rules that use a state number filter on the **Script** and **Conditions** fields. You can use the Debug tool to trace the order of the business rule execution.
- New values representing inactive states should have a value above 8.

You can define any of the following attributes for a state field by configuring the dictionary. If the attributes are not defined, the system uses the default values. The TaskStateUtil API uses the following attributes. For more information on the TaskStateUtil API, see TaskStateUtil.

Related Attributes

Attribute	Definition
close_states	Semicolon delimited list of state values that are inactive, used to identify whether the task should be set to active or inactive. This is a required attribute to use the TaskStateUtil functionality.
default_close_state	Optional attribute to define the state value of the default close state if you want to define business rules that automatically close a task. Defaults to 3, typically Closed Complete if attribute is not defined.
default_work_state	Optional attribute to define the state value of the default working state if you want to define business rules that automatically set a task for working. Defaults to 2, typically Work in Progress if the attribute is not defined.

State modification examples

Follow these examples for modifying the states of incidents and change requests.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Choice Lists**.
2. At the top of the list, construct a list filter like the following:
   - **Table**: incident
   - **Element**: incident_state
3. Run the filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notice that the **Closed** state has a value of **7** and the **Resolved** state has a value of **6**. Any state greater than or equal to **7** is assumed to be inactive. Therefore, you should use a positive integer greater than **7** if you want to add a new inactive-type of state. Use a negative value like **-1** or **-2** if you wish to add a new active-type of state field, such as **Awaiting Vendor**.

4. Navigate again to **System Definition** > **Choice Lists**.
5. At the top of the list, construct a list filter like the following:
   - **Table**: change_request
   - **Element**: phase_state
6. Run the filter.

   Notice that the **Complete** state has a value of **8**. Any state greater than or equal to **8** is assumed to be inactive. Therefore, you should use a positive integer greater than **8** if you want to add a new inactive-type of state, such as **Cancelled**. Use a negative value like **-1** or **-2** if you wish to add a new active-type of state field, such as **Pending**.

Troubleshoot change states and business rules

Business rules in the system make assumptions about state values. You can troubleshoot business rules to see the order in which they run and see how it affects changes you make to **State** field values.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Business Rules**.
2. Construct a filter like this one to view the scripts and conditions that pertain to the Resolved incident_state of 6 or the Closed incident_state value of 7:

   The **Script** field contains 7 OR the **Condition** field contains 7 OR the **Script** field contains 6 OR the **Condition** field contains 6 AND the **Table** field is incident AND the **Active** field is true.

What to do next

See Debug Business Rule for information on how to trace the order of business rule execution. You can click **Debug All**, resolve an incident, and then check the trace at the bottom of form to watch the business rules execute. These two line examples show that the mark_closed business rule code is entered `==>` and then exited `<==`.

```
==> 'mark_closed' on incident
<== 'mark_closed' on incident
```

View choice list definitions

The Choice Set [sys_choice_set] table contains a record for every field that uses a choice list.

Before you begin

Role required: personalize_choices

Note: The personalize_choices role must be explicitly granted to the user; it cannot be an ACL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The choice set record is associated with an application file, which allows update sets and team development to track and transfer all choices for a field in a single update record.

Choice list values allow a maximum length of 40 characters. The range of allowable numerical values is [-999, 999].

Procedure

1. Right-click the choice list field label and select **Show Choice List**.
   To view other choice list values, modify the filter at the top of the list.

   Note: When you use an ACL to grant personalize_choices on a particular field, **Show Choice List** is not available. It is only available if you explicitly grant the role to the user. **Configure Choices** continues to appear regardless of whether it is an ACL or an explicitly granted user role.

2. Review the items in the list.

   Warning: Do not add new choices to the list. To add new choices to a choice list field, use the **Configure Choices** option.

Related topics

Define an option for a choice list

Define an option for a choice list

You can personalize the options that are available in a choice list.

Before you begin

Role required: personalize_choices

Procedure

1. Navigate to a form where the field appears.
2. If the choice list is dependent on another field, enter the choice value that the options depend on.

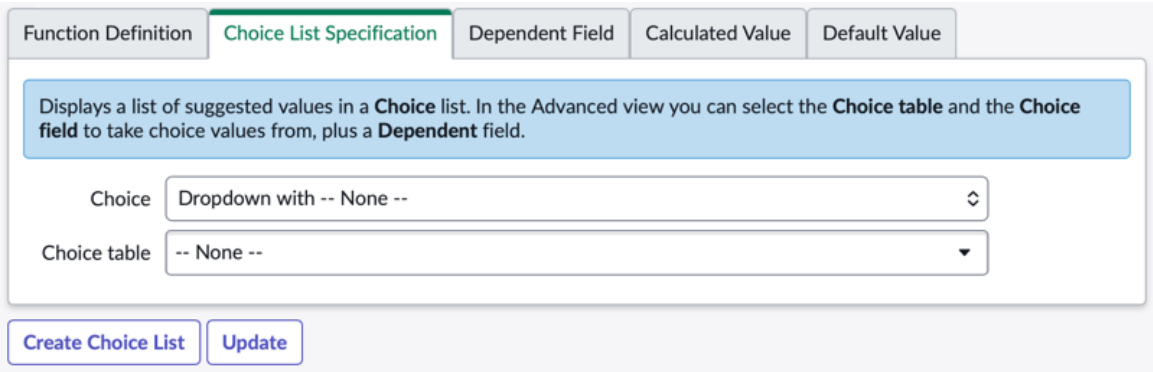
   For example, on the incident table, the **Subcategory** is dependent on the **Category**. To customize which subcategory choices are available for the hardware category, select **Hardware** in the **Category** field.

3. Right-click the field label and select **Configure Choices**.
4. Use the slushbucket to rearrange the order, add, or remove items or to create new items.
5. Click **Save**.

   To dynamically add items to a choice list, use the `addOption` GlideForm method .

   Note: Some business rules may be affected by changes to choice list options (for example, default Incident states).

Reuse a choice list



After defining a set of choice list values, you can reuse the values for another field in a different table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

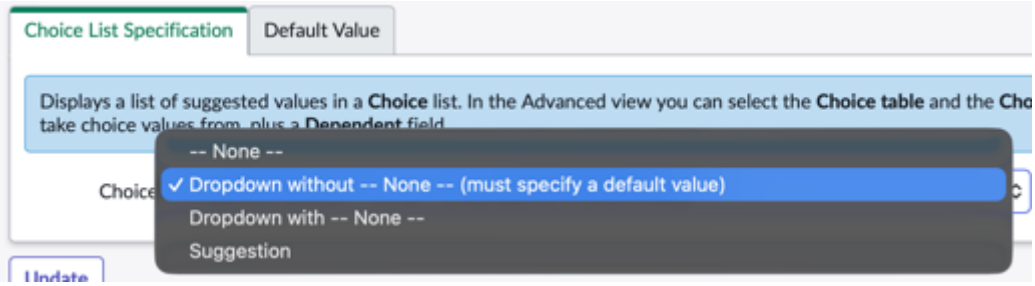
Before you begin
Role required: personalize_choices

Procedure

1. Right-click an existing choice field (Field A) and select **Configure Choices**.
2. Add the desired choice list values in the **Choices** related list.
3. To reuse the choice list values for another field (Field B) in a different table, right-click the label for Field B and select **Configure Dictionary**.
4. In the **Choice table** field, select the table where Field A resides.
5. In the **Choice field** field, select Field A.

6. Click **Update**.

   The choice list values defined on Field A are displayed on Field B. When you add or remove choice list values on Field A, those changes are also reflected on Field B. After you specify a choice table and a choice field, the field no longer uses the defined choice list.



Remove the None option from a choice list

You can remove the **None** option from a choice list if it is not necessary.

Before you begin
Role required: personalize_dictionary

Procedure

1. Navigate to a form where the field appears.
2. Right-click the field label and select **Configure Dictionary**.
3. Change the **Choice** field value to **Dropdown without -- None -- (must specify a default value)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Ensure that the **Default** field is populated to determine which choice is displayed by default.

Note: If the field is dependent on another field, the **-- None --** option remains available.

Change the None display value for a choice list

You can change the default display label of the **None** option for a choice field.

Before you begin

Role required: personalize_choices

Note: The personalize_choices role must be explicitly granted to the user; it cannot be an ACL.

Procedure

1. Navigate to a form on which the field appears.
2. Select and hold (or right-click) the field label and select **Show Choice List**.
3. Select **New**.
4. Complete the form.

Choice form fields

Field	Value
Table	Select the table.
Element	Leave the name of the field that is automatically populated.
Language	Enter ISO language code for the label.
Sequence	Leave empty. This field determines the order.
Inactive	Leave cleared.
Label	Enter the label to appear in the choice list. You can use JavaScript, including calls to script includes, to define the label. For example, the JavaScript label in the following example changes the **-- None --** value of the **Time zone** choice list in a user record to use the time zone value of the instance: `javascript:"System (" + gs.getSysTimeZone() + ")"`
Value	Enter `NULL_OVERRIDE`. **Note:** You must enter `NULL_OVERRIDE` as the value, or the new label appears in addition to the **-- None --** option.
Dependent value	Leave empty.
Hint	Leave empty. **Note:** When field type is set to **List (Glide List)** the hint won't display.

5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete all choice list options

You can delete all choices for a choice field from the Choice Set record.

Before you begin
Role required: personalize

About this task
You may want to use this method when you are developing a new application and the business requirements change. If you are updating a choice list that is already in use, consider deactivating the options you no longer use to avoid conflicts with existing data or scripts that may rely on the previous options.

Procedure

1. In the navigation filter, enter `sys_choice_set.list` and press Enter.
2. Open the choice set record for the field.

   For example, to locate the choice set for the incident subcategory, filter by **[Table] [is] [incident] AND [Element] [is] [subcategory]**.
3. Check the box beside the choice set record to delete and select **Delete** from the Actions choice list below the list.
4. Click **Delete** in the confirmation window.
   All choices for the field are deleted.

Create a choice list for another field type

You can create a choice list for a field with another type, such as an integer, string, or reference field.

Before you begin
Role required: personalize_dictionary

About this task
You can use this configuration to standardize data entry and limit available options for a field while still maintaining the original field type.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Open the dictionary entry for the field.

   Note: Reference fields with a large number of records in the reference table cannot be converted to look like choice fields. A reference field with too many records reverts to looking like a reference field.
3. Change the **Choice** value to **Dropdown with --- None ---** or **Dropdown without --- None --- (must specify a default value)**.
4. Right-click the form header and select **Save**.
5. Click **Create Choice List**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Choices** related list appears on the dictionary entry form.
- If records on the table contains data for the field, a choice list value for each unique field value is created. For example, if three records exist on the table and each record has a unique value in the field, then three choices are created.
- If no data exists in the field, a choice list value of **-- New choice --** is created.

Display invalid choice list values

By default, inactive or invalid choice list values appear in blue text instead of black. You can disable the color indicator for invalid choices.

Before you begin
Role required: admin

About this task
In the following example, the **Network** category has been deactivated, so it appears in blue for records that still contain the inactive value.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Activate the check box for the **Display missing choice list entries** property.

Add search option to a choice field

Add a search field to choice fields that have a long list of options.

Before you begin
Role required: admin

Procedure

1. Navigate to a form that contains choice fields.
   For example, incident.
2. From a choice field on the form, for example State, right-click the field and select **Configure Dictionary**.
3. Switch to the advanced view for the dictionary entry form using the context menu by navigating to **View** > **Advanced**.
4. In the Attributes field, type `is_searchable_choice=true`.
   If there are other entries in the attributes field, use a comma to separate the entries.
5. Update the Dictionary Entry form and reload the page containing the choice list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Condition field types

A condition field specifies when to run business logic such as a business rule or workflow.

There are two types of condition field.

Condition field types

Condition field type	Description
Condition string	A text field that accepts a plain JavaScript condition statement. The system validates the condition syntax for correctness before an update.
Conditions	A field that adds a condition builder to a form. Condition builders require specifying a dependent field whose values the system uses to display choice list options. Typically, the dependent field is the **Table** field.

The system evaluates both types of condition field to determine if the conditions are true or false. When true, the system runs the business logic. When false, the system ignores the business logic.

To find dictionary attributes that affect condition fields, see Altering tables and fields using dictionary attributes.

Add the condition count to a condition field

The condition count widget can be activated on condition fields to display a preview of the records that would meet the current set of conditions. For fields where the condition count is activated, the number of records that match the conditions will automatically display. The count refreshes if the field the condition field depends on, such as Table, is changed. If the Table field is left empty, the widget is hidden.

Before you begin

Role required: personalize_dictionary

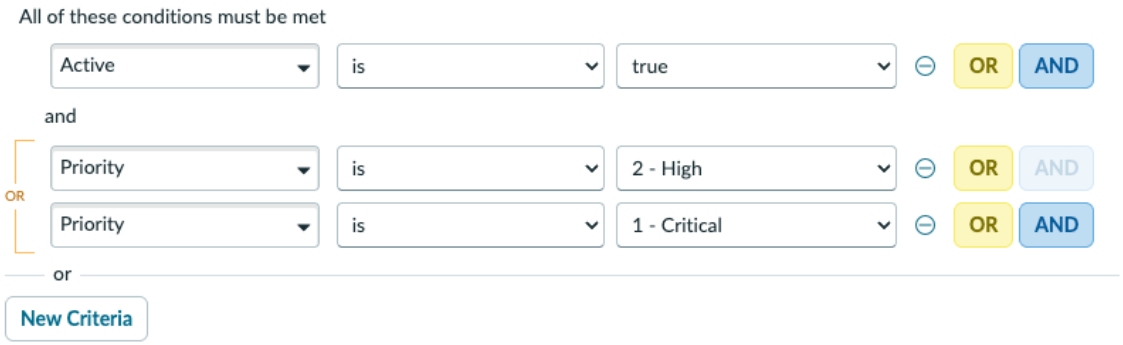
Procedure

1. Select and hold (or right-click) the field label, then select **Configure Dictionary**.
2. To the **Attributes** field, add `show_condition_count=true`.
3. Select Submit.

Update a conditions field to use condition builder v2

In Core UI, you can update a conditions field to display the version 2 condition builder.

Before you begin



Role required: admin

About this task

You add a dictionary attribute to the Conditions field to enable condition builder version 2 (v2).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Condition builder v2 enabled on a form

Procedure

1. Open the form with the condition builder to configure.
2. Right-click the **Conditions** label and click **Configure Dictionary**.
3. In the **Attributes** field, enter `condition_builder=v2`.
   If attributes exist, add this string at the end separated by a comma.
4. Select **Update**.
   The form reloads with the v2 version of the condition builder.

Database field type

Several field types are available in the system.

This table shows field types and corresponding MySQL database types. Typically, it isn't necessary to perform any actions at the database level. To learn about changing a field type, see System dictionary.

Database field types

Field types	Options	Dictionary XML type	MySQL DB type
String	small	string	VARCHAR(40)
String	medium	string	VARCHAR(100)
String	large	string	MEDIUMTEXT
String	extralarge	string	MEDIUMTEXT
Decimal		decimal	Decimal (15,2) older instances may have (12,2)
Integer		integer	Integer
True-False		boolean	TINYINT(1)
Date		glide_date	DATE
Date-Time		glide_date_time	DATETIME
Time		glide_time	DATETIME
Duration		glide_duration	DATETIME
Choice		string	VARCHAR(40)
Suggestion		string	VARCHAR(40)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Database field types (continued)

Field types	Options	Dictionary XML type	MySQL DB type
Journal		journal	MEDIUMTEXT
Reference	<reference table>	reference	VARCHAR(32)
List		glide_list	MEDIUMTEXT
Url		url	MEDIUMTEXT
Image		user_image	VARCHAR(40)
Due-Date		due_date	DATETIME

Note: An example of option types is as follows:

- A string field defined in the platform with a max length of 40 characters → VARCHAR(40).
- A string field defined in the platform with a max length of x, where x = 41-255 characters, inclusive → VARCHAR(x) [examples: String 42 is VARCHAR(42) and String 211 is VARCHAR(211)].
- A string field defined in the platform with a max length of 256 and upwards → MEDIUMTEXT.

Dictionary entry data types

You can only change a dictionary entry's data type when the change does not result in data loss. Use the following guidelines to change a dictionary entry's data type.

Valid data type changes

Condition	Restrictions
The field is empty in all table records.	None. You can convert an empty field from any data type to another without restriction.
The table contains existing data for the field.	You can only convert between logical data types that map to the same physical data type in the database. For example, you can convert a glide duration to a glide datetime since both logical data types map to the DATETIME physical data type in the database.
The field is a string field you are converting to another type of string field.	You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.
The field is a string field you are converting to a globally unique ID (GUID).	You can only convert a string field to a GUID if all of the exiting data in the field are already **Sys ID** values.
The field is a GUID field you are converting to a string field.	None. You can convert a GUID field to a string field without restriction.

Document ID field

You can create document ID fields to reference any record on any table.

Before you begin

Role required: personalize_dictionary

About this task

In comparison, a reference field references a record on a specific table. To reference records from any table, two fields need to work together—one to store the table reference and another to store the record reference.

You can select the document ID type when creating a new field.

Procedure

1. Navigate to the form view for the table.
2. Right-click the header and select **Configure** > **Form Layout**.
3. Create a field to store the table name and click **Add**.
   - **Name**: Any label (for example, `Model table`)
   - **Type**: String
4. Create a field to store the record reference and click **Add**.
   - **Name**: Label for your document ID field (for example, `Model ID`)
   - **Type**: Document ID
5. Click **Save**.
6. Right-click the form header and select **Configure** > **Dictionary**.
7. Open the dictionary entry for the document ID field.
8. Under **Related Links**, click **Advanced view**.
9. In the **Dependent** field, enter the column name of the table reference field (for example, `u_model_table`).
10. **Optional:** In **Attributes**, add the *`show_all_tables`* dictionary attribute to display system tables.
11. Click **Update**. When users click the reference lookup for the document ID field, a dialog appears that allows them to select the table and then the record. The sys_id of the selected record is stored in the document ID field and the table name is stored in the table reference field.
12. **Optional:** Configure the form to remove the table reference field.

Configuring the form layout

Altering tables and fields using dictionary attributes

Dynamic attribute store field type

The dynamic attribute store field type stores one or more dynamic attributes and their values.

You can describe a record by capturing one or more dynamic attribute-value pairs as string objects in a dynamic attribute store field. For details on defining a flexible schema and creating a dynamic attribute store field to capture attributes and their values, see Dynamic Schema.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also simply capture attribute-value pairs on a record by adding a dynamic attribute store field to a table and populating the field with string data using the Glide API. After populating the field with string data, you can query the field just like any string field.

When configuring a dynamic schema, you can create a relationship between a dynamic attribute store field and a dynamic schema reference field. You can make the dynamic attribute store field dependent on the dynamic schema reference field.

Function field

Create function fields and scripts in the ServiceNow AI Platform to perform common database transformations and calculations.

Regular fields store a value in the database. Instead of storing data, a function field displays the results of a database query. Function fields do not have an associated database column. Instead, function fields generate a value based on simple computations of other fields and constants. They can be used like any other fields in the system: in forms, lists, query conditions, reports, data visualizations, and so on.

Warning: A function field that references another function field in the function will result in an error. Function fields don't hold data or evaluate in run-time.

Example: Use case

You want to identify all incidents with a probably useless short description of fewer than 10 characters.

Instead of querying all records to determine which record meets a given criteria, create a function field or function script that retrieves only the records that meet the criteria.

For a simple computation, it is better to use a function field or function script rather than store a computed value. The value is always calculated on retrieval. Another benefit of using function fields is that the database server performs the transformation rather than the application node.

Function fields versus calculated fields

The values of the calculated fields are stored in the database. The values of function fields or function scripts are not stored in the database, but are calculated at the time of retrieval. Function field values are always up to date.

Function fields versus business rules

Use function fields or scripts when business logic is based on a simple transformation of one or more existing fields. Function fields and scripts let you implement business logic without storing and maintaining the result of a transformation.

Function fields versus filters, query strings, and Rhino

Rather than calling Rhino to perform string transformations, you can use a function field or function script to perform the transformations for you. Function fields and function scripts are more efficient and result in up-to-date values that do not have to be stored or maintained.

Function field limitations

Because function field calculations are not stored in the database, some operations are not relevant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

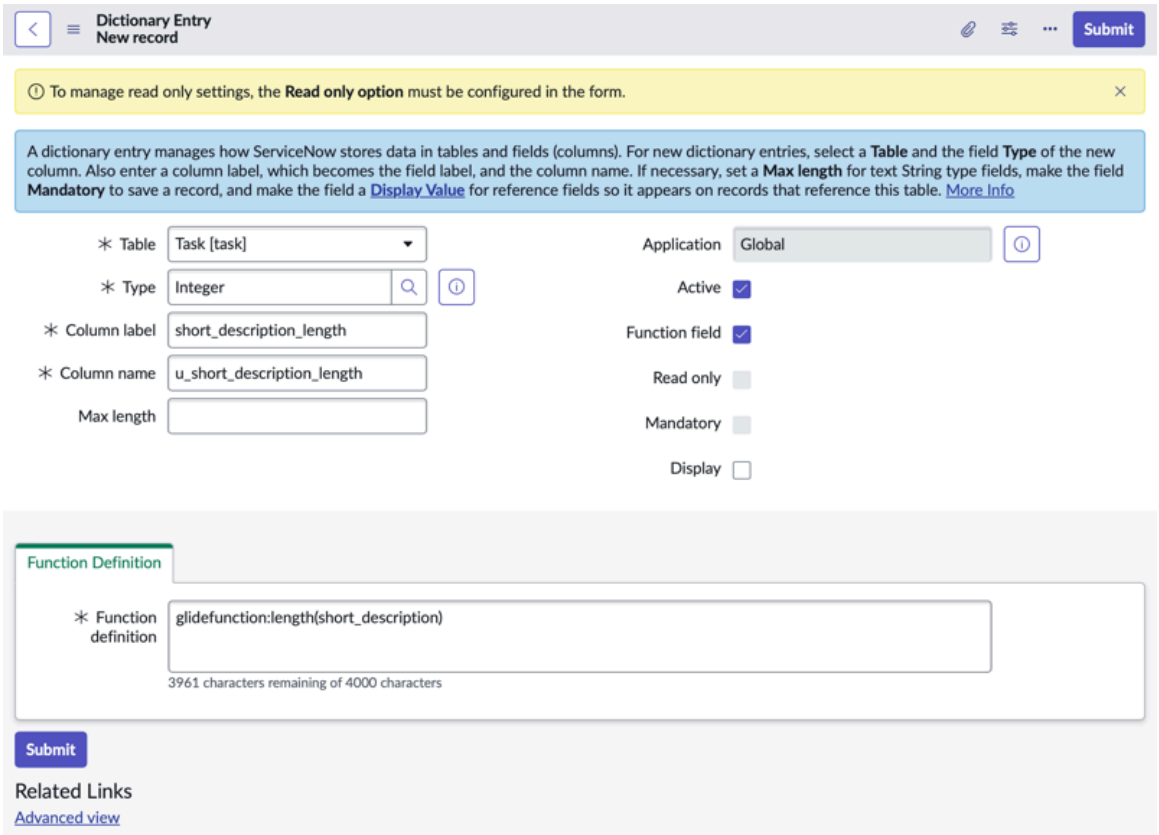
- Function fields cannot be directly audited or indexed.

  Note: To index a function field as if it were a regular field, make sure the individual fields used by the function are indexed. Or for best performance, make sure that there is a composite index including all fields that are used in the function.

- Function fields cannot be encrypted, since a function field value is never stored in the database.
- Function fields cannot be converted to regular fields or vice versa.
- Function fields that you create in the Reporting UI do not support dot-walking. For more information, see Configure function fields in Reporting.
- Security is evaluated on the components of the function and on the calculated value of the field. When used in visualizations, sections that contain information that the user is not permitted to see are hidden from the user.
- Field function names must be unique.

Defining platform functions

Platform functions can be defined in two ways:



1. Use the following application programming interfaces (APIs) to build and use functions in a script.

   Function APIs

APIs	Description
Scoped GlideDBFunctionBuilder	Construct the function to perform a SQL operation.
GlideRecord - addFunction(Object function)	Apply the function to a GlideRecord.
GlideDBFunctionCaseBuilder - Global	Build case statements.

2. Create a field that holds the function definition, as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the **Function field** check box on the Dictionary Entry [sys_dictionary] form. This action specifies that the field runs a function rather than stores a value.

glidefunction operations

Function fields can perform the following operations using the `glidefunction:<operation>` syntax. When providing a field as an argument, you can dot-walk to related fields. For example, `cmdb_ci.name`.

Note: The function field type must be compatible with the return type of the glide function. For example, integer, longint, string, and so on. If the returned type cannot be converted to the dictionary type, you get exceptions.

Function field operations

Operation	Description	Example
add()	Takes two number fields as input, adds them, and returns the results as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	*glidefunction:add(child_incident parent_incident)* Returns 6 if the incident has five child incidents and one parent incident. Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Function field operations (continued)

Operation	Description	Example
`coalesce()`	Takes any number of comma-separated fields as input and returns the first non-empty value.	`glidefunction:coalesce(closed_at resolved_at, sys_updated_on)` If the value of closed_at is empty, the function returns the value of resolved_at. If the value of resolved_at is also empty, the function returns the value of sys_updated_on. Return type: Text
`concat()`	Takes any number of comma-separated fields and constants as input, concatenates the input, and returns a single string as a field value.	`glidefunction:concat(incident_nu '/', short_description)` Returns "INC0001 / My client needs a new laptop." if the value of the number field is 'INC0001' and the short_description is 'My client needs a new laptop'. Return type: Text
`datediff()`	Takes two date/time fields as input, calculates the difference between the dates in days, minutes, and seconds, and returns the results as a duration field value.	`glidefunction:datediff(closed_at sys_created_on)` Returns the duration of an incident from the creation date to the close date. Example result: 10 days, 8 hours 23 minutes 11 seconds Return type: Duration
`dayofweek()`	Takes two arguments: A date field and a constant of either `'1'` (week starts on Sunday) or `'2'` (week starts on Monday). Returns the results as an integer value that represents the day of the week. The `dayofweek()` function uses UTC dates, but adjusts comparison values based on the instance's time zone.	`glidefunction:dayofweek(resolved '1')`. If resolved_at occurs on a Wednesday, returns 4 if the integer is 1 and returns 3 if the integer is 2. Return type: Whole number

Function field operations (continued)

Operation	Description	Example
`distance_sphere()`	Takes two locations and returns the distance between them in meters.	• `glidefunction:distance_sphere( '51.473584', '80.206458', '25.767242')` Returns the distance between the two sets of longitude and latitude pairs. • `glidefunction:distance_sphere(u '80.206458', '25.767242')` Returns the distance between the u_location geo point field and the longitude and latitude coordinates. • `glidefunction:distance_sphere(l location2)` Returns the distance between the location1 and location2 geo point fields. • `glidefunction:divide(distance_s '-0.189937', '51.473584'), '1000')` Returns the distance between the location1 geo point field and London in kilometers. Return type: Decimal
`divide()`	Takes two number fields as input, divides the first by the second, and returns the result as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	`glidefunction:divide(u_num2,u_nu` Returns 5 if num2 = 10 and num1 = 2. Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number
`get_latitude()`	Takes any geo point column or numeric field or numeric constant and converts it to a valid latitude value within the [-90,90] range.	• `glidefunction:get_latitude(u_ge` Returns the latitude value in the u_geo_point_field. • `glidefunction:get_latitude(u_nu` the latitude value in the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Function field operations (continued)

Operation	Description	Example
		u_numerical_column within [-90,90] range. • `glidefunction:get_latitude('305` Returns -54.232758 latitude value. Return type: Floating point number
`get_longitude()`	Takes any geo point column or numeric field or numeric constant and converts it to a valid longitude value within the [-179,180] range.	• `glidefunction:get_longitude(u_g` Returns the longitude value in the u_geo_point_field. • `glidefunction:get_longitude(u_numerical_column)` Re the longitude value in the u_numerical_column within [-179,180] range. • `glidefunction:get_longitude('38` Returns 20.206458 longitude value. Return type: Floating point number
`greatest()`	Takes two or more values as input and returns the greatest value of the list of arguments.	`glidefunction:greatest(10,100,10` Returns 1000 Possible numeric return types: Decimal, Floating Point Number, Large Whole Number, Whole Number This function also works with date and string fields.
`least()`	Takes two or more values as input and returns the lowest value of the list of arguments.	`glidefunction:least(10,100,1000)` Returns 10 Possible numeric return types: Decimal, Floating Point Number, Large Whole Number, Whole Number This function also works with date and string fields.
`length()`	Takes a string field as input, calculates the field length in characters, and returns the results as a field value.	`glidefunction:length(short_descr`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Function field operations (continued)

Operation	Description	Example
		Returns 37 if short_description = "This application is performing a test". Return type: Whole number
`multiply()`	Takes two number fields as input, performs the multiplication, and returns the results as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	`glidefunction:multiply(u_num1, u_num2)` Returns 48 if num1 = 8 and num_2 = 6. Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number
`position()`	Takes two text fields or two text fields and a whole number as input. One or both of the text fields can also be strings. **1.** Returns the position of the first occurrence of the string of the first text field in the second. **2.** If a whole number is specified, this function returns the position of the second text field after the position of the whole number. Returns 0 if the first text field is not present in the second (after the position of the whole number if specified).	• `glidefunction:position('e',shor` If the value of the short_description field is "This computer is performing an upgrade", returns 12. • `glidefunction:position('e',shor` If the value of the short_description field is "This computer is performing an upgrade", returns 19. Return type: Whole number
`substring()`	Takes a text field and two whole numbers as input. Returns the first instance of a string that starts at the position of the first whole number and is the length of the second.	`glidefunction:substring(short_de '7', '2')` If the value of the short_description field is 'We're going to the store', returns 'go'. Return type: Text
`subtract()`	Takes two number fields as input, subtracts the second from the first, and returns the result as a field value.	`glidefunction:subtract(u_num1, u_num2)` Returns 2 if num1 = 8 and num_2 = 6.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Function field operations (continued)

Operation	Description	Example
	This function also takes numerical values for either input. Place numerical values in single or double quotation marks.	Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number
`to_geopoint()`	Takes latitude and longitude columns or numerical values and converts them to a geo point column.	• `glidefunction:to_geopoint(u_lon u_lat_column)` Converts the latitude and longitude columns into a single geo_point column. • `glidefunction:to_geopoint('80.2` Returns a geo_point field with the coordinates "(80.206458, 25.767242)". Return type: Geo point

Create a function field to perform database functions

Create a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Test in a subproduction instance before deploying to a production instance.

Before you begin

Role required: personalize_dictionary or admin.

Procedure

1. Navigate to **All** > **System Definition** > **Dictionary**.
2. Click **New**.
3. Select **Function field**.
4. Fill in these fields on the form.

Fields for function fields

Field	Description
Table	Table to which the function field is added.
Type	Species the type of field: string, number, date, and so on.
Column label	Defines the label for the column.
Column name	Defines the name of the column. Created automatically based on **Column label**.
Max length	Defines the maximum length of the return value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Function field	If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Once the new function record is saved, you cannot clear the check box to make the field a regular field.
Function definition	Defines the function that the field performs. Starts with `glidefunction:`, followed by the operation to be performed (for example, `concat`), followed by function parameters. Constants must be enclosed in single quotes. For example, the following function definition creates a field that shows the short description, followed by a space, followed by the caller name: `glidefunction:concat(short_description, ' ', caller_id.name)` **Note:** Function parameters support dot-walking. See Dot-walking to data in related tables.

5. Click **Submit**.
   You return to the Dictionary Entry [sys_dictionary] table.
6. Navigate to the table to which you added the function field.
7. Add the function field to the list.
   See Configure items on forms or in lists using a list collector.

Result

Use the function field like any other field. For example, add it to a form, use it in a filter, or use it in the condition builder.
If the function definition is invalid, instead of the expected value you receive the message **Invalid function** if the function field is a string type field, or an empty value for other field types.

Geo point field type

The geo point data type stores longitude and latitude coordinates.

You can store longitude and latitude coordinates by adding a geo point data type field to any table. For example, you can define a geo point field to store a longitude and latitude pair to help technicians find the location of a part in a warehouse.

Function fields provide several glidefunction operations for working with geo point fields.

- Calculate the distance between geo points using distance_sphere() in a function field and use it to order records in a list based on how far away the warehouse is. For example:

```
glidefunction:distance_sphere(geopointField1, geopointField2)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Convert longitude and latitude columns to a geo point field using get_longitude() and get_latitude() in a function field. For example:

```
glidefunction:get_latitude(u_geo_point_field)
```

```
glidefunction:get_longitude(u_geo_point_field)
```

- Convert a geo point field or any valid numeric values or columns into longitude and latitude columns or values using to_geopoint() in a function field. For example:

```
glidefunction:to_geopoint(u_long_column, u_lat_column)
```

See Function field.

Values for geo points are in longitude, latitude format where:

- Both longitude and latitude are restricted to 6 decimal places of precision. For example, “80.206458”, “25.767242”.
- The longitude range is [-180, 180].
- The latitude range is [-90, 90].
- Values entered outside the ranges for longitude or latitude are normalized to values inside their respective ranges.

HTML field editors

An HTML field enables you to insert HTML content directly, which is useful for rich text or custom HTML content within forms. An HTML editor provides simple functionality and HTML source mode editing.

The HTML field editors available depend on your version of the UI.

UI support for available HTML field editors

HTML field editor	UI support
TinyMCE version 8.3.0	Core UI, configurable workspace
htmlArea (legacy)	Basic support in Core UI

Knowledge articles, service catalog item descriptions, release documentation, email clients, and HTML content blocks are common examples of entities using HTML field editors.

Note: The TinyMCE v8.3.0 editor doesn't support converting Microsoft Word shapes or nested lists with custom icons into HTML.

While HTML fields can be added to split pane forms, they can behave unexpectedly because of the limited width available in split pane forms.

If accessibility is enabled, a help icon appears with the HTML field. The help icon indicates how to use keys to access and escape the HTML field toolbar.

Configure a field editor for the HTML field

Configure HTML fields to use TinyMCE or the legacy htmlArea editor. The TinyMCE editor provides better stability and more editing functions than the legacy htmlArea editor.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

There are two options for HTML editors:

- TinyMCE: A field that displays text as readers would see it on the screen. TinyMCE is the default editor.
- htmlArea: The legacy editor, which offers a more basic interface as well as a mode that shows only HTML markup.

Note: htmlArea only works in Core UI, not configurable workspace.

Procedure

1. Navigate to **All** > **System Properties** > **UI Properties**.
2. Locate the **HTML field editor to use** property (*glide.ui.html.editor*).
3. Select **TinyMCE** or **htmlArea**.
4. Select **Save**.

Configuring system properties for TinyMCE HTML editor

There are multiple system properties that are used to configure the behaviour of the HTML editor field type. Learn about the system properties available in the TinyMCE rich text editor.

HTML system properties in TinyMCE

System properties for TinyMCE HTML editor	Type	Description
glide.ui.html.editor.valid_plugins	String	Client-side HTML editor plugins that CAN BE added/or used (spaced delimited). **Important:** Removing plugins could cause undesirable side-effects.
glide.ui.html.editor.enabled_plugins	String	Client-side HTML editor plugins that should be added (spaced delimited) in order for them to get enabled on the widget. Only plugins added in glide.ui.html.editor.valid_plugins can be added. Removing plugins could cause undesirable side-effects.
glide.ui.html.editor.toolbar.valid_buttons	String	A valid (supported) button list for html fields. Use this to limit what buttons CAN BE added to the toolbar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTML system properties in TinyMCE (continued)

System properties for TinyMCE HTML editor	Type	Description
glide.ui.html.editor.toolbar	String	Configures the editing toolbar for HTML fields. This is a space-separated list without commas. Only valid buttons added in glide.ui.html.editor.toolbar.valid_buttons can be added.
glide.ui.html.editor.paste.html_import	Choice list	Paste formatting behavior for HTML. This setting controls how content from sources other than Microsoft Word is filtered when being pasted on html-editor. Note that this includes content copied from TinyMCE itself. The supported values are: • Clean: Preserves the structure of the content such as headings, tables, and lists but remove inline styles and classes. This results in simple content that uses the site's CSS stylesheet while retaining the semantic structure from the original document. • Merge: Preserves the inline formatting and structure of the original document. Invalid and proprietary styles, tags and attributes are still removed ensuring that the HTML is valid while more closely matching the original document formatting. • Prompt: Prompts the user to choose between the clean and merge options after attempting to paste HTML content.
glide.ui.html.editor.paste.word_import	Choice list	Paste formatting behavior for word. This setting controls how content from Microsoft Word is filtered when being pasted on html-editor. Note

HTML system properties in TinyMCE (continued)

System properties for TinyMCE HTML editor	Type	Description
		<pre> Andale Mono=andale mono,times; Arial=arial,helvetica,sans-serif; Arial Black=arial black,avant garde; Book Antiqua=book antiqua,palatino; Comic Sans MS=comic sans ms,sans-serif; Courier New=courier new,courier; Georgia=georgia,palatino;Helvetica=helvetica; Impact=impact,chicago;Symbol=symbol; Tahoma=tahoma,arial,helvetica,sans-serif; Terminal=terminal,monaco; Times New Roman=times new roman,times; Trebuchet MS=trebuchet ms,geneva; Verdana=verdana,geneva; Webdings=webdings; Wingdings=wingdings,zapf dingbats; </pre>
glide.ui.html.editor.paste.filtered_inline_elements	String	This setting allows the content to be filtered when pasted from MS Word to the TinyMCE V6 editor. This property takes input as a comma separated string of inline elements to be filtered by selecting the **Remove formatting** button on the paste prompt dialog. Default value is 'strong, b'.
glide.ui.html.editor.convert_urls	True | False	This system property is used to set the convert_urls config of TinyMCE. Default: false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTML system properties in TinyMCE (continued)

System properties for TinyMCE HTML editor	Type	Description
		Note: This is related to the value of relative_urls which itself is set by glide.ui.html.editor.relative_urls.
glide.ui.html.editor.extended_valid_elements	String	This system property is used to set the extended_valid_elements config of TinyMCE. Default: <Empty string>.
glide.ui.html.editor.relative_urls	True | False	glide.ui.html.editor.relative_urls is used to set the relative_urls config of TinyMCE. Default: true. **Note:** This is related to the document_base_url which is not configurable in ServiceNow and is set to the window.location.origin (the base url of the instance).
glide.ui.html.editor.contextmenu	String	Controls the context menu options available in the HTML editor. The default value is `false`, which displays the browser context menu when you press Ctrl and right- click. To display the HTML editor context menu, set the value to `link image table`.
glide.ui.html.editor.toolbar.on.focus	String	True: User should be able to see hide toolbar behaviour if they move focus out. False: User should always see the toolbar regardless of the tab focus. **Note:** This property isn't added OOTB (out of the box) but can be added by an admin.

HTML system properties in TinyMCE (continued)

System properties for TinyMCE HTML editor	Type	Description
glide.ui.html.editor.default_link_target	Choice list	This system property is used to set link_default_target.
glide.ui.html.editor.textpatterns	String	Takes an array of objects used to configure text patterns for HTML editor on forms. Use this property to enable or disable text patterns for formatting, text replacement, or command execution in HTML editor. For more information, see TinyMCE text patterns documentation.

Configuring plugins for the TinyMCE HTML editor

The TinyMCE HTML editor is a powerful, flexible, and customizable rich text editor. You can configure and extend the editor by using plugins.

Plugins supported in the TinyMCE HTML editor

Plugin name	Description
a11ychecker	Allows you to check the HTML in the editor for various WCAG & Section 508 accessibility problems. It has an auto-repair feature that lets the user fix identified problems.
accordion	Enables the creation of sections in a document that can be expanded or collapsed to show or hide additional content.
advlist	Extends the core bullist and numlist toolbar controls by adding additional CSS list-style-type styled number formats and bullet types to the controls.
align_listitems	Confirms that bullets and numbers are aligned along with the content.
anchor	Adds an anchor/bookmark button to the toolbar that inserts an anchor at the editor's cursor insertion point. It also adds the menu item anchor under the Insert menu.
autolink	Creates hyperlinks automatically when you enter a valid, complete URL. For example, `www.example.com` is converted to `http://www.example.com`.
autoresize	Resizes the editor to the content inside it automatically. It's typically used to help prevent the editor from expanding infinitely as you enter text into the editable area.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins supported in the TinyMCE HTML editor (continued)

Plugin name	Description
charmap	Adds a dialog to the editor with a map of special unicode characters, which can't be added directly from the keyboard.
codemirror	Provides a more advanced code editor than the default text area.
codesample	Insert and embed syntax color highlighted code snippets into the editable area. It also adds a button to the toolbar that opens a dialog box to accept raw code input.
directionality	Adds directionality controls to the toolbar, enabling TinyMCE to better handle languages written from right to left. It also adds a toolbar button for each of its values, ltr for left-to-right text and rtl for right-to-left text.
editimage	Adds editing capabilities for images within the TinyMCE editable area.
emoticons	Adds a dialog to the editor that lets you insert emoji into the TinyMCE editable area.
formatpainter	Enables copying and applying formatting-including font style, size, and table styles-between locations within the TinyMCE editable area, supporting various formats like inline and block styles.
fullscreen	Adds full screen editing capabilities to TinyMCE. When you press the toolbar button, the editable area fills the viewport of the browser.
help	Allows users to check the handy shortcuts, keyboard navigation for accessibility and TinyMCE.
image	Enables you to insert an image into the TinyMCE editable area.
insertdatetime	Provides a toolbar control and menu item that lets you insert the current date and time into the editable area at the cursor insertion point.
link	Enables you to link external resources, such as website URLs, to selected text in their document.
lists	Enables you to add numbered and bulleted lists to TinyMCE. To enable advanced lists, such as alpha numbered lists and square bullets, you should also enable the Advanced List (advlist) plugin.
media	Lets you add HTML5 video and audio elements to the editable area.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins supported in the TinyMCE HTML editor (continued)

Plugin name	Description
nonbreaking	Adds a button for inserting nonbreaking space entities such as at the cursor insert point. It also adds a menu item Nonbreaking space under the Insert menu drop-down list and a toolbar button.
pagebreak	Adds page break support and enables you to insert page breaks in the editable area. This ability is useful where a CMS uses a special separator to break content into pages.
preview	Adds a preview button to the toolbar that opens a dialog box showing the current content in a preview mode.
readonlynoborder	Enables a read-only mode for HTML field types.
searchreplace	Adds search and replace dialogs to TinyMCE.
table	Adds table management functionality to TinyMCE , including dialogs, context menus, context toolbars, menu items, and toolbar buttons.
tableofcontents	Generates a basic table of contents (ToC) and inserts it into the editor at the cursor insert point. ToC entries are generated from header elements in the content.
visualblocks	Enables you to see block-level elements in the editable area.
visualchars	Adds the ability to see invisible characters like in the editable area.
wordcount	Adds the functionality for counting words to the TinyMCE editor. **Note:** This plugin is no longer supported in workspaces.
powerpaste	Cleans up content from Microsoft Word, Microsoft Excel, Google Docs, and HTML sources automatically to create clean content that matches the look and feel of the site.

Note: Adding a custom plugin to the valid plugins can cause unexpected results.

Change the TinyMCE HTML editor plugins

Configure the TinyMCE plugins in our workspaces.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for and select the plugin (glide.ui.html.editor.enabled_plugins).

Plugins for TinyMCE HTML editor

Type	Plugins
Default value	**Note:** The **value** field displays the default plugins that are enabled in the TinyMCE editor. ○ accordion ○ advlist ○ align_listitems ○ anchor ○ autolink ○ autoresize ○ charmap ○ codemirror ○ codesample ○ directionality ○ editimage ○ emoticons ○ formatpainter ○ fullscreen ○ help ○ image ○ insertdatetime ○ link ○ lists ○ media ○ nonbreaking ○ pagebreak ○ preview ○ readonlynoborder ○ searchreplace ○ table ○ tableofcontents ○ visualblocks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Plugins
	○ visualchars ○ wordcount
Available plugins	**Note:** The **choices** field lists all available plugins. Add a plugin from the **choices** list to the **value** field in order to enable them. ○ a11ychecker ○ accordion ○ advlist ○ align_listitems ○ anchor ○ autolink ○ charmap ○ codemirror ○ codesample ○ directionality ○ editimage ○ emoticons ○ fullscreen ○ help ○ image ○ insertdatetime ○ link ○ lists ○ media ○ nonbreaking ○ pagebreak ○ preview ○ readonlynoborder ○ searchreplace ○ table ○ tableofcontents ○ visualblocks ○ visualchars ○ wordcount

Note: PowerPaste is a standard plugin that is enabled by default. Unlike other HTML plugins listed here, PowerPaste can't be added or removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Make changes (add/remove) in the available plugins property.
4. Select save.
   If there's a custom plugin added to available plugins its not recommended unless critical.

Configure the HTML toolbar

Configure which buttons are available on the HTML toolbar.

Before you begin

Role required: admin

Procedure

1. Update the toolbar options for your preferred HTML field editor.

Option	Description
htmlArea toolbar	**a.** Navigate to the System properties [sys_properties] table by entering `sys_properties.list` in the application navigator. **b.** In the **Name** column, search for `glide.ui.html.toolbar`. **c.** Select the **glide.ui.html.toolbar** property.
TinyMCE	**a.** Navigate to the System properties [sys_properties] table by entering `sys_properties.list` in the application navigator. **b.** In the **Name** column, search for `glide.ui.html.editor.toolbar`. **c.** Select the **glide.ui.html.editor.toolbar** property.

2. In the **Value** field, enter or remove buttons for each toolbar as a space-separated list without commas.

   For the TinyMCE toolbar, all the toolbar buttons mentioned in the TinyMCE button options table are available in the **glide.ui.html.editor.toolbar.valid_buttons**. You can choose from the list found there and add it to the System properties [sys_properties] **glide.ui.html.editor.toolbar**. Use a vertical bar ("|") to add a section separator.

3. Select **Update**.

What to do next

See Change the TinyMCE default toolbar for more detailed information.

Formatting functions in HTML field editors

The formatting table displays how to control the way text appears.

The following table displays icons that are available in the TinyMCE and the htmlArea editors. Names marked with an asterisk (*) aren't available with the htmlArea editor.

Formatting table

Name	htmlArea icon	TinyMCE icon	Description
A11y Checker			Allows you to check the HTML in the editor for various WCAG & Section 508 accessibility problems. `a11ychecker`
Align Center			Applies center alignment to the current paragraph. Code reference: `text-align:center`
Align Left			Applies left alignment to the current paragraph. Code reference: `text-align:left`
Align Right			Applies right alignment to the current paragraph. Code reference: `text-align:right`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Formatting table (continued)

Name	htmlArea icon	TinyMCE icon	Description
Background Color			Applies background color to the current word or selected text. Select the button to use the current color. Select **More Colors...** to view various color options and the hexadecimal codes.
Blocks			Applies the selected header or paragraph style to the current word or selected text.
*Block quote			Applies block quote format to the current block level element.
Bold			Applies bold formatting to the selected text or current word. Keyboard shortcut: CTRL + B
Bullet List			Applies or removes unordered list tags for the selected paragraphs. Select the arrow to choose a different bullet type.
Font Family			Applies a font family to the selected text or current word.
Font Size			Applies a font size to the selected text or current word.
Format painter			Applies formatting choices, including font style, size, and table styles, between locations within the TinyMCE editable area. Supports various formats like inline and block styles.
Increase Indent			Applies indentation to the current or selected paragraphs, adding 30 px of left padding. Code reference: `padding-left`
Italic			Applies italic formatting to the selected text or current word. Keyboard shortcut: CTRL + I
Justify			Applies justified alignment, which stretches the lines to be equal widths, to the selected paragraph. Code reference: `text-align:justify`
*LTR (Left to Right)			Sets the directionality of contents to from left to right.
