If your organization's security practices don't allow granting of Sites.FullControl.All permission, you can instead grant the Sites.Selected SharePoint API permission to the OAuth 2.0 application. With this permission granted, the Microsoft SharePoint Online connector can only read content, metadata, and security information for sites and site collections that the OAuth 2.0 app has FullControl permission for.

A source system administrator must grant FullControl permission for each site or site collection that you want the Microsoft SharePoint Online connector to be able to crawl. If you want to prevent the connector from crawling a site or site collection, you can revoke a previously granted FullControl permission for that site or site collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Import the SelectedSiteAppPermissionManager PowerShell module on your local system.

   a. Download the SelectedSiteAppPermissionManager PowerShell module archive from the Assign FullControl permission to sites for indexing via PowerShell (Microsoft SharePoint Online external content connector) [KB2741707] article in the Now Support Knowledge Base.

   b. Extract the downloaded archive's contents to a directory.

   c. Start a PowerShell session and navigate to the directory where you extracted the archive's contents.

   d. Verify that you have the latest version of the Microsoft Graph PowerShell SDK installed by running these PowerShell commands:

   ```
   Install-Module -Name Microsoft.Graph -Scope CurrentUser
   ```

   ```
   Update-Module -Name Microsoft.Graph -Force -Scope CurrentUser
   ```

   e. View your PowerShell module paths by running this PowerShell command:

   ```
   $env:PSModulePath -split [System.IO.Path]::PathSeparator
   ```

   f. Copy the SelectedSiteAppPermissionManager module folder from the downloaded archive into one of your PowerShell module paths by running this PowerShell command, replacing `<PowerShell-module-path>` with one of the paths reported in step 1.e.

   ```
   Copy-Item -Path "SelectedSiteAppPermissionManager"
    -Destination "<PowerShell-module-path>" -Recurse
   ```

   As an example, to copy the module folder into your personal modules folder, you might run this command:

   ```
   Copy-Item -Path "SelectedSiteAppPermissionManager"
    -Destination "$HOME\Documents\PowerShell\Modules" -Recurse
   ```

   g. Import the SelectedSiteAppPermissionManager module by running this PowerShell command:

   ```
   Import-Module SelectedSiteAppPermissionManager
   ```

   h. Verify that the SelectedSiteAppPermissionManager module is correctly imported by running this PowerShell command:

   ```
   Get-Module SelectedSiteAppPermissionManager
   ```

   The command should display information about the SelectedSiteAppPermissionManager module, including its version and supported commands.

2. Copy one of the JSON-format example configuration files found in the `SelectedSiteAppPermissionManager\Config` directory to a new `my-config.json` file, depending on which authentication method you want to use when configuring site access:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To use interactive authentication in the browser, copy `app-config-interactive.example.json` to `my-config.json`.
- To use service principal authentication with a client secret, copy `app-config.client-secret.example.json` to `my-config.json`.
- To use service principal authentication with a PFX-format certificate, copy `app-config.certificate.example.json` to `my-config.json`.

3. In a text editor, modify the JSON object literal key-value pairs in your `my-config.json` file to match your Microsoft Entra app configuration.

JSON object literal key	Value
ServicePrincipal.Authentication.Certificate.Password	Password for the PFX-format certificate used for service principal authentication. You only need this key-value pair if you're using service principal authentication with a certificate that has a password. If your certificate has no password, omit this key-value pair. Type: String
ServicePrincipal.Authentication.Certificate.Path	Relative path to a PFX-format certificate file that contains the certificate and private key for your service principal app in Microsoft Entra. You only need this key-value pair if you're using service principal authentication with a certificate. Type: String
ServicePrincipal.Authentication.Secret	Client secret for your service principal app in Microsoft Entra. You only need this key-value pair if you're using service principal authentication with a client secret. Type: String
ServicePrincipal.Authentication.Type	Type of authentication to use for your service principal. You only need this key-value pair if you're using service principal authentication with a certificate or a client secret. Type: Choice Supported values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JSON object literal key	Value
	○ *`Certificate`*: Authenticate using a PFX-format certificate. ○ *`Secret`*: Authenticate using a client secret.
ServicePrincipal.ClientId	Application (client) ID for your service principal app in Microsoft Entra. You only need this key-value pair if you're using service principal authentication with a certificate or a client secret. Type: String
ServicePrincipal.TenantId	Directory (tenant) ID for your service principal app in Microsoft Entra. You only need this key-value pair if you're using service principal authentication with a certificate or a client secret. Type: String
TargetApp.DisplayName	Display name for the OAuth 2.0 app that's registered in Microsoft Entra for the Microsoft SharePoint Online connector. For details on this app, see Configure Microsoft SharePoint Online for external content indexing. Type: String
TargetApp.Id	Application (client) ID for the OAuth 2.0 app that's registered in Microsoft Entra for the Microsoft SharePoint Online connector. For details on this app, see Configure Microsoft SharePoint Online for external content indexing. Type: String

Example configuration for interactive authentication:

```
{
    "TargetApp": {
        "Id": "your-application-id",
        "DisplayName": "Your Application Name"
    }
}
```

Example configuration for service principal authentication with PFX-format certificate:

```
{
    "TargetApp": {
        "Id": "your-application-id",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "DisplayName": "Your Application Name"
    },
    "ServicePrincipal": {
        "ClientId": "your-service-principal-id",
        "TenantId": "your-tenant-id",
        "Authentication": {
            "Type": "Certificate",
            "Certificate": {
                "Path": "path/to/certificate.pfx",
                "Password": "pfx-password"  // Optional if certificate has no password
            }
        }
    }
}
```

Example configuration for service principal authentication with client secret:

```
{
    "TargetApp": {
        "Id": "your-application-id",
        "DisplayName": "Your Application Name"
    },
    "ServicePrincipal": {
        "ClientId": "your-service-principal-id",
        "TenantId": "your-tenant-id",
        "Authentication": {
            "Type": "Secret",
            "Secret": "your-client-secret"
        }
    }
}
```

4. **Optional:** Create a site list file with all the Microsoft SharePoint Online site and site collection URLs you want to operate on for bulk operations.

   a. In a text editor, create a new file called `sitelist.txt`.

   b. Populate the new `sitelist.txt` file with the URLs for all the Microsoft SharePoint Online sites and site collections you want to view or modify permissions for, one per line.
   As an example, if you wanted to view or modify permissions for two sites at once, your file might look like this:

   ```
   https://example.sharepoint.com/sites/site1
   https://example.sharepoint.com/sites/site2
   ```

5. To view existing app permissions for specified Microsoft SharePoint Online sites and site collections, run this PowerShell command:

   ```
   Get-SharePointAppPermission
    -SiteUrls "https://example.sharepoint.com/sites/site1","https://example.sharepoint.com/sites/site2" -ConfigFile "./my-config.json"
   ```

   If you have a site list file, you can specify it with the `-SiteListFile` argument (replacing the `-SiteURLs` argument):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Get-SharePointAppPermission -SiteListFile "./sitelist.txt"
 -ConfigFile "./my-config.json"
```

Important: If you're using service principal authentication, add the `-UseServicePrincipal` argument to your command line.

6. To add FullControl permissions to specified Microsoft SharePoint Online sites and site collections, run this PowerShell command:

```
Add-SharePointAppPermission
 -SiteUrls "https://example.sharepoint.com/sites/site1","https://example.sharepoint.
com/sites/site2" -ConfigFile "./my-config.json"
```

If you have a site list file, you can specify it with the `-SiteListFile` argument (replacing the `-SiteURLs` argument):

```
Add-SharePointAppPermission -SiteListFile "./sitelist.txt"
 -ConfigFile "./my-config.json"
```

Important: If you're using service principal authentication, add the `-UseServicePrincipal` argument to your command line.

7. To remove FullControl permissions from specified Microsoft SharePoint Online sites and site collections, run this PowerShell command:

```
Remove-SharePointAppPermission
 -SiteUrls "https://example.sharepoint.com/sites/site1","https://example.sharepoint.
com/sites/site2" -ConfigFile "./my-config.json"
```

If you have a site list file, you can specify it with the `-SiteListFile` argument (replacing the `-SiteURLs` argument):

```
Remove-SharePointAppPermission -SiteListFile "./sitelist.txt"
 -ConfigFile "./my-config.json"
```

Important: If you're using service principal authentication, add the `-UseServicePrincipal` argument to your command line.

What to do next

If you remove FullControl permissions from sites or site collections that are still crawled by the Microsoft SharePoint Online external content connector, the connector will log permissions alerts when it tries to crawl content from those sites or site collections. To eliminate these alerts, ask your connector administrator to remove or exclude the affected sites and site collections from the set of sites crawled by the connector.

Create a Microsoft SharePoint Online external content connector

Create an external content connector to retrieve searchable content and security principals from your Microsoft SharePoint Online source system.

Before you begin

A source system administrator must have already configured your Microsoft SharePoint Online source system to allow access by the Microsoft SharePoint Online external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For the required source system configuration steps, see Create a public/private key pair for the Microsoft SharePoint Online external content connector and Configure Microsoft SharePoint Online for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **SharePoint Online** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Microsoft SharePoint Online external content connector.
Application (client) ID	Application (client) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft SharePoint Online source system. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Application (client) ID** field in the Essentials section. If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Application (client) ID** value.
Directory (tenant) ID	Directory (tenant) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft SharePoint Online source system. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Directory (tenant) ID** field in the Essentials section. If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Directory (tenant) ID** value.
JKS Certificate	Java KeyStore (JKS) file containing a public/private key pair generated with the Java keytool utility. These keys must match the public key from the DER-encoded binary X.509 format certificate uploaded to the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft SharePoint Online external content connector to access your source system data. If you don't have a copy of the JKS file, ask your security administrator for it. You can't download the JKS file from the OAuth 2.0 application's registration record in the Microsoft Entra portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
JKS certificate password	Password for the Java KeyStore (JKS) file specified in *JKS Certificate*. If you don't have the password for the JKS file, ask your security administrator for it. You can't retrieve the JKS certificate password from the registration record for the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft SharePoint Online external content connector to access your source system data.
JKS certificate thumbprint	Base64-encoded or hexadecimal SHA1 hash for the DER-encoded binary X.509 format public key certificate uploaded to the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft SharePoint Online external content connector to access your source system data. If you don't have this hash, ask your Microsoft Entra administrator for the SHA1 thumbprint hash for the application's DER-encoded binary X.509 format public key certificate, in either base64-encoded or hexadecimal format.
Settings for regulated markets	
Configure settings for regulated markets	Option to display *Authority endpoint* and *Graph API endpoint* settings fields.
Authority endpoint	URL for the Microsoft authorization server that you use to log in to your source system (Microsoft tenant). This field appears only when *Configure settings for regulated markets* is selected. Default value: `https://login.microsoftonline.com/` Cloud service endpoint URLs include: ○ `https://login.microsoftonline.com/`: Endpoint URL for the Microsoft 365 cloud ○ `https://login.microsoftonline.us/`: Endpoint URL for the Microsoft 365 GCC and GCC High cloud and the Microsoft 365 DoD cloud If you don't know the authority endpoint URL to use, ask your Microsoft administrator for it. **Important:** The authority endpoint URL must end with a trailing slash.
Graph API endpoint	Microsoft Graph API endpoint for your source system (Microsoft tenant). This field appears only when *Configure settings for regulated markets* is selected. Default value: `https://graph.microsoftonline.com/` Microsoft Graph API endpoint URLs include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	○ `https://graph.microsoftonline.com/`: Endpoint URL for the Microsoft Graph global service cloud ○ `https://graph.microsoftonline.us/`: Endpoint URL for the Microsoft Graph for US Government L4 cloud ○ `https://dod-graph.microsoftonline.us/`: Endpoint URL for Microsoft Graph for US Government L5 (DOD) cloud If you don't know the Microsoft Graph API endpoint URL to use, ask your Microsoft administrator for it. **Important:** The Microsoft Graph API endpoint URL must end with a trailing slash.
Validate connection settings with test crawl	Option to run a short test crawl to verify whether your connection settings and source system permissions are correctly set. For more details on validating connection settings and source system permissions with a test crawl, see Verify your connection settings and source system permissions for an external content connector. **Important:** For connectors that support user permission crawls, all searchable content and metadata indexed by the validation test crawl is public until the connector completes its first user permission crawl. This means the test crawl's content will be visible to all users of portals and search applications that the connector is linked to.

Note: The **Settings for regulated markets** connection settings aren't shown for Microsoft SharePoint Online connectors that you created in versions of External Content Connectors prior to version 4.0. Starting in External Content Connectors version 4.0, these connection settings are shown when you create a new Microsoft SharePoint Online external content connector.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Microsoft SharePoint Online external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

on this procedure and user permission settings, see Configure user permission settings for an external content connector.

10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.
12. Select **Save**.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Microsoft SharePoint Online external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure crawl settings for a Microsoft SharePoint Online external content connector

Specify the sites you want your Microsoft SharePoint Online external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Microsoft SharePoint Online external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Microsoft SharePoint Online external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Microsoft SharePoint Online external content connector crawls all sites from its specified source system. It sends all supported content types, including files and attachments with all supported file extensions, to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the sites to crawl when running content crawls
- Inclusion or exclusion filters for individual content types (sites, lists, list items, attachments, and files)
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls
- Exclusion of guest users from Entra ID when retrieving users for user mappings.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, the Microsoft SharePoint Online external content connector can index up to ten million (10,000,000) content items from its source system. When the connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When the connector's indexed content item count exceeds eight million (8,000,000) content items, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

The Microsoft SharePoint Online external content connector can handle permissions for up to five hundred thousand (500,000) users and their groups. If the connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If your Microsoft SharePoint Online connector reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Microsoft SharePoint Online external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all sites from the source system, select **Crawl all content**.
   - To crawl only a specified set of sites from the source system, select **Include only these sites**, then use the **Add URL** field and **Add** button to enter URLs for sites that you want to include in the crawl.

     For example, you might enter `https://example.sharepoint.com/sites/ProductionSite` to include only searchable content from the specified site.
   - To crawl all except a specified set of sites from the source system, select **Exclude only these sites**, then use the **Add URL** field and **Add** button to enter URLs for sites that you want to exclude from the crawl.

     For example, you might enter `https://example.sharepoint.com/sites/TestSite` to exclude searchable content from the specified site.

   Important: The connector validates access permissions for your specified sites on every crawl. If it encounters a site that it doesn't have FullControl SharePoint API permission for, it records an alert for that site. The type of event depends on whether the site in question was automatically discovered or whether it was specified in your site inclusion list.
   - If the connector automatically discovers a site that it doesn't have FullControl permission for, it records an informational alert indicating that it can't index that site.
   - If the connector doesn't have FullControl SharePoint API permission for a site in your inclusion list, it records a warning alert indicating that it can't traverse (crawl) that site.

   For details on configuring SharePoint API permissions for your Microsoft SharePoint Online sites, see Configure Microsoft SharePoint Online for external content indexing and Configure site and site collection access for the Microsoft SharePoint Online external content connector.
5. In the Content types section, deselect the options for any content types you want the connector to exclude when crawling.
   Supported content types include sites, lists, list items, attachments, and files.

   As an example, to exclude lists and list items from the connector's content crawls, deselect the **Lists** and **List items** options. You must include at least one content type.
6. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.

- To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.

7. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
8. In the Users section, to exclude guest users when retrieving users from Entra ID, deselect the **Fetch guest users from Entra ID** option.

   Note: When the **Fetch guest users from Entra ID** option is selected, the connector retrieves guest users and tenant members from Entra ID. This can significantly increase the user corpus size for user mappings and can affect performance. With the option deselected, the connector only retrieves tenant members from Entra ID. Deselect this option unless mapping guest users from Entra ID to ServiceNow AI Platform users is a requirement for the external content connector.

9. Select **Save**.

Result

The Microsoft SharePoint Online external content connector is updated with your crawl scope and file extension filter settings.

What to do next

To retrieve content from your Microsoft SharePoint Online source system using your modified crawl settings, create and run a one-time content crawl for your Microsoft SharePoint Online external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

View retrievable page content using the Microsoft SharePoint Online REST API

Review the elements of a Microsoft SharePoint Online page's content that can be retrieved by the Microsoft SharePoint Online external content connector.

Before you begin

You need the following details about each Microsoft SharePoint Online page that you want to view retrievable content for:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Your site URL. This is typically in the format `https://<tenant-name>.sharepoint.com/sites/<site-name>`, where `<tenant-name>` is the hostname for your tenant and `<site-name>` is the name of the site in which the page resides. As an example, your site URL might be `https://example.sharepoint.com/sites/my-site`.
- The `.aspx` page's filename, without the extension. As an example, if the URL for your page is `https://example.sharepoint.com/sites/my-site/SitePages/sample-page.aspx`, the page's filename is `sample-page`.

> **Note:** Microsoft SharePoint Online page filenames are case-sensitive, so copy the filename exactly as it appears in the URL field of your web browser.

Role required: none

About this task

Perform this procedure to review the contents of a Microsoft SharePoint Online page's CanvasContent1 and WikiFields metadata fields. These fields contain the static content that the connector retrieves and makes searchable in your AI Search applications.

Microsoft SharePoint Online pages are stored as `.aspx` files in a site's Site Pages library. These files include static content in their CanvasContent1 and WikiFields metadata fields, but they also include scripts that call a server-side engine to dynamically render viewable content at request time. The exact content rendered depends on user context, permissions, and web parts loaded as part of the page request.

Rendering a page's full viewable content requires an authenticated user session. The Microsoft SharePoint Online connector can't impersonate a user to trigger this rendering process. As a result, the connector cannot capture the final HTML output that a web browser would display.

For each page retrieved, the Microsoft SharePoint Online connector queries the SharePoint REST API to access the page's underlying list item. The API endpoint used is `_api/web/lists('<list-id>')/items(<item-id>)`, where `<list-id>` and `<item-id>` are dynamically substituted values. The connector retrieves content primarily from the page's CanvasContent1 and WikiFields metadata fields, and also captures the page's other metadata fields such as title, author, and modification date where available. Page content stored exclusively in dynamic web parts may be retrieved only partially or not at all, since that content doesn't exist in the list item metadata.

The upshot of this limitation is that pages built primarily with static text content authored in the Microsoft SharePoint Online editor produce searchable content that more closely matches what users see in a web browser. By contrast, pages that rely on dynamic web parts may not contain all of the content that users see in a web browser.

Procedure

1. Retrieve the ID for your site's Site Pages list.

   a. In a web browser, navigate to your Microsoft SharePoint Online tenant and log in.

   b. In the browser, navigate to `<site-url>/_api/web/lists?$select=ID,Title&$filter=Title%20eq%20%27Site%20Pages%27`, replacing `<site-url>` with your Microsoft SharePoint Online site URL.
   If this request doesn't return an XML response describing the Site Pages list, navigate to `<site-url>/_api/web/lists?$select=ID,Title` instead, then find the entry for the Site Pages list in the unfiltered response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the XML response, locate the `<d:Id>` element and copy the list GUID given as its value. As an example, the list GUID might be `4acc128d-166d-441d-a7a6-d96ae2e8b46f`.

2. View static content for your selected page.

a. In your web browser, navigate to `<site-url>/_api/web/lists('<list-id>')/items?$filter=FileLeafRef%20eq%20%27<filename>.aspx%27`, replacing `<site-url>` with your site URL, `<list-id>` with the GUID that you copied in step 1.c, and `<filename>` with the filename of the page you want to view searchable content for.

b. In the XML response, locate the CanvasContent1 and WikiField metadata fields and examine their values.
These fields contain the static content that the Microsoft SharePoint Online connector makes searchable when the page is retrieved.

Note: If the CanvasContent1 and WikiField metadata fields are missing or empty, the page is likely rendered entirely via dynamic web parts and doesn't contain static content that can be retrieved by the Microsoft SharePoint Online external content connector.

Microsoft Teams external content connector

The Microsoft Teams external content connector retrieves conversations and attachments from teams in your Microsoft Teams source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Create a public/private key pair for the Microsoft Teams external content connector

Generate a public/private key pair for the Microsoft Teams external content connector. Extract the public key as a DER-encoded binary X.509 format certificate for use in configuring API access for the connector in the Microsoft Entra admin center.

Before you begin

You must have access to the Java keytool utility. For details on the keytool utility, see https://docs.oracle.com/en/java/javase/21/docs/specs/man/keytool.html.

Role required: none

About this task

The Microsoft Teams external content connector uses a public/private key pair to authenticate with an OAuth 2.0 app configured in the Microsoft Entra admin center. Key pair authentication allows the connector to access your Microsoft Teams data via the Microsoft Graph API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To configure public/private key pair authentication for the connector, you need to create the following items:

1. A public/private key pair in Java KeyStore (JKS) format.
   - Your connector administrator needs this JKS keystore file and its password when configuring settings for the Microsoft Teams external content connector.
   - When the Microsoft Teams external content connector runs a crawl, it uses the private key from this JKS keystore file to sign the authentication request it sends to the OAuth 2.0 app defined in the Microsoft Entra admin center.
2. A copy of the public key in DER-encoded binary X.509 certificate format.
   - Your administrator needs to upload this certificate file to the OAuth 2.0 app defined in the Microsoft Entra admin center that grants API access to the Microsoft Teams external content connector.
   - When the Microsoft Teams external content connector submits its authentication request to the OAuth 2.0 app defined in the Microsoft Entra admin center, the app uses the public key from this uploaded certificate to confirm that the authentication request was signed with the private key.

Note: If your organization has its own guidelines for generating public/private key pairs, follow those to generate a key pair and a public key certificate in the required formats.

Procedure

1. Generate a public/private key pair in JKS keystore format:

   a. Run this keytool command, replacing `<alias>`, `<jks-file>`, and `<password>` with values of your choice:

   ```
   keytool -genkey -alias <alias> -keyalg RSA -keysize 2048
    -keystore <jks-file>.jks -storepass "<password>" -storetype
    JKS -validity 360
   ```

   As an example, you might specify `ms-teams-connector-cert` as the key alias and the JKS repository filename, and enter a password:

   ```
   keytool -genkey -alias ms-teams-connector-cert -keyalg
    RSA -keysize 2048 -keystore ms-teams-connector-cert.jks
    -storepass "gC+M{wKyqSu*}7HY" -storetype JKS -validity 360
   ```

   b. When prompted for your first and last name, enter the Common Name (CN) you want for the key pair, then press Enter.
   As an example, you might specify `Microsoft Teams external content connector` as the Common Name for the key pair.

   c. At each of the remaining distinguished name prompts, enter the requested information and press Enter.

   d. When prompted to confirm that the distinguished name is correct, enter `yes` and press Enter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. When prompted for a key password, press Enter to use the same password you specified for the keystore file.

> **Important:** The key must use the same password as the keystore. Record this password in a secure location. Your connector administrator needs this password when configuring the Microsoft Teams external content connector.

The keytool utility generates a new Java KeyStore (.jks) file containing your public/private key pair.

> **Important:** Ignore the keytool warning message about migrating your keystore to the PKCS12 format. The external content connector only supports the Java KeyStore format.

2. Export your public key in DER-encoded binary X.509 certificate format by running the following keytool command, replacing `<cer-file>` with a filename of your choice and replacing `<alias>`, `<jks-file>`, and `<password>` with the same values you used in step 1:

```
keytool -export -alias <alias> -file <cer-file>.cer -keystore
 <jks-file>.jks -storepass "<password>" -storetype JKS
```

As an example, you might specify `ms-teams-connector-cert` as the filename for the DER-encoded binary X.509 format certificate:

```
keytool -export -alias ms-teams-connector-cert
 -file ms-teams-connector-cert.cer -keystore
 ms-teams-connector-cert.jks -storepass "gC+M{wKyqSu*}7HY"
 -storetype JKS
```

The keytool utility exports a copy of your public key as a DER-encoded binary X.509 format certificate file with your chosen filename.

> **Important:** Ignore the keytool warning message about migrating your keystore to the PKCS12 format. The external content connector only supports the Java KeyStore format.

What to do next

Provide both of the files you generated to the admins who configure your Microsoft Teams instance and AI Search on your ServiceNow AI Platform® instance, as follows:

File	Description
DER-encoded binary X.509 format public key certificate file	Provide this certificate file to your Microsoft Teams administrator. They will need to upload the certificate to the Microsoft Entra admin center when configuring an OAuth 2.0 application for the Microsoft Teams external content connector. For more information on configuring an OAuth 2.0 application in the Microsoft Entra admin center for the Microsoft Teams external content connector, see Configure Microsoft Teams for external content indexing.
JKS keystore file and password	Provide this Java KeyStore file and its password to your ServiceNow AI Platform admins. They will need the file and password when configuring the Microsoft Teams external content connector. For details on creating and configuring the Microsoft Teams external content connector, see Create a Microsoft Teams external content connector.

Configure Microsoft Teams for external content indexing

Register an OAuth 2.0 application in the Microsoft Entra admin center to allow the Microsoft Teams external content connector to access your Microsoft Teams source system.

Before you begin

You need the following credentials and permissions for your organization in the Microsoft Entra admin center:

- Login credentials
- Permission to register an application
- Permission to add API permissions to an application
- Permission to grant admin consent for an application's API permissions
- Permission to upload certificates for an application

You must have created a public/private key pair for the Microsoft Teams external content connector and extracted the public key certificate in DER-encoded binary X.509 format. For details on creating the public/private key pair and extracting the public key certificate, see Create a public/private key pair for the Microsoft Teams external content connector.

Role required: none

About this task

The Microsoft Teams external content connector retrieves content from your Microsoft Teams source system using Microsoft Graph and the Microsoft SharePoint REST APIs.

To enable the connector to access your Microsoft Teams source system via these APIs, you must configure an OAuth 2.0 application in the Microsoft Entra admin center. Your connector administrator can use settings copied from this Microsoft Entra application to configure the Microsoft Teams external content connector for proper connection to your Microsoft Teams source system.

Procedure

1. Register a new application in the Microsoft Entra admin center.

   a. Log in to the Microsoft Entra admin center at https://entra.microsoft.com/.

      Note: If your Microsoft Teams tenant is in the Microsoft 365 GCC or GCC High cloud or the Microsoft 365 DoD cloud, log in at https://entra.microsoft.us/ instead.

   b. Select **Applications** > **App registrations**.

   c. On the App registrations page, select **New registration**.

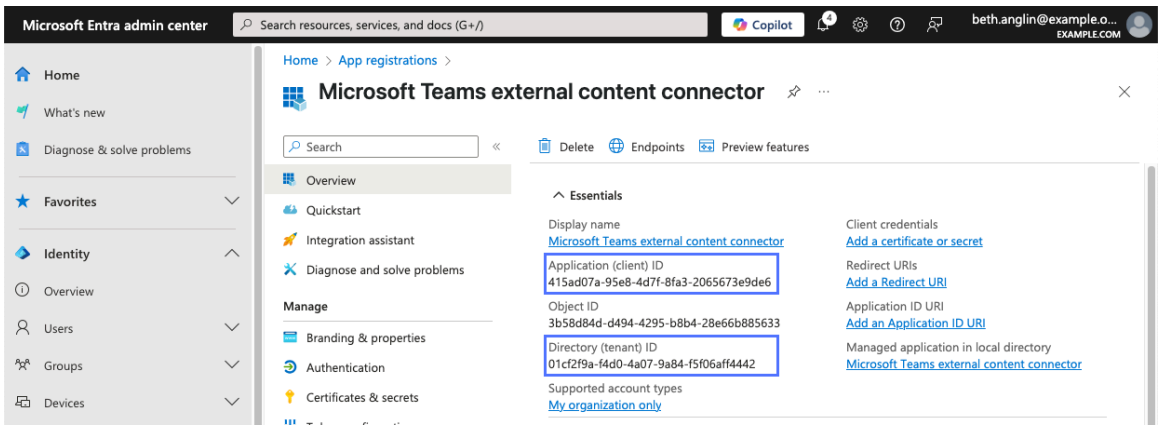
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

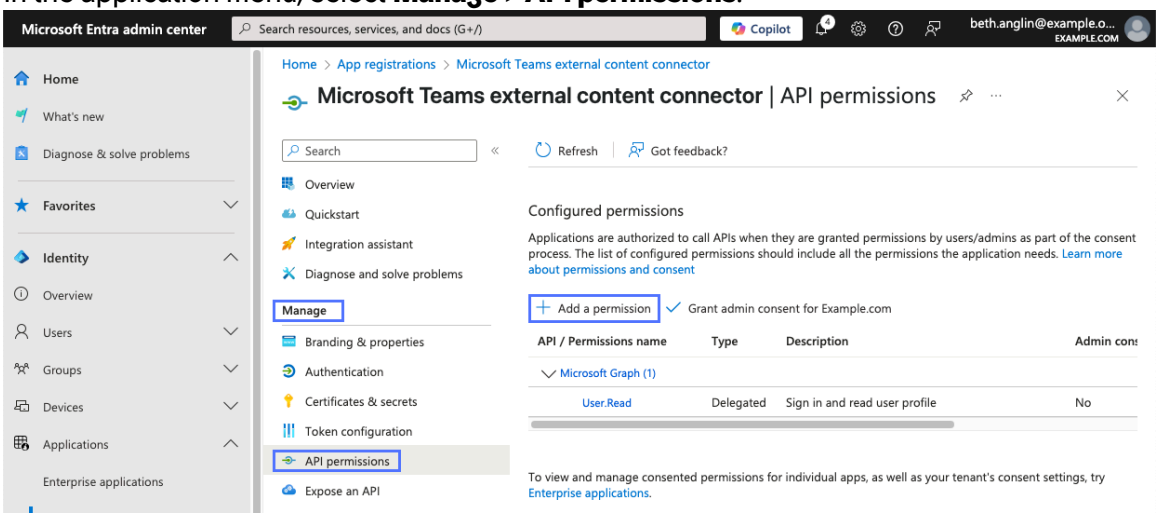
d. On the Register an application form, fill in the following fields:



Field	Instructions
Name	Enter a unique name for your OAuth 2.0 application. For example, you might enter `Microsoft Teams external content connector`.
Supported account types	Select **Accounts in this organizational directory only (<instance-name> only - Single tenant)**, where `<instance-name>` is the name of your Microsoft Entra instance.
Redirect URI (optional)	Leave this field empty.

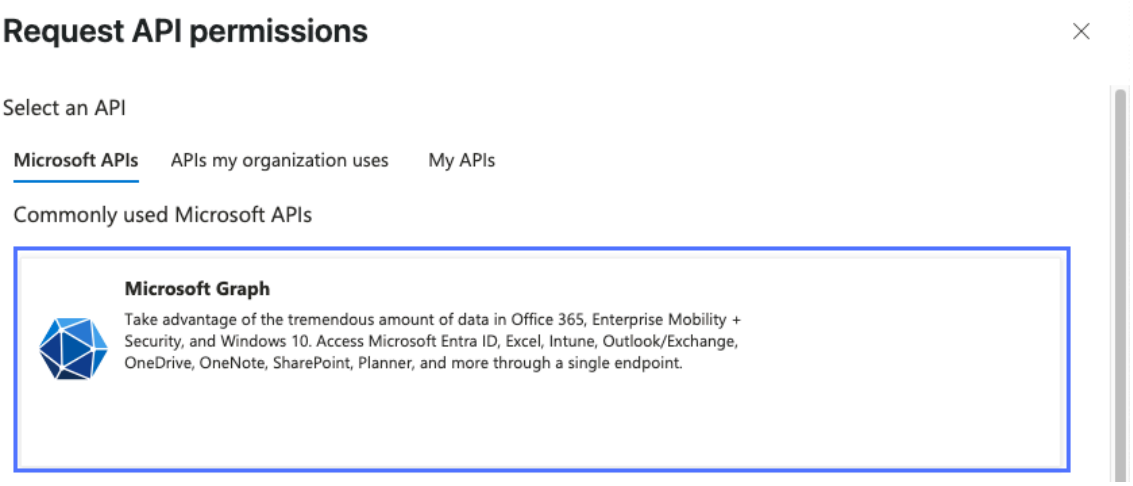
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Register**.
The new application's Overview page appears.



2. Record the values of the **Application (client) ID** and **Directory (tenant) ID** properties in a secure location.

Important: Your connector administrator needs the application's tenant and client IDs to configure a Microsoft Teams external content connector.

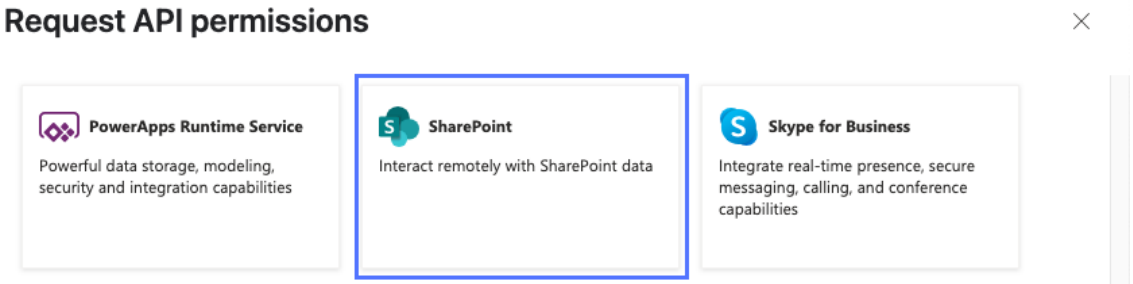


3. Add the API permissions required by the Microsoft Teams external content connector.

a. In the application menu, select **Manage** > **API permissions**.

b. Select **Add a permission**, then select *Microsoft Graph*, then select **Application permissions**.

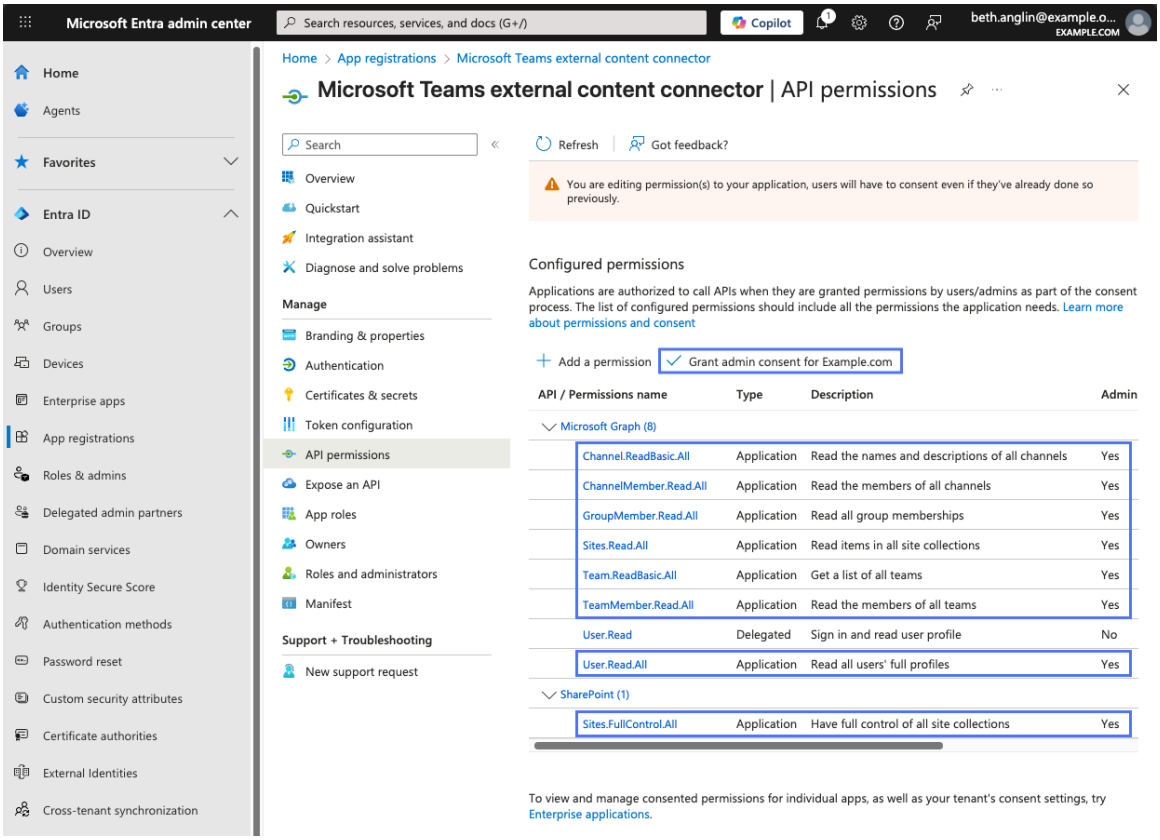
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. For each of the following permissions, enter the permission name into the **Select permissions** search field, then locate and select the option for the permission.

- Channel.ReadBasic.All
- ChannelMember.Read.All
- GroupMember.Read.All
- Sites.Read.All
- Team.ReadBasic.All
- TeamMember.Read.All
- User.Read.All

d. Select **Add permissions**.
The new Microsoft Graph permissions appear in the application's Configured permissions list.

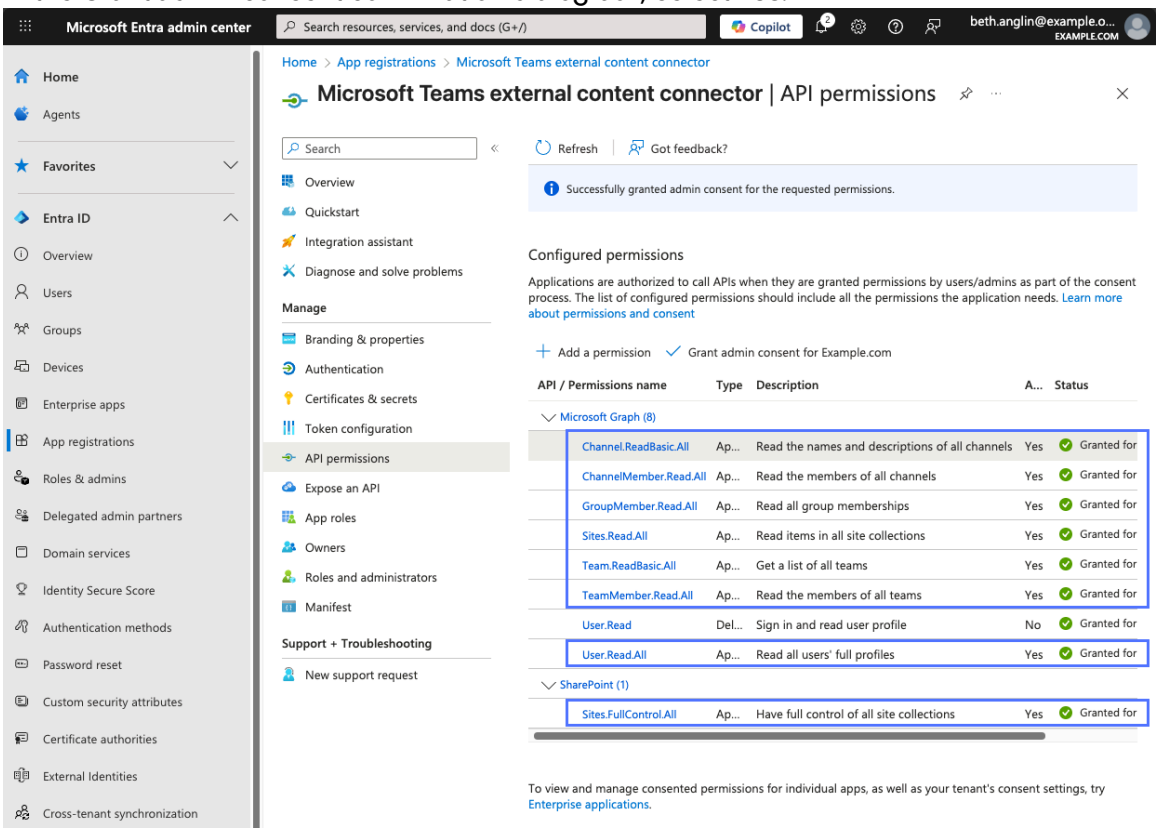


e. Select **Add a permission**, then select **SharePoint**, then select **Application permissions**.

f. In the **Select permissions** search field, enter `Sites.FullControl.All`, then locate and select the option for the permission.

g. Select **Add permissions**.
The new SharePoint permission appears in the application's Configured permissions list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

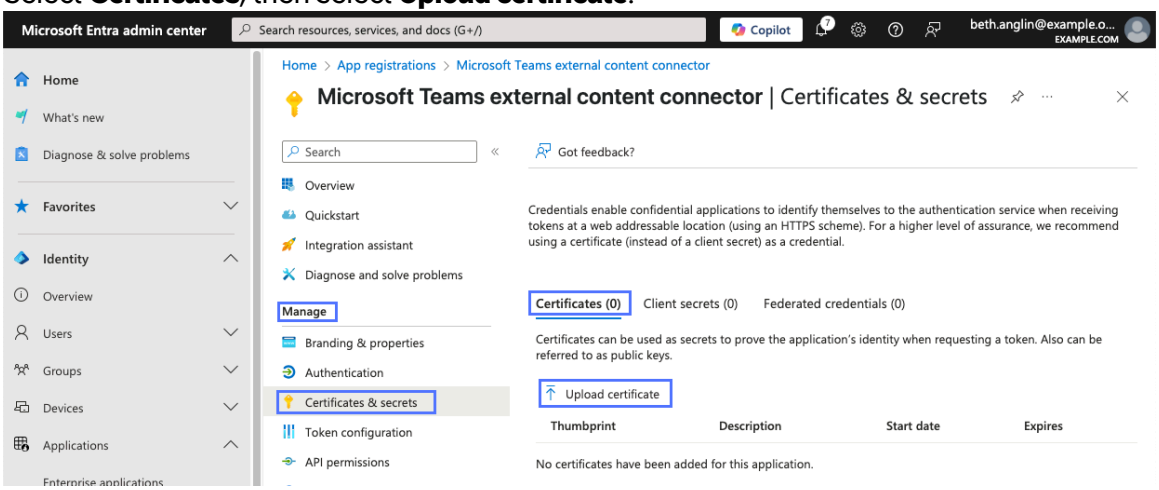


4. Grant admin consent for the added API permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

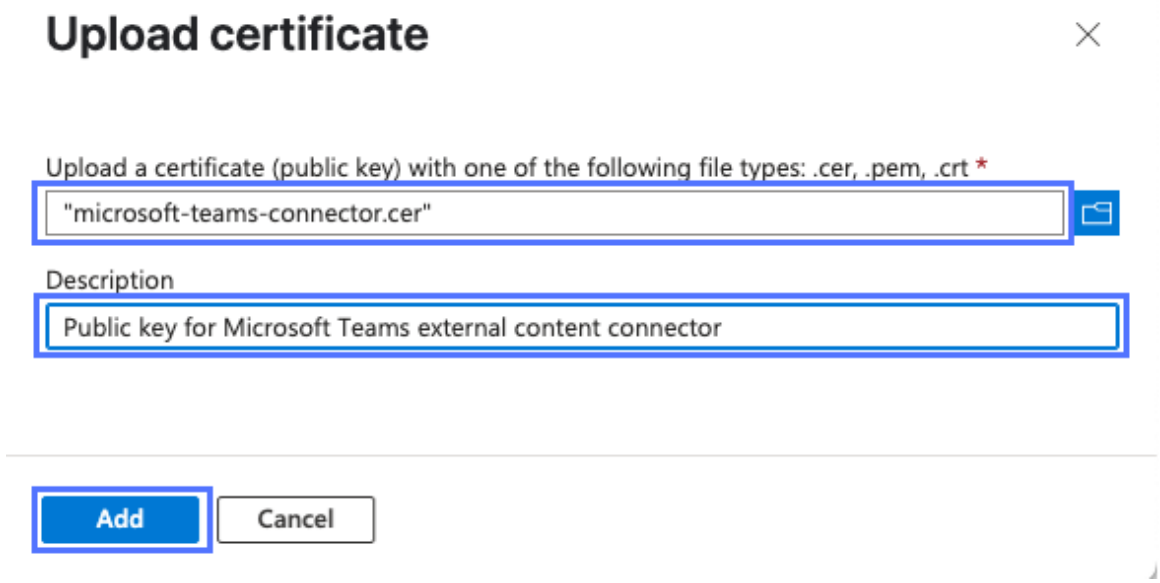
a. Select **Grant admin consent for <instance-name>**, where `<instance-name>` is the name of your Microsoft Entra instance.

b. In the Grant admin consent confirmation dialog box, select **Yes**.



The status for the added API permissions changes to `Granted for <instance-name>`, where `<instance-name>` is the name of your Microsoft Entra instance.

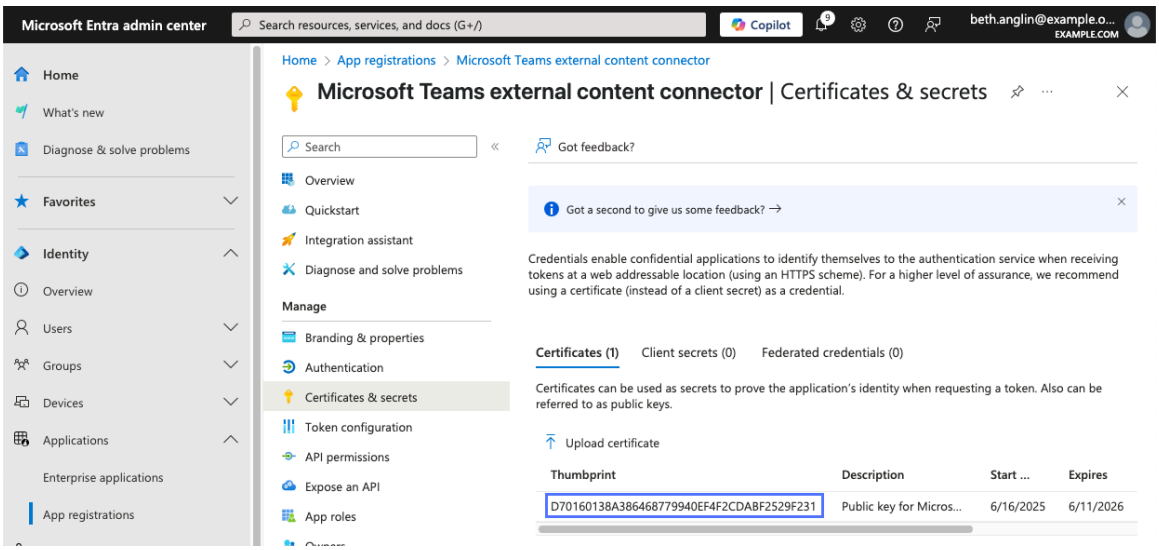
5. Upload your DER-encoded binary X.509 format public key certificate for the Microsoft Teams external content connector.



a. In the Microsoft Entra application menu, select **Manage** > **Certificates & secrets**.

b. Select **Certificates**, then select **Upload certificate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Select **Select a file** and locate your DER-encoded binary X.509 format public key certificate file, then enter a description for it.

d. Select **Add**.
The DER-encoded binary X.509 format public key certificate appears in the Certificates list.

Note: You can drag the column separators in the Certificates list to view the entire thumbprint SHA1 hash value.

e. Copy the certificate's **Thumbprint** SHA1 hash, shown in hexadecimal format, and record it in a secure location.

Important: Your connector administrator needs the DER-encoded binary X.509 format public key certificate's SHA1 thumbprint hash in base64-encoded format to configure the Microsoft Teams external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Retain copies of the generated public/private key files and the key password in a secure location.

Note: You can't download the public key certificate or its password from the Microsoft Entra admin center.

What to do next

Provide the following items to your connector administrator:

- The OAuth 2.0 application's tenant ID and client ID that you recorded in step 2.
- The DER-encoded binary X.509 format public key certificate's SHA1 thumbprint hash in hexadecimal format that you recorded in step 5.e.

Your connector administrator needs these items to configure a Microsoft Teams external content connector to retrieve searchable content and security principals from your Microsoft Teams instance.

For details on creating and configuring a Microsoft Teams external content connector, see Create a Microsoft Teams external content connector.

Create a Microsoft Teams external content connector

Create an external content connector to retrieve searchable content and security principals from your Microsoft Teams source system.

Before you begin

A source system administrator must have already configured your Microsoft Teams source system to allow access by the Microsoft Teams external content connector. For the required source system configuration steps, see Create a public/private key pair for the Microsoft Teams external content connector and Configure Microsoft Teams for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Microsoft Teams** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Microsoft Teams external content connector.
Application (client) ID	Application (client) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft Teams source system. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Application (client) ID** field in the Essentials section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Application (client) ID** value.
Directory (tenant) ID	Directory (tenant) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft Teams source system. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Directory (tenant) ID** field in the Essentials section. If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Directory (tenant) ID** value.
JKS Certificate	Java KeyStore (JKS) file containing a public/private key pair generated with the Java keytool utility. These keys must match the public key from the DER-encoded binary X.509 format certificate uploaded to the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft Teams external content connector to access your source system data. If you don't have a copy of the JKS file, ask your security administrator for it. You can't download the JKS file from the OAuth 2.0 application's registration record in the Microsoft Entra admin center.
JKS certificate password	Password for the Java KeyStore (JKS) file specified in *`JKS Certificate`*. If you don't have the password for the JKS file, ask your security administrator for it. You can't retrieve the JKS certificate password from the registration record for the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft Teams external content connector to access your source system data.
JKS certificate thumbprint	Base64-encoded or hexadecimal SHA1 hash for the DER-encoded binary X.509 format public key certificate uploaded to the OAuth 2.0 application defined in the Microsoft Entra admin center that allows the Microsoft Teams external content connector to access your source system data. If you don't have this hash, ask your Microsoft Entra administrator for the SHA1 thumbprint hash for the application's DER-encoded binary X.509 format public key certificate, in either base64-encoded or hexadecimal format.
Settings for regulated markets	
Configure settings for regulated markets	Option to display *`Authority endpoint`* and *`Graph API endpoint`* settings fields.
Authority endpoint	URL for the Microsoft authorization server that you use to log in to your source system (Microsoft tenant). This field appears only when *`Configure settings for regulated markets`* is selected. Default value: `https://login.microsoftonline.com/`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	Cloud service endpoint URLs include: ○ `https://login.microsoftonline.com/`: Endpoint URL for the Microsoft 365 cloud ○ `https://login.microsoftonline.us/`: Endpoint URL for the Microsoft 365 GCC and GCC High cloud and the Microsoft 365 DoD cloud If you don't know the authority endpoint URL to use, ask your Microsoft administrator for it. **Important:** The authority endpoint URL must end with a trailing slash.
Graph API endpoint	Microsoft Graph API endpoint for your source system (Microsoft tenant). This field appears only when *`Configure settings for regulated markets`* is selected. Default value: `https://graph.microsoftonline.com/` Microsoft Graph API endpoint URLs include: ○ `https://graph.microsoftonline.com/`: Endpoint URL for the Microsoft Graph global service cloud ○ `https://graph.microsoftonline.us/`: Endpoint URL for the Microsoft Graph for US Government L4 cloud ○ `https://dod-graph.microsoftonline.us/`: Endpoint URL for Microsoft Graph for US Government L5 (DOD) cloud If you don't know the Microsoft Graph API endpoint URL to use, ask your Microsoft administrator for it. **Important:** The Microsoft Graph API endpoint URL must end with a trailing slash.
Validate connection settings with test crawl	Option to run a short test crawl to verify whether your connection settings and source system permissions are correctly set. For more details on validating connection settings and source system permissions with a test crawl, see Verify your connection settings and source system permissions for an external content connector. **Important:** For connectors that support user permission crawls, all searchable content and metadata indexed by the validation test crawl is public until the connector completes its first user permission crawl. This means the test crawl's content will be visible to all users of portals and search applications that the connector is linked to.

Note: The **Settings for regulated markets** connection settings aren't shown for Microsoft Teams connectors that you created in versions of External Content Connectors prior to version 4.0. Starting in External Content Connectors version 4.0, these connection settings are shown when you create a new Microsoft Teams external content connector.

6. Save and validate your connection settings by selecting **Validate Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Microsoft Teams external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Microsoft Teams external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Microsoft Teams external content connector

Specify the teams you want your Microsoft Teams external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Microsoft Teams external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Microsoft Teams external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Microsoft Teams external content connector crawls all teams from its specified source system and sends documents with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the teams to crawl when running content crawls
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Microsoft Teams external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all teams from the source system, select **Crawl all content**.
   - To crawl only a specified set of teams from the source system, select **Include only these teams**, then use the **Add URL** field and **Add** button to enter URLs for teams that you want to include in the crawl.

     For example, you might enter `https://teams.microsoft.com/l/team/NJ1UM7Km8nxdInbXeBw4` to include only searchable content from the specified team.
   - To crawl all except a specified set of teams from the source system, select **Exclude only these teams**, then use the **Add URL** field and **Add** button to enter URLs for teams that you want to exclude from the crawl.

     For example, you might enter `https://teams.microsoft.com/l/team/ipSKKdSu0IeCrO3kWXmD` to exclude searchable content from the specified team.
5. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.

- To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save**.

Result

The Microsoft Teams external content connector is updated with your crawl scope and file extension filter settings.

What to do next

To retrieve content from your Microsoft Teams source system using your modified crawl settings, create and run a one-time content crawl for your Microsoft Teams external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Microsoft Viva Engage external content connector

The Microsoft Viva Engage external content connector retrieves messages and attachments from conversations in your Microsoft Viva Engage source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Limitations for the Microsoft Viva Engage external content connector

The Microsoft Viva Engage external content connector only retrieves searchable content from attachments that are stored in Microsoft SharePoint Online. To learn about file attachment storage in Microsoft Viva Engage, see the Microsoft Viva Engage file storage overview resource.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only members of a private community can see searchable content from attachments found in that community. Non-members cannot see searchable content from attachments in the private community, even if those attachments are shared with them in Microsoft Viva Engage.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Configure Microsoft Viva Engage for external content indexing

Register an OAuth 2.0 application in the Microsoft Entra admin center to allow the Microsoft Viva Engage external content connector to access your Microsoft Viva Engage source system.

Before you begin

You need the following credentials and permissions for your organization in the Microsoft Entra admin center:

- Login credentials
- Permission to register an application
- Permission to add API permissions to an application
- Permission to create client secrets for an application

Role required: none

About this task

The Microsoft Viva Engage external content connector retrieves content from your Microsoft Viva Engage source system using the Yammer API.

To enable the connector to access your Microsoft Viva Engage source system via these APIs, you must configure an OAuth 2.0 application in the Microsoft Entra admin center. Your connector administrator can use settings copied from this Microsoft Entra application to configure the Microsoft Viva Engage external content connector for proper connection to your Microsoft Viva Engage source system.

Procedure

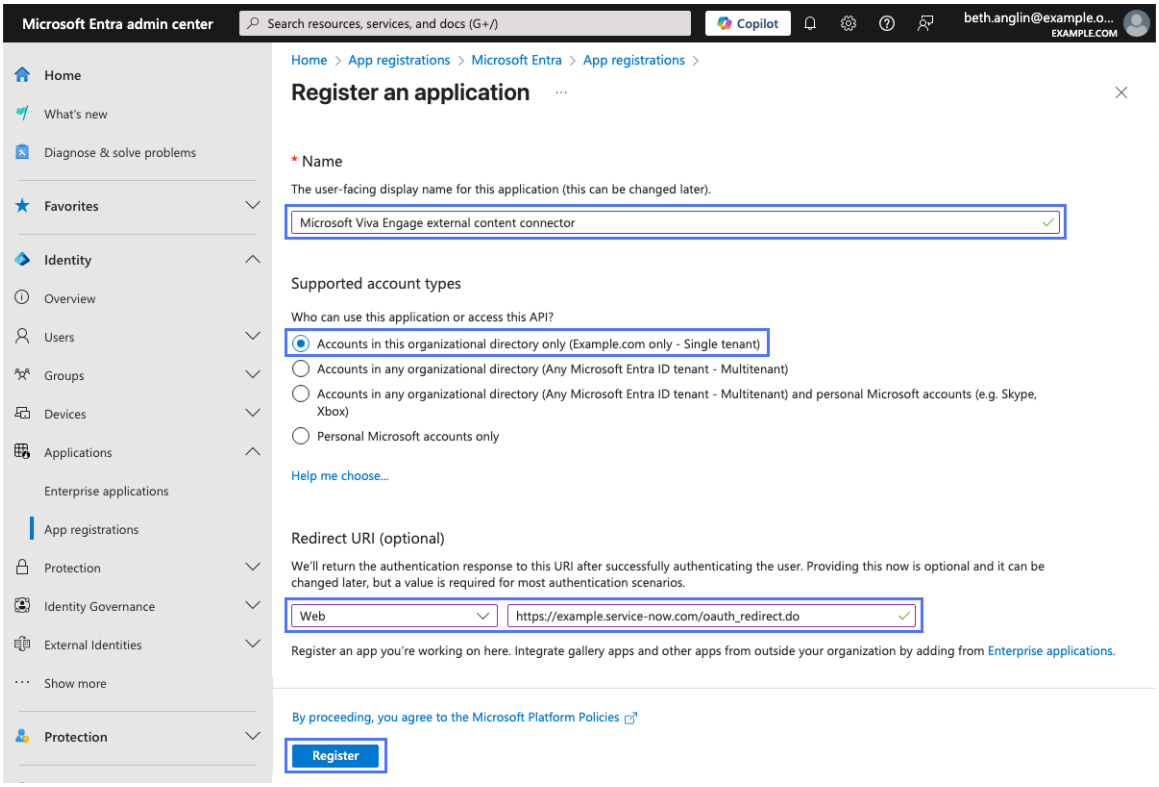
1. Register a new application in the Microsoft Entra admin center.

   a. Log in to the Microsoft Entra admin center at https://entra.microsoft.com/.

   Note: If your Microsoft Viva Engage tenant is in the Microsoft 365 GCC or GCC High cloud or the Microsoft 365 DoD cloud, log in at https://entra.microsoft.us/ instead.

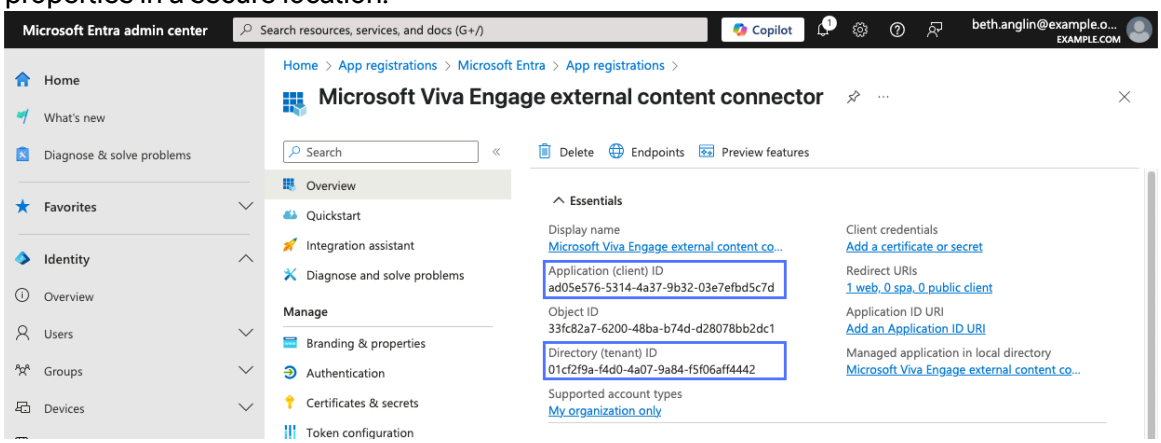
   b. Select **Applications** > **App registrations**.

   c. On the App registrations page, select **New registration**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. On the Register an application form, fill in the following fields:

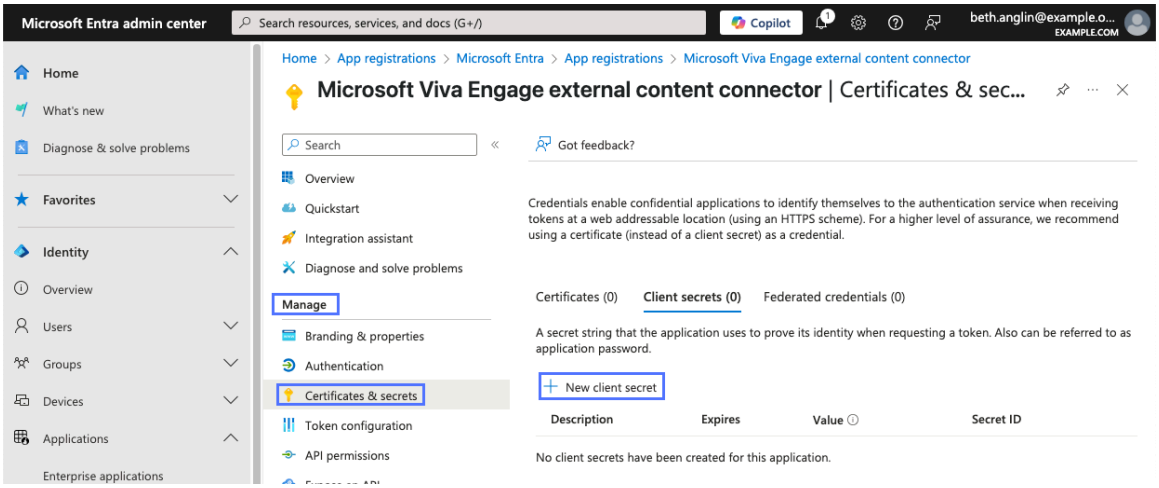


Field	Instructions
Name	Enter a unique name for your OAuth 2.0 application. For example, you might enter `Microsoft Viva Engage external content connector`.
Supported account types	Select **Accounts in this organizational directory only (<instance-name> only - Single tenant)**, where `<instance-name>` is the name of your Microsoft Entra instance.
Redirect URI (optional)	Select **Web** as the redirect URI type, then enter `https://<instance-name>.service-now.com/oauth_redirect.do` as the URI, replacing `<instance-name>` with the hostname for the ServiceNow AI Platform® instance where the Microsoft Viva Engage external content connector will be created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

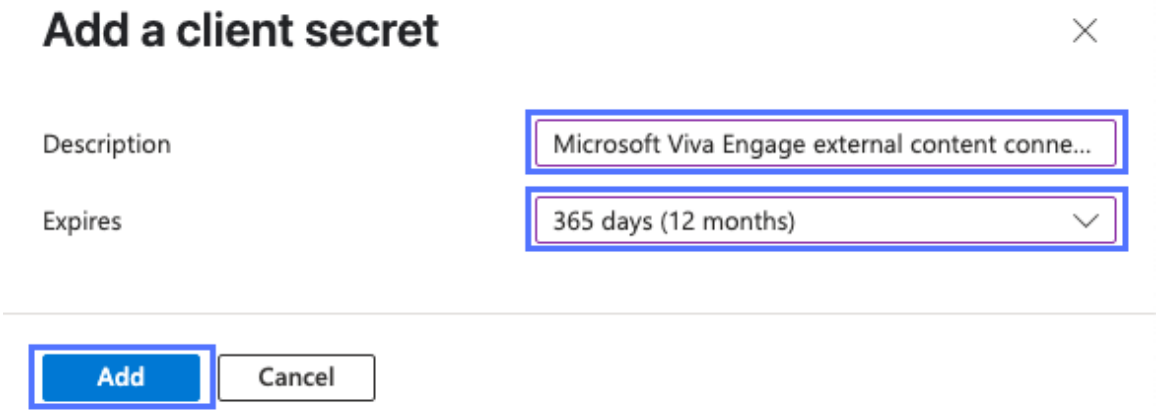
e. Select **Register**.
The new application's Overview page appears.

2. Record the values of the new application's **Application (client) ID** and **Directory (tenant) ID** properties in a secure location.



Important: Your connector administrator needs the application's tenant and client IDs to configure a Microsoft Viva Engage external content connector.

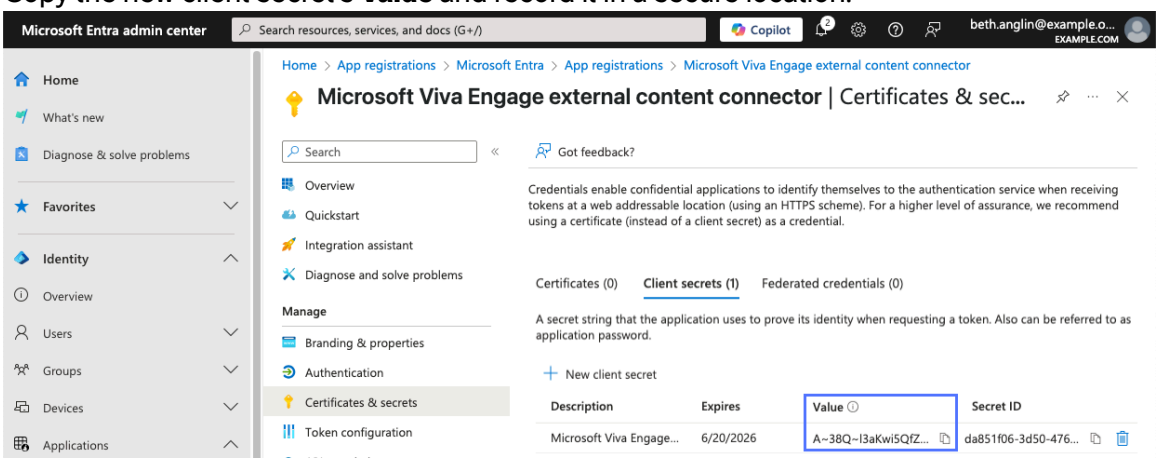
3. Create a client secret for the new application.



a. In the application menu, select **Manage** > **Certificates & secrets**.

b. Select **Client secrets**, then select **New client secret**.

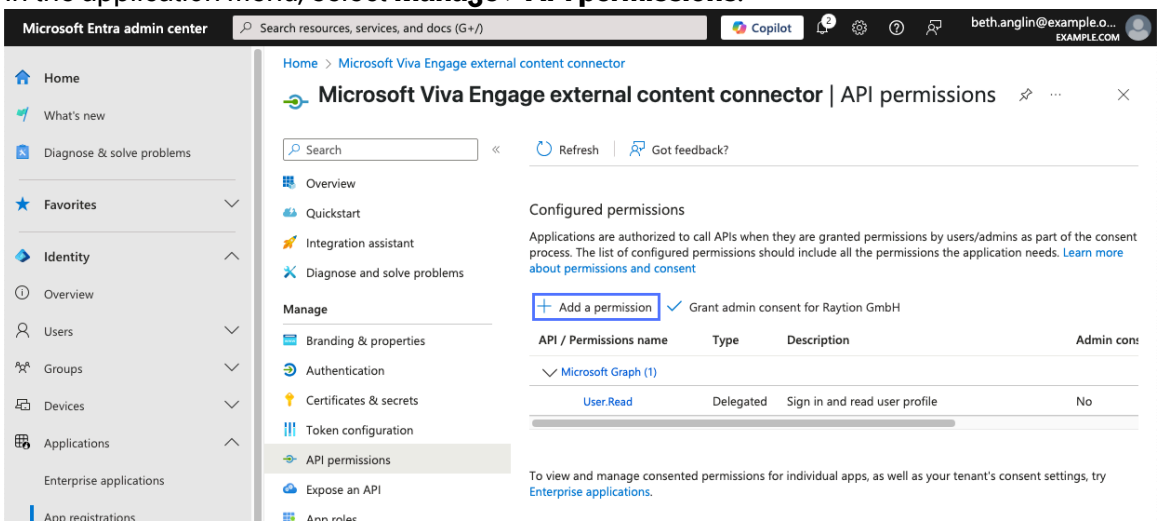
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



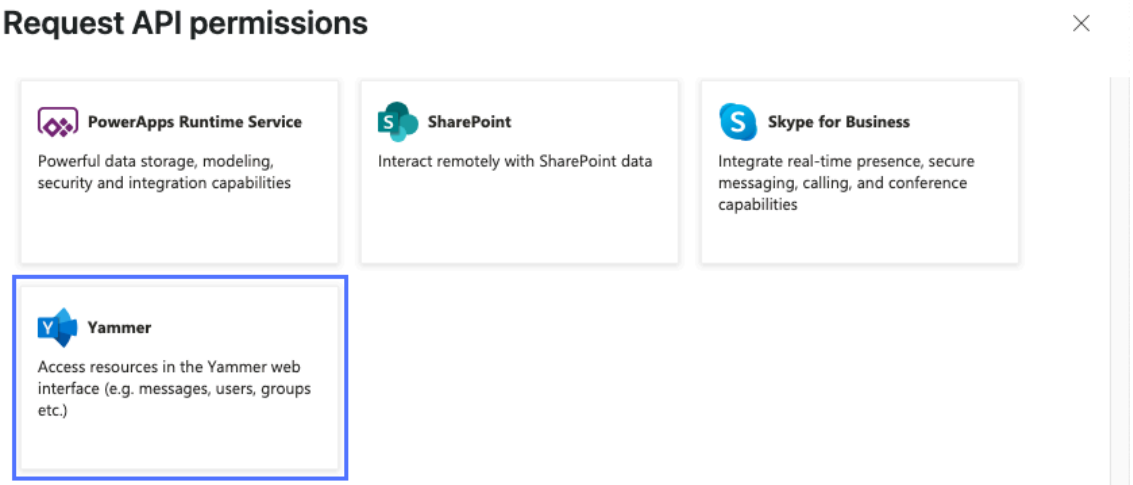
c. In the Add a client secret pane, enter a description for the secret and select its expiration period, then select **Add**.

The new client secret appears in the Client secrets list.

d. Copy the new client secret's **Value** and record it in a secure location.



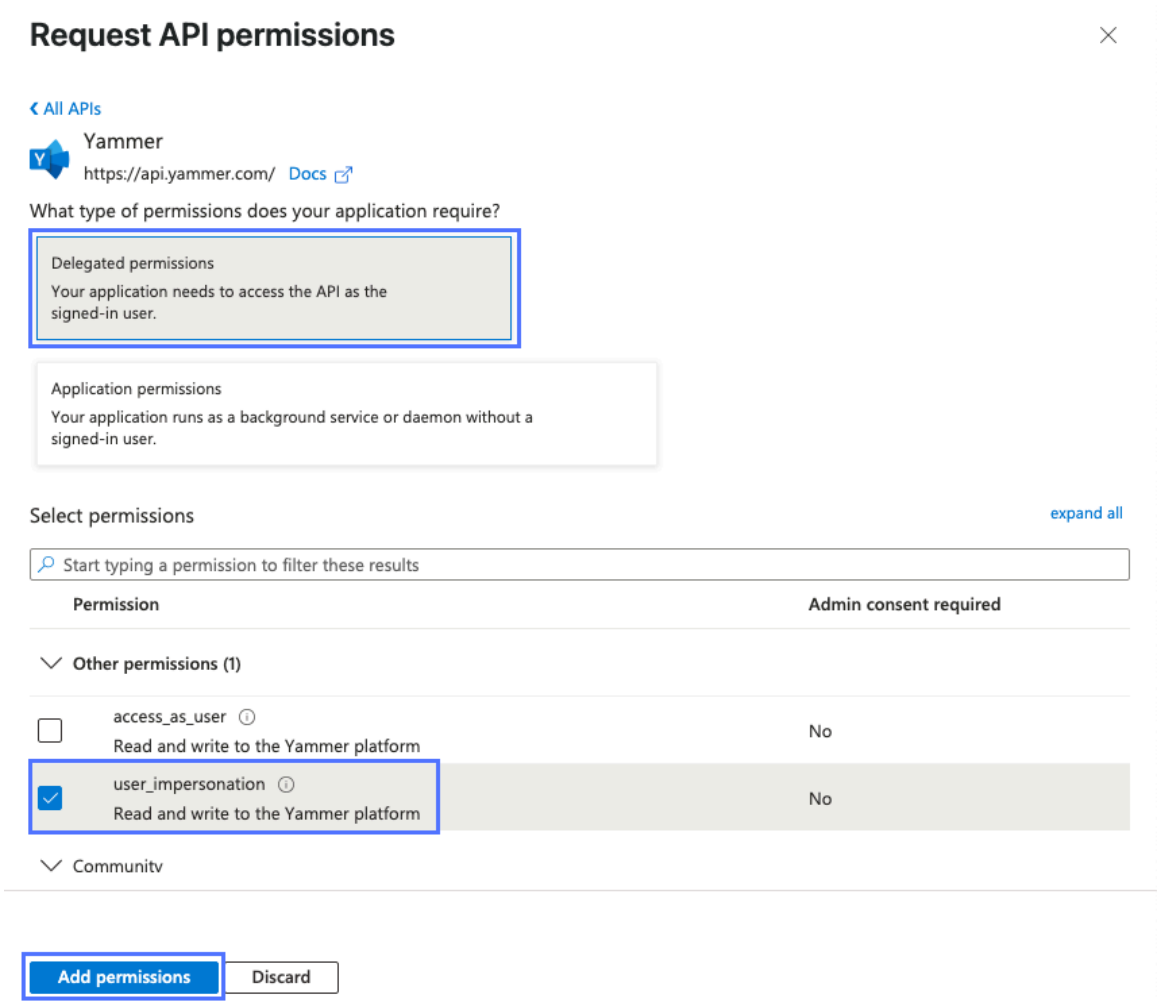
Important: Your connector administrator needs the value of this client secret to configure a Microsoft Viva Engage external content connector.



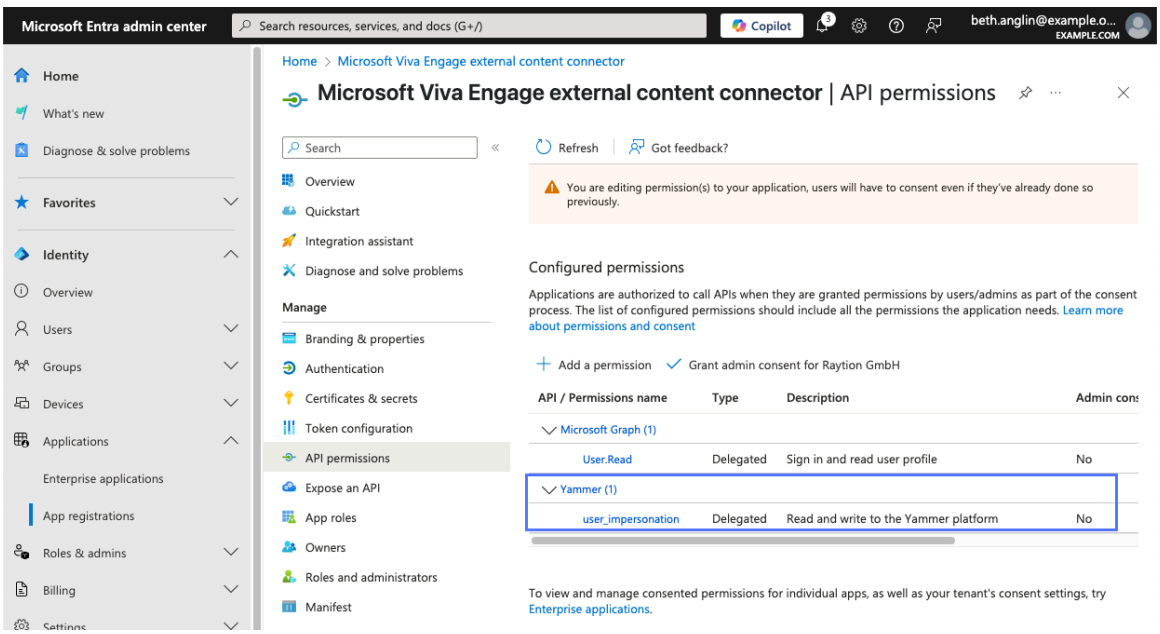
4. Add the Yammer API permission required by the Microsoft Viva Engage external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the application menu, select **Manage** > **API permissions**.



b. Select **Add a permission**, then select **Yammer**.



c. Select **Delegated permissions**, then select the option for the **user_impersonation** permission and select **Add permissions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The new Yammer API permission appears in the application's Configured permissions list.

What to do next

Provide the following items to your connector administrator:

- The OAuth 2.0 application's tenant ID and client ID that you recorded in step 2.
- The client secret value that you recorded in step 3.d.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your connector administrator needs these items to configure a Microsoft Viva Engage external content connector to retrieve searchable content and security principals from your Microsoft Viva Engage instance.

For details on creating and configuring a Microsoft Viva Engage external content connector, see Create a Microsoft Viva Engage external content connector.

Create a Microsoft Viva Engage external content connector

Create an external content connector to retrieve searchable content and security principals from your Microsoft Viva Engage source system.

Before you begin

A source system administrator must have already configured your Microsoft Viva Engage source system to allow access by the Microsoft Viva Engage external content connector. For the required source system configuration steps, see Configure Microsoft Viva Engage for external content indexing.

You need login credentials for a Microsoft Entra service user account that can grant the Microsoft Viva Engage connector access to your Microsoft Viva Engage tenant.

Note: In order for the connector to retrieve searchable content and metadata from a private community in your Microsoft Viva Engage source system, one of these conditions must be true:

- The service user account is a member of the private community
- The service user account has the Global Administrator Microsoft Entra role
- The service user account has the Groups Administrator Microsoft Entra role

To learn more about administrator roles in Microsoft Viva Engage, see the https://learn.microsoft.com/en-us/entra/identity/role-based-access-control/permissions-reference resource.

Verify that you're logged out of all your Microsoft accounts.

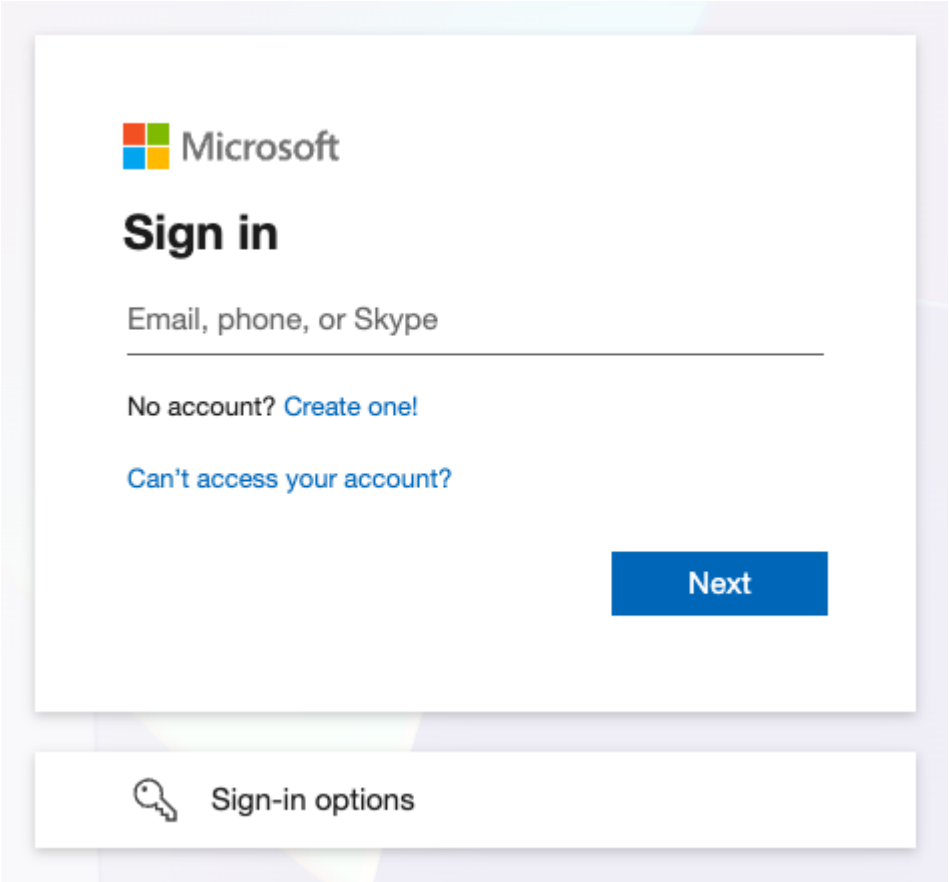
Important: If you're logged in to a Microsoft account when creating the connector, the connector runs using that account instead of prompting you for your Microsoft Entra service user account credentials. Using a non-service user account may prevent Microsoft Viva Engage content from being searchable in AI Search applications.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Viva Engage** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Connection settings

Connection setting	Description
Connector name	Unique name for this Microsoft Viva Engage external content connector.
Authority URL	Authority URL used to log in to your Microsoft Viva Engage source system. The authority URL typically consists of your Microsoft cloud service endpoint URL, possibly followed by organization-specific parameters. Cloud service endpoint URLs include: ○ `https://login.microsoftonline.com/` (for the Microsoft 365 cloud) ○ `https://login.microsoftonline.us/` (for the Microsoft 365 GCC or GCC High cloud or the Microsoft 365 DoD cloud) If you don't know the authority URL to use, ask your Microsoft Viva Engage administrator for it.
Tenant ID	Directory (tenant) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft Viva Engage instance. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Directory (tenant) ID** field in the Essentials section. If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Directory (tenant) ID** value.
Client ID	Application (client) ID for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft Viva Engage instance. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Overview** and copy this ID from the **Application (client) ID** field in the Essentials section. If you can't access the OAuth 2.0 application's registration record in the Microsoft Entra admin center, ask your Microsoft Entra administrator for the application's **Application (client) ID** value.
Client Secret	Value of the client secret for the OAuth 2.0 application defined in the Microsoft Entra admin center that grants access to your Microsoft Viva Engage instance. If you have access to the OAuth 2.0 application's registration record in the Microsoft Entra admin center, you can navigate to **Manage** > **Certificates & secrets** and copy this value from the appropriate client secret's **Value** field in the Client secrets section. If you can't access the OAuth 2.0 application's client secret value in the Microsoft Entra admin center, ask your Microsoft Entra administrator for it.

6. Save and validate your connection settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Validate Connection**.

A pop-up window prompts you to sign in with a Microsoft account.

Important: If you don't see the pop-up window, make sure you're signed out of all your Microsoft accounts, then repeat the connector creation procedure.

b. Sign in using your Microsoft Entra service user account credentials.
The connector runs its crawls using permissions from this service user account.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Microsoft Viva Engage external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

on this procedure and user permission settings, see Configure user permission settings for an external content connector.

10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Microsoft Viva Engage external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Microsoft Viva Engage external content connector

Specify the communities you want your Microsoft Viva Engage external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

A connector administrator must have already created the Microsoft Viva Engage external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Microsoft Viva Engage external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Microsoft Viva Engage external content connector retrieves searchable content from all communities in your Microsoft Viva Engage source system, and from all supported attachment file types. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the communities to crawl when running content crawls
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Microsoft Viva Engage external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all communities from the source system, select **Crawl all communities**.
   - To crawl only a specified set of communities from the source system, select **Include only these communities**, then use the **Add URL to include** field and **Add** button to enter URLs for the communities that you want to include in the crawl.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you might enter `https://engage.cloud.microsoft/main/org/example.com/groups/Lj3YgLhPGsZQLZHoSnS0YB3w6` to include only searchable content from the specified community.

- To crawl all except a specified set of communities from the source system, select **Exclude only these communities**, then use the **Add URL to exclude** field and **Add** button to enter URLs for the communities that you want to exclude from the crawl.

  For example, you might enter `https://engage.cloud.microsoft/main/org/example.com/groups/kBrGU2W3fKneiSPBU4e7Yc4PZ` to exclude searchable content from the specified community.

5. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result

The Microsoft Viva Engage external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Microsoft Viva Engage source system using your modified crawl settings, create and run a one-time content crawl for your Microsoft Viva Engage external content

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Miro external content connector

The Miro external content connector crawls boards from Spaces in your Miro source system and makes their text content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Miro for external content indexing

Create and authorize an application in the Miro Developer Hub to allow the Miro external content connector to access your Miro source system.

Before you begin

You must be on the Miro Enterprise plan. For details on the Enterprise plan, see https://help.miro.com/hc/en-us/articles/360017730433-Enterprise-Plan.

You need the Company Admin role for your organization in Miro. To learn about admin roles in Miro, see https://help.miro.com/hc/en-us/articles/14766440626834-Understand-admin-roles-and-their-privileges.

You must have a Developer team set up for your organization in Miro. To learn about creating a Developer team for your organization, see https://help.miro.com/hc/en-us/articles/4766759572114-Enterprise-Developer-teams.

Role required: none

About this task

The Miro external content connector retrieves searchable text content and metadata from boards in your Miro source system using the Miro REST API.

To allow the connector to access your Miro source system via the Miro REST API, you must configure and authorize an OAuth 2.0 application in the Miro Developer Hub. Your connector administrator can use settings copied from the OAuth 2.0 application to configure the Miro external connector for proper connection to your source system.

Procedure

1. In the Miro Developer Hub, create a new application for the Miro external content connector.
   a. Navigate to https://developers.miro.com/ and log in with your Company Admin credentials.
   b. Navigate to **Your apps**, then select **Create a new app**.
      If you haven't created an app before, the app creation link may show **Create your first app** instead of **Create a new app**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Profile settings screen appears and displays a Create new app modal window.

c. In the Create new app modal window, enter a name for your new app.
As an example, you might enter `Miro external content connector`.

d. Select the Developer team for your new app.

e. Select the **Expire user authentication token** option.

f. Select **Create app**.

The Profile settings page displays settings for your new app.

2. Record the client settings for your new app.

a. In the App Credentials section of the app's settings screen, copy the client ID for your new app and record it in a secure location.

> **Important:** Your external content connector administrator needs this client ID when configuring the Miro external content connector.

b. Copy the client secret for your new app and record it in a secure location.

> **Important:** Your external content connector administrator needs this client secret when configuring the Miro external content connector.

3. Configure the OAuth 2.0 redirect URI for your new application.

a. In the Redirect URI for OAuth 2.0 section of the app's settings screen, enter `https://<instance-name>.service-now.com/oauth_redirect.do`, replacing `<instance-name>` with your ServiceNow AI Platform® instance hostname.

b. Select **Add**.
The new redirect URI appears in the application's settings.

4. Configure permissions for your new application.

a. In the Permissions section of the app's settings screen, select the options for the following permissions in the All plans listing:

- boards:read
- identity:read
- team:read

b. Select the options for the following permissions in the Enterprise plan only listing:

- organizations:read
- organizations:teams:read
- projects:read

Your permissions changes are automatically saved as you make them.

What to do next

Provide the following items to your connector administrator:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The OAuth 2.0 application client ID that you copied in step 2.a
- The OAuth 2.0 application client secret that you copied in step 2.b

Your connector administrator needs these items to configure a Miro external content connector to retrieve searchable text content and metadata and security principals from your Miro source system.

For details on creating and configuring a Miro external content connector, see Create a Miro external content connector.

Create a Miro external content connector

Create an external content connector to retrieve searchable text content and metadata and security principals from your Miro source system.

Before you begin

A source system administrator must have already configured your Miro source system to allow access by the Miro external content connector. For the required source system configuration steps, see Configure Miro for external content indexing.

You need a Miro account with the Company Admin role for your organization. To learn about admin roles in Miro, see https://help.miro.com/hc/en-us/articles/14766440626834-Understand-admin-roles-and-their-privileges.

Role required: sn_ext_conn.xcc_admin or admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Miro** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Miro external content connector.
Client ID	Client ID for the OAuth 2.0 application that grants the connector access to your Miro source system. If you don't have this client ID, ask your Miro administrator for it.
Client Secret	Client secret for the OAuth 2.0 application that grants the connector access to your Miro source system. If you don't have this client secret, ask your Miro administrator for it.

6. Save and validate your connection settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Validate Connection**.
You're prompted to add the OAuth 2.0 application to a Miro team.

b. In the Select a team field, select the Miro team that owns all Spaces you want the external content connector to crawl.

c. Select **Add**.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Miro external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Miro external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Miro external content connector

Specify the Spaces and boards you want your Miro external content connector to crawl. Define inclusion or exclusion filters to restrict the content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Miro external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Miro external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Miro external content connector crawls all accessible Spaces from its specified source system and sends searchable text content and metadata from all boards it finds to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the Spaces to crawl when running content crawls
- Inclusion or exclusion filters for the boards to retrieve searchable text content and metadata from when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Miro external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Dates** options:
   - To only retrieve searchable text content and metadata from boards that were published in the last year, select **Published last year**.
   - To only retrieve searchable text content and metadata from boards that were published in the last quarter, select **Published last quarter**.
   - To only retrieve searchable text content and metadata from boards that were published in the last month, select **Published last month**.
   - To only retrieve searchable text content and metadata from boards that were published in the last week, select **Published last week**.
5. Select one of the following **Spaces** options:
   - To crawl boards from all Spaces found on the source system, select **Crawl all spaces**.
   - To crawl only boards from a specified set of Spaces, select **Include only these spaces**, then use the **Add space ID to include** field and **Add** button to enter IDs for Spaces with boards that you want the connector to include when crawling.

     As an example, you might enter `3458764623126768011` to only retrieve searchable text content and metadata from boards in the Space with the specified ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl boards from all but a specified set of Spaces, select **Exclude only these spaces**, then use the **Add space ID to exclude** field and **Add** button to enter IDs for Spaces with boards you want the connector to exclude when crawling.

  As an example, you might enter `3074457347343237232` to exclude searchable text content and metadata from boards in the Space with the specified ID.

6. Select one of the following **Boards** options:
   - To retrieve searchable text content and metadata from all boards found in the source system, select **Crawl all boards**.
   - To retrieve searchable text content and metadata from only a specified set of boards found in the source system, select **Include only these boards**, then use the **Add board ID to include** field and **Add** button to enter IDs for boards you want the connector to include when crawling.

     As an example, you might enter `uXjVJYMjOOM=` and `o9J_1eLUTqM=` to only retrieve searchable text content and metadata from boards with the specified IDs.
   - To retrieve searchable text content and metadata from all but a specified set of boards found in the source system, select **Exclude only these boards**, then use the **Add board ID to exclude** field and **Add** button to enter IDs for boards you want the connector to exclude when crawling.

     As an example, you might enter `uXjVK7XkyFY=` to exclude searchable text content and metadata from the board with the specified ID.
7. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
8. Select **Save and validate**.

Result

The Miro external content connector is updated with your modified crawl settings.

What to do next

To retrieve searchable text content and metadata from your Miro source system using your modified crawl settings, create and run a one-time content crawl for your Miro external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

monday.com external content connector

The monday.com external content connector crawls workspaces, boards, board items, and workdocs from your monday.com source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure monday.com for external content indexing

Obtain an API token for a monday.com user account with admin privileges to allow the monday.com external content connector to access searchable content and metadata from your monday.com source system.

Before you begin

Your monday.com account must have administrator privileges or API access for your monday.com organization.

Your monday.com account must also have permissions to access all the workspaces, boards, board items, and workdocs that you want the monday.com external content connector to retrieve searchable content and metadata from.

Role required: none

About this task

The monday.com external content connector retrieves searchable content from workspaces, boards, board items, and workdocs found in your monday.com source system using the monday.com API.

To allow the connector to access your monday.com source system via the monday.com API, you need an API token for a monday.com user account with administrator privileges or API access. Your connector administrator can use this API token and the monday.com API endpoint URL to configure the monday.com external connector for proper connection to your source system.

Procedure

1. Log in to monday.com with your credentials.
2. If your account has administrator privileges, perform these steps.
   a. Open the context menu by selecting your profile picture.
   b. Navigate to **Administration** > **Connections** > **Personal API token**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Copy the value of your personal API token and store it in a secure location.

> **Important:** Your external content connector administrator needs this API token when configuring the monday.com external content connector.

3. If your account doesn't have administrator privileges but has API access, perform these steps.

a. Open the context menu by selecting your profile picture.

b. Select **Developers**.
The monday.com Developer Center opens.

c. In the Developer Center, navigate to **API token**.

d. On the API token page, display your personal API token by selecting **Show**.

e. Copy the value of your personal API token and store it in a secure location.

> **Important:** Your external content connector administrator needs this API token when configuring the monday.com external content connector.

What to do next

Provide the following items to your connector administrator:

- The URL for the monday.com API endpoint. This is typically `https://api.monday.com/v2`. To find the current API endpoint URL, see https://developer.monday.com/api-reference/docs/introduction-to-graphql.
- The API token that you copied in step 2.c or step 3.e.

Your connector administrator needs these items to configure a monday.com external content connector to retrieve searchable content and metadata from workspaces, boards, board items, workdocs, and security principals found in your monday.com source system.

For details on creating and configuring a monday.com external content connector, see Create a monday.com external content connector.

Create a monday.com external content connector

Create an external content connector to retrieve searchable content and security principals from your monday.com source system.

Before you begin

A source system administrator must have already configured your monday.com source system to allow access by the monday.com external content connector. For the required source system configuration steps, see Configure monday.com for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Choose source page, select the *monday.com* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this monday.com external content connector.
URL	URL for the monday.com API. This URL typically has the value `https://api.monday.com/v2`. If you don't have the monday.com API URL, ask your monday.com administrator for it.
Auth Token	Personal API token for a monday.com user account with either administrator privileges or API access. The monday.com external content connector uses this token to authenticate as the admin user when running crawls. If you don't have the authentication token, ask your monday.com administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

> **Note:** If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a monday.com external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a monday.com external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a monday.com external content connector

Specify the workspaces you want your monday.com external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the monday.com external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a monday.com external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the monday.com external content connector crawls all workspaces, boards, items, and workdocs found in its specified source system and sends them

all to AI Search for indexing. Only perform this task if you want the connector to apply inclusion or exclusion filters for the workspaces to crawl when running content crawls.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the monday.com external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Workspaces** options:
   - To crawl all workspaces from the source system, select **Crawl all workspaces**.
   - To crawl only a specified set of workspaces from the source system, select **Include only these workspaces**, then use the **Add workspaces to include** field and **Add** button to enter URLs for workspaces you want the connector to include when crawling.

     As an example, you might enter `https://example.monday.com/workspaces/2871949` to only retrieve searchable content from the specified workspace.
   - To crawl all but a specified set of workspaces from the source system, select **Exclude only these workspaces**, then use the **Add workspaces to exclude** field and **Add** button to enter URLs for workspaces you want the connector to exclude when crawling.

     As an example, you might enter `https://example.monday.com/workspaces/6743223` to exclude searchable content from the specified workspace.
5. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

This option is only available when the Platform Multimodal Service plugin is activated on your instance.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

6. Select **Save and validate**.

Result
The monday.com external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your monday.com source system using your modified crawl settings, create and run a one-time content crawl for your monday.com external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Notion external content connector

The Notion external content connector retrieves pages and files from your Notion source system and makes their content and metadata searchable in AI Search applications.

Search administrators can run or schedule content crawls to retrieve updated content from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Important: The Notion external content connector doesn't retrieve per-user permissions when running content crawls. All content indexed by the connector is searchable by all mapped users who have access to your configured AI Search experience.

Related topics

Configure Notion for external content indexing

Create and authorize an internal integration in the Notion integrations dashboard to allow the Notion external content connector to access your Notion source system.

Before you begin
You need a Notion account with the Workspace owner role for your organization's workspace. To learn about workspace member roles, see the Manage members & guests Notion help resource.

Role required: none

About this task
The Notion external content connector retrieves pages and files from your Notion source system using the Notion REST API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To allow the connector to access your Notion source system via the Notion REST API, you must configure and authorize an internal integration in the Notion integrations dashboard. Your connector administrator can use settings copied from the internal integration to configure the Notion external connector for proper connection to your source system.

Important: The Notion external content connector doesn't retrieve per-user permissions when running content crawls. All content indexed by the connector is searchable by all mapped users who have access to your configured AI Search experience.

Procedure

1. In the Notion integrations dashboard, create a new internal integration for the Notion external content connector.
   a. Navigate to https://www.notion.so/profile/integrations and log in with your Notion credentials.
   b. Select **New integration**.
   c. Enter a name for your new integration.
   As an example, you might enter `Notion external content connector`.
   d. Select your organization's workspace as the workspace to associate with your new integration.
   e. Set your new integration's type to **Internal**.
   f. Select **Save**.

   A message indicates that your new internal integration was successfully created and shows a **Configure integration settings** button.
2. Get the secret for your new internal integration.
   a. Select **Configure integration settings**.
   The Configuration page for your new internal integration appears.
   b. Locate the internal integration secret and display its value by selecting **Show**.
   c. Copy the internal integration secret and record it in a secure location.

   Important: Your external content connector administrator needs this internal integration secret when configuring the Notion external content connector.
3. Configure the capabilities for your new internal integration.
   a. In the Capabilities section, under Content Capabilities, select the **Read content** option if it's not already selected.
   b. In the Capabilities section, under User Capabilities, select the **Read user information including email address** option if it's not already selected.
4. Perform the following steps to enable your new internal integration for each page in your workspace that you want the Notion external content connector to be able to retrieve searchable content and metadata from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Enabling your internal integration for a page automatically enables it for all of that page's subpages.

a. Navigate to the selected Notion page.

b. In the menu at the upper right of the page, navigate to **...** > **Connections** > **Add connection**.

c. Select your new internal integration from the list of available connections.

d. Select **Confirm**.
The selected Notion page and all of its subpages are added to your internal integration, allowing the Notion external content connector to retrieve their searchable content and metadata.

What to do next

Provide the internal integration secret that you copied in step 2.c to your connector administrator.

Your connector administrator needs this item to configure a Notion external content connector to retrieve pages, files, and security principals from your Notion source system.

For details on creating and configuring a Notion external content connector, see Create a Notion external content connector.

Create a Notion external content connector

Create an external content connector to retrieve searchable content and security principals from your Notion source system.

Before you begin

A source system administrator must have already configured your Notion source system to allow access by the Notion external content connector. For the required source system configuration steps, see Configure Notion for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Notion* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Notion external content connector.
Authentication token	Secret for the internal integration created to allow the connector to access your Notion workspace. If you don't have the internal integration secret, ask your Notion administrator for it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Save your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection setting entries fails, the system shows an error message. Verify your connection settings to ensure they're correct.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Notion external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Notion external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

Important: The Notion external content connector doesn't retrieve per-user permissions when running content crawls. All content indexed by the connector is searchable by all mapped users who have access to your configured AI Search experience.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Notion external content connector

Specify the pages you want your Notion external content connector to crawl and feed to AI Search for indexing.

Before you begin

A connector administrator must have already created the Notion external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Notion external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

The Notion external content connector crawls pages in your Notion workspace. To make a page eligible for crawling, you must add a connection from that page to the internal integration registered for the Notion external content connector.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Notion external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select **Go to Notion to share content**, then perform the following steps in your Notion workspace for each page you want the connector to be able to retrieve searchable content, metadata, and files from:
   a. Navigate to the selected Notion page.
   b. In the menu at the upper right of the page, navigate to **. . .** > **Connections** > **Add connection**.
   c. Select the internal integration registered for the Notion external content connector from the list of available connections.
   d. Select **Confirm**.
   A **Configured** status indicator appears once you've added the internal integration as a connection for one or more pages in your Notion workspace.
5. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
6. Select **Save and validate**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The Notion external content connector is updated with your modified crawl settings.

> **Important:** The Notion external content connector doesn't retrieve per-user permissions when running content crawls. All content indexed by the connector is searchable by all mapped users who have access to your configured AI Search experience.

What to do next
To retrieve content from your Notion source system using your modified crawl settings, create and run a one-time content crawl for your Notion external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

SAP DMS external content connector

The SAP DMS external content connector retrieves documents from repositories in your SAP Document Management System instance and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Create a subaccount in the SAP Business Technology Platform (BTP)

Create a subaccount with required entitlements in your SAP global account using the SAP BT cockpit. You need this subaccount in order to configure SAP access for the SAP DMS external content connector.

Before you begin
You must be a global account administrator on the SAP Business Technology Platform (BTP). Your global account must be authorized to access the SAP Document Management Service.

Role required: none

About this task
This task is optional. To configure the SAP DMS external content connector, you need a subaccount in your SAP BTP global account, with these entitlements:

- Document Management Service, Application Option
- Document Management Service, Integration Option
- Document Management Service, Repository Option
- Cloud Foundry Environment
- Authorization and Trust Management Service

If your SAP BTP global account already includes a subaccount with these entitlements, you can skip this task and go on to configure your SAP BTP global account to allow access by the connector. For details on this procedure, see Configure SAP DMS for external content indexing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a new subaccount in your global account.
   a. Log in to the SAP Business Technology Platform (BTP) at https://cockpit.btp.cloud.sap/ using your global account credentials.
   b. Select **Create** > **Subaccount**.
   c. Enter a display name for your new subaccount.
   As an example, you might enter `SAP DMS external content connector subaccount`.
   d. **Optional:** Enter a description for your new subaccount.
   e. Enter a subdomain for your new subaccount.
   f. Select the desired region for your new subaccount.
   g. Select a parent for your new subaccount.
   The parent can be your global account or a directory.
   h. Select **Create**.

   SAP BTP creates your new subaccount.
2. Create a Cloud Foundry organization in your new subaccount.
   a. Select your new subaccount and navigate to its Overview page.
   b. Select **Enable Cloud Foundry**.
   c. On the Enable Cloud Foundry form, in the Plan field, select the plan for the Cloud Foundry runtime.
   d. In the Org Name field, enter a name for your new Cloud Foundry organization.
   As an example, you might enter `sap-dms-integrate`.
   e. Select **Create**.

   SAP BTP creates the new Cloud Foundry organization for your new subaccount.
3. Create a new Cloud Foundry space named **DMS** in the Cloud Foundry organization for your new subaccount.
   a. Navigate to the **Cloud Foundry** > **Spaces** page for your new subaccount.
   b. Select **Create Space**.
   c. On the Create Space form, enter `DMS` as the name for your new space.
   d. Select the options for the **Space Developer** and **Space Manager** roles.
   e. Select **Save**.
   SAP BTP creates the new Cloud Foundry space in the Cloud Foundry organization for your new subaccount.
4. Add a service plan for the SAP Document Management Service to your new subaccount.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to your global account.

b. In the menu, navigate to **Entitlements** > **Entity Assignments**.

c. In the Subaccounts/Directories field, search for and select your new subaccount.

d. In the My Subaccount pane, select **Edit**.

e. Select **Add Service Plans**.

f. In the Services section, search for and select the **Document Management Service, Integration Option** entry.

g. In the Service Details pane, in the Available Plans field, select the **standard** plan.

h. Select **Add 1 Service Plan**.

i. Select **Save**.

SAP BTP adds the service plan to your new subaccount.

What to do next

Now that you've created a subaccount with the required entitlements, go on to configure service instances and service keys in your SAP BTP global account. For details on this procedure, see Configure SAP DMS for external content indexing.

Create a SAP user and role collection

Create a user and a role collection in the SAP Business Technology Platform (BTP) cockpit. The SAP DMS external content connector needs this user account to access your SAP DMS content.

Before you begin

You must be a global account administrator on the SAP BTP.

A SAP global account administrator must have created a subaccount in your SAP BTP global account, with these entitlements:

- Document Management Service, Application Option
- Document Management Service, Integration Option
- Document Management Service, Repository Option
- Cloud Foundry Environment
- Authorization and Trust Management Service

If you don't already have a subaccount with these entitlements in your SAP BTP global account, perform the Create a subaccount in the SAP Business Technology Platform (BTP) preliminary task before performing this task.

Role required: none

About this task

The SAP DMS external content connector requires a user account with specific roles. Create a role collection with these roles and assign it to a user account to allow the connector to access your SAP DMS folders and files.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a new user account for use with the SAP DMS external content connector.

   a. Log in to the SAP Business Technology Platform (BTP) at https://cockpit.btp.cloud.sap/ using your global account credentials.

   b. In the Subaccounts tab, select your subaccount with the aforementioned entitlements.

   c. Navigate to **Security** > **Users**.

   d. Select **Create**.

   e. On the Create User form, fill in the fields.

Field	Description
User Name	Enter a name for this user account.
Identity Provider	Select **Default identity provider**.
E-Mail	Enter the email address for this user account.

   f. Select **Create**.

   The SAP BTP creates your new user account.

2. Create a new role collection.

   a. From your subaccount, navigate to **Security** > **Roles Collections**.

   b. Select **Create**.

   c. On the Create Role Collection form, enter a name for your role collection.

   d. Select **Create**.
   The SAP BTP creates your new role collection.

3. Assign the required roles to your new role collection.

   a. In your subaccount, search for and then select the name of your new role collection.

   b. On the form for your new role collection, select **Edit**.

   c. Select the name of your new role collection.

   d. Select each of the following roles.

   - SDMWeb_Admin
   - SDMWeb_Migration
   - SDMWeb_User
   - SDM_MobileAdmin
   - SDM_Admin

   e. Select **Add**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Assign your new role collection to your new user account.
   a. From the Users list, search for and select the name of your new user account.
   b. Select **Assign Role Collection**.
   c. Select the name of your new role collection.
   d. Select **Assign Role Collection**.

Configure SAP DMS for external content indexing

Create service instances and service keys in your SAP Business Technology Platform (BTP) global account to allow the SAP DMS external content connector to access your SAP DMS documents and repositories.

Before you begin

You must be a global account administrator on the SAP BTP. Your global account must be authorized to access the SAP Document Management Service.

A SAP global account administrator must have created a subaccount in your SAP BTP global account, with these entitlements:

- Document Management Service, Application Option
- Document Management Service, Integration Option
- Document Management Service, Repository Option
- Cloud Foundry Environment
- Authorization and Trust Management Service

If you don't already have a subaccount with these entitlements in your SAP BTP global account, perform the Create a subaccount in the SAP Business Technology Platform (BTP) preliminary task before performing this task.

Role required: none

About this task

The SAP DMS external content connector retrieves documents from repositories in your SAP DMS source system using the Document Management Service, Integration Option REST API.

To allow the connector to access your SAP DMS source system via this API, you must configure service instances and service keys in the SAP DMS Business Technology Platform (BTP). Your connector administrator can use settings copied from your new service keys to configure the SAP DMS external connector for proper connection to your source system.

Procedure

1. Create a service instance for the Document Management Service, Application Option in your subaccount.
   a. Log in to the SAP Business Technology Platform (BTP) at https://cockpit.btp.cloud.sap/ using your global account credentials.
   b. In the Subaccounts tab, select your subaccount.
   c. Navigate to **Service Marketplace**.
   d. Search for and select the **Document Management Service, Application Option** entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Create**.

f. On the New Instance or Subscription form, fill in the fields.

Field	Description
Plan	Select **standard**, then select the disclaimer option.
Runtime Environment	Select **Cloud Foundry**.
Space	Enter the name of the Cloud Foundry space you created for your subaccount. If you followed the subaccount creation steps from Create a subaccount in the SAP Business Technology Platform (BTP), this name is `DMS`.
Instance Name	Enter a name of your choice. As an example, you might enter `DMS - AO`.

g. Select **Create**.
SAP BTP creates the Document Management Service, Application Option service instance in your subaccount.

2. Create a service key for your new Document Management Service, Application Option service instance.

a. From your subaccount, navigate to **Instances and Subscriptions**.

b. In the Subscriptions tab, in the row for your new Document Management Service, Application Option service instance, select **...** > **Create Service Key**.

c. On the New Service Key form, enter a name for your new service key.
As an example, you might enter `DMS - AO`.

d. Select **Create**.
SAP BTP creates the Document Management Service, Application Option service key in your subaccount.

3. Create a service instance for the Document Management Service, Integration Option in your subaccount.

a. Log in to the SAP Business Technology Platform (BTP) at https://cockpit.btp.cloud.sap/ using your global account credentials.

b. In the Subaccounts tab, select your subaccount.

c. Navigate to **Service Marketplace**.

d. Search for and select the **Document Management Service, Integration Option** entry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Create**.

f. On the New Instance or Subscription form, fill in the fields.

Field	Description
Plan	Select **standard**, then select the disclaimer option.
Runtime Environment	Select **Cloud Foundry**.
Space	Enter the name of the Cloud Foundry space you created for your subaccount. If you followed the subaccount creation steps from Create a subaccount in the SAP Business Technology Platform (BTP), this name is `DMS`.
Instance Name	Enter a name of your choice. As an example, you might enter `DMS-IO`.

g. Select **Create**.
SAP BTP creates the Document Management Service, Integration Option service instance in your subaccount.

4. Create a service key for your new Document Management Service, Integration Option service instance and copy its client settings and API URL.

a. From your subaccount, navigate to **Instances and Subscriptions**.

b. In the Subscriptions tab, in the row for your new Document Management Service, Integration Option service instance, select **...** > **Create Service Key**.

c. On the New Service Key form, enter a name for your new service key.
As an example, you might enter `DMS-IO`.

d. Select **Create**.
SAP BTP creates the Document Management Service, Integration Option service key in your subaccount.

e. In the Service Keys section, view your new service key by selecting **...** > **View** in its entry.

f. On the Credentials form, copy the **clientid**, **clientsecret**, and **url** values from the **uaa** section and store them in a secure location.

> **Important:** Your external content connector administrator needs these client setting values when configuring the SAP DMS external content connector.

g. On the Credentials form, copy the **url** field value from the endpoints section's ecmservice entry and store it in a secure location.

> **Important:** Your external content connector administrator needs this endpoint URL when configuring the SAP DMS external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. On the Credentials form, copy the **apiurl** field value and store it in a secure location.

> **Important:** Your external content connector administrator needs this role collections endpoint URL when configuring the SAP DMS external content connector.

i. On the Credentials form, copy the portion of the **xsappname** field value that appears after the pipe | symbol and store it in a secure location.
As an example, if the **xsappname** field value is `673dc63a-f785-4225-b974-de10815701fc!b23581|sdm-di-DocumentManagement-sdm_integration!b62497`, the portion of the value to copy is `sdm-di-DocumentManagement-sdm_integration!b62497`.

5. Create a service instance for the Document Management Service, Repository Option in your subaccount.

a. Log in to the SAP Business Technology Platform (BTP) at https://cockpit.btp.cloud.sap/ using your global account credentials.

b. In the Subaccounts tab, select your subaccount.

c. Navigate to **Service Marketplace**.

d. Search for and select the **Document Management Service, Repository Option** entry.

e. Select **Create**.

f. On the New Instance or Subscription form, fill in the fields.

Field	Description
Plan	Select **standard**, then select the disclaimer option.
Runtime Environment	Select **Cloud Foundry**.
Space	Enter the name of the Cloud Foundry space you created for your subaccount. If you followed the subaccount creation steps from Create a subaccount in the SAP Business Technology Platform (BTP), this name is DMS.
Instance Name	Enter a name of your choice. As an example, you might enter DMS-R0.

g. Select **Create**.
SAP BTP creates the Document Management Service, Repository Option service instance in your subaccount.

6. Create a service key for your new Document Management Service, Repository Option service instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From your subaccount, navigate to **Instances and Subscriptions**.

b. In the Subscriptions tab, in the row for your new Document Management Service, Repository Option service instance, select **...** > **Create Service Key**.

c. On the New Service Key form, enter a name for your new service key.
As an example, you might enter `DMS-RO`.

d. Select **Create**.
SAP BTP creates the Document Management Service, Repository Option service key in your subaccount.

7. Create a service instance for the Authorization and Trust Management Service in your subaccount.

a. From your subaccount, navigate to **Services** > **Service Marketplace**.

b. Search for and select the **Authorization and Trust Management Service** entry.

c. Select **Create**.

d. On the New Instance or Subscription form, fill in the fields.

Field	Description
Plan	Select **apiaccess**.
Runtime Environment	Select **Cloud Foundry**.
Space	Enter the name of the Cloud Foundry space you created for your subaccount. If you followed the subaccount creation steps from Create a subaccount in the SAP Business Technology Platform (BTP), this name is `DMS`.
Instance Name	Enter a name of your choice. As an example, you might enter `ATMS`.

e. Select **Next**.

f. On the New Instance or Subscription form, paste the following JSON code into the Configure instance parameters text entry field, replacing `<instance-name>` with the name of your ServiceNow AI Platform instance.

```
{
  "xsappname": "dms-servicenow-client",
  "tenant-mode": "dedicated",
  "description": "XSUAA config for DMS API access via IAS",
  "oauth2-configuration": {
    "redirect-uris": [
      "https://<instance-name>.service-now.com/oauth_redirect.do"
    ],
    "grant-types": [
```

            "scope-references": [
                "$XSAPPNAME.DMSAdministrator"
            ]
        }
    ],
    "authorities": [
        "$XSAPPNAME.DMSViewer",
        "$XSAPPNAME.DMSContributor",
        "$XSAPPNAME.DMSAdministrator"
    ]
}
```

g. Select **Create**.
SAP BTP creates the service instance for the Authorization and Trust Management Service in your subaccount.

8. Create a service key for your new Authorization and Trust Management Service instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From your subaccount, navigate to **Instances and Subscriptions**.

b. In the Subscriptions tab, in the row for your new Authorization and Trust Management Service instance, select **...** > **Create Service Key**.

c. On the New Service Key form, enter a name for your new service key.
As an example, you might enter `ATMS`.

d. Select **Create**.
SAP BTP creates the service key for the Authorization and Trust Management Service in your subaccount.

e. In the Service Keys section, view your new service key by selecting **...** > **View** in its entry.

f. On the Credentials form, copy the **clientid**, **clientsecret**, and **url** values from the service key section and store them in a secure location.

> **Important:** Your external content connector administrator needs these client setting values when configuring the SAP DMS external content connector.

9. Create a new instance for the Authorization and Trust Management Service with the application plan in your SAP BTP subaccount.

a. From your subaccount, navigate to **Services** > **Instances and Subscriptions**.

b. Select **Create**.

c. On the New Instance or Subscription form's Basic Info page, fill in the fields.

Field	Description
Service	Select **Authorization and Trust Management Service**.
Plan	Select **application**.
Runtime Environment	Select **Cloud Foundry**.
Space	Select **DMS**. **Note:** This is the name of the Cloud Foundry space you created for your SAP BTP subaccount. For details on this procedure, see Create a subaccount in the SAP Business Technology Platform (BTP).
Instance Name	Enter a unique name for this service instance.

d. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. On the New Instance or Subscription form's Parameters page, paste the following JSON code into the Configure instance parameters text entry field, replacing `<service-name>` with the name you entered for the new Authorization and Trust Management Service instance with the application plan in step 9.c, `<instance-name>` with the name of your ServiceNow AI Platform instance, and `<xsappname>` with the **xsappname** substring that you copied in step 4.i.

```
{
  "xsappname": "<service-name>",
  "tenant-mode": "dedicated",
  "description": "XSUAA config for DMS API access via IAS",

f. Select **Create**.
SAP BTP creates the service instance for the Authorization and Trust Management Service with the application plan in your subaccount.

10. Create a service key for your new Authorization and Trust Management Service instance with the application plan.

a. From your subaccount, navigate to **Instances and Subscriptions**.

b. In the Subscriptions tab, in the row for your new Authorization and Trust Management Service instance with the application plan, select **...** > **Create Service Key**.

c. On the New Service Key form, enter a name for your new service key.
As an example, you might enter `ATMS-app-plan`.

d. Select **Create**.
SAP BTP creates the service key for the Authorization and Trust Management Service instance with the application plan in your subaccount.

e. In the Service Keys section, view your new service key by selecting **...** > **View** in its entry.

f. On the Credentials form, copy the **clientid** and **clientsecret** values from the service key section and store them in a secure location.

> **Important:** Your external content connector administrator needs these client setting values when configuring the SAP DMS external content connector.

11. Copy the base web URL for documents in your SAP DMS tenant.

a. Log in to your SAP DMS tenant using your global account credentials.

b. Navigate to a repository of your choice.

c. In the repository, navigate to a folder of your choice that contains one or more documents.

d. Select **...** in any document entry, then select **Show properties** from the context menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Copy the **Web Link** for the document, then extract the base web URL and store it in a secure location.

The base web URL is the portion of the **Web Link** URL that ends with `/open`. As an example, if the **Web Link** URL is `https://example.sap.com/cp.portal/site#user-display?sap-ui-app-id-hint=com.sap.ecm.sdm.user&/documents/v1/open/rep=ABCDE&obj=12345&vs=1`, the base web URL is `https://example.sap.com/cp.portal/site#user-display?sap-ui-app-id-hint=com.sap.ecm.sdm.user&/documents/v1/open`.

Important: Your external content connector administrator needs this base web URL when configuring the SAP DMS external content connector.

What to do next

Provide the following items to your connector administrator:

- The client ID, client secret, and access token URL that you copied from the service key for the Document Management Service, Integration Option service instance in step 4.f.
- The ecmservice endpoint URL that you copied from the service key for the Document Management Service, Integration Option service instance in step 4.g.
- The role collections endpoint URL that you copied from the service key for the Document Management Service, Integration Option service instance in step 4.h.
- The client ID, client secret, and access token URL that you copied from the service key for the Authorization and Trust Management Service instance in step 8.f.
- The client ID and client secret that you copied from the service key for the Authorization and Trust Management Service instance with the application plan in step 10.f.
- The base web URL that you copied in step 11.e.

Your connector administrator needs these items to configure a SAP DMS external content connector to retrieve documents and security principals from your SAP DMS source system.

For details on creating and configuring a SAP DMS external content connector, see Create a SAP DMS external content connector.

Create a SAP DMS external content connector

Create an external content connector to retrieve searchable content and security principals from your SAP DMS source system.

Before you begin

A source system administrator must have already configured your SAP DMS source system to allow access by the SAP DMS external content connector. For the required source system configuration steps, see Configure SAP DMS for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *SAP* **Document Management System** tile, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this SAP DMS external content connector.
Client ID	Client ID from the service key for the Document Management Service, Integration Option service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the client ID from this service key, ask your SAP DMS administrator for it.
Client secret	Client secret from the service key for the Document Management Service, Integration Option service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the client secret from this service key, ask your SAP DMS administrator for it.
Connection URL	URL from the service key for the Document Management Service, Integration Option service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the URL from this service key, ask your SAP DMS administrator for it.
Base Web URL	Base web URL for documents in your SAP DMS tenant. If you don't have the base web URL, ask your SAP DMS administrator for it.
Endpoint URL	Endpoint URL for the ecmservice from the service key for the Document Management Service, Integration Option service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the endpoint URL from this service key, ask your SAP DMS administrator for it.
Role Collections Endpoint	Role collections endpoint URL from the service key for the Document Management Service, Integration Option service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the role collections endpoint URL from this service key, ask your SAP DMS administrator for it.
Client ID for token exchange	Client ID from the service key for the Authorization and Trust Management Service instance with the application plan that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the client ID from this service key, ask your SAP DMS administrator for it.
Client secret	Client secret from the service key for the Authorization and Trust Management Service instance with the application plan that's defined in a subaccount in your organization's SAP BTP global account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
for token exchange	If you don't have the client secret from this service key, ask your SAP DMS administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. On the Client credentials screen, fill in the client credential settings.

   Connection settings

Client credential setting	Description
Client ID	Client ID from the service key for the Authorization and Trust Management Service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the client ID from this service key, ask your SAP DMS administrator for it.
Client secret	Client secret from the service key for the Authorization and Trust Management Service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the client secret from this service key, ask your SAP DMS administrator for it.
Connection URL	URL from the service key for the Authorization and Trust Management Service instance that's defined in a subaccount in your organization's SAP BTP global account. If you don't have the connection URL from this service key, ask your SAP DMS administrator for it.

8. Save and validate your client credential settings by selecting **Validate connection**.

   Note: If validation of your client credential settings fails, the system shows an error message. Verify your client credential settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that need to be corrected. Provide the information from this message to your source system administrator.

9. After your connection settings are validated, select **Next**.
10. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a SAP DMS external content connector.

11. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
12. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
13. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a SAP DMS external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a SAP DMS external content connector

Specify the folders you want your SAP DMS external content connector to crawl. Define inclusion or exclusion filters to specify which content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the SAP DMS external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a SAP DMS external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the SAP DMS external content connector crawls all folders and repositories from its specified source system and sends all documents and their attachments with supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for documents to retrieve based on their last modification date
- Inclusion or exclusion filters for the folders to crawl when running content crawls
- Inclusion or exclusion filters for the repositories to crawl when running content crawls
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the SAP DMS external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Last modified date** options:
   - To retrieve content from all documents regardless of their last modification date, select **All**.
   - To only retrieve content from documents that were last modified in the preceding 365 days, select **Last 365 days**.
   - To only retrieve content from documents that were last modified in the preceding 180 days, select **Last 180 days**.
   - To only retrieve content from documents that were last modified in the preceding 90 days, select **Last 90 days**.
   - To only retrieve content from documents that were last modified in the preceding 30 days, select **Last 30 days**.
   - To only retrieve content from documents that were last modified in the preceding 7 days, select **Last 7 days**.
5. Select one of the following **Folders** options:
   - To crawl all folders from the source system, select **Crawl all folders**.
   - To crawl only a specified set of folders from the source system, select **Include only these folders**, then use the **Add folder ID to include** field and **Add** button to enter IDs for folders you want the connector to include when crawling.

     As an example, you might enter `9173ggdzt1671gfeja` to only retrieve searchable content from the folder with the specified ID.
   - To crawl all but a specified set of folders from the source system, select **Exclude only these folders**, then use the **Add folder ID to exclude** field and **Add** button to enter IDs for folders you want the connector to exclude when crawling.

     As an example, you might enter `48dhgdgf16712gvsa` to exclude searchable content from the folder with the specified ID.
6. Select one of the following **Repositories** options:
   - To crawl documents from all repositories on the source system, select **Crawl all repositories**.
   - To crawl only documents from a specified set of repositories on the source system, select **Include only these repositories**, then use the **Add repositories name or ID to include** field and **Add** button to enter names or IDs for repositories you want the connector to include when crawling.

     As an example, you might enter `5b01d7f6-6263-4aeb-9b75-2186db9b201e` and `production-repo` to only retrieve documents from the specified repositories.
   - To crawl documents from all but a specified set of repositories on the source system, select **Exclude only these repositories**, then use the **Add repositories name or ID to exclude** field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and **Add** button to enter names or IDs for repositories you want the connector to exclude when crawling.

As an example, you might enter `d11d7f07-c4ad-4742-b17d-c078869e54a5` and `test-repo` to exclude documents from the specified repositories.

7. Select one of the following **Attachments** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file types**, then use the **File types to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file types**, then use the **File types to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
8. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
9. Select **Save and validate**.

Result

The SAP DMS external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your SAP DMS source system using your modified crawl settings, create and run a one-time content crawl for your SAP DMS external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

SAP SuccessFactors external content connector

The SAP SuccessFactors external content connector parses trainings exported from your SAP SuccessFactors Learning environment and makes their content and metadata searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The SAP SuccessFactors connector runs content and user permission crawls. Unlike most connector crawls, these crawls don't retrieve content or security principals directly from your SAP SuccessFactors Learning source system. Instead, content retrieval involves these steps:

1. As a one-time step, a SAP SuccessFactors Learning admin creates three custom reports that retrieve the user, library and assignment, and training item data needed by the connector. These custom reports can be imported into SAP SuccessFactors Learning environments as needed.
2. On a schedule of your choosing, a SAP SuccessFactors Learning admin runs the custom reports in your SAP SuccessFactors Learning environment. This process exports three comma-separated value (CSV) data files containing trainings content and security principals from the selected environment.
3. After each data export, a connector administrator updates the SAP SuccessFactors connector configuration, attaching the latest exported CSV data files.
4. On a schedule of your choosing, the connector runs content and user permission crawls. During a crawl, the connector parses the attached CSV data files to discover trainings content or security principals. It sends the discovered data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Export SAP SuccessFactors Learning data for external content indexing

Export user, library and assignment, and training item data from your SAP SuccessFactors Learning environment. The SAP SuccessFactors external content connector needs this exported data to index your content and user permissions for search.

Before you begin

You need a non-production SAP SuccessFactors Learning environment configured to include the Learning Report Designer tool. To learn how to request Learning Report Designer configuration in a non-production environment, see the 2171592 - Process to enable the use of Plateau Report Designer (PRD) on Learning SAP support resource.

Note: Many SAP resources still refer to the Learning Report Designer using its legacy name, Plateau Report Designer.

In both the non-production SAP SuccessFactors Learning environment and the environment that you want the connector to retrieve data from, you need administrator accounts with the following report permissions:

- Edit Report
- Import/Export Reports
- Publish/Unpublish Reports
- Run [report title] Report
- Run Unpublished Reports
- Search Reports
- View Report Query

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on these report permissions in SAP SuccessFactors Learning, see the Report Permissions SAP Help Portal resource.

In the non-production SAP SuccessFactors Learning environment that has Learning Report Designer enabled, your administrator account needs the REPORT_DEVELOPER role. For details on adding this role to an administrator account, see the Setting up a Plateau Report Designer Account SAP Help Portal resource.

The Learning Report Designer tool must be downloaded and installed on a Windows workstation with a 32-bit Java Runtime Environment (JRE). You must have configured Learning Report Designer to connect to your non-production SAP SuccessFactors Learning environment. To learn about these procedures, see the Downloading Learning Report Designer SAP Help Portal resource.

Role required: none

About this task

Unlike most other external content connectors, the SAP SuccessFactors connector doesn't retrieve content and metadata directly from your source system.

Instead, the SAP SuccessFactors external content connector retrieves user, library and assignment, and training item data from three comma-separated value (CSV) files. These CSV data files are generated using custom reports that you run in your SAP SuccessFactors Learning environment. Your connector administrator needs these generated CSV data files to configure the SAP SuccessFactors external content connector.

Perform these steps to import the custom reports into your SAP SuccessFactors Learning environment and generate the three CSV data files required by the SAP SuccessFactors connector.

Procedure

1. On your Windows workstation that has Learning Report Designer installed, download the three custom report ZIP archive files attached to the External Content Connector (XCC) for SAP SuccessFactors - Attach report SQL [KB3047950] article in the Now Support Knowledge Base.
2. Start Learning Report Designer and use it to edit the SQL query for one of the three downloaded custom reports.

   a. Navigate to **File** > **Open File...**, then open the `Users_custom_report` report from the `Users_custom_report.zip` custom report ZIP archive file.
   To learn about opening a report in Learning Report Designer, see "Updating a System Report in Report Designer" steps 2–8 in the Using Plateau Report Designer SAP Help Portal resource.

   b. In the Data Explorer panel, expand the **Data Sets** section and double-click (or use the keyboard shortcut) to open the data set associated with the custom report query.

   c. In the query editor, find this clause in the custom report's SQL query:

```
(SELECT User_value
FROM PA_STUD_USER c
WHERE a.STUD_ID = c.STUD_ID (+)
AND c.col_num = 10) as "Custom Column 10"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Learning Report Designer query editor, edit the SQL query clause from the preceding step to reference the user mapping column for your SAP SuccessFactors Learning environment.
   Your user mapping column is the column with values that uniquely identify each user in your SAP SuccessFactors Learning environment. Values in this column might contain user IDs, email addresses, or some other uniquely identifying information.

   The SAP SuccessFactors connector uses values from your user mapping column to map users from your source system to users in your ServiceNow AI Platform® instance. This mapping is needed to preserve user access permissions for content indexed from your SAP SuccessFactors Learning environment.

   Your user mapping column may be a predefined column from the PA_STUDENT table, such as EMAIL_ADDR, or a custom column from the PA_STUD_USER table.

   - If your user mapping column is a predefined column from the PA_STUDENT table, replace the entire clause shown in the preceding step with this clause:

     ```
     a.EMAIL_ADDR AS "Email Address"
     ```

     Change the column name and alias in this clause to match your user mapping column. As an example, if your user mapping column is PA_STUDENT.STUD_ID, change the clause to refer to that column:

     ```
     a.STUD_ID AS "Student ID"
     ```

   - If your user mapping column is a custom column from the PA_STUD_USER table, change the column number in the `c.col_num = 10` condition and the `"Custom Column 10"` alias to match the column number of your custom column. As an example, if your user mapping column is a custom column with column number 20, change the last line of the clause to `AND c.col_num = 20) as "Custom Column 20"`.

4. Use Learning Report Designer to save the modified custom report.
   a. Select **Save**.
   b. In the Outline panel, select the modified report name, then select the **Zip** icon.
   c. Save the modified report to the Workspace as a ZIP archive.
5. Replace the downloaded `Users_custom_report.zip` custom report ZIP archive file with the modified copy that you saved in the preceding step.
6. Use your administrator credentials to log in to the SAP SuccessFactors Learning environment that you want the connector to retrieve trainings data for.
7. Import the custom reports from the downloaded and updated ZIP archives.
   For details on importing reports into your SAP SuccessFactors Learning environment, see the Importing Reports SAP Help Portal resource.

   Importing a report automatically grants you the Run [report title] Report permission for that report.

8. **Optional:** Make the imported custom reports accessible to other users in your SAP SuccessFactors Learning environment.

   Note: This step is only required if you want the reports to be run by users other than the user who imported them. If you will run the custom reports from your administrator account, skip to the next step.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Publish the imported custom reports.
Publishing a report makes it available to users who can access the report and who have the Run [report title] Report permission. Unpublished reports are only available to users who satisfy these conditions and who have the Run Unpublished Reports permission.

(Optional) To learn how to publish a SAP SuccessFactors Learning report, see the Publishing a Report SAP Help Portal resource.

b. For each of the imported custom reports, grant the Run [report title] Report permission to all users who will run the report.

(Optional) For details on the Run [report title] Report permission in SAP SuccessFactors Learning, see the Report Permissions SAP Help Portal resource.

9. In SAP SuccessFactors Learning, run each of the imported custom reports, specifying CSV as the report format.
To learn how to run a SAP SuccessFactors Learning report, see the Running Reports in Learning SAP Help Portal resource.

Result
The custom reports generate CSV files that include current user data, library data, assignment data, and training item data from your selected SAP SuccessFactors Learning environment.

Note: The SAP SuccessFactors external content connector can't accept CSV data files that exceed the maximum attachment size specified by the value of the `com.glide.attachment.max_size` system property. By default, this property limits the size of attachments to 1 Gb or less. For details on configuring this system property, see Maximum allowed attachment size.

What to do next
Provide the three CSV data files that you generated in step 9 to your connector administrator.

Your connector administrator needs these three files to configure a SAP SuccessFactors external content connector to retrieve trainings from your SAP SuccessFactors Learning source system.

For details on creating and configuring a SAP SuccessFactors external content connector, see Create a SAP SuccessFactors external content connector.

Note: To update the user, library and assignment, and training item data available to the SAP SuccessFactors external content connector, repeat step 9 and provide the three updated CSV data files to your connector administrator. To learn how to update the connector configuration to read these files, see Update CSV data files for a SAP SuccessFactors external content connector.

Create a SAP SuccessFactors external content connector

Create an external content connector to retrieve searchable content and security principals from your SAP SuccessFactors source system.

Before you begin
A source system administrator must have already exported user, library and assignment, and training item data from your SAP SuccessFactors Learning source system in three comma-separated value (CSV) files. For details on exporting the appropriate data from your source system in CSV format, see Export SAP SuccessFactors Learning data for external content indexing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The SAP SuccessFactors external content connector can't accept CSV data files that exceed the maximum attachment size specified by the value of the *com.glide.attachment.max_size* system property. By default, this property limits the size of attachments to 1 Gb or less. For details on configuring this system property, see Maximum allowed attachment size.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *SAP SuccessFactors* tile, then select **Next**.
5. On the Manage data page, attach the three exported CSV data files to entries in the Data tables section as follows.

   a. In the Users data table, use the **Add file** link to attach the CSV data file from the Users custom report.
   This CSV file includes the contains the User Mapping ID and Assignment Profile ID columns. Data from this file populates the user mapping table for the connector. The connector crawls this table during user permission crawls. AI Search uses the retrieved data to find the original document access restrictions to apply for each search user.

   b. In the Library and assignment profiles data table, use the **Add file** link to attach the CSV data file from the Libraries and assignment profiles custom report.
   This CSV file includes the Library ID and Assignment Profile ID columns. Data from this file links assignment profiles to libraries. The connector crawls this table during user permission crawls. AI Search uses the retrieved links to enforce the original document access restrictions for each search user.

   c. In the Trainings data table, use the **Add file** link to attach the CSV data file from the Training items custom report.
   This CSV file includes the Type ID, Item ID, Revision Date, Item Classification ID, Item Title, Item Description, Aggregated Library ID, and Locale_ID columns. Data from this file provides content and metadata for training items. The connector crawls this table during content crawls. AI Search uses the retrieved information to make training item content and metadata searchable for users with the correct access controls.

   d. In the Trainings data table, enter the URL for one of your SAP SuccessFactors source system's training items.
   AI Search analyzes this sample training item URL to determine the correct URL format for training item search results from your source system.

6. Select the **I agree to the following disclaimer** option, then select **Next**.
7. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
9. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

   When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you need to configure and run content and user mapping crawls for it. You can create content crawls for the connector from the External Content Admin Home page even if you skipped this step during connector creation.

For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Update CSV data files for a SAP SuccessFactors external content connector

Upload newly generated comma-separated value (CSV) data files to your SAP SuccessFactors external content connector. The connector reads these files to retrieve updated content and metadata from your SAP SuccessFactors Learning source system.

Before you begin
A source system administrator must have already exported updated user, library and assignment, and training item data from your SAP SuccessFactors Learning source system as three files in comma-separated value (CSV) format. To learn how to export the appropriate data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

from your source system, see Export SAP SuccessFactors Learning data for external content indexing.

Note: The SAP SuccessFactors external content connector can't accept CSV data files that exceed the maximum attachment size specified by the value of the *com.glide.attachment.max_size* system property. By default, this property limits the size of attachments to 1 Gb or less. For details on configuring this system property, see Maximum allowed attachment size.

A connector administrator must have already created the SAP SuccessFactors external content connector that parses the three CSV data files. For details on creating the connector, see Create a SAP SuccessFactors external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

Unlike most external content connectors, the SAP SuccessFactors connector doesn't automatically retrieve updated content and metadata from its source system every time it crawls. To make updated content and metadata available for retrieval in crawls, you must update the connector configuration, attaching the latest CSV-format data files exported from the source system.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors list, select the SAP SuccessFactors connector you want to update the CSV data files for, then navigate to **Settings** > **Connection settings**.
4. On the Connection settings page, attach the three exported CSV data files to entries in the Data tables section as follows.

   a. In the Users data table, use the **Add file** link to attach the CSV data file from the Users custom report.
   This CSV file includes the contains the User Mapping ID and Assignment Profile ID columns. Data from this file populates the user mapping table for the connector. The connector crawls this table during user permission crawls. AI Search uses the retrieved data to find the original document access restrictions to apply for each search user.

   b. In the Library and assignment profiles data table, use the **Add file** link to attach the CSV data file from the Libraries and assignment profiles custom report.
   This CSV file includes the Library ID and Assignment Profile ID columns. Data from this file links assignment profiles to libraries. The connector crawls this table during user permission crawls. AI Search uses the retrieved links to enforce the original document access restrictions for each search user.

   c. In the Trainings data table, use the **Add file** link to attach the CSV data file from the Training items custom report.
   This CSV file includes the Type ID, Item ID, Revision Date, Item Classification ID, Item Title, Item Description, Aggregated Library ID, and Locale_ID columns. Data from this file provides content and metadata for training items. The connector crawls this table during content crawls. AI Search uses the retrieved information to make training item content and metadata searchable for users with the correct access controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the Trainings data table, enter the URL for one of your SAP SuccessFactors source system's training items.
AI Search analyzes this sample training item URL to determine the correct URL format for training item search results from your source system.

5. Select the **I agree to the following disclaimer** option, then select **Save**.

ServiceNow® instance external content connector

The ServiceNow instance external content connector retrieves KB article records (and their attachments) from your ServiceNow AI Platform source instance and makes their content and metadata searchable in AI Search applications in your ServiceNow AI Platform destination instance.

The ServiceNow AI Platform instance that you want the external content connector to retrieve searchable content and metadata from is your source instance. The instance where the connector runs and populates search applications with the retrieved data is your destination instance.

Search administrators can run or schedule content crawls to retrieve updated content from your source instance, or user permission crawls to retrieve updated security principals from your source instance. Both types of crawl feed their data to AI Search for indexing on your destination instance.

In your destination instance, the indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Important: Your source and destination instances must be distinct from one another. Don't use the ServiceNow® instance external content connector to feed an instance's content back into itself.

User permissions

To view search results from the source instance, a user on the destination instance must satisfy the following conditions:

- There must be a matching user account defined for them on the source instance, with the same email address.
- Their user account on the source instance must have access to the content represented by the search results.

If these conditions aren't satisfied, the destination instance user won't be able to see search results crawled from the source instance.

Create a user permission crawl for an external content connector

Configure your ServiceNow AI Platform® instance for external content indexing

Create and configure a non-interactive service user account on your ServiceNow AI Platform® source instance to allow access by the ServiceNow instance external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin and security_admin

Note: The security_admin role is an elevated privilege role. To learn more about elevated privilege roles, see Elevated privilege roles. For details on the security_admin elevated privilege role, see Security_admin role.

About this task

The ServiceNow instance external content connector retrieves KB articles and security principals from a ServiceNow AI Platform instance. To allow the external content connector to access this content, you need to configure a non-interactive service user account that the connector will use when running document and user mapping crawls.

Perform all of these steps on the ServiceNow AI Platform instance that you want the external content connector to retrieve searchable content and metadata from. This is your source instance. The instance where the connector runs and populates search applications with the retrieved data is your destination instance.

Procedure

1. On your source instance, create a new non-interactive user and save its user ID.

   a. Create a new user by following the steps from Create a user.

      Note: Make sure to select the **Web service access only** option on the new user record. This option designates your new user as a non-interactive user. To learn more about how non-interactive users differ from interactive users, see Non-interactive sessions.

   b. Copy the **User ID** for your new source instance user account and store it in a secure location.

      Important: Your connector administrator needs this user account's user ID when configuring the ServiceNow instance external content connector on your destination instance.

2. On your source instance, generate and copy a strong password for your new user.

   a. Generate a strong password for your new user by following the steps from Configure password for a user.

   b. Store the copied password in a secure location.

      Important: Your connector administrator needs this user account's password when configuring the ServiceNow instance external content connector on your destination instance.

3. On your source instance, add your new user to the **MFA Exempted User Group** by following the steps from Add a user to a group.

   Note: Inclusion in this group exempts your new user from the default requirement to use multi-factor authentication (MFA) when logging in to your source instance. This configuration is needed for proper operation of the ServiceNow instance external content connector.

4. On your source instance, create a new custom role in the Global application scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the Global application scope, following the steps from Application picker.

b. Navigate to **All** > **User Administration** > **Roles**.

c. Select **New**.

d. On the Role form, enter a name for your new custom role.
As an example, you might enter `ext_cont_connectors_custom_role`.

e. Select **Submit**.

5. On your source instance, create and edit ACLs (access control lists) to grant users with your new custom role access to the Security Attribute [sys_security_attribute] table.

a. Navigate to **All** > **System Security** > **Access Control (ACL)**.

b. Select **New**.

c. On the Access Control form, fill in the fields.

Field	Value
Type	Select **record**.
Operation	Select **read**.
Active	Select this option.
Name	In the **Tables** list, select the Security Attribute [sys_security_attribute] table. Leave the **Fields** list set to its default value.
Conditions	
Requires role	Insert a new row with the name of your new custom role.

d. Select **Submit**, then select **Continue**.
The new ACL record appears in the Access Control list view.

e. In the Access Control [sys_security_acl] table list view, create and apply a filter with the following condition.

Field	Operation	Value
Sys ID	is	ee3ebfdc9f4112108647e8c40b0a1cb0

For details on creating and applying filters to limit records shown in a table's list view, see Create a filter in List.

This filter should display a single Access Control record with Decision Type **Deny Unless**.

f. Open the filtered Access Control record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. On the Access Control form, in the Conditions section, find the **Requires role** condition list and insert a new row with the name of your new custom role.

h. Select **Update**.

6. On your source instance, assign roles to your new user.

a. Assign your new custom role to your new user by following the steps from Assign a role to a user.

b. Assign each of the following roles to your new user by following the steps from Assign a role to a user.

Role	Description
access_analyzer_admin	Grants the user access to tables relating to access control in your source instance, including the Access Control [sys_security_acl], Role [sys_user_role], and Table [sys_db_object] tables. To learn more about access control, see Access Control Lists (ACLs).
catalog_manager	Grants the user access to Service Catalog items in your source instance. For more details on this base system role, see Base system roles.
itil	Grants the user access to incidents and user criteria in your source instance. For more details on this base system role, see Base system roles.
knowledge_admin	Grants the user access to KB articles in your source instance. For more details on this base system role, see Base system roles.
snc_platform_rest_api_access	Grants the user access to Platform Rest APIs in your source instance. The ServiceNow instance external content connector uses the Attachment API and Table API to access your source instance during crawls. For more details on this base system role, see Base system roles.
snc_read_only	Restricts the user to read-only access on all tables that it has access to. For more details on this base system role, see Read-only role.

What to do next

Provide the following items to the connector administrator who will create the ServiceNow instance connector on your destination instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The URL for your ServiceNow AI Platform source instance. As an example, you might provide `https://example.service-now.com/` as the instance URL.
- The user ID for the non-interactive service user you created on your source instance, as copied in step 1.b. As an example, you might provide `sn.instance.connector` as the user ID.
- The password for the non-interactive service user you created on your source instance, as copied in step 2.b.

Your connector administrator needs these items to configure a ServiceNow instance external content connector on your destination instance to retrieve content and security principals from your ServiceNow AI Platform source instance.

For details on creating and configuring a ServiceNow instance external content connector, see Create a ServiceNow instance external content connector.

Create a ServiceNow® instance external content connector

Create an external content connector to retrieve searchable content and security principals from a ServiceNow AI Platform instance.

Before you begin

A user with the admin role must have already configured your ServiceNow AI Platform source instance to allow access by the ServiceNow instance external content connector. For the required source instance configuration steps, see Configure your ServiceNow AI Platform instance for external content indexing.

Role required: sn_ext_conn.xcc_admin

About this task

Create a ServiceNow® instance external content connector to retrieve content and metadata from a remote source instance and make it searchable on the destination instance where the connector runs.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **ServiceNow Instance** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this ServiceNow instance external content connector. You may find it useful to name the connector to match your source instance's hostname. As an example, if your source instance is `https://example-prod.service-now.com/`, you might enter `Example-Prod` as the connector name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
Instance URL	URL for the ServiceNow AI Platform source instance that you want to crawl searchable content from. As an example, you might enter `https://example-prod.service-now.com/`.
User Name	User ID for the service user defined in your ServiceNow AI Platform source instance. If you don't know the service user's ID, ask the admin who configured the ServiceNow AI Platform source instance for external content indexing for it.
Password	Password for the service user defined in your ServiceNow AI Platform source instance. If you don't know the service user's password, ask the admin who configured the ServiceNow AI Platform source instance for external content indexing for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a ServiceNow instance external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a ServiceNow instance external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a ServiceNow® instance external content connector

Specify the content types that you want your ServiceNow instance external content connector to retrieve when running content crawls.

Before you begin
A connector administrator must have already created the ServiceNow® instance external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a ServiceNow instance external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the ServiceNow instance external content connector retrieves all KB articles from your ServiceNow AI Platform instance. Only perform this task if you want the connector to use inclusion or exclusion filters for the KB articles to retrieve when running content crawls.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the ServiceNow instance external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Short description filtering** options in the KB articles section.
   - To crawl all KB articles from the source instance, select **Crawl all short descriptions**.
   - To crawl only a specified set of KB articles from the source instance, select **Include only these short descriptions**, then use the **Add short description patterns to include** field and **Add** button to enter Java regular expression patterns that match the short descriptions for the KB articles that you want to include in the crawl.

     As an example, you might enter `Beginner's [Gg]uide` to include all KB articles with short descriptions that contain the terms `Beginner's Guide` or `Beginner's guide`.
   - To crawl all except a specified set of KB articles from the source instance, select **Exclude only these short descriptions**, then use the **Add short description patterns to exclude** field and **Add** button to enter Java regular expression patterns that match the short descriptions for the KB articles that you want to exclude from the crawl.

     As an example, you might enter `(?i)\[Legacy\]` to exclude all KB articles with short descriptions that contain the terms `[Legacy]` or `[legacy]`.

   Note: To learn about Java regular expression pattern syntax, see the Javadoc for the java.regex.util.Pattern class.
5. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

This option is only available when the Platform Multimodal Service plugin is activated on your instance.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

6. Select **Save and validate**.

Result
The ServiceNow instance external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your ServiceNow AI Platform instance using your modified crawl settings, create and run a one-time content crawl for your ServiceNow instance external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

ServiceNow® product documentation external content connector

The ServiceNow® product documentation external content connector retrieves topics from the ServiceNow product documentation and makes their content and metadata searchable in AI Search applications.

Note: This external content connector is not included in the External Content Connectors Application Suite application. To use this connector, you must install it separately. For details on installation, see Install External Content Connectors.

The system automatically schedules monthly content crawls to retrieve updated content from the product documentation for a family release that you specify. Search administrators can run one-time content crawls to update content ahead of schedule.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Related topics

Create a content crawl for an external content connector

Create a ServiceNow® product documentation external content connector

Create an external content connector to retrieve searchable content from the ServiceNow product documentation site.

Before you begin
Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Choose source page, select the **ServiceNow Product Documentation** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this ServiceNow product documentation external content connector.
Select source	ServiceNow AI Platform® family release to crawl product documentation for. Supported values: ○ *`Automatically sync to current instance`*: Crawl product documentation for the ServiceNow AI Platform family release used by your instance. As an example, if your instance has Yokohama Patch 3 installed, the connector crawls product documentation for the Yokohama family release. ○ *`Manually select family version`*: Specify a ServiceNow AI Platform family release that you want to crawl product documentation for.
Family version	ServiceNow AI Platform family release that you want to crawl product documentation for. This field appears only when **Manually select family version** is selected from **Family version**.

6. Save and validate your connection settings by selecting **Validate Connection**.

> **Note:** If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a ServiceNow product documentation external content connector.
8. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
9. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

   When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a ServiceNow product documentation external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a ServiceNow® product documentation external content connector

Choose the products that you want your ServiceNow product documentation external content connector to crawl documentation for.

Before you begin
A connector administrator must have already created the ServiceNow® product documentation external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a ServiceNow product documentation external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the ServiceNow product documentation external content connector crawls documentation for all ServiceNow products. Only perform this task if you want to exclude the documentation for some products from the connector's crawls.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the ServiceNow product documentation external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. To restrict the connector's content crawl scope, select the products that you want to crawl the documentation for.
   By default, all products are selected. You can use the option in the list header to select or deselect all products.
5. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
6. Select **Save**.

Result

The ServiceNow product documentation external content connector is updated with your chosen crawl scope.

Slack external content connector

The Slack external content connector retrieves attachments from public channels in your Slack source system and makes their content and metadata searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector administrators can run or schedule content crawls to update searchable content and metadata from your source system. Content crawls feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Slack connector limitations

The Slack external content connector doesn't retrieve text or metadata content from messages in your Slack source system's public channels. It only retrieves and indexes attachments from those public channels.

User access permissions aren't preserved for indexed attachments, so any user with access to your indexed Slack content can view any indexed attachment.

The connector doesn't retrieve content from your Slack source system's private channels.

Related topics

Create a content crawl for an external content connector

Configure Slack for external content indexing

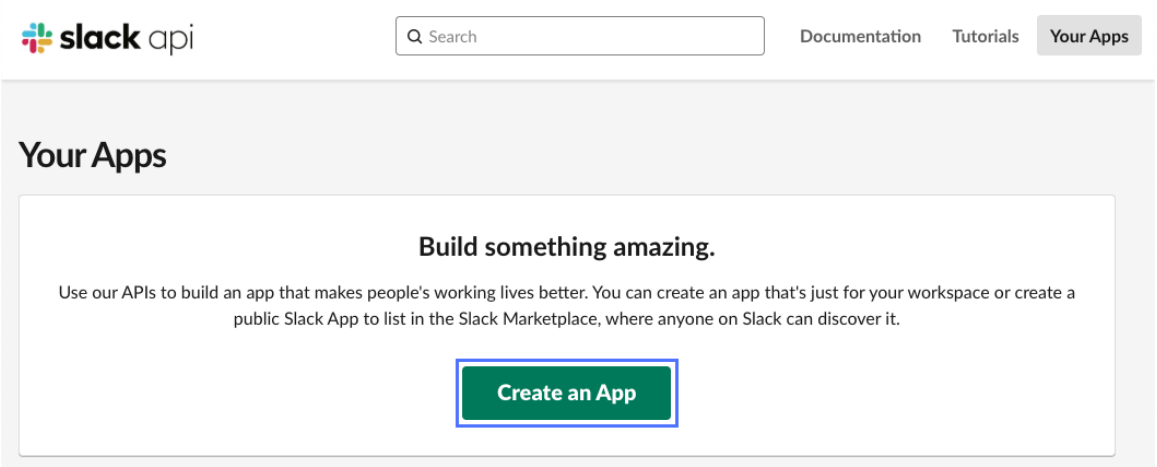
Create a Slack API application to allow the Slack external content connector to crawl public channels in your Slack source system.

Before you begin

You need permission to create Slack API applications in your organization's Slack workspace.

Role required: none

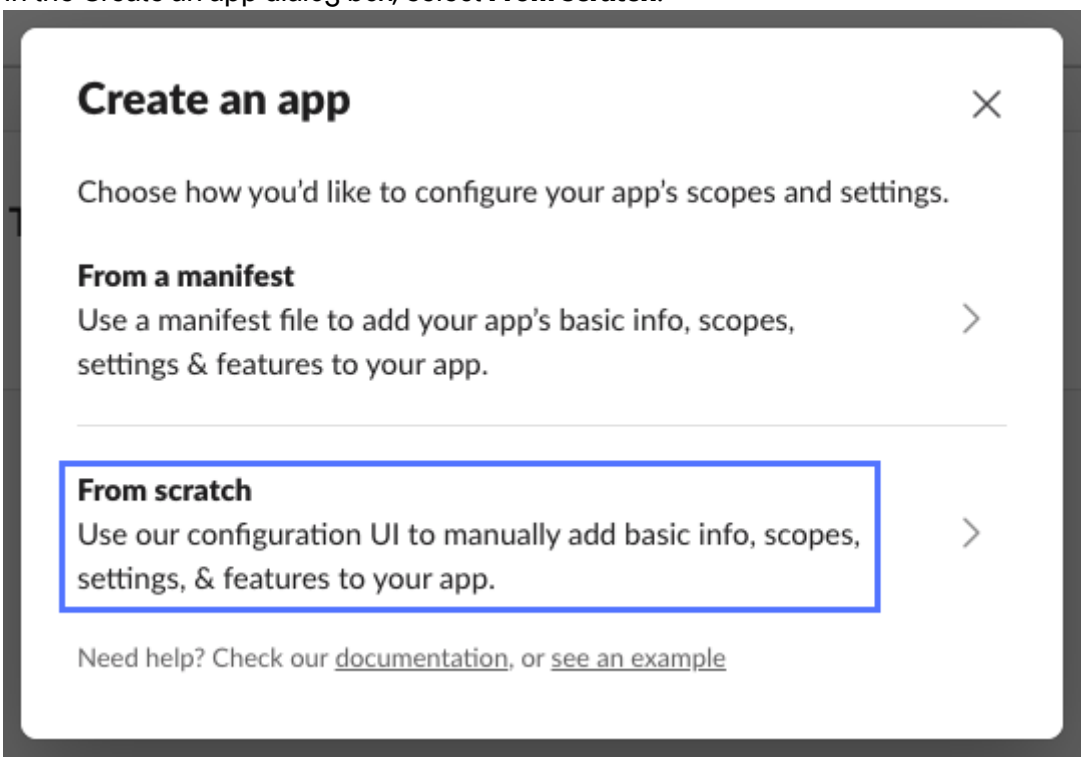
About this task



The Slack external content connector retrieves content from public channels in your Slack source system using a Slack API application. You need to create this application and configure its OAuth settings to allow the external content connector access to your Slack workspace.

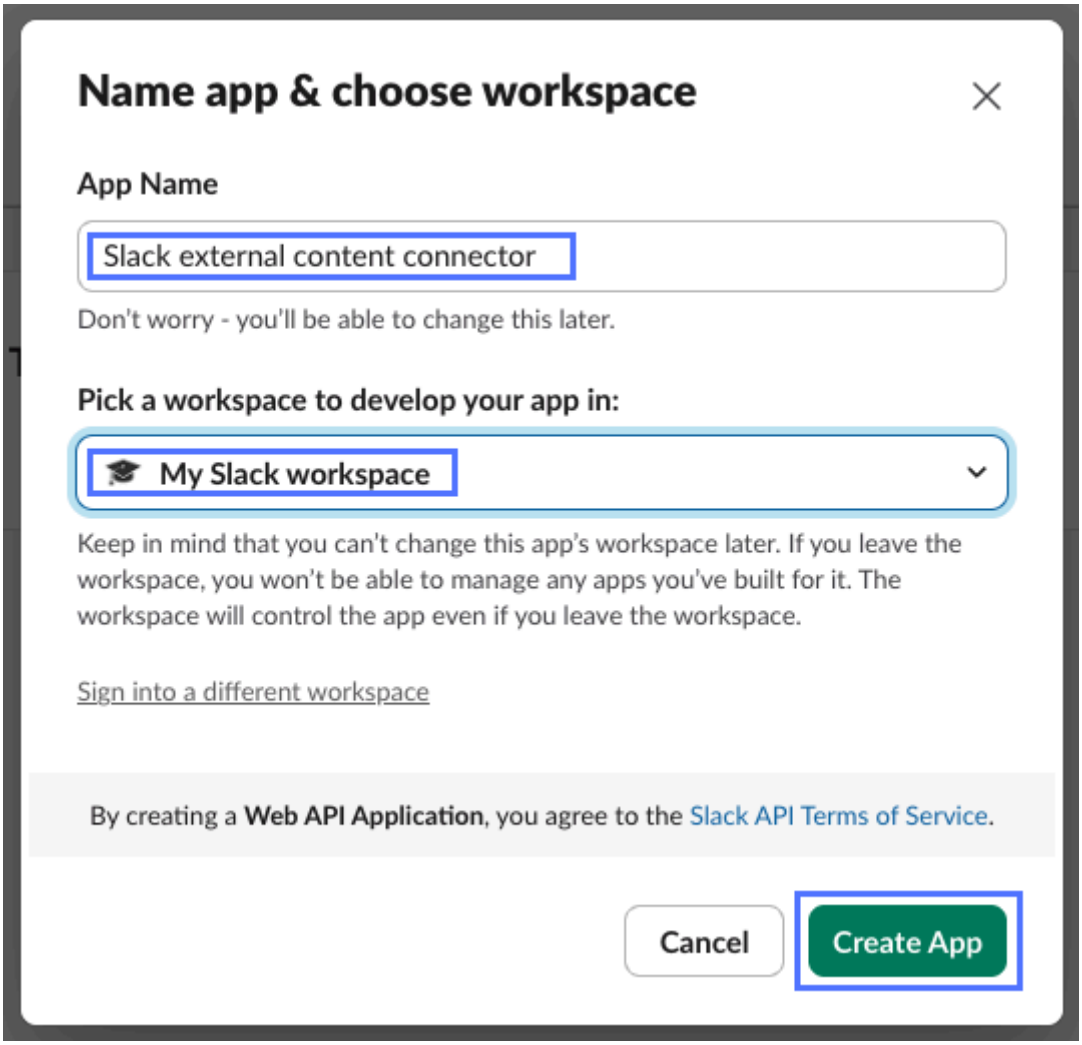
Your connector administrator needs the Slack API application's client ID and secret to configure the Slack external content connector for proper connection to your Slack source system.

Procedure



1. Navigate to the Slack API: Applications page at https://api.slack.com/apps.
2. If prompted, sign in to your Slack account and select the workspace that you want the external content connector to crawl.
3. Select **Create an App**.

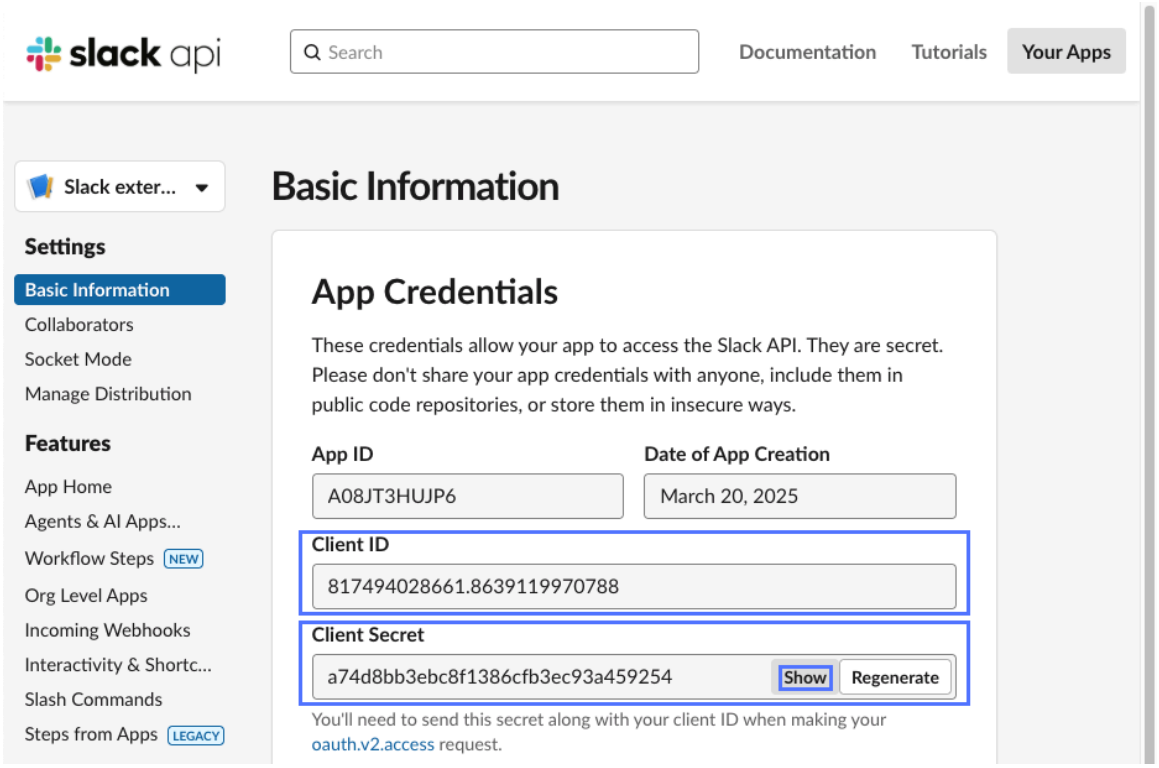
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you already have existing applications on this page, select **Create New App** instead.

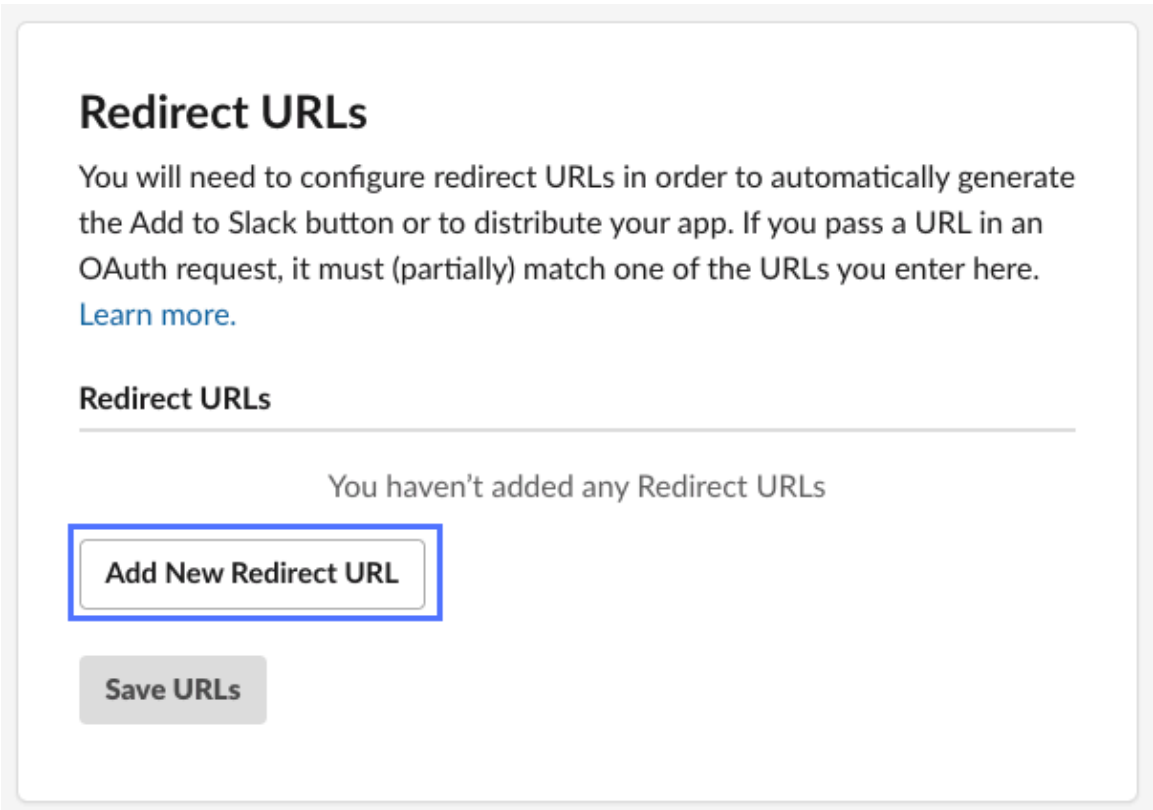
4. In the Create an app dialog box, select **From scratch**.

5. In the Name app & choose workspace dialog box, specify a name and workspace for your application.
   a. In the **App Name** field, enter a name for your application.
   b. In the **Pick a workspace to develop your app in** field, select the workspace that you want the external content connector to crawl.
   c. Select **Create App**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The application's Settings page appears, open to the Basic Information page.

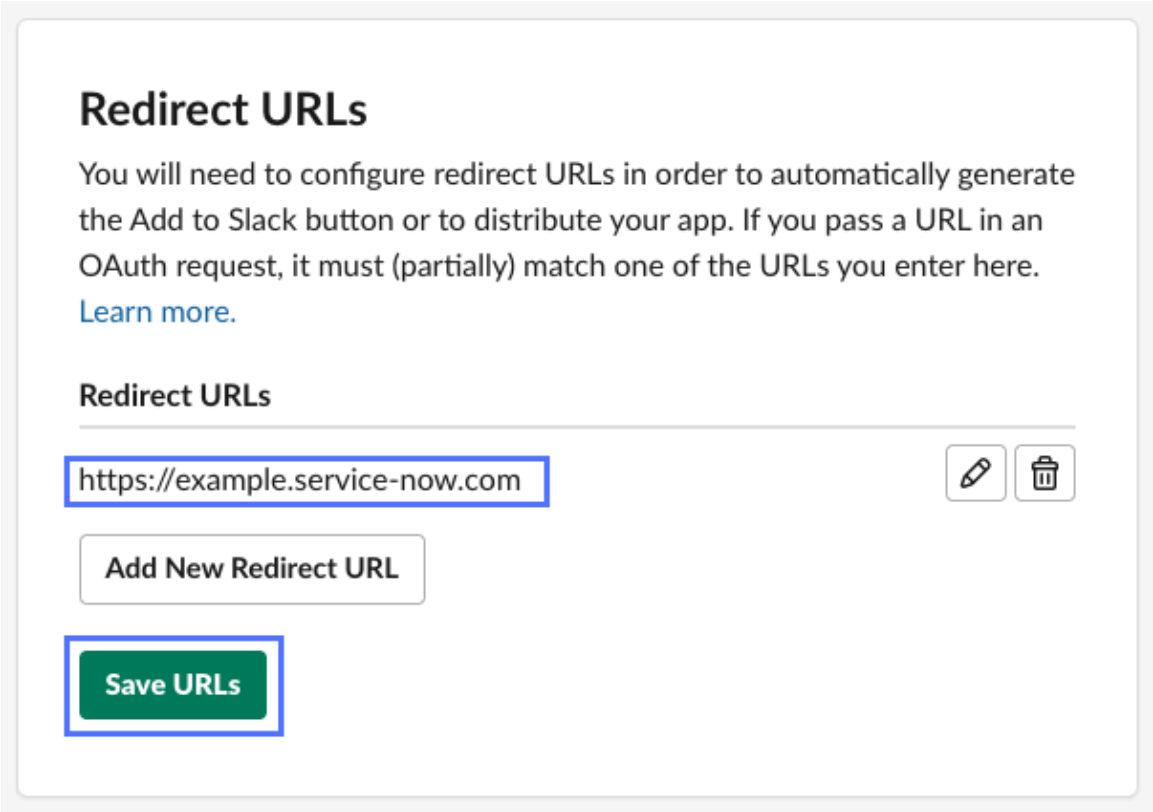


6. In the App Credentials section, select **Show** to display the **Client Secret** field value, then record the application's **Client ID** and **Client Secret** values in a secure location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Your connector administrator needs these values to configure the Slack external content connector.

7. Navigate to **Features** > **OAuth & Permissions**.
8. On the OAuth & Permissions page, configure a redirect URL for the application.
   a. In the Redirect URLs section, select **Add New Redirect URL**.

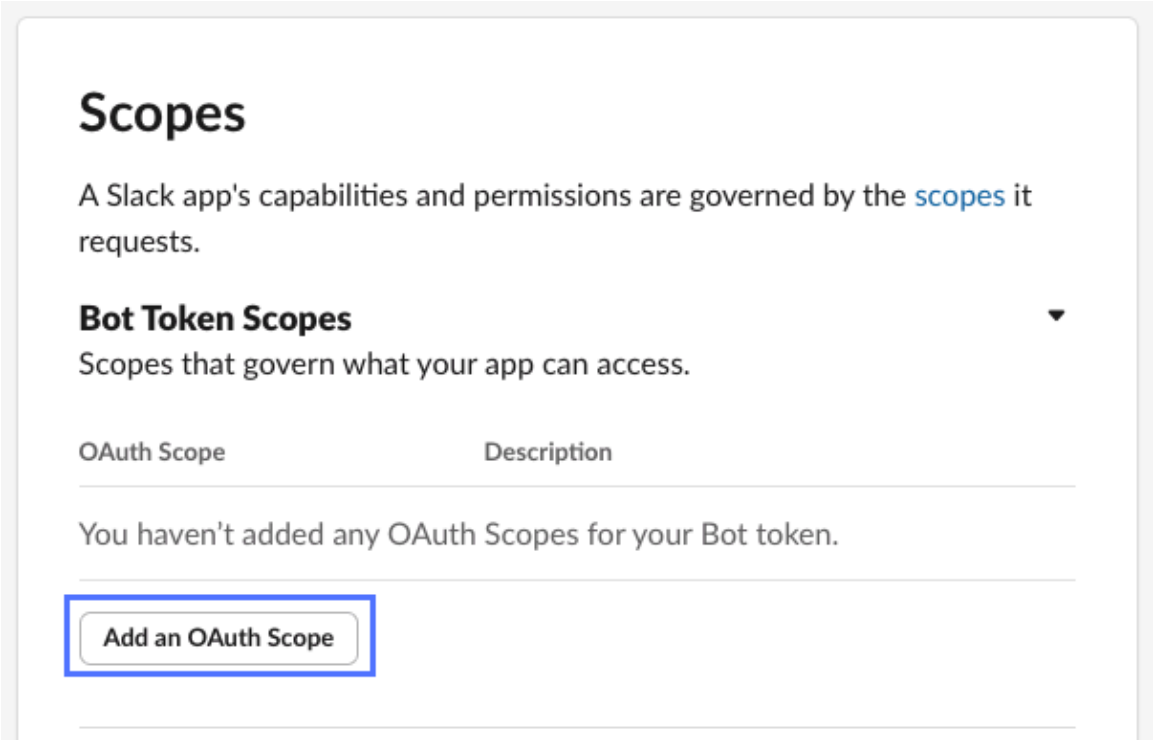


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Enter the URL for your ServiceNow AI Platform® instance, `https://<instance-name>.service-now.com`, replacing `<instance-name>` with the name of your instance.

c. Select **Add**.

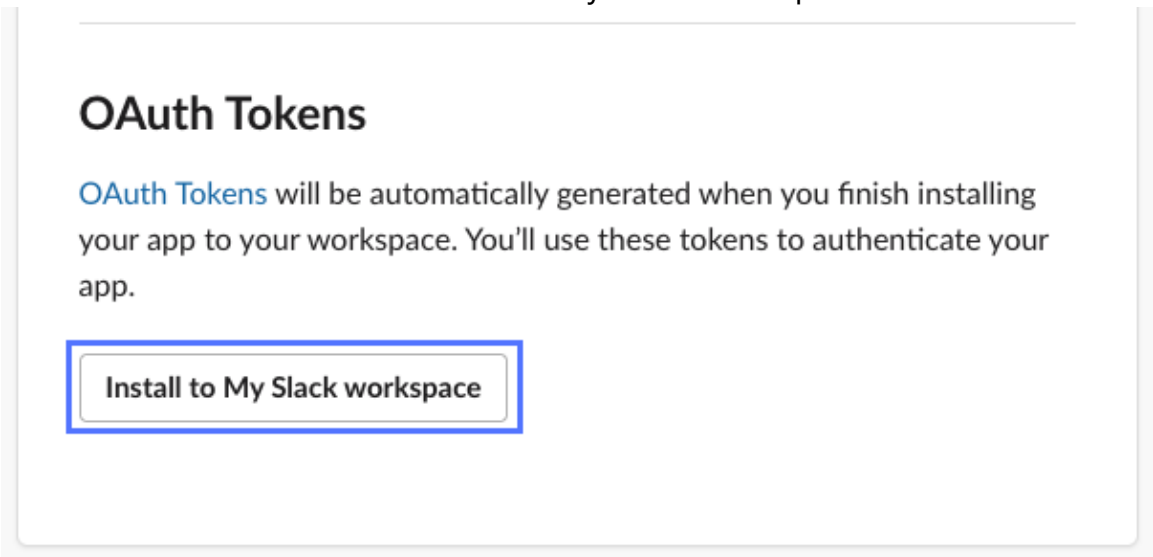
d. Select **Save URLs**.



9. On the OAuth & Permissions page, in the Scopes section's Bot Token Scopes subsection, configure each of these bot token scopes for the application.

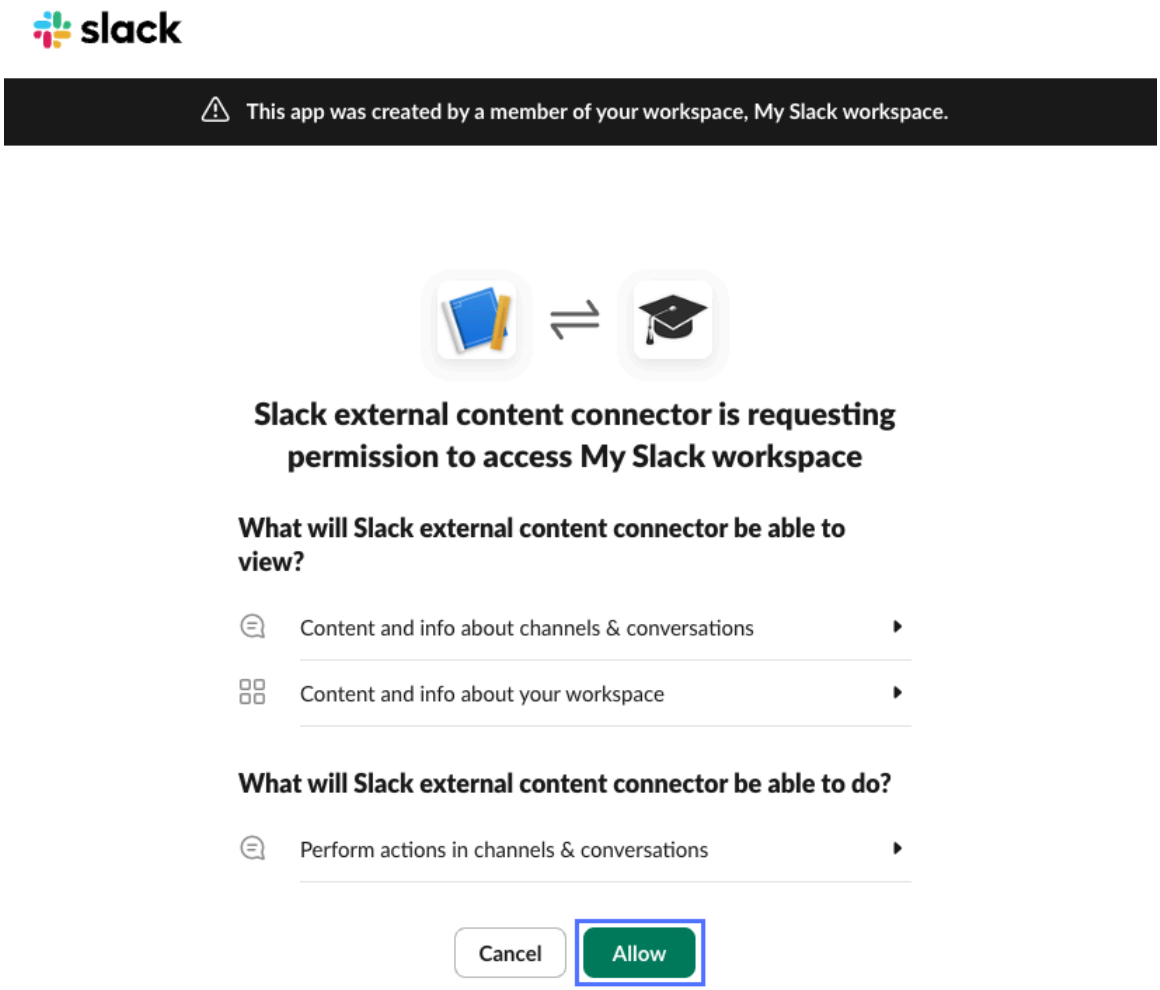
- channels:history
- channels:join
- channels:read
- files:read
- remote_files:read
- team:read
- users:read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. Select **Add an OAuth Scope**.

b. Enter the OAuth scope's name to filter the list of scopes, then select the scope's entry.
The selected scope appears in the list of Bot Token Scopes for your application.



10. On the OAuth & Permissions page, install the application into your Slack workspace.

a. In the OAuth Tokens section, select the link to install the application to your Slack workspace.
The installation link's text includes the name of your Slack workspace.

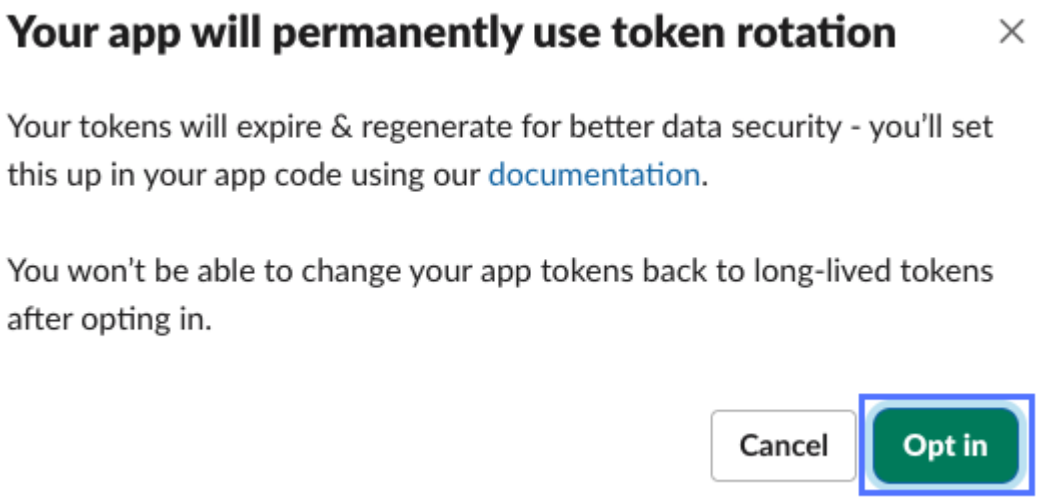
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. On the confirmation page, select **Allow**.



11. On the OAuth & Permissions page, opt into token rotation for the application.

a. In the Advanced token security via token rotation section, select **Opt In**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. On the confirmation page, select **Opt in**.

What to do next

Provide the following items to your connector administrator:

- The Slack API application client ID and client secret that you recorded in step 6.
- The URL where your Slack workspace is accessible. This is usually `https://slack.com`.

Your connector administrator needs these items to configure a Slack external content connector to retrieve attachments from your Slack instance.

For details on creating and configuring a Slack external content connector, see Create a Slack external content connector.

Create a Slack external content connector

Create an external content connector to retrieve searchable content from public channels in your Slack source system.

Before you begin

A source system administrator must have already configured your Slack source system to allow access by the Slack external content connector. For the required source system configuration steps, see Configure Slack for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Slack** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection settings

Connection setting	Description
Connector name	Unique name for this Slack external content connector.
URL	URL where your Slack workspace is accessible. This is usually `https://slack.com`.
Client ID	Client ID for the Slack API application that allows the external content connector to access your Slack workspace. If you don't know the client ID for the application, ask your Slack administrator for it.
Client secret	Client secret for the Slack API application that allows the external content connector to access your Slack workspace. If you don't know the client secret for the application, ask your Slack administrator for it.
I am aware that this connector crawls documents from public channels only and that those documents are accessible by every user that has access to my configured AI Search experience.	Option confirming your understanding that the Slack external content connector doesn't preserve user access permissions and only retrieves content from attachments in public channels.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for an Atlassian Confluence Cloud external content connector.
8. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
9. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Slack external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Slack external content connector

Specify the public channels you want your Slack external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the Slack external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Slack external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Slack external content connector crawls all public channels from its specified source system and sends attachments with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Inclusion or exclusion filters for the public channels to crawl when running content crawls
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Slack external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Content filtering** options:
   - To crawl all channels from the source system, select **Crawl all content**.
   - To crawl only a specified set of channels from the source system, select **Include only these channels**, then use the **Add URL** field and **Add** button to enter URLs for channels that you want to include in the crawl.

     For example, you might enter `https://example.slack.com/archives/D27X71EJRLU` to include only searchable content from the specified channel.
   - To crawl all except a specified set of channels from the source system, select **Exclude only these channels**, then use the **Add URL** field and **Add** button to enter URLs for channels that you want to exclude from the crawl.

     For example, you might enter `https://example.slack.com/archives/K84Z67CKEIB` to exclude searchable content from the specified channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

When specifying URLs for Slack channels, always use the format that includes your Slack workspace's hostname followed by `/archives/` and a channel ID, as in this example: `https://example.slack.com/archives/C69S1L3SS`. You can obtain the URL for a channel by long-pressing (or right-clicking) the channel in Slack and then selecting **Copy** > **Copy link** from the context menu.

Don't use channel URLs that include `app.slack.com` as the hostname, such as `https://app.slack.com/client/TP6U2MGFM/C69S1L3SS`, as these aren't supported by the Slack external content connector.

5. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save**.

Result

The Slack external content connector is updated with your crawl scope and file extension filter settings.

What to do next

To retrieve content from your Slack source system using your modified crawl settings, create and run a one-time content crawl for your Slack external content connector. To learn about

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

creating and running one-time content crawls, see Create a content crawl for an external content connector.

Smartsheet external content connector

The Smartsheet external content connector retrieves sheets from workspaces in your Smartsheet source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Smartsheet for external content indexing

Generate an API key in Smartsheet to allow the Smartsheet external content connector to access your Smartsheet source system.

Before you begin

You need a Smartsheet account with administrator privileges. The external content connector will run in the context of this account.

Role required: none

About this task

The Smartsheet external content connector retrieves sheets from workspaces in your Smartsheet source system using the Smartsheet API.

To allow the connector to access your Smartsheet source system via the Smartsheet API, you must generate an API key (access token) in Smartsheet. Your connector administrator can use this API key to configure the Smartsheet external connector for proper connection to your source system.

Procedure

1. Record your Smartsheet domain URL.
   The domain URL typically has the format `https://example.smartsheet.com/`.

   Important: Your connector administrator needs this Smartsheet domain URL when configuring the Smartsheet external content connector.

2. In Smartsheet, generate an API key for the Smartsheet external content connector.

   a. Navigate to https://app.smartsheet.com/ and log in with administrator credentials.

   b. Select the **Account Settings** icon, then select **Personal Settings...** in the context menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Personal Settings dialog box, select **API Access**, then select **Generate new access token**.

d. Enter a name for your API key, then select **OK**.
As an example, you might enter *Smartsheet* external content connector API key as the name for the API key.
The value of your new API key appears in the dialog box.

e. Copy the API key value and store it in a secure location.

> **Important:** Your connector administrator needs this API key value when configuring the Smartsheet external content connector.

f. Close the API key dialog box by selecting **OK**, then close the Personal Settings dialog box by selecting **Close**.

What to do next

Provide the following items to your connector administrator:

- The URL for your Smartsheet domain that you recorded in step 1.
- The API key value that you copied in step 2.e.

Your connector administrator needs these items to configure a Smartsheet external content connector to retrieve sheets and security principals from your Smartsheet source system.

For details on creating and configuring a Smartsheet external content connector, see Create a Smartsheet external content connector.

Create a Smartsheet external content connector

Create an external content connector to retrieve searchable content and security principals from your Smartsheet source system.

Before you begin

A source system administrator must have already configured your Smartsheet source system to allow access by the Smartsheet external content connector. For the required source system configuration steps, see Configure Smartsheet for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Smartsheet** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection settings

Connection setting	Description
Connector name	Unique name for this Smartsheet external content connector.
Domain	URL for your Smartsheet domain, such as `https://example.smartsheet.com/`. If you don't have the domain URL, ask your Smartsheet administrator for it.
API Key	Value of an API key configured for a Smartsheet user account with administrator privileges. If you don't have the API key value, ask your Smartsheet administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Smartsheet external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Smartsheet external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Smartsheet external content connector

Specify the items you want your Smartsheet external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the Smartsheet external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Smartsheet external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Smartsheet external content connector crawls all workspaces from its specified source system and sends all sheets and attachments with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for workspaces to crawl when running content crawls
- Inclusion or exclusion filters for sheets to retrieve when running content crawls

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls
- Inclusion or exclusion filters for the content types to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Smartsheet external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. In the Workspaces, Sheets, Attachments, and Crawl content types sections, select the options for the items you want the connector to visit and retrieve when you run content crawls.
5. Select one of the following **Workspaces** options:
   - To crawl all workspaces found in the source system, select **Crawl all workspaces**.
   - To crawl only a specified set of workspaces found in the source system, select **Include only these workspaces**, then use the **Add workspace name to include** field and **Add** button to enter names for workspaces you want the connector to include when crawling.

     As an example, you might enter `Project Horizon` to only retrieve content from this workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all but a specified set of workspaces found in the source system, select **Exclude only these workspaces**, then use the **Add workspace name to exclude** field and **Add** button to enter names for workspaces you want the connector to exclude when crawling.

  As an example, you might enter `Catalyst Programs` to exclude content from this workspace.

6. Select one of the following **Sheets** options:
   - To crawl all sheets found in the source system, select **Crawl all sheets**.
   - To crawl only a specified set of sheets found in the source system, select **Include only these sheets**, then use the **Add sheet name to include** field and **Add** button to enter names for sheets you want the connector to include when crawling.

     As an example, you might enter `Efficiency Enhancements` to only retrieve content from sheets with this name.
   - To crawl all but a specified set of sheets found in the source system, select **Exclude only these sheets**, then use the **Add sheet name to exclude** field and **Add** button to enter names for sheets you want the connector to exclude when crawling.

     As an example, you might enter `Future Plans` to exclude sheets with this name.
7. Select one of the following **Attachments** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
8. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

9. Select **Save and validate**.

Result
The Smartsheet external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Smartsheet source system using your modified crawl settings, create and run a one-time content crawl for your Smartsheet external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Trello external content connector

The Trello external content connector retrieves boards that are accessible to all users in your Trello source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to update searchable content and metadata from your source system. Content crawls feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Note: The Trello external content connector only retrieves searchable content and metadata from boards that can be accessed by all users in your Trello enterprise. It doesn't retrieve content and metadata from secure boards.

Related topics

Create a content crawl for an external content connector

Configure Trello for external content indexing

Create and authorize a Power-Up in the Trello Power-Up Admin Portal to allow the Trello external content connector to access your Trello source system.

Before you begin
Your organization must be on the Trello Enterprise plan. For details on this plan, see https://trello.com/enterprise.

Make sure that you have the Trello Enterprise Name for your organization.

Note: You can find your Enterprise Name in the URL for your organization's Trello Enterprise Admin Dashboard, which has the format `https://trello.com/e/EnterpriseName/admin`. For more information on the Trello Enterprise Admin Dashboard, see https://trello.com/guide/enterprise/admins-dashboard.

You need developer privileges for the Trello Power-Up Admin Portal.

Role required: none

About this task
The Trello external content connector retrieves content from publicly accessible boards in your Trello source system using the Trello REST API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To allow the connector to access your Trello source system via the Trello REST API, you must configure and authorize a Power-Up in the Trello Power-Up Admin Portal. Your connector administrator can use settings copied from the Power-Up to configure the Trello external connector for proper connection to your source system.

Procedure

1. In the Trello Power-Up Admin Portal, create a new Power-Up for the Trello external content connector.

   a. Navigate to https://trello.com/power-ups/admin and log in with developer credentials.

   b. Select **New**.

   c. Enter a name for your new Power-Up.
   As an example, you might enter `Trello external content connector`.

   d. Select the Trello workspace that will own your new Power-Up.
   This should be the workspace that includes the content you want the external content connector to retrieve and make searchable.

   e. **Optional:** Enter your email address, a support contact email address or URL, and an author name for your new Power-Up.

   f. Select **Create**.

   You're taken to the Basic Information page for your new Power-Up.

2. Generate an API key and a token for your new Power-Up.

   a. Navigate to the **API Key** page for your new Power-Up.

   b. Select **Generate a new API key**.

   c. In the Generate API key modal window, select **Generate API key**.

   d. Copy your new API key and store it in a secure location.

   > **Important:** Your external content connector administrator needs this API key when configuring the Trello external content connector.

   e. Select **Token**.

   f. On the authorization screen, select **Allow**.

   g. Copy your new token and store it in a secure location.

   > **Important:** Your external content connector administrator needs this API token when configuring the Trello external content connector.

3. Get the ID for your enterprise (organization) from Trello.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Run this curl command, replacing `<enterprise-name>` with your organization's Trello Enterprise Name, `<api-key>` with your copied API key, and `<api-token>` with your copied API token:

```
curl --request GET \
  --url
 'https://api.trello.com/1/enterprises/<enterprise-name>?key=
<api-key>&token=<api-token>' \
  --header 'Accept: application/json'
```

b. Copy the `idEnterprise` value from the curl response and store it in a secure location.

> **Important:** Your external content connector administrator needs this enterprise ID when configuring the Trello external content connector.

What to do next

Provide the following items to your connector administrator:

- The API key that you copied in step 2.d.
- The API token that you copied in step 2.g.
- The enterprise ID that you copied in step 3.b.
- The base URL for the Trello REST API. This is usually `https://api.trello.com`.

Your connector administrator needs these items to configure a Trello external content connector to retrieve boards from your Trello source system.

For details on creating and configuring a Trello external content connector, see Create a Trello external content connector.

Create a Trello external content connector

Create an external content connector to retrieve searchable content from your Trello source system.

Before you begin

A source system administrator must have already configured your Trello source system to allow access by the Trello external content connector. For the required source system configuration steps, see Configure Trello for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Trello** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection settings

Connection setting	Description
Connector name	Unique name for this Trello external content connector.
API Key	API key for the Power-Up that grants the connector access to your Trello source system. If you don't have the API key, ask your Trello administrator for it.
API Token	API token for the Power-Up that grants the connector access to your Trello source system. If you don't have the API token, ask your Trello administrator for it.
Trello EnterpriseId	Trello ID for your enterprise (organization). If you don't have the enterprise ID, ask your Trello administrator for it.
URL	Base URL for the Trello REST API. If you don't have the base URL, ask your Trello administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Trello external content connector.
9. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
10. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Trello external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Trello external content connector

Specify the workspaces you want your Trello external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin
A connector administrator must have already created the Trello external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Trello external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Trello external content connector retrieves boards found in all workspaces in its specified source system, and sends them and all their cards to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Inclusion or exclusion filters for the workspaces to crawl when running content crawls
- Inclusion or exclusion filters for the boards to retrieve when running content crawls
- Inclusion or exclusion filters for the cards to retrieve from boards when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Trello external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. In the Crawl content types section, select one of the following options for workspaces:
   - To crawl boards from all workspaces found in the source system, select **Crawl all workspaces**.
   - To crawl only boards from a specified set of workspaces found in the source system, select **Include only these workspaces**, then use the **Add workspaces to include** field and **Add** button to enter URLs for workspaces you want the connector to include when crawling.

     As an example, you might enter `https://trello.com/w/user_team27179485/home` to only retrieve searchable content and metadata from boards in the specified workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl boards from all but a specified set of workspaces found in the source system, select **Exclude only these workspaces**, then use the **Add workspaces to exclude** field and **Add** button to enter URLs for workspaces you want the connector to exclude when crawling.

  As an example, you might enter `https://trello.com/w/user_team79211866/home` to exclude searchable content and metadata from boards in the specified workspace.

5. In the Crawl content types section, select one of the following options for boards:
   - To crawl all boards found in the source system, select **Crawl all boards**.
   - To crawl only a specified set of boards found in the source system, select **Include only these boards**, then use the **Add boards to include** field and **Add** button to enter URLs for boards you want the connector to include when crawling.

     As an example, you might enter `https://trello.com/b/PmX4mI8k/production-3` to only retrieve searchable content and metadata from the specified board.
   - To crawl all but a specified set of boards found in the source system, select **Exclude only these boards**, then use the **Add boards to exclude** field and **Add** button to enter URLs for boards you want the connector to exclude when crawling.

     As an example, you might enter `https://trello.com/b/QcW9nC3p/qe-test-1` to exclude searchable content and metadata from the specified board.
6. In the Crawl content types section, select one of the following options for cards:
   - To crawl all cards found in the source system, select **Crawl all cards**.
   - To crawl only a specified set of cards found in the source system, select **Include only these cards**, then use the **Add cards to include** field and **Add** button to enter URLs for cards you want the connector to include when crawling.

     As an example, you might enter `https://trello.com/c/6CExZNvG/2-doing-task-1-updated` to only retrieve searchable content and metadata from the specified card.
   - To crawl all but a specified set of cards found in the source system, select **Exclude only these cards**, then use the **Add cards to exclude** field and **Add** button to enter URLs for cards you want the connector to exclude when crawling.

     As an example, you might enter `https://trello.com/c/9JLeCQpK/task-270-updated` to exclude searchable content and metadata from the specified card.
7. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

8. Select **Save and validate**.

Result

The Trello external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Trello source system using your modified crawl settings, create and run a one-time content crawl for your Trello external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Webcrawler external content connector

The Webcrawler external content connector retrieves pages and subdomains from a public website and makes their content and metadata searchable in AI Search applications. This connector can crawl content from predefined public web sources or your own custom web sources.

Note: This external content connector is not included in the External Content Connectors Application Suite application. To use this connector, you must install it separately. For details on installation, see Install External Content Connectors.

Connector administrators can run or schedule content crawls to retrieve updated content from pages and subdomains found on the selected website. Scheduled content crawls can run on a daily, weekly, or monthly basis. Content crawls feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Each Webcrawler connector can retrieve up to 50,000 items (URLs) from its source system when running content crawls.

Note: This is an exception to the general content crawl limit of one million (1,000,000) items.

By default, you can configure up to three Webcrawler connectors for custom web sources. If you need to retrieve items from more than three custom web sources, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the Webcrawler connector.

Note: The Webcrawler external content connector includes a dedicated search source for each predefined web source. Each dedicated search source includes content from the specified predefined web source that's stored in the connector's indexed source. Use these search sources to access searchable content and metadata retrieved from predefined web sources. As an example, searchable content and metadata retrieved from the Google Drive predefined web source is accessible in a search source named *`Google Drive`*.

To create a Webcrawler external content connector, see Create a Webcrawler external content connector. To configure crawl settings for a Webcrawler external content connector, see Configure crawl settings for a Webcrawler external content connector.

Create a Webcrawler external content connector

Create an external content connector to retrieve searchable content from pages and subdomains in a public web source system. Select from a list of predefined web sources or specify your own web source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_ext_conn.xcc_admin

About this task
Follow this procedure to create a new Webcrawler connector to retrieve searchable content and metadata from URLs found in a predefined or custom web source.

By default, you can configure up to three Webcrawler connectors for custom web sources. If you need to retrieve items from more than three custom web sources, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the Webcrawler connector.

Procedure
1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Webcrawler** tile, then select **Next**.
5. On the Connection settings page, specify the web source that you want to retrieve searchable content from.
   - To retrieve searchable content from a web source in the list of predefined web sources, select the **Predefined web source** tile, then select your desired web source from the list.
   - To retrieve searchable content from a public web source not included in the list, select the **Custom web source** tile. Enter a name for the connector and the URL for your selected web source, then select the legal disclaimer option.

     Note: If you select this option, content crawls for the Webcrawler external content connector retrieve content and links from URLs found in the source system's sitemaps that include the specified start point URL. The connector reads matching URLs from all sitemaps referenced in the source system's `robots.txt` file and all sitemaps located in common sitemap locations.

     As an example, suppose you select the **Use sitemap** option and then specify `https://example.com/mysite` as the start point URL for a content crawl. When you run the content crawl, the Webcrawler connector retrieves content and links from sitemap URLs that include `https://example.com/mysite`. In this case, the connector retrieves content and links from sitemap URLs `https://example.com/mysite/a` and `https://example.com/mysite/b` but ignores sitemap URLs `https://example.com/othersite/c` and `https://example.com/yoursite/d` because they don't include the start point URL.
6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.
7. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

procedure and the available crawl settings, see Configure crawl settings for an Atlassian Confluence Cloud external content connector.

8. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
9. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

   When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Webcrawler external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you need to link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Search sources for predefined web sources

The Webcrawler external content connector includes a dedicated search source for each predefined web source. Each dedicated search source includes content from the specified predefined web source that's stored in the connector's indexed source. Use these search sources to access searchable content and metadata retrieved from predefined web sources. As an example, searchable content and metadata retrieved from the Google Drive predefined web source is accessible in a search source named *Google Drive*.

Default search source

By default, the system creates a search source that includes all searchable content from your Webcrawler connectors.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Webcrawler external content connector

Specify the pages and subdomains you want your Webcrawler external content connector to retrieve from your specified web source.

Before you begin

A connector administrator must have already created the Webcrawler external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Webcrawler external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Webcrawler external content connector crawls all pages and subdomains from its specified source system. Only perform this task if you want to specify inclusion or exclusion filters for the subdomains to crawl or pages to retrieve when running content crawls.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Each Webcrawler connector can retrieve up to 50,000 items (URLs) from its source system when running content crawls.

Note: This is an exception to the general content crawl limit of one million (1,000,000) items.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Webcrawler external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. **Optional:** To load content crawl URLs from the source system's sitemaps, select the **Use sitemap** option.
   If you select this option, content crawls for the Webcrawler external content connector retrieve content and links from URLs found in the source system's sitemaps that include the specified start point URL. The connector reads matching URLs from all sitemaps referenced in the source system's `robots.txt` file and all sitemaps located in common sitemap locations.

   As an example, suppose you select the **Use sitemap** option and then specify `https://example.com/mysite` as the start point URL for a content crawl. When you run the content crawl, the Webcrawler connector retrieves content and links from sitemap URLs that include `https://example.com/mysite`. In this case, the connector retrieves content and links from sitemap URLs `https://example.com/mysite/a` and `https://example.com/mysite/b` but ignores sitemap URLs `https://example.com/othersite/c` and `https://example.com/yoursite/d` because they don't include the start point URL.
5. Select one of the following **Content** options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all pages and subdomains from the source system, select **Crawl all content**.
- To crawl only a specified set of pages and subdomains from the source system, select **Include only these URLs**, then use the **Add URL** field and **Add** button to enter URLs or wildcard URL expressions for pages and subdomains that you want to include in the crawl.

  For example, you might enter `https://support.apple.com/ipad` to include only searchable content from the specified page or subdomain. Alternately, you might enter `https://support.apple.com/ipad**` to include every page or subdomain with a URL that matches the specified wildcard expression.

- To crawl all except a specified set of pages and subdomains from the source system, select **Exclude only these URLs**, then use the **Add URL** field and **Add** button to enter URLs or wildcard URL expressions for pages and subdomains that you want to exclude from the crawl.

  For example, you might enter `https://knowledgebase.paloaltonetworks.com/KCSArticleDetail` to exclude searchable content from the specified page or subdomain. Alternately, you might enter `https://knowledgebase.paloaltonetworks.com/KCSArticleDetail**` to exclude every page or subdomain with a URL that matches the specified wildcard expression.

Note: Wildcard URL expressions can include a URL prefix followed by the `**` suffix. They match all URLs that begin with the specified prefix.

6. In the **Include only these pages and subdomains** section, use the **Add URL to include** field and **Add** button to enter URLs or URL wildcard expressions for the pages and subdomains that you want to include in content crawls.
   As an example, you might enter `https://www.example.com/products*` and `https://www.example.com/newsroom*` to only retrieve searchable content and metadata from pages and subdomains that match one of the specified URL wildcard expressions.
7. In the **Exclude only these pages and subdomains** section, use the **Add URL to exclude** field and **Add** button to enter URLs or URL wildcard expressions for the pages and subdomains that you want to exclude from content crawls.
   As an example, you might enter `*contact*` to exclude pages and subdomains with URLs that match the specified URL wildcard expression.
8. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
9. Select **Save and validate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The Webcrawler external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from the public web source using your modified crawl settings, create and run a one-time content crawl for your Webcrawler external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

WordPress external content connector

The WordPress external content connector retrieves pages and blog posts and their attachments from websites in your WordPress source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

- Create a user permission crawl for an external content connector

Configure WordPress for external content indexing

Create an admin user and an application password in your WordPress website to allow the WordPress external content connector to access your WordPress content.

Before you begin
You need administrator access privileges for the WordPress website that you want the connector to retrieve content from.

Role required: none

About this task
The WordPress external content connector retrieves pages and blog posts and their attachments from your WordPress source system using the WordPress REST API.

To allow the connector to access your WordPress source system via the WordPress REST API, you must set an application user name and password in the WordPress Admin dashboard. Your connector administrator can use these credentials to configure the WordPress external connector for proper connection to your source system.

Procedure

1. Navigate to the WordPress Admin dashboard at `https://<wordpress-site>/wp-admin/`, replacing `<wordpress-site>` with the fully qualified hostname for your WordPress website.
   For example, if your WordPress website is in the `wordpress.com` domain, you might replace `<wordpress-hostname>` with `example.wordpress.com`. If your WordPress website has its own domain, you might replace `<wordpress-hostname>` with `example-wordpress.com`.
2. When prompted, log in with your WordPress administrator credentials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Navigate to **Users**.
4. Add a new administrator user account:
   a. Select **Add User**.
   b. Enter a username and email address for your new user account.
   As an example, you might enter `WP_XCC_admin_user` as the username and `wp-admin@example.com` as the email address.
   c. Copy the username you entered and record it in a secure location.

      Important: Your external content connector administrator needs this user name when configuring the WordPress external content connector.

   d. **Optional:** Replace the auto-generated password for the new user account by selecting **Generate password** or entering a password of your own choice.
   e. In the Role field, select **Administrator** as the role for the new user account.
   f. Select **Add User**.

   The new user account appears in the Users list with the administrator role.
5. Generate an application password for your new administrator user account.
   a. In the Users list, edit your new administrator user account.
   b. In the New Application Password Name field, enter a name for the new application password.
   As an example, you might enter `WordPress external content connector app password`.
   c. Select **Add Application Password**.
   The user editor page displays the new application password.
   d. Copy the new application password and record it in a secure location.

      Important: Your external content connector administrator needs this application password when configuring the WordPress external content connector.

   e. Select **Update User**.

What to do next

Provide the following items to your connector administrator:

- The URL for your WordPress website.
- The user name for the administrator user account that you copied in step 4.c.
- The application password for the administrator user account that you copied in step 5.d.

Your connector administrator needs these items to configure a WordPress external content connector to retrieve pages and blog posts and security principals from your WordPress source system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on creating and configuring a WordPress external content connector, see Create a WordPress external content connector.

Create a WordPress external content connector

Create an external content connector to retrieve searchable content and security principals from your WordPress source system.

Before you begin

A source system administrator must have already configured your WordPress source system to allow access by the WordPress external content connector. For the required source system configuration steps, see Configure WordPress for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *WordPress* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this WordPress external content connector.
Instance URL	URL for your WordPress website. If you don't have the WordPress website URL, ask your WordPress administrator for it.
User name	User name for the administrator user configured for your WordPress source system. If you don't have the user name for the administrator user, ask your WordPress administrator for it.
Password	Application password for the administrator user configured for your WordPress source system. If you don't have the application password for the administrator user, ask your WordPress administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a WordPress external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a WordPress external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a WordPress external content connector

Specify the pages and blog posts you want your WordPress external content connector to crawl. Define inclusion or exclusion filters to dictate the types of content the crawl retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the WordPress external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a WordPress external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the WordPress external content connector crawls all pages and blog posts from its specified source system and sends attachments with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the pages and blog posts to crawl when running content crawls
- Inclusion or exclusion filters for the file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the WordPress external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Pages** options:
   - To crawl all pages from the source system, select **Crawl all pages**.
   - To crawl only a specified set of pages from the source system, select **Include only these pages**, then use the **Add page URL to include** field and **Add** button to enter URLs for pages you want the connector to include when crawling.

     As an example, you might enter `https://example.com/mainSite/mainPage` to only retrieve searchable content from this page.
   - To crawl all but a specified set of pages from the source system, select **Exclude only these pages**, then use the **Add page URL to exclude** field and **Add** button to enter URLs for pages you want the connector to exclude when crawling.

     As an example, you might enter `https://example.com/testSite/testPage` to exclude searchable content from this page.
5. Select one of the following **Blog posts** options:
   - To crawl all blog posts from the source system, select **Crawl all blog posts**.
   - To crawl only a specified set of blog posts from the source system, select **Include only these blog posts**, then use the **Add URL to include** field and **Add** button to enter URLs for blog posts you want the connector to include when crawling.

     As an example, you might enter `https://example.com/blog/latestContent` to only retrieve searchable content from this blog post.
   - To crawl all but a specified set of blog posts from the source system, select **Exclude only these blog posts**, then use the **Add URL to exclude** field and **Add** button to enter URLs for blog posts you want the connector to exclude when crawling.

     As an example, you might enter `https://example.com/blog/testPost` to exclude searchable content from this blog post.
6. Select one of the following **Categories** options:
   - To retrieve blog posts that belong to all categories from the source system, select **Crawl all categories**.
   - To retrieve only blog posts belonging to a specified set of categories from the source system, select **Include only these categories**, then use the **Categories to include** field and **Add** button to enter URLs for categories you want the connector to include when crawling blog posts.

     As an example, you might enter `Company news`, `Tech blog`, and `Press events` to only retrieve searchable content from blog posts that belong to the specified categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To retrieve blog posts belonging to all but a specified set of categories from the source system, select **Exclude only these categories**, then use the **Categories to exclude** field and **Add** button to enter URLs for categories you want the connector to exclude when crawling blog posts.

  As an example, you might enter `Testing` to exclude searchable content from blog posts that belong to the specified category.

7. Select one of the following **Date** options:
   - To retrieve pages and blog posts from the source system that were modified in the last year, select **Modified last year**.
   - To retrieve pages and blog posts from the source system that were modified in the last quarter, select **Modified last quarter**.
   - To retrieve pages and blog posts from the source system that were modified in the last month, select **Modified last month**.
   - To retrieve pages and blog posts from the source system that were modified in the last week, select **Modified last week**.
8. Select one of the following **State** options:
   - To retrieve pages and blog posts with all states from the source system, select **Crawl all states**.
   - To retrieve only pages and blog posts with a specified set of states from the source system, select **Include only these states**, then use the **States to include** field and **Add** button to enter states you want the connector to include when crawling.

     As an example, you might enter `publish` to only retrieve pages and blog posts that have this state.
   - To retrieve pages and blog posts with all but a specified set of states from the source system, select **Exclude only these states**, then use the **States to exclude** field and **Add** button to enter states you want the connector to exclude when crawling.

     As an example, you might enter `private`, `future`, `pending`, and `draft` to exclude pages and blog posts that have any of the specified states.
9. Select one of the following **Attachments** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

  As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.

10. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

    This option is only available when the Platform Multimodal Service plugin is activated on your instance.

    - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
    - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
11. Select **Save and validate**.

Result
The WordPress external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your WordPress source system using your modified crawl settings, create and run a one-time content crawl for your WordPress external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Workday external content connector

The Workday external content connector retrieves help articles, benefits, learning assignments, Manager Insights Hub data, payroll information, PTO information, and vacation policies from your Workday source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Workday security settings

Create an unconstrained integration system security group in Workday. The Workday external content connector uses this security group when accessing your Workday content.

Before you begin

You need administrator privileges in your organization's Workday tenant.

Role required: none

About this task

The Workday external content connector runs as an integration in Workday. To enable the connector to access your Workday content, you need to create an integration system user and an unconstrained integration system security group in your Workday tenant.

Procedure

1. Create an integration system user account in Workday.
   a. Log in to your Workday tenant with your administrator credentials.
   b. In the Workday search bar, search for the **Create Integration System User** task and select it.
   c. On the Create Integration System User page, enter `ISU SNOW ACL` as the name for your new integration system user.
   d. Enter a password for your new user or generate one by selecting **Generate Random Password**.
   e. Clear the **Require New Password at Next Sign In** option.
   f. Select **OK**.
   Workday creates your new integration system user account.
2. Create an unconstrained integration system security group in Workday.
   a. In the Workday search bar, search for the **Create Security Group** task and select it.
   b. On the Create Security Group page, select **Integration System Security Group (Unconstrained)** as the type for your new group.
   c. Enter `ISSG Service Now ACL` as the name for your new integration system security group.
   d. Select **OK**.
   Workday creates your new unconstrained integration system security group.
   e. In the Integration System Users field, enter `ISU SNOW ACL` and press Enter.
   Workday adds your new integration system user account to your new unconstrained integration system security group.
3. Assign domain security policy permissions to your new integration system security group.
   a. In the Workday search bar, search for the **View Security Groups for User** task and select it.
   b. In the Person field, enter `ISU SNOW ACL`, then select **OK**.
   c. On the View Security Groups for User page, select the entry for your `ISSG Service Now` ACL integration system security group.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. On the View Integration System Security Group (Unconstrained) page, navigate to **...** > **Security Group** > **Maintain Domain Permissions for Security Group**

e. On the Maintain Domain Permissions for Security Group page, enter each of the following domain security policy names into the **Domain Security Policies permitting View access** field, pressing Enter after each name:

- HCM All Organizations
- Indexed Data Source: Positions
- Manage: Company
- Manage: Cost Center
- Manage: Custom Organization
- Manage: Help Articles
- Manage: Region
- Manage: Supervisory Organization
- Person Data: Learning
- Person Data: Work Email
- Reports: Learning Record
- Reports: Organization
- Security Administration

  Note: This domain security policy permission is inherited by the following domain security policies:

  - Lock Out Workday Accounts
  - Manage: Authorized Applications
  - Process: User-Based Security Group Event
  - Set Up: Security Rules

- Security Configuration
- Set Up: Compensation Guidelines
- Set Up: Organization
- Set Up: Payroll - Pay Group Specific
- Workday Accounts
- Workday Query Language
- Worker Data: Active and Terminated Workers
- Worker Data: Current Job Profile Information
- Worker Data: Current Management Level Information
- Worker Data: Current Staffing Information
- Worker Data: Headcount Reports
- Worker Data: Historical Staffing Information
- Worker Data: Payroll (Payroll Input)
- Worker Data: Public Worker Reports

- Worker Data: Time Off (Time Off Balances Manager View)
- Worker Data: Time Off (Time Off Balances)
- Worker Data: Time Off (Time Off Manager View)
- Worker Data: Time Off (Time Off)
- Worker Data: Work Shifts
- WQL for Workday Extend

4. Activate the security policy changes for your new integration system security group.

   a. In the Workday search bar, search for the Activate Pending Security Policy Changes task and select it.

   b. On the Activate Pending Security Policy Changes page, enter a comment, then select **OK**. Workday displays the list of changes pending for your new integration system security group.

   c. Select **Confirm**, then select **OK**.
   The pending changes are applied to your new integration system security group.

Configure access to help articles in Workday

Create an article audience rule in Workday and specify it for your help articles to make them accessible by all your employees. The Workday external content connector uses the audience rule and article settings to make content and metadata from your help articles searchable.

Before you begin

You need administrator privileges in your organization's Workday tenant.

Role required: none

About this task

This task is optional. By default, the Workday external content connector retrieves searchable content and metadata from help articles that are accessible by all your organization's employees in Workday. To facilitate this retrieval, you need to create an article audience rule and then apply that rule to each article that you want to make searchable.

If you don't want the connector to retrieve searchable content and metadata from help articles in Workday, you can skip this task.

Procedure

1. Create a new article audience rule in Workday.

   a. Log in to your Workday tenant with your administrator credentials.

   b. In the Workday search bar, search for the **Create Article Audience Rule** task and select it.

   c. On the Create Article Audience Rule page, in the Description field, enter `Public` as the description for your new article audience rule.

   d. In the Rule Conditions table, select **+** to add a new rule condition row, then enter the following field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
And/Or	And
Source External Field or Condition Rule	Worker is Employee
Relational Operator	equal to
Comparison Type	Value specified in this filter
Comparison Value	Yes

e. In the Rule Conditions table, select **+** to add a second new rule condition row, then enter the following field values.

Field	Value
And/Or	Or
Source External Field or Condition Rule	Worker is Contingent Employee
Relational Operator	equal to
Comparison Type	Value specified in this filter
Comparison Value	Yes

f. Select **OK**.
Workday creates your new article audience rule.

2. Create an audience record for your new article audience rule.
   a. In the Workday search bar, search for the **Maintain Article Audiences** task and select it.
   b. On the Maintain Article Audiences page, in the Audiences table, select **+** to add a new audience row.
   c. In the Name field, enter `Public` as the name for your new audience row.
   d. In the Who Can View field, select your **Public** article audience rule.
   e. Select **OK**.
   Workday creates your new audience record.
3. Perform these steps for each article that you want to make searchable through the Workday external content connector.
   a. In the Workday search bar, search for the **Edit Article** task and select it.
   b. On the Edit Article page, in the Article field, search for and then select the article that you want to make accessible by all your organization's employees.
   c. On the article page, select **Edit**.
   d. In the Settings pane, in the Who Can View field, select **Public**.
   e. Select **Publish**.
   Workday republishes the article, making it accessible by all your organization's employees.

Configure a payslip report in Workday

Configure a custom report for payroll data in Workday. The Workday external content connector uses this report to make content and metadata from your payroll data searchable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

A Workday admin must have already an integration system user and an unconstrained integration system security group in your Workday tenant. For details on this preliminary task, see Configure Workday security settings.

You need an account with the following privileges in your organization's Workday tenant:

- **Custom Report Creation** domain access
- Access to the **Payroll Results** report data source
- **Copy Standard Report to Custom Report** task access

Role required: none

About this task

This task is optional. The Workday external content connector can retrieve payslip data from your Workday source system using a custom report that you configure. If you don't want to retrieve payslip data from Workday, you can skip this task.

Procedure

1. Log in to your Workday tenant with your administrator credentials.
2. Create a new custom report from the Payslip to Print - Report Design standard report.

   a. In the Workday search bar, search for the **Copy Standard Report to Custom Report** task and select it.

   b. On the Copy Standard Report to Custom Report page, in the Standard Report field, search for the **Payslip to Print - Report Design** report and select it.

   c. Enter a name for your custom report.
   As an example, you might enter `Workday connector payslip report`.

   d. Select **OK**.

   Workday creates your new custom report and displays its configuration screen.
3. In the Data Source field, search for the **Payroll Results** entry and select it.
   Workday automatically populates the Data Source Filter field.
4. Configure the columns for your new custom report.

   a. On the Columns tab for your new custom report, in the table, select **+** to add a row for a new column.

   b. Select or enter the following field values for the new column.

Business Object	Field	Column Heading Override	Column Heading Override XML Alias
Payroll Result	Sub Period (if different from Pay Period)		Sub_Period_if_different_from_Pay_Pe

   c. For each row in the table that has **Absence Plans** specified as its Business Object, select **–** to remove the row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure the group column headings for your new custom report.
   a. In the Group Column Headings table, select **–** to remove the row that has **Absence Plans** specified as its Business Object.
   b. For each remaining group column header rows, select and delete all text in the Group Column Heading field.
6. Configure the prompts for your new custom report.
   a. On the Prompts tab for your new custom report, in the Prompt Defaults table, select **–** to remove the existing prompt row.
   b. Select the **Populate Undefined Prompt Defaults** option.
   Workday automatically populates the Prompt Defaults table with built-in prompts.
7. On the Advanced tab for your new custom report, select the **Enable As Web Service** option if it's not already selected, then select **OK**.
   Workday saves your configuration changes for your new custom report.
8. Transfer ownership of your new custom report to the integration system user created for the Workday external content connector.
   a. From the View Custom Report page, navigate to **...** > **Custom Report** > **Transfer Ownership**.
   b. On the Transfer Ownership of Custom Reports page, in the New Owner field, enter or select the **ISU SNOW ACL** integration system user account.

      Important: If you don't see this integration system user account in the system, check that a Workday admin has completed the Configure Workday security settings preliminary task.

   c. Select **OK**.
9. Generate a sample report using your new custom report and copy its CSV URL.
   a. On the View Custom Report page for your new custom report, navigate to **...** > **Web Service** > **View URLs**.
   b. On the View URLs Web Service page, configure a sample report by filling in the fields.

Field	Value
Period Date Indicator	Select **Based on Payment Date**.
End Date	Select an arbitrary end date for the report. The end date must occur after your specified start date.
Start Date	Select an arbitrary start date for the report.
Worker	Select any member of your Workday organization.

   c. Select **OK**.
   Workday displays parameters and URLs for your sample report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Long-press (or right-click) the **CSV** link and copy the CSV URL.

e. Paste the copied URL into a web browser or a text editor.

The CSV URL has the format `https://<hostname>.workday.com/ccx/service/customreport2/<tenant-name>/<report-owner-user-name>/<report-name-alias>`. This URL may optionally be followed by a question mark and one or more URL parameters separated by ampersands. As an example, your CSV URL might be `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_payslip_report?Period_Date_Indicator%21WID=e3e3e13f80904ee185eab1fbf331acef`.

10. Copy the base URL for your Workday tenant, your Workday tenant name, the custom report owner's user name, the custom report name alias, and the period date indicator Workday ID (WID).

a. Copy the base URL for your Workday tenant from the pasted CSV URL and store it in a secure location.
The base URL for your Workday tenant is the `https://<hostname>.workday.com` portion of the CSV URL (everything before the third slash character). As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_payslip_report?Period_Date_Indicator%21WID=e3e3e13f80904ee185eab1fbf331acef`, the base URL for your Workday tenant is `https://wd2-impl-services1.workday.com`.

> **Important:** Your external content connector administrator needs this base URL when configuring the Workday external content connector.

b. Copy the tenant name for your Workday tenant from the pasted CSV URL and store it in a secure location.
The tenant name for your Workday tenant is the `<tenant-name>` portion of the CSV URL (everything between the sixth and seventh slash characters). As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_payslip_report?Period_Date_Indicator%21WID=e3e3e13f80904ee185eab1fbf331acef`, your Workday tenant name is `Example`.

> **Important:** Your external content connector administrator needs this tenant name when configuring the Workday external content connector.

c. Copy the report owner's user name for your custom payslip report from the pasted CSV URL and store it in a secure location.
The report owner's user name for your custom payslip report is the `<report-owner-user-name>` portion of the CSV URL (everything between the seventh and eighth slash characters). As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_payslip_report?Period_Date_Indicator%21WID=e3e3e13f80904ee185eab1fbf331acef`, your custom payslip report owner's user name is `ISU_SNOW_ACL`.

> **Important:** Your external content connector administrator needs this payslip report owner's user name when configuring the Workday external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Copy the report name alias for your custom payslip report from the pasted CSV URL and store it in a secure location.
The report name alias for your custom payslip report is the `<report-name-alias>` portion of the CSV URL (everything between the eighth slash character and the question mark or the end of the URL). As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_payslip_report?Period_Date_Indicator%21WID=e3e3e13f80904ee185eab1fbf331acef`, your custom payslip report name alias is `Workday_connector_payslip_report`.

> **Important:** Your external content connector administrator needs this payslip report name alias when configuring the Workday external content connector.

e. Copy the period date indicator WID (Workday ID) for your custom payslip report from the pasted CSV URL and store it in a secure location.
The period date indicator WID for your custom payslip report is the value of the `Period_Date_Indicator_WID` URL parameter from the CSV URL. As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_payslip_report?Period_Date_Indicator%21WID=e3e3e13f80904ee185eab1fbf331acef`, your period date indicator WID is `e3e3e13f80904ee185eab1fbf331acef`.

> **Important:** Your external content connector administrator needs this period date indicator WID when configuring the Workday external content connector.

What to do next

Provide the following items to the connector administrator who creates your Workday external content connectors:

- The base URL for your Workday tenant that you copied in step 10.a.
- The Workday tenant name that you copied in step 10.b.
- The custom payslip report owner's user name that you copied in step 10.c.
- The custom payslip report's name alias that you copied in step 10.d.
- The period date indicator WID (Workday ID) that you copied in step 10.e.

Your connector administrator needs these items to configure a Workday external content connector to retrieve searchable content and metadata from payroll information in your Workday source system.

Configure a Learning assignment custom report in Workday

Configure a custom report for Learning assignments in Workday. The Workday external content connector uses this custom report to make content and metadata from your Learning assignment data searchable.

Before you begin

A Workday admin must have already an integration system user and an unconstrained integration system security group in your Workday tenant. For details on this preliminary task, see Configure Workday security settings.

You need an account with the following privileges in your organization's Workday tenant:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Administrator privileges
- **Custom Report Creation** domain access
- Access to the **Learning Assignments by Learning Organization** report data source

Role required: none

About this task

This task is optional. The Workday external content connector can retrieve Learning assignment data from your Workday source system using a custom report that you configure. If you don't want to retrieve Learning assignment data from Workday, you can skip this task.

Procedure

1. Log in to your Workday tenant with your administrator credentials.
2. For each of the calculated fields shown in the following Calculated fields table, perform these steps.

   a. In the Workday search bar, search for the **Create Calculated Field** task and select it.

   b. On the Create Calculated Field page, enter the Field Name shown in the entry for the calculated field in the following Calculated fields table.

   c. Select the Business Object and Function values shown in the entry for the calculated field in the following Calculated fields table.

   d. Select **OK**.
   Workday takes you to the Calculation tab for the new calculated field.

   e. On the Calculation tab, enter the calculation setting field values shown in the entry for the calculated field in the following Calculated fields table.

   f. Select **OK**.
   Workday saves your calculation settings for the new calculated field.

   g. Select **Done**.

3. Create a cf_learning_content_id calculated field.

   a. In the Workday search bar, search for the **Create Calculated Field** task and select it.

   b. On the Create Calculated Field page, enter `cf_learning_content_id` as the Field Name for the new calculated field.

   c. Select **Learning Assignments by Learning Organization** as the Business Object for the new calculated field.

   d. Select **Evaluate Expression** as the Function for the new calculated field.

   e. Select **OK**.
   Workday takes you to the Calculation tab for the new calculated field.

   f. On the Calculation tab, enter these calculation field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Field Type: Text
- Business Object: (empty)
- Default Value: Empty String

g. On the Calculation tab, in the table, add a new row with the specified field values for each entry in the following cf_learning_content_id calculated field conditions table.

cf_learning_content_id calculated field conditions

Condition	Return Value If Condition is True
cf_course_type_is_blended	cf_blended course id
Cf_learning_content_type_is_digital_course	cf_digital_course_id
Cf_learning_content_type_is_course_offering	cf_course_offering_id
Cf_learning_content_type_is_program	Cf_program_id
Cf_learning_content_type_is_lesson	cf_lesson_id

h. Select **OK**.

i. Select **Done**.

4. Create a learning assignment report in Workday.

a. In the Workday search bar, search for the **Create Custom Report** task and select it.

b. On the Create Custom Report page, enter a name for your new custom report. As an example, you might enter `Workday connector LA report`.

c. In the Report Type field, select **Advanced**.

d. Clear the **Optimized for performance** option.

e. In the Data Source field, select **Learning Assignments by Learning Organization**.

f. Select the **Enable As Web Service** option.

g. Select **OK**.

Workday takes you to the Edit Custom Report page for your new custom report.

5. On the Edit Custom Report page, on the Columns tab, perform the following steps for each entry in the following Custom report columns table.

a. Select **+** to add a new column row.

b. In the new row, select or enter the field values shown in the column entry in the table.

6. On the Columns tab, in the Group Column Headings section for your new custom report, perform the following steps for each entry in the following Custom report group column headings table.

   a. Select **+** to add a new column row.

   b. In the new row, select or enter the field values shown in the group column heading entry in the table.

Custom report group column headings

Business Object	Group Column Heading	Group Column Heading XML Alias
Assigned By		Assigned_By_group
Worker		Worker_group
Worker's Manager(s)		Worker_s_Manager_s__group

7. On the Edit Custom Report page, navigate to the Sort tab, then perform these steps.

   a. In the table, select **+** to add a new result sort order row for your custom report.

   b. In the new row, select or enter the field values shown in the following Sort order table.

Sort order

Field	Sort Direction
Last Functionally Updated	Alphabetical - Ascending

8. On the Edit Custom Report page, navigate to the Filter tab, then perform the following steps for each filter condition entry in the following Filter conditions table.

   a. In the Filter conditions for filtering on instances table, select **+** to add a new sort order row for your custom report.

   b. In the new row, select or enter the field values shown for the filter condition entry in the table.

Filter conditions

Last Functionally Updated	Ending Prompt	End_Assigned_Date	No default value		

11. On the Advanced tab for your new custom report, select the **Enable As Web Service** option if it's not already selected, then select **OK**.
Workday saves your configuration changes for your new custom report.
12. Transfer ownership of your new custom report to the integration system user created for the Workday external content connector.
    a. From the View Custom Report page, navigate to **...** > **Custom Report** > **Transfer Ownership**.
    b. On the Transfer Ownership of Custom Reports page, in the New Owner field, enter or select the **ISU SNOW ACL** integration system user account.

    > **Important:** If you don't see this integration system user account in the system, check that a Workday admin has completed the Configure Workday security settings preliminary task.

    c. Select **OK**.
13. Generate a sample report using your new custom report and copy its CSV URL.
    a. On the View Custom Report page for your new custom report, navigate to **...** > **Web Service** > **View URLs**.
    b. On the View URLs Web Service page, configure a sample report by filling in the fields.

Field	Value
Worker	Select any member of your Workday organization.
Learning Organizations for Learning Assignment	Select the supervisory organization for the chosen worker.
Starting Last Functionally Updated	Select an arbitrary start date and time for the report.
Ending Last Functionally Updated	Select an arbitrary end date and time for the report. The end date and time must occur after your specified start date and time.

    c. Select **OK**.
    Workday displays parameters and URLs for your sample report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Long-press (or right-click) the **CSV** link and copy the CSV URL.

e. Paste the copied URL into a web browser or a text editor.

The CSV URL has the format `https://<hostname>.workday.com/ccx/service/customreport2/<tenant-name>/<report-owner-user-name>/<report-name-alias>`. This URL may optionally be followed by a question mark and one or more URL parameters separated by ampersands. As an example, your CSV URL might be `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_LA_report`.

14. Copy the base URL for your Workday tenant, your Workday tenant name, the custom report owner's user name, and the custom report name alias.

a. Copy the base URL for your Workday tenant from the pasted CSV URL and store it in a secure location.
The base URL for your Workday tenant is the `https://<hostname>.workday.com` portion of the CSV URL (everything before the third slash character). As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_LA_report`, the base URL for your Workday tenant is `https://wd2-impl-services1.workday.com`.

> **Important:** Your external content connector administrator needs this base URL when configuring the Workday external content connector.

b. Copy the tenant name for your Workday tenant from the pasted CSV URL and store it in a secure location.
The tenant name for your Workday tenant is the `<tenant-name>` portion of the CSV URL (everything between the sixth and seventh slash characters). As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_LA_report`, your Workday tenant name is `Example`.

> **Important:** Your external content connector administrator needs this tenant name when configuring the Workday external content connector.

c. Copy the report owner's user name for your custom Learning assignment report from the pasted CSV URL and store it in a secure location.
The report owner's user name for your custom Learning assignment report is the `<report-owner-user-name>` portion of the CSV URL (everything between the seventh and eighth slash characters). As an example, if your CSV URL is `https://wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_LA_report`, your custom Learning assignment report owner's user name is `ISU_SNOW_ACL`.

> **Important:** Your external content connector administrator needs this Learning assignment report owner's user name when configuring the Workday external content connector.

d. Copy the Learning assignment report name alias for your custom report from the pasted CSV URL and store it in a secure location.
The report name alias for your custom Learning assignment report is the `<report-name-alias>` portion of the CSV URL (everything between the eighth slash character and the question mark or the end of the URL). As an example, if your CSV URL is `https://`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`wd2-impl-services1.workday.com/ccx/service/customreport2/Example/ISU_SNOW_ACL/Workday_connector_LA_report`, your custom Learning assignment report name alias is `Workday_connector_LA_report`.

Important: Your external content connector administrator needs this Learning assignment report name alias when configuring the Workday external content connector.

What to do next

Provide the following items to the connector administrator who creates your Workday external content connectors:

- The base URL for your Workday tenant that you copied in step 14.a.
- The Workday tenant name that you copied in step 14.b.
- The custom Learning assignment report owner's user name that you copied in step 14.c.
- The custom Learning assignment report's name alias that you copied in step 14.d.

Your connector administrator needs these items to configure a Workday external content connector to retrieve searchable content and metadata from learning assignments in your Workday source system.

Get Workday task code for Find Learning Assignments

Get the task code for the Find Learning Assignments task from your Workday tenant. The Workday external content connector needs this task code to retrieve Learning assignment data from Workday.

Before you begin

You need the manager role and access to the Find Learning Assignments task in your organization's Workday tenant.

Role required: none

About this task

This task is optional. The Workday external content connector can retrieve Learning assignment data from your Workday source system. If you don't want to retrieve Learning assignment data from Workday, you can skip this task.

Procedure

1. Log in to your Workday tenant with your manager credentials.
2. In the Workday search bar, search for the **Find Learning Assignments** task and select it.
3. Copy the task code from the Workday URL for the Find Learning Assignments page and store it in a secure location.
   The task code is the path element between the final slash and the `.htmld` extension in the URL shown for the Find Learning Assignments page. As an example, if your Find Learning Assignments page URL is `https://impl.workday.com/example/d/task/3005$6923.htmld`, the task code is `3005$6923`.

Important: Your external content connector administrator needs this task code when configuring the Workday external content connector to retrieve Learning assignment data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Provide the task code you copied in step 3 to your connector administrator. They need this task code to configure a Workday external content connector to retrieve Learning assignment data from your Workday source system.

For details on creating and configuring a Workday external content connector, see Create a Workday external content connector.

Get Workday task code for My Team's Birthday

Get the task code for the My Team's Birthday task from your Workday tenant. The Workday external content connector needs this task code to retrieve team birthday data from the Manager hub.

Before you begin
You need the manager role and access to the My Team's Birthday task in your organization's Workday tenant.

Role required: none

About this task
This task is optional. The Workday external content connector can retrieve Manager hub data from your Workday source system. If you don't want to retrieve Manager hub data from Workday, you can skip this task.

Procedure
1. Log in to your Workday tenant with your manager credentials.
2. In the Workday search bar, search for the **My Team's Birthday** task and select it.
3. Copy the task code from the Workday URL for the My Team's Birthday page and store it in a secure location.
   The task code is the path element between the final slash and the `.htmld` extension in the URL shown for the My Team's Birthday page. As an example, if your My Team's Birthday page URL is `https://impl.workday.com/example/d/task/3005$6924.htmld`, the task code is `3005$6924`.

> **Important:** Your external content connector administrator needs this task code when configuring the Workday external content connector to retrieve Manager hub data.

What to do next
Provide the task code you copied in step 3 to your connector administrator. They need this task code to configure a Workday external content connector to retrieve Manager hub data from your Workday source system.

For details on creating and configuring a Workday external content connector, see Create a Workday external content connector.

Get Workday task code for My Team Anniversaries

Get the task code for the My Team Anniversaries task from your Workday tenant. The Workday external content connector needs this task code to retrieve team anniversary data from the Manager hub.

Before you begin
You need the manager role and access to the My Team Anniversaries task in your organization's Workday tenant.

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

This task is optional. The Workday external content connector can retrieve Manager hub data from your Workday source system. If you don't want to retrieve Manager hub data from Workday, you can skip this task.

Procedure

1. Log in to your Workday tenant with your manager credentials.
2. In the Workday search bar, search for the **My Team Anniversaries** task and select it.
3. Copy the task code from the Workday URL for the My Team Anniversaries page and store it in a secure location.
   The task code is the path element between the final slash and the `.htmld` extension in the URL shown for the My Team Anniversaries page. As an example, if your My Team Anniversaries page URL is `https://impl.workday.com/example/d/task/3005$6925.htmld`, the task code is `3005$6925`.

> **Important:** Your external content connector administrator needs this task code when configuring the Workday external content connector to retrieve Manager hub data.

What to do next

Provide the task code you copied in step 3 to your connector administrator. They need this task code to configure a Workday external content connector to retrieve Manager hub data from your Workday source system.

For details on creating and configuring a Workday external content connector, see Create a Workday external content connector.

Configure Workday for external content indexing

Create and authorize an OAuth 2.0 API client in your Workday tenant to allow the Workday external content connector to access your Workday source system.

Before you begin

You need administrator privileges for your organization's Workday tenant. You need modify access for these domains in the System functional area:

- Set Up: Tenant Setup - Security
- Security Administration

A Workday admin must have already completed the preliminary tasks shown in the following table.

Preliminary task	Description
Configure Workday security settings	Required task.
Configure access to help articles in Workday	Optional task. Only required if you want the connector to retrieve searchable content and metadata from help articles accessible by all users in your Workday organization.
Configure a payslip report in Workday	Optional task. Only required if you want the connector to retrieve searchable content and metadata from payroll data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preliminary task	Description
Configure a Learning assignment custom report in Workday and Get Workday task code for Find Learning Assignments	Optional tasks. Only required if you want the connector to retrieve searchable content and metadata from Learning assignment data.
Get Workday task code for My Team's Birthday and Get Workday task code for My Team Anniversaries	Optional tasks. Only required if you want the connector to retrieve searchable content and metadata from Manager hub data.

Role required: none

About this task

The Workday external content connector retrieves public help articles, benefits, learning assignments, Manager Insights Hub data, payroll information, PTO information, and vacation policies from your Workday source system using the Workday REST API.

To allow the connector to access your Workday source system via the Workday REST API, you must configure and authorize an OAuth 2.0 API client in your Workday tenant. Your connector administrator can use settings copied from this OAuth 2.0 API client and your Workday tenant to configure the Workday external connector for proper connection to your source system.

Procedure

1. Log in to your Workday tenant and record its base connection URL and tenant name.

   a. Navigate to your Workday tenant and log in with developer credentials.

   b. Copy the base connection URL and the tenant name for your Workday tenant and record them in a secure location.
   Your tenant's base connection URL is the HTTPS protocol prefix and the hostname from the Workday URL that you see after logging in. Your tenant's name is the first path element that follows the hostname in the Workday URL. As an example, if logging in takes you to `https://wd-2-impl-services1.workday.com/example/d/home.htmld`, your base connection URL is `https://wd-2-impl-services1.workday.com` and your tenant name is `example`.

   > **Important:** Your external content connector administrator needs the base connection URL and tenant name when configuring the Workday external content connector.

2. Enable OAuth 2.0 clients in your Workday tenant.

   a. In the Workday search bar, search for the **Edit Tenant Setup - Security** task and select it.

   b. On the Edit Tenant Setup - Security form, in the OAuth 2.0 Settings section, select the **OAuth 2.0 Clients Enabled** option, then select **OK**.

   c. Select **Done**.

3. Create a new OAuth 2.0 API client for the Workday external content connector.

   a. In the Workday search bar, search for the **Register API Client** task and select it.

   b. On the Register API Client form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Client Name	Unique name for this API client. As an example, you might enter `Workday external content connector`.
Client Grant Type	Select **Authorization Code Grant**.
Access Token Type	Select **Bearer**.
Redirection URI	Enter `https://<instance-name>.service-now.com/oauth_redirect.do`, replacing `<instance-name>` with your ServiceNow AI Platform® instance name.
Non-Expiring Refresh Tokens	Select this option.
Grant Administrative Consent	Select this option.
Scope (Functional Areas)	In the drop-down list, select **Custom Objects**, then select all of the listed scopes.
Include Workday Owned Scope	Select this option.

c. Select **OK**.

Your new OAuth 2.0 API client is registered.

4. Find the client ID and client secret for your new OAuth 2.0 API client.

a. Copy the client ID for your new OAuth 2.0 API client and store it in a secure location.

> **Important:** Your external content connector administrator needs this client ID when configuring the Workday external content connector.

b. Copy the client secret for your new OAuth 2.0 API client and store it in a secure location.

> **Important:** Your external content connector administrator needs this client secret when configuring the Workday external content connector.

c. Copy the token endpoint URL for your new OAuth 2.0 API client and store it in a secure location.

> **Important:** Your external content connector administrator needs this token endpoint URL when configuring the Workday external content connector.

d. Copy the authorization endpoint URL for your new OAuth 2.0 API client and store it in a secure location.

> **Important:** Your external content connector administrator needs this authorization endpoint URL when configuring the Workday external content connector.

What to do next

Provide the following items to your connector administrator:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The base connection URL for your Workday tenant that you copied in step 1.b.
- The tenant name that you copied in step 1.b.
- The client ID that you copied in step 4.a.
- The client secret that you copied in step 4.b.
- The token endpoint URL that you copied in step 4.c.
- The authorization endpoint URL that you copied in step 4.d.

Your connector administrator needs these items to configure a Workday external content connector to retrieve Workday content from your Workday source system.

For details on creating and configuring a Workday external content connector, see Create a Workday external content connector.

Create a Workday external content connector

Create an external content connector to retrieve searchable content from your Workday source system.

Before you begin

A source system administrator must have already configured your Workday source system to allow access by the Workday external content connector. For the required source system configuration steps, see Configure Workday for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Workday** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Workday external content connector.
Connection URL	Base connection URL for your Workday tenant. This URL typically has the format `https://<hostname>.workday.com`. If you don't have this connection URL, ask your Workday administrator for it.
Client ID	Client ID for the OAuth 2.0 API client that grants the connector access to your Workday tenant. If you don't have this client ID, ask your Workday administrator for it.
Client secret	Client secret for the OAuth 2.0 API client that grants the connector access to your Workday tenant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	If you don't have this client secret, ask your Workday administrator for it.
Token URL	Token endpoint URL for the OAuth 2.0 API client that grants the connector access to your Workday tenant. This URL typically has the format `https://<hostname>.workday.com/ccx/oauth2/<tenant-name>/token`. If you don't have this token endpoint URL, ask your Workday administrator for it.
Authorization URL	Authorization endpoint URL for the OAuth 2.0 API client that grants the connector access to your Workday tenant. This URL typically has the format `https://<hostname>.workday.com/<tenant-name>/authorize`. If you don't have this authorization endpoint URL, ask your Workday administrator for it.
Tenant name	Name of your Workday tenant. If you don't have this tenant name, ask your Workday administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Workday external content connector.
9. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
10. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content with your new connector, you must configure and run content crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Workday external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Workday external content connector

Specify the content types you want your Workday external content connector to retrieve.

Before you begin
A connector administrator must have already created the Workday external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Workday external content connector.

A Workday admin must have already completed the preliminary tasks shown in the following table.

Preliminary task	Description
Configure Workday security settings	Required task.
Configure access to help articles in Workday	Optional task. Only required if you want the connector to retrieve searchable content and metadata from help articles accessible by all users in your Workday organization.
Configure a payslip report in Workday	Optional task. Only required if you want the connector to retrieve searchable content and metadata from payroll data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preliminary task	Description
Configure a Learning assignment custom report in Workday and Get Workday task code for Find Learning Assignments	Optional tasks. Only required if you want the connector to retrieve searchable content and metadata from Learning assignment data.
Get Workday task code for My Team's Birthday and Get Workday task code for My Team Anniversaries	Optional tasks. Only required if you want the connector to retrieve searchable content and metadata from Manager hub data.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Workday external content connector crawls the following content types and sends them to AI Search for indexing:

- Help articles accessible by all users in your Workday organization
- Benefits information
- PTO information
- Vacation policy information

Only perform this task if you want to prevent the connector from retrieving one or more of these default content types, or if you want it to retrieve any of the following content types:

- Payroll information
- Learning assignments
- Birthday, anniversary, and PTO request data from Manager Insights Hub

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Workday external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. In the Crawl content types section, deselect the options for any of these content types that you don't want the connector to retrieve from Workday:
   - **Articles**
   - **Benefits**
   - **PTO information**
   - **Vacation policy**
5. In the Payroll information section, perform one of the following steps.
   - If you don't want the connector to retrieve payroll information from Workday, disable the **Crawl payroll information** option.
   - If you want the connector to retrieve payroll information from Workday, fill in the fields:

Field	Description
Payslip period date indicator	Workday ID (WID) for the period data indicator from the payslip report configured in your Workday tenant. If you don't have this WID, ask your Workday administrator for it.
Payslip report owner user name	User name for the integrated system user account that owns the payslip report configured in your Workday tenant. If you don't have this user name, ask your Workday administrator for it.
Payslip report name XML alias	XML alias for the name of the payslip report configured in your Workday tenant. If you don't have this XML alias, ask your Workday administrator for it.

6. In the Learning assignments section, perform one of the following steps.
   - If you don't want the connector to retrieve Learning assignments from Workday, disable the **Crawl Learning assignments** option.
   - If you want the connector to retrieve Learning assignments from Workday, fill in the fields:

Field	Description
Learning assignment manager view task code	Task code for the Find Learning Assignments task in your Workday tenant. If you don't have this task code, ask a Workday manager who has access to the Find Learning Assignments task for it. For details on how to find this task code, see Get Workday task code for Find Learning Assignments.
Learning assignments	User name for the integrated system user account that owns the Learning assignments report configured in your Workday tenant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
report owner user name	If you don't have this user name, ask your Workday administrator for it.
Learning assignments report name XML alias	XML alias for the name of the Learning assignments report configured in your Workday tenant. If you don't have this XML alias, ask your Workday administrator for it.

7. In the Manager hub data section, perform one of the following steps.
   - If you don't want the connector to retrieve Manager Insights Hub data from Workday, disable the **Crawl manager Hub data** option.
   - If you want the connector to retrieve Manager Insights Hub data from Workday, fill in the fields:

Field	Description
Birthday task code	Task code for the My Team's Birthday task in your Workday tenant. If you don't have this task code, ask a Workday manager who has access to the My Team's Birthday task for it. For details on how to find this task code, see Get Workday task code for My Team's Birthday.
Anniversary task code	Task code for the My Team Anniversaries task in your Workday tenant. If you don't have this task code, ask a Workday manager who has access to the My Team Anniversaries task for it. For details on how to find this task code, see Get Workday task code for My Team Anniversaries.

8. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
9. Select **Save and validate**.

Result
The Workday external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Workday source system using your modified crawl settings, create and run a one-time content crawl for your Workday external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workvivo external content connector

The Workvivo external content connector retrieves articles, comments, documents, events, kudos, pages, and updates from your Workvivo source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Related topics

Create a content crawl for an external content connector

Create a user permission crawl for an external content connector

Configure Workvivo for external content indexing

Create and authorize a new application in your Workvivo instance to allow the Workvivo external content connector to access your source system and content.

Before you begin

You need the Developer role for your Workvivo instance.

Role required: none

About this task

The Workvivo external content connector retrieves articles, comments, documents, events, kudos, pages, and updates that are present globally, in teams, or in spaces in your Workvivo source system using the Workvivo API.

To allow the connector to access your Workvivo source system via the API, you must configure and configure an app in your Workvivo instance. Your connector administrator can use this app's API key and settings from your instance to configure the Workvivo external connector for proper connection to your source system.

Procedure

1. In your Workvivo instance, create a new app to grant the Workvivo external content connector access to your content.

   a. Navigate to your Workvivo instance URL and log in with credentials for your account with the Developer role.

   b. In the navigation bar, navigate to **Admin** > **Tools**.

   c. Navigate to **Platform** > **API Keys & JWT Settings**.

   d. Copy your organization's Workvivo ID from the banner and store it in a secure location.

   > **Important:** Your external content connector administrator needs this Workvivo ID when configuring the Workvivo external content connector.

   e. Copy your organization's API URL from the banner and store it in a secure location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Your external content connector administrator needs this API URL when configuring the Workvivo external content connector.

f. Select **Add New App**.

g. On the Create New App form, enter a name for your new app.

h. Select all of the following permissions for your new app.

- users.*.read
- users.peerendorsement.read
- teams.*.read
- teams.types.read
- spaces.*.read
- spaces.public.read
- spaces.private.read
- spaces.hidden.read
- articles.*.read
- events.*.read
- updates.*.read
- pages.*.read
- likes.*.read
- comments.*.read
- kudos.*.read
- documents.*.read

i. Select **Save**.

Workvivo creates your new app.

2. Create an API key for your new app.

a. In the list item for your new app, select **Manage Keys**.

b. Select **Add new Key**.

c. On the New API Key form, enter a name for your new key, then select **Save**.

d. Copy your the token for your new API key and store it in a secure location.

Important: Your external content connector administrator needs this API key token when configuring the Workvivo external content connector.

What to do next

Provide the following items to your connector administrator:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The host URL for your Workvivo instance. This is typically `https://<organization-name>.workvivo.us`, where `<organization-name>` is the name of your organization.
- Your organization's Workvivo ID that you copied in step 1.d.
- The API URL that you copied in step 1.e.
- The API key token that you copied in step 2.d.

Your connector administrator needs these items to configure a Workvivo external content connector to retrieve articles, comments, documents, events, kudos, pages, and updates and security principals from your Workvivo source system.

For details on creating and configuring a Workvivo external content connector, see Create a Workvivo external content connector.

Create a Workvivo external content connector

Create an external content connector to retrieve searchable content and security principals from your Workvivo source system.

Before you begin

A source system administrator must have already configured your Workvivo source system to allow access by the Workvivo external content connector. For the required source system configuration steps, see Configure Workvivo for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Workvivo* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Workvivo external content connector.
API base URL	Base URL for the Workvivo API. If you don't have the API base URL, ask your Workvivo administrator for it.
Instance base URL	URL for your Workvivo instance host. This is typically `https://<organization-name>.workvivo.us`, where `<organization-name>` is the name of your organization. If you don't have the instance base URL, ask your Workvivo administrator for it.
Organization ID	Workvivo ID for your organization. This is typically a numeric value, such as `1755225`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection setting	Description
	If you don't have the organization ID, ask your Workvivo administrator for it.
Access token	Token for an API key defined in the app that grants the connector access to your Workvivo instance's content. If you don't have the API key token for the app, ask your Workvivo administrator for it.

6. Save your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection setting entries fails, the system shows an error message. Verify your connection settings to ensure they're correct.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Workvivo external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Workvivo external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Workvivo external content connector

Define inclusion or exclusion filters to control the attachment file types the Workvivo external content connector retrieves and feeds to AI Search for indexing.

Before you begin

A connector administrator must have already created the Workvivo external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Workvivo external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Workvivo external content connector crawls all global items, space scoped items, and team scoped items from its specified source system and sends all articles, comments, documents, events, kudos, pages, updates, and attachment binary files with all supported file extensions to AI Search for indexing. Only perform this task if you want the connector to use inclusion or exclusion filters for the binary attachment file extensions to retrieve when running content crawls.

Note: The Workvivo external content connector retrieves comments from articles, events, kudos, and updates.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Workvivo external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **Attachments** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
5. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This option is only available when the Platform Multimodal Service plugin is activated on your instance.

- For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
- To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.

6. Select **Save and validate**.

Result
The Workvivo external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Workvivo source system using your modified crawl settings, create and run a one-time content crawl for your Workvivo external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Zendesk Guide external content connector

The Zendesk Guide external content connector retrieves articles and attachments from knowledge bases in your Zendesk Guide source system and makes their content and metadata searchable in AI Search applications.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

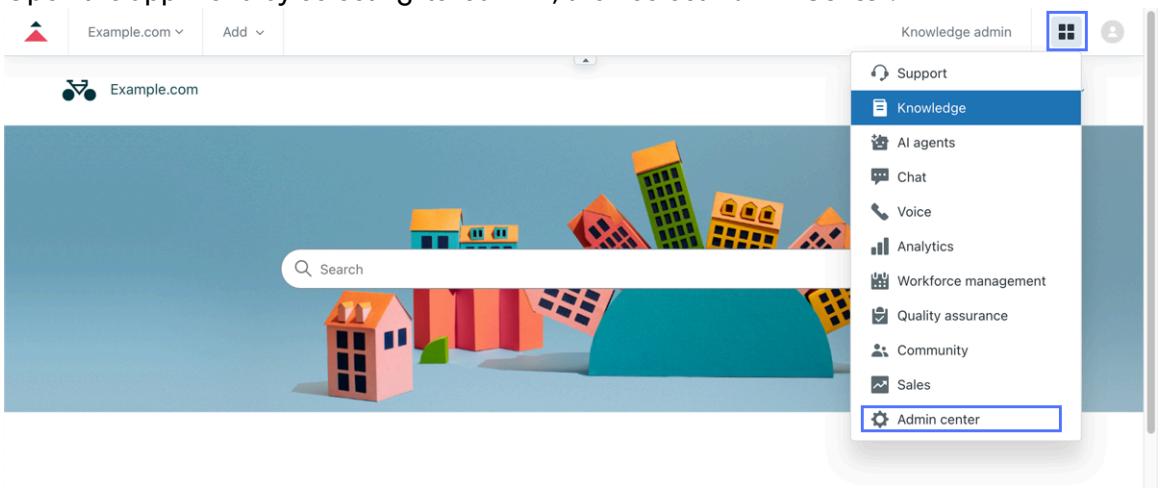
Configure Zendesk for external content indexing

Create an API token in Zendesk Admin Center to allow the Zendesk Guide external content connector to access your Zendesk source system.

Before you begin
You need administrator access to your Zendesk instance.

Role required: none

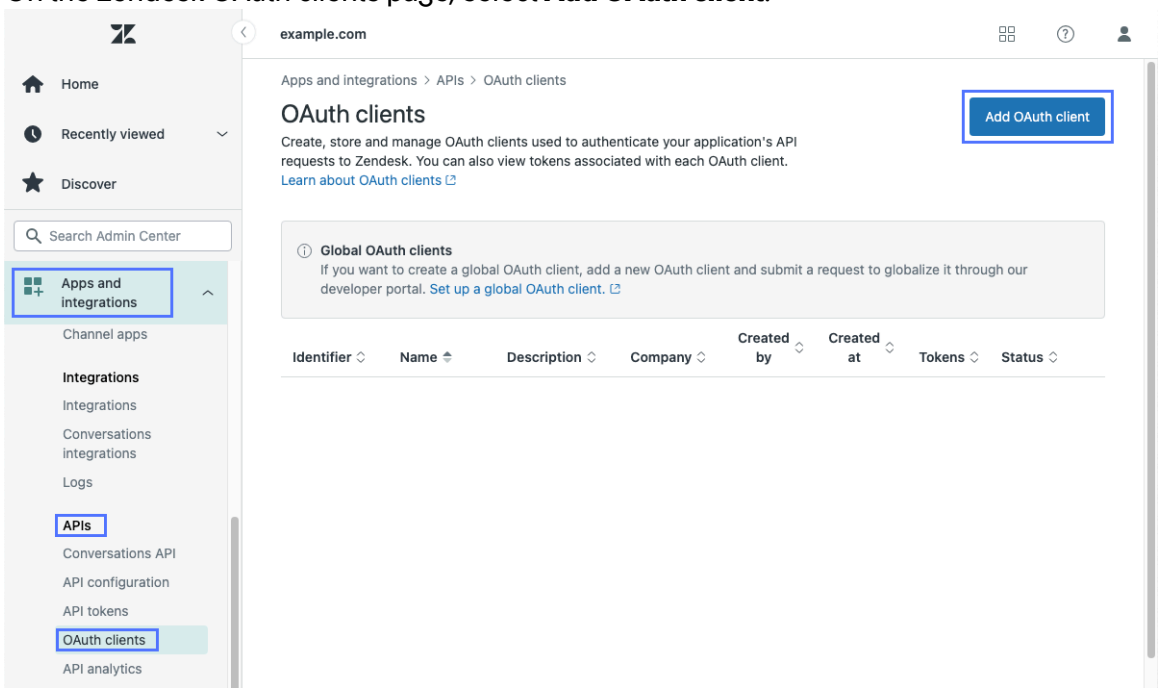


About this task
The Zendesk Guide external content connector retrieves documents and user permissions from your Zendesk source system using the Zendesk API.

To allow the connector to access your Zendesk source system via the Zendesk API, you must create an API token in the Zendesk Admin Center. Your connector administrator can use this API token to configure the Zendesk Guide external connector for proper connection to your source system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



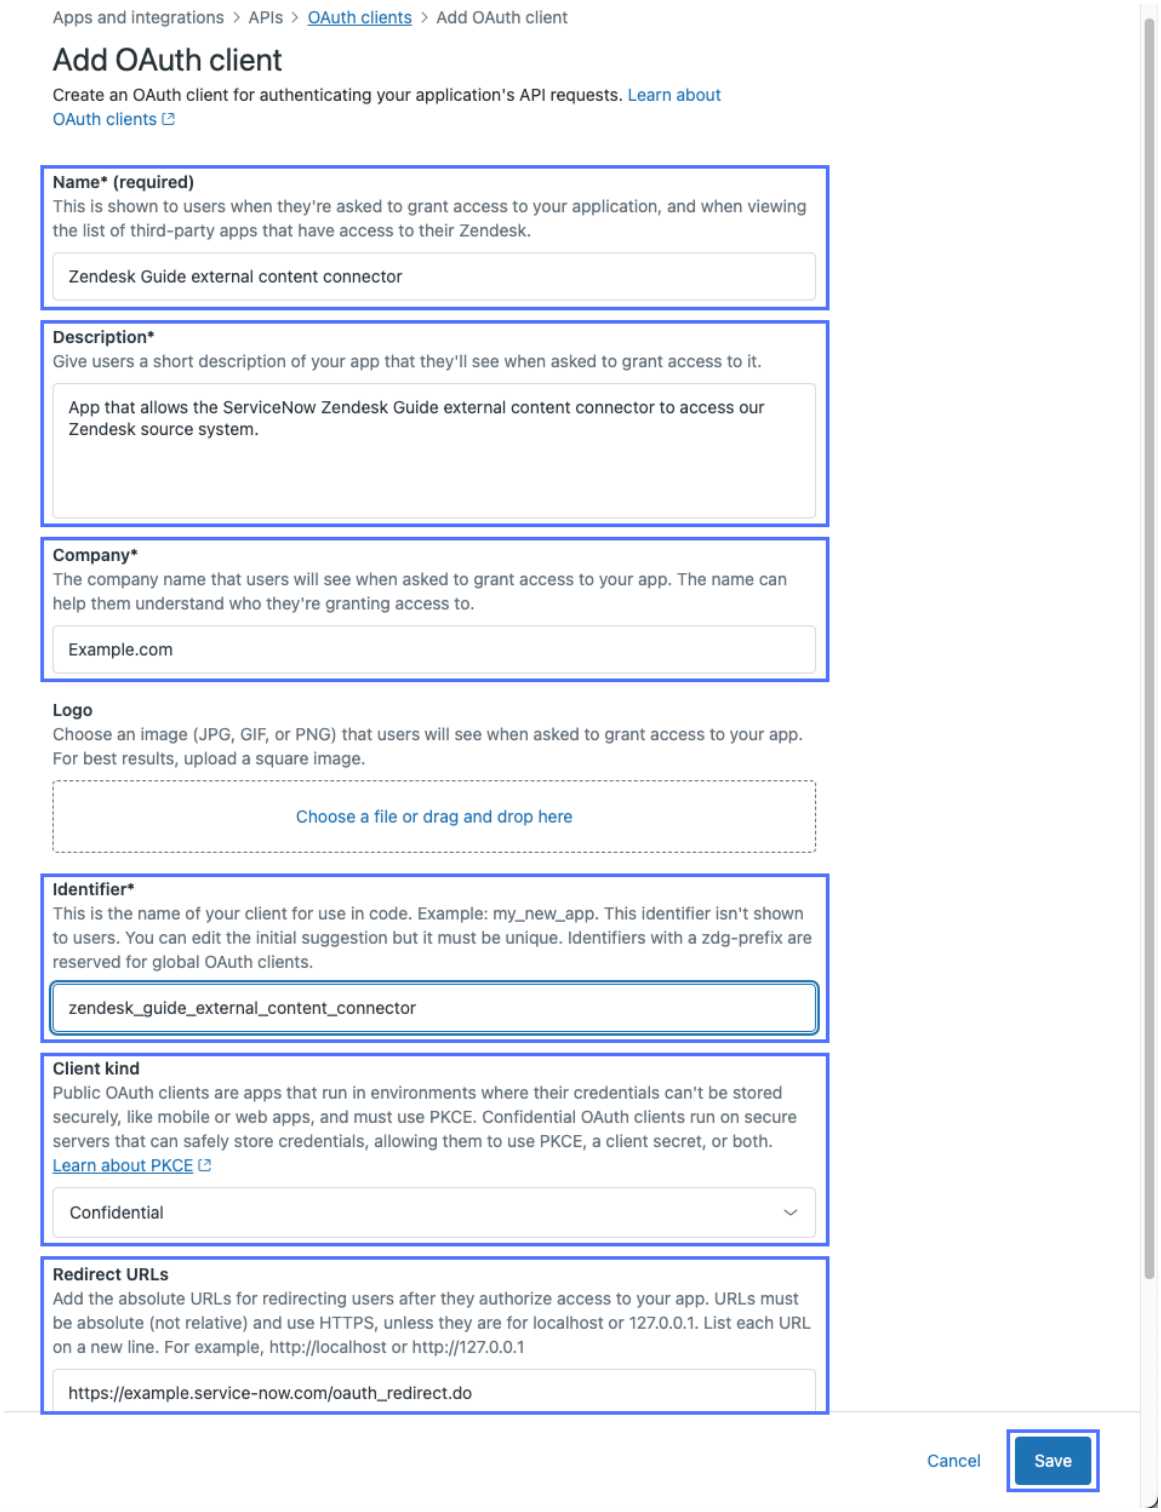
1. Navigate to `https://<subdomain>.zendesk.com`, where `<subdomain>` is the unique identifier for your Zendesk instance.
2. Log in with your Zendesk administrator credentials.
3. Open the app menu by selecting its icon , then select **Admin Center**.

4. In the Admin Center menu, navigate to **Apps and integrations** > **APIs** > **OAuth clients**.

   If the Admin Center menu labels aren't shown, select the **Apps and integrations** icon to expand the menu and navigate.

5. On the Zendesk OAuth clients page, select **Add OAuth client**.

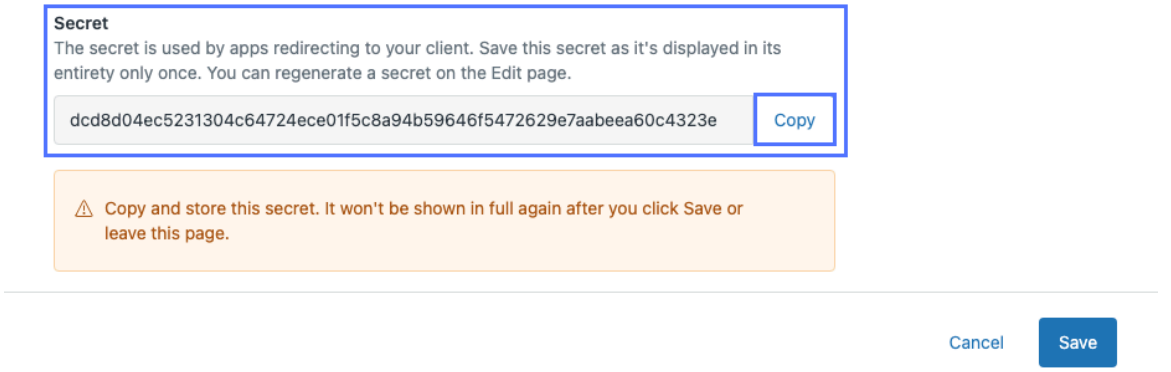
   The Add OAuth client page appears.



6. On the Add OAuth client page, fill in the fields.

Field	Description
Name* (required)	Enter a name for your new OAuth 2.0 client application. As an example, you might enter

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
	Zendesk Guide external content connector.
Description*	Enter a short description for your new OAuth 2.0 client application. This description is shown to users when they're asked to grant access to the application. As an example, you might enter App that allows the ServiceNow Zendesk Guide external content connector to access our Zendesk source system..
Company*	Enter the name of your organization. As an example, you might enter Example.com.
Identifier*	Enter the identifier string you want to use when referring to your new OAuth 2.0 client application in code. A default identifier is automatically generated from the application name you enter, but you can override it if you want to use a different value. **Important:** Your connector administrator needs this client identifier when configuring the Zendesk external content connector.
Client kind	Select **Confidential**.
Redirect URLs	Enter https://<instance-name>.service-now.com/oauth_redirect.do, where <instance-name> is the hostname for your ServiceNow AI Platform® instance where you will create and run the external content connector. As an example, you might enter https://example.service-now.com/oauth_redirect.do.

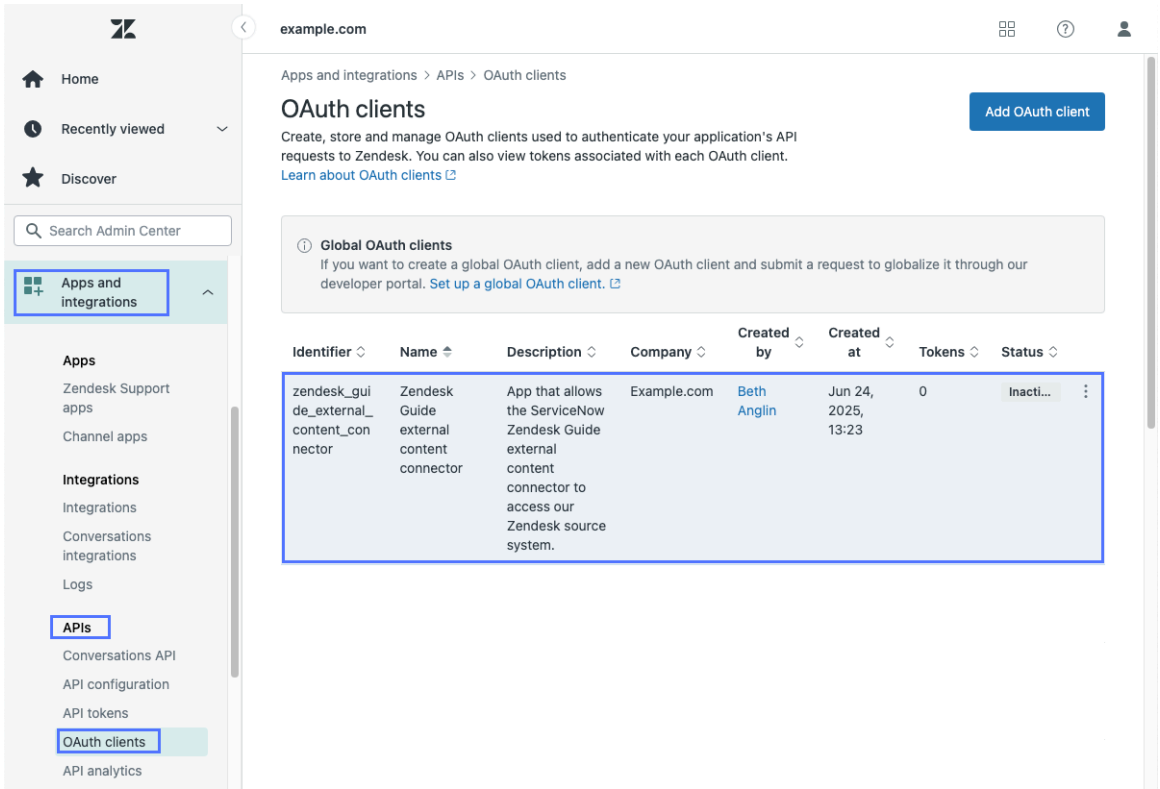
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Save**.
   Zendesk adds your new OAuth 2.0 client application and displays its generated client secret at the bottom of the Add OAuth client page.
8. Copy your new OAuth 2.0 client application's **Secret** and save it in a secure location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important: Your connector administrator needs this client secret when configuring the Zendesk external content connector.

9. Select **Save**.

Zendesk updates your new OAuth 2.0 client application with the generated secret. Your new application appears on the Zendesk OAuth clients page.

What to do next

Provide the following items to your connector administrator:

- The OAuth 2.0 client identifier that you entered in step 6.
- The client secret that you saved in step 8.

Your connector administrator needs these settings to configure a Zendesk Guide external content connector to retrieve searchable content and security principals from your Zendesk source system.

For details on creating and configuring a Zendesk Guide external content connector, see Create a Zendesk Guide external content connector.

© 2026 ServiceNow, Inc. All rights reserved.

Create a Zendesk Guide external content connector

Create an external content connector to retrieve searchable content and security principals from your Zendesk source system.

Before you begin

A source system administrator must have already configured your Zendesk source system to allow access by the Zendesk Guide external content connector. For the required source system configuration steps, see Configure Zendesk for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the **Zendesk** tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

Connection settings

Connection setting	Description
Connector name	Unique name for this Zendesk Guide external content connector.
Zendesk instance hostname	URL for your Zendesk instance. As an example, you might enter `https://example.zendesk.com`. If you don't know the instance URL to use, ask your Zendesk administrator for it.
Client ID	Identifier for the OAuth 2.0 client application configured in Zendesk that grants access to your Zendesk source system. As an example, you might enter `zendesk_guide_external_content_connector`. If you don't know the client identifier to use, ask your Zendesk administrator for it.
Client Secret	Secret for the OAuth 2.0 client application configured in Zendesk that grants access to your Zendesk source system. If you don't know the client secret to use, ask your Zendesk administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Zendesk Guide external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page. For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

    When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result

Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next

To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Zendesk Guide external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Zendesk Guide external content connector

Specify the article locales and attachment file types you want your Zendesk Guide external content connector to crawl when running content crawls. Define inclusion or exclusion filters for domains to restrict the set of users the crawl retrieves access permissions for when running user permission crawls.

Before you begin

A connector administrator must have already created the Zendesk Guide external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Zendesk Guide external content connector.

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. By default, the Zendesk Guide external content connector crawls all users from the source system during user permission crawls. During content crawls, it defaults to retrieving help center articles from all locales and retrieving all attachments with supported file extensions. Only perform this task if you want the connector to use any of the following non-default settings:

- Inclusion or exclusion filters for the user accounts to access on the source system when running user permission crawls
- Inclusion or exclusion filters for the help center article locales to crawl when running content crawls
- Inclusion or exclusion filters for the attachment file extensions to retrieve when running content crawls

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Zendesk Guide external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select one of the following **User *permission* filtering** options:
   - To retrieve user permissions for all users from the source system, select **Map all users**.
   - To only retrieve user permissions for users from specified domains in the source system, select **Map only these users**, then use the **Add domain for user email addresses to include** field and **Add** button to enter domains whose users you want to include in the user permission crawl.

     For example, you might enter `example.com` to include only user permissions for users from the specified domain.
5. Select one of the following **Locale filtering** options:
   - To crawl articles from all locales defined in the source system, select **Crawl all locales**.
   - To crawl only articles from a specified set of locales defined in the source system, select **Include only these locales**, then use the **Locales to include** field to enter identifiers for the locales of articles that you want to include in the crawl.

     For example, you might enter `en-US` and `es-MX` to only crawl searchable content from articles with the US English or Mexican Spanish locales.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To crawl all articles except those from a specified set of locales defined in the source system, select **Exclude only these locales**, then use the **Locales to exclude** field to enter identifiers for the locales of articles that you want to exclude from the crawl.

  For example, you might enter `pt-BR` to exclude searchable content from articles with the Brazilian Portuguese locale.

6. Select one of the following **Attachment filtering** options:
   - To retrieve all attachments with supported file extensions from the source system, select **Crawl all attachments**.
   - To retrieve only attachments with specified file extensions from the source system, select **Include only these file extensions**, then use the **File extensions to include** field to enter attachment file extensions you want the connector to include when crawling.

     As an example, you might enter `.docx` to retrieve only attachments with the Microsoft Word file format.
   - To retrieve all attachments except those with specified file extensions from the source system, select **Exclude only these file extensions**, then use the **File extensions to exclude** field to enter attachment file extensions you want the connector to exclude when crawling.

     As an example, you might enter `.csv` to exclude attachments with the Comma-Separated Values (CSV) file format.

   For details on the supported attachment file extensions, see Binary file extensions supported in External Content Connectors.
7. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.
   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
8. Select **Save and validate**.

Result

The Zendesk Guide external content connector is updated with your modified crawl settings.

What to do next

To retrieve content from your Zendesk Guide source system using your modified crawl settings, create and run a one-time content crawl for your Zendesk Guide external content connector.
To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Zoom external content connector

The Zoom external content connector retrieves webinars and meetings from your Zoom source system and makes their content and metadata searchable in AI Search applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector administrators can run or schedule content crawls to retrieve updated content and access permissions from your source system, or user permission crawls to retrieve updated security principals from your source system. Both types of crawl feed their data to AI Search for indexing.

The indexed content and metadata are stored as records in a connector-specific indexed source. Search administrators can create search sources from this indexed source and link them to search profiles to make the indexed records searchable in AI Search applications.

Configure Zoom for external content indexing

Create and activate a Server-to-Server OAuth app in the Zoom App Marketplace to allow the Zoom external content connector to access your Zoom source system.

Before you begin

You need admin privileges for the Zoom App Marketplace.

Role required: none

About this task

The Zoom external content connector retrieves webinars and meetings from your Zoom source system using the Zoom APIs.

To allow the connector to access your Zoom source system via the Zoom APIs, you must configure and activate a Server-to-Server OAuth app in the Zoom App Marketplace. Your connector administrator can use settings copied from this app to configure the Zoom external connector for proper connection to your source system.

Procedure

1. In the Zoom App Marketplace, create a new Server-to-Server OAuth app for the Zoom external content connector.

   a. Navigate to https://marketplace.zoom.us/ and log in with your admin credentials.

   b. Navigate to **Develop** > **Build app**.

   c. If prompted, agree to the Zoom API license and terms of use by selecting **Agree**.

   d. Select **Server to Server OAuth App** as the kind of app to create, then select **Create**.

   e. Enter a name for your new Server-to-Server OAuth app.
   As an example, you might enter `Zoom external content connector`.

   f. Select **Create**.

   You're taken to the App Credentials page for your new Server-to-Server OAuth app.

2. On the App Credentials page, record the account ID, client ID, and client secret for your new Server-to-Server OAuth app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Copy the account ID for your new Server-to-Server OAuth app and store it in a secure location.

> **Important:** Your external content connector administrator needs this account ID when configuring the Zoom external content connector.

b. Copy the client ID for your new Server-to-Server OAuth app and store it in a secure location.

> **Important:** Your external content connector administrator needs this client ID when configuring the Zoom external content connector.

c. Copy the client secret for your new Server-to-Server OAuth app and store it in a secure location.

> **Important:** Your external content connector administrator needs this client secret when configuring the Zoom external content connector.

d. Select **Continue**.

You're taken to the Information page for your new Server-to-Server OAuth app.

3. On the Information page, add details about your new Server-to-Server OAuth app. These details are required in order to activate your new app.
   a. In the Company Name field, enter the name of your organization.
   b. **Optional:** In the Short Description field, enter a brief description of your new Server-to-Server OAuth app.
   c. In the Name field, enter your name.
   d. In the Email field, enter your email address.
   e. Select **Continue**.
   You're taken to the Feature page for your new Server-to-Server OAuth app.
4. On the Feature page, select **Continue**.
   You're taken to the Scopes page for your new Server-to-Server OAuth app.
5. On the Scopes page, add the required API scopes to your new Server-to-Server OAuth app.
   a. Select **Add Scopes**.
   b. In the Add Scopes window, search for and then select each of the following scopes.
      - cloud_recording:read:list_user_recordings:admin
      - meeting:read:list_meetings:admin
      - meeting:read:list_past_instances:admin
      - meeting:read:list_past_participants:admin
      - meeting:read:meeting:admin
      - meeting:read:participant:admin
      - meeting:read:past_meeting:admin
      - meeting:read:past_qa:admin
      - meeting:read:summary:admin
      - user:read:list_users:admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- user:read:user:admin
- webinar:read:list_panelists:admin
- webinar:read:list_past_instances:admin
- webinar:read:list_past_participants:admin
- webinar:read:list_webinars:admin
- webinar:read:past_qa:admin
- webinar:read:webinar:admin

These scopes grant read access to your new Server-to-Server OAuth app for the specified content elements in your Zoom source system. The app can't modify your source system content with these scopes.

c. Select **Continue**.

You're taken to the Activation page for your new Server-to-Server OAuth app.

6. On the Activation page, activate your new Server-to-Server OAuth app by selecting **Activate your app**.
Your new Server-to-Server OAuth app is activated.

What to do next

Provide the following items to your connector administrator:

- The account ID that you copied in step 2.a.
- The client ID that you copied in step 2.b.
- The client secret that you copied in step 2.c.

Your connector administrator needs these items to configure a Zoom external content connector to retrieve meetings, webinars, and security principals from your Zoom source system.

For details on creating and configuring a Zoom external content connector, see Create a Zoom external content connector.

Create a Zoom external content connector

Create an external content connector to retrieve searchable content and security principals from your Zoom source system.

Before you begin

A source system administrator must have already configured your Zoom source system to allow access by the Zoom external content connector. For the required source system configuration steps, see Configure Zoom for external content indexing.

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors section, select **New**.
4. On the Choose source page, select the *Zoom* tile, then select **Next**.
5. On the Connection settings page, fill in the connection settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection settings

Connection setting	Description
Connector name	Unique name for this Zoom external content connector.
Account ID	Account ID for the Server-to-Server OAuth app that grants the connector access to your Zoom content. If you don't have the account ID, ask your Zoom administrator for it.
Client ID	Client ID for the Server-to-Server OAuth app that grants the connector access to your Zoom content. If you don't have the client ID, ask your Zoom administrator for it.
Client secret	Client secret for the Server-to-Server OAuth app that grants the connector access to your Zoom content. If you don't have the client secret, ask your Zoom administrator for it.

6. Save and validate your connection settings by selecting **Validate Connection**.

   Note: If validation of your connection settings fails, the system shows an error message. Verify your connection settings to ensure they're correct. If permissions required by the connector are missing or incorrectly configured in the source system, a warning message appears showing the permissions that must be corrected. Provide the information from this message to your source system administrator.

7. After your connection settings are validated, select **Next**.
8. On the Crawl settings page, modify any default crawl settings that you want to override for this connector, then select **Next**.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the crawl settings for this connector from the External Content Admin Home page. For details on this procedure and the available crawl settings, see Configure crawl settings for a Zoom external content connector.
9. On the User permission settings page, modify any default user permission settings that you want to override for this connector.
   If you want to skip this step for now, select **Skip** instead of **Next**. You can modify the user permission settings for this connector from the External Content Admin Home page. For details on this procedure and user permission settings, see Configure user permission settings for an external content connector.
10. On the Create crawl page, create a content crawl for this connector by selecting a crawl scope (if supported) and any desired options, then select **Next**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can create and run crawls for this connector from the External Content Admin Home page. For details on creating content crawls, see Create a content crawl for an external content connector.
11. On the Connect search profile page, use the **Connect to search profile** field and **Add** button to add any search profiles that you want to connect this external content connector's default search source to, then select **Save**.
    If you want to skip this step for now, select **Skip** instead of **Next**. You can connect search sources for this connector to search profiles from the External Content Admin Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on connecting an external content connector to search profiles, see Connect an external content connector to a search profile.

When you link a connector search source to a search profile in this step, the system automatically publishes the search profile to make the new link take effect.

Result
Your new external content connector appears in the Connectors list on the External Content Admin Home page.

What to do next
To retrieve searchable content and security principals with your new connector, you must configure and run content and user mapping crawls for it. You can modify your new connector's crawl settings and create crawls for it from the External Content Admin Home page even if you skipped these steps during connector creation.

- To learn how to configure your new connector's crawl settings, see Configure crawl settings for a Zoom external content connector.
- For details on creating crawls for your new connector, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

To make content crawled by your new connector searchable in portals and search applications, you must link one of its search sources to the search profile used by each portal or search application. You can use the connector's default search source or create your own custom search sources.

Default search source

By default, the system creates a search source that includes all content from your external content connector's indexed source.

Custom search sources

You can create your own search sources with filters to specify which content from the connector's indexed source is searchable. To view the connector's indexed source, navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**. For information about creating search sources, see Search sources in AI Search.

You can link connector search sources to search profiles from the External Content Admin Home page. For details on this procedure, see Connect an external content connector to a search profile.

Configure crawl settings for a Zoom external content connector

Specify the content types you want your Zoom external content connector to retrieve.

Before you begin
A connector administrator must have already created the Zoom external content connector that you want to configure crawl settings for. To learn about this procedure, see Create a Zoom external content connector.

Role required: sn_ext_conn.xcc_admin

About this task
This task is optional. By default, the Zoom external content connector crawls all webinars and meetings found in its specified source system and sends their searchable content and metadata to AI Search for indexing. Only perform this task if you want the connector to exclude content from webinars or from meetings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content is only retrieved from the source system if it passes all of your configured crawl setting filters. If any crawl setting filter excludes a content item, the external content connector doesn't retrieve it.

Important:

By default, each external content connector can index up to one million (1,000,000) content items from its source system. When a connector exceeds this limit, it continues to crawl the source system, but only sends content item deletions and updates to AI Search for indexing, ignoring new content items. The connector logs an error message for every 10,000 content items it crawls beyond the indexing limit.

When a connector's indexed content item count exceeds 800,000, a warning message appears in the connector's UI to indicate that it's approaching the indexing limit. If the connector reaches the indexing limit, an error message appears in its UI.

External content connectors that support user permissions crawls can handle permissions for up to five hundred thousand (500,000) users and their groups. If a connector retrieves users in excess of this limit, user and group permissions may not be correctly applied to the connector's retrieved content. As a result, the content may not be searchable.

If one of your connectors reaches the content indexing limit, you can update its crawl settings and file inclusion/exclusion filters to reduce the number of content items it retrieves. If you need to index more content items than the limit allows, you can create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase for the connector.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the Zoom external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **Crawl settings**.
4. Select the options for the webinar content types that you want the connector to retrieve searchable content and metadata from.

   Past webinars

   Select this option to index searchable content and metadata from completed webinars.

   Index only transcriptions

   Select this option to only index searchable content from webinar transcripts. This will ignore content and metadata from webinar agendas, summaries, and question and answer sessions. Webinars without transcripts will have no content or metadata indexed.

5. Select the options for the meeting content types that you want the connector to retrieve searchable content and metadata from.

   Past meetings

   Select this option to index searchable content and metadata from completed meetings.

   Index only transcriptions

   Select this option to only index searchable content from meeting transcripts. This will ignore content and metadata from meeting agendas, summaries, and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

question and answer sessions. Meetings without transcripts will have no content or metadata indexed.

Note: If you deselect both **Past webinars** and **Past meetings**, the connector won't retrieve any searchable content or metadata from your Zoom source system.

6. **Optional:** If you want AI Search to automatically generate captions for content in attachments and files retrieved by the connector, select the **Multimodal captions** option.
   When you select this option, the Platform Multimodal Service automatically generates descriptive captions for images, tables, charts, and other visual elements found in retrieved attachments and files. You can discover these retrieved attachments and files by searching for terms from their generated captions.

   This option is only available when the Platform Multimodal Service plugin is activated on your instance.

   - For details on activating the plugin, see Activate the Platform Multimodal Service plugin.
   - To learn how to select the VLM (visual learning model) provider and model used for the Platform Multimodal Service, see Configure multimodal captioning for AI Search.
7. Select **Save and validate**.

Result
The Zoom external content connector is updated with your modified crawl settings.

What to do next
To retrieve content from your Zoom source system using your modified crawl settings, create and run a one-time content crawl for your Zoom external content connector. To learn about creating and running one-time content crawls, see Create a content crawl for an external content connector.

Rename an external content connector

Change the name of an existing external content connector.

Before you begin
Verify that the external content connector you want to rename is not currently running a crawl.

Role required: sn_ext_conn.xcc_admin

Procedure
1. Use the application picker to switch to the External Content Connectors Admin application scope.
2. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
3. In the Connectors pane, find the record for the connector you want to deactivate or delete, and open its context menu in one of the following ways:
   - Select the connector record's Overflow icon .
   - Long-press (or right-click) the connector record.
4. In the context menu, select **Manage**.
   The connector's Configuration tab opens.
5. Select the pencil icon .
   The Rename connector dialog box appears.
6. Enter a new name for the connector, then select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deactivate, reactivate, or delete an external content connector

Deactivate an external connector to pause its scheduled crawls while retaining all of the content and metadata that it has already crawled. Reactivate a deactivated connector to resume its scheduled crawls. Delete an external content connector to remove the connector's definition along with all content and metadata that it has crawled.

Before you begin

Role required: sn_ext_conn.xcc_admin

About this task

You can deactivate an external content connector to suspend its scheduled crawls. The connector's status changes to `Inactive`. All content, metadata, and permissions indexed from the deactivated connector's previous crawls remain available in search. No new updates are retrieved from the deactivated connector's external data source unless you choose to run a one-time crawl. You can reactivate the connector to resume its scheduled crawls.

You can delete an external content connector to remove its definition. When you delete a connector, AI Search removes all content, metadata, and permissions from that connector's crawls from the index. As a result, users cannot find content from the deleted connector when searching in AI Search applications.

Note: Deleting an external content connector doesn't automatically unlink its search source from your search profiles. You must manually unlink the search source from any search profiles that it's linked to. For details on this procedure, see Unlink a search source from a search profile.

Procedure

1. Use the application picker to switch to the External Content Connectors Admin application scope.
   For details on selecting an application scope using the application picker, see Application picker.
2. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
3. In the Connectors pane, find the record for the connector you want to deactivate or delete, and open its context menu in one of the following ways:
   - Select the connector record's Overflow icon ⋮.
   - Long-press (or right-click) the connector record.
4. In the context menu, select one of the following options:
   - To suspend crawling for an active connector, select **Deactivate**.
   - To reactivate an inactive connector, select **Activate**.
   - To permanently delete a connector, select **Delete**, then select **I understand** and **Delete** in the Delete connector dialog box.

Warning: Deleting an external connector is not reversible. After you delete a connector, you cannot restore its definition or its crawled content, metadata, and permissions.

Result

The result depends on which selection you made:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you deactivated a connector, its status changes to `Inactive`.
- If you reactivated a deactivated connector, its status changes from `Inactive` to some other value.
- If you deleted a connector, it disappears from the Connectors list.

What to do next

If you deactivated an external content connector to disable its scheduled crawls, you can still run one-time crawls to update its content and metadata or its permissions. For details on running one-time crawls, see Create a content crawl for an external content connector and Create a user permission crawl for an external content connector.

If you deleted an external content connector, manually unlink its search source from any search profiles that it's linked to. For details on this procedure, see Unlink a search source from a search profile.

Edit connection or crawl settings for an external content connector

Connector administrators can modify the connection settings and crawl settings for an existing external content connector. If your changes to a connector's settings invalidate its current crawl results, the system prompts you to run a new content crawl.

Before you begin

Role required: sn_ext_conn.xcc_admin

About this task

This task is optional. Perform it only if you need to modify the connection settings or crawl settings specified for one of your existing external content connectors.

Modify a connector's connection settings to reflect changes made in your source system's configuration. As an example, if your source system administrator generates a new client secret for the OAuth 2.0 application that grants the connector access to your content, you can replace the old client secret with the new one in the connector's connection settings.

Modify a connector's crawl settings to alter the set of source system locations it crawls and the set of source system items it retrieves searchable content and metadata from. As an example, if you want to exclude content from items in a newly created Slack channel, you can add that channel to the channel exclusion list in your Slack external content connector's crawl settings.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, choose which settings you want to modify:
   - To modify connection settings for the external content connector, select **Connection settings**.
   - To modify crawl settings for the external content connector, select **Crawl settings**.
4. On the selected settings page, make your desired changes.

   For details on connection settings, see the creation task for the external content connector type, as listed in Creating external content connectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details on crawl settings, see the crawl-settings configuration task for the external content connector type, as listed in Configuring crawl settings for external content connectors.

5. Select **Save and Validate**.

Result
The external content connector you selected is updated with your modified connection settings or crawl settings.

If your modifications to the connector's connection or crawl settings invalidate its existing content crawl results, the connector status changes to indicate that a recrawl is required.

What to do next
If the external content connector status indicates that a recrawl is required, run a new content crawl for it to update its search results using the modified settings. For details on running content crawls, see Create a content crawl for an external content connector.

Configure user permission settings for an external content connector

Override the default field mappings for an external content connector's user permission crawls. Specify the fields that uniquely identify user security principals in your source system and users in your ServiceNow AI Platform® instance. Optionally execute a custom script to transform security principal IDs before they're compared with the IDs of users in your instance.

Before you begin
Role required: sn_ext_conn.xcc_admin or admin

About this task
User permission crawls for external content connectors retrieve user security principals from your source system and map them to users in your ServiceNow AI Platform instance. A user security principal from the source system should map to no more than one user in your instance.

Each external content connector specifies a predefined source system field that the connector uses as the unique identifier for user security principals in the source system. As an example, a connector might specify a username or email address field as the principal identifier for its source system. All connectors default to using the email field from the Users [sys_user] table as the unique identifier for users in your ServiceNow AI Platform instance.

If you need to specify a different field as the identifier for source system principals or instance users, you can override the default field selections for the external content connector. You can optionally execute a custom script to transform source field values to make them match destination field values for users in your ServiceNow AI Platform instance.

Procedure
1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector whose settings you want to modify.
3. In the connector editor's Settings tab, select **User** *permission* **settings**.
4. In the Map from section, select a source system field with values that uniquely identify your user security principals.
   As an example, if your source system security principals are uniquely identified by their email addresses, you might select the source system's **email** field.
5. **Optional:** Select the **Custom script** option and enter a custom script function in the code editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You only need to perform this step if you want to transform source system field values before they're compared with destination field values in your ServiceNow AI Platform instance.
As an example, if your source system identifies user security principals with user IDs like `beth.anglin` but your ServiceNow AI Platform instance users have email-based usernames like `beth.anglin@example.com`, you might use the script to append the @ symbol and your domain name to each user security principal ID so that it correctly matches a ServiceNow AI Platform username.

Warning: The system executes your custom script for each user security principal retrieved by the external content connector's user permission crawl. A long-running script can affect performance for the user mapping crawl. Keep your scripts as simple as possible.

The custom script must include a function that transforms the incoming field value for a user from the connector's source system to an output value that will be used to match a user in the ServiceNow AI Platform's User [sys_user] table. Continuing the previous example, you might define this custom script to transform bare usernames into user email addresses in your domain:

```
/**
* Maps the incoming field value of the user from the source system to an output value that
 will be used to match the user in the ServiceNow platform.
* Supported return types are "string" and "number".
*/

var mapSourceUser = function(sourceUserValue) {
   // Append @ symbol and domain name to source user ID
   //  Source field value format = user
   //  Destination field value format = user@example.com

   return sourceUserValue + "@example.com";
}

mapSourceUser(sourceUserValue);
```

The default script includes several code examples that you can use as a basis for your own custom script. To revert the code in the code editor to the default script, select **Reset to default script** and then **Reset**.

Important: Don't change the `mapSourceUser` function declaration at the start of the script or the subsequent call to that function. You should only edit the function body inside the curly braces to implement your desired custom field value transformation.

6. In the Map to section, select the ServiceNow AI Platform field to use as the unique identifier for users in your instance.
   The default identifier field is the email field from the User [sys_user] table.
7. Test your user permission settings by selecting **Test** and then performing the following steps.

   a. When prompted, enter a sample value for the external content connector's source field.
      As an example, if your source system uses email addresses to identify user security principals, you might enter `abel.tuter@example.com`.

   b. Select **Run test** and wait for the test to complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system uses your user permission settings to look for a ServiceNow AI Platform instance user that matches the specified user security principal from the source system. You can interrupt this process and cancel the test by selecting **Cancel** or closing the modal window.

c. View the test results.

Match

This status indicates that the test successfully matched a single ServiceNow AI Platform instance user.

No match

This status indicates that the test did not match any ServiceNow AI Platform instance user.

Inconclusive

This status indicates that the test matched multiple ServiceNow AI Platform instance users, rather than a single unique user as desired.

d. Perform the appropriate step depending on the test's result.

- To return to the user permission settings editor, select **Close**.
- To return to the sample value entry field so you can repeat the test with different input, select **New test**. You can edit your previous input to see how different values behave.

8. When you're done testing, select **Save**.

Result

The external content connector is updated with your modified user permission settings.

If you configured a custom script, any script errors encountered during user permission crawls are recorded in the Alerts section of the connector's crawl details page. To learn about accessing the crawl details page from an external content connector's crawl history entry, see Review crawl history for an external content connector.

What to do next

To retrieve updated user permissions from your source system using your modified settings, create and run a user permission crawl for the external content connector that you edited. To learn about creating and running user permission crawls, see Create a user permission crawl for an external content connector.

Connect an external content connector to a search profile

Make results from an external content connector searchable in your portals and search applications by connecting its search sources to your existing search profiles.

Before you begin

Role required: sn_ext_conn.xcc_admin or admin

About this task

To make results from an external content connector searchable in a portal or search application, you need to link one of its search sources to the search profile used by that portal or search application. As an example, linking a connector's search source to the **Service Portal** search profile makes filtered content from that connector available in Service Portal searches.

Each external content connector type feeds its crawled results to a unique indexed source. By default, the system creates a search source for each connector type which has no filters and includes all documents from the connector's indexed source. You can define additional search

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sources for the indexed source with filter sets applied to limit which documents are searchable. To learn more about search sources and filters, see Search sources in AI Search.

Linking an external content connector's search source to a search profile makes crawled content that satisfies the search source's filters searchable in all portals and search applications that use the specified search profile. For more details on search profiles, see Search profiles in AI Search.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector with results that you want to make searchable using one or more search profiles.
3. In the connector editor's Settings tab, select **Manage index**.
4. In the Connected search profiles section, repeat these steps for each search profile you want to link the selected external content connector to.

   a. Use the **Select search source** field to select a search source derived from the connector's indexed source.

   b. Use the **Connect to search profile** field to select the search profile you want to link the selected search source to.

   c. Select **Add**.
   A new connection entry appears showing your search source and search profile selections.

5. Select **Save**.
   The system automatically publishes the search profile to make the new search source link take effect.

Result

For each connection you created, content from the selected external content connector search source becomes searchable in portals and search applications that use the selected search profile.

Add an external content search source to ServiceNow® Otto for Virtual Agent

Include searchable content retrieved by an external content connector in your ServiceNow Otto for Virtual Agent chats.

Before you begin

You must have already created at least one search source for the indexed source associated with the external content connector. For instructions on creating search sources, see Create a search source for AI Search.

Role required: ais_admin

About this task

Linking a search source to the *ServiceNow Otto* **in VA** search profile makes its filtered content available in ServiceNow Otto for Virtual Agent chats. AI Search only uses content from the search profile's linked search sources when generating responses for ServiceNow Otto for Virtual Agent chats.

When linking a search source to the *ServiceNow Otto* **in VA** search profile, you can specify options that control how the search source's content is accessed for ServiceNow Otto for Virtual Agent chats. You can exclude the search source's content from being considered when finding

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

standard search results, or prevent it from being considered during Genius Result answer generation.

Procedure

1. Navigate to **All** > *AI Search* > **Search Experience** > **Search Profiles**.
2. Open the *ServiceNow Otto* **in VA** search profile record.
3. In the Search Sources related list, select **Link Existing**.
4. On the Search Profile - Search Source Mapping form, fill in the fields.
   For a description of the field values, see Search Profile - Search Source Mapping form.
5. Select **Submit**.

Result
The new search source appears in the Search Sources related list. ServiceNow Otto for Virtual Agent chats immediately reflect changes to the set of records searchable through the search profile.

What to do next
Derived auto-correction term lists for the *ServiceNow Otto* **in VA** search profile's typo handling dictionary don't automatically update to reflect changes to the set of searchable records. To update these auto-correction term lists, publish the *ServiceNow Otto* **in VA** search profile. For details on publishing a search profile, see Publish an AI Search search profile.

Verify your connection settings and source system permissions for an external content connector

Check that connection settings and source system permissions are correctly specified for your external content connector. Perform this task to verify whether permission changes or revocations affect the connector's ongoing or scheduled crawls.

Before you begin
Role required: sn_ext_conn.xcc_admin

About this task
When you create a new external content connector, the system offers the option to validate your connection settings and verify that source system permissions are properly set to allow access by the connector.

Permission changes and revocations that occur after the connector is created can affect its ability to complete ongoing crawls or to run scheduled crawls. You can verify that the connector still has valid connection settings and source system permissions by running a one-time test crawl that only refreshes a small portion of the source system's searchable content and metadata. Success on this crawl indicates that your connection settings and source system permissions are valid. Failure may indicate that these settings should be double-checked.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector that you want to verify the connection settings and source system permissions for.
3. In the connector editor's Settings tab, select **Index management**.
4. In the Trigger test crawl section, select **Trigger test crawl**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The external content connector runs a one-time test crawl. This crawl checks whether the connector's current connection settings and source system permissions enable it to refresh a small portion of its source system's searchable content and metadata.

The test crawl appears in the connector's crawl history with name **Test crawl** so you can monitor its status. For details on monitoring crawl history, see Review crawl history for an external content connector.

When the test crawl finishes its run, an alert message indicates whether it completed successfully or encountered errors. If it completed successfully, its connection settings and source system permissions are valid.

What to do next
If the test crawl encountered errors, review its crawl history entries to see whether it experienced connection issues or source system permissions issues. If it did, ask your source system administrator to verify your connection settings and to confirm that the permissions required by the connector are properly set.

Resolve health issues for an external content connector

View and resolve connector health issues using the connector health dashboard in the external content connector editor.

Before you begin
Role required: sn_ext_conn.xcc_admin

About this task
External content connectors depend on a variety of configuration settings, permissions, and operations. Incorrect or outdated settings or permissions in the ServiceNow AI Platform® or the source system can prevent a connector from operating properly. Issues encountered during crawls may prevent specific content items from being retrieved and indexed for search.

Specific occurrences that can prevent proper function of an external content connector include:

- Certificate expiration
- Permission mismatches after a source system policy change
- Connector plugin scope changes following an upgrade to External Content Connectors or the ServiceNow AI Platform
- Quota exhaustion on the ServiceNow AI Platform side
- User identity mapping gaps that silently conceal connector search results from users

When an external content connector has one or more of these health issues, its status changes to **Action required**. Perform the following steps to view and resolve health issues for the affected connector.

Procedure
1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors list, select the record for the external content connector that you want to check or resolve health issues for.

> **Note:** Connectors with health issues show **Action required** status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the connector editor, select the Overview tab.
5. Review the health category cards in the **Connector health** section.
   Each card includes a health category name, a status indicator, and a context label.

   Health category name

   The health category name describes which aspects of the external content connector's configuration and operations the card refers to.

   - **Source connection**: Connection and authentication settings for the source system.
   - **Internal connection**: ServiceNow AI Platform connectivity needed to run crawls.
   - **Content Permissions**: Permissions needed to access content and metadata in the source system.
   - **Content**: Status of crawled items and any crawl errors that need attention.
   - **User permissions**: Status of user and group access permissions for secure search.
   - **Search profile**: Assignment to at least one search profile.

   Status indicator

   The status indicator indicates the status of the health category for the external content connector. Typical values include **Ready**, **Not configured**, **Warning**, and **Error**.

   Context label

   The context label indicates whether the health category refers to settings in the ServiceNow AI Platform or settings in the external content connector's source system.

6. For each health category card that shows a status other than **Ready**, perform the following steps.

   a. Select the health category card.
   In the **Issues** section, actionable entries show all health issues associated with the selected health category.

   b. Follow the provided action links or guidance to resolve all health issues for the selected health category.

Result
The external content connector no longer shows **Action required** status.

Crawling content with External Content Connectors

Search administrators can use the External Content Connectors application to run one-time document and user permission crawls on demand. They can review connector-specific crawl history and analytics and details of user and group mappings retrieved from external data sources.

To access the External Content Connectors application, navigate to **All** > **External Content Connectors** > **External Content Admin Home**.

On the application's main page, the Connectors list shows your external content connectors with their source, status, count of documents retrieved, last content crawl start date and time, and failed crawl count.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Starting with External Content Connectors 6.0, crawls that time out due to connectivity issues during their run are automatically resumed when connectivity resumes.

Create a content crawl for an external content connector

Retrieve searchable content and metadata from your source system with a content crawl. Run the crawl as a one-time task or schedule it to run on a recurring basis.

Before you begin

To run crawls for external content connectors, your instance must have inbound mTLS support enabled. For details on verifying that this feature is enabled on your instance, see Verify whether inbound mTLS support is activated for your instance.

Role required: sn_ext_conn.xcc_admin

About this task

Search administrators can retrieve searchable content and metadata from an external content connector's source system by creating a content crawl for the connector. Search administrators can specify the crawl's scope: a full content crawl retrieves searchable content and metadata from all available locations (called start points) in your source system, while a partial content crawl only retrieves content and metadata from a single specified start point and its descendants. A content crawl may take hours or days to complete, depending on the amount of content available in your source system and the scope of the crawl.

Note: Both full and partial content crawls honor the crawl settings defined for your external content connector, including any inclusion/exclusion content filters. Running a full content crawl doesn't bypass these settings.

Some external content connectors include an **Update user** *permissions* content crawl option. When you select this option, running the crawl launches both a content crawl and a user permission crawl for your source system. For more details on user permission crawls, see Create a user permission crawl for an external content connector.

You can run a content crawl as a one-time task or set it to recur on a scheduled basis.

Note: Starting with External Content Connectors 6.0, the External Content Connectors application allows a maximum of five connector crawls to run simultaneously on your ServiceNow AI Platform® instance. Both content crawls and user permission crawls count against this limit. You can schedule and run external content connector crawls throughout the day to avoid overlap, or create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the connector that you want to create a content crawl for.
3. In the connector editor's Create crawls tab, select **Crawl content**.
   The Crawl content dialog box appears.
4. Select the tile for the scope you want for your content crawl.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To retrieve searchable content and metadata from all available start points in your source system, select **Full content crawl**.
- To only retrieve searchable content and metadata from a single start point, select **Partial content crawl** and enter or select the start point for the crawl. The partial crawl only retrieves content from this start point and its descendant locations.

  Note: When configuring a partial content crawl, you can select **Refresh start points** to populate the list of available start points. Refreshing this list requires retrieval of data from the source system and may take a minute or two.

Note: If the **Partial content crawl** tile isn't shown, the external content connector only supports full content crawls.

5. **Optional:** To configure your content crawl to launch a user permission crawl (retrieving security principals from your source system) when it runs, select the **Update user mappings** option.

   Note: If the **Update user** *permissions* option isn't shown, the external content connector doesn't support launching user permission crawls from content crawls.

6. **Optional:** To make your content crawl run on a recurrent schedule, select the **Make recurring** option, then specify the schedule options.

   Note: If the **Make recurring** option isn't shown, the external content connector automatically schedules its own content crawls. In this case, you can only run one-time content crawls.

   a. Enter a name for your scheduled crawl.

   b. Select **Daily**, **Weekly**, or **Monthly** as the frequency for your scheduled crawl.

   Note: Not all external content connectors support all of these crawl frequency options. Select a crawl frequency option that's shown for your external content connector.

   c. If you selected **Weekly** as the crawl frequency, select the options for the days of the week that you want your scheduled crawl to run on.

   d. If you selected **Monthly** as the crawl frequency, select a **Day** field value to specify the day of the month that you want your scheduled crawl to run on.

   e. Specify when you want the system to run your scheduled crawl by entering its start time and selecting a time zone.
   The start time should be in *hh:mm a* format, where the format parameters have the following values:

   - *hh*: a one- or two-digit hour between 0 and 12 inclusive, such as `5` or `11`
   - *mm*: a two-digit minute between 00 and 59 inclusive, such as `15` or `37`
   - *a*: any of `A`, `a`, `AM`, or `am` for AM (morning) or any of `P`, `p`, `PM`, or `pm` for PM (afternoon)

7. Create your new content crawl by selecting the appropriate option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you skipped step 6, select **Create one-time crawl**.
- If you selected the **Make recurring** option in step 6, select **Create crawl schedule**.

Result

If you skipped step 6, your new content crawl is added to the system's crawl queue. The system runs your crawl when it has resources available to do so.

If you selected the **Make recurring** option in step 6, your new crawl appears in the external content connector editor's **Manage crawls** tab. For partial crawls, the list entry includes a link with the ID of the chosen start point. Selecting this link displays the record for the start point, showing its label as well as its ID.

What to do next

You can monitor your content crawl's status or review its results using the crawl history and analytics. For details on these metrics, see Review crawl history for an external content connector.

If you need to cancel your running content crawl, see Cancel a running external content connector crawl.

Activate delta content crawling for an external content connector

Reduce content crawl time for your external content connector by enabling delta content crawls, which ignore unchanged content items from your source system.

Before you begin

You must have completed a full content crawl for the selected external content connector. For details on creating and running content crawls, see Create a content crawl for an external content connector.

Note: If you upgraded from a previous version of the External Content Connectors application, you must have completed a new full content crawl in the new version. Full content crawls completed in a previous version don't retrieve all of the metadata needed for delta content crawling.

Role required: sn_ext_conn.xcc_admin

About this task

The External Content Connectors application supports delta content crawl operations for some external content connectors. When running a delta content crawl, an external content connector only examines, retrieves, and indexes newly added, changed, or deleted items from its source system. By ignoring unchanged items, delta content crawling can significantly reduce the time taken to crawl content from the source system. This means you can refresh your searchable content more often by running delta content crawls between your scheduled full or partial content crawls.

Note: Delta content crawls don't replace full content crawls. They're supplemental crawls that enable you to refresh searchable content more frequently in between full content crawls.

To enable delta content crawling for an external content connector, perform the following steps.

Note: In External Content Connectors 9.0, delta content crawls are only supported for the Google Drive external content connector.

For full details on how delta content crawls behave and operate, see Delta content crawls for external content connectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector that you want to enable delta content crawling for.
3. In the connector editor's **Manage crawls** tab, navigate to the **Default crawl schedules** section and select the **Delta content crawls** option.
4. Select **Save default schedules**.

Result

The system activates delta content crawling for the selected external content connector.

You can deactivate delta content crawling for the connector by deselecting the **Delta content crawls** option, then selecting **Save default schedules**.

Create a user permission crawl for an external content connector

Retrieve security principals from your source system with a user permission crawl. Run the crawl as a one-time task or schedule it to run on a recurring basis.

Before you begin

To run crawls for external content connectors, your instance must have inbound mTLS support enabled. For details on verifying that this feature is enabled on your instance, see Verify whether inbound mTLS support is activated for your instance.

Role required: sn_ext_conn.xcc_admin

About this task

Many external content connectors support preservation of access permissions for searchable content retrieved from their source systems. To use this feature, search administrators must retrieve security principals from the connector's source system by creating a user permission crawl for the connector.

The user permission crawl maps security principals retrieved from the source system to users in your ServiceNow AI Platform® instance. Each user that corresponds to a source system security principal inherits content access permissions specified for that security principal.

A user permission crawl may take hours or days to complete, depending on the number of security principals defined in your source system.

You can run a user permission crawl as a one-time task or set it to recur on a scheduled basis.

Note: Starting with External Content Connectors 6.0, the External Content Connectors application allows a maximum of five connector crawls to run simultaneously on your ServiceNow AI Platform® instance. Both content crawls and user permission crawls count against this limit. You can schedule and run external content connector crawls throughout the day to avoid overlap, or create a Customer Service and Support case at https://support.servicenow.com/now to request a limit increase.

For external content connectors that support user permission crawls, you can also start a user permission crawl by selecting the **Update user** *`permissions`* option when creating or scheduling a content crawl. For more details on this option and defining content crawls, see Create a content crawl for an external content connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The following external content connectors don't retrieve user or group access permissions. You can't run user permission crawls for these connectors.

- Adobe Experience Manager as a Cloud Service external content connector
- Amazon S3 external content connector
- Cornerstone external content connector
- ServiceNow® product documentation external content connector
- Slack external content connector
- Trello external content connector
- Webcrawler external content connector

The Atlassian Confluence Cloud external content connector only retrieves permissions for Confluence Cloud users who have made their email addresses visible to all users. To allow user permission, each Confluence Cloud user must set their own email visibility to **Anyone** as explained in the https://support.atlassian.com/confluence-cloud/docs/configure-user-email-visibility/ Atlassian support resource.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the connector that you want to create a user permission crawl for.
3. In the connector editor's Create crawls tab, select **Crawl user permissions**.
   The Crawl user permissions dialog box appears, with the **User** *permission* **crawl** tile selected.
4. **Optional:** To make your user permission crawl run on a recurrent schedule, select the **Make recurring** option, then specify the schedule options.

   Note: If the **Make recurring** option isn't shown, the external content connector automatically schedules its own user permission crawls. In this case, you can only run one-time user permission crawls.

   a. Enter a name for your scheduled crawl.

   b. Select **Daily** or **Weekly** as the frequency for your scheduled crawl.

   c. If you selected **Weekly** as the crawl frequency, select the options for the days of the week that you want your scheduled crawl to run on.

   d. Specify when you want the system to run your scheduled crawl by entering its start time and selecting a time zone.
   The start time should be in *hh:mm a* format, where the format parameters have the following values:
   - *hh*: a one- or two-digit hour between 0 and 12 inclusive, such as `5` or `11`
   - *mm*: a two-digit minute between 00 and 59 inclusive, such as `15` or `37`
   - *a*: any of `A`, `a`, `AM`, or `am` for AM (morning) or any of `P`, `p`, `PM`, or `pm` for PM (afternoon)

5. Create your new user permission crawl by selecting the appropriate option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you skipped step 4, select **Crawl user permissions**.
- If you selected the **Make recurring** option in step 4, select **Create user crawl schedule**.

Result
If you skipped step 4, your new user permission crawl is added to the system's crawl queue. The system runs your crawl when it has resources available to do so.

If you selected the **Make recurring** option in step 4, your new crawl appears in the external content connector editor's **Manage crawls** tab.

What to do next
You can monitor your user permission crawl's status or review its results using the crawl history and analytics. For details on these metrics, see Review crawl history for an external content connector and Review user permissions for an external content connector.

If you need to cancel your running user permission crawl, see Cancel a running external content connector crawl.

Cancel a running external content connector crawl

Cancel a running crawl for an external content connector to prevent the connector from retrieving and feeding additional documents or access permissions to AI Search for indexing.

Before you begin
Role required: sn_ext_conn.xcc_admin

About this task
Search administrators can manually cancel external content connector crawls that are in the running state. When you cancel an external content connector's crawl, the connector stops retrieving documents or access permissions and feeding them to AI Search for indexing.

Procedure
1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector whose crawl you want to cancel.
3. In the connector editor, select the **Crawl history** tab.
4. Select the crawl history record for the currently running crawl.
   The running crawl has state **In progress**.
5. Select **Cancel**, then select **Yes, cancel** in the Cancel crawl dialog box.

> **Note:** Canceling a crawl may take a minute or two. During this time, the connector may continue to retrieve searchable content and security principals and feed them to AI Search.

Result
The selected external content connector halts its crawl.

Refresh content for an external content connector

Refresh searchable content and metadata, including unchanged items, for an external content connector by running a one-time full or partial content crawl.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To run crawls for external content connectors, your instance must have inbound mTLS support enabled. For details on verifying that this feature is enabled on your instance, see Verify whether inbound mTLS support is activated for your instance.

Role required: sn_ext_conn.xcc_admin

About this task

You can force an external content connector to refresh some or all of its searchable content and metadata by performing a one-time content crawl. This crawl ignores the change history for crawl locations and retrieved items. As a result, unchanged items that would normally be skipped are instead retrieved and reindexed along with changed items.

⚠ **Warning:** Refreshing content for a connector may take hours or days to complete, depending on the scope and scale of the content crawl.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector that you want to refresh searchable content and metadata for.
3. In the connector editor's Settings tab, select **Index management**.
4. In the Force reindex section, select **Force reindex all content**.
5. Select **Start reindex crawl**.

Result

The external content connector runs a one-time full content crawl to refresh its searchable content and metadata.

This one-time crawl appears in the connector's crawl history with name **Force reindex** so you can monitor its status. For details on monitoring crawl history, see Review crawl history for an external content connector.

Reviewing external content connector crawl results and analytics

Search administrators can review crawl histories and analytics for external content connectors to gain a better understanding of what they're crawling. Administrators with the ais_high_security_admin elevated role can also review user and group permission mappings for external content connectors to verify that source system security principals are correctly associated with ServiceNow AI Platform® users.

To access the External Content Connectors application, navigate to **All** > **External Content Connectors** > **External Content Admin Home**. From this page, you can select an individual connector to review its crawl history, its analytics, or its user permissions.

Review crawl history for an external content connector

View crawl history records for an external content connector. Drill into a crawl history record to see metrics and alerts for the crawl in question.

Before you begin

Role required: sn_ext_conn.xcc_admin

About this task

The crawl history page for an external content connector shows a crawl history record for each crawl run by the connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can select an individual crawl history record to examine a crawl in more detail, viewing counts of items found, discovered, and updated as well as performance data and a list of any alerts encountered during the crawl.

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector that you want to review crawl history for.
3. In the connector editor, select the **Crawl history** tab.
   The Crawl history section shows a record for each crawl run for the connector in the last 30 days.
4. **Optional:** To view more detailed metrics and alert messages for a specific crawl, select the crawl history record for that crawl.

   (Optional) On the Crawl details page, the About this crawl header section reports the crawl's status, its scope (full or partial), its cadence (whether it was scheduled or a one-time crawl), its start and end times and duration, and the ID of the user who started it. For a partial crawl, this section also shows a link with the label of the chosen start point. Selecting this link displays the record for the start point, showing its ID as well as its label.

   The Statistics tab shows details about items encountered during the crawl.

   - For content crawls, this tab shows document statistics and crawl speed in documents per second. For explanations of these document statistics, see Statistics for external content connector content crawls.
   - For user permission crawls, this tab shows permission statistics and crawl speed in users per second. For explanations of these permission statistics, see Statistics for external content connector user permission crawls.
5. **Optional:** To view entries for any alerts encountered during the crawl, navigate to the Alerts tab.

   (Optional) Alerts include informational, debugging, warning, and error events logged by the connector during its crawl.

   Each alert entry includes a type and a scope. The alert type indicates the importance of the recorded event, as follows.

   Debugging

   A debugging alert provides detailed insights into the connector's behavior during a crawl.

   Informational

   An informational alert indicates the successful operation of connector functionality during a crawl.

   Warning

   A warning alert indicates that the connector encountered an unusual behavior or potentially problematic issue during a crawl.

   Error

   An error alert indicates that the connector encountered a problem that disrupted its functionality during a crawl.

   The alert scope indicates what the recorded event affected.

   Single

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The event affected a single content item retrieved by the connector crawl.

Multiple

The event affected multiple content items retrieved by the connector crawl.

All

The event affected all content items retrieved by the connector crawl.

Crawl

The event affected the crawl job for the connector crawl.

6. To view details for an alert, select the **View Details** link for that alert entry.

Review analytics for an external content connector

Review analytics for an external content connector to gain insight into its crawl behavior.

Before you begin

Role required: sn_ext_conn.xcc_admin

Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors list, select the record for the external content connector that you want to review analytics for.
3. In the connector editor, select the Analytics tab.
   For details on the available analytics metrics, see Analytics for external content connectors.

Review indexing status for individual content items

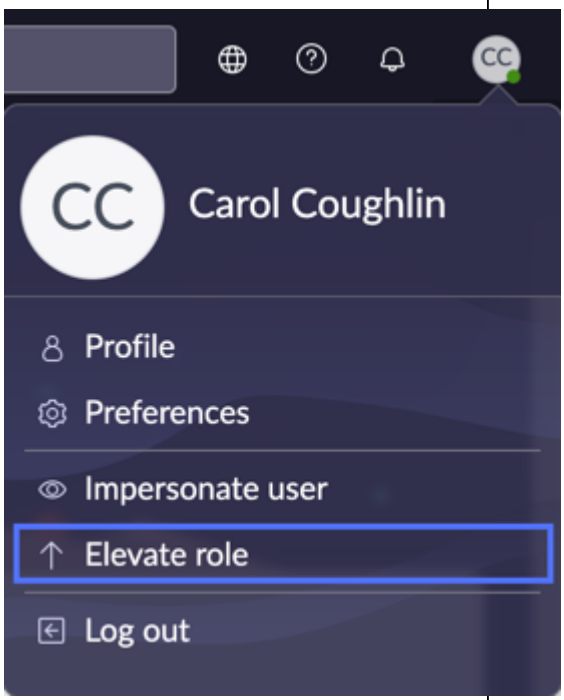
View indexing status, selected fields, errors, and user and group access permissions for individual content items using the Index inspector tool in the external content connector editor.

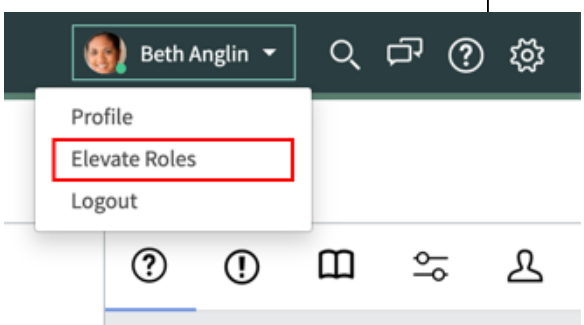
Before you begin

Roles required: sn_ext_conn.xcc_admin and ais_high_security_admin

Note: The ais_high_security_admin role is an elevated privilege role. To learn more about elevated privilege roles, see Elevated privilege roles. For details on the ais_high_security_admin elevated privilege role, see Assign roles to AI Search administrators and users.

About this task

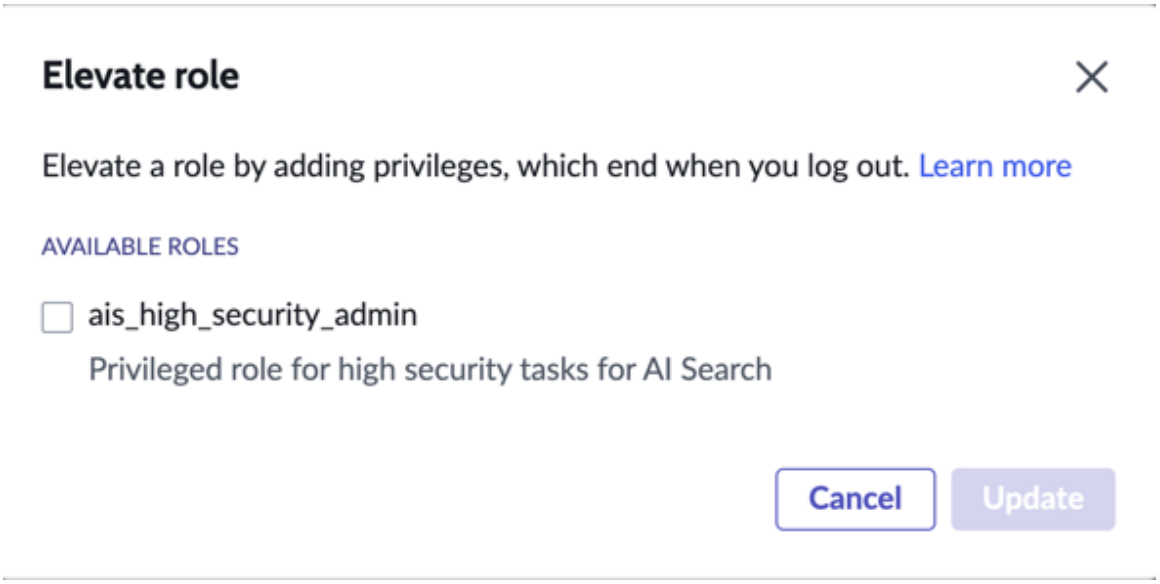




Use the index inspector tool to review individual content items retrieved by an external content connector. You can view an item's indexing status and see whether errors were encountered while retrieving and indexing it. View a content item's details to see its activity and selected fields, or to verify user access to the item in secure search.

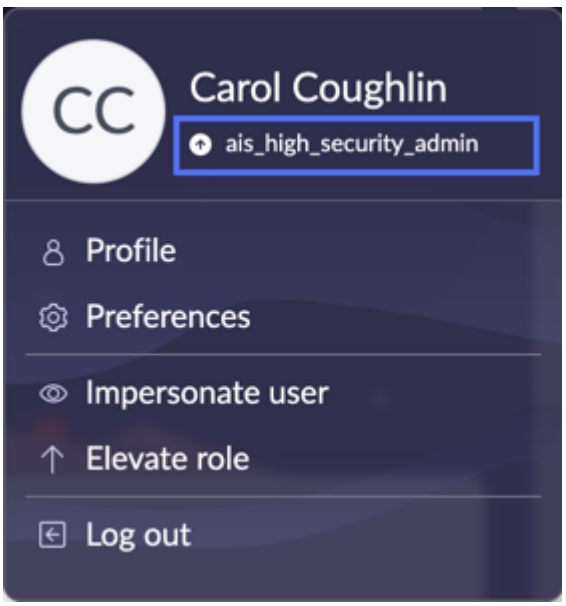
Procedure

1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. If prompted to switch scope, select **Switch scope** and select the application scope specified in the prompt.
3. In the Connectors list, select the record for the external content connector whose content items you want to view indexing status for.
4. Elevate to the ais_high_security_admin role:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Perform the appropriate action for your version of the UI:



UI version	Action
Next Experience UI	In the banner frame, select the icon for your account to open the user menu, then select **Elevate role**. 
Core UI	In the banner frame, select your name to open the user menu, then select **Elevate Roles**. 

A dialog box appears, displaying a checklist of your available privileged roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. In the dialog box, select the **ais_high_security_admin** option, then select **Update** (in Next Experience UI) or **OK**.
The page reloads and an elevated role indicator appears next to your user name in the user menu. In Next Experience UI, this indicator displays the names of the active privileged roles.
In Core UI, the indicator displays the elevated role icon .

Note: When the page reloads, any unsaved edits are lost.

5. In the connector editor, select the Index inspector tab.
6. In the **Before you access the index inspector** modal window, select the **I agree to the following disclaimer** option, then select **Access index inspector**.
7. Enter the title, source system URL, or ID for a content item that you want to view indexing status for, then select **Search index** or press Enter.
The system displays a list of content items that match your search. Each content item entry shows indicators for the item's indexing status and the number of errors encountered while retrieving and indexing it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** To view additional details on a content item, select its **Open details** link.
   The system displays details on the item including its URL, ID, and selected fields. A **Who can see this document?** section shows users and groups with access to the item (for secure search). An **Activity** section reports the item's status from the most recent connector crawl and its last seen and last indexed timestamps. This section also displays entries for the most recent errors encountered while retrieving or indexing the item. You can select **See all** to view more error entries.

   Note: You can hide index fields so they're not displayed on documents in the index inspector. For details on hiding fields in the index inspector, see Hide fields in the index inspector.

9. **Optional:** To verify whether a specific user can see the content item in search results, perform these steps.

   a. In the **Who can see this document?** accessibility section, enter a user's email address into the **Test with user** field.

   b. Select the Search icon.
   The system reports whether the specified user can view the content item in search results or not.

Hide fields in the index inspector

Suppress display of fields on documents in the index inspector.

Before you begin
Role required: admin

About this task
By default, the index inspector displays fields found on indexed documents that match your search. Administrators can hide sensitive fields in the index inspector by setting the value of the *glide.ais.externalcontent.query_api_denied_fields* system property. Hidden fields don't appear in index inspector search results.

To learn about the index inspector, see Review indexing status for individual content items.

Procedure
1. Navigate to the System Property [sys_properties] table's list view.
   a. Select **All**.
   b. In the **Filter** field, enter `sys_properties.list`.
   c. Press Enter.
2. Search for the *glide.ais.externalcontent.query_api_denied_fields* system property.
   - If the system property already exists, open it.
   - If the system property doesn't exist, select **New**, then enter the following field values on the System Property form.

Field	Value
Name	glide.ais.externalcontent.query_api_denied_fields

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Type	string

3. In the system property record's **Value** field, enter a comma-separated list of names for fields that you want to hide in the index inspector.
   As an example, you might enter `title,url` to hide the **Title** and **URL** fields for indexed records.

   The default value is empty, meaning that no fields are hidden.

   Note: Field names are case sensitive and all in lowercase. Don't capitalize field names when entering them.

4. To save your changes, select **Save** or **Update**.

Result
The specified fields are hidden when viewing indexed documents in the index inspector.

Review user permissions for an external content connector

View user and group access permissions retrieved by an external content connector, and see how the connector maps those permissions to your ServiceNow AI Platform® instance's users.

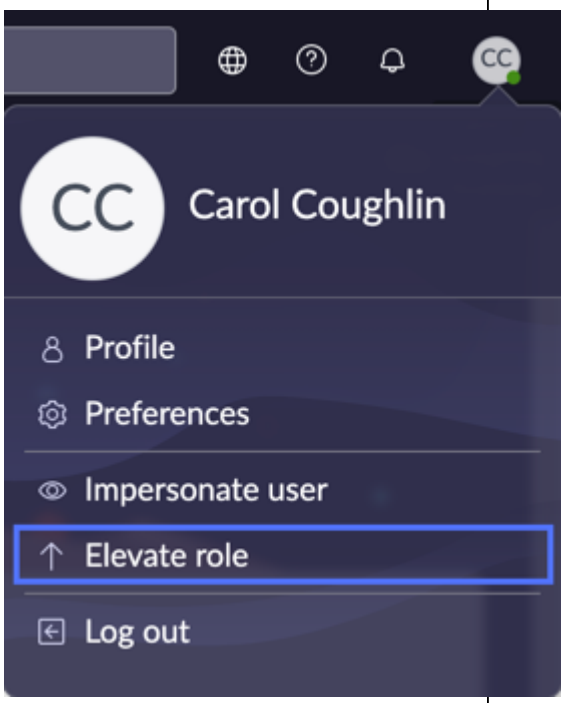
Before you begin
Role required: ais_admin, plus ais_high_security_admin to view full user permission details

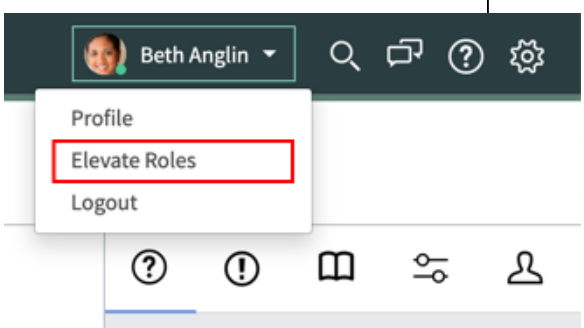
About this task
The User permissions list for an external content connector shows user and group access permissions retrieved from the connector's source system, along with details of how those permissions are mapped to your ServiceNow AI Platform instance's users. Review this information when you want to verify user and group permission mappings for your external content connector.

To view the user permissions list, you must elevate to the ais_high_security_admin role. If you don't elevate or don't have this role, you can see the number of user permissions created for the external content connector, but can't see details of those user permissions.

Note: The following external content connectors don't retrieve user or group access permissions. You can't run user permission crawls for these connectors.

- Adobe Experience Manager as a Cloud Service external content connector
- Amazon S3 external content connector
- Cornerstone external content connector
- ServiceNow® product documentation external content connector
- Slack external content connector
- Trello external content connector
- Webcrawler external content connector

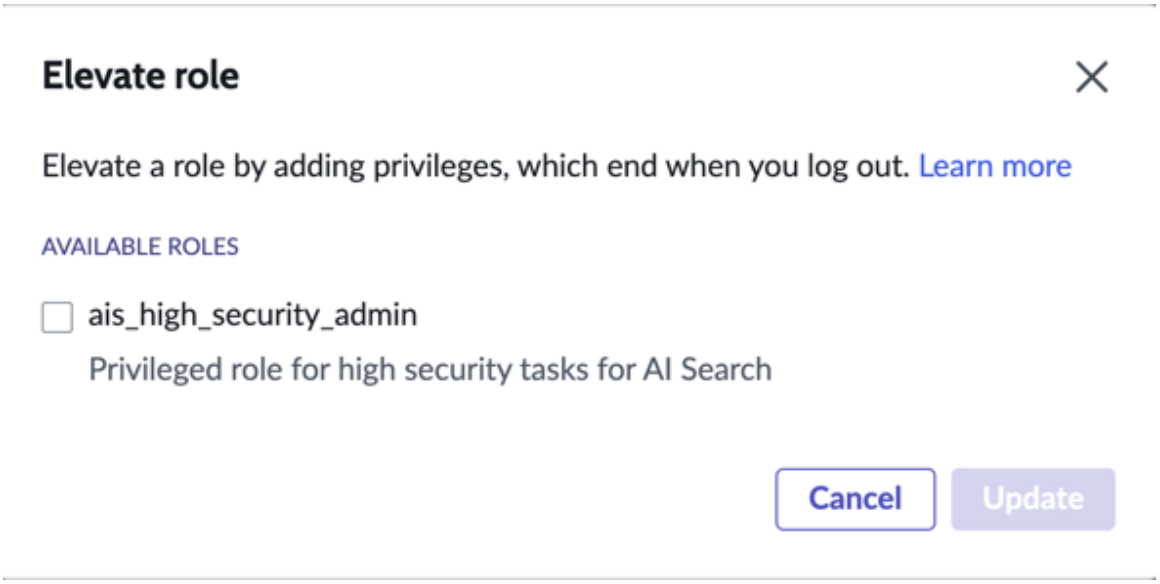




The Atlassian Confluence Cloud external content connector only retrieves permissions for Confluence Cloud users who have made their email addresses visible to all users. To allow user permission, each Confluence Cloud user must set their own email visibility to **Anyone** as explained in the https://support.atlassian.com/confluence-cloud/docs/configure-user-email-visibility/ Atlassian support resource.

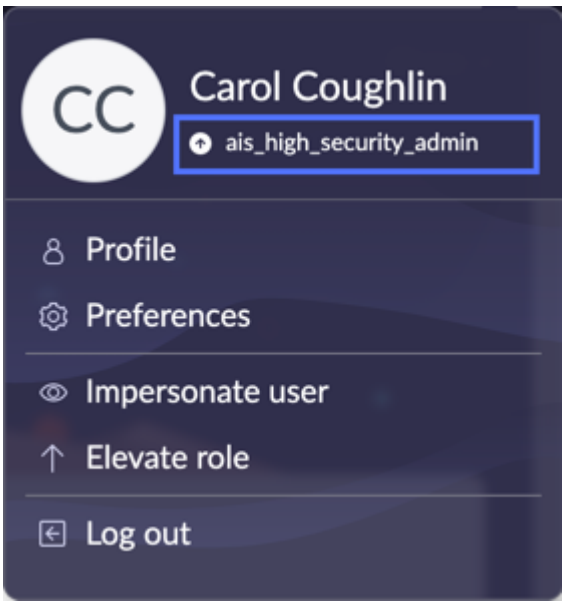
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **All** > **External Content Connectors** > **External Content Admin Home**.
2. In the Connectors pane, select the record for the external content connector whose user permissions you want to review.
3. In the connector editor, select the **User** *permissions* tab.
   The User permissions page shows the total count of user permissions created by the external content connector.
4. **Optional:** Elevate to the ais_high_security_admin role:

   a. Perform the appropriate action for your version of the UI:



UI version	Action
(Optional) Next Experience UI	In the banner frame, select the icon for your account to open the user menu, then select **Elevate role**. 
Core UI	In the banner frame, select your name to open the user menu, then select **Elevate Roles**. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A dialog box appears, displaying a checklist of your available privileged roles.

b. In the dialog box, select the **ais_high_security_admin** option, then select **Update** (in Next Experience UI) or **OK**.
The page reloads and an elevated role indicator appears next to your user name in the user menu. In Next Experience UI, this indicator displays the names of the active privileged roles.
In Core UI, the indicator displays the elevated role icon .

Note: When the page reloads, any unsaved edits are lost.

5. **Optional:** Review the entries in the User permissions list.
Each entry shows a single ServiceNow AI Platform user along with the external user mapped to them and any external group memberships associated with that external user. You can sort and filter the list to locate entries of interest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External Content Connectors reference

Reference information for the External Content Connectors application and for individual external content connectors.

Components installed with External Content Connectors

The External Content Connectors plugin installs a connector administrator role and a scheduled job to remove unused OAuth 2.0 credentials for deleted external content connectors.

Roles installed

Role title [name]	Description	Contains roles
External Content Connectors administrator [sn_ext_conn.xcc_admin]	Manages configuration settings for the External Content Connectors application, including the following: • Creates, reads, updates, and deletes external content connectors • Creates, reads, updates, and deletes crawl settings for external content connectors • Tests and validates external content connector configuration and crawl settings • Schedules and runs external content connectors • Views external content connector crawl logs This is a granular admin role that enables you to complete external content connector configuration tasks without requiring the full admin role. To learn more about how granular admin roles improve security and efficiency, see Granular admin roles.	• ais_admin • connection_admin • sn_kmf.cryptographic_manager

Scheduled jobs installed

Scheduled job	Description
Clean orphan external content oauth credential	Deletes stored OAuth 2.0 credentials for external content connectors that have been deleted. By default, this job runs once per day. Users with the admin role can change the schedule for this job: 1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs** > **Scheduled Jobs**. 2. Open the **Clean orphan external content oauth credential** record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	3. Set the desired schedule for the job by modifying the **Trigger type**, **Time zone**, and **Run time** field values. 4. Select **Update**.

Binary file extensions supported in External Content Connectors

Connector administrators can restrict the binary file types an external content connector retrieves by specifying file extensions in inclusion or exclusion filters.

Binary file type	Supported file extensions
Comma-Separated Values	`.csv`
Email Message	• `.eml` • `.msg`
Extensible Markup Language	`.xml`
Hypertext Markup Language	• `.htm` • `.html`
Microsoft Excel	• `.xls` • `.xlsm` • `.xlsx` • `.xltx`
Microsoft PowerPoint	• `.potx` • `.pps` • `.ppsx` • `.ppt` • `.pptm` • `.pptx`
Microsoft Word	• `.doc` • `.docm` • `.docx` • `.dotx`
Plain Text	`.txt`
Portable Document Format	`.pdf`
Rich Text Format	`.rtf`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Some external content connectors include support for indexing searchable content and metadata from additional content formats, such as video transcriptions or source-specific native document formats. Examples of source-specific native document formats include `.aspx` pages in Microsoft SharePoint Online and Wiki pages in Atlassian Confluence Cloud.

For details on defining file-extension inclusion and exclusion filters for external content connectors, see Configuring crawl settings for external content connectors.

Binary files may be retrieved as content items, or as attachments found on content items. The exact behavior depends on the connector type.

Important: The maximum file size for binary files is 25 MB. Keyword indexing processes up to the first 1 MB of text. Use semantic search to index data containing between 1 MB and 25 MB of text.

Statistics for external content connector content crawls

Each crawl history entry for an external content connector's content crawl includes statistics about the documents (items or files with searchable content and metadata) retrieved by the crawl.

Document statistics entries

Document statistics entry	Description
Indexed	Score shows the total number of new and updated items that were successfully processed by the content crawl and are included in the AI Search index.
Added	Score shows the number of items that were added to the AI Search index by the content crawl.
Updated	Score shows the number of items that were updated in the AI Search index by the content crawl.
Deleted	Score shows the number of items that were deleted from the AI Search index by the content crawl.
Unchanged	Score shows the number of items that were processed by the content crawl without requiring changes to the AI Search index.
Error	Score shows the number of Error-level alerts recorded for the content crawl. Select **Details** to view the Alerts tab for the crawl history entry.
Warning	Score shows the number of Warning-level alerts recorded for the content crawl. Select **Details** to view the Alerts tab for the crawl history entry.
Discovered	Score shows the total number of items that were processed during the content crawl. Chart shows the number of items processed by the content crawl for each result status shown in the following Discovered item result statuses table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovered item result statuses

Result status	Description
Indexed	The number of items successfully added to or updated in the AI Search index.
Not indexed	The number of items that weren't added to or updated in the AI Search index because of processing errors.
Skipped	The number of items that weren't added to or updated in the AI Search index for any of the following reasons: **The item doesn't satisfy indexing limits** The connector skips an item when any of these conditions is true. • The item is a binary file/attachment with an unsupported format. For the list of supported binary file formats, see Binary file extensions supported in External Content Connectors. • The item is a binary file/attachment that exceeds the maximum file-size limit (25 MB). • The connector has reached its content indexing limit. **The item is excluded by an inclusion or exclusion filter in the connector's crawl settings** The connector skips an item if it or its location is not included in your specified inclusion filter. It similarly skips an item if it or its location is explicitly included in your specified exclusion filter. **The item doesn't satisfy the connector's content validation rules** Individual external content connectors have their own validation rules that determine what content they accept for indexing. As an example, the Webcrawler external content connector rejects HTML pages that don't have a title element. The connector skips any item that doesn't satisfy its content validation rules.

Performance statistics entry	Description
Average crawl speed	Score shows the average speed of the content crawl, expressed in documents (items) processed per second of crawl time.

Statistics for external content connector user permission crawls

Each crawl history entry for an external content connector's user permission crawl includes statistics about the permissions (user and group-membership security principals) retrieved by the crawl.

Permission statistics entry	Description
Mapped users	Score shows the number of users from the source system that were successfully mapped to users on your ServiceNow AI Platform® instance by the user permission crawl.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Permission statistics entry	Description
Unmapped users	Score shows the number of users from the source system that weren't mapped to users on your ServiceNow AI Platform instance by the user permission crawl.
Error	Score shows the number of Error-level alerts recorded for the user permission crawl. Select **Details** to view the Alerts tab for the crawl history entry.
Warning	Score shows the number of Warning-level alerts recorded for the user permission crawl. Select **Details** to view the Alerts tab for the crawl history entry.
Users	
Users	Score shows the total number of users that were added to the AI Search index by the user permission crawl.
Discovered	Score shows the number of users that were processed by the user permission crawl.
Deleted	Score shows the number of users that were deleted from the AI Search index by the user permission crawl.
Groups	
Discovered	Score shows the number of group-membership permissions that were processed by the user permission crawl.
Deleted	Score shows the number of group-membership permissions that were deleted from the AI Search index by the user permission crawl.

Performance statistics entry	Description
Average crawl speed	Score shows the average speed of the user permission crawl, expressed in users processed per second of crawl time.

Analytics for external content connectors

Metrics that show how your external content connector has run over time.

You can view analytics for an external content connector by navigating to the **Analytics** tab in the connector editor. For more details on this procedure, see Review analytics for an external content connector.

Date range

Use the **Date range** interactive filter to specify the reporting time period for all external content connector analytics reported on this page.

Document statistics

Metric	Description
Documents indexed	*Timeseries visualization:* Graph shows the number of items (documents with searchable content and metadata) the connector retrieved that were included in the AI Search index for each date in the selected date range.
Quota usage	*Single score with progress bar:*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	• First value shows the number of items the connector retrieved that are currently included in the AI Search index. **Note:** Deleted items aren't deducted from this quota usage figure. • Second value shows the indexing limit for the connector. • Progress bar shows how close the connector is to its indexing limit.
New	*Single score with trend:* • Score shows the number of new items the connector added to the AI Search index in the selected date range. • Trend shows how this score changed in the selected date range as compared with the previous time period.
Updated	*Single score with trend:* • Score shows the number of items the connector updated in the AI Search index (to reflect content and metadata changes) in the selected date range. • Trend shows how this score changed in the selected date range as compared with the previous time period.
Discovered	*Single score with trend:* • Score shows the number of items the connector processed in the selected date range. • Trend shows how this score changed in the selected date range as compared with the previous time period.
Indexed	*Single score with trend:* • Score shows the number of items the connector fed to the AI Search index in the selected date range. • Trend shows how this score changed in the selected date range as compared with the previous time period.
Deleted	*Single score with trend:* • Score shows the number of items the connector deleted from the AI Search index in the selected date range. • Trend shows how this score changed in the selected date range as compared with the previous time period.
Skipped	*Single score with trend:*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric	Description
	• Score shows the number of items skipped due to processing errors in the selected date range. **Note:** This number doesn't include items excluded by crawl settings specified for the connector. • Trend shows how this score changed in the selected date range as compared with the previous time period.

Crawl statistics

Metric	Description
Crawls executed	*Timeseries visualization:* • Histogram area chart shows the number of successful crawls run for the connector for each date in the selected date range. • Histogram line chart shows the number of failed crawls run for the connector for each date in the selected date range. Select an individual crawl's name from the histogram legend to hide its entries from the histogram or display them again.
Document crawls	*Dual score:* • First value shows the number of successful content crawls run for the connector in the selected date range. • Second value shows the number of failed content crawls run for the connector in the selected date range.
User permission crawls	*Dual score:* • First value shows the number of successful user permission crawls run for the connector in the selected date range. • Second value shows the number of failed user permission crawls run for the connector in the selected date range.

Reassign the External Content Connectors Service Account user to the global domain

Fix issues with missing user permissions for users on your instance by reassigning the External Content Connectors Service Account user to the global domain.

Symptom

On an instance with domain separation configured, if you assign the External Content Connectors Service Account user to a domain other than the global domain, external content connector user permission crawls can only map source system user and group permissions correctly for instance users assigned to the same domain. Instance users assigned to other domains are unable to search private content indexed by your external content connectors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause

The External Content Connectors application includes an External Content Connectors Service Account user. When you run user permission crawls for your external content connectors, this user account assigns the retrieved source system user and group permissions to users on your instance.

When the External Content Connectors Service Account user is assigned to a domain other than the global domain, it can only map source system user and group permissions to instance users in its own domain. Instance users assigned to any other domain don't get correctly mapped source system user and group permissions and can't search private content retrieved by your external content connectors.

As an example, suppose you have an instance with domain separation configured where you assign the External Content Connectors Service Account user to the PKD/BR 1.0/VK domain. With this configuration, external content connector user permission crawls can only map source system user and group permissions to your instance users who are assigned to the same PKD/BR 1.0/VK domain. Instance users assigned to any other domain don't get source system user and group permissions mapped correctly and can't search private content retrieved by your external content connectors.

Resolution

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Open the user record with ID **xcc-connector-service-account** and name **External Content Connectors Service Account**.
3. On the User form, configure the layout to show the **Managed domain**, **Domain**, and **Domain Path** fields.
   To learn how to show or hide fields on a form, see Configuring the form layout.
4. Select the **Managed domain** option.
5. Set the value of the **Domain** field to `global`.
   This is the default value for the field.
6. Set the value of the **Domain Path** field to `/`.
   This is the default value for the field.
7. Select **Update**.
   The External Content Connectors Service Account user is reassigned to the global domain with default settings.
8. Update your user permission mappings by rerunning user permission crawls for your affected external content connectors.

Contextual search

Contextual search is a search technology that focuses on the context of the query as well as the intent of the user in order to fetch the most relevant set of results. Contextual search displays related results within a form or record producer based on the text you enter in a field.

Example use cases for Incident:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An agent, working on an Incident record, can use contextual search to find and attach knowledge articles, order a catalog item on behalf of the caller, or search for an article and link it to a related incident or problem.
- A user, creating an Incident via the Service Portal, can see related catalog items that the user can order. The user can also view related knowledge articles to help them resolve the issue on their own without involving the service desk operators.

Contextual search helps with incident deflection for the following areas:

- Incident record producers: deflecting incidents by helping end users resolve issues before they raise an incident.
- Incident forms: helping service desk staff resolve incidents quickly by providing relevant knowledge.
- Incident email notifications: helping end users resolve their incidents themselves without requiring manual intervention from service desk staff.

Contextual search plugin

Contextual search plugin is activated in the base system.

Contextual search plugin

The Contextual Search plugin (com.snc.contextual_search) is activated by default in the base system. This plugin activates related plugins if they aren't already active.

Before you begin

Role required: admin

About this task

If the related plugins aren't activated, Contextual Search activates the plugins.

Plugins for Contextual Search

Plugin	Description
JSON Service request/response model [com.snc.application.json_service]	Core components and helpers for a JSON request/response model. Includes JSON and XML transports for NG and GlideAjax support. An extension of the processor framework.
Contextual Search — Internal [com.snc.contextual_search.internal]	An internal plugin component for Contextual Search.
GraphQL Schema for Contextual Search [com.snc.contextual_search.graphql]	Provides GraphQL schema for contextual search services.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Components installed with Contextual Search

Several types of components are installed with the activation of the Contextual Search plugin (com.snc.contextual_search), including tables and user roles.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Tables installed

Table	Description
Available Search Resource [cxs_search_resource]	List of available search resources used in configuration of searches.
Email Configuration [cxs_table_email_config]	List of email notifications configured to have contextual search results attached.
Record Producer Configuration [cxs_rp_config]	List of record producers configured to have contextual search.
Relevant Document [cxs_relevant_doc]	Groups the Relevant Document Detail individual recorded actions by search session. **Note:** A new search session group is created every time you create or open a record or reload the page. For more information on the table, refer Feedback information on contextual search.
Relevant Document Detail [cxs_rel_doc_detail]	List of individual recorded actions. For example, **Preview**, **This helped**, **Attach**, or **Order**. For more information on the table, refer Feedback information on contextual search.
Search Context	Search contexts for contextual search.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[cxs_context_config]	
Search Field [cxs_table_field_config]	All form fields that have contextual search configured to it.
Search Resource [cxs_search_res_config]	Search resource configurations for the related searcher.
Search Resource Context Configuration [cxs_res_context_config]	Conditions for this search context that restrict the results returned to a user.
Search Resource Context Property [cxs_res_context_config_prop]	Property values for search resource context configuration.
Search Resource Property [cxs_search_res_config_prop]	Property values for search resource searcher configuration.
Searcher Configuration [cxs_searcher_config]	Details of available search configurations.
Table Configuration [cxs_table_config]	Lists the tables configured for table configurations.
Wizard Configuration [cxs_wizard_config]	Lists the tables configured for wizard configurations.
Base UI Configuration [cxs_ui_config_base]	Common elements for the record producer, table, and wizard configurations.

Contextual search concepts

Contextual search concepts help you to understand different contextual search components that are used in the documentation, configuration, and user interface. Understanding of the concepts makes it easier for you to comprehend the interconnection between the components.

Contextual search uses terms and concepts that can differ from industry norms due to the unique nature of the ServiceNow platform. Contextual search includes the following concepts and components:

Search resource

Resource that can be searched such as Catalog or Knowledge Articles. As the resources are scripted and contain JavaScript, they can combine results from more than one table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- ServiceNow provides pre-defined scripted search resources. You can't create, update, or delete search resources.
- A search resource uses the Zing search engine to search a table.

Searcher

A single search resource or a group of search resources that can be searched. For example, the Knowledge and catalog searcher contains Knowledge Articles, Questions and Catalog Items as its search resources.

Note: ServiceNow provides pre-defined searchers. You can't create, update, or delete searchers.

Additional resources

An additional resource is a single table source with query conditions that you can search. Additional resources aren't scripted as you search from a single table. For example, Resolved Incidents (within the last six months).

Note:

- ServiceNow provides pre-defined additional resources. You can't create or delete additional resources, but can update additional resources to better match your organization requirements. For example, you can update the condition and description for Resolved Incidents (Last 6 months) to change it to Resolved Incidents (Last 3 months).
- An additional resource performs the search based on the type of the source:
  - Table: The Zing search engine to used to search a table.
  - Predictive Intelligence similarity : Search is based on similarity and not on the Zing search engine.

Search result display fields

Defines the fields whose values are displayed with the search result of an additional resource. The fields can include **Assigned to**, **Opened by**, and **State**. The search result display fields appear at the bottom of a search result record.

Note: ServiceNow provides pre-defined search result display fields. You can't create or delete additional resources, but you can update search result display fields to better match your organization requirements. For example, change which field to use as a title or the description or which fields to show at the bottom of a search result record.

Search context

Brings together a searcher and additional resources (if any) that can be searched.

Note: ServiceNow provides pre-defined search contexts. You can also create search contexts.

Searcher text

Defined in a search context, a searcher text specifies a user-friendly group name for the searcher. When a searcher contains more than one search resource, a group name is used to represent that group of search resources. For example, the Incident Deflection search context uses a searcher that searches Knowledge

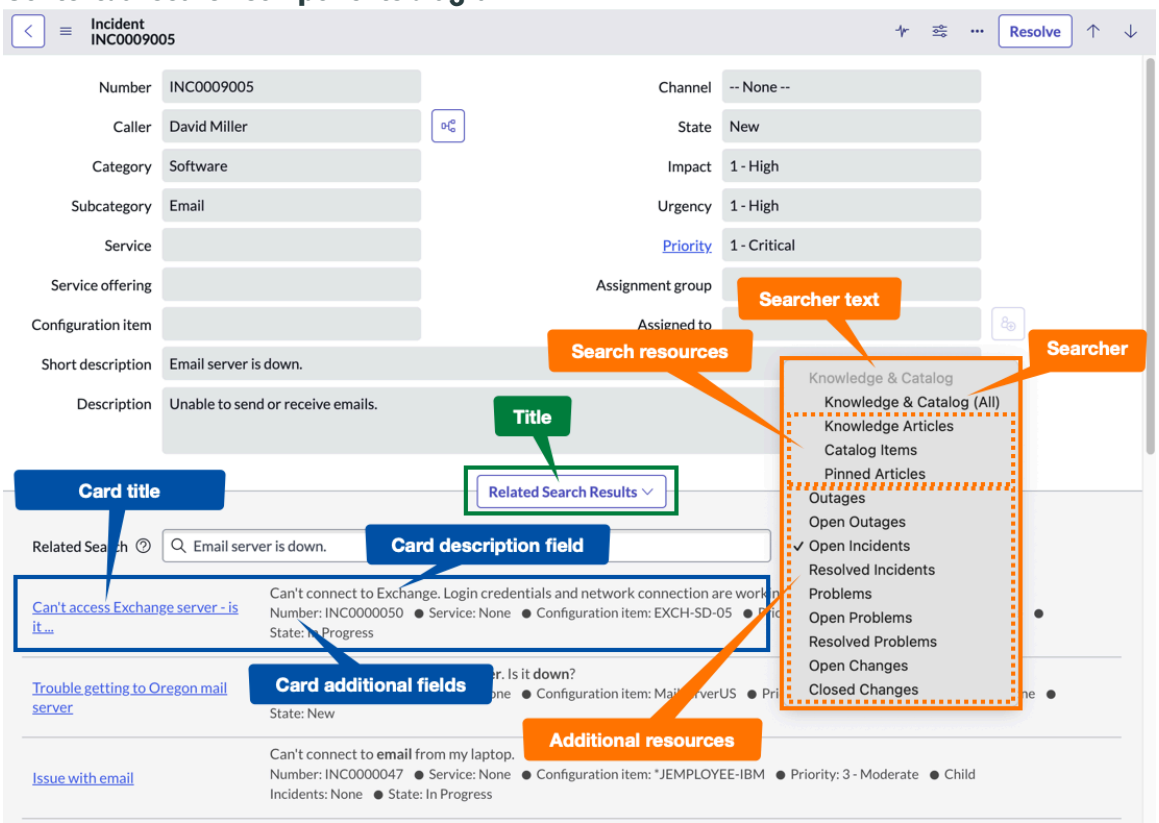
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Articles, Questions and Catalog Items. The user-friendly searcher group name that represents all of them is Knowledge & Catalog.

Search on tab

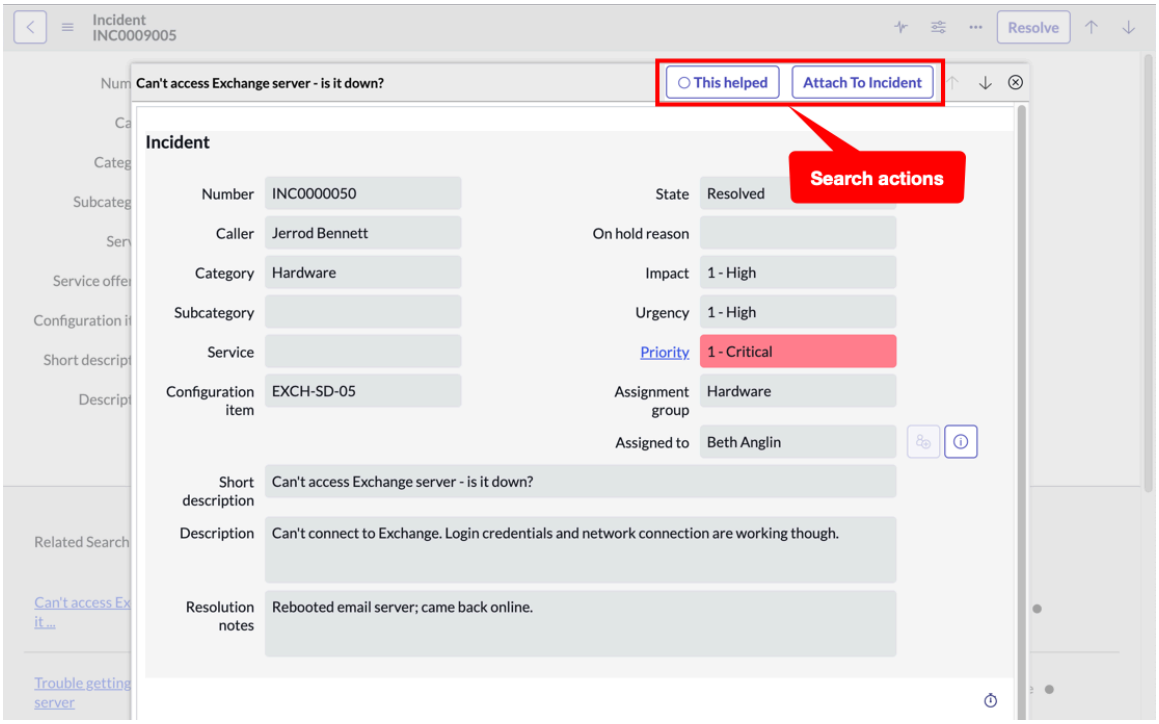
Defined in the search context, **Search on tab** specifies when a contextual search should start the search. The different scenarios when search is performed are:

- If you select the **Search on tab** check box, the search only runs when you update and leave the search field (recommended).
- If you clear the **Search on tab** check box, the search runs when you pause typing.



Search actions

Specifies the actions for each such results. For example, for catalog items, the search action is **Order** and for knowledge articles it's **Attach**. All sources have the **This helped** action.



Contextual search components diagram

The contextual search components diagram helps you to understand how contextual search concepts work together to perform a search and from which module you can configure the components.

Components	Navigation
Table configuration	You can configure the search title and the form using the **All** > **Contextual search** > **Table configuration** module. For more information, refer Configure table for a contextual search.
Search Contexts	You can configure the searcher text and the searcher using the **All** > **Contextual search** > **Search Contexts** module. For more information, see Define a search context.
Search Result Display Configurations	You can configure the card title, card description field, and card additional fields using the **All** > **Contextual search** > **Search Result Display Configurations** module. For more information, see Edit search resource display field record.
Search Action Configurations	You can configure the search actions using the **All** > **Contextual search** > **Table Configuration** > **Search Action Configurations** module. For more information, see Modify or disable search actions available for contextual search. To add conditional logic such as filtering results by record state, see Define a search context

Tip: To filter contextual search results by conditions such as problem state or record category, configure conditions in the Search Contexts module. For details, see Define a search context.

Configuring contextual search

You can configure different components of contextual search.

Contextual search properties

Contextual search properties are used to control the fields that you can search from and the number of results displayed per page.

The contextual search properties are available at **Contextual Search** > **Properties**.

Properties for contextual search

Property label	Description
Default value for maximum number of search results returned for table and record producer configurations [com.snc.contextual_search.result.default.limit]	Default value for the maximum number of search results returned when you create a table or record producer configuration. By default, the value is 10.
Number of characters that a configured field needs before triggering a search [com.snc.contextual_search.min_length]	Number of characters that contextual search requires before triggering a search based on the text entered in the search field. By default, the value is set to 3 characters. This property also applies to the Agent Assist search.
Number of milliseconds that a configured field will wait before triggering a search [com.snc.contextual_search.wait_time]	Number of milliseconds that contextual search waits before triggering a search based on the text entered in the search field. By default, the value is set to 1,000 milliseconds (one second).
Records returned above this threshold will log warnings [com.snc.contextual_search.result.threshold]	Triggers a warning message within the system log whenever more than this number of results are returned in a search. This logging helps if you're experiencing performance issues because of large searches. By default, the value is set to 10,000 results.
When a Form configuration is created a search field with a name matching this property will be automatically created [com.snc.contextual_search.widget.form.default_field]	The default field that is used for searching when you create a table configuration. By default, the value is set to short_description.
Collapse the search results widget when creating a new record in a form [com.snc.contextual_search.widget.form.open_collapsed_new_records]	When the value is set to true and you create a record, the search results widget is collapsed to save space. By default, the value is set to false.
Collapse the search results widget when opening an existing record in a form [com.snc.contextual_search.widget.form.open_collapsed_existing_records]	When the value is set to true and you open an existing record, the search results widget is collapsed to save space. By default, the value is set to true.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for contextual search (continued)

Property label	Description
	Note: The property applies only to existing records and not to new records.
Auto expand the search results widget when search field updates in a form [com.snc.contextual_search.widget.form.expand_on_search_field_update]	When the value is set to true and you update the search field in a form, the search results widget automatically expands and runs the search. By default, the value is set to true.
Show meta data on form contextual search results [com.snc.contextual_search.widget.form.show_meta_data]	When the value is set to true, each search result includes additional metadata below each result record. By default, the property is set to true. • For Knowledge articles, you configure the metadata fields to display by modifying Knowledge search properties. As an example, you can display the article's author, article number, and knowledge base name. For details on Knowledge search properties, see Knowledge Management properties. • Configure the search result display fields for other resources by editing search result display configurations. For details on search result display configuration settings, see Edit search resource display field record.
Always force a relative link in the cxs_new_window UI Page [com.snc.contextual_search.cxs_new_window.force_relative_link]	The property ensures that only relative links open from the contextual search modal window. By default, the property is set to true. When the value is set to true, a link opened from the contextual search modal window is forced to be a relative link. When the value is set to false, a relative or external link can be opened from the contextual search modal window. To review this property in the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for contextual search (continued)

Property label	Description
	Note: The contextual search window is displayed in the core UI.

Define a search context

Define where agents can search for a particular resource. You can specify that the search resources are predefined or additional resources outside the system.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Contextual Search** > **Search Contexts**.
2. Select **New**.
3. On the form, fill in the fields.

Search Context form

Field	Description
Name	Unique name of the search context.
Short description	Brief summary of the context.
Searcher	Lookup icon ( ) to select a searcher for this context. The searcher determines the information source to search. ○ Catalog only: Provides search results from service catalog items. ○ Knowledge and catalog: Provides search results from knowledge articles and service catalog items. ○ Knowledge only: Provides search results from knowledge articles. ○ Knowledge, Discussions and pinned: Provides search results from knowledge articles, pinned knowledge articles, and ServiceNow Community. ○ Knowledge, pinned knowledge and catalog: Provides search results from knowledge articles, pinned knowledge articles, and service catalog items. ○ Knowledge and pinned knowledge: Searches knowledge articles and pinned knowledge articles. ○ Knowledge, Pinned, Catalog: Provides search results from Knowledge, Pinned Knowledge, and Catalog Items. ○ Knowledge and pinned: Provides search results from knowledge articles and pinned knowledge articles. ○ Pinned Knowledge only: Provides search results from pinned knowledge articles. **Note:** The **Searcher** field is optional. You can decide whether to show or hide sources from an agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Searcher default search	List used to select a specific resource from the **Searcher** field to search as default.
Searcher text	Unique label for the searcher group that is used when there is more than one resource in the searcher.
Active	Option to activate the search context form.
Enable wildcard searches	Option to enable wildcard characters, such as * and %, for searches.
Search on tab	Option to determine when to perform the search. If you select this option, the search runs only when you enter text in a field and then leave the field. If you clear the check box, the search runs after you stop typing even though the cursor is still in the same field. **Note:** To display the search context in the Source selector on Platform, you must select this option. Search contexts with this option deselected don't appear in the Source selector on Platform.

The **Searcher default search** list is available if the **Searcher** is the default search. If an additional resource is the default search, you see the **Set Searcher as the Default Search** related link. For information on how to set the default source for search context, see Set the default source for search context.

4. Select and hold (or right-click) the form header and select **Save**.

Configure table for a contextual search

Configure the options for the contextual search that a table performs.

Before you begin

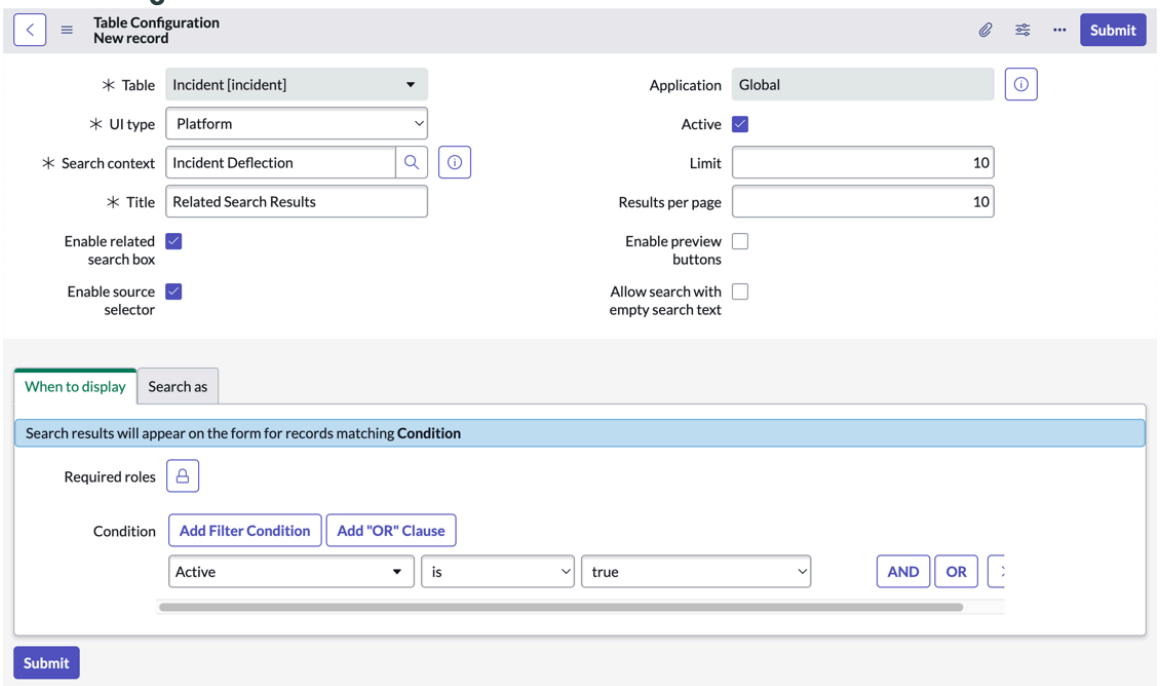
Role required: admin

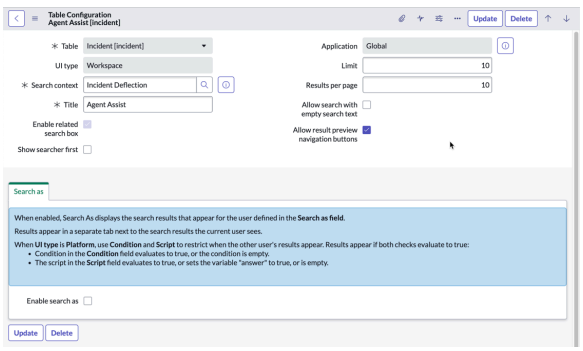
Procedure

1. Navigate to **All** > **Contextual Search** > **Table Configuration** and click **New**.
2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table Configuration form





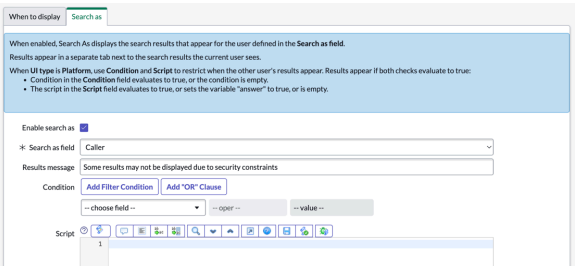


Table Configuration fields

Field	Description
Table	Name and label of the table associated with the form. For example, Incident [incident].
UI type	User interface differs depending on whether you use the table configuration for Platform or Workspace. **Note:** The **When to display** section appears only when you select *Platform* from **UI type**. 
Search context	Lookup icon to select a search context for which you are configuring the table.
Title	Unique title for the search results area that appears in the form. For example, if you enter `Knowledge results` as the value in this field, the related search area displays **Knowledge results** as the title. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Enable related search box	Option to show the related search box in the form.
Show searcher first	Option to display searcher resources before additional resources in the search context. This field appears only when you select *Workspace* from **UI type**.
Enable source selector	Option to show the list of search sources that you can search from. **Note:** This field appears only when you select **Enable related search box**.
Application	Application scope of the table configuration. The configuration is available for all applications or for scoped applications.
Active	Option to activate the table configuration.
Limit	Maximum number of search results returned.
Results per page	Number of results to display per page.
Allow expand/ collapse	Option to enable a user to collapse the search results in the form.
Enable preview buttons	Option to show a preview button (platform only) for each search result. The user can then use the preview button or the search result title to preview the result record. **Note:** The option is available from the London release. Clear the option to provide a more compact display for each search result.
Allow search with empty search text	Option to specify whether the search runs when there is no search text. **Note:** There is no search text when there is no **Search Field** specified or when there is a **Search Field** whose value is empty.
When to display	
Required roles	List of roles that grant access to the related search results widget from the table. Users must have one of these roles to see the widget when viewing the table.
Condition	Conditions that records must satisfy to appear as related search results. For example, set **[Active] [is] [true]** to only enable the active records as related search results.
Search as	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Enable search as	Option to enable searching as a different user. The message box describes the settings available when you select this option.  For more information on using **Search as**, see Enable viewing of search results for the current and another selected user.

3. Click **Submit**.
   The Search Fields, Filter Configurations, Email Configurations, and Search Action Configurations related lists appear. By default, the **Short description** field is added to the Search Fields related list.

   Note: Search results only appear for Search Fields that are visible on the form.

Filter configuration for contextual search

Define filter configurations to map fields from the form to provide a more targeted search result set.

Create a filter configuration using mapping

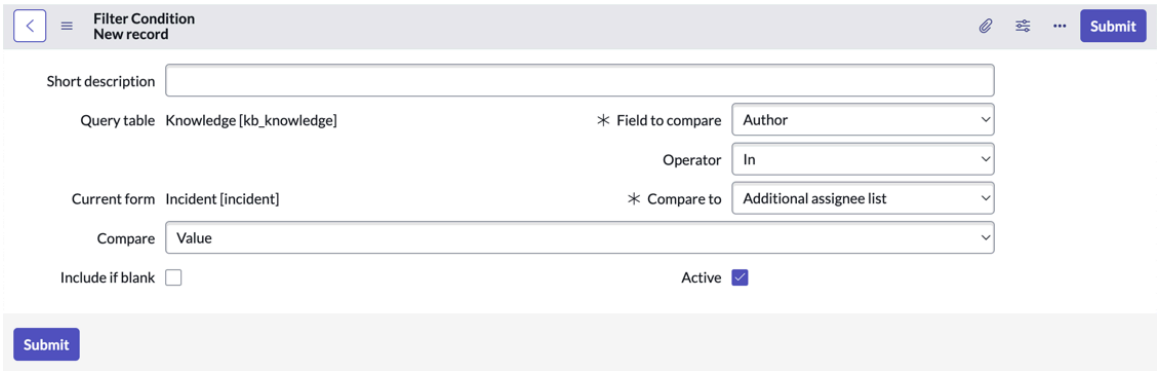
Create filter conditions using mapping that you can associate with a table configuration. The search result displays result that meets the filter conditions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. Open a table configuration record on which to create the filter.
3. In the Filter Configurations related list, click **New**.
4. On the form, fill in the fields.



Filter Configuration form

Field	Description
Resource configuration	Lookup icon to select a resource such as Knowledge Articles.
Table configuration	[Read-only field]. Table for which you are applying the filter configuration.
Scripted filter	Option to define the filter using a script. **Note:** Clear this option since you want to create a filter configuration using mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option to activate the filter configuration.

5. Click **Submit**.
   The Table Configurations form appears.
6. In the Filter Configuration related list, click the filter that you have created.
7. In the Filter Conditions related list, click **New**.

8. In the form, fill in the fields.

Field	Description
Short description	Brief summary of the filter condition.
Query table	[Read-only] Table from which the filter condition is queried.
Current form	[Read-only] Form for which you created the filter conditions.
Field to compare	Value of the field is compared with the value of the **Compare to** field.
Operator	Operation that should be performed on the **Field to compare** and **Compare to** field.
Compare to	Value of the field is compared against the value of **Field to compare**.
Compare	Comparison of the field can be based on the actual value stored on the database or the value that is displayed on the interface. The available values are: **Value** and **Display Value**.
Include if blank	Option to include a condition when the value of the **Compare to** field is blank.
Active	Option to activate the filter configuration.

9. Click **Submit**.

Create a filter configuration using scripts

Create filter conditions using script that you can associate with a table configuration. The search result displays results that meet the filter conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. Open a table configuration record on which to create the filter.
3. In the Filter Configurations related list, click **New**.
4. On the form, fill in the fields.

Filter Configuration form

Field	Description
Resource configuration	Lookup icon to select a resource such as Knowledge Articles.
Table configuration	[Read-only field]. Table for which you want to apply the filter configuration.
Scripted filter	Check box to select if you want to enter scripts in the **Script** field. **Note:** The **Script** field appears only when you select **Scripted filter**.
Application	Application scope for your filter configuration.
Active	Check box to activate the filter configuration.

5. Enter a script corresponding to the resource configuration.

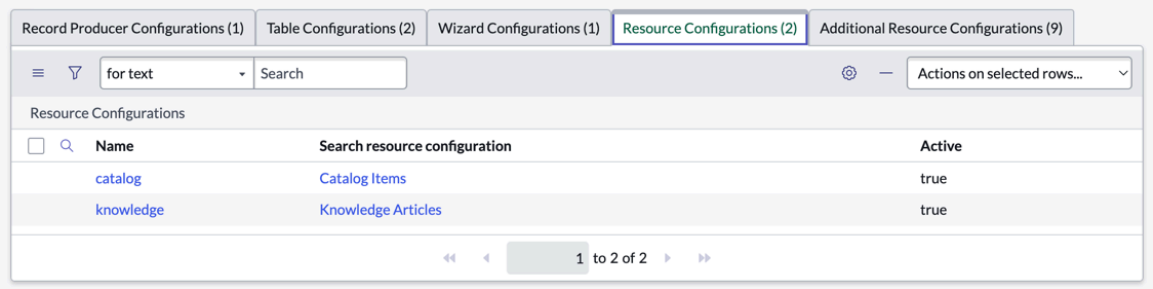
Note:

Use one of these dynamic filter scripts to set up your dynamic filter.

6. Click **Submit**.

Configure search resource context properties

Configure the properties to limit the search to a specific catalog or knowledge base. For example, if you want to limit the knowledge search to an IT knowledge base or a service catalog search to software service catalog, you can configure the properties.



Before you begin
Role required: admin

About this task
The following procedure uses Incident Deflection as an example.

Procedure

1. Navigate to **All** > **Contextual Search** > **Search Contexts**.
2. Open the Incident Deflection record.
3. View the Resource Configurations related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

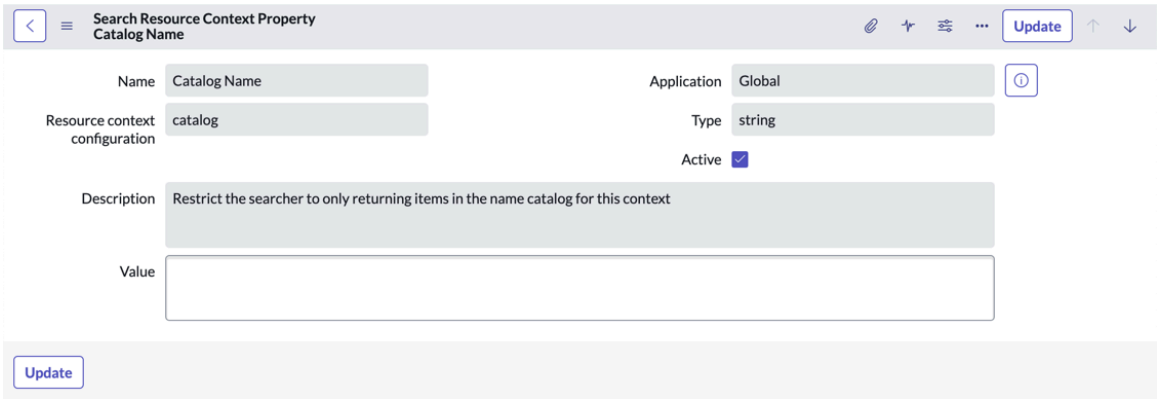
In the Resource Configurations related list, edit a resource configuration record to view the properties of the search resource.

The **knowledge** record displays the following knowledge resource configuration properties:

Knowledge resource configuration properties

Property	Description
Condition	Conditions to specify one or more knowledge bases to search.
Exclude pinned articles	Pinned article is a knowledge article. This property helps to decide whether to exclude pinned articles from knowledge base search or not.

Example use case: To restrict knowledge search to the IT knowledge base only, set the **Condition** property value to a condition that filters by your IT knowledge base sys_id (for example, `kb_knowledge_base=<sys_id_of_IT_KB>`).



The **catalog** record displays the following catalog resource configuration properties:

Catalog resource configuration properties

Property	Description
Catalog name	A catalog name to search the catalog items.
Search operator	Value of the operator is used in the Zing search engine to instruct how to combine the AND and OR conditions when parsing the search string. The integration of the search strings helps to score the displayed results. The value can only be one of the following values: ○ **IR_AND_OR_QUERY** (the default): Display results with exact matches of all terms if the number of results is greater than the value of the *`glide.ts.query.and_or_limit`* property (default 0) or the (overriding) value of the table custom attribute *`text_search_and_or_limit`* (when added). Otherwise display results with any matches of any terms. ○ **IR_AND_QUERY**: Display results with exact matches of all terms only. ○ **IR_OR_QUERY**: Display results with any matches of any terms.

4. To edit the value of any property, select the property name and in the Search Resource Context Property form, update the **Value** field to `true` or `false`.

5. Select **Update**.

Managing contextual search

Contextual search provides a way to display results that can be relevant to the issue for which you are creating an incident or requesting a service.

The section covers topics that help you to:

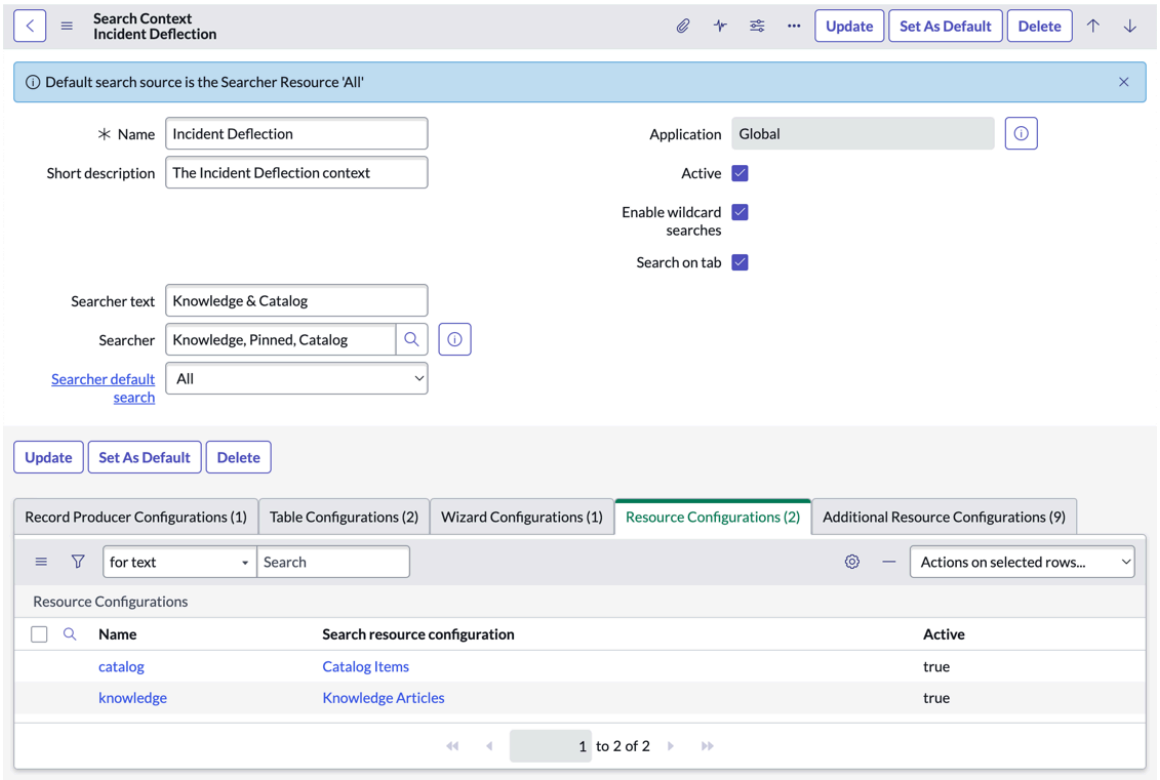
- Understand the actions that are taken on the search results.
- Use contextual search results in a record producer within the Service Portal or as an agent in a form.

Set a search context as default

If you use the contextual search REST API and don't specify which search context to use, the API uses the search context that you have set as default. The search context that you use in the API takes preference over the one marked as default.

Before you begin

Role required: admin



About this task

Procedure

1. Navigate to **All** > **Contextual Search** > **Search Contexts**.
2. Open the search context record that you want to set as default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Set As Default**.

Set the default source for search context

You can decide which source to set as the default search source.

Before you begin

Role required: admin

About this task

- If you set an additional resource as the default source that source is considered the default search source.
- If you don't mark any additional resource as the default source, then the searcher source is considered the default search source.
- If you don't have a searcher and you have not marked any additional resource as the default source, the default is the additional resource with the lowest value in the **Order** field.

Procedure

1. Navigate to **All** > **Contextual Search** > **Search Contexts**.
2. Open the search context record to change its default source.
3. To set an additional resource as the default search source:
   a. Click the Additional Resource Configuration related list.
   b. Select and hold (or right-click) the search resource configuration record and click **Set as Default Search**.
4. To set a searcher source as the default search source:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click the **Set Searcher as the Default Search** related link to set **Searcher** as the default search source.

> **Note:** The **Set Searcher as the Default Search** related link appears only if an additional resource is the default search source.

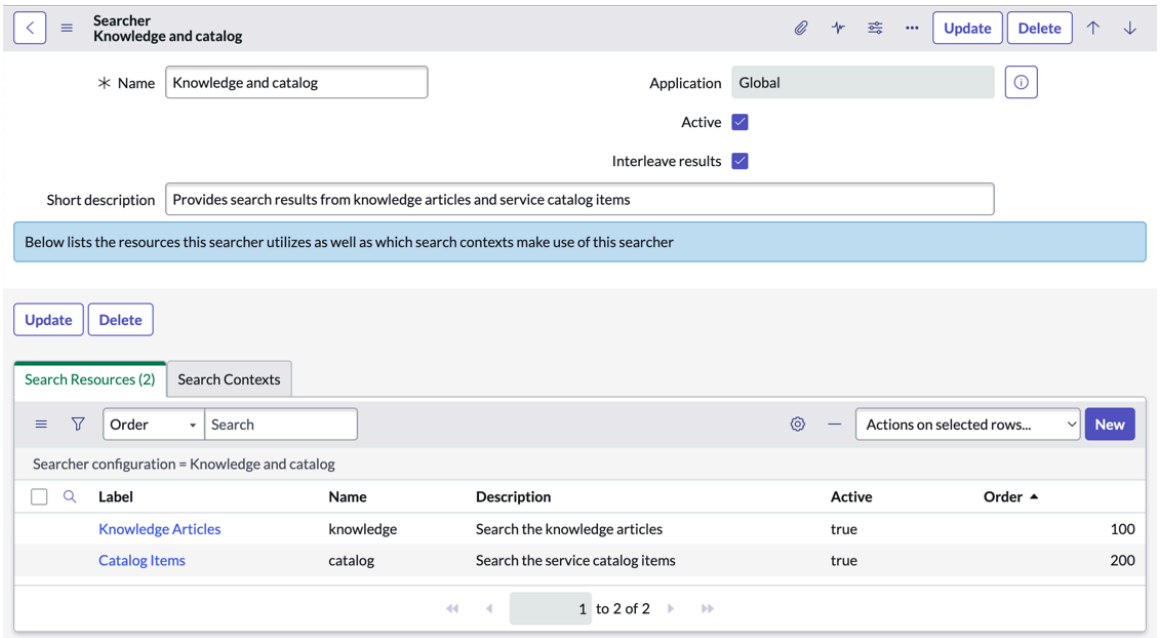
b. To search all searcher sources or a specific searcher source from the list, select **All**.

> **Note:** The **Searcher default search** field appears only when the **Searcher** field contains more than one source.

View a searcher

View the details of a searcher to know which search resources it searches and which search contexts use it.

Before you begin



Role required: admin

About this task

ServiceNow provides pre-defined searchers. You can't create, update, or delete searchers.

Procedure

1. Navigate to **All** > **Contextual Search** > **Searchers**.
2. Edit a searcher record.

3. **Optional:** In the Search Resources related list, view the resources searched by this searcher.
4. **Optional:** In the Search Contexts related list, view all the search contexts that use this specific searcher.

Show the related search box in a form

Enable agents to search for related content without having to modify the text in the **Short description** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Starting in the London release, the related search box is available in forms by default for new instances. If your form doesn't display the related search box, you can follow this procedure to show it.

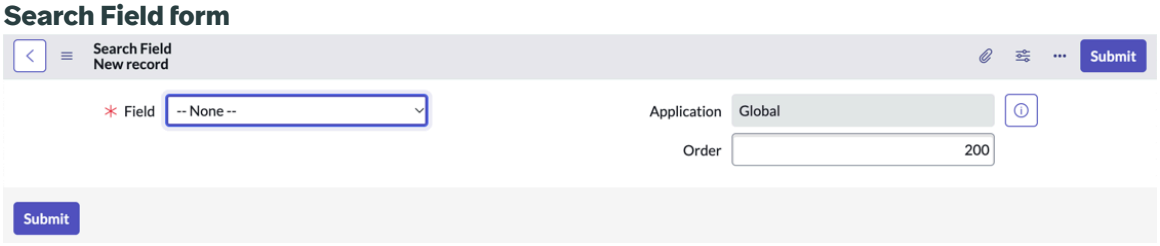
Procedure
1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. Open the record for the table whose form you want to show the related search box on.
3. Select the **Enable related search box** option.
   The **Enable source selector** option appears.
4. Select and hold (or right-click) the header form and select **Save**.

Add multiple search fields for contextual search

Add multiple search fields if you want to search from a field other than the short description without using the related search box.

Before you begin
Role required: admin

About this task
Search results for the default search field appear automatically when you open a record. You can configure contextual search to search for results even when there is no text in the default search field. Search results in other associated fields only appear when you have updated content in those fields.



As an example, in the base system the **Short description** field is the default search field for the Incident form, so search results based on the field are displayed automatically. If you configure **Description** as an additional search field, contextual search displays search results for **Description** when you open a record with an empty **Short description**.

Warning: Adding large fields can significantly affect contextual search performance. For best results, only add search fields that are restricted to 100 or fewer characters.

Note: Search results only appear for Search Fields that are visible on the form.

Procedure
1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. Open the table configuration record for which you want to add multiple search fields.
3. In the Search fields related list, click **New**.
4. On the form, fill in the fields.

Search Field form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Field	The search field to be added in the search fields list. **Note:** You can only select a text field.
Application	Application scope of the table configuration. The configuration is available for all applications or for scoped applications.
Order	Order in which the field appears in the search fields list. If there are multiple search fields, this field indicates which searched field is executed first.

5. Click **Submit**.
   The new search field appears in the table configuration record's Search Fields related list.

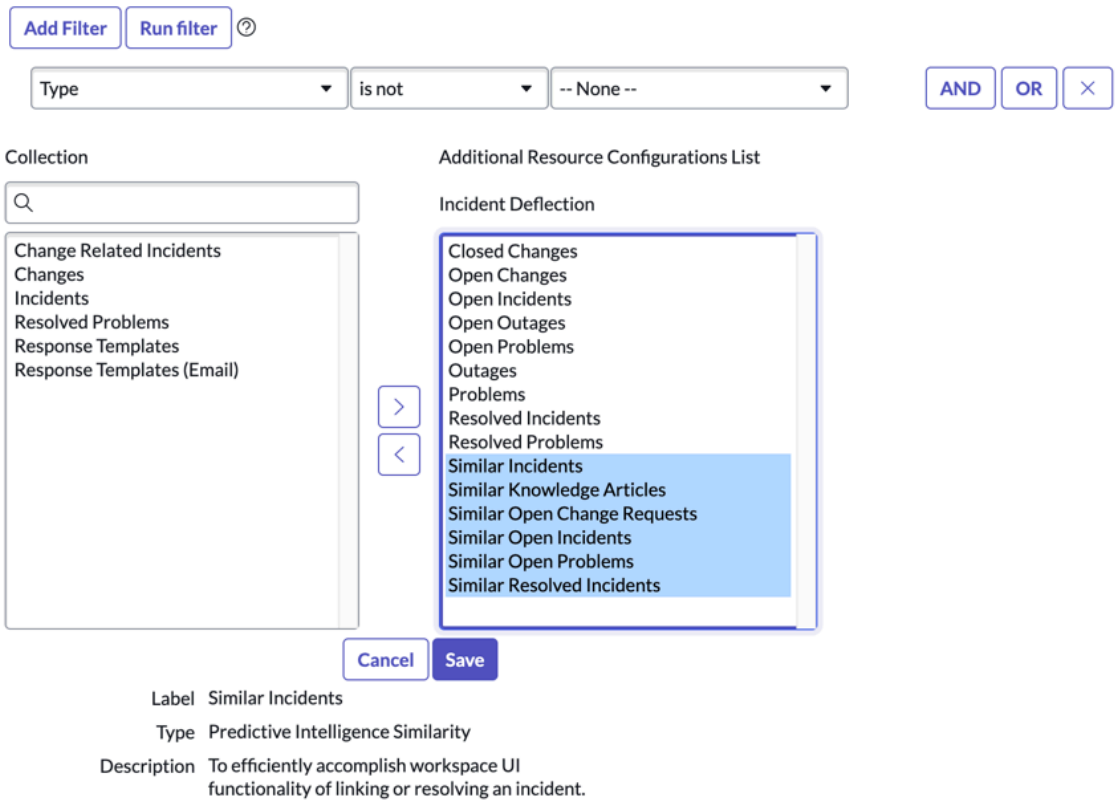
What to do next
Use the **Default** column to set one search field as the default search field.

Add additional resources to the source selector of a form

Add additional resources when you want the user to search beyond Knowledge and Service Catalog search resources. For example, add additional resources for **Open Incidents**, **Resolved Incidents**, or **Similar Open Incidents**.

Before you begin
Role required: admin

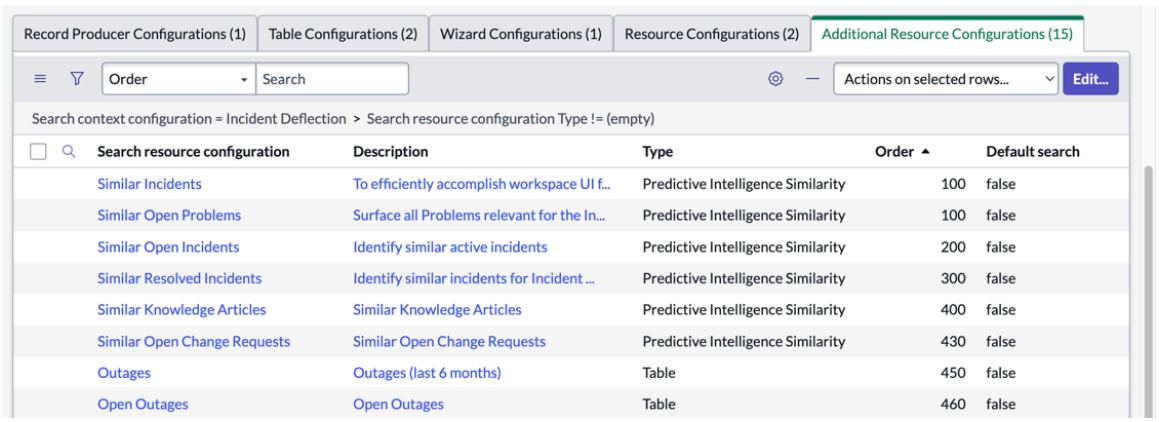
About this task
Additional resources are pre-defined. An additional resource is either a searchable source table with query conditions or a reference to a Predictive Intelligence Similarity solution definition.



Note: You can only view the Predictive Intelligence resources if you are licensed for Predictive Intelligence and have activated Predictive Intelligence for Contextual Search.

Procedure
1. Navigate to **All** > **Contextual Search** > **Search Contexts**.
2. Open the search context record for which you want to see the additional resources.
3. In the Additional Resource Configurations related list, select **Edit**.
4. **Optional:** Filter the additional resources displayed in the **Collection** field by defining filter conditions and selecting **Run filter**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



As an example, you can display only additional resources with the Predictive Intelligence Similarity type.

5. From the **Collection** field, move the required additional resources to the **Additional Resource Configurations List** field.
   For example, if you want to move additional resources whose type is **Predictive Intelligence Similarity**, then move **Similar Incidents**, **Similar Knowledge Articles**, **Similar Open Change Requests**, **Similar Open Incidents**, **Similar Open Problems**, and **Similar Resolved Incidents** from the **Collection** field to the **Additional Resource Configurations List** field.

Note: You can view the Predictive Intelligence sources only if you have license for Predictive Intelligence.

6. Select **Save**.
   The additional resources appear under **Additional Resource Configurations**.

© 2026 ServiceNow, Inc. All rights reserved.

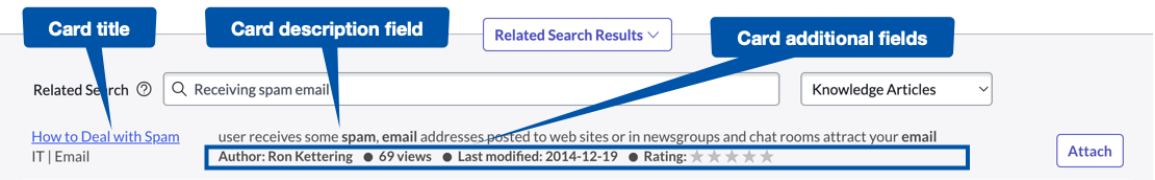
Edit search resource display field record



Use the search result display fields to provide titles, descriptions, and additional details for contextual search results.

Before you begin

Role required: admin

About this task

ServiceNow provides pre-defined additional resource or search sources to the user. You can't create or delete search result display configurations. Each table referred by an additional resource has a search result display configuration record. You can edit the values in the **Card title field**, **Card description field**, and the **Card additional fields**.

Note: Ensure that you select the contextual search property **Shows meta data on form contextual search results** to view **Card additional fields** in the search result.

Procedure

1. Navigate to **All** > **Contextual Search** > **Search Result Display Configurations**.
2. Open the search result display configuration record that you want to modify.

   Note: Search result display configuration records with the Platform UI type do not affect search for Knowledge articles, Catalog Items, or pinned articles. You can configure settings for platform Knowledge article searches using Knowledge search properties.

3. In the form, edit the fields.

Search Result Fields form

Field	Description
UI type	[Read-only] Interface where the values of the search result display fields should appear. It can appear in platform or workspace.
Table	[Read-only] Name of the table in which the values of the search result display fields should appear. For example, if you mention Incident [incident] as the table, then the additional resource field values appear in the search result for the Incident [incident] table.
Application	[Read-only] Application scope of the record. The record is available for all applications or for scoped applications.
Card View	

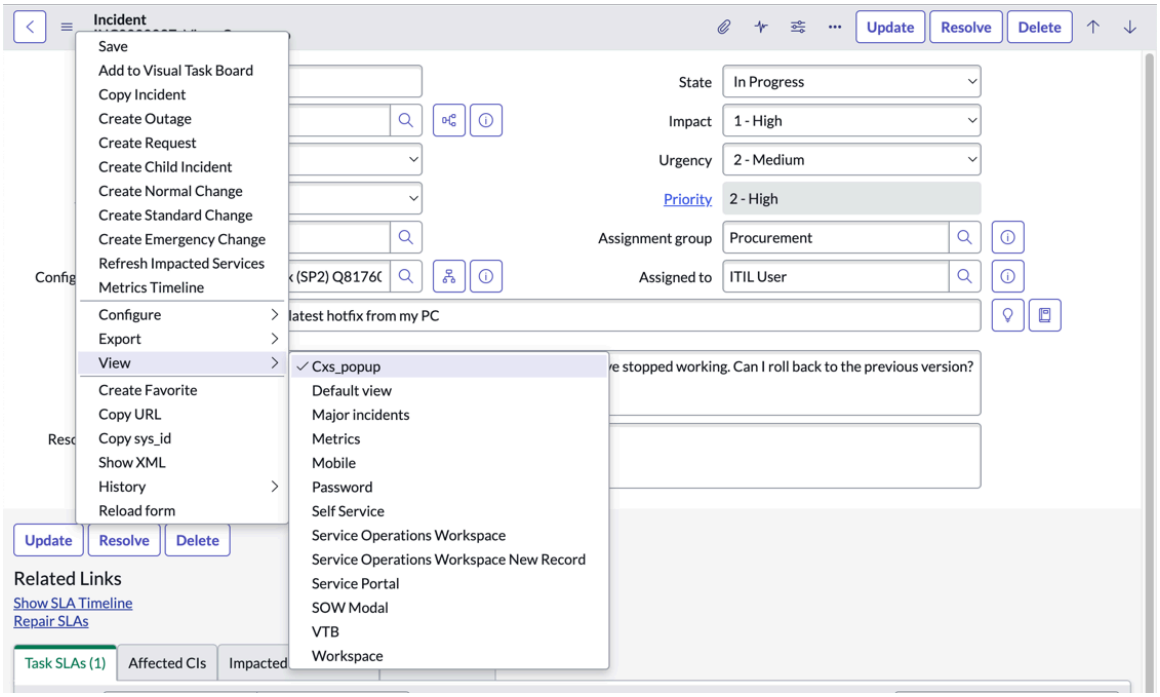
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Card icon	[Workspace] Icon name displayed on the search result card view.
Card label	[Workspace] Label displayed on the search result card view.
Card title field	[Platform or Workspace] Field whose value is shown as title in the search result title.
Card additional fields	[Platform or Workspace] List of field names displayed on the search result to provide more context to the search result. The card additional fields appear at the bottom of a search result record.
Card description field	[Platform or Workspace] Name of the field whose value is shown as the search result description.
Card display updated date	[Workspace] Check box to display the latest date on the search result card view.
Details View (only when the UI type is Workspace)	
Detail title field	Field whose value is shown as title in the search result detail view.
Detail link field	Field used as clickable link on the search result detail view.
Detail additional fields	List of field names displayed on the search result detail view.
Detail show last work note	Check box to display the latest work note on the search result detail view.

4. Select **Update**.

Specify fields for the Cxs_popup view

Edit the Cxs_popup view to specify the fields to be shown for addition resources in the preview window of a task record. The preview helps you with the summary of the record.



Before you begin
Role required: admin

About this task
If a Cxs_popup view isn't defined for the additional resource table, the sys_popup view is used. If the sys_popup view is also not defined, the default view is considered.

Procedure

1. Navigate to **Incident** > **All**.
2. Open the incident record whose view you want to change to Cxs_popup.
3. Select the additional actions icon ( ) and in the **View** option, select **Cxs_popup**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The view of the incident record changes to Cxs_popup view.

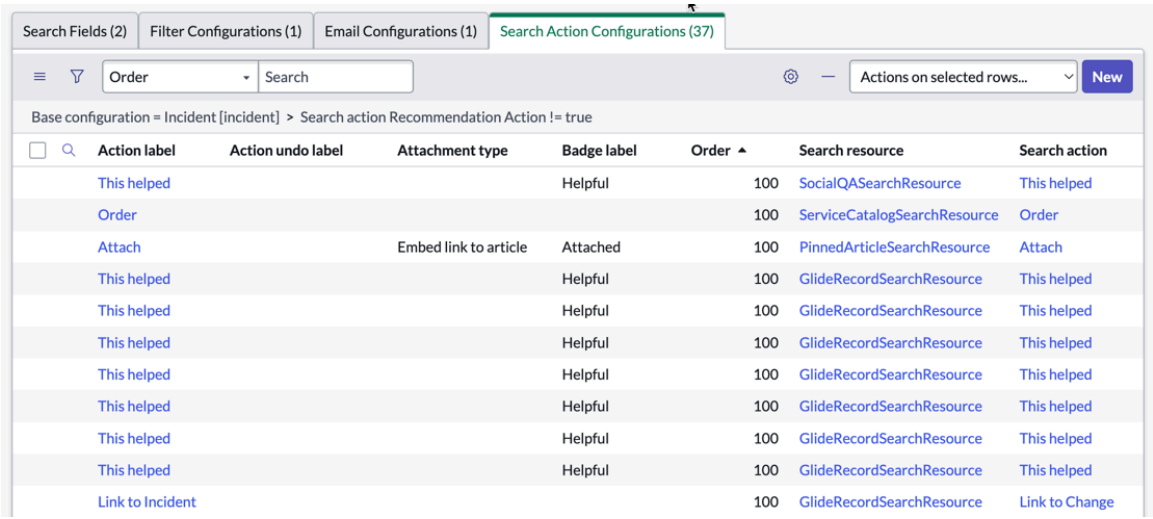
4. Select the additional actions icon ( ), and in the **Configure** option, select **Form Layout**.
5. From the **Available** list of fields, select the fields that you want to be available in the Cxs_popup view and move them under **Selected**.
6. Select **Save**.

Modify or disable search actions available for contextual search

Modify or disable search actions to restrict the actions that a user can perform on a search result.

Before you begin

Role required: admin



About this task

The Search Action Configurations related list contains all the available Search actions available for the selected Search context. Search actions can be modified and disabled but not deleted.

Procedure

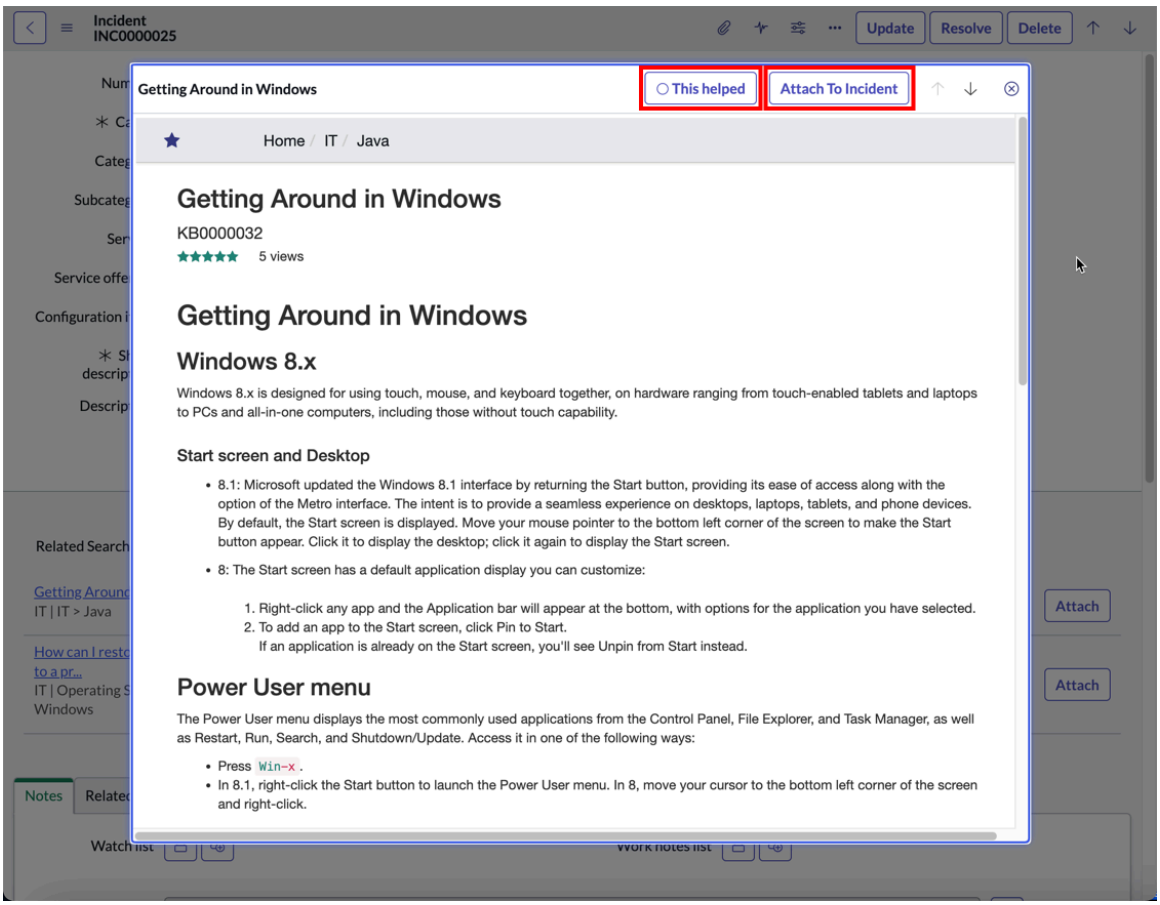
1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. Edit a table configuration record.
3. In the Search Action Configurations related list, view the list of search actions available for the contextual search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action label	Action undo label	Attachment type	Badge label	Order	Search resource	Search action
This helped			Helpful	100	SocialQASearchResource	This helped
Order				100	ServiceCatalogSearchResource	Order
Attach		Embed link to article	Attached	100	PinnedArticleSearchResource	Attach
This helped			Helpful	100	GlideRecordSearchResource	This helped
This helped			Helpful	100	GlideRecordSearchResource	This helped
This helped			Helpful	100	GlideRecordSearchResource	This helped
This helped			Helpful	100	GlideRecordSearchResource	This helped
This helped			Helpful	100	GlideRecordSearchResource	This helped
This helped			Helpful	100	GlideRecordSearchResource	This helped
This helped			Helpful	100	GlideRecordSearchResource	This helped
Link to Incident				100	GlideRecordSearchResource	Link to Change

To disable a search action, set the value of **Active** to **false**.

Note: You can't disable the **This helped** action.



The search actions that you can modify are as follows:

- **Action label**: Label on the action button on the preview window. For example, **This helped** or **Attached To Incident**.
- **Attachment type**: Method to attach a knowledge article with the record. You can embed a link (recommended) to the article or embed a copy of the article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Show on new record**: Enables the **Attach** button to appear when you are creating a record. Prior to the London release, the user had to fill out and save the form, then re-expand the related search results to access the **Attach** button.

  Note: This option only applies to tables with the Platform UI type. It defaults to **false** to provide a consistent user experience between Platform and Workspace tables.

Enable viewing of search results for the current and another selected user

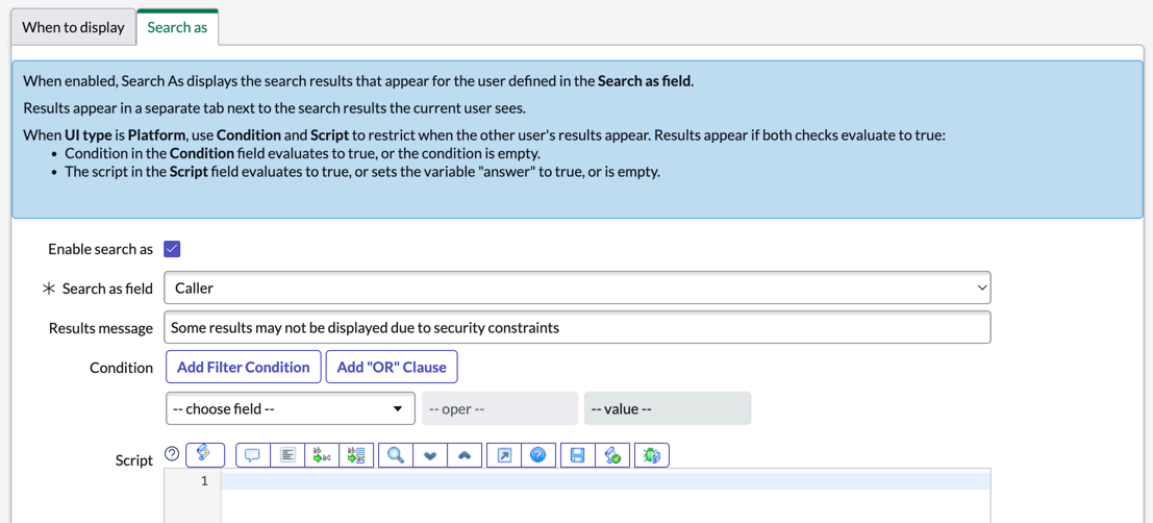
Enable the search as functionality when you want the ability to view search results common to the current user and another user that you specify.

Before you begin

Role required: admin

About this task

For example, an HR administrator may have some confidential information. A user might have partial access to the information. The Search as functionality applies security access to display results that are common to both the logged in or current user and the user referenced in the **Search as field**. The search result for the other user may have fewer entries than what that current user can actually view.



Note: No search result is displayed for **Predictive Intelligence Similarity** additional resources. Record producers only support searching for the current user.

Procedure

1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. Edit a table configuration record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Search as section, fill in the fields.

Search as configuration fields

Field	Description
Enable search as	Option to enable the Search as functionality.
Search as field	Field defining the other user to search as. This field appears only when you select **Enable search as**.
Results message	Message to display with search results when searching as a different user. This field appears only when you select **Enable search as**.
Condition	Condition restricting when the search result of the user mentioned in the **Search as field** should appear. This field appears only when you select **Enable search as**. **Note:** Both **Condition** and **Script** must evaluate to *true* for search results to appear. An empty condition or script also evaluates to *true*.
Script	A condition script, enabling administrators to implement more powerful conditions. For example, to restrict access to users that are members of a group, use `gs.getUser().isMemberOf("<group name>")`. This field appears only when you select **Enable search as**. **Note:** Both **Condition** and **Script** must evaluate to *true* for search results to appear. An empty condition or script also evaluates to *true*.

Result

The **My Results** tab displays search results for the currently logged-in user. The **<user-name> Results** tab displays search results for the user referenced in the **Search as field**.

Define contextual search for record producer

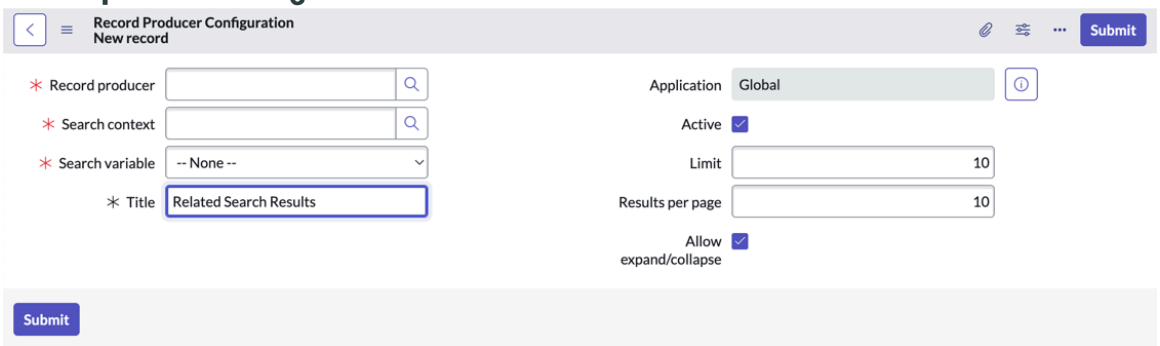
Define a record producer to trigger a search based on the text that you enter in a variable field. Search results appear at the bottom of the record producer form.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task



The base system **Create New Incident** record producer is configured to use contextual search. If you have customized this record producer, you can configure contextual search to link to a specific field on your record producer.

Note: Only one variable within a record producer can use contextual search.

Procedure

1. Navigate to **All** > **Contextual Search** > **Record Producer Configuration**.
2. Select **New**.
3. On the form, fill in the fields.

Record producer configuration form

Record producer configuration form

Field	Description
Record producer	Unique name of the record producer where you want to add the contextual search.
Search context	Name of the search context to use.
Search variable	Variable within the selected record producer that uses the contextual search.
Title	Title for the search results area that appears in the form.
Active	Option to activate the record producer configuration.
Limit	Maximum number of search results returned.
Results per page	Number of search results to display per page.
Allow expand/collapse	Option to allow expanding or collapsing the search results in the form.

4. Select **Submit**.

Define email configuration for contextual search

Define email configurations to allow the system to include search results with an email notifications.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
When Knowledge articles are associated with a record, those search results can be included in email notifications. For example, email notifications sent when an incident is created can include Knowledge search results. An article in the search results may help the user who raised the incident to resolve the issue independently.

Procedure
1. Navigate to **All** > **Contextual Search** > **Table Configuration**.
2. In the Email Configurations related list, click **New**.
3. In the form, fill in the fields.

Email Configuration form

Field	Description
Email notification	Lookup icon to select an email notification to attach the search results. You can select only from the notifications that are on the same table as the table configuration record.
User field	A reference field that helps to narrow down on the search results. For example, if you select **Opened by**, the search results include only the articles that the **Opened by** user can access based on user criteria.
Application	Application scope of the email configuration. The configuration is available for all applications or for scoped applications.
Limit	Maximum number of search results returned.

4. Click **Submit**.

Provide knowledge in incident email notification

Contextual search results are included in email notifications that are sent to users who create a new incident.

Before you begin
Role required: admin

About this task
The email notification provides links to knowledge articles that may help users resolve their issues faster. For example, if a user raises an incident when the service desk staff isn't available, the email notification provides knowledge links that may help the user.

By default, contextual search results are based on the short description in the incident. Within the automated email response, contextual search adds links to relevant knowledge articles.

Procedure
1. A customer sends an email to IT support with the subject `My laptop keeps crashing`.
2. An incident is created based on this email.
3. The email subject is inserted into the **Short description** field of the new incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. The automated email notification sent to the user includes search results based on `My laptop keeps crashing`.
   By default, notifications provide three article links.
5. The customer may then be able to use the search results to resolve the incident.

> **Note:** The knowledge links provided are filtered to ensure that the articles are accessible to the user who submitted the email.

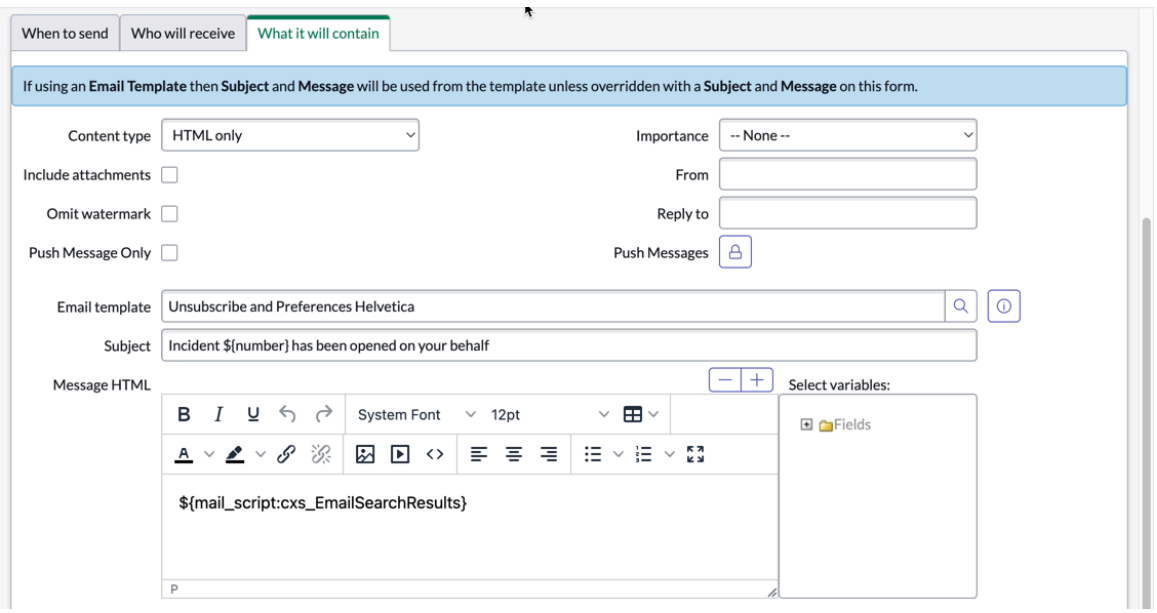
What to do next

You can configure notification options, such as changing the number of links provided with notifications. You can also configure contextual search functionality to match the email notifications of your organization or you can use contextual search with notifications for other records.

Related topics

Edit an email notification for the search results

Edit an email notification for the search results



Include search results in an email notification sent to users.

Before you begin

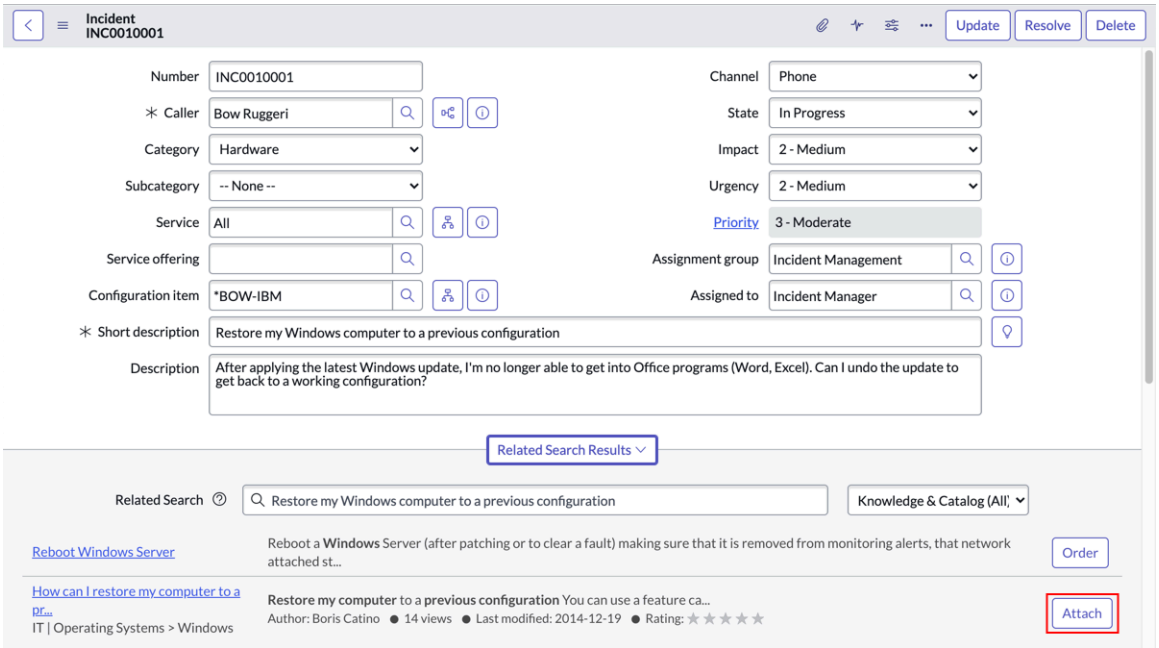
Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Open the email template that you want to modify to include search results.
3. Select **What it will contain**.
4. In the **Message HTML** field, add the following script:
   `${mail_script:cxs_EmailSearchResults}`

5. Select and hold (or right-click) on the header form and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Attach a Knowledge article

Attach a Knowledge article to an incident to solve issues quickly by going through the in-depth troubleshooting steps and other detailed information in the article.

Before you begin

Role required: none

About this task

Procedure

1. Navigate to **All** > **Incident** > **All**.
2. Edit an active incident record.
3. Select **Related Search Results**.
   Search results display in the Related Search Results pane.
4. **Optional:** To display only Knowledge article search results, open the source selector and select **Knowledge Articles**.
5. Select **Attach** in the search result for the Knowledge article that you want to attach to the incident record.
   A note about the Knowledge article is copied or appended to the **Additional comments (Customer visible)** field on the incident record. To set a different destination field on the incident record, see Specify field for attached Knowledge article links.

   Note: Attachments from the selected Knowledge article aren't attached to the incident record.

6. To add the note to the activity stream, select **Post**.
   Alternately, you can select and hold (or right-click) the form header, then select **Save**.

Result

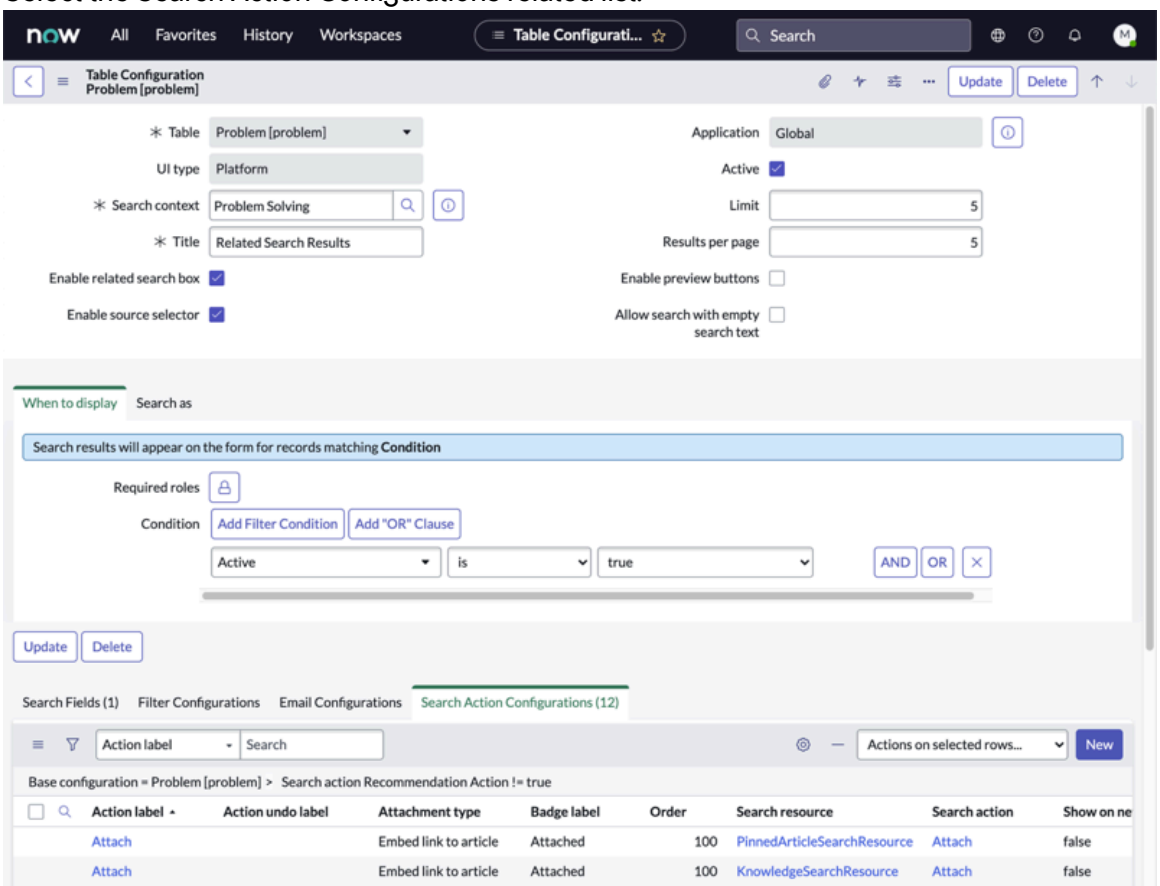
Details of the selected Knowledge article appear in the designated field.

Specify field for attached Knowledge article links

Specify which field to add a note to when you attach a Knowledge article to a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin



About this task
When you attach a Knowledge article to a record, by default a link to the Knowledge article is added to the **Additional comments (Customer visible)** field. You can specify the field for this link based on the table. For example, a Problem record doesn't have the **Additional comments (Customer visible)** field on the form, so the **Attach** action is configured to add the note to the **Work notes** field.

You can specify the field either globally or locally. The local field for a table overrides the global default field value.

To specify the global field, navigate to *Knowledge* > **Administration** > **Properties** > **Other Knowledge Properties** and specify the name of the field in the *glide.knowman.attach.fields* property.

You can specify the local field using the following procedure.

Procedure
1. Navigate to **All** > *Contextual Search* > **Table Configuration**.
2. Open the table configuration that you want to change attachment fields for.
3. Select the Search Action Configurations related list.

4. For each search action that you want to change the default field for, perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the search action.

b. Select the **Use custom field for attach note** option, if not already selected.

c. In the **Attach note field**, enter the name of the field that you want to copy the article information into, such as `comments` or `work_notes`.

If field is not present on the form, Agent Assist will fallback on `comments` or `description` field depending on what is available.

d. Select **Update**.

Note:

- If you don't want to add a note to any field, leave the **Attach note field** blank.
- If the field you have specified in the **Attach note field** isn't found on the form, then the note isn't added to any field.

What to do next

Clear the system cache to make sure the changed field specification applies. You can clear the system cache by appending `cache.do` to the instance URL. For example, `https://<instance name>.service-now.com/cache.do`.

Warning:

Clearing the system cache can affect overall performance and degrade system response times. Don't run cache flushes during business hours, and don't trigger cache flushes automatically.

Feedback information on contextual search

When a user clicks any of the action buttons such as **This helped**, **Order**, or **Attached**, the feedback information is stored in specific tables. The information helps you to understand the effectiveness of the searches. You can also create custom reports by querying these tables.

Table [name]	Description
Relevant Document Detail [cxs_rel_doc_detail]	The list of individual recorded actions. For example, Preview, This helped, Attach, or Order. The key fields in the Relevant Document Detail table are as follows: • **Original search terms**: The original search terms. This field is used only when the fulfiller has overridden the original search terms using the related search box. • **Relevance type**: The recorded action. • **Relevant document**: The reference to the search session group in the Relevant Document table. • **Created by**: The user who performed the action. • **Position**: The position of the recorded action in the result list. • **Search Resource**: The reference to the search resource for that particular result. Used only for a Predictive Intelligence Similarity result.

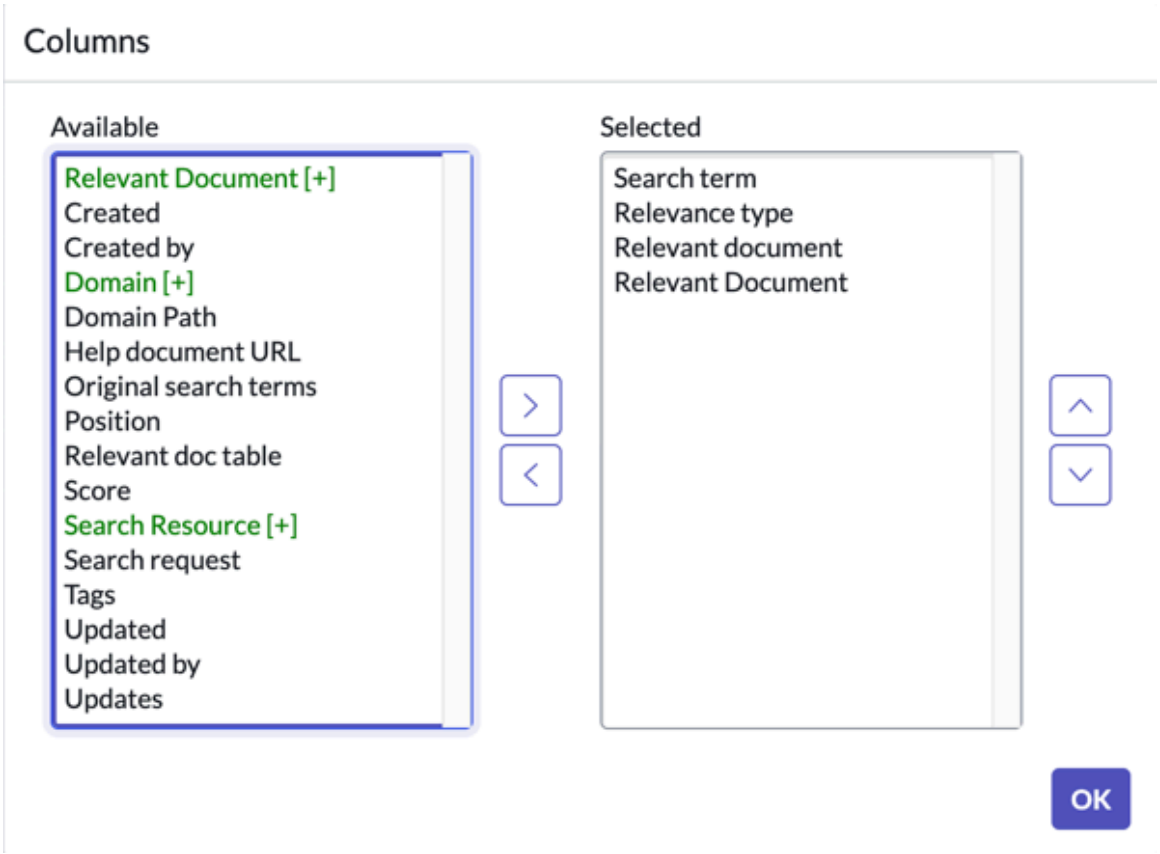
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table [name]	Description
Relevant Document [cxs_relevant_doc]	Groups the Relevant Document Detail individual recorded actions by search session. **Note:** A new search session group is created every time you create or open a record or reload the page. The key fields in the Relevant Document table are as follows: • **Search session**: The search session group. • **Displayed on**: The table or record producer where the results were displayed. • **Relevant to**: The reference to the table record when **Displayed on** is **Table**. • **User/Created by**: The user who performed the action.

Run a report on contextual search usage

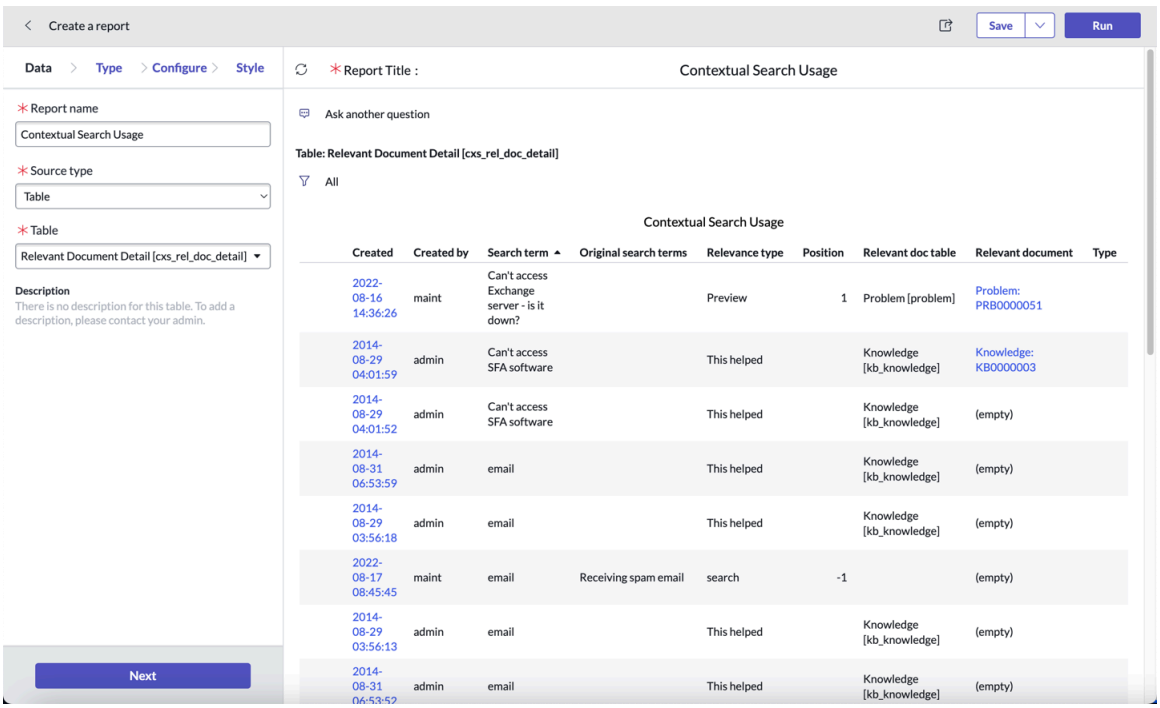
Run a report on usage such as how many times a knowledge article is attached to a record to know the effectiveness of the contextual search results.

Before you begin
Role required: admin



About this task
A service desk manager can generate a report on user issues that were resolved without an incident being raised. The information can help to create targeted knowledge based on trends. You can analyze commonly raised incidents and then create knowledge articles around those incidents which can help resolve or deflect similar incidents in future.

Procedure
1. Navigate to **All** > **Reports** > **View/Run**.
2. Select **Create a report**.
3. Under **Data**, fill in the fields.



Field	Description
Report name	Unique name for the report.
Source type	Source from which the data is populated. The default value is **Data source**. Select **Table**.
Table	Select the Relevant Document Detail table [cxs_rel_doc_detail].

4. Select **Next**.
5. Under **Type**, select **Next**.
6. Under **Configure**, select **Choose columns** and move the required fields from the **Available** box to the **Selected** box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **OK** and then select **Run**.

Note: When users select the **Search on tab** check box in the Search Context [csc_context_config] table and then modify and leave the search field, an action gets logged in the Relevant Document Detail table [cxs_rel_doc_detail]. The information in the table can help you find the instances where users ran a search but did not take any action. In those cases, the value of the **Position** column is **-1**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation and Contextual Search

Domain separation is supported in Contextual Search. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

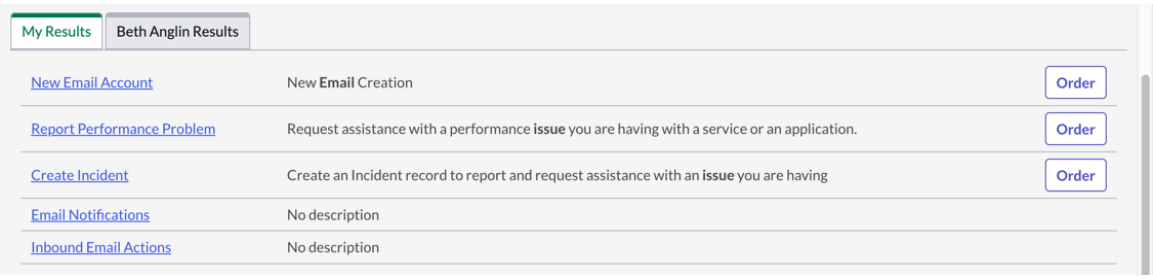
For more information on support levels, see Application support for domain separation .

How domain separation works in Contextual Search

By default, Contextual Search Suggestions results that appear use the domain of the currently logged-in user.

Search as a different user

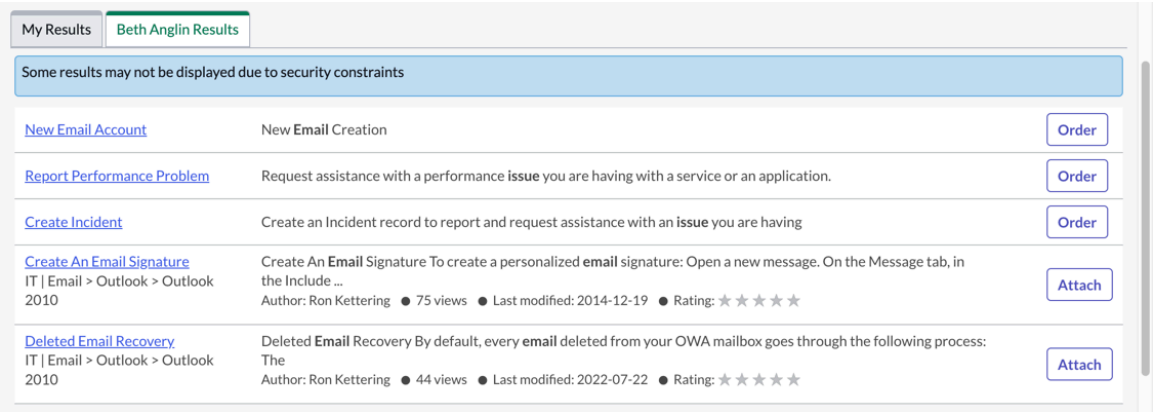
In addition to being able to search for results using the domain of the logged-in user, the administrator can also configure Contextual Search to Search as a different user .



When **Search as** is configured, two tabs appear in the search results:

1. **My Results** tab searches using the currently logged-in user domain.
2. The **Search as** user tab searches using the domain of the User Reference field selected by the administrator. For example, selecting a request's **Opened by** or **Caller** field searches using the domain of the user who made the request.

Note:



- The **Search as** user results apply security access to display results that are common to both the logged-in user and the **Search as** user. Hence, the search result view for that user may have fewer entries than what that user can actually view.
- Record producers only support searching as the currently logged-in user.

Example: An Incident displaying search results for the currently logged-in user on the **My Results** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: The same Incident displaying search results for the user from the **Caller** reference field on a second tab.

Intelligent Search for CMDB

Use everyday natural language query (NLQ) in a search string to query for a set of CIs in the CMDB. Intelligent Search for CMDB, parses, resolves ambiguities, and converts your search string into a valid CMDB query. Complex search strings open fully constructed on a canvas of CMDB Query Builder where you can continue and refine, or run.

Intelligent Search for CMDB is supported only on English language instances and isn't supported when the instance preferred language is set to a language other than English.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration with CMDB Workspace

Intelligent Search for CMDB is integrated into the Home view in the CMDB Workspace store app. For more information, see:

- Home view in CMDB Workspace (Intelligent Search section) for details about how to use Intelligent Search, sample search strings, and helpful tips.
- CMDB Workspace for additional details about CMDB Workspace.

Integration with Service Graph Workspace

Intelligent Search for CMDB is integrated into the Search and Explore view in the Service Graph Workspace store app. For more information, see:

- Explore and Search view in CMDB Workspace, Search tab for details about how to use Intelligent Search, sample search strings, and helpful tips.
- for additional details about Service Graph Workspace.

Integration with CMDB Query Builder

Intelligent Search for CMDB is integrated with the CMDB Query Builder in the ServiceNow AI Platform. This integration is controlled by the system property *`glide.cmdb.query.nlq.activated`*, which is set to **true** by default. Intelligent Search for CMDB lets you use natural language processing in the CMDB Query Builder to find CIs and their relationships using Intelligent Search for CMDB functions.

Using Intelligent Search for CMDB

Intelligent Search is tailored to the CMDB, searching only through the CMDB class hierarchy for tables, and for CIs and their relationships.

Use the Intelligent Search search field to construct a search string using everyday natural language. Your queries can span multiple CMDB classes and involve many CIs that are connected by different relationships. After resolving any ambiguities with table names or relationship types, Intelligent Search converts your search string into a query that the CMDB can run. The CMDB query is constructed dynamically as you type into the search box and spell checker is applied if needed. A dynamic list of relevant suggestions appears as you type, with items such as table names, matching single words or part phrases in the typed-in text.

Use Intelligent Search:

- **Search tips**: Shows details and tips about the usage, and examples for single and multi-table search, advanced filtering, and relationships in Intelligent Search. The Relationships tab contains a link to the CMDB Implicit Relationships table.

- **Search**: Depending on whether the search string is already fully converted into a valid CMDB query and whether the search is for a single or multiple tables.

  - If the search string has no ambiguities with the table name or relationships, then the query runs and the results appear in a list view format.

    If the constructed CMDB query contains more than a single table, then the **View in Query Builder** button appears. Click the button to open the CMDB Query Builder with your query fully constructed on the Query Builder canvas. You can use the Query Builder to continue editing the query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If there are any ambiguities with table names or relationship types in the search string, then the search string can't be converted into a valid CMDB query. In this case, the Refine your query dialog box appears to continue and parse your search string into a valid CMDB query. The dialog box contains suggested synonyms and labels for phrases in your search string. Use the drop-down lists to select the synonyms that match your intended search and then click **Go** to run the query.
- If Intelligent Search is unable to convert your search string into a valid CMDB query, then clicking **Search** does not generate any query results. Instead, a feedback form appears. Fill out the form and click **Submit Feedback** to send your feedback to ServiceNow analysis.

- **Results Feedback**: Submit feedback to ServiceNow analysts, to express your assessment of the results. Choose descriptions that capture any gap between the results and your expected results, and add any helpful details.

Sample searches

When you click the search box, the drop-down list of pre-defined sample searches appears. The list consists of more common searches, or searches that are more difficult to construct such as searches that involve application services. Run any of those searches to get started.

- Sample searches are stored in the NLQ Sample Search [sn_cmdb_ws_nlq_sample_search] table
- Referenced tables are stored in the NLQ Sample Search Table [sn_cmdb_ws_nlq_sample_search_table] table

CMDB Admins (sn_cmdb_admin user role) can modify a sample search by directly editing its record in the NLQ Sample Search table. Click **All** and then in the Filter navigator, enter `sn_cmdb_ws_nlq_sample_search.list`. In the NLQ Sample Searches list view edit the record for a search that you want to modify.

Any modification to sample searches is reflected in CMDB Workspace, Service Graph Workspace, and the CMDB Query Builder.

Synonyms

The NLQ Synonym [nlq_synonym] table is pre-populated with synonyms for natural language strings for CMDB table and column names, and relationships. This table is used to match natural language search words to the CMDB query language. For example, the phrase ‘linux server’ has synonyms such as ‘Linux Server’, ‘Server’, and ‘Virtual Machine Instance’.

For details about viewing and adding synonyms customized to your business needs, see NLQ synonyms.

CMDB Implicit Relationships

You can help Intelligent Search find more results by defining some of the relationships between classes as implicit relationships. Implicit relationships can be useful in queries that involve service offering and application services.

NLQ admins can create new implicit relationships by navigating to **All** > **NLQ** > **CMDB Implicit Relationships**.

An implicit relationship defines the relationship between two tables and includes any filters you want to apply. When creating an implicit relationship, you set the following items:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- From table (from_table): The class that acts as the parent
- Filters: Conditions that are applied to the columns of the from_table
- To table: The class that acts as the child
- Relationship: How the from_table interacts with the to_table. For example, Contains: Contained by means the from_table contains the to_table
- Skipped table: The class that is implied and not captured by the CMDB Query Builder

For example, in CMDB Query Builder, you want to see your service offerings that have had a P1 incident in the last 10 days. However, if you were to type `show me all business service offerings with p1 incidents in the last 10 days`, NLQ wouldn't understand the relationship.

Implicit relationships are stored in the NLQ CMDB Implicit Relationship [nlq_cmdb_implicit_relationship] table and are used in the CMDB Workspace and in Service Graph Workspace, and if integrated, also in CMDB Query Builder.

For more information about NLQ in the ServiceNow AI Platform, see Natural Language Query (NLQ).

Time configuration

A standard feature of the ServiceNow AI Platform, ServiceNow's time configuration system handles scheduling across your entire enterprise, enabling you to manage projects efficiently, track and schedule events, and more.

Get started

Time configuration includes the scheduling of events and tracking of time. There are several functions available which enable tracking of time and using that information across applications.

Explore	Use	References
Learn about time configuration concepts and features.	Discover how to use various time configuration options.	Find useful time configuration reference materials and information.

Exploring time configuration

Time configuration helps you easily handle any necessary timing or scheduling aspects of your online enterprise.

Records stored on the ServiceNow AI Platform are kept with times measured down to the millisecond. Time configuration includes multiple applications to help you use those records correctly, with scheduling and monitoring activities in your business' day-to-day operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Date and Date/Time fields

Records in the ServiceNow AI Platform store date and time values in several different types of fields. These values are stored as integer numbers, in milliseconds, and appear in the appropriate date or date/time format.

Date and Date/Time field types

The ServiceNow AI Platform stores date and date/time information in records using the following field types:

Date and time field types

Field type	Dictionary XML type	MySQL DB type
Date	*glide_date*	DATE
Date/Time	*glide_date_time*	DATETIME
Time	*glide_time*	DATETIME
Duration	*glide_duration*	DATETIME
Due date	*due_date*	DATETIME

For the full listing of field types, see Introduction to Fields.

Global date and time field format

You define default date and time formats globally using system properties.

Date format

The *glide.sys.date_format* property defines the date format. An administrator can modify the property by navigating to **System Properties** > **System**. The default format is: yyyy-MM-dd.

Note: A user can override the global date or time format with a personal preference.

Modifying the *glide.sys.date_format* property changes the date or time format globally. When modifying the standard date format, also verify the format using a Validate date and time script. You can use the same pattern strings as the *java.text.SimpleDateFormat* class, with the following exception:

- You cannot append the 'z' character to include the time zone when adding it to a script.
- If the resulting time zone is not three characters, an Invalid Date appears error appears when you validate the script, because the Date/Time Validation Script (sys_script_validator) fails. This failure occurs even though the script debugger shows that the content of the value meets the requirement of 'g_user_date_time_format'.

MM is months, while *mm* indicates minutes. The format string consists of the following abbreviations.

Field	Full form	Short form
Year	yyyy (4 digits)	yy (2 digits), y (2 or 4 digits)
Month	MMM (name or abbr.)	MM (2 digits), M (1 or 2 digits)
Day of Month	dd (2 digits)	d (1 or 2 digits)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: It is recommended that you use a `yyyy` format-based date. For example, use `MM-dd-yyyy`, `yyyy-MM-dd`, or `dd-MM-yyyy`.

- If your system date format is set to use the `yy` year format, the system considers dates 20 years later or 80 years earlier from the current date as a date in the past or future leading to an unexpected behavior.
- For example, if you set the year as `51` for 2051, the system considers the year as 1951. Similarly, if you set the year as `37` for 1937, the system considers the year as 2037.

Time format

An administrator can modify the *`glide.sys.time_format`* property by navigating to **System Properties** > **System**. Modifying the property changes the date or time format globally. When modifying the standard time format, also verify the format using a Validate date and time script. You can use the same pattern strings as the *`java.text.SimpleDateFormat`* class, with the following exception: Appending 'z' to include the time zone is not supported.

The format string consists of the following abbreviations.

Field	Full form	Short form
Hour (1-12)	hh (2 digits)	h (1 or 2 digits)
Hour (0-23)	HH (2 digits)	H (1 or 2 digits)
Minute	mm (2 digits)	m (1 or 2 digits)
Second	ss (2 digits)	s (1 or 2 digits)

Add the character `a` to the end of the time format string to indicate AM or PM. This option shows AM or PM whether you are using 12-hour time (hh) or 24-hour time (HH).

The default format is: HH:mm:ss.

Note: A user can override the global date or time format with a personal preference.

Personalize the system date format

You can personalize the format in which date values appear in your instance.

About this task

Personalizing the date format does not change global settings or impact the way other users see date values.

Note: It is recommended that you use a `yyyy` format-based date. For example, use `MM-dd-yyyy`, `yyyy-MM-dd`, or `dd-MM-yyyy`.

- If your system date format is set to use the `yy` year format, the system considers dates 20 years later or 80 years earlier from the current date as a date in the past or future leading to an unexpected behavior.
- For example, if you set the year as `51` for 2051, the system considers the year as 1951. Similarly, if you set the year as `37` for 1937, the system considers the year as 2037.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Self-Service** > **My Profile**.
2. In the **Date format** field, select an option.
3. Click **Update**.

Personalize the system time format

You can personalize the format in which time values appear in your instance.

Before you begin

An administrator must add the **Time format** field to the Self-Service view of the User form. For more information, see Configuring the form layout.

Role required: Admin

About this task

Personalizing the time format does not change global settings or impact the way other users see time values.

Procedure

1. Navigate to **All** > **Self-Service** > **My Profile**.
2. In the **Time format** field, select an option.
3. Select **Update**.

Configure the date picker for the list editor

A system property enables you to choose between two date picker configurations for the list editor.

Before you begin

Role required: admin

Procedure

1. Navigate to `sys_properties.list`.
2. Search for the property *`glide.ui.list_edit.show_calendar_only`*.
3. Set the property **Value** to either of the following options.

Value	Description
false	Calendar as well as a field appears for a date picker for manual date entry.
true	Calendar only appears for a date picker, which is the default behavior in Core UI.

List editor administration

Default date and time fields

Certain time fields are provided by default to store particular date and time fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global timestamp fields

All records inherit certain time stamp fields from the Global [global] table.

- **Created**
- **Updated**

These fields are automatically populated with the correct date and time, expressed in Greenwich Mean Time (GMT), rather than in the logged in user's local time zone.

Planned Task time fields

The Planned Task plugin provides a table (Planned Task [planned task]) with standard fields for measuring a planned task's time. For more information, see Planned Task.

Task fields for measuring work time

Use default task fields to measure progress and resolution for certain records.

The following base system fields are provided on certain tables to track how long it takes to close tickets:

- Time worked: A timer that runs when you view the record, and pauses while you close it, or when you manually pause it. Used to track the time spent by the help desk while working on the record.
- Resolve time: A calculated field that measures the time from the moment the record is opened, to the moment the record is closed. Used to track how long it takes to resolve the record.

These fields provide different metrics for request response.

The following additional tools are available for tracking work time:

- **Service level agreements (SLAs)**: Measures how long it takes a record fulfill certain conditions (such as an incident being marked **Resolved**).
- **Time cards**: Use the **Time worked** field to break down how much time was spent by day of the week.

Time worked

The Task [task] table provides a time-tracking field called **Time worked**.

Time worked field

This field measures how long a record has been viewed to track work time on a ticket. Any table that extends Task can use this field. To use this field, you must first add it to the form by configuring the form layout. The Time worked field does not appear on forms by default.

As the record is viewed, the timer counts upward. To pause the timer, click the stop icon ( ).

To resume the timer, click the start icon ( ).

When you save a task, the amount of new time in the timer is used to generate a record on the Time Worked [task_time_worked] table. You can view this table as a related list on the task form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the time in the **Time worked** field is a cumulative value stored in the task record. If you modify a Time Worked record, the changes are not reflected in the task timer.

You can set the property *com.snc.time_worked.update_task_timer* to enable updating of the task timer value, based on changes to the Time worked records. You do this using the *Update task timer* business rule.

You can also enable the dictionary attribute *time_worked_alert* so that updates to the time worked field make the form dirty. By default the attribute is set to false.

Resolve time

The **Resolve time** field is available on the Incident [incident] and Request [sc_request] tables. This field allows for easy reporting on how long it takes for requests to be closed, and is stored as an integer number of seconds.

Business rule calculation

Specific business rules calculate the **Resolve time** field when the record is resolved or marked closed, and measures the difference between the **Opened** and **Closed** dates. The field is stored in the system as an integer number of seconds.

- On the Incident table, the field is calculated on closure by the business rule *mark_closed*. The following lines of code calculate the resolve time:

```
if (dataChange || current.calendar_stc.nil())
      current.calendar_stc = gs.dateDiff(opened, resolved,
 true);
```

- When the incident is closed directly, the calculation is based on the *mark_closed* business rule. The following lines of code calculate the resolve time:

```
if (dataChange || current.calendar_stc.nil())
        current.calendar_stc = gs.dateDiff(opened, closed,
 true);
```

Display resolve time as a duration

You can display the resolve time as a human-readable duration rather than an integer representing a duration in seconds.

Procedure

1. From the Incident or Request form, right-click the form header and click **Configure** > **Table**.
2. From the **Columns** embedded list, click **Resolve time**.
3. From the **Attributes** related list, click **New**.
4. Enter these values.

Dictionary attribute values

Field	Value
Attribute	Format
Dictionary entry	Resolve time
Value	glide_duration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Submit**.

The resolve time appears in forms and lists as a duration, expressed in days, hours, and minutes.

Note: This attribute does not change the field data format, which remains an integer representing a duration in seconds. In reports and data exports, it still appears as the actual number of seconds, rather than as a duration.

Export date and time formats

Because some export formats are intended for human consumption and others for database usage, various methods are used to provide date and time field information in different formats.

Excel

Date, Date-Time, and Time fields are all exported as their display values, and appear in a custom format, instead of the system date format. However, duration fields, export as the value stored in the database, which is an integer value of seconds.

Note: If the date and time format is `hh:mm:ss` in the *`glide.sys.date_format`* System Properties setting, and you export time values to Excel, they appear in 24-hour military time.

To display the exported values in standard 12-hour am/pm time formats, select the `1:30PM time` format in **Format Cells** > **Time** in Excel.

XML

All Date and Time fields export as the value stored in the database.

PDF

All Date and Time fields (including Duration) export as their display value.

CSV

All Date and Time fields export as the value stored in the database.

Schedules

Use schedules to specify when service level agreements or inactivity monitors are active, or to specify when on-call rotations should take effect. Schedules are rules that include or exclude time for various actions or tasks.

For example, if a service level agreement is set to an 8-5 Weekdays schedule, the SLA only counts time during those hours. Generate and validate schedules in the **System Scheduler** > **Schedules** menu.

Default schedules

Default schedules are available in a base system.

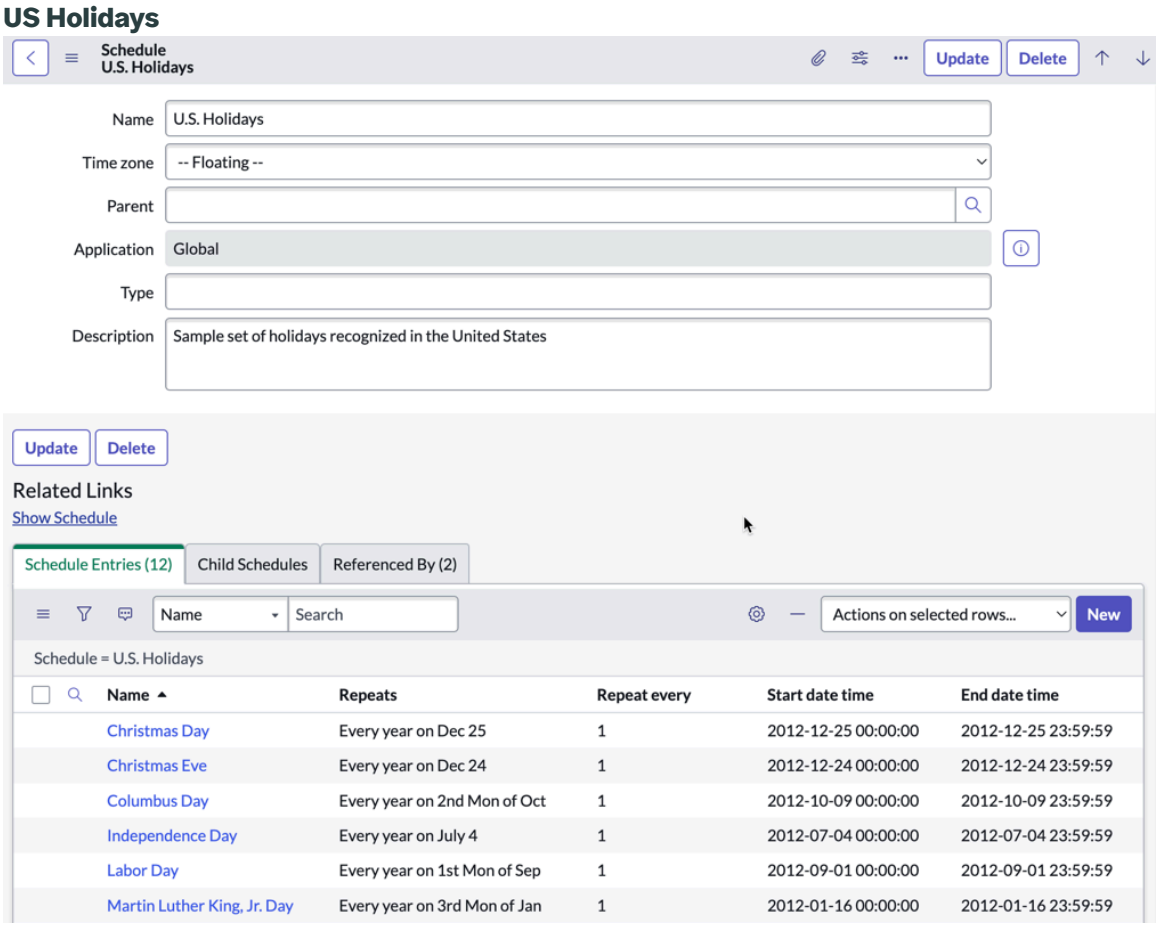
Name	Schedule
8-5 weekdays	Repeats every week on weekdays Monday through Friday.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Schedule
8-5 weekdays excluding holidays	Repeats every week on weekdays Monday through Friday. Includes the child schedule U.S. Holidays.
Application	Repeats every week on Sunday.
Application FLX	Repeats every week on Sunday.
Blackout Wednesdays (GMT)	Repeats every week on Wednesday.
Database Server FLX	Repeats every week on Saturday.
Default MS Project	Repeats every week on weekdays Monday through Friday from 8:00am to noon and 1:00-5:00pm.
Global Infrastructure	Repeats every week on Saturday.
MySQL Database Service	Repeats every week on Saturday.
Network	Repeats every week on Saturday.
Project Management Schedule	Repeats every week on weekdays Monday through Friday from 8:00am to noon and 1:00-5:00pm. Default schedule for the Project Management application.
Resource Management Schedule	Repeats every week on weekdays Monday through Friday from 8:00am to noon and 1:00-5:00pm. Default schedule for the Resource Management application.
Server	Repeats every week on Saturday.
Servers San Diego	Repeats every week on Wednesday.
Software Blackout	Repeats every week on Wednesday.
U.S. Holidays	Lists 12 U.S. holidays.
WebServer FLX	Repeats every week on Sunday.
Weekends	Repeats every week on Saturday for two days.

Related topics

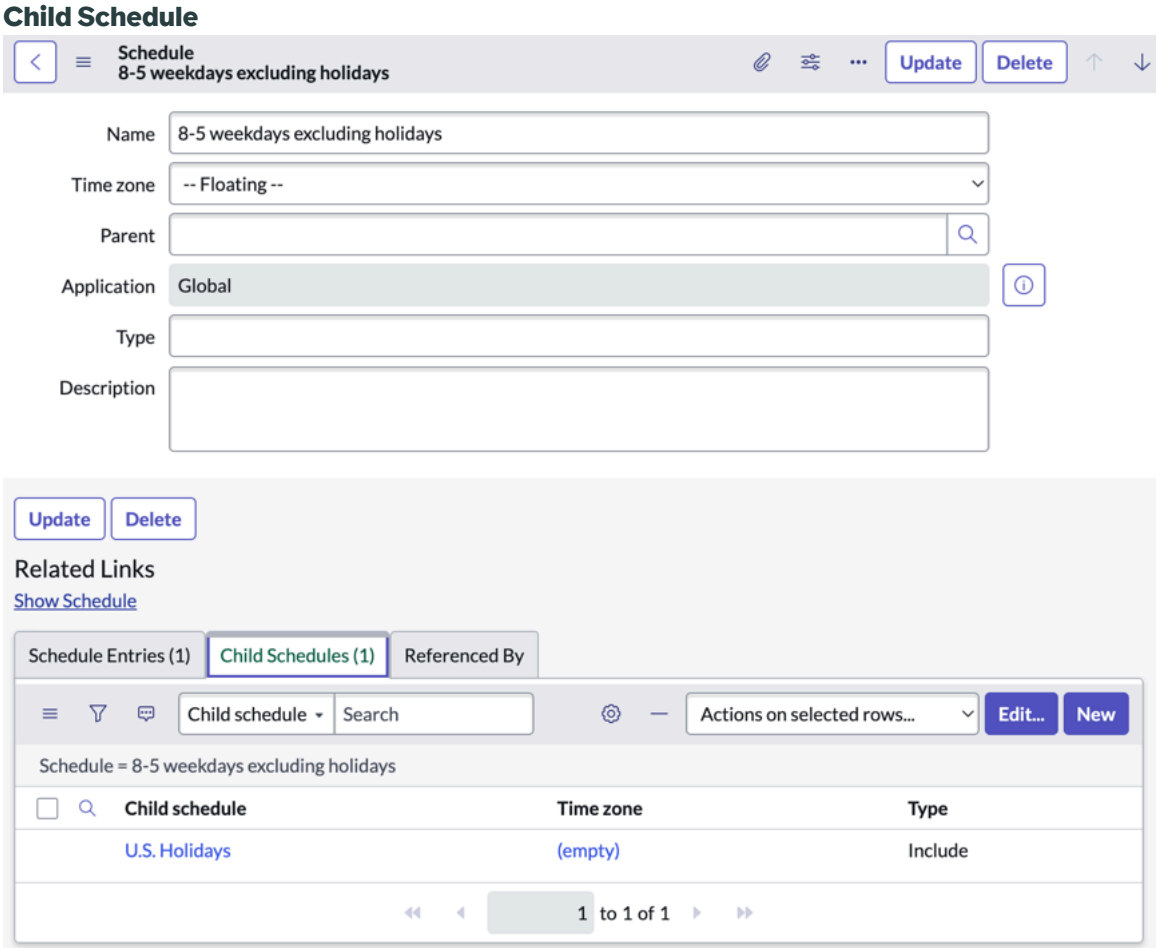
Schedules



Holidays

You can define each individual holiday as a schedule entry to create exceptions to existing schedules.

For instance, if an SLA requires an incident be resolved within three business days excluding Christmas, create a schedule entry for Christmas. Creating this entry ensures that the SLAs do not count Christmas when calculating elapsed time, even if it falls within the work week.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Because schedules can be included in other schedules through a parent-child relationship, it is also possible to create a holiday schedule and include it in other schedules to keep holidays consistent. The following example shows a holiday schedule.

The following example shows a schedule that includes the preceding holiday schedule.

Related topics

Schedules

Define a schedule

Create a holiday schedule for multiple regions

You can create holiday schedules for multiple regions that follow the same work schedule but have different holidays.

About this task

The following method supports multiple regions with the same work schedule (for example, an 8-5 weekdays schedule) but with different holiday schedules.

Procedure

1. Create a holiday schedule for each region. For example, U.S. Holidays, British Holidays, and Australian Holidays.
2. Add the work schedule as a child schedule to each region's holiday schedule.

   This method requires making <number of schedules> + 1 total schedules. If you make the regional holiday schedule a child schedule of the work hours schedule, you must create a separate work hours schedule for each region. The total number of schedules in this case is <number of schedules> x two schedules.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Schedules

Define a schedule

Parent and child schedules

Schedules can have one of two parent-child relationships with other schedules.

Parent field

When a schedule record lists a value for the **Parent** field, schedule entries from the parent schedule apply to both the parent schedule and the child schedule. By default, there are no sample schedules that use the **Parent** field.

Child schedule

When a schedule record has one or more child schedules in the **Child Schedules** related list, schedule entries from the child schedule apply to the containing schedule. By default, there are several sample schedules that use child schedules. For example, see the **8-5 weekdays excluding holidays** schedule that includes the **U.S. Holidays** schedule.

Parent and child schedules cannot contain conflicting schedule entry types. For example, a schedule containing maintenance schedule entries cannot also contain blackout schedule entries. Nor can a maintenance schedule have a child schedule containing blackout schedule entries.

Note: To create a Holiday schedule and include it in a parent schedule, you must add it as a child schedule and with an Include type.

Parent schedules must have at least one entry that is not an **Excluded** type. If parent schedules are only exclusionary, they are invalid.

Note: The **Show Schedule** related link shows schedule entries from the current schedule and the child schedule record. For example, when showing the **8-5 weekdays excluding holidays** schedule, holidays are also shown as excluded because the holiday schedule is a child schedule.

Related topics

Schedules

Define a schedule

Define a schedule

Configure schedules using schedule and schedule entry records.

Before you begin

Role required: schedule_admin or admin

About this task

- Schedule records specify a time zone and a type of schedule and use one or more schedule entries. Schedule records are saved in the Schedule [`cmn_schedule`] table.
- Schedule entry records specify the time periods that are included or excluded from a schedule. Schedule entries are saved in the Schedule Entry [`cmn_schedule_span`] table.

Alternately, you can also use the Business Calendar functions to create schedules. To learn more about creating business calendars and schedules, see Creating business calendars.

Warning: If you're using Performance Analytics, use caution when changing time spans. Any change you make to the time span on a business or fiscal calendar can invalidate the Performance Analytics data. Consult with a Performance Analytics administrator before making such changes.

Procedure

1. Navigate to **All** > **System Scheduler** > **Schedules** > **Schedules**.
2. Select **New**, enter a unique and meaningful **Name** and **Description** and then fill in the form.

   For detailed information on Schedule form fields, see Schedule fields.

   Note: If there are no active entries defined for the current schedule, a warning message appears in the Schedule form. If your schedule is a child schedule that contains only exclusions, ignore the message because exclusions are non-active entries.

3. Right-click the header bar and select **Save**.

   Note:

   - In the Related link, select **Show Schedule** to view the schedule in the calendar using the Next Experience user interface. For more information on this framework, see Next Experience UI. To create schedule entries in the Next Experience UI, refer to Create schedule entries in the Schedule calendar.

     To use the classic schedule calendar, you can add the `glide.schedule.enable_classic_calendar` property and set it to **true**. For information on how to add a system property, see Add a system property.

   - If you create a schedule of type **maintenance** and save the record, a UI policy hides the **Type** field from the form. To view or change the **Type** value, use the list of schedules instead of the schedule form. Add the **Type** column if necessary. You can click the cell for the value in the **Type** column and modify the value in the list view.

4. Configure one or more schedule entries.

   For detailed information on Schedule Entry form fields, see Schedule entry fields.

Schedules

Schedule fields

The Schedule form contains the following fields.

Field	Description
Name	Unique name for the schedule.
Time Zone	Time zone for the schedule. If you select **Floating**, the time zone is relative to whatever process is accessing the item at the time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• For example, if a resource manager in Amsterdam sets a floating schedule for 8:00A.M. to 5:00P.M., a user in San Jose sees the schedule as 8:00 A.M. to 5:00 P.M. • When a schedule is defined in a specific time zone, users in different time zones see the schedule with their own time zone applied.
Parent	Parent schedule that constraints the new schedule.
Application	Application scope of the schedule.
Type	Text label that describes the purpose of the schedule. You can also use one of these system terms to determine how to process certain schedules: • **Excluded**: Excludes time periods from SLA counts. • **Maintenance**: Specifies time periods where change management activities are allowed. A schedule containing maintenance schedule entries cannot also contain blackout schedule entries. • **Blackout**: Excludes time periods from change management schedules. A schedule containing blackout schedule entries cannot also contain maintenance schedule entries.
Description	Description of the schedule.

Define a schedule

Schedule entry fields

You can only associate a schedule entry with one schedule. The **Schedule Entries** related list contains the definitions of the time periods you want to include in or exclude from the schedule.

Field	Description
Name	Unique name for the schedule entry.
Type	Label that describes the purpose of the schedule. The system also uses the schedule type to determine how to process certain schedules. • **Excluded**: Excludes time periods from SLA counts. • **Maintenance**: Specifies time periods where change management activities are allowed. A schedule containing maintenance schedule entries cannot also contain blackout schedule entries. • **Blackout**: Excludes time periods from change management schedules. A schedule containing blackout schedule entries cannot also contain maintenance schedule entries.
Show As	Option that indicates how the schedule entry should appear in calendar applications and how it should interact with other schedule entries. • **Busy**: Schedule entry is not available for scheduling a work task. • **At no extra charge**: Schedule entry is available for scheduling a work task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Tentative**: Schedule entry is tentatively available for scheduling a work task. • **On call**: Schedule entry is on call, which provides a means to determine which member of a user group is available to complete a task.
When	Date and time to which the schedule entry applies. If the schedule entry applies to a full 24-hour day, select the **All day** check box. **Note:** Changing the global date and time format in the *glide.sys.date_format* System Properties setting has significant impact on schedule calculations made when you select the **All day** check box. To learn more, see Global date and time field format.
Repeats	Repetition interval for the schedule entry, if any. If you select a repetition interval, other fields appear so you can further specify the repeat interval.
Repeat every	Scheduling repetition frequency - weekly, monthly, or yearly. This field is only visible when the **Repeats** field has a value of **Daily**, **Weekly**, **Monthly**, or **Yearly**.
Repeat on	Days of the week a weekly schedule repeats on. This field is only visible when the **Repeats** field has a value of **Weekly**.
Monthly type	Monthly schedule repetition frequency. This field is only visible when the **Repeats** field has a value of **Monthly**. Monthly repeat options include: • Repeat on a specific day of the month • Repeat on a specific day in a specific week of the month • Repeat on the last day of the month • Repeat on a specific weekday in the last week of the month
Yearly type	Yearly schedule repetition frequency. This field is only visible when the **Repeats** field has a value of **Yearly**. Yearly repeat options include: • Repeat on a specific day of the year • Repeat on a floating day
Float week	Week of the month a floating yearly schedule repeats on. This field is only visible when the **Yearly type** field has a value of **Floating**.
Float day	Day of the week a floating yearly schedule repeats on. This field is only visible when the **Yearly type** field has a value of **Floating**.
Month	Month of the year a floating yearly schedule repeats on. This field is only visible when the **Yearly type** field has a value of **Floating**.
Repeat until	Repetition end date. If you leave this field blank, the schedule repeats indefinitely.
Type	[Optional] Schedule entry description.

Schedule for the fifth instance of a week date

You can select a date that computes to the fifth instance of a weekday for a date near the end of a month for a repeating monthly schedule,

About this task

Three options are available for handling months that do not have a matching Fifth instance of the selected day.

- Last: Selects the last instance of the weekday in the month.
- Next: Selects the first instance of the weekday in the next month.
- Strict: Skips any month without a matching Fifth instance and selects only months that have a matching Fifth instance.

Use the *glide.schedules.fifth* system property to control how a schedule entry that selects the fifth occurrence of a weekday behaves in months containing only four occurrences of that day.

- Use of this property is only valid when the *glide.schedules.repeat_nth* property is set to **Day**.
- The following example illustrates computing what day of the month a schedule repeats on when the schedule starts on the Fifth instance of a weekday in the month.

Procedure

1. Navigate to *sys_properties.list*.
2. Open the *glide.schedules.fifth* property.
3. Verify that the **Value** is set to **last**.
4. Navigate to **System Scheduler** > **Schedules** > **Schedules**, define a new schedule, and click **Submit**.
5. Open the new schedule and in the **Schedule Entries** related list, create a new entry with the following parameters:
   - When: November 29, 2012 at 10:00 to November 29, 2012 at 11:00
   - Repeats: Monthly
   - Monthly type: Day of the Week
   - Starting: November 29

   Note: In this example, November 29 is the fifth Thursday in the month.
6. Click **Submit**.
7. Open the same schedule entry.

   Note: The message **Every month on the Fifth Thu** appears on the form.

   The schedule for the first three months is computed as:
   - November 29, 2012 (Fifth Thursday of the month)
   - December 27, 2012 (Last Thursday of the month)
   - January 31, 2013 (Fifth Thursday of the month)
8. If you set the **Value** on the *glide.schedules.fifth* property to **next** instead of **last** in step 3, the schedule for the first three months is computed as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- November 29, 2012 (Fifth Thursday of the month)
- January 3, 2012 (First Thursday of the next month since December 2012 does not have five Thursdays)
- January 31, 2013 (Fifth Thursday of the month)

9. If the **Value** on the *glide.schedules.fifth* property is set to strict instead of **last** in step 3, the schedule for the first three months is computed as:
   - November 29, 2012 (Fifth Thursday of the month)
   - No meeting (December 2012 skipped because it does not have five Thursdays)
   - January 31, 2013 (Fifth Thursday of the month)

Schedules

Define a schedule

Repeat a monthly schedule

Repeat a monthly schedule

Repeat a monthly schedule to reduce the amount of time required to define schedules and to provide consistency in scheduling.

About this task

You can specify the following options for monthly schedules that start on a particular day of the month (**Monthly type** is set to **Day of the month.**). The following methods are available to compute what day of the week a monthly schedule repeats on:

- **Day**: Calculates the day of the week to repeat on by determining the order of the selected starting date within the month. For example, if you specified that the starting date appears on the first Monday in the month, the schedule repeats every first Monday of every month.
- **Week**: Calculates the day of the month to repeat on by determining what week number the selected starting date appears in the month. For example, if the starting date is a Monday during the second week of the month, the schedule repeats the second Monday of every month.

Use the system property *glide.schedules.repeat_nth* to determine what method your instance uses to compute what day a repeating monthly schedule occurs on. By default, instances use the more accurate Day method.

Note: Use the **Week** method to maintain backwards compatibility with customized schedule logic. To learn more about calculations for the starting day of each month, for monthly schedules that start on the fifth instance of a day, see Fifth Instance of a Day of the Week.

The following example illustrates computing what day of the week a monthly schedule repeats on.

Procedure

1. Navigate to *sys_properties.list*.
2. Open the *glide.schedules.repeat_nth* property.
3. Verify that the **Value** is set to **day**.
4. Navigate to **System Scheduler** > **Schedules** > **Schedules**, define a new schedule, and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Open the new schedule and in the **Schedule Entries** related list, create a new entry with the following parameters:
   - When: November 5, 2012 at 10:00 to November 5, 2012 at 11:00
   - Repeats: Monthly
   - Monthly type: Day of the Week
   - Starting: November 5

   Note: In this example, November 5 is the first Monday in the month, but it is in the second week.

6. Click **Submit**.
7. Open **Schedule Entry**.

   Note: The message **Every month on the first Mon** appears on the form. The first few dates this schedule runs on are:
   - November 5, 2012 (First Monday of the month)
   - December 3, 2012 (First Monday of the month)
   - January 7, 2012 (First Monday of the month)

8. If you set the **Value** on the *glide.schedules.repeat_nth* property to **week** instead of **day** in step 3, the first few dates this schedule run on are:
   - November 5, 2012 (Schedule starts on Monday in the second week of the month)
   - December 10, 2012 (Second Monday in the month)
   - January 14, 2012 (Second Monday in the month)

Schedules

Define a schedule

Using schedules and calendars

Specific applications within the ServiceNow AI Platform generate graphical calendar displays based on schedule pages.

These schedule pages appear in daily, weekly, or monthly views. Currently, the applications using schedule pages include:

- Project Management
- Maintenance Schedules
- Group On-Call Rotation
- Field Service Management

Schedule pages are records that contain the scripts that determine the functionality of the graphical display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Because of the heavy degree of scripting involved in a schedule page, you should, for most instances, use the default schedule pages in the base platform.
- The schedule page uses a URL with a series of parameters attached to generate the graphical display.
- A schedule page controls calendar content (`cmn_schedule_page`) record.

To access Schedule Pages, navigate to **System Scheduler > Schedules > Schedule Pages**. The Schedule Pages form provides the following fields:

Field	Field Type	Description
Name	String	General name used to identity the current schedule page.
Schedule type	String	Schedule type is a string that is used to uniquely identity the schedule page via the "`sysparm_page_schedule_type`" URI parameter. For example, a schedule page cou follows: **/show_schedule_page.do?sysparm_page_schedule_type=gantt_chart&sysparm_timeline_task_id=d530bf907f0** Alternatively, you can access the schedule page can by setting the "**sysparm_page_sys_i** unique 32 character hexadecimal system identifier of the schedule page.
View Type	Choice	Each view type displays different field combinations. There are two options available: • **Calendars** • Schedule Pages
Description	String	General description that provides additional information about the current schedule page. necessary.
Init function name	String	**Note:** This functionality is only used by **Calendar** type schedule pages. The init function name specifies the name of the JavaScript function to call inside the **Clie** calendar type schedule pages.
HTML	String	**Note:** This functionality is only used by **Calendar** type schedule pages. Jelly parses the HTML field, which is a scriptable section. It then injects it into the display p the calendar. It can be used to pass in variables from the server and define extra fields are
Client script	String	The client script is a scriptable section that allows for configuring options of the schedule different depending on the schedule page view type.
Server AJAX processor	String	**Note:** This functionality is only used by **Calendar** type schedule pages. The Server AJAX processor is specific to calendar type schedule pages that is used to retu items and spans that display.

Invoke the Schedule page and view a calendar

You can use the URL from arguments module, a field decoration (dictionary attribute `ref_contributions`), or a UI Action linking to `show_schedule.do` to invoke the Schedule page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, the On-call calendar module generates the calendar from the following URL:

```
$ocf.do?sysparm_start_date=2016-03-01&sysparm_current_view=monthly&sysparm_include_view=monthly,daily
```

This URL takes the user to the monthly calendar view dated March 1, 2016.

- The URL component `sysparm_current_view = monthly || weekly || daily` determines the current calendar view. If `sysparm_current_view` is given an invalid or empty value, it defaults to monthly view and rewrite the URL to that view. Valid values are monthly or weekly or daily.
- The URL component `sysparm_include_view = monthly,weekly,daily` determines which calendar views are available. If `sysparm_include_view` is given invalid or empty values, only the valid views appear. If all values are invalid, the default three views appears and rewrites the URL to those views. Valid values are `monthly`, `weekly`, and `daily`.

  Note: The `sysparm_include_view` is only available for the new on-call calendar view.

- The URL component `sysparm_group_id=group_sys_id` determines the specified group to filter on. If `sysparm_group_id` is specified, it filters by the specified group. Valid value is a group sysId.
- The URL component `sysparm_start_date=2016-03-02` determines the date based on which every view appears. If `sysparm_start_date` is specified, it opens the calendar contesting that particular date in which every view is selected. The format is YYYY-MM-DD. If an invalid format or date is specified, it uses the current date and rewrites the URL to that date.

Note: The `sysparm_zoom` URL component has been replaced with `sysparm_current_view` in OnCallRotation only.

Schedule calendar

Use the Schedule calendar to create, view, and edit events.

The schedule calendar is available in day, week, or month views in calendar and time line views. To create events in the calendar, see Create schedule entries in the Schedule calendar.

Note: To use the classic schedule calendar, see Define a schedule.

Domain support and schedules

Domain separation is supported in schedules. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data. Activate the Domain Support [com.glide.domain] plugin to enable the domain separation functionality for schedules.

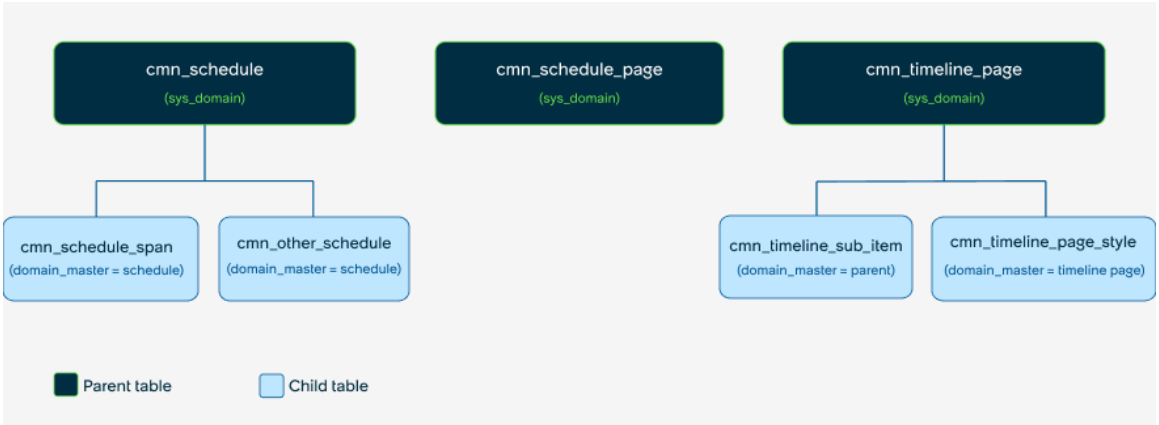
Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.



Overview

The records in the Schedule [cmn_schedule], Schedule Page [cmn_schedule_page], and Timeline Page [cmn_timeline_page] tables have a defined domain.

- The child tables use the *domain_master* attribute to derive the domain from the parent table.
- You can find the *domain_master* attribute on the dictionary record for the respective table.

The following diagram illustrates the scope of domain separation in different schedule tables:

Domain support for schedules

Custom domain support implementations

Domain separation support does not automatically occur when you migrate to a new release containing a custom implementation of domain support for tables such as Schedule Entry [cmn_schedule_span]. This action avoids changing any specific configurations that you may have in place.

To implement the base system domain support for schedules, a sys.script utility is provided. To run this utility, navigate to **Background** > **Scripts – Background**. The script is listed under the com.glide.schedules plugin as `fix_schedule_domain_support.js`.

- The utility attempts to add the **Domain** [sys_domain] column to the Schedule [cmn_schedule], Schedule Page [cmn_schedule_page], and Timeline page [cmn_timeline_page] tables.
- It then attempts to add the domain_master attribute to the Schedule Entry [cmn_schedule_span], Other Schedule [cmn_other_schedule], Timeline Sub Item [cmn_timeline_sub_item], and Timeline Page Span Style [cmn_timeline_page_style] tables.
- If the script finds existing records between a child and parent record that have differing domain, the script does not introduce the *domain_master* attribute to the child table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, consider the relationship of the Schedule [cmn_schedule] (parent) and Schedule Entry [cmn_schedule_span] (child) tables. If the **Domain** [sys_domain] column is available on both tables in the upgrading instance, the utility must migrate to the base system implementation of domain support for schedules.

- If the script detects records where the child Schedule Entry [cmn_schedule_span] domain differs from its parent Schedule [cmn_schedule] domain, it stops executing and logs a warning message.
- If the script does not find differing records, it deactivates and limits read access to the **Domain** [sys_domain] and **Domain Path** [sys_domain_path] columns on the Schedule Entry [cmn_schedule_span] table.
- Finally, the script adds the domain_master=schedule attribute to the dictionary file for the Schedule Entry [cmn_schedule_span] table.

Note: The *domain_master* attribute ensures that the child and parent record domains remain the same as the domain for the child that is derived from the specified reference field.

System scheduler

The System Scheduler application contains two separate engines for scheduling: the Scheduled Jobs engine and the Schedules engine.

Scheduled jobs

Scheduled Jobs executes any work that must be performed at a specific time, or on a recurring basis. The Scheduled Jobs module links to the Schedule [sys_trigger] table. Manipulating records on the Schedule table is not recommended. Use this table to view existing base system scheduled jobs.

The Scheduled Jobs module in System Definition is an admin-friendly interface for scheduling work. Use this module to create new scheduled jobs. For more information, see Create a Scheduled Job.

Schedules

Schedules are rules that include or exclude time on a calendar. They are used by service levels, inactivity monitor, and group on-call rotation. For instance, you can define a schedule to restrict service levels to only apply to weekdays during business hours. You can also exclude holidays from an on-call rotation.

For more information, see Use Schedules.

Event scheduling

You can use various tools for scheduling actions or tasks to happen in the future.

Maintenance schedules

Changes to the CMDB can be managed through the Maintenance Schedules plugin, which enables changes to be proposed and viewed through a timeline.

On-call rotation

The Group On-Call Rotation plugin enables a schedule to be defined to determine what users are primary contacts during particular hours of the day.

Scheduled reports

Once you define reports, you can schedule them for emailing at a specific time, or at regular intervals, using the reporting interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled workflows

Workflows provide a robust system for automating advanced multi-step processes. Workflows are triggered by conditions, like business rules, or they can be scheduled for a particular time/recurring schedule, like scheduled jobs.

Scheduled jobs

Scheduled jobs are scripts you can specify should automatically generate at a specific date and time, or on a repeating basis.

Event registry

You can use events to schedule actions or tasks to occur when conditions are fulfilled.

For example:

kb.view

An event triggered when a user views a Knowledge Base article. You use it to trigger the script action Knowledge View that create a Knowledge Use record every time an article is viewed.

incident.commented

An event triggered when a user comments on an article, used by two incidents commented email notifications.

Inactivity Monitors

If a record has not been updated for a defined length of time, an inactivity monitor triggers an event.

Script Actions

Scripts that trigger when an event is recorded in the log. You can set scripts to execute whenever a particular activity occurs in the platform, rather than at a particular time, such as scheduled jobs, or in response to particular conditions, such as Business rules.

Notifications

You can also use events to trigger Email Notifications when an event is recorded in the log.

Set an inactivity monitor

You can set an inactivity monitor that triggers an event for a task record when the task has been inactive for a certain amount of time.

Before you begin

Role required: admin

About this task

If the task remains inactive, the monitor repeats at regular intervals. User updates to the task record restart the monitor. If reset conditions you defined for it have not been met, the monitor does not restart when you update the task record. Inactivity monitors only apply to records on tables that extend the `Task` table, or the `Task` table itself.

When an inactivity monitor triggers, it generates an event in the form `<tablename>.inactivity` (for example, `incident.inactivity`). Define an Email and SMS notifications or script action to drive further action for the inactivity monitor.

A record's activity is only based on user updates. System updates do not count as activity.

Inactivity monitors only support one matching inactivity monitor per task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If multiple inactivity monitors do match a task record, one of the inactivity monitors will delete all other sys_trigger jobs, leaving only its own, preventing the others from triggering. Since inactivity monitors are driven by condition builder, the definition time can't identify inactivity monitors from intersecting with each other per task record.

Procedure

1. Navigate to **All** > **System Policy** > **SLA** > **Inactivity Monitors** and click **New**.
2. Give the inactivity monitor a name.
3. Specify the type of record to monitor in the **Table** field.
4. Specify how long the inactivity monitor should wait before sending each notification in the **Wait** field.
5. Specify any additional conditions in the **Condition** field.
   At least one condition must be specified for the inactivity monitor to work.
   - If you are using incident auto-close, add a Reset condition because, if you don't, auto-close won't work properly. To prevent this reset, set a **Reset Condition** on your inactivity monitor. To learn more about Incident auto-close, see Configure incidents to close automatically.
   - All conditions need to be True per user update for the Inactivity Monitor to start running. For example, Set this condition only works if the due date is earlier than the current date when user updates the task.
6. Specify an Order if multiple inactivity monitors might have their conditions met for a given record - the one with the lowest order is used.
7. Click **Save**.

> **Note:** If you change conditions on an inactivity monitor, the monitor stops tracking previously tracked records. It does not track records that you created before the inactivity monitor, even if the record meets all other conditions.

Escalation intervals and pause conditions

Escalation Intervals and Pause Conditions are not relevant to an inactivity monitor.

The related list and field are available because the inactivity monitor table extends the table used for SLAs, but these elements are not used in any way when an inactivity monitor attaches or is triggered.

Scheduled jobs

Scheduled Jobs are automated pieces of work that can be performed at a specific time or on a recurring schedule.

You can automate the following kinds of tasks:

- Automatically generate and distribute a report
- Automatically generate and schedule an entity of records, such as an incident, change item, configuration item, from a template
- Run scheduled jobs from scripts or business rules
- Scheduling at the end of the month
- Scheduling for weekdays

For developer training, see Scheduled Script Executions and Events Objectives on the ServiceNow Developer Site.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the System Events and Jobs Dashboard to monitor the system event processing system and the scheduled jobs processing system.

Scheduled job states

A scheduled job can be in any one of the following states.

Ready

Job is ready to run at the next scheduled interval.

Running

Job is in the process of carrying out a task.

Queued

Job has been added to the scheduler queue and is waiting to run.

Error

Error occurred while running the job.

Schedule job errors

If you encounter errors generating a scheduled job, visit for additional information.

Create a scheduled job

Create a scheduled job on the Schedule Job [sysauto] table.

Before you begin

Role required: admin

About this task

Create all new scheduled jobs using this method.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Click **New**.
3. Select the appropriate type of scheduled job.
   - Automate the generation and distribution of a report
   - Automatically generate something (a change, an incident, a ci, etc) from a template
   - Automatically run a script of your choosing

Result

The fields presented depend on the type of scheduled job required.

Automate generation and distribution of a report

Generate and distribute scheduled reports via email.

Before you begin

Roles required: admin

A user with the report_scheduler role can also create a scheduled report through a different navigation path. For more information, see Schedule emails of Core UI reports.

About this task

Scheduled reports can be distributed in PDF, CSV, or XLS format. Graphical reports can be distributed in PNG or PDF format. Multilevel pivot reports can only be scheduled in PDF format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- It is not possible to schedule Calendar, Map, or Single Score reports. You can schedule Pivot Table reports only if the plug-in *com.snc.whtp* is enabled.
- Data may not appear on reports created by an individual whose user account is deactivated. To ensure that the desired data appears, an active user must recreate the scheduled report.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Select **New**.
3. Select **Automate the generation and distribution of a report**.
4. Populate the following fields:

Field	Description
Name	Name of the scheduled report.
Report	Reference to the report you are scheduling. You can use the Search icon to locate the report. **Note:** Automatic email support is not available for Calendar, Map, and Single Score reports.
Users	Individual users who receive the report at the scheduled date and time. Users must have **Notification** set to **Enabled** on their user records to receive reports.
Groups	Groups that receive the report at the scheduled date and time.
Email addresses	Comma-separated list of email addresses of report recipients who are not users on your instance.
Application	Name of the scoped application that contains the report. **Global** appears if the report is in the global scope.
Active	When active, scheduled reports are delivered.
Run	Time interval to use for running the scheduled job: ○ **Daily**: Runs daily, at a designated time. ○ **Day and Month in Year**: Runs yearly on a specific day and month (for example, July 14), at a designated time. ○ **Day in Week in Month in Year**: Runs yearly on a specific day of the week in a specific week of a specific month (for example, the second Monday in October), at a designated time. ○ **Week in Month**: Runs monthly during a specific week of the month (for example, the third week of each month), on designated days and at a designated time. ○ **Weekly**: Runs on a weekly basis, at a designated time and day of the week. ○ **Monthly**: Runs on a monthly basis, at a designated time and day of the month. ○ **Periodically**: Runs on a designated repeating interval.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Once**: Runs for a single occurrence only. ○ **On Demand**: Runs immediately on demand. ○ **Business Calendar: Entry Start**: Runs on the starting entry dates for the business calendar that you select in the **Business Calendar** field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month. ○ **Business Calendar: Entry End**: Runs for the ending date for the business calendar that you select in the **Business Calendar** field. This selection runs in the same manner as **Business Calendar: Entry Start**, but for the end dates of the associated business calendar entries. **Note:** When you select **Business Calendar: Entry Start** or **Business Calendar: Entry End**, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. If you select a business calendar and all its business calendar spans are in the past, the job would never run since that is an invalid configuration. To learn more, see the **Offset type** and **Offset** fields. To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.
Time zone	Time zone to use with the **Time** field entry when you specify the time at which the scheduled job should run. Select a time zone entry: ○ **-None-**: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it's the user's assigned time zone, and you enter `16 : 45` into the **Time** field. ○ **Use System Time Zone**: Use the default system time zone that is specified for the instance in which it runs. For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter `22 : 15` in the **Time** field. ○ Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select **US/Eastern**, and enter `13 : 30` in the **Time** field.
Time	Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the **Time zone** field determines the time zone for this entry.
Day	Day on which the scheduled job should run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ If **Run** is set to **Weekly**, select the day of the week. For example, select Wednesday. ○ If **Run** is set to **Monthly**, select the day of the month. For example, select 25 for the 25th day of the month. This field appears only if you select **Monthly** or **Weekly** in the **Run** field.
Repeat Interval	Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example: ○ To run the scheduled job every four days, enter `04` in the **Days** field. ○ To run it every 26 hours, enter `26` in the **Hours** field. ○ If it should repeat at an interval of 13:30:25, enter `13` in the **Hours** field, and then enter `30` and `25` in the two unlabeled fields after it.
Advanced	Enables advanced scheduling options for greater flexibility in job planning and execution. You can configure jobs to start on a future date, end on a particular date, and define how the job should repeat. For more information, see Advanced options for scheduled jobs.
Starting	Allows you to define the beginning window of time (date and time) when you would like your job to start running. Within this window, the job actually starts at the time specified in the **Time** field. The **Starting** field appears only if you select the **Advanced** option and one of the following values in the **Run** field: ○ **Daily** ○ **Day and Month in Year** ○ **Day in Week in Month in Year** ○ **Monthly** ○ **Once** ○ **Periodically** ○ **Week in Month** ○ **Weekly** For the run type **Periodically**, the starting time is the date and time of the first scheduled job generation. For more information, see Starting and Ending fields.
Ending	Allows you to define the ending window of time (date and time) when you would like your job to stop running. Within this window, the job actually stops at the time specified in the **Time** field. The **Ending** field appears only if you select the **Advanced** option and one of the following values in the **Run** field: ○ **Daily** ○ **Day and Month in Year** ○ **Day in Week in Month in Year** ○ **Monthly**

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Once** ○ **Periodically** ○ **Week in Month** ○ **Weekly** For the run type **Periodically**, the ending time is the date and time of the first scheduled job generation. For more information, see Starting and Ending fields.
Business Calendar	Business calendar entry that you're using to determine the business calendar start or end date for the scheduled job. This field appears only if you select **Business Entry: Start Date** or **Business Entry: End Date** in the **Time** field.
Offset type	Type of time offset, if any, to apply to the business calendar that you selected for scheduling this job: ○ **Past**: Apply an offset factor to schedule the job to run before the start of the time span of the selected business calendar. ○ **Future**: Apply an offset factor to schedule the job to run after the end of the time span of the selected business calendar. ○ **--None--**: Don't apply a time offset when scheduling this job. Adding an offset factor enables you to schedule the job to run before or after the formal time span that is defined in the business calendar for the following use cases:
Offset	Amount of time offset, expressed in days, hours, minutes, and seconds, to apply to the business calendar that you selected for scheduling this job. For example, if you want to schedule the job to start three days, 14 hours, 10 minutes, and 45 seconds before the business calendar start date, do the following actions: ○ Select **Past** in the **Offset type** field. ○ Enter **3** in the **Days** field. ○ Enter **14**, **10**, and **45** in the **Hours** field. The **Offset Days** and **Hours** fields appear only if you select **Business Calendar: Entry Start** or **Business Calendar: Entry End** in the **Run** field, and **Past** or **Future** in the **Offset type** field.
Priority	Numerical priority for the scheduled job: ○ Set essential jobs to a priority value below 100. ○ Set nonessential jobs to a priority above 100. ○ If 70 percent or more of all scheduled jobs are **Overdue**, any jobs that are marked with a value above 100 don't run.
Conditional	When enabled, specify a scripted condition for generating the report.
Omit if no records	When enabled, empty reports are not distributed.

Field	Description
Condition	A conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select **Use conditions**. For more information about scripts on the ServiceNow platform, see Scripts. **Warning:** Conditional scripts for scheduled emails are executed in the sandbox. Therefore, function definitions aren't allowed. Some API calls and keywords are also not allowed. For more information, see Script sandbox property.
Subject	Text that appears in the subject line of the distribution email.
Introductory message	(Optional) Add a message to the report. If the report output type is Embedded PNG, ○ Use the tag `${report:png}` in the message body to position the report in the message. Otherwise, the report appears at the bottom of the message. ○ Use the tag `${report:include_with}` to position other reports included with the email. Otherwise, these reports appear at the bottom of the message.
Type	Report output type. Graphical reports can be PNG or PDF files. List reports can be PDF, Excel, or CSV files. When scheduling a graphical report, select the output type **PDF** or **PDF-landscape** to include the chart grid data. When scheduling a List report, select output type **Excel** or **CSV**. Select **Embedded PNG** to embed the report visualization in the body of the email. Large images are scaled to fit the email. For more information, see the section Report output formats. **Note:** It is only possible to schedule multilevel pivot reports in PDF output.
Zip output	When selected, the report is sent as a zip file attachment to the email.
Include with	One or more additional reports to include with the email. It is not possible to order the reports within the email. You can use the Search icon to locate the additional reports.
Page size (Multilevel pivot report only)	Choose from A3, A4, Letter, or Legal size. To specify a different paper size, select **Custom** and enter the **Page height** and **Page width** in pixels.
Page height (in pixels) (Multilevel pivot report only)	Shows when **Page size** is set to **Custom**. For non-standard paper sizes, multiply the page height in inches by 72 and enter the value in this field.
Page width (in pixels) (Multilevel	Shows when **Page size** is set to **Custom**. For non-standard paper sizes, multiply the page width in inches by 72 and enter the value in this field.

Automatically generate something from a template

Schedule the generation of entities, which include changes, incidents, and CIs.

Before you begin

Roles required: template_scheduler

Procedure

1. Navigate to Scheduled Entity Generations [sysauto_template] table.
2. Select **New**.
3. Populate the following fields:

Schedule entity generation

Field	Description
Name	Name that identifies this scheduled job.
Active	Option that indicates that scheduled job is active and should be executed at the specified date and time.
Application	Name of the application that contains the entity. **Global** appears if the entity is in the global scope.
Conditional	Option for enabling the running of the scheduled job if certain conditions are met in the associated script.
Condition	A conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select **Use conditions**.
Run	Time interval to use for running the scheduled job: ○ **Daily**: Runs daily, at a designated time. ○ **Day and Month in Year**: Runs yearly on a specific day and month (for example, July 14), at a designated time.

Field	Description
	○ **Day in Week in Month in Year**: Runs yearly on a specific day of the week in a specific week of a specific month (for example, the second Monday in October), at a designated time. ○ **Week in Month**: Runs monthly during a specific week of the month (for example, the third week of each month), on designated days and at a designated time. ○ **Weekly**: Runs on a weekly basis, at a designated time and day of the week. ○ **Monthly**: Runs on a monthly basis, at a designated time and day of the month. ○ **Periodically**: Runs on a designated repeating interval. ○ **Once**: Runs for a single occurrence only. ○ **On Demand**: Runs immediately on demand. ○ **Business Calendar: Entry Start**: Runs on the starting entry dates for the business calendar that you select in the **Business Calendar** field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month. ○ **Business Calendar: Entry End**: Runs for the ending date for the business calendar that you select in the **Business Calendar** field. This selection runs in the same manner as **Business Calendar: Entry Start**, but for the end dates of the associated business calendar entries. **Note:** When you select **Business Calendar: Entry Start** or **Business Calendar: Entry End**, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. If you select a business calendar and all its business calendar spans are in the past, the job would never run since that is an invalid configuration. To learn more, see the **Offset type** and **Offset** fields. To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.
Time	Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the **Time zone** field determines the time zone for this entry.
Time zone	Time zone to use with the **Time** field entry when you specify the time at which the scheduled job should run. Select a time zone entry: ○ **-None-**: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it's the user's assigned time zone, and you enter 16 : 45 into the **Time** field. ○ **Use System Time Zone**: Use the default system time zone that is specified for the instance in which it runs.

Field	Description
	For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter 22 : 15 in the **Time** field. ○ Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select **US/Eastern**, and enter 13 : 30 in the **Time** field.
Day	Day on which the scheduled job should run. ○ If **Run** is set to **Weekly**, select the day of the week. For example, select Wednesday. ○ If **Run** is set to **Monthly**, select the day of the month. For example, select 25 for the 25th day of the month. This field appears only if you select **Monthly** or **Weekly** in the **Run** field.
Repeat Interval	Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example: ○ To run the scheduled job every four days, enter 04 in the **Days** field. ○ To run it every 26 hours, enter 26 in the **Hours** field. ○ If it should repeat at an interval of 13:30:25, enter 13 in the **Hours** field, and then enter 30 and 25 in the two unlabeled fields after it.
Advanced	Enables advanced scheduling options for greater flexibility in job planning and execution. You can configure jobs to start on a future date, end on a particular date, and define how the job should repeat. For more information, see Advanced options for scheduled jobs.
Starting	Allows you to define the beginning window of time (date and time) when you would like your job to start running. Within this window, the job actually starts at the time specified in the **Time** field. The **Starting** field appears only if you select the **Advanced** option and one of the following values in the **Run** field: ○ **Daily** ○ **Day and Month in Year** ○ **Day in Week in Month in Year** ○ **Monthly** ○ **Once** ○ **Periodically** ○ **Week in Month** ○ **Weekly** For the run type **Periodically**, the starting time is the date and time of the first scheduled job generation. For more information, see Starting and Ending fields.

Field	Description
Ending	Allows you to define the ending window of time (date and time) when you would like your job to stop running. Within this window, the job actually stops at the time specified in the **Time** field. The **Ending** field appears only if you select the **Advanced** option and one of the following values in the **Run** field: ○ **Daily** ○ **Day and Month in Year** ○ **Day in Week in Month in Year** ○ **Monthly** ○ **Once** ○ **Periodically** ○ **Week in Month** ○ **Weekly** For the run type **Periodically**, the ending time is the date and time of the first scheduled job generation. For more information, see Starting and Ending fields.
Business Calendar	Business calendar entry that you're using to determine the business calendar start or end date for the scheduled job. This field appears only if you select **Business Entry: Start Date** or **Business Entry: End Date** in the **Time** field.
Offset type	Type of time offset, if any, to apply to the business calendar that you selected for scheduling this job: ○ **Past**: Apply an offset factor to schedule the job to run before the start of the time span of the selected business calendar. ○ **Future**: Apply an offset factor to schedule the job to run after the end of the time span of the selected business calendar. ○ **--None--**: Don't apply a time offset when scheduling this job. Adding an offset factor enables you to schedule the job to run before or after the formal time span that is defined in the business calendar for the following use cases:
Offset	Amount of time offset, expressed in days, hours, minutes, and seconds, to apply to the business calendar that you selected for scheduling this job. For example, if you want to schedule the job to start three days, 14 hours, 10 minutes, and 45 seconds before the business calendar start date, do the following actions: ○ Select **Past** in the **Offset type** field. ○ Enter **3** in the **Days** field. ○ Enter **14**, **10**, and **45** in the **Hours** field.

Automatically run a script of your choosing

Schedule both conditional and non-conditional scripts. If Domain Separation is installed in the instance, you can also select, filter, sort, and schedule scripts based on their assigned domains.

Before you begin

Roles required: admin

About this task

The following is an example of a conditional script. It runs the scheduled job only if there are active incidents older than 30 days.

```
// Only run this Scheduled Job if there are active Incidents
 over 30 days old
var ga = new GlideAggregate('incident');
ga.addAggregate('COUNT');
ga.addQuery('active', 'true');
ga.addQuery('sys_created_on', '<', gs.daysAgo(30));
ga.query();
ga.next();
ga.getAggregate('COUNT') !== '0'
```

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Select **New**.
3. Select **Automatically run a script of your choosing**.
4. On the form, fill in the fields.

Schedule script execution

Field	Description
Name	Name that identifies this scheduled job.
Active	Option that indicates that scheduled job is active and should be executed at the specified date and time.
Application	Name of the application that contains the script. **Global** appears if the script is in the global scope.

© 2026 ServiceNow, Inc. All rights reserved.

Field	Description
Conditional	Option for enabling the running of the scheduled job if certain conditions are met in the associated script.
Condition	A conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select **Use conditions**. ⚠ **Warning:** Conditional scripts for scheduled report emails and Performance Analytics data collection jobs are executed in the sandbox. Therefore, function definitions aren't allowed. Some API calls and keywords are also not allowed. For more information, see Script sandbox evaluator. After upgrade, jobs with conditional scripts that contain these disallowed API components finish with errors.
Run	Time interval to use for running the scheduled job: ○ **Daily**: Runs daily, at a designated time. ○ **Day and Month in Year**: Runs yearly on a specific day and month (for example, July 14), at a designated time. ○ **Day in Week in Month in Year**: Runs yearly on a specific day of the week in a specific week of a specific month (for example, the second Monday in October), at a designated time. ○ **Week in Month**: Runs monthly during a specific week of the month (for example, the third week of each month), on designated days and at a designated time. ○ **Weekly**: Runs on a weekly basis, at a designated time and day of the week. ○ **Monthly**: Runs on a monthly basis, at a designated time and day of the month. ○ **Periodically**: Runs on a designated repeating interval. ○ **Once**: Runs for a single occurrence only. ○ **On Demand**: Runs immediately on demand. ○ **Business Calendar: Entry Start**: Runs on the starting entry dates for the business calendar that you select in the **Business Calendar** field. A scheduled job runs for the starting date of each of the business entries that you defined for the business calendar. For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month. ○ **Business Calendar: Entry End**: Runs for the ending date for the business calendar that you select in the **Business Calendar** field. This selection runs in

Field	Description
	the same manner as **Business Calendar: Entry Start**, but for the end dates of the associated business calendar entries. **Note:** When you select **Business Calendar: Entry Start** or **Business Calendar: Entry End**, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. If you select a business calendar and all its business calendar spans are in the past, the job would never run since that is an invalid configuration. To learn more, see the **Offset type** and **Offset** fields. To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.
Day	Day on which the scheduled job should run. ○ If **Run** is set to **Weekly**, select the day of the week. For example, select Wednesday. ○ If **Run** is set to **Monthly**, select the day of the month. For example, select 25 for the 25th day of the month. This field appears only if you select **Monthly** or **Weekly** in the **Run** field.
Repeat Interval	Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example: ○ To run the scheduled job every four days, enter `04` in the **Days** field. ○ To run it every 26 hours, enter `26` in the **Hours** field. ○ If it should repeat at an interval of 13:30:25, enter `13` in the **Hours** field, and then enter 30 and 25 in the two unlabeled fields after it.
Time zone	Time zone to use with the **Time** field entry when you specify the time at which the scheduled job should run. Select a time zone entry: ○ **-None-**: Use the default time zone for the logged-in user who is creating the scheduled job. For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it's the user's assigned time zone, and you enter `16 : 45` into the **Time** field. ○ **Use System Time Zone**: Use the default system time zone that is specified for the instance in which it runs. For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter `22 : 15` in the **Time** field. ○ Actual time zone. For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select **US/Eastern**, and enter `13 : 30` in the **Time** field.
Time	Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection that you make in the **Time zone** field determines the time zone for this entry.

	○ **Monthly** ○ **Once** ○ **Periodically** ○ **Week in Month** ○ **Weekly** For the run type **Periodically**, the ending time is the date and time of the first scheduled job generation. For more information, see Starting and Ending fields.
Business Calendar	Business calendar entry that you're using to determine the business calendar start or end date for the scheduled job. This field appears only if you select **Business Entry: Start Date** or **Business Entry: End Date** in the **Time** field.
Run as [Optional]	Select another user to run the script execution as. Configure the form to add this field if it is not present.
Run this script	Name of the script to run at the scheduled date and time. For example, copy script logic from a business rule, or call a script include.

5. If Domain Separation is installed in this instance, the following fields also appear for selecting, sorting, and scheduling jobs by domain.

   Note: The Domain Support - Domain Extensions Installer plugin installs these fields. To learn more, see Request domain separation.

Field	Description
Domain iterator	Check box that enables this job to run across multiple domains. If selected, the **Domain source table** and **Domain source filter** fields appear.
Domain source table	Name of the domain-separated table that is the source of the domains in which the scheduled job should run. For example, select **Department (cmn_department)** if you want to use it as the source of the assigned domains used to schedule scripts. The scheduled job determines these domains from the sys_domain field of the source table records. To learn more, see Domain assignment. **Note:** It's a good idea to create a domain-separated table solely dedicated to sourcing domains, unless you have a use case that warrants using an existing one. If you do create a new one, simply select it using this field.
Domain source filter	Optional condition you can specify to filter the records queried from the selected domain source table. **a.** Select the field to use for filtering records. **b.** Add filtering conditions and operators to narrow the domain selection criteria. To learn more, see Filters.

The following processing takes place when scheduling a job in a domain-separated instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- It first queries the selected domain source table.
- If you specified a condition in the **Domain source filter** field, it applies the filtering condition to narrow down the resulting set of records.
- Finally, it retrieves its list of unique domains from the sys_domain columns of these records.

6. Select **Update** to update the scheduled job, **Execute Now** to execute the scheduled script immediately, or **Delete** to delete the job.

Advanced options for scheduled jobs

Create a scheduled job

Enable run types for scheduled job child tables

Personalize the system date format

Set a system time zone

Domain separation for service providers

Enable run types for scheduled job child tables

The run types; **Day and Month in Year**, **Day in Week in Month in Year**, and **Week in Month**, require the fields; **Day**, **Month**, and **Year** to be visible. Child tables which don't display those fields can't create jobs with that run type selected.

Before you begin

Identify the child table for which you're configuring new run times. To find child tables, follow the instructions in Find child tables for scheduled jobs.

Role required: admin

Procedure

Configure **Run** time options:

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Select **New**.
3. Select **Automatically run a script of your choosing**.
4. Select the **Run** menu to display available choices.
   If the choices for the **Run** menu have been previously modified, the new run types won't be visible. To add them:
   a. Select and hold (or right-click) **Run** and select **Configure Choices**.
   b. Select the choices for **Run** that you want to add and select **Add**.

Find child tables for scheduled jobs

Identify child tables in scheduled jobs to promote consistent configuration across all related tables. This helps maintain data integrity and uniform processing logic throughout the table hierarchy.

Before you begin

Role required: admin

About this task

There are two ways to locate child tables of a scheduled job; either by running a script or using search parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. **Optional:** Run a background script such as:
   ```
   gs.info(GlideDBObjectManager.get().getAllExtensions('sysauto'));
   ```
   (Optional) The script is an efficient and thorough way to gather the names of all child tables to a parent table.

2. **Optional:** Search the **sys_db_object_list** table, using the search parameters: **Extends table label starts with Scheduled Job or Extends table Extends table label starts with scheduled Job or Extends table Extends table Extends table label starts with scheduled jobs.**
   (Optional) Depending on the depth of the table hierarchy, additional parameters might be needed to find all child tables.

Special cases in job schedules

Some special cases require care in job scheduling.

End of the month schedules

Because months have different lengths, take care when scheduling jobs for the end of the month.

- Scheduling an event for the 29th or 30th is not recommended, because the scheduled job is executed in months (like February) which are shorter than those dates.
- If an event is scheduled for the 31st, it executes on the last day of the month, even if the month is shorter.

For example, something scheduled to run on the 31st of the month runs on February 28 or February 29 in a leap year.

Weekday schedules

For scheduled scripts, use the following script to run only on weekdays:

Warning: Conditional scripts for scheduled report emails are executed in the sandbox. Therefore, function definitions are not allowed. Some API calls and keywords are also not allowed.

```
var isWeekday;
var today = new Date();
var dayOfWeek = today.getDay(); // Get day of the week(0 =
 Sunday, 1 = Monday, ... , 6 = Saturday)
switch (dayOfWeek) {
case 0: // Sunday
case 6: // Saturday
isWeekday = false;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
break;
default:
isWeekday = true;
}
answer=isWeekday;
```

If the conditional script on a Scheduled Report is more complex and you need to make use of our Glide classes, then please use the following steps as a workaround:

1. Create a Scheduled Job and complete all the conditional logic of the Scheduled Report inside the Scheduled Job.
2. If all the conditional logic is satisfied, you can trigger the Scheduled Report with the following script inside the Scheduled Job.

```
var schRpGr = new GlideRecord("sysauto_report");
schRpGr.get("<sys_id of the scheduled report>");
gs.executeNow(schRpGr);
```

Scheduled jobs from scripts

To execute a scheduled job triggered by an event, use the following script:

```
//Execute a scheduled script job
var rec = new GlideRecord('sysauto_script');
rec.get('name', 'YOUR_JOB_NAME_HERE');
SncTriggerSynchronizer.executeNow(rec);
```

You can run the script using one of several tables:

- scheduled_import_set (Scheduled Import Sets)
- sysauto_script (Scheduled Script Execution)
- sysauto_template (Scheduled Template Generation)
- sysauto_report (Scheduled Report)

Note: `SncTriggerSynchronizer` does not provide methods to execute scheduled jobs in the future.

Running scheduled scripts and jobs imported from another instance

Scheduled Script Execution and Scheduled Jobs are categorized as data records in the ServiceNow AI Platform, which means they are excluded from update sets. To determine if a table is included, navigate to **All** > **System Definition** > **Dictionary** and view the **Attribute** value for the table in question. Only tables with the attribute update_sync=true are included in update sets.

You can optionally export and import data records via XML. However, to prevent unexpected data changes, Schedule Item [sys_trigger] records are not created for data records imported from an XML file such as an update set. To run scheduled jobs or scripts imported from another instance, update the corresponding job or script record in the target instance.

Advanced options for scheduled jobs

Advanced scheduling options for scheduled jobs support greater flexibility in job planning and execution. You can configure jobs to start on a future date, end on a particular date, and define how the job should repeat.

When the **Run** field is set to one of the following values, an **Advanced** option displays on the scheduled job form:

- Daily: Runs daily, at a designated time.
- Day and Month in Year: Runs yearly on a specific day and month (for example, July 14), at a designated time.
- Day in Week in Month in Year: Runs yearly on a specific day of the week in a specific week of a specific month (for example, the second Monday in October), at a designated time.
- Monthly: Runs on a monthly basis, at a designated time and day of the month.
- Periodically: Runs on a designated repeating interval.
- Week in Month: Runs monthly during a specific week of the month (for example, the third week of each month), on designated days and at a designated time.
- Weekly: Runs on a weekly basis, at a designated time and day of the week.

If you select the **Advanced** option, the following advanced fields display on the form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Starting or Starting (Timezone): Specifies the beginning of a window in the future within which the job starts running. The **Time** field determines the actual start time in the window.
- Ending or Ending (Timezone): Specifies the ending of a window in the future within which the job stops running. The **Time** field determines the actual stop time in the window.
- Repeat every: Enables custom recurrence patterns. For example, a daily job that repeats every two days or a weekly job that repeats every three weeks.

Note: The **Repeat every** field isn't supported with the Day and Month in Year and Day in Week in Month in Year run types.

Starting and Ending fields

The Scheduled Job [sysauto] table has multiple **Starting** and **Ending** fields. Each field behaves differently depending on whether a time zone is selected in the **Time zone** field.

Starting and Ending field behavior by time zone selection

Column name	Column label	When used	Behavior
run_start	Starting	No time zone selected	Stores the value you enter directly. The job starts at the entered time in the time zone of the user who runs the job. By default, the user who creates the job is the user who runs the job.
entered_run_start	Starting (Timezone)	Time zone selected	Uses the value you enter and the selected time zone to automatically calculate the value of the other **Starting** [run_start] field by converting your entered time to the equivalent local time as displayed in the UI.
run_end	Ending	No time zone selected	Stores the value you enter directly. The job stops at the entered time in the time zone of the user who runs the job. By default, the user who creates the job is the user who runs the job.
entered_run_end	Ending (Timezone)	Time zone selected	Uses the value you enter and the selected time zone to automatically calculate the value of the other **Ending** [run_end] field by converting your entered time to the equivalent local time as displayed in the UI.

When setting the **Starting** and **Ending** fields, follow these guidelines based on your time zone selection:

- Time zone selected: In the **Time zone** field, select a time zone, and then enter your desired starting and ending times in the **Starting (Timezone)** [entered_run_start] and **Ending (Timezone)** [entered_run_end] fields. The system automatically calculates the values of the other **Starting** [run_start] and **Ending** [run_end] fields.
- No time zone selected: In the **Time zone** field, select **-- None --**, and then enter your desired starting and ending times in the **Starting** [run_start] and **Ending** [run_end] fields. The job runs in the time zone of the user who runs the job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you select a time zone, you must enter the starting and ending times after setting the **Time zone** field otherwise the times might be reset.

Example: Daily scheduled job with no time zone

The following example of a daily job illustrates the behavior of the **Starting**, **Ending**, and **Repeat every** fields. The daily job has the following schedule:

- **Starting** [run_start]: June 1 at 00:00
- **Ending** [run_end]: June 30 at 23:59
- **Time**: 9:00 a.m.
- **Repeat every**: 1 day

Although the job is scheduled to start on June 1 at 00:00, it doesn't run at that time. Instead, the job first runs at 9:00 a.m. on June 1 because that is the specified run time. The starting and ending times define the window of time during which the job is set to run. The first valid scheduled run within that window is when the job will run, in this case at 9:00 a.m. on June 1. When creating scheduled job records, if the value of the **Starting** field is empty, the system uses the current time.

If you change the value of the **Repeat every** field to 2, the job runs every 2 days at 9:00 a.m. starting on June 1. That means it runs on June 1, June 3, June 5, and so on, continuing every other day until June 29—the last occurrence before the ending time of June 30 at 23:59.

Related topics

Scheduled jobs

Create a scheduled job

Enable run types for scheduled job child tables

Using time configuration

Handle scheduling, set up events, track metrics, and more with this feature.

Use time configuration apps for everything from basic time and task tracking, to calendars for business and fiscal events, all customizable to any given time zone.

Creating business calendars

Create business calendars in the ServiceNow AI Platform so that you can schedule events for your users and track their time across applications. You define schedules and calendars of all types, including fiscal calendars, in the Business Calendar menu.

Business calendar components

Use the following forms when you define calendars and schedules in the Business Calendar menu:

Business calendar definition record

Identifies an individual business calendar where you can specify a reference name, labeling, parent business calendar (if any), and a time zone. A business calendar can represent any time period, and its definition record is saved in the Business Calendar [business_calendar] table.

To learn more about creating a business calendar definition, see Create a business calendar.

Business calendar entries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defines the individual entries that make up a business calendar, and saves them in the Business Calendar Entry [business_calendar_span] and Business Calendar Entry Name (business_calendar_span_name) tables. In contrast to legacy schedule entries, which have repeating and excluding time spans, you must create individual business calendar entries for all time spans in the calendar. You can also create business calendar spans across both global and scoped applications using the Script Includes **BusinessCalendarGeneratorUtil**. To learn more see Create a business calendar span using a Script includes.

To learn more about creating entries for a business calendar, see Define business calendar entries and Create business calendar entry names.

Business calendar filter options

Defines the date and time filtering options for the business calendar that you're creating. These filtering options are in addition to the standard date and time filtering in the ServiceNow AI Platform.

To learn more about creating filtering options for a business calendar, see Create a business calendar.

Calendars for package

Pairs a business calendar with a ServiceNow AI Platform package so that you can enable the calendar for use in that functional area. A package is a collection of scopes and applications that make up a functional area, such as HR Service Delivery.

To learn more about associating a business calendar with a package, see Pair business calendars with packages.

⚠ **Warning:** If you're using Performance Analytics, use caution when changing time spans. Any change you make to the time span on a business or fiscal calendar can invalidate the Performance Analytics data. Consult with a Performance Analytics administrator before making such changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fiscal calendar example

In this example, you create a fiscal calendar with 4 quarters and 12 fiscal periods.

Parent Calendar — **Fiscal Year**
Business Calendar Entry — **October 1, 20nn to September 30, 20nn**

Child Calendar — **Fiscal Year Quarter**			
Business Calendar Entries — **Each Quarter in Fiscal Year**			
Fiscal Quarter 1 **Oct 1 – Dec 31, 20nn**	**Fiscal Quarter 2** **Jan 1 – Mar 31, 20nn**	**Fiscal Quarter 3** **Apr 1 – Jun 3, 20nn**	**Fiscal Quarter 4** **Jul 1 – Sep 30, 20nn**

Child Calendar — **Fiscal Year Period**			
Business Calendar Entries — **Each Period in Fiscal Quarters**			
Fiscal Period 1 **October 1 – 31, 20nn**	**Fiscal Period 2** **November 1 – 30, 20nn**	**Fiscal Period 3** **December 1 – 31, 20nn**	**Fiscal Period 4** **January 1 – 31, 20nn**
Fiscal Period 5 **February 1 – 28, 20nn**	**Fiscal Period 6** **March 1 – 31, 20nn**	**Fiscal Period 7** **April 1 – 30, 20nn**	**Fiscal Period 8** **May 1 – 31, 20nn**
Fiscal Period 9 **June 1 – 30, 20nn**	**Fiscal Period 10** **July 1 – 31, 20nn**	**Fiscal Period 11** **August 1 – 31, 20nn**	**Fiscal Period 12** **September 1 – 30, 20nn**

- When you navigate to **Business Calendar** > **Business Calendars**, you create:
  - A business calendar with a title of Fiscal Year.
  - A calendar for quarters that belong to the fiscal year.
  - A calendar for periods with a parent of Fiscal Year or Fiscal Quarter.

  When you create the Fiscal Year Quarter child calendar, you designate that the Fiscal Year is its parent calendar. For the child Fiscal Year Period calendar, you designate a Fiscal Year Quarter as its immediate parent.
- When you create each calendar, use the Business Calendar Entries related list, or navigate to **Business Calendar** > **Business Calendar Entries** to create business calendar entries for it. For each business calendar entry, create a reference name (for example, Fiscal Period 1) and designate start and end dates for each time span within the calendar.
  - For example, the parent Fiscal Year calendar has a business calendar entry for the time span of October 1, 20nn 12:00 through September 30, 20nn 23:59:59.
  - The child Fiscal Year Quarter calendar consists of four business calendar entries, each with the start and end dates of each quarter that makes up the fiscal year.

    Note: You can also create 13 period, 445, 454 and 544 types of fiscal calendars. To learn more about these types of fiscal calendars, see Defining fiscal calendars.

  - The child Fiscal Year Quarters calendar consists of multiple business calendar entries, with the start and end date times for each period in the fiscal year.
- Use **Business Calendar** > **Calendars for Package** to pair the parent Fiscal Year 20nn calendar with ServiceNow AI Platform packages, such as HR Service Delivery or Finance Close Automation.

Business calendar schedule example

In this example, you create a work schedule for the month of December.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The work schedule consists of a parent calendar, a child calendar for the working weeks in December, and another child calendar for the working days in December.
- The December Workdays calendar consists of business calendar entries for each working day. You don't include non-work days such as Saturdays, Sundays, and company holidays.

- Use **Business Calendar** > **Business Calendars** to create a parent business calendar with a title of December Work Schedule, and a child business calendar for December work weeks. When you create the child calendar, you designate that the December Work Schedule is its parent calendar.

  Note: You can make the December Work Schedule even more granular by creating a subordinate child calendar for December workdays. In this case, its immediate parent is the December Work Weeks calendar.

- When you create each calendar, use the Business Calendar Entries related list, or navigate to **Business Calendar** > **Business Calendar Entries** to create, at minimum, one business calendar entry for it. For each business calendar entry, you give it a reference name, and designate the start and end date times for each time span within the calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For example, the parent December Work Schedule calendar is for a time span of December 1, 20nn 12:00 through December 31, 20nn 23:59:59.
- The child December Work Week calendar consists of five business calendar entries. Each entry is for the start and end dates of each calendar week in December.
- The child December Workdays calendar consists of multiple business calendar entries. Each entry is for the start and end date times for each working day in December. You don't create business calendar entries for company holidays such as New Year's Eve or New Year's Day.

- Use **Business Calendar** > **Calendars for Package** to pair the parent business calendar December Work Schedule with the appropriate ServiceNow AI Platform packages, such as Customer Service Management.

Using business calendars in place of legacy calendar and schedule definitions

The legacy functions that you may have used, on the **System Scheduler** > **Schedules** and Fiscal Calendar menus, to define schedules and fiscal calendars, continue to be supported. However, you should use the Business Calendar menu in their places to define calendars and schedules and then associate them with specific ServiceNow AI Platform packages.

Note: For Strategic Portfolio Management (SPM) applications, you must define Fiscal Calendars using the Generate a fiscal calendar feature.

- If you use the legacy functions to create fiscal calendars and schedules, the resulting definition records are internally flagged as belonging to the legacy [cmn_schedule] table hierarchy. These records appear on the lists on the Business Calendar menu, as well as on the lists on the respective menus for the legacy functions used. For example, if you defined fiscal calendars using legacy fiscal calendar functions, the resulting records appear on lists on the Business Calendar Fiscal Calendar menus.
- If you select a legacy fiscal calendar or schedule from these lists, you can only modify it using the legacy function that you originally used to create it. For example, if you select a legacy fiscal calendar, you can only modify it by using the functions on the Fiscal Calendar menu. You can't modify it with the Business Calendar menu functions.

Related topics

Using schedules and calendars

Create a business calendar

Create a definition record for an individual parent or child business calendar. You create this record so that you can easily identify a business calendar when you use it in a ServiceNow AI Platform package or functional area. A business calendar can represent any length of time, such as a week, a month, a year, or a fiscal period.

Before you begin

Role required: admin

About this task

When you create a business calendar, you specify a reference name, labeling, parent business calendar, if any, and a time zone for it.

You first create a business calendar record and then create business calendar entries for it in the Business Calendar Entries related list. To learn more about how business calendar entries work, see Define business calendar entries and Create business calendar entry names. You can also create records from the Business Calendar Entries table itself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Business Calendar Filter Options related list, you can also define the date and time filtering options for the business calendar that you're creating.

You can also create a business calendar span using a Script includes titled, **BusinessCalendarGeneratorUtil**. For more information, see Create a business calendar span using a Script includes.

Note: Fiscal calendars or schedules you may have created in the **Fiscal Calendar** or **System Scheduler** > **Schedules** menu also appear on the lists on the **Business Calendar** menu. If you select a fiscal calendar or schedule, it appears in the legacy function that you originally used to create it. You can't view or update legacy fiscal calendars or schedules using this form.

Procedure

1. Navigate to **All** > **Business Calendar** > **Business Calendars**.
2. Select **New**.
3. On the form, fill in the fields.

Business calendar form

Field	Description
Name	Unique reference name and identifier for the business calendar record. The name should be unique per domain.
Label	Unique singular label for identifying the business calendar when you perform filtering. For example, you can assign a week-long work calendar with a label of `Workweek`.
Plural Labels	Unique plural label for identifying the business calendar. For example, you can assign a week-long work calendar with a label of `Workweeks`. Use plural labels when you do filtering that is based on more than one unit in the past or future. For example, Last 2 Fiscal Quarters.
Parent	Parent business calendar to the current business calendar that you're creating. To search for an existing business calendar, select the **Lookup using list** icon ( ). For example, you created a business calendar for 2020, and an individual child calendar for each month within the year, each with its own business calendar entries. As you create a business calendar for each month, you would select 2020 as the parent calendar for each. These entries create the relationship between a parent and its child business calendars. Leave this field empty if you're creating a parent business calendar.
Application	Application that is associated with this business calendar. If you are working on an application or are creating a business calendar from an application record, the field defaults to that application. Otherwise, the field defaults to **Global**. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default. To learn more about application scoping, see Application scope
Time zone	Time zone to use for the business calendar when you specify the starting and ending times for each associated business calendar entry. Select a time zone entry:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **-None-**: Use the time zone specified in the logged in user's profile. ○ **Use System Time Zone**: Use the default system time zone specified for the instance. ○ **– Floating --**: Time zone is relative to whatever is accessing the business calendar entry at any given time. For example, if an administrator in Amsterdam creates a floating business calendar for 08:00 a.m. to 5:00 p.m., a person in San Jose, California, sees it as 08:00 a.m. to 5:00 p.m. When you define a business calendar in a specific time zone, users in different time zones see the business calendar in their own time zone. ○ Actual time zone. For example, Europe/London, US/Pacific, US/Central.
Description	Description of the business calendar.

4. Select **Submit**.
5. In the Business Calendars list, select the business calendar that you created.
6. In the Business Calendar Entries related list, create entries that define each span of time within the business calendar.
   Create, at minimum, one business calendar entry for the selected calendar.

   Note: To learn more about creating business calendar entries, see Define business calendar entries and Creating business calendars.

7. In the Business Calendar Filter Options related list, select **New** to create filtering options for the business calendar.
   You can define the date and time filtering options for the business calendar that you're creating. These filtering options are in addition to the standard date and time filtering in the ServiceNow AI Platform.

   Note: To learn more about creating business calendar filtering options, see Define business calendar filtering options.

8. Select **Submit**.

Result
A business calendar record is saved in the Business Calendar [business_calendar] table.

If you create business calendar entries in the Business Calendar Entries related list, records are created in the Business Calendar Entry (business_calendar_span) table. The records are associated with the business calendar.

If you created business calendar filter options in the Business Calendar Filter Options related list, a record is saved in the Business Calendar Filter Option (business_calendar_filter_option) table. The record is associated with the business calendar.

Create a business calendar group

For Performance Analytics and Reporting to use business calendars, organize several calendars into a business calendar group. An application might also contain a business calendar group.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can base a Performance Analytics indicator or a report on business calendars instead of the standard calendar. The business calendars themselves are too granular in scale, and have to be grouped. The report or indicator then uses that group. Work with your Performance Analytics team to design the business calendar groups.

Note: Fiscal calendars are also supported. When you generate a fiscal calendar, a corresponding business calendar group is also generated automatically.

Procedure

1. Navigate to **All** > **Business calendars** > **Business calendar group**.
2. Select **New**.
3. Name the group and save it.
   The **Business calendars** related list appears.
4. In the **Business calendars** related list, select **Edit**.
5. Choose from existing business calendars to add to the group.
   You can also create a new business calendar from this list.

   Important: Do not select business calendars that cover a period shorter than a 24-hour day for use with Performance Analytics indicators. Performance Analytics does not store times, only dates. If only reports will use the group, you can select a shorter period.

6. Select **Update** when finished.

Example: Gregorian calendar group

The Gregorian Calendar group comes with the base system. It includes the Week, Month, Quarter, and Year business calendars, which also come with the base system.

Each business calendar record (Week, Month, Quarter, and Year) also shows which groups it belongs to.

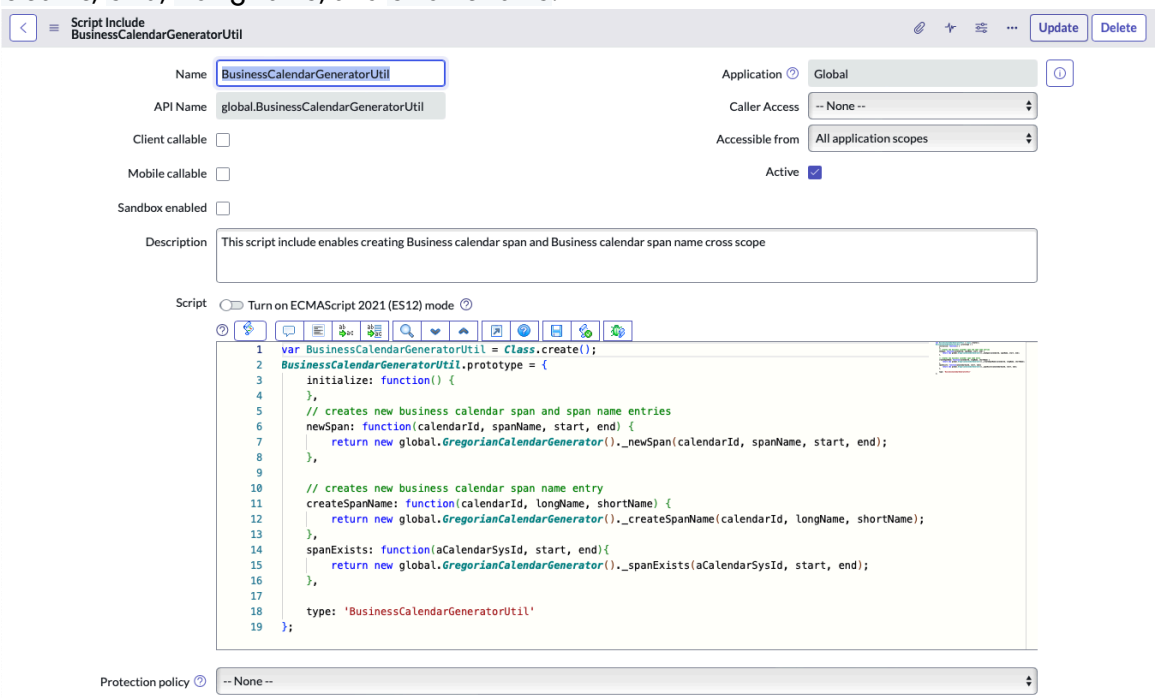
Related topics

"Indicators with business calendars" in Create an automated indicator

Create a business calendar span using a Script includes

You can generate business calendar spans and their names using the **Script includes** titled **BusinessCalendarGeneratorUtil**. The calendars you create are accessible across both global and scoped applications.

Before you begin



Role required: admin

Procedure

1. Access the **BusinessCalendarGeneratorUtil** script.
   a. Navigate to **All** and search `Script Includes`.
   b. Select the `Script Includes` option listed under **System UI**.
   c. Type `BusinessCalendarGeneratorUtil` in the search bar near the top of the form, and press **enter** or **return** on your keyboard.
   d. Select `BusinessCalendarGeneratorUtil`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Set options such as the scope of the script and who can call it (**Client callable** or **Mobile callable**), whether it's **Sandbox enabled**, and the description of the script, at the beginning of the form.
3. Modify the description of the script as needed.
4. Enter the necessary values where you see placeholders for `calendarId`, `spanName`, `start`, `end`, `longName`, and `shortName`.

5. Select **Update** to save changes.

Result

A business calendar span script includes is created. The year is appended to the beginning of the display name from the `longName` field.

Script includes

Define business calendar entries

Create business calendar entry records that define the individual time periods that make up a business calendar. You create a business calendar entry for every individual time span in the calendar.

Before you begin

Role required: admin

About this task

In contrast to legacy schedule entries that have repeating and excluding time spans, you have to create individual business calendar entries for every business calendar time span. For example, if you are creating a Fiscal Year 2020 business calendar with 13 fiscal periods, you have to create individual business calendar entries for each fiscal period. For each fiscal period, you specify start and end date times. The year is appended to the beginning of the display name, according to the information entered in the `long name` field. This helps in avoiding confusion between similarly named entries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Fiscal calendars or schedules you may have created in the **Fiscal Calendar** or **System Scheduler** > **Schedules** menu also appear on the lists on the **Business Calendar** menu. If you select a fiscal calendar or schedule, it appears in the legacy function that you originally used to create it. You can't view or update legacy fiscal calendars or schedules using this form.

To create business calendar entries and associate them with a business calendar, use the Business Calendar Entries related list in the Business Calendar form. To learn more about creating a business calendar, see Create a business calendar.

Procedure

1. Navigate to **All** > **Business Calendar** > **Business Calendar Entries**.
2. Select **New**.
3. On the form, fill in the fields.

Business calendar entry form

Field	Description
Name	Unique reference name for the business calendar entry. To select a business calendar name or to create one: **a.** To search for an existing business calendar entry name, select  . **b.** If no business calendar entry name exists and you want to create a business calendar entry name, select **New**. The Business Calendar Entry Name form appears. **Note:** To learn how to create business calendar entry names, see Create business calendar entry names.
Start	Start date and time for the business calendar period. It uses the time zone that you specified in the business calendar record that you associate with it. For example, if you're defining a fiscal period for the month of January, the starting date time is January 1, 2020 00:00
End	End date and time for the business calendar period. It uses the time zone that you specified in the business calendar record that you associate with it. For example, if you're defining a fiscal period for the month of January, the ending date time is January 31, 2020 23:59

4. Select **Submit**.
5. Select the business calendar entry that you created from the list that populates.
6. Verify that the info in the fields for the `Short name`, `Long name`, `Label`, `Calendar`, and `Application` is correct.
7. Select **Update** to save any changes and return to the list.

Create business calendar entry names

Create a name for an individual business calendar entry. You create this record so you can easily identify a specific business calendar entry when you use it in a business calendar.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Business Calendar** > **Business Calendar Entry Names**.

   Note: Alternately, you can create a business calendar entry name at the time you create the associated business calendar entry. To learn more about creating a business calendar entry, see Define business calendar entries.

2. Select **New**.
3. On the form, fill in the fields.

Business calendar entry name form

Field	Description
Short name	Abbreviated name for the business calendar entry. For example, January.
Long name	Longer name for the business calendar entry. For example, January fiscal period. It is from this field that the year is pulled and appended to the display name.
Label	Unique label for identification of the business calendar entry when you perform filtering.
Calendar	Name of the business calendar that you want the business calendar entry to belong to. This entry creates the relationship between a business calendar and the business calendar entries that define each individual time span with it. For example, if you're creating a business calendar entry for the January fiscal period, you select FY20 to associate it with Fiscal Year 2020. To select an existing business calendar: **a.** Select the **Lookup using list** icon ( ) or **b.** Select inside the **Calendar** field to view and select from a listing of recent business calendars that are created in **Business Calendar** > **Business Calendars**. **Note:** If you attempt to use the **Lookup using list** icon ( ) and see a dialog box with **Cancel** and **Leave** options, select **Cancel** and then select inside the **Calendar** field to select from a listing of recent business calendars.
Calendar type	Select the type of calendar. By default, no option is selected. The base system options are, **Business calendar** and **Fiscal calendar**. You can add other choices for the calendar type by extending the table and adding the choices you prefer. For scoped applications, you should extend the table with in the scope, create a choice list, then add choices from the choice set.
Application	Application that is associated with this business calendar. If you are working on an application or are creating a business calendar from an application record, the field defaults to that application. Otherwise, the field defaults to **Global**. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default. To learn more about application scoping, see Application scope

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

Records are created in the Business Calendar Entry (business_calendar_span) and the Business Calendar Entry Name (business_calendar_span_name) tables. If you create business calendar entries in the Business Calendar Entries related list in the Business Calendar form, these records are also associated with the specific business calendar.

Define business calendar filtering options

Define date and time filtering options for a business calendar. These filtering options are in addition to the standard date and time filtering in the ServiceNow AI Platform. You can provide your users with additional filtering options when they use the business calendar with ServiceNow AI Platform packages and functional areas.

Before you begin

Role required: admin

About this task

To learn more about standard filtering options, see Values for date/time fields.

Note: The easiest way to create business calendar filtering options and associate them with a business calendar is to use the Business Calendar Filter Options related list in the Business Calendar form. To learn more about creating a business calendar, see Create a business calendar.

Procedure

1. Navigate to **All** > **Business Calendar** > **Business Calendar Filter Options**.
2. Click **New**.
3. On the form, fill in the fields.

Business calendar filter options form

Field	Description
Period	Number of periods that should be traversed forward, backward, or both, for the business calendar. For example, if the business calendar reflects a week: ○ Provide a filter option for the current week by entering 0 for the base period. ○ Provide a filter option for a previous period by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter -1 for the last period, or enter -2 for two periods ago. ○ Provide a filter option for a future period by entering a positive number. For example, enter 1 for the next period, or enter 2 for the next two weeks. If the business calendar reflects a week: ○ Provide a filter option for the current week by entering 0 for the base period. ○ Provide a filter option for a previous period by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter -1 for the last period, or enter -2 for two periods ago. ○ Provide a filter option for a future period by entering a positive number. For example, enter 1 for next period, or enter 2 for the next two weeks. If the business calendar reflects a fiscal year with 13 periods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Provide a filter option for the current fiscal year by entering `0` for the base period. ○ Provide a filter option for a previous fiscal year by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter `-2` for two fiscal periods ago, or enter `-13` for the last fiscal year. ○ Provide a filter option for a future fiscal year by entering a positive number. For example, enter `13` for the next fiscal year. If the business calendar reflects a fiscal year with four fiscal quarters: ○ Provide a filter option for the current fiscal quarter by entering `0` for the base period. ○ Provide a filter option for a previous fiscal quarter by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter `-1` for the last fiscal quarter, or enter `-2` for the last two fiscal quarters. ○ Provide a filter option for a future fiscal quarter by entering a positive number. For example, enter `1` for the next fiscal quarter, or enter `2` for the next two fiscal quarters.
Calendar	Name of the business calendar that you want the filter options to belong to. To select a business calendar, or create a new one: **a.** Search for an existing business calendar by clicking  . **b.** If no business calendar exists, or if you want to create a new business calendar, click **New**.
Application	Application that is associated with this business calendar. If you are working on an application or are creating a business calendar from an application record, the field defaults to that application. Otherwise, the field defaults to **Global**. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default. To learn more about application scoping, see Application scope

Note: Within a calendar filtering option record, you can only associate a business calendar with a single filter option. To create multiple filtering options, you have to create multiple filtering option records, each with its own period entry.

4. Click **Submit**.

Result

Records are created in the Business Calendar Filter Option (business_calendar_filter_option) table. If you create business calendar filtering options in the Business Calendar Filter Options related list in the Business Calendar form, these records are also associated with the specific business calendar.

Pair business calendars with packages

Pair a business calendar that you created with a package, or functional area, in the ServiceNow AI Platform. When you associate a business calendar with a package, it enables the use of the calendar in that specific functional area. Until you pair a business calendar definition with at least one package, it remains a definition record only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
A package is an application, or generic set of functions, such as HR Service Delivery or Finance Close Automation, in the ServiceNow AI Platform. For example, if you created a fiscal calendar, you can associate it with the Finance Close Automation package.

Note: Within a single calendar package record, you can only associate a business calendar with a single package. To associate business calendars with multiple packages, you have to create multiple calendar package records. For example, if you created a fiscal calendar and want to associate it with the HR and Fixed Assets packages:

- In the first record you create, in the **Calendar** field, select the fiscal year, and in the **Package** field, select **HR**.
- In the second record you create, you again select the same fiscal calendar, and then select **Fixed Asset** in the **Package** field.

Procedure
1. Navigate to **All** > **Business Calendar** > **Calendars for Package**.
2. Select **New**.
3. On the form, fill in the fields.

Package form

Field	Description
Calendar	Name of the business calendar that you want to associate with a ServiceNow AI Platform package. Select  to access Business Calendars where you can search for an existing business calendar. If there is no existing calendar, you can create a new one.
Package	Name of the ServiceNow AI Platform package that you want to associate with the selected business calendar. Select  to access Packages where you can search for an existing package. If there is no existing package, you can create a new one.

4. Select **Submit**.

Result
A record is created in the Calendars for Package (calendars_for_package) table that associates the selected business calendar with a ServiceNow AI Platform package.

Defining fiscal calendars

Create fiscal calendars with defined fiscal periods, for use with Financial Management applications, such as Finance Close Automation. You can define fiscal periods, such as one month long, four weeks long, Q1 2015, or July 2015.

To create a fiscal calendar, activate the Fiscal Calendar [com.snc.fiscal_calendar] plugin. You can then use the legacy functions on the **Fiscal Calendar** menu to generate and validate fiscal calendars and their associated fiscal periods. You can create one of these types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calendar type	Description
Regular	A calendar with 12 periods, each of which is one month long.
13 Period	A calendar with 13 periods, each of which is four weeks long. **Note:** This calendar is the only type that doesn't use quarters.
445	A calendar that divides a year into subsequent 4-week, 4-week, 5-week periods. The first and second periods have four weeks, and the last has five weeks. The application creates these periods for the calendar duration.
454	A calendar that divides a year into subsequent 4-week, 5-week, 4-week periods. The first period has four weeks, the second has five weeks, and the third has four weeks. The application creates these periods for the calendar duration.
544	A calendar that divides a year into subsequent 5-week, 4-week, 4-week periods. The first period has five weeks, and the second and third have four weeks.

Important: After you start working with a set of financial data with a fiscal calendar type, you can't change to another type of fiscal calendar. Verify that your fiscal calendar can be used with your financial data. If you import records into the Fiscal period [fiscal_period] table, you should validate that they're correct and don't contain any gaps.

After the fiscal calendar has been generated, don't change either **Start date time** or **End date time** fields of fiscal period records to avoid validation issues.

Note:

- The legacy functions that you may have used, on the **System Scheduler** > **Schedules** and Fiscal Calendar menus, to define schedules and fiscal calendars, continue to be supported. However, you should use the Business Calendar menu in their places to define calendars and schedules and then associate them with specific ServiceNow AI Platform packages. To learn more about defining and using business calendars, see Creating business calendars.
- For Strategic Portfolio Management (SPM) applications, you must define Fiscal Calendars using the Generate a fiscal calendar feature.

Activate Fiscal Calendar plugin

If you have the admin role, you can activate the Fiscal Calendar plugin (com.snc.fiscal_calendar). This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Generate a fiscal calendar

You can generate a fiscal calendar for a specified time period.

Before you begin

Role required: fiscal_calendar_admin

About this task

Important: Once you start working with a set of financial data with a fiscal calendar type, you cannot change to another type of fiscal calendar. Verify that your fiscal calendar can be used with your financial data.

Note: Instead of generating fiscal calendars, can also use the Business Calendar functions to create fiscal calendars. To learn more about creating business calendars and schedules, see Creating business calendars.

Procedure

1. Navigate to **All** > **Fiscal Calendar** > **Generate**
2. In the **Fiscal Calendar Types** section, select the type of fiscal year calendar.
3. In the **Fiscal Calendar Configuration** section, fill in the fields.

Field	Description
Fiscal Unit	Base unit for the calendar. ○ **Month**: Generate fiscal calendar with monthly periods. ○ **Quarter**: Generate fiscal calendar with quarterly periods.
Start Month	Month that is the beginning of your fiscal year.
Start Year	Starting year for the calendar.
Prefix for Year	Prefix that the application uses in the name of the records that represent the fiscal year.
Prefix for Quarter/Period	Prefix that the application uses in the name of the records that represent the fiscal quarter or period.
Start Day	Day that represents the beginning of each month.
End Year	Ending year for the calendar.
Prefix for Month/ Period	Prefix that the application uses in the name of the records that represent the month or period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Generate Calendar**.
5. Navigate to **System Definition** > **Fiscal Periods** and verify that the monthly, quarterly, and annual fiscal period records exist.

View, modify, and validate fiscal periods - Legacy

After you generate a fiscal calendar, you can view fiscal period records, modify the start and end date, deactivate a fiscal period if necessary, and validate.

Before you begin

Role required: fiscal_calendar_user

Procedure

1. Navigate to **All** > **System Definition** > **Fiscal Periods**.
2. Open any of the fiscal periods (see table for field descriptions) to view, modify, or deactivate.

Fiscal period form

Field	Description
Name	Name of the fiscal period.
Start date time	Date the fiscal period starts.
End date time	Date the fiscal period ends.
Fiscal Type	[Read-Only] Type of period, either **Year** or **Quarter**.

3. Validate the fiscal periods to ensure that there are no gaps and that they match a valid style of calendar.
   a. To validate, return to the list view of fiscal periods and click **Validate Periods**.

Set a system time zone

Set your system time zone with a system property.

Before you begin

Role required: admin

About this task

The ServiceNow AI Platform stores time values in Universal Coordinated Time. Times appear globally based on the system time zone (glide.sys.default.tz), or if specified, based on user settings.

Procedure

1. Navigate to **All** > **System Properties** > **System**.
2. Locate the property **System timezone for all users unless overridden in the user's record** [glide.sys.default.tz].

   By default, the field is empty. If you have not defined a time zone for this property, *America/Los Angeles* is the default.

   For more information on setting the default time, see Configure Next Experience language and region preferences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Add a time zone in the format Country/City or using the name of a time zone (for example, *GMT*) and select **Save**.

   For available values, see Time zone representation.

   The new system time zone automatically cascades to all users who don't already have a specified time zone. If a user selects a different time zone, or if the administrator selects a different time zone for them, the selected time zone is assigned to the user. The system time zone isn't used.

Change the time zone choice list

Wherever users have a choice of time zone, the choices are populated using the **Time Zone** choice list on the `User [sys_user]` table. Not all time zones appear by default.

About this task

To add or remove time zones from the list of time zones:

Procedure

1. Navigate to **All** > **User Administration** > **Users** and open any user record, or click **New**. Notice that the default time zone is **System (America/Los_Angeles)**.
2. Right-click the Time zone label, and then select **Configure Choices**.
3. Highlight the desired time zone from the **Available** or **Selected** lists, and then **Add** or **Remove** the time zones as needed.

Change a time zone in a scheduled report

By default, scheduled reports use the time zone of the user who runs them (the user in the **Run As** field) to evaluate the query parameters. You are able to change this time zone.

About this task

For example, a report on 'incidents open today' resolves 'today' based on the user's time zone. To manually specify the time zone used to resolve the parameters of the report:

Procedure

1. Navigate to **All** > **Reports** > **Scheduled Reports**.
2. Choose the report with the time zone you want to edit.
3. Add Run as fields to the layout.

   a. Configure the form layout to add the **Run as tz** field to the **Scheduled Report** form. See Configuring the form layout for instructions.
   The Run as tz field lets you choose either a the time zone of the user who configured the schedule, or a specific time zone.

   b. **Optional:** Configure the form layout to add the **Run as [+]** field to the **Scheduled Report** form. See Configuring the form layout for instructions.
   The Run as [+] field lets you choose a specific user to run the report as.

4. Select the time zone you would like to use.
5. **Optional:** Select the user to run the report as.
6. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change a time zone in a scheduled data import

By default, scheduled data imports are run using the time zone of the user who creates them. However, there is a way to manually specify the time zone for the import.

About this task

To change the time zone of the scheduled data import:

Procedure

1. Configure the form to add the **Run As tz** field to the **Scheduled Data Import** form.
2. Select the appropriate time zone.
3. Click **Update**.

Define a relative duration

Define relative durations to calculate duration time for SLAs based on business schedules and specific time requirements.

Before you begin

Role required: admin

About this task

Relative durations calculate time periods based on business schedules. You can customize existing relative durations or create new ones to meet specific SLA requirements.

Procedure

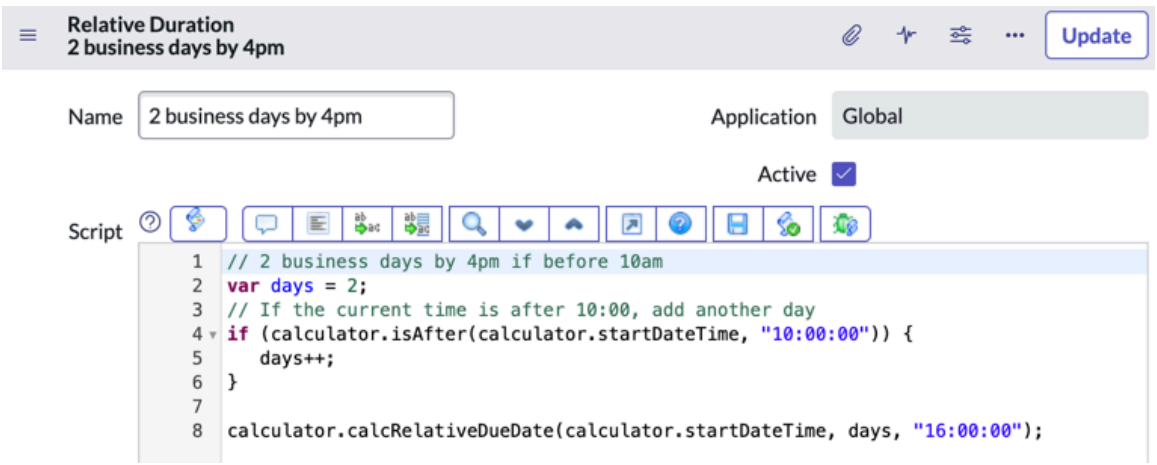
1. Navigate to **System Scheduler** > **Relative Durations**.

   Four base relative durations are available:

   - Two business days by 4pm
   - Three business days by 4pm
   - Next business day by 4pm
   - End of next business day

   Note: The business schedule you use defines business day durations. If you define no schedule, durations default to 24 x 7.

2. Select a relative duration to view or modify its configuration.
3. Customize the script variables and logic as needed for your requirements.



Example:

The **End of next business day** relative duration shows how to configure a basic calculation. The *days* variable is set to one because the result should land one day in the future. You can customize the end time (currently set to 5pm) in the script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **2 business days by 4pm** relative duration demonstrates conditional logic. The script includes an if-statement that checks whether the calculated time is after 10am. If it is, an extra day is added to the calculation. Therefore, the description reads `2 business days by 4pm if before 10am`.

The end time of 17:00 is hard-coded into the relative duration script and is not related to the associated schedule. To change the end time from 5pm, modify the script directly.

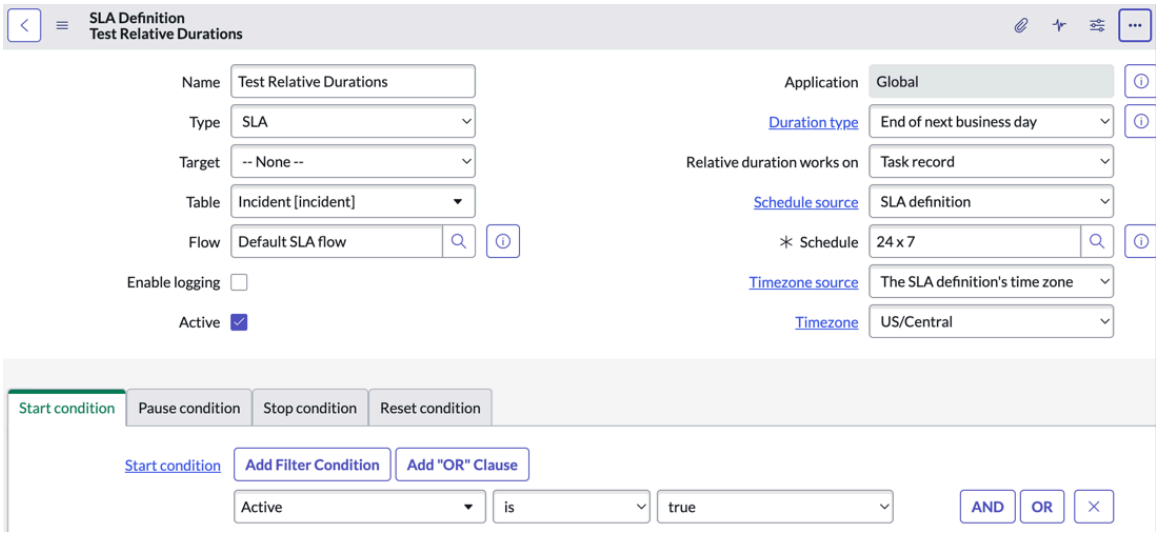
Use a relative duration

When you define an SLA, you can set the **Duration type** to be a relative duration.

Before you begin

Role required: admin

About this task



When using relative durations, you can also use the **Relative duration works on** field. It calculates against the SLA record, or the task record that the SLA record is used for.

This example demonstrates how a relative duration of *End of next business day* works.

Procedure

1. Create an SLA that has a relative duration of **End of next business day**.
2. Complete the rest of the fields of this SLA with the values as shown, also setting a Timezone if you want.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To show how this Relative Duration works, create a new incident.

   The SLA starts for this incident. In the **Task SLAs** related list, if you look at the **Business time left** and **Start time** fields, notice that the time left is until the next business day at 5pm.

   Note: Pause conditions are not compatible with Relative Durations.

Create schedule entries in the Schedule calendar

Add events such as meeting, time-off, or appointment to display them in the schedule calendar.

Before you begin

Role required: schedule_admin, itil_admin, admin

About this task

You can add and analyze the events using a calendar view. You can also do this in a time line view for a given day, week, or month, which is defined as four weeks in the time line view.

A calendar view displays events for a specified time period. A time line view displays all events for the selected time line in the calendar.

Procedure

1. Navigate to **All** > **System Scheduler** > **Schedules** > **Schedules**.
2. Select a schedule.
3. Select **Show Schedule** related link.
   Using the Next Experience user interface, you can view the schedules in the schedule calendar for all schedule types except the roster type. The schedules of roster type display in the on-call schedule.
4. Create a schedule entry.

   a. Do any of the following to open the **Add event** form:
      - Select a day in the calendar.
      - Drag the span of days for which you want to create the event.

   b. In the **Name** field, enter a name for the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. From the **Type** menu, select the type of event.

d. From the **Show as** field, select the status you want to display for this event.

e. In the **Start** field, select the calendar icon and select the start date for the event.

f. In the **End** field, select the calendar icon and select the end date for the event.
If the event is for the entire day, select **All Day**.

g. From the **Repeats** menu, select how often you want this event repeated.

h. Select **Save**.

- The schedule entry displays in the calendar for that time period and is based on the user's time zone.
- You can reschedule an event by dragging and moving it to another date. You can also update that particular occurrence or all occurrences for an event.
- You can click on an event to view the details in a pop-up display and edit or delete the event by selecting the respective icon.
  - When you add or edit an event, the time zone in the event displays the **Timezone** field value from the schedule record.

    Note: If the **Timezone** field value is **Floating**, then the time zone isn't displayed.

  - When you add or edit an event, the calendar uses the start and end dates from the time zone of the schedule.

    Note: If the **Timezone** field value is **Floating**, then the calendar uses the start and end dates from the time zone of the logged-in user.

Time configuration references

This section provides information on properties of time configuration.

Time zones

All times are stored in Coordinated Universal Time (UTC) and appear globally based on the system time zone. However, times appear to users in their local time zone, according to their user preference settings.

Time zone representation

Time zones that have the Country/City format are primary time zone IDs. Other time zone IDs are links to the primary time zone.

- For example, US/Pacific is a link to the America/Los_Angeles time zone. Both America/Los_Angeles and US/Pacific represent Pacific Standard Time with the same zone offset and Daylight Savings Time (DST) schedule.
- Other than the representation, there is no impact on date and time functionality.

In the absence of a default time zone for the user or the system, JVM reads default time zone information from the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Depending on how the server is configured, it might return the Country/City or link, for example, US/Pacific or America/Los_Angeles.
- Administrators should configure their system with a default time zone `glide.sys.default.tz` to avoid system dependencies. For more information, see Time zone representation.

Daylight Saving Time

In general, if you specify a time zone based on location (for example, **America/Los Angeles**), the system automatically adjusts for daylight saving time.

- If you specify a time zone based on the time zone name (for example, **GMT**), which is discouraged, it does not typically adjust for daylight saving time. There are however exceptions to these guidelines.
- For more detailed information on how daylight saving time is handled in Java, see https://www.iana.org/time-zones and https://en.wikipedia.org/wiki/Tz_database.

User preferences

Once the System Time Zone is defined, users can also select their own time zone from their user form, accessed through **Self-Service** > **My Profile**.

Note:

The System default appears as **System ([name of the default time zone])**. For example, if the System time zone is **America/Los_Angeles**, the user sees **System (America/Los Angeles)**.

Java time zone class

The ServiceNow AI Platform supports all Java time zone class time zones. To view a listing of these time zones:

1. In the **Type filter text** field, enter `sys_user.list`.
2. Open one of the user records in the listing.
3. Right-click the **time zone** field and select **Show Choices**.

The resulting list is a complete listing of available time zone IDs.

Time zones in email notifications

The date and time stamp of a notification uses the **system time zone** and not the time zone of any recipient.

Note:

The *glide.email.append.timezone* property in **System Properties** > **Email** controls whether to append the time zone. If set to true, the system time zone of the instance is appended to any dates or date/times in outbound email messages (for example, 2010-07-02 04:01:14 PST).

Time zones in service level agreements

Service level agreements have different options for which time zone to use. To set a time-zone for SLAs, navigate to the SLA definition and locate the **Timezone source** field, and select an option.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Some special considerations:

- If you select the time zone for the caller, unpredictable behavior can occur if the caller does not have a time zone defined.
- If you select the time zone for the SLA definition, you must manual specify the time zone on the form for the SLA.

Time zone in scripting

When you create scripting on the server, the script uses several `GlideSystem` date and time functions to obtain time values. For more information about specific methods and to learn the format in which each returns the requested time, see the GlideSystem API.

Enhancements

DST enhancement requires that reports and queries observe Daylight Saving Time rules. Changes affect trend charts, line charts, and filters using the "trend on" operation.

Time zone changer

The time zone changer is active by default. Users can change their time zone for the current session in the system settings (the gear on the top right of the banner). At the next login, the time zone setting reverts to the system default, or user profile setting for time zone.

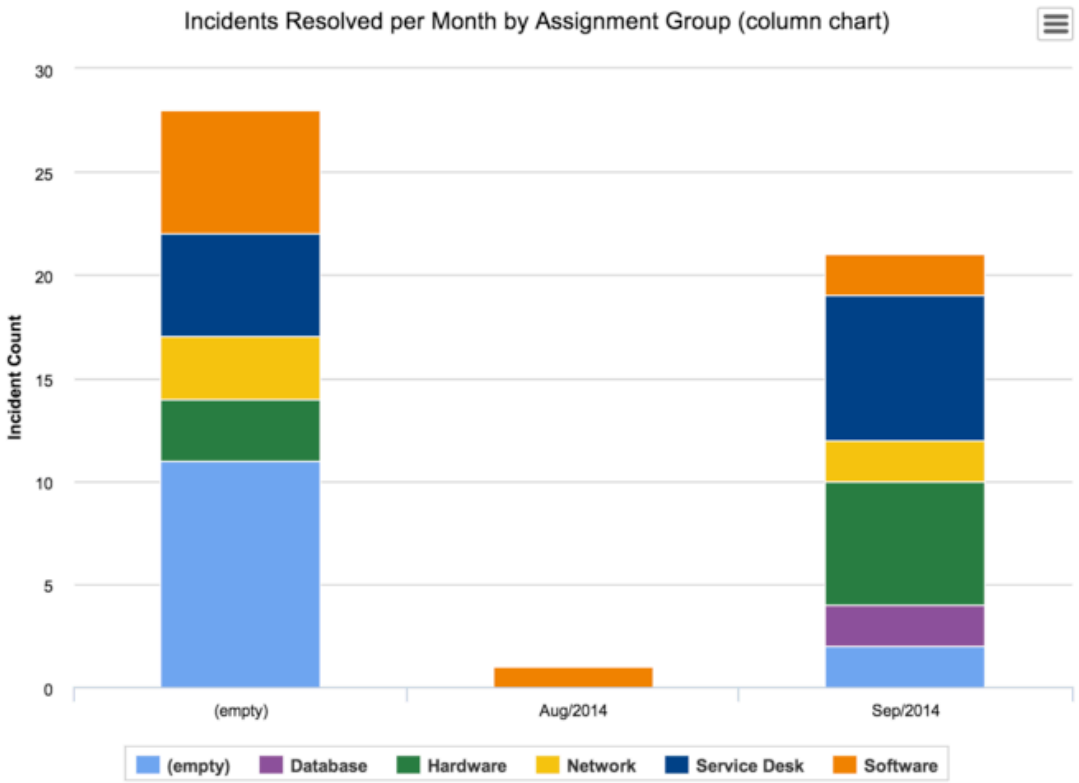
Change a time zone in a scheduled report

Change a time zone in a scheduled data import



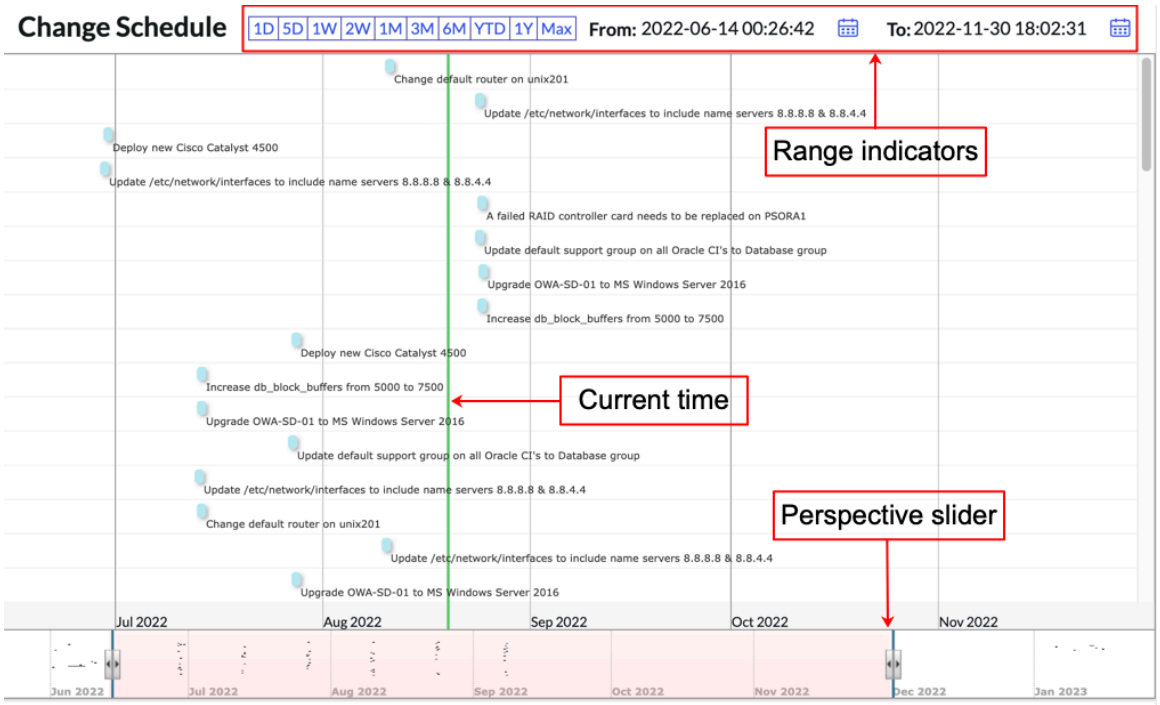
Viewing record information over time

You can use three different interfaces to view record information over time: reports and performance analytics, timeline pages, and schedule pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reports and performance analytics

Report example

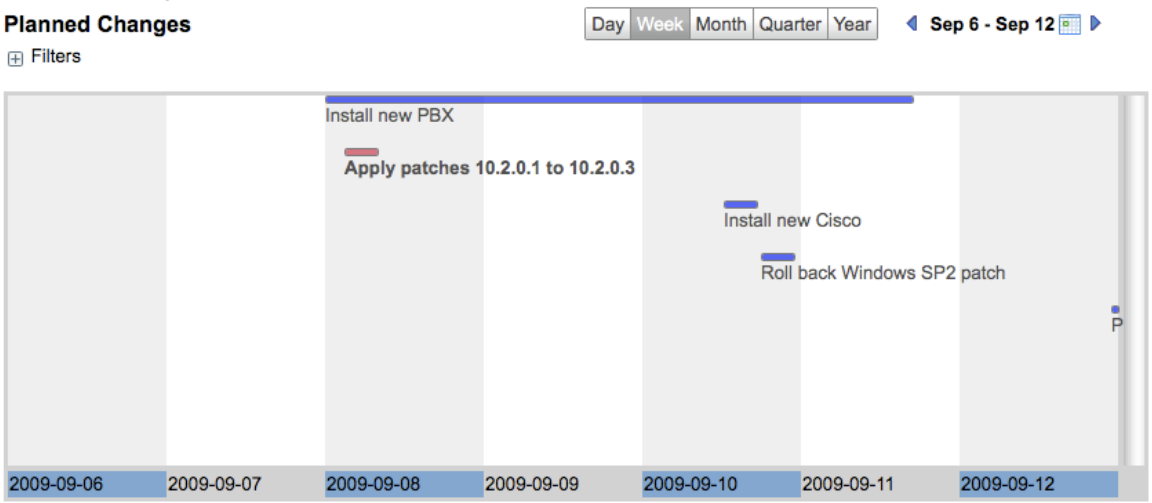


You can visualize data using Reporting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timeline pages

Timeline pages example



This type of page enables you to define linear time lines from records with time information.

This type of page enables you to define linear time lines from records with time information.

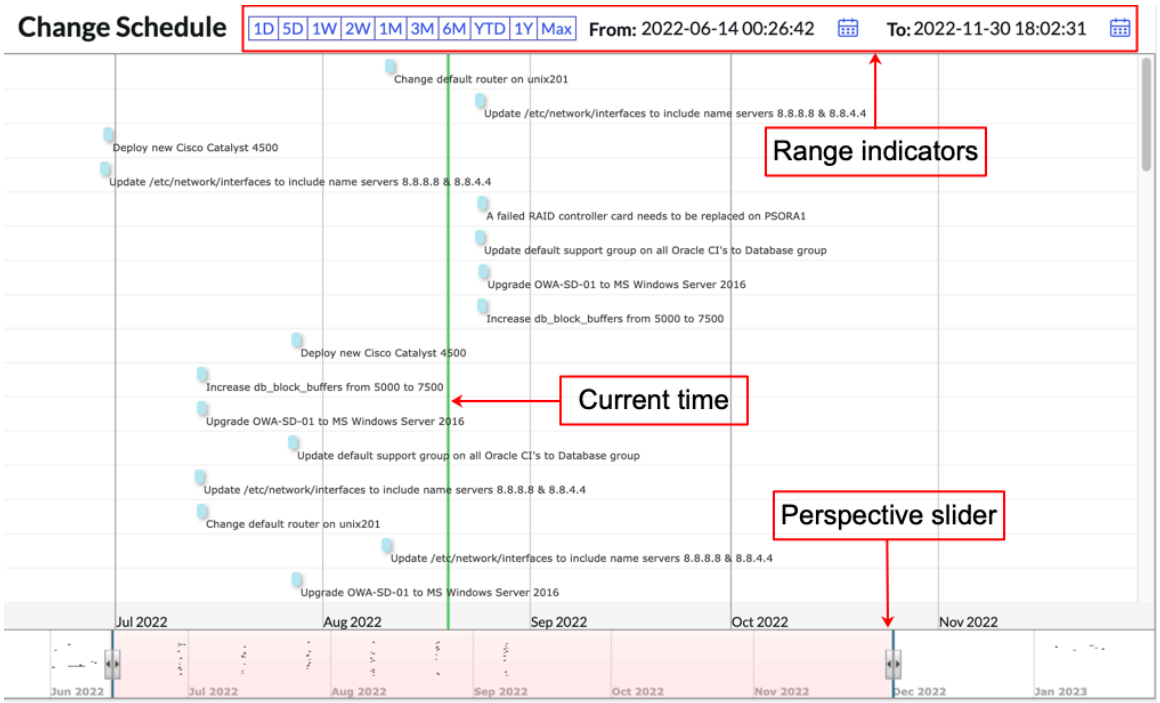
Schedule pages

Schedule pages example

Timeline pages

Use timeline pages to track any activity bounded by two dates, such as change request start and end dates, or incident open and close dates. Administrators can create timeline pages, which are user interactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Features

- Make selected timelines available to users by role.
- Select perspective from daily to yearly views.
- Create dynamic labels for timeline spans.
- Configure tooltips for each span.
- Permit span dragging and resizing by users.
- Lock timelines to prevent editing.

Viewing timelines

By default, only administrators have a module to access timeline records. ITIL users can only view timelines by selecting a context menu item from an incident record.

Timeline View

Administrator role users

Users with an administrator role can view timelines from the timeline page records.

1. Navigate to **System UI** > **Timeline Pages**.
2. Select a timeline record to view.
3. Click **View Timeline**.

Other users

By default, timeline metrics only appear for incident records. ITIL users can view timelines associated with any task record where the metrics are set to appear as timeline records. To view the Assigned to duration and the State duration metric timelines, ITIL users can select the **Metrics Timeline** context menu UI action.

1. Navigate to active task record, such as an incident.
2. Right-click the banner, and select **Metrics Timeline**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To enable non-administrators to view other timelines, create a custom module.

Timing functionality

Timing functionality are tools that exist to answer the question "How Long?"

Related topics

- Time worked fields
- Time configuration SLAs
- Metric definitions

Metric definitions

Defined metrics can track how long an audited field holds a certain value.

For instance, a metric can track how long an incident is assigned to an individual, or how long an incident is in the state *Active*.

See Metrics for more information.

Time configuration SLAs

Service Level Agreements time how long a task meets a certain condition, and is primarily used to ensure that tasks are handled within a pre-determined time limit.

SLAs define the following conditions:

- Start Conditions
- Pause Conditions
- Stop Conditions

Once a task meets the Start Conditions, the SLA will time how long the task remains in that condition (unless it meets Pause Conditions). The timer will end if the Stop Conditions are met. If the time-limit is passed, the SLA will be marked *breached*.

Notifications can be driven off of the SLA to warn interested parties as the time limit approaches.

Time worked fields

The Task [task] table provides a time-tracking field called **Time worked**. This field measures how long a record has been viewed in order to measure work time on a ticket.

Any table that extends Task can use this field. To add the field, Personalize a form.

As the record is viewed, the timer counts upward. To pause the timer, click the stop icon ( ).

To resume the timer, click the start icon ( ).

When the task is saved, the amount of new time in the timer is used to generate a record on the Time Worked [task_time_worked] table. This table can be viewed as a related list on the task form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the time displayed in the **Time worked** field displays a cumulative value stored in the task record. If you modify a Time Worked record, the changes will not be reflected in the task timer.

You can set the property `com.snc.time_worked.update_task_timer` to enable updating of the task timer value based on changes to the time worked records. This is accomplished through the **Update task timer** business rule.

Note: Timer fields, such as Time Worked, do not display correctly in Service Portal. For more information and a workaround, see the Timer fields do not display the correct data in Service Portal [KB0752404] article in the Now Support Knowledge Base.

Related topics

Timing functionality

Create a timeline page

Create a timeline page to track any activity bounded by two dates.

Procedure

Navigate to **System UI** > **Timeline Pages** and create a new record (see table for field descriptions).

Creating a timeline page

Field	Description
Name	Unique name that describes the function of this timeline. For example, `High Priority Change Requests`.
Table	Name of the table associated with this timeline, such as Change Request `[change_request]`.
Start date field	Time-related field from the specified table to use as the start date for the timeline. The timeline begins with the span for the record with the earliest start date from this field, after it applies the filter and sort order. For example, you can select **Updated** as the start date field. It then starts the span for each active change request on the date it was updated to a high priority.
End date field	Time-related field from the specified table to use as the end date for the timeline. The timeline ends with the span for the record with the latest date from this field, after it applies the filter and sort order. For example, you can select **Closed** as the end date field and display all high priority change requests by the date on which they were closed.
Display Options	
Show grid lines	Select this check box to show horizontal background shading to highlight alternate spans.
Show left pane	Select this check box to show label text in a pane on the left of the timeline. The text that appears in this pane is defined in **Span text fields**.
Show summary pane	Select this check box to show the pink, perspective slider at the bottom of the timeline. Move the slider from right to left to scroll across the chart. Adjust the end points of the slider to change the magnification. A narrow slider zooms in on the spans and provides a more detailed view. A wide slider pulls the view out and makes more of the timeline visible on the screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Auto refresh	Select an automatic refresh interval or disable automatic refresh. When auto refresh is disabled, the timeline adjusts only when the browser is manually refreshed or when a start or end date field is updated in a record.
CSS span color	Enter a custom span color using any CSS color format, such as RGB or hexadecimal. If this field is blank, the default span color, light blue, is used. The dark blue color indicates tasks that have a planned start date only, with no planned end date. Adding a planned end date updates the color to light blue.
Show span text	Select this check box to display the content of the **Span text fields** as labels below each span.
Span text fields	Select fields from the specified table to have those values appear as span labels. For example, you might select **Number** and **Short description**. The span labels also appear in the left pane if the left pane is visible.
Show tooltips	Select this check box to display tooltips when the cursor rests on a span.
Tooltip text fields	Select from the specified table the fields whose values appear as tooltips. For example, you might select **Category**, **Assigned to**, and **Due date**.
Filtering and Sorting	
Condition	Create a condition to filter the results that appear in the timeline. For example, a condition that displays only active, high priority incidents. Add the condition count to a condition field to preview what records will be returned by this condition set.
Perform custom sort?	Select this check box to enable custom sorting. Configure the sort order by selecting fields in the **Sort by** and **Sort by order** fields.
Sort by	Select any field in the list for sorting the spans in the timeline. Common practice is to select either the **Start date field** or the **End date field** as the sorting field. If you select a different sorting field, also include that field in the list of **Tooltip text fields** to give users a way of discovering the sort criteria.
Sort by order	Select the sort order for the sorting fields selected.
Interactive Options	
Allow horizontal moving?	Select this check box to permit users to drag timeline spans horizontally. Dragging changes the start and end dates and updates the record.
Allow start time dragging?	Select this check box to permit users to update the record by dragging the start time of a span.
Allow end time dragging?	Select this check box to permit users to update the record by dragging the end time of a span.
Range calculator	Specify a script include that Using DurationCalculator to calculate a due date range restrictions and processes parent updates, if appropriate.

Customize the timeline page span style

The Timeline Page Span Styles related list allows you to define conditional span styles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System UI** > **Timeline Pages**.
2. Open the timeline page for which you want to define the span style.
3. Go to the Timeline Page Span Styles related list and click **New**.
4. Fill in the form and click **Submit**.

Customizing timeline page span styles

Field	Description
Condition	Condition Builder that filters the results that appear in the timeline.
Label color	Color for the text under each span.
Label decoration	Character style for the text under each span: **Bold**, **Italic**, **Underline**, or **Line-through**.
Order	Number to determine the sequence in which the style conditions are evaluated. Style conditions with a lower order are evaluated first.
Span color	Color of each span.
Timeline page	Timeline page to which the span style applies. By default, the span applies to the current timeline.

Timeline sub item

Use the Timeline Sub Items related list to define child spans for the timeline, based on records in a table that references the parent timeline's table.

About this task

You can create a timeline sub item generate a hierarchical relationship, starting from a timeline page to any number of levels. For example, if there is a timeline page for a release, the sub item might be sprints, and the sprint might have stories as a sub item.

Procedure

1. Navigate to **All** > **System UI** > **Timeline Pages**.
2. Open the timeline page for which you want to add a sub item.
3. Go to the Timeline Sub Items related list and click **New**.
4. Fill in the form (see table for field descriptions) and click **Submit**.

Timeline Sub Items

Field	Definition
Parent	[Read-only] Identifies the parent of the timeline sub item.
Name	Enter a unique name that describes the function of this timeline. For example, Sprints for late Priority Changes.
Table	Select the table called by this timeline. The selected table must contain at least one field that references the table you selected for the parent timeline page. For example, if the parent timeline page uses the Scrum Release [rm_release_scrum] table, you might choose the Sprint [rm_sprint] table for a timeline sub item.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Start date field	Select a time-related field from the specified table to use as the start date for the timeline. For example, Planned start date.
End date field	Select a time-related field from the specified table to use as the end date for the timeline. For example, Planned end date.
Parent Reference Column	Select a reference field on which to base the timeline connection between the sub item records and the parent records. ○ If multiple reference fields are available, choose the reference field that forms part of the hierarchy modeled by this timeline. ○ If this list is blank, the sub item table contains no reference fields to the parent table. In this case, you must choose a different table for the sub item. ServiceNow uses the parent reference column to determine which records appear at each level of the timeline.
Display Options	
CSS span color	Enter a custom span color using any CSS color format, such as RGB or hexadecimal. If this field is blank, it uses the default span color, light blue. The dark blue color indicates tasks with a planned start date only, with no planned end date. Adding a planned end date updates the color to light blue.
Span text fields	Select fields from the specified table to have those values appear as span labels. For example, you might select **Number** and **Short description**. If the timeline displays the left pane, span labels also appear in the left pane
Tooltip text fields	Select fields from the specified table to have those values appear as tooltips. For example, you might select **Category**, **Assigned to**, and **Due date**.
Filtering and Sorting	
Condition builder	Create a condition to filter the results that appear in the sub item. For example, you might create a condition that displays only active, high priority incidents.
Perform custom sort	Select this check box to enable custom sorting. Configure the sort order by selecting fields in the **Sort by** and**Sort by order** fields.
Sort by	Select any field in the list for sorting the spans in the timeline. Common practice is to select either the **Start date field** or the **End date field** as the sorting field. If you select a different sorting field, also include that field in the list of tooltip text fields to give users a way of discovering the sort criteria.
Sort by order	Select the sort order for the sorting fields selected.
Interactive options	
Allow horizontal moving?	Select this check box to permit users to drag timeline spans horizontally. Dragging changes the start and end dates and updates the record.
Allow start time dragging?	Select this check box to permit users to update the record by dragging the start time of a span.
Allow end time dragging?	Select this check box to permit users to update the record by dragging the end time of a span.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Restriction	Specify the behavior when you drag a child span. This option is available only if you did not specify **Range calculator** for the parent timeline page. ○ **None**: No restriction is in place. ○ **Restrict by parent**: Move the child span only within the time frame defined by the parent span. ○ **Update parent**: Update the span when you move the child span outside the time frame defined by the parent span.

Display a metric as a timeline

Administrators can enable users to display any metric on a timeline by activating the *Timeline Metrics* UI action.

Procedure

1. Navigate to **All** > **Metrics** > **Definitions**.
2. Select the metric you want to display on a timeline. For example, Problem State Duration.
3. Select the **Timeline** check box.
4. Click **Update**.

Make a timeline visible to a selected user

Create a custom module within an application and defining the roles that can access it, to make selected timelines available to users.

About this task

To permit these users to update task records directly from the timeline, configure the timeline to enable span dragging.

Note: Timelines delivered by a custom module are not entirely dynamic. The left pane, summary pane, auto-refresh feature, and the grid lines are not dynamic, and do not reflect updates to the timeline record after creating the module link. However, the data represented by the spans, labels, and tooltips display all updates in the custom module.

To create a timeline page module:

Procedure

1. Click the **Edit application** icon on an application (such as Incident) in the navigation pane.
2. In the application Modules related list, click **New**.
3. Configure the Module form to add the **Timeline page** field.
4. Fill in the form as described in the table and click **Submit**.

The Module form provides the following fields.

Making timelines visible to selected users

Field	Description
Title	Name of the module as it appears in the navigation pane. For example, you might use Planning Timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Number to determine the sequence in which this condition should be evaluated if more than one matching condition exists. Conditions with a lower order are evaluated first.
Application	Application for the new module.
Hint	Brief description of the module that appears when the user places the cursor over the module name. For example, you might enter Weekly view of high priority changes.
Active	Check box that enables the module for the defined roles. Clear this check box to disable the module for all users.
Image	Icon that should appear with the module name.
Link type	Select **Timeline Page**. When you select this link, the **Timeline Page** field appears.
Timeline Page	Timeline page you want to appear in this module. For example, for the Change application select a change-related timeline, for the Incident application select an incident-related timeline.
Roles	Roles that can access this module.
Override application menu roles	Check box that indicates that this module should appear when the user has the specified roles. Otherwise, the user must have the roles specified by both the application menu and the module.

Range calculator scripts

You can specify a script include that calculates range restrictions and processes parent updates in a timeline page.

Range Calculator Scripts

Following are three examples of script includes that help specify range restrictions.

ExampleUpdateParentsRangeCalculator

Updates parent records when a child record span is moved or resized in the timeline.

```
var ExampleUpdateParentsRangeCalculator = Class.create();
ExampleUpdateParentsRangeCalculator.prototype = {
initialize: function() { },
updateParents: function(id, table, startDate, endDate){
 if (table == "rm_sprint"){
   var releaseID;
   var sprint = new GlideRecord(table);
   sprint.addQuery('sys_id', id);
   sprint.query();
   if (sprint.next())
     releaseID = sprint.release + "";
   if (releaseID) {
         var now_GR = new GlideRecord("rm_release_scrum");
         gr.addQuery("sys_id", releaseID);
         gr.query();
         if (gr.next()) {
           if (startDate  && startDate <
 this.getTimeMs(gr.start_date))
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                gr.start_date = this.getTimeObject(startDate);
            if (endDate && endDate > this.getTimeMs(gr.end_date))
               gr.end_date = this.getTimeObject(endDate);
               gr.update();
         }
    }
  }
},
getMinRangeDetails: function(id, table){ return [-1, -1, "",
 ""]; },
getMaxRangeDetails: function(id, table){ return [-1, -1, ""]; },
getTimeMs: function(date){
  return new GlideScheduleDateTime(date).getMS(); },
getTimeObject: function(timeMS) {
  var gdt = new GlideDateTime();
  gdt.setNumericValue(timeMS);
  return gdt; },
logMessage: function(message){ gs.log(message); },
type: 'ExampleUpdateParentsRangeCalculator'
}
```

In this example, the span is identified based on the id and table from function(id, table, startDate, endDate).

ExampleMinRangeCalculator

Defines the earliest start date and the latest end date for a specified span.

```
var ExampleMinRangeCalculator = Class.create();
  ExampleMinRangeCalculator.prototype = {
      initialize: function() { },
      updateParents: function(id, table, startDate, endDate){ },
      getMinRangeDetails: function(id, table){
           var min = -1;
           var max = -1;
           var minID = "";
           var maxID = "";
           if (table == "rm_release_scrum"){
                    var now_GR = new GlideRecord("rm_sprint");
                    gr.addQuery("release", id);
                    gr.query();
                    while(gr.next()){
                         var start =
 this.getTimeMs(gr["start_date"]);
                         var end =
 this.getTimeMs(gr["end_date"]);
                         var id = gr["sys_id"];
                         if (min == - 1 || start <= min){
                                if (start != min)
                                     minID = "";
                         min = start;
                         minID += "," + id;
                         }
                         if (max == -1 || end >= max){
                                   if (end != max)
                                           maxID = "";
                                   max = end;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                                    maxID += "," + id;
                                }
                            }
                        }
                return [min, max, minID, maxID];
},
getMaxRangeDetails: function(id, table){ return [-1, -1, ""]; },
getTimeMs: function(date){ return new
 GlideScheduleDateTime(date).getMS(); },
getTimeObject: function(timeMS) {
  var gdt = new GlideDateTime();
  gdt.setNumericValue(timeMS);
  return gdt; },
logMessage: function(message){ gs.log(message); },
type: 'ExampleUpdateParentsRangeCalculator'
}
```

ExampleMaxRangeCalculator

Defines the earliest start date and the latest end date for a specified span.

```
var ExampleMaxRangeCalculator = Class.create();
ExampleMaxRangeCalculator.prototype = {
   initialize: function() { },
   updateParents: function(id, table, startDate, endDate){ },
   getMinRangeDetails: function(id, table){ return [-1, -1, "",
 ""]; },
   getMaxRangeDetails: function(id, table){
      if (table == "rm_sprint"){
         var sprint = new GlideRecord(table);
         sprint.addQuery('sys_id', id);
         sprint.query();
         if (sprint.next())
            releaseID = sprint.release + "";
         if (releaseID) {
            var now_GR = new GlideRecord("rm_release_scrum");
            gr.addQuery("sys_id", releaseID);
            gr.query();
            if (gr.next())
               return [this.getTimeMs(gr.start_date),
                this.getTimeMs(gr.end_date), gr.sys_id];
         }
      }
      return [-1, -1, ""];
   },
   getTimeMs: function(date){ return new
 ScheduleDateTime(date).getMS(); },
   getTimeObject: function(timeMS) {
     var gdt = new GlideDateTime();
     gdt.setNumericValue(timeMS);
     return gdt; },
   logMessage: function(message){ gs.log(message); },
   type: 'ExampleUpdateParentsRangeCalculator'
}
```

Use the following two functions to obtain the correct start and end dates in the three example script includes provided for reference.

```
getTimeMs: function(date){
        return new ScheduleDateTime(date).getMS();
    }
```

```
getTimeObject: function(timeMS) {
        var gdt = new GlideDateTime();
        gdt.setNumericValue(timeMS);
        return gdt;
    }
```

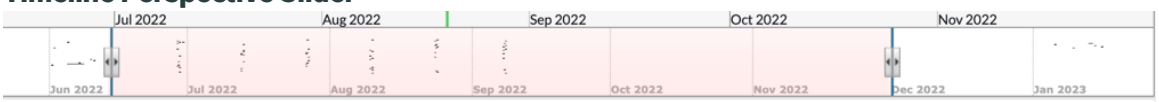
Timelines

Timelines display a linear calendar of tasks, such as incidents and change requests, defined by their start and end dates.

A span represents each task on the timeline, which is displayed as a horizontal bar and may have distinctive color coding. Each span has a label and can have tooltip text containing additional information about the task. You can also change the perspective of the calendar for a more granular view of the data.

Changes in perspective

Use the range selectors at the top of the timeline to change the perspective.



The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, select **Max**. Use the starting and ending calendar fields to select the timeline perspective. These fields control the same perspective as the slider at the bottom of the timeline. The green, vertical line indicates the current date and time, and sweeps across the timeline automatically.

Timeline Perspective Bar

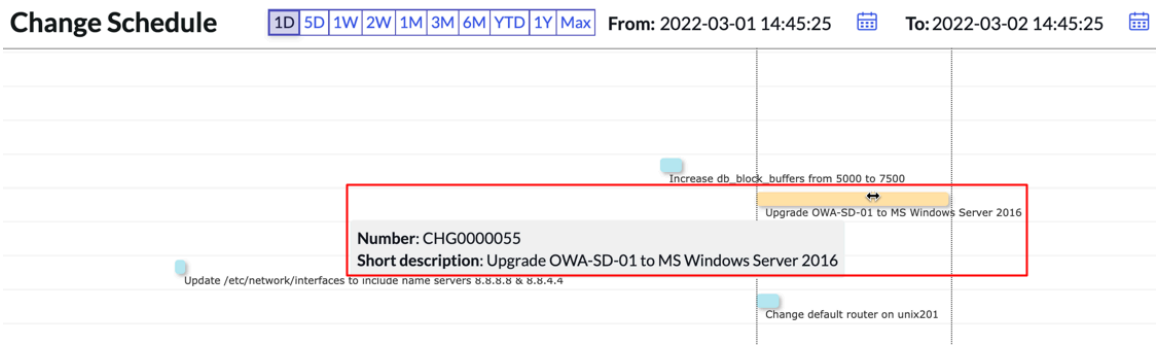
The pink slider at the bottom of the timeline offers another way to change the perspective. Move the slider from right to left to view all the spans on a long timeline. Adjust the end points of the slider to make arbitrary changes to the magnification. A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

Timeline Perspective Slider

Managing spans

You can view span details, focus and zoom spans, and edit spans.

A span represents each task on the timeline, which is displayed as a horizontal bar and may have distinctive color coding. Each span has a label and can have tooltip text containing additional information about the task. You can also change the perspective of the calendar for a more granular view of the data.



Span details

If the left navigation pane is visible, the span label is visible in the left pane.

If the left pane is hidden, point the cursor over a span to view the tooltip.

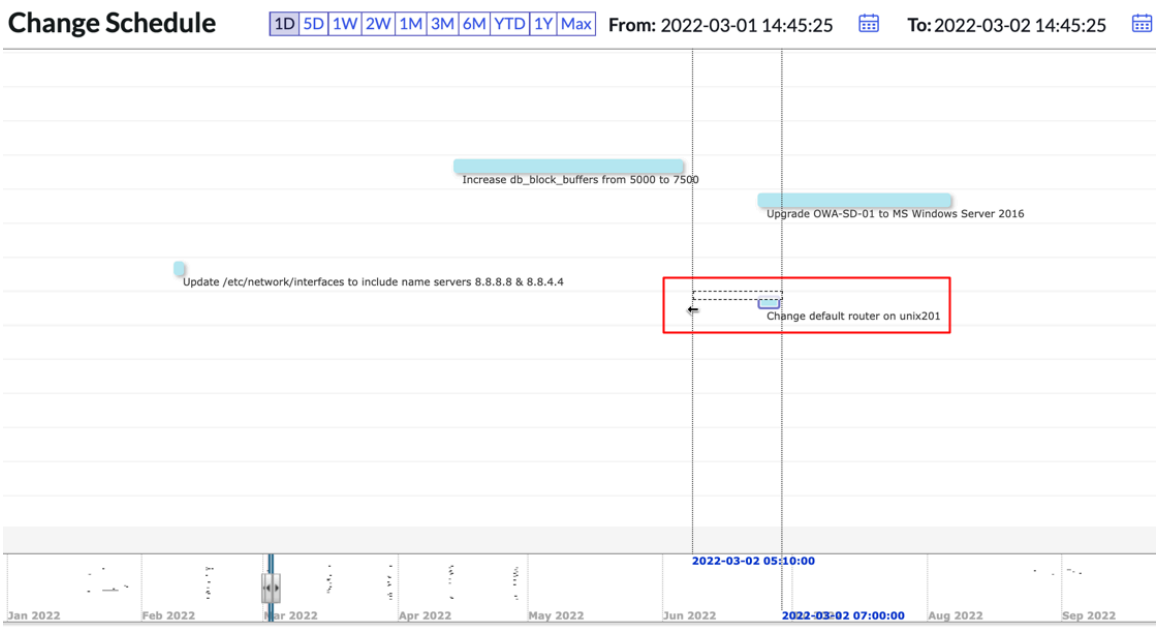
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timeline Tooltip

Span focus and zoom

You can use keyboard shortcuts when using timelines.

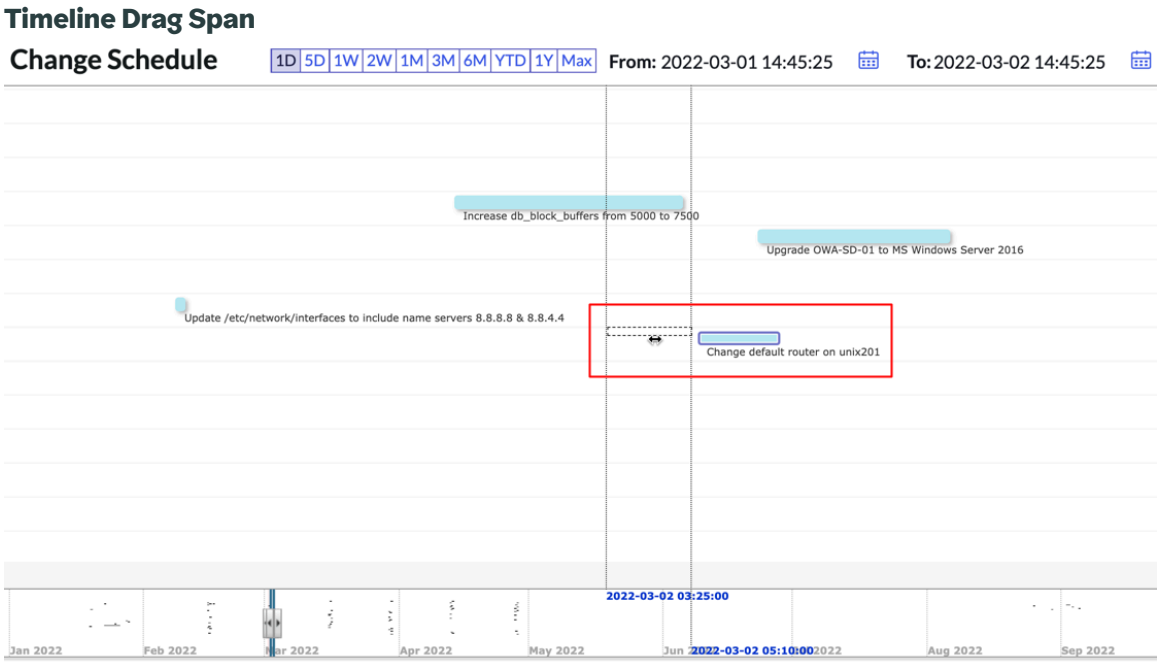
Focusing and Zooming on a Span



Operating System	Shortcut
Macintosh	Command + Click
Windows	Control + Click

Span edits

If the timeline has been configured for editing (horizontal moving, start and end date dragging), use the mouse to adjust the spans to suit your needs.



Move the start or end dates to change the duration of the task.

Timeline Drag Start

Move the entire span horizontally to adjust the start and end dates but not the duration.

Client transaction timings

The Client Transaction Timings plugin enhances the system logs by providing additional information about the durations of transactions taking place between the client and the server.

You can track down performance issues to their source by viewing where the time is being consumed, and how time was spent during a transaction.

This plugin requires the Response Time Indicator Response Time Indicator to be enabled, and collects information from the following browsers:

- Firefox
- Internet Explorer
- Chrome

Client Transactions Information

Installing the plugin adds the *Client Transactions* module to the *System Logs* application. It provides a list of every logged transaction between client and server within the last day:

Client Transactions Information

Field	Description
Created	Moment the transaction was recorded.
Response Time	Number of ms spent by the server in fulfilling the transaction.
Business Rule Time	Number of ms spent by business rules triggered by the transaction.
SQL Time	Number of ms spent by the SQL database.
Client Response Time	(Load_completion_time) - (start_time). It is inclusive of server time.
Client Network Time	Number of ms spent by the network the client is connecting through.
Browser Time	Number of ms spent by the browser during the transaction.
Client Script Time	The number of ms spent executing client scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client Transactions Information (continued)

Field	Description
UI Policy Time	Number of ms spent executing ui policy.
Type	Type of transaction: • Form • List • Other
Table	Name of table that appeared. For example, incident, change_request.
View	View for this form/list.

Client Detailed Information

A more detailed breakdown of the client timings for all Form rendering (but not list rendering) is also tracked. To see details, drill into a particular client transaction record and observe the related list at the base of the screen.

Client Detailed Information

Field	Description
Order	Order during the load in which this operation occurred.
Type	Type of operation.
Name	Descriptive name of this particular operation
Duration	Number of ms this operation took to complete.

Components installed with Client Transaction Timings

The Client Transaction Timings plugin installs several components.

Database Table Structure

The plugin adds the table *syslog_client_transaction*.

Scripts

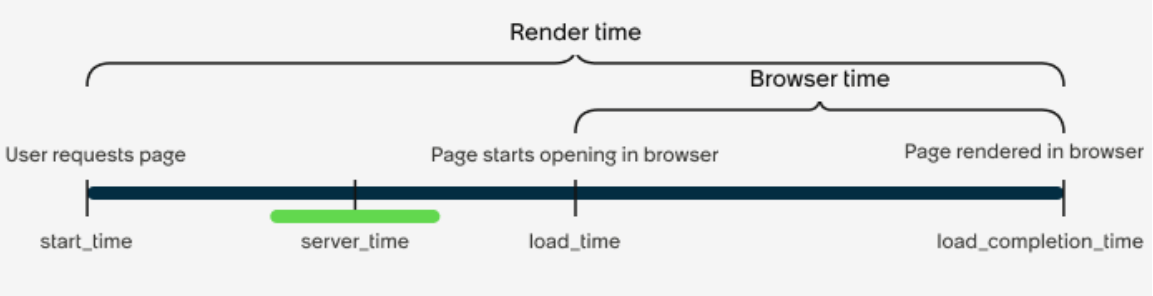
The plugin relies on the new script include *AJAXClientTiming*. This script gathers the information required and populates them on the *syslog_client_transaction* table.

Dependencies

This plugin does not require any other plugins, but does not gather information unless the Response Time Indicator Response Time Indicator is enabled.

Activating the Plugin

To activate the plugin, navigate to **System Definition** > **Plugins** and activate the plugin.



Note: New instances have the plugin activated by default.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timing values

Timing values are broken down into several sections.

Client Transaction Timing

The variables in this diagram are defined as follows:

Timing Values

Variable	Description
start_time	Date and time the user requests a page (the user clicks on a link). This value is set by hooking into the *before unload* event of the previous page. WebKit browsers do not properly support the *beforeunload* event, which is why the client timings are not supported i Safari or Chrome.
load_time	Date and time that the current page starts loading in the browser. An inline javascript that runs as the first script in the HTML body sets this value.
server_time	Time in ms spent by the server processing the transaction. The server reports this value to the client.
load_completion_time	Date and time that the page is fully rendered in the browser. This operation is performed as the last script on the page and identifies the time the page completed loading.

The following timings are reported at the bottom right of many forms and lists:

Timing Values

Label	Element	Description	Calculation
Response Time	client_response_time	Overall time to deliver the page by subtracting the time the user requests the page from the time the page is fully rendered in the browser.	load_completion_time - start_time
Server Time	client_server_time	Time the server takes to process the transaction.	server_time
Network Time	client_network_time	Time the network takes to process the request. Calculated by subtracting the time of the user's request, from the time the page starts loading in the browser,	load_time - start_time - server_time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timing Values (continued)

Label	Element	Description	Calculation
		and then subtracting the server processing time.	
Browser Time	browser_time	Time the browser takes to deliver the page by subtracting the time the page is fully rendered from the time the page starts loading in the browser.	load_completion_time - load_time

Currency administration

Currency fields provide features for handling the calculation, conversion, and display of currency values.

Exploring currency administration

The ServiceNow AI Platform® supports two types of currency fields: default (or standard) currency and Foreign Exchange (FX) currency.

Default (standard) currency

The default, or standard, currency fields that are delivered with the ServiceNow AI Platform.

FX Currency

FX Currency is an alternate type of currency field that is highly configurable, supports custom rate tables, and provides for improved visibility into conversion calculations. You can add FX Currency fields to base and custom applications, and they work independently of existing standard currency fields.

Standard currency fields

The standard, or default, currency fields are installed with the base system and used in most non-financial applications.

A standard currency field stores a currency value, a currency code, and a reference currency value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Three-letter ISO code that identifies the currency that you select for the currency amount. For example, USD for the US Dollar, or EUR for the Euro.
- The reference currency value is the currency value, expressed in the reference currency. When you save a currency value, the reference currency value is calculated using a rate conversion.

A price field is similar to a currency field, but with special features for conversion and display. To learn more, see Price fields.

Locale settings

There are two locale settings, system and user. The system locale determines the reference currency, and the user locale determines the session currency.

System locale

You set the system locale using the *glide.system.locale* property. The value is in the format `Language.Country`, where the:

- `Language` is an ISO 639 language code.
- `Country` is an ISO 3166 language code.

Internally, this value is used as specified by Java. The system locale setting should be in the Java supported locales list. Set the system locale once after a fresh zBoot, because reference currency values that appear in currency fields are in the currency implied by the system locale. To set this property, see Control default currency field configuration and use in an instance.

Note: Do not change the system locale after currency values have been entered into the instance. When you change the system locale, the reference currency values are not adjusted. There is no rate conversion. This persistence results in invalid aggregations and filtering.

User locale

The ServiceNow AI Platform® determines the user locale in the following sequence:

- User record in which the country, or both the country and language, are specified.
- System locale set using the *glide.system.locale* property.
- Browser locale.

Amounts in currency fields are composed of a currency code and amount. Amounts always appear in the session currency, and are formatted in the Java-specified format for the user locale.

Session and reference currency

The default, or standard, currency fields in the ServiceNow AI Platform® use two kinds of currency, Session and Reference.

Session currency

The session currency is defined for the user by the user's locale or single-currency mode.

Reference

The system local determines the reference currency, and is the standard used across the entire instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each time you enter a value into a currency or price field, the system stores three pieces of information:

- Value as entered, in the user's locale.
- Currency code, in the user's locale.
- Value converted to the reference currency using the current exchange rate.

Note: In multiple-currency mode, the currency code saved in the currency field may not be the same as the session currency code. For example, the session currency could be the Euro and the number entered could be the Japanese Yen.

Session currency

When users view a currency value, they can see the value as entered or in the session-currency format. The format contains the:

- Currency symbol
- Value converted to the session currency and shown in a localized number format.

The user's locale determines the session currency format.

The number format can differ in features such as the decimal separator based on the locale. For example, the US formatting is 1,234,567.89, while German formatting is 1.234.567,89. The ServiceNow AI Platform® determines the session currency in the following sequence:

- Single-currency mode setup using *glide.i18n.single_currency* and *glide.i18n.single_currency.code*.
- Default currency for the user's locale.

Reference currency

To perform calculations on heterogeneous currency values, the ServiceNow AI Platform® stores currency values converted to a system currency, referred to as the reference currency. Every currency field contains a reference currency value. The system determines the reference currency in the following sequence:

- System locale set using the property *glide.system.locale*
- Java default locale, typically en.US

The filtering and aggregation features use the reference currency value to perform calculations on default currency fields. These features can yield inaccurate results because of conversion rate changes.

Issues with currency fields

Users are often confused by the results of filtering, sorting, and displaying currency fields because the system works with at least two currencies for each value: the session currency and the reference currency.

Note: Aggregations and filtering of currency fields use the reference currency, and the user sees the session currency. Because of changing conversion rates, the filtered reference currency values might not result in the same order as the session currency values would suggest. The same issue happens with aggregations.

The user might see the following issues:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Lists filtered on currency fields might not be in the expected order. It uses the reference currency values for filtering but displays session currency values.
- Aggregation of currency fields may not produce the expected results because reference currency values are aggregated, and then converted to the session currency.
- Currency values may not appear as expected because currency values are formatted based on the user's locale and not on the currency code.

This confusion may be the result of the difference between session and reference currencies, changing conversion rates, and different session currencies used by different users.

Single-currency mode

Single-currency mode enables all users of the platform to view currency values in the same currency.

Before enabling single-currency mode, set the system locale. To configure single-currency mode, set the following properties:

- *glide.i18n.single_currency*: **true** or **false**
- *glide.i18n.single_currency.code*: the three-letter ISO currency code
- *glide.system.locale*: the system locale

Note: For detailed information about valid locale formats, see Locale settings.

Using the single-currency mode has the following limitations:

- The single-currency mode changes the currency that appears in the user views, but does not change the number formatting. Even though users in different countries see currency values in one currency, the number formatting, as determined by the user's locale, might not be what they expect.
- Price fields, which have flexible conversion and currency features, can't be used because currency value input is constrained to the single currency.

You can avoid the effects of rate conversions by setting the system locale and the reference currency to be the single currency.

Price fields

A price field is a currency field that enables control over conversions and display.

You can select conversion and display options per price field, and change them at any time. There are three variations:

Calculated [Default]

Behaves in the same way as the default currency field type. Whenever conversions are performed, it uses the latest currency conversion rates. The price field appears in the session currency for the user.

Fixed

When the price field appears, it is shown in the currency code used when you entered the value. Whenever conversions are performed, it uses the latest currency conversion rates.

Multiple

Enables you to enter multiple price values for an item using a different currency for each price. The field value is the value entered in the user's session currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Otherwise, the first price entered converts to the user's session currency. Whenever conversions are performed, it uses the latest currency rates.

Note: The first value entered is used during display. The additional values are not used during calculations.

You can change the currency code and numeric value for a price field. When you click the **Edit** icon that appears next to the price field, a form appears that you use to edit the details for the price field:

Price field currency details

Field	Description
Currency	List of currencies enabled in the system in the combo box. In single currency mode, the currency is a label and cannot be changed.
Amount	Numeric value formatted in the user's locale.
Type	Calculated, Fixed, Multiple. • When you change the price type to Multiple, the system creates child records for all currencies enabled in the platform. The child records are populated with values converted from the amount field, using latest currency conversion rates. • You cannot change the price type in single currency mode. • You can modify the price type at any time.

Default currency values in forms

In forms, currency values appear in the currency in which they were entered.

A combo box provides a list of available currencies, and the user's locale determines its format. When entering or changing the numeric currency value, enter it in the same format specified by the user's locale. In the form for a new record, the reference currency is pre-selected in the currency list, with the numeric value set to zero.

- If the record is read only, the currency value appears in the **Currency** field as it was entered, and is formatted in the user's locale. In the **Price** field, the session currency value appears.
- In Single currency mode, the currency is a label that cannot be changed, and the **Edit** icon does not appear.

Editing the currency instance record

If a currency instance record exists, an **Edit** icon appears next to the **Currency** field if you have edit rights for the fx_currency_instance table. Users with the financial_mgmt_user role can edit the values associated with the currency field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Normally, you should not edit the fx_currency_instance table directly. The ServiceNow AI Platform maintains these tables, and your changes could have unintended consequences.

Default currency values in reports

Currency values in reports appear in the user's session currency, and are formatted in the user's locale with a currency symbol.

The user determines how the report is run.

- Shared report: The user who runs the report.
- Scheduled report: Generally run as the user who scheduled the report.

The two user-specific values in the report are:

- User session currency
- Converted value

Note: A user that has a different session currency than the person who runs a report might receive unexpected results.

Default currency values in lists

In lists, default currency values appear in the user's session currency, formatted for display in the user's locale. Typically, a formatted number follows the currency symbol.

Different field types appear as follows in lists:

Field	Description
Currency field type	Value expressed in the user's session currency.
Price field type	• **Calculated**: Value in the user's session currency. • **Fixed**: Currency value, as entered by the user. • **Multiple**: Value associated with the user's session currency if this value exists. Otherwise, the first value entered converts to the user's session currency.

A Globe icon appears beside the currency value that enables you change to one of the following values:

- Value as entered by the user.
- Value in session currency.
- Value as entered and, in brackets, the value in reference currency.

The icon appears when the user's session currency is different from the currency entered. Clicking the icon cycles through the listed displays. In the preview for the record, currency values appear as entered, formatted in the user's locale.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Aggregation

Aggregation operations can be used on currency columns. Aggregation operations include total, group by, average, minimum, and maximum. Aggregation is done in two steps:

- Aggregate the reference currency values for all records.
- Convert this aggregate to the user's session currency for display.

Note: The resulting value may not be what you expect. The conversion rate used for the value that appears for the currency field, and for its reference currency, that is used for the aggregation, may have changed.

This limitation extends to different price types.

- For price type fixed, the calculated reference value can be old.
- For price type multiple, the reference value of the first price entered is used. The other values are not used.

The aggregate value is shown formatted in user's locale with a currency symbol. Currency fields are stored with four decimal places, and aggregates have four decimal places. For upgrades, you must set the *glide.currency_price.use_all_fraction_digits* property. See Change default currency decimal places for more information.

Filtering

You can set up filters on currency fields. The currency value is entered as a currency code and numeric value. Filtering is done in two steps:

- The filter currency value is converted to the reference currency.
- The filter's calculated reference value is compared with the reference value in the records.

Matching records are shown in the list view.

Note: At times, the filtering results might not provide the expected result. The conversion rate used when you run the filter might be different than the conversion rate used when calculating the reference values in the individual records. This limitation extends to the following price types:

- For a Fixed price field type, the calculated reference value can be old.
- For a Multiple price field type, it uses the reference value of the first price, and does not use the other values.

Default currency values in import and export

In general, currency values crossing the boundaries of the platform are represented in the user's session currency and formatted in the user's locale.

Import

Currency values are imported as strings, just like other fields. The default transform mapping to a currency field uses *setDisplayValue()*. The expected format for this function is:

- A number formatted in the user's locale. The number is taken as a value in the user's session currency, for example, 1,234.56.
- The number prefixed by the three-letter currency code separated by a semicolon, for example, EUR;1.234,56.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This behavior can be customized in transform map scripts.

Export

Currency values can be exported in several formats, including CSV, XLSX, PDF, and XML. Depending on the export format, currency values are exported in the user's session currency and formatted in the user's locale or they're exported in the reference currency value with no formatting.

Related topics

Exporting currency fields to Excel

Default currency values in scripts

You can use currency fields in scripts.

These methods are available on GlideElement objects.

To display currency values, use the `getDisplayValue()` display API. To work with currency values in any way other than display, use the APIs that return/accept unformatted numbers.

Note: Before performing calculations on the value, do not use the `getDisplayValue()` methods and then process the string to remove formatting information.

Methods such as `getValue()` and `getCurrencyValue()` return unformatted numbers as strings. To obtain the floating point value, use the JavaScript function `parseFloat()`, and then use resulting value to perform calculations. To obtain the currency associated with these values, use the APIs that return the currency code. You can also use the `getCurrencyCode()` methods to determine a field's currency.

```
var rate = parseFloat(current.base_rate);
var currencyCode = current.base_rate.getCurrencyCode();
```

Use the `setValue()` method to set the value of a currency field. If this currency is the user's session currency, use a plain number or the floating point number of a string containing it. Otherwise, prefix the value with the 3-letter ISO currency code.

```
var totalCost = rate*current.hourly_rate;
current.total_cost.setValue(currencyCode + ";" + totalCost);
```

You are working with the reference currency value when you use GlideAggregate on currency or price fields. Be sure to convert the aggregate values to the user's session currency for display. The resulting value may not be what you expect. The conversion rate used for the currency or price field value, and for its reference currency, which is used for the aggregation, may have changed.

When you delete a record containing a currency value, the platform deletes any associated currency records.

Note: Do not use `deleteMultiple()` on tables with currency fields. Always delete each record individually.

Currency values contain four decimal places.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- APIs that return values such as `getValue()` return up to four decimal places. Trailing zeros are always removed.
- APIs that return display values such as `getDisplayValue()` have at least two decimal places and up to four decimal places.
- GlideAggregate returns four decimal places.

You can have the system use two decimal places. When you set it to two decimal places, numeric values returned by the API contain two decimal places. Although currency conversion rates may have more decimal places, currency fields store only two decimal places. APIs that accept numeric values round decimal places to two places.

- APIs that return values such as `getValue()` return up to two decimal places. The trailing zeroes are removed for values read from the database, but if a value such as 00 is set later, 1.00 can be returned. The number of trailing zeros returned is not consistent.
- APIs that return display values such as getDisplayValue() contain up to two decimal places. It could sometimes return two places even for values such as 7.10, but could remove trailing zeros at other times. The number of trailing zeros returned is not consistent.
- GlideAggregate returns two decimal places.

Note: To learn how to change the number of decimal places used by the system, see Change default currency decimal places.

The following example, the user's locale is set to German (de.DE), and the reference currency set to USD. The values use a currency value of 21345.67 in Japanese yen, 1563.72 in Euros, and 1152.48 in US dollars.

Methods to access currency fields

Method name	Description	Example
`getValue()`	Returns the currency value in the user's session currency as an unformatted number.	1563.72
`getReferenceValue()`	Returns the currency value in the reference currency as an unformatted number.	1152.48
`getSessionValue()`	Returns the currency value in the user's session currency as and unformatted number.	1563.72
`getCurrencyValue()`	Returns the currency value as entered as an unformatted number.	21345.67
`getDisplayValue()`	Returns the currency value in the user's session currency, formatted in the user's locale with a currency symbol.	€1.563,72
`getSessionDisplayValue()`	Returns the currency value in the user's session currency, formatted in the user's locale with a currency symbol.	€1.563,72

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Methods to access currency fields (continued)

Method name	Description	Example
`getReferenceDisplayValue()`	Returns the currency value in the reference currency, formatted in the user's locale with a currency symbol.	$1,152.48
`getCurrencyDisplayValue()`	Returns the currency value as entered formatted in the user's locale with a currency symbol.	¥21.345,67
`getCurrencyString()`	Returns the currency value as entered as an unformatted number, prefixed by the 3-letter ISO currency code, separated by a semicolon.	JPY 21345.67
`getCurrencyCode()`	Returns the 3-letter ISO currency code for the currency value as entered.	JPY
`getSessionCurrencyCode()`	Returns the 3-letter ISO currency code for the user's session currency.	EUR
`getReferenceCurrencyCode()`	Returns the 3-letter ISO currency code for the reference currency.	USD
`setValue()`	Sets the currency value as: • An unformatted number taken as a value in the user's session currency. • An unformatted number prefixed by a 3-letter currency code separated by a semicolon.	4369.21 or JPY 4369.21
`setDisplayValue()`	Sets the currency value as: • A number formatted in the user's locale that is taken as a value in the user's session currency. • A number formatted in the user's locale prefixed by a 3-letter currency code separated by a semicolon.	4369.21 or JPY 4369.21

FX Currency fields

Use FX (Foreign Exchange) Currency fields as an alternative to the standard (default) currency fields found in most applications. They are highly configurable, support use of custom rate tables, report aggregations, and provide for improved visibility into conversion calculations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You don't have to install a plugin to use FX Currency functionality. It's activated by default.

Use considerations

Use the FX Currency field type in place of the standard currency fields when you must:

- Support values expressed in multiple currencies, for example, EUR 100, JPY 200, USD 30, as values in a field. FX Currency fields provide better support for multi-currency applications than do standard currency fields.
- Control how the FX Currency field is configured, including specifying its internal behavior and currency value formatting.

  To learn more about currency configuration, see Configuring FX Currency field behavior.
- Create custom conversion rate tables.

  To learn more about custom table rates, see Add conversion rates using a custom rate table.
- Have more control over when the actual currency conversion occurs. FX Currency values convert on demand only, making the conversion results much more transparent.

  To learn more about currency conversions, see Understanding how FX Currency field conversions work.
- Provide greater transparency into currency conversion calculations. You can view and configure the calculation components, including conversion dates, reference currency, and number of displayed decimals.
- Build query conditions using FX Currency field values. For available query conditions, see Operators available for filters and queries.
- Access FX Currency fields through richer scriptable APIs.
- Aggregate currency values as entered by users, or aggregate them in selected reference currencies, for reporting purposes.
- Use the three-digit ISO 4217 numeric currency code for a currency with Numeric code field on the Currency [fx_currency] table and the `ScriptableCurrencyCode` API. For more information, see .

Important: You can add FX Currency fields to base and custom applications, and they work independently of existing standard currency fields. However, you can't convert or change a standard currency field to an FX Currency type field. No functions are available to convert standard currency fields to FX Currency fields, then migrate the data from one to the other.

Field types reference

Understanding FX Currency values in forms

In forms, the FX Currency field behaves like a dot walkable field in script. It consists of an entry field, and an accompanying list for selection of a currency code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specifically, FX Currency fields that appear on forms contain the following:

- An empty field for entry of a numeric currency value, formatted according to your assigned user locale. For example, in the US, it is formatted with two decimal places, for entry of cents.

  If this is a new record, the field is empty. If it is an existing record, the previous currency amount that you entered appears.

- A selection list of active currencies from the Currency [fx_currency] table. The default currency code is based on your user locale. You can select another currency for use during the entry session.

  For example, in the US, the default currency value, based on the user locale, is USD. You can select another currency code to use in the current entry session.

- An edit icon ( ). Users with an assigned currency_instance_admin role can click it to edit currency detail in the accompanying Currency Instance [fx_currency2_instance] record.

Understanding how FX Currency field conversions work

You can use existing system currency rates or define a custom conversion rate table for use in FX Currency processing.

A currency conversion rate represents the conversion factor for exchanging one currency for another. The conversion rate is used when converting a currency value, expressed in one currency, to another currency. Conversions can occur for storage (for example, conversion to a reference currency) or for display (for example, conversion to a session currency).

When conversions occur

FX Currency fields expose the values inside the Currency Instance [fx_currency2_instance] record as dot walkable fields. You can access to all data held in an FX Currency field without any transformations. Conversions can happen in these situations:

1. Calculation of a reference value, calculated when you enter a currency value, whether on insert or update. The reference currency value is saved as well as the currency value as entered. Once this calculation takes place, the reference value is not recalculated.
2. Calculation of the session display value returned from `getDisplayValue()`, which performs conversions to the required currency.

   The conversion rate is based on the settings of the **Conversion Rate Table** and **Conversion Date Source** fields in **System Localization** > **FX Currency Configuration.**

   Note: To learn more about these settings, see Specify the rate table and date source for currency conversions.

Conversion rates

FX Currency conversion rates are stored in the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- System rate [fx_system_rate] table: Contains system conversion rates. Each record contains the conversion rate from the Euro to a given currency. The rates are downloaded daily from the ECB website by a scheduled job called Retrieve System Rates. To learn more, see Schedule the rate update job.
- Custom rate table: Contains custom currency conversion rates, and custom rate tables extend the Currency Conversion Rate [fx_conversion_rate] table. To learn more about creating custom rate tables, see Add conversion rates using a custom rate table.

Understanding FX Currency values in lists and reports

By default, the currency values that appear in the FX Currency fields in lists and reports are the values that you directly enter into the FX Currency fields. For reports, the aggregations of FX Currency fields are, by default, reference currency values.

FX Currency values in list views

In lists, FX Currency values appear as a formatted currency string returned from *`getDisplayValue()`*.

- The settings in the **Display Digits** and **Display Value Currency** fields in **System Localization** > **FX Currency Configuration** determine how the currency values appear in lists.
- To learn more, see Identify the FX Currency field and its display parameters.

For an FX Currency field that depends on another FX Currency field, the currency value comes from the Currency Instance [fx_currency2_instance] record associated with the latter. The display value format is based on how you configured its display settings in **System Localization** > **FX Currency Configuration.**

Note: An FX Currency field in a custom table is a reference field that stores the reference (sys_id) to the actual record. Because the sys_id is 32 characters, the **Max length** of the FX Currency column must be 32 (default).

Filtering FX Currency values in lists

In lists, FX Currency field filtering behaves differently than with standard currency fields. The filtering takes place using the currency type selected when a currency value is originally entered into an FX Currency field. It doesn't take reference currencies into account when you filter a list. So, if the unfiltered list contains FX Currency field entries in multiple currencies, a filtered list would only contain those records originally entered using the specified filtering currency.

- For example, if you entered a currency value in Euros (EUR) and the reference currency is US Dollars (USD), the reference currency value may appear in an unfiltered list.
- However, if you filter the list, and select USD as the currency, the currency value, originally entered in Euros, doesn't appear. In this case, only currency values originally entered in USD would appear.

Dependent FX Currency fields

Use of FX Currency view or dependent fields enable you to use alternate display configurations defined in **System Localization** > **FX Currency Configuration** for a particular FX Currency field. To learn more about FX Currency field configurations, see Configuring FX Currency field behavior.

When you create an FX Currency field, you can mark it as dependent on another FX Currency field. Marking an FX Currency field as dependent enables it to use the configuration settings for the original FX Currency field to display the amount values in different currency. Any changes that you make to the dependent field don't affect the original FX Currency field.

FX Currency reporting, aggregation, and group by

You can select FX Currency fields for inclusion on reports, and they display in the same manner as in list views.

- FX Currency fields appear as a formatted currency string returned from *`getDisplayValue()`*.
- If you set the **Display Value Currency** field in **System Localization** > **All Properties** to **Display in Session Currency**, the session currency assigned to the user running the report appears.

You can aggregate like reference currency values within a Currency Instance record. The following is the aggregated FX Currency data format in the ServiceNow AI Platform®:

Aggregate FX Currency value

Type	Description
String	Value of the aggregation. If the values being aggregated are FX Currency values, the returned value is in the format `currency_code:currency_value`, such as: `USD:134.980000` Otherwise, the returned value is just the currency value, such as: `134.980000`. **Note:** If the field contains FX Currency values of mixed currency types, the values cannot be aggregated. The value is returned as a semicolon (;).

For example, if the **Cost** field on a transaction record is an FX Currency field, you can group by *`cost.amount`* or *`cost.currency`*.

- Aggregation operations, such as SUM, translate as `SUM(amount)` or `SUM(reference_amount)`. The aggregation source determines the translation when the currency associated with the currency values in the grouping is the same.

  For example, the aggregate value returned by `GlideAggregate.getAggregate()` is a string of the format USD; 1234.56. The total currency value is expressed in the single reference currency that is associated with all currency values in the grouping.

- If there are different currencies associated with currency values in the grouping, then the aggregate value is empty. For example, if some of the currency values are in US Dollars, some are in Euros, and others in Yen, the aggregate value would be empty.

You can also use a Group By command on FX Currency fields.

- It is equivalent to grouping by currency and amount, or by reference_currency and reference_amount, as dictated by the aggregation source.
- The value of the grouping is available by dot-walking on the FX Currency field, or using an API such as `getDisplayValue()`.

FX Currency values in import and export

FX Currency values that you import must include a three-letter ISO currency code, a semicolon, and an amount formatted for the user's locale, such as `USD;1,234.56`. In general, imported and exported values represent the display value returned by `getDisplayValue`.

FX Currency import

If using the default `setDisplayValue()` import method, FX Currency works in a manner similar to the standard currency field. It imports a value such as `USD;1,234.56` as `setDisplayValue("USD;1,234.56")`. It then parses the value as a three letter ISO currency code, followed by a semi-colon, followed by a number formatted in the locale of the user. The currency code is required. FX Currency values are imported as display value strings, so each value in the source file must include the code. For example, to import 100 US dollars from an Excel file, enter `USD;100` in the source column. If you import only a number, such as `100`, the value might not be imported. This method should work for most use cases.

Defaults for other Currency Instance fields come from FX Currency field configuration you defined in **System Localization** > **FX Currency Configuration**. To explicitly set these fields, you can use a custom import script that sets those fields to desired values, possibly using values from another import column.

There are various ways to import FX Currency data.

Method	Description
Importing data into custom rate tables	Main method for importing custom rates, other than editing rates directly. When you modify existing rates, existing currency values that use that rate aren't updated. **Note:** This is specific for importing only.

FX Currency export

There are various ways to export FX Currency data.

Method	Description
Show XML	Shows an XML file with instance records for each FX Currency field bundled inside the XML payload.
Export to XML	Shows an unload XML with unloads for all instance records.
Export to Excel/PDF	Uses the default method of exporting data that extracts data from fields using `getDisplayValue()`. For FX Currency fields, using this method returns a formatted currency string of the form $1,234.56.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method	Description
	To access specific information inside an FX Currency field directly without any transformations, simply export that column using dot walking.

Configuring currency fields

Configure defaults for standard currency and Foreign Exchange (FX) currency.

Setting up defaults required for standard currency use

Set up the defaults required for use of standard currency fields in your instance.

Control default currency field configuration and use in an instance

You can control how currency fields are configured and used in your instance.

These properties are available for currency fields.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for default currency fields

Property	Description
glide.sys.audit_currency_value	When **true**, currency fields in audit records are the value entered by the user, in the format USD;1234.56. When **false**, the value is the numeric value in the session currency. • Type: Boolean • Default value: **false** • Location: System Property [sys_properties] table • Learn more: Configure default currency fields in audit records
glide.currency_price.use_all_fraction_digits	When **true**, currency fields have four decimal places. When **false**, two decimal places are used. • Type: Boolean • Default value: **false**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for default currency fields (continued)

Property	Description
	• Location: System Property [sys_properties] table • Learn more: Change default currency decimal places
glide.currency_price_optimizer.enabled	When **true**, the optimizer is used. When **false**, the optimizer is not used. • Type: Boolean • Default value: **true** • Location: System Property [sys_properties] table • Learn more: Configure the currency optimizer
glide.currency_price_optimizer.min_rows	Minimum number of rows in parent table needed for the optimizer. When fewer than this number of rows are present, the optimizer is not used. • Type: Number • Default value: **4** • Location: System Property [sys_properties] table • Learn more: Configure the currency optimizer
glide.excel.convert_to_user_currency	When **true**, currency fields in a table are output in the user's session currency. • Type: Boolean • Default value: **false** • Location: System Property [sys_properties] table • Learn more: Exporting currency fields to Excel
glide.excel.fixed_currency_usd	When **true**, currency fields in a table are converted to US dollars.

Exporting currency fields to Excel

Change default currency decimal places

You can specify the number of decimal places stored and used in currency fields and calculations.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **sys_properties.list**.
2. Find *glide.currency_price.use_all_fraction_digits*, and set to the desired value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Value	Description
false	Uses two decimal places.
true	Uses four decimal places. This value is the default.

Configure default currency fields in audit records

You can control what currency value is stored in audit records.

Before you begin

Role required: admin

About this task

Procedure

1. Navigate to **All** > **sys_properties.list**.
2. Find *glide.sys.audit_currency_value*, and set to the desired value.

Value	Description
false	Value entered in the audit record is the numeric value in the session currency. It does not include the currency code. This value is the default.
true	Value as entered by the user in the format USD. For example, 1234.56.

Configure the currency optimizer

You can configure the system to use an optimizer for currency/price fields to speed up list view (reading currency/price values).

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **sys_properties.list**.
2. To turn on the currency optimizer, find *glide.currency_price_optimizer.enabled*, and set to the desired value.

Value	Description
false	Optimizer is not used.
true	Optimizer is used. This value is the default.

3. To set the minimum number of rows needed by the currency optimizer, find *glide.currency_price_optimizer.min_rows*, and set to the desired value. The default value is 4.

Default currency conversions

Currency values can be converted to other currencies when stored and accessed.

Conversions can happen in these situations.

- The currency value converts to the reference currency when stored, whether on insert or update. The reference currency value is saved as well as the currency value.
- The currency value converts to the user's session currency for display.
- The value entered into a filter converts to the reference currency using the currency specified in the filter.

Conversion rates are stored in the Exchange Rate [fx_rate] table. Each record contains the conversion rate from a given currency to the Euro. The rates are updated daily from the ECB website by a scheduled job called Update Currency Conversion Rates.

A currency conversion from one currency to another involves two rates.

- Actual: In the Exchange Rate table, each record contains the conversion rate from a given currency to the Euro.
- Expected: In the Exchange Rate table, each record contains the conversion rate from the Euro to the given currency.

Whenever you perform a conversion, it uses the latest conversion rates. Therefore, calculations can potentially yield unexpected results. For example:

- Different currency values can have different rates applied to them while storing the reference currency value. Therefore, aggregation can combine values at different rates and convert back at another rate.
- A filter value is converted at current rates while the values it filters in the database can be converted at different rates. A filter for $100 at today's rate can match a value of $99 obtained at yesterday's rates.

Note: For display purposes, the currency value used is what the user entered converted to session currency. However, for aggregation and filtering, the reference currency value is used. Using the reference currency enables currency values converted at different rates to be compared together.

Schedule the rate update job

Schedule the Update Currency Conversion Rates job to perform a nightly download of currency-conversion tables from the European Central Bank.

Before you begin

Role required: admin

About this task

You can adjust the frequency of this behavior or turn it off it entirely. For information about turning off the regularly scheduled update and maintaining the Exchange Rate table [fx_rate] manually, see Use your own currency-conversion rates and FX Currency fields.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the job named **Update Currency Conversion Rates**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Modify the schedule, as needed.

   After the job runs, it stores and loads the rates from the Exchange Rate table. Navigate to **System Localization** > **Exchange Rates** to see the exchange rates.

Use your own currency-conversion rates

All currency conversions are based on the rates stored in the Exchange Rate table. You can turn off the regularly scheduled update from the European Central Bank (ECB), and maintain the table manually.

Before you begin

Role required: admin

About this task

Daily exchange rates are loaded in the Exchange Rate [fx_rate] table automatically using the Euro foreign exchange reference rates from the ECB and the Update Currency Conversion Rates scheduled job.

If ECB does not supply the daily rates for a specific currency, you can manually enter rates into the Exchange Rate table. Use an import set or another service (for example, JSON or SOAP) that supports uploading additional currency rates. You can then add a scheduled job similar to the Update Currency Conversion Rates scheduled job to update these currencies.

Note: The Update Currency Conversion Rates job replaced the ECB Exchange Rate Load and Retrieve System Rates jobs, which are turned off by default. They must remain turned off to use custom conversion rates.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the job named **Update Currency Conversion Rates**.
3. Clear the **Active** option.
4. Select **Update**.
5. Enter new exchange rates either manually or with an import set.

Setting up defaults required for FX Currency use

Set up the defaults required for use of FX Currency fields in your instance.

Perform the following setup tasks to enable FX Currency processing:

Add conversion rates using a custom rate table

You can create a custom rate table to ensure repeatable and consistent calculations. In a custom rate table, you control the conversion rates and the frequency of rate conversions. If you don't define custom rate tables, FX Currency fields use the System Conversion Currency Rate [fx_system_rate] table, which updates rates daily from the ECB (European Central Bank) website.

Before you begin

Role required: admin, currency_admin

About this task

A conversion rate can be quoted in different ways.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Direct conversion rate (A -> B) that may or not be invertible (that is, given rate R for A -> B, the rate for B -> A can be derived as 1/R).
- Indirect conversion rate through some intermediate currency (A -> C and C -> B).

Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Click **New**.
3. In **Label** field, enter the name of the conversation rate.
   For example, Convert-US-Euro.
4. In the **Extends** field, select the Currency Conversion Rate [fx_conversion_rate] table.
5. Complete the remaining fields to create the new extended table.
   For more details, see Create a table for details.
6. Click **Submit**.
7. Navigate to the new table and fill in the fields on the form.

Field	Description
From Currency	Currency to convert the rate conversion table from. For example, USD if you are converting from US Dollars.
To Currency	Currency to convert the rate conversion table to. For example, EUR if you are converting to Euros.
Span start	Date/time from which this currency rate is valid, for example, January 1, 2020 00:00:00.
Span end	Date/time to which this currency rate is valid, for example, January 30, 2020 23:59:59.
Order	Order in which a currency conversion selects currency rates when their time spans overlap. For a date/time and a currency pair, if there are multiple rates with a Span start less than or equal to the date/time, and Span end greater than or equal to the date/time, the currency conversion selects the highest order rate.
Rate	Actual conversion rate, stored as a decimal with six decimal places.

8. Click **Update**.

What to do next

After you create the custom rate table:

1. Manually populate the table, or import data to populate it.
2. To use this rate table on a global basis, change the *glide.currency2.system_rate_table* system property.

   To use it for a specific FX Currency field, change the **Conversion Rate Table** field setting in **System Localization** > **FX Currency Configuration.**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

- Specify the rate table and date source for currency conversions

Configuring FX Currency global settings

Before setting up and using FX Currency, review the related system properties to confirm or modify its default behavior.

Before you begin

Role required: admin

About this task

The global defaults you establish in system properties apply the configuration option to all FX Currency fields. You can then customize them for specific dictionary attributes in **System Localization** > **FX Currency Configuration.** When you create a currency configuration, it applies those settings only to the FX Currency field that you add it to. To learn more about FX Currency configurations, see Configuring FX Currency field behavior.

FX Currency configuration settings for specific FX Currency fields take precedence over system properties. Administrators can set a global configuration for a property, and then apply exceptions on a field-by-field basis.

- If you change system defaults, except for *`display_digits`* and *`display_value`*, the changes apply to updated and new values only.
- Existing values and data don't change but rather display differently, depending on configuration.

Important: Don't edit the Currency [fx_currency] table directly. The system maintains this table and your changes could have unintended consequences.

Procedure

1. Navigate to **All** > **System Localization** > **FX Currency Configuration.**
2. Review the system defaults and make any desired changes.

FX Currency field properties and attributes

System property	FX Currency configuration mapping	Description
glide.currency2.display_digits	currency_display_digits	Default number of digits displayed in FX Currency fields. **Note:** In a form, FX Currency fields display the number of digits you enter, up to 12 digits in length. ○ **Type**: Number ○ **Default value**: -1, or currency default

© 2026 ServiceNow, Inc. All rights reserved.

glide.currency2.default_reference_currency	reference_currency	Three-digit ISO currency code used for the reference currency. The default reference currency for FX Currency fields is the system reference currency. ○ **Type**: String ○ **Default value**: If you set *glide.system.reference_currenc* to true, the three-digit ISO currency code determined by *glide.system.reference_currenc* If set to false, the system locale is the default. ○ **Learn more**: Session and reference currency ○ **Develop**: GlideElementCurrency2

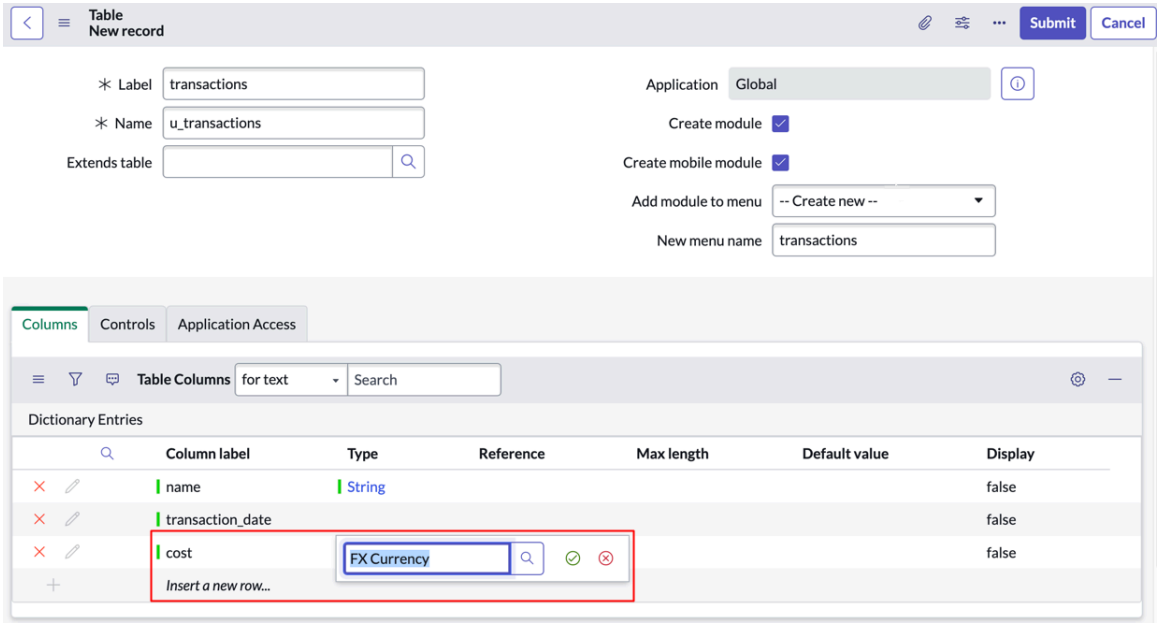
Add an FX Currency field to a table

Before using and configuring an FX Currency field, you first add it an existing table, or to a new one, in **System Definition** > **Tables.**

Before you begin

Role required: admin

About this task



For example, you create a new custom table, named `transactions`, that stores transactional information and contains an FX Currency field called `cost`.

Procedure

1. Follow the normal procedures to add a table, or access an existing table.
   To learn more about creating and modifying tables in an instance, see Create a table.
2. In the **Columns** section, use the **Table Columns** embedded list to add columns to the table.
3. In the **Column label** field, enter the column name.
   For example, `cost`.
4. In the **Type** field, select **FX Currency** as the field type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

5. As needed, enter other required parameters.

> **Note:** Do not change the **Max length** value for **FX Currency** in custom tables. **Max length** must be 32 (default).

6. Click **Submit**.

Configuring FX Currency field behavior

After establishing global currency defaults, you can create custom FX Currency configurations for specific table fields. Identify the table fields that use FX Currency, and define how currency conversion calculations should be performed, displayed, filtered, and aggregated.

For each selected field that uses FX Currency, you configure settings that:

- Govern decimal precision and currency display in lists, forms, and reports.
- Identify the reference currency code for converting currency values entered into an FX Currency field into a common currency for report aggregations.
- Identify the rate table and data source to use for currency conversions.
- Specify the rate and target fields to use for filtering custom conversion rates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When you create a currency configuration, it applies those settings only to the FX Currency field that you add it to. An FX Currency configuration takes precedence over global system properties that you established in **System Localization** > **All Properties.**

To learn more about global currency defaults, see Configuring FX Currency global settings.

You can change the defaults at any time. Doing so doesn't affect existing values, but it can make working with existing values difficult.

- For example, if you modify the **Reference Currency** field in the Currency tab, existing instance records have the old reference currency, but new instance records have the new reference currency. You can't perform an operation such as sum aggregation because the reference values are in different currencies.
- However, because the actual reference currency in the Currency Instance [fx_currency2_instance] table is accessible in an FX Currency field, you can use any script that performs this aggregation.

Identify the FX Currency field and its display parameters

Specify the table, and the field within the table (for example, cost), that the FX Currency configuration applies to. Then, select the decimal precision and currency display parameters for the field.

Before you begin

Role required: admin, currency_admin

Procedure

1. Navigate to **All** > **System Localization** > **FX Currency Configuration**.
2. Click **New**.
3. In the **Table** field, select the table that contains the FX Currency dictionary attribute.
   For example, if you created a custom table that stores transactional information and contains an FX Currency field, select it from the table listing. To learn more about creating tables in an instance, see Create a table.
4. In the **Field** field, select the column with the FX Currency field type.
   For example, if you created a custom table column for entry of the transaction cost, select it from the listing of fields for the table.
5. Click **Save**.
6. Click the Display tab.
7. In the **Display Digits** field, select the number of digits that should appear after the decimal point in lists and reports.

Option	Description
Currency Default	Number of digits that appear on lists and forms, based on what is ap propriate and customary for the specified currency itself. For exam ple: ○ USD: Two digits appear after the decimal, for example, 12.33. ○ Dinar: Three digits appear after the decimal, for example, 69.535. ○ Yen: No digits appear after the decimal, because the Yen uses no cents and numbers round to the next latest value. For example, a calculated currency value of 69.535 rounds up to, and appears as, 67 Yen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
0–12	Specific number of digits that should appear after the decimal, with selectable values from 0 through 12. If you select more than 1, it pads the values with zeroes. ○ For example, if you select 3, and the calculated value is 1.1, the currency value appears as 1.100. ○ If you select 5, this value appears as 1.10000.

Note: In a form, FX Currency fields display the number of digits as entered by the user, up to 12 digits in length.

8. In the **Display Value Currency** field, select what currency value appears in the designated FX Currency field on forms and lists.

Option	Description
Use Global Default	Use the global default you established in the *glide.currency2.display_value* system property in **System Localization** > **All Properties.**
Display As Entered	Currency value, as entered into the designated FX Currency field. For example, if the user locale is US Dollars, the value appears in Euros if they select the Euro as the currency during an entry session.
Display in Session Currency	Currency value entered into the designated FX Currency field, converted to the session currency. ○ For example, if the user locale is the United States, the session currency appears in US Dollars. ○ If the user locale is Japan, the session currency appears in the Yen. To learn more about the user locale, see Locale settings.
Display in Reference Currency	Currency value entered into the designated FX Currency field, converted to the reference currency designated in the **Reference Currency** field in the Reference tab. For example, if you enter the currency amount in Euros, it converts to and appears in US Dollars if that is the designated reference currency. To learn more the reference currency, see Set the reference currency.

9. In the **Aggregation Source** field, select the currency type to use when aggregating currency amounts for the designated field on reports.

Option	Description
Use Global Default	Use the global default you established in the *glide.currency2.default_reference_currency* property in **System Localization** > **All Properties.**
As Entered Values	Currency values, as entered into the designated FX Currency field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: If you select this option, you may experience situations where amounts entered in dissimilar currencies can't be aggregated on reports. For example, if you enter currency amounts in US Dollars, Yen, and Euros, the amounts can't be properly aggregated, or may result in erroneous totals.
Reference values	Currency values, as entered into the designated FX Currency field, converted to the reference currency you designate in the **Reference Currency** field in the Reference tab. For example, if you designate USD as the reference currency, values entered into this field convert to the reference currency, regardless of the currency you entered them in. The currency values that appear on reports are the aggregated converted reference values.

10. Click **Save**.

Set the reference currency

Set the reference currency for the designated FX Currency field. The ServiceNow AI Platform uses the reference currency to convert values entered into the FX Currency field into a common currency for report aggregation purposes.

Before you begin

Roles required: admin

Procedure

1. Click the Currency tab.
2. In the **Reference Currency** field, select the three-digit ISO currency code used for the reference currency.
   For example, select **USD** if the currency values expressed in various currencies convert into US Dollars for report aggregation.

   To use the global reference currency default you established in the *glide.currency2.default_reference_currency* property in **System Localization > All Properties.**
3. In the **Reference Currency Source** field, designate the source of the reference currency.
   - To use as the source of its reference currency when creating or updating a currency value for this FX Currency field, select the dot-walked field.
     - For example, `Cost` is an FX Currency field, and `my_currency` is a reference or string field in the Currency [fx_currency] table that contains a currency code such as USD.
     - When you create an FX Currency configuration for the `Cost` field, you select `my_currency` as its reference currency.
   - If you do not want to select the reference currency from another field, select **--None--**.
4. Click **Save**.

Specify the rate table and date source for currency conversions

Identify the rate table and data source to use for currency conversions for the designated FX Currency field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Click the Rate Table tab.
2. In the **Conversion Rate Table** field, select the rate table used for conversions of currency values in the FX Currency field:
   - To use the default system rate table you defined in the *glide.currency2.system_rate_table* property in **System Localization** > **All Properties.**, select **System Currency Conversion Rate**. This table stores daily reference rates retrieved from the European Central Bank.

     To learn more about the system rate table, see Default currency conversions.
   - If you have defined a custom rate table, you can select it to use in currency conversions for the FX Currency field. To learn more about how to define custom rate tables, see Add conversion rates using a custom rate table.
3. In the **Conversion Date Source** field, select the field to use as the source of the date and time for the currency conversion for the FX Currency field:
   - To use the date and time at which the user performs the currency conversion, select **--None--**.
   - To use as the source of the date and time for the currency conversion, select the dot-walked field.

     For example, to perform the currency conversion based on the currency rates in effect, select a transaction date field. So, if you entered the transaction on July 15, and you perform the currency conversion on July 31, it uses the currency conversion rates in effect on July 15.
4. Click **Save**.

Related topics

Understanding how FX Currency field conversions work

Add conversion rates using a custom rate table

Select the rate and target table fields used for filtering

Optionally specify the rate table and target table fields to use for filtering conversion rate information.

About this task

For example, you maintain interfaces to several ERP systems, have currency conversion rates that are unique to each ERP, but you maintain all rates in a single table.

- To identify rates for a specific ERP system, there is a **System** field in the rate table that contain entries identifying each ERP system, for example, ABC, XYZ. In the target table with the FX Currency field, you have a similarly named field for identifying the conversion rates required for specific ERP systems.
- When you perform currency conversions, and the rate and target table field entries match, it uses the rates that are unique to that specific ERP.

Procedure

1. Click the Rate Filter tab.
2. In the **Rate Table Field** field, select the field in the rate table to match against the specified target table field for conversion rate filtering.
   Select **--None--** skip use of a rate table field for conversion rate filtering.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Target Table Field** field, select the field in the target table to match against the specified rate table field for rate filtering.
   Select **--None--** skip use of a target table field for rate filtering.
4. Click **Save**.

Understanding FX Currency values in lists and reports

Understanding FX Currency values in forms

Update a Currency Instance record

Review and edit the details of a currency entry in an FX Currency field.

Before you begin

Role required: currency_instance_admin, with ACL access to the FX Currency field, or admin

Procedure

1. Access the Currency Instance record using one of the following methods.

Access method	Description
Direct access from an FX Currency field	Select the edit icon ( ) that appears next to the FX Curren cy field in a transaction record.
From the navigator bar	**a.** Navigate to **System Localization** > **FX Currency Instances**. **b.** Select the Currency Instance record to edit. **Note:** Only users with an assigned admin role can ac cess this selection from the navigator.

2. On the form, fill in the fields.

Currency Instance

Field	Description
Amount	Currency amount that you entered into the FX Currency field, formatted according to the currency code in your user locale. The amount stores internally as a currency code and a numerical value of up to 12 digits in length. For example, `USD; 1234.56`. **Note:** The currency value has two parts: the currency amount and a currency code. The amount stores as a decimal value, for example, `1234.56`.
Currency Code	Three-letter ISO code that identifies the currency that you select for the currency amount. For example, USD for the US Dollar, or EUR for the Euro.
Conversion Rate	Conversion rate used to calculate the reference currency value. It converts a session currency value, expressed in one currency, to another, and stores as a reference to a record in the Currency Conversion Rate [fx_conversion_rate] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The conversation rate is based on the **Conversion Rate Table** and **Conversion Date Source** settings for the FX Currency field in the Rate tab of FX Currency Configuration. To learn more about these settings, see Configuring FX Currency field behavior. You change or select the conversion rate as needed.
Reference Amount	Calculated reference currency amount. The ServiceNow AI Platform converts the currency value entered into the **Amount** field into a common reference currency. It uses the settings in the **Reference Currency Source** and **Reference Currency** fields in **System Localization** > **FX Currency Configuration** to do so. You can't change the calculated reference amount. **Note:** To learn more about reference currencies, see Set the reference currency.
Reference Currency Code	Three-letter ISO code that identifies the reference currency, for example, USD, to which the entered currency value converted. You can't change the reference currency code.

Note: You can't edit the reference currency and value because they are calculated automatically.

3. Select **Save**.

Currency administration references

The following sections show the properties associated with currency administration.

Life cycle of records containing FX Currency fields

The behavior of FX Currency fields varies during the processing that occurs during the lifetime of a record containing them.

Insert / Update

The FX Currency field points to a Currency Instance [fx_currency2_instance] record. When you change the currency value in an FX Currency field, it determines the conversion rate and calculates the reference currency before:

- The *before* business rules run.
- The *after* business rules run, and it includes any further changes you may have made to the *before* business rules.

Note: If the FX Currency field contains an invalid currency code, an exception condition may appear before these two stages occur.

Auditing

Since an FX Currency field points to a Currency Instance record that stores multiple values, the audit string is a composite that contains this information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The string stored in the System Audit [sys_audit] table is in the format of `EUR;111.222;4555525f5553445f3230313931323033`, with the following values, separated by semicolons:

- Three letter ISO currency code. For example, `EUR`.
- Amount as an unformatted number. For example, `111.222`.
- System identifier (sys_id) for the conversion rate record in the Currency Conversion Rate [fx_conversion_rate] table. For example, `4555525f5553445f3230313931323033`.

When creating history lines for a user, the audited string is formatted, using the locale of the user. It's in the format of `€111.22;2019-12-03 17:00:00-3000-01-01 23:59:59;fx_system_rate`, with the following values, separated by semicolons:

- Formatted currency string in the user locale. For example, `€111.22`.
- Start span-End span, as expressed in the conversion rate record in the System Rate [fx_system_rate] table. For example, `2019-12-03 17:00:00-3000-01-01 23:59:59`.
- Name of the conversion rate table. For example, `fx_system_rate`.

Dot-walkable Currency Instance fields

You can dot-walk certain fields in the Currency Instance [fx_currency2_instance] record, and field values stored in the database are consistent with each other. However, in script, since fields can be changed individually, and you change only some of the fields, they can be inconsistent.

Currency code

The **Currency** field isn't a reference field, so you can set it to any value. However, if you enter an invalid currency code, an exception message is generated. An empty value is considered a session currency code.

Query conditions

You can add query conditions on dot-walked fields in the instance table. However, when the query condition value is in a special format with currency code and amount, it's treated as a compound condition on the dot walked fields. The value has to be in format `XYZ, abc` where:

- `XYZ` is a currency code, and
- `abc` is an amount.

For example, `USD, 12.34`.

A condition such as `cost>USD,12.34` is treated as `cost.currency>USD AND cost.amount12.34`.

When the second operand is another Currency2 field, the condition translates in a similar manner:

`cost1>cost2` is treated as `cost1.currency=cost2.currency AND cost1.amount>cost2.amount`.

ServiceNow AI Platform translation and localization

Provide service around the globe with language translation and localization for specified regions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic Translation

Translate user-generated content live on your instance to streamline communication for your agents and end users.

Localization Framework

Standardize the process of translating artifacts such as Service Catalog items, Knowledge Base articles, and Document Templates across the platform.

Localization Workspace

Localization Workspace is a targeted translation management experience for content owners and translation requesters. With Localization Workspace you can manage and deliver multilingual content at scale.

System Localization

Set up location-based translation and currency support for users on your instance, wherever they are in the world.

For additional resources about globalization tools on the ServiceNow AI Platform, see the Localization page in the ServiceNow Customer Success Center.

Dynamic Translation

Translate user-generated content live on your instance to streamline communication for your agents and end users. Integrate with the machine translation service provider of your choice to enable translation on forms, activity streams, and chats. Microsoft Azure and Google Cloud Translator Service are partially preconfigured with the activation of Dynamic Translation, or you can configure a custom service provider using Integration Hub.

Localization Framework

The Localization Framework app uses configurable workflows to standardize the process of translating artifacts across the platform. Translate Service Catalog items, Knowledge Base articles, Document Templates, and more.

Localization Workspace

Localization Workspace is a targeted translation management experience for content owners and translation requesters. It streamlines and automates task creation and translation workflows. With Localization Workspace you can manage and deliver multilingual content at scale.

Dynamic Translation overview

Activating the Dynamic Translation plugin (com.glide.dynamic_translation) enables real-time machine translation of user-entered text in form fields, activity streams, chats, and knowledge articles. You can integrate with a machine translation service provider of your choice. You can configure which tables and features offer on-demand translation for your users.

To localize your instance, including static UI elements, currency, and time displays, see System Localization.

To manage and deliver multilingual content at scale, see Localization Workspace.

Dynamic Translation workflow

1. Procure any ServiceNow, Inc. subscription that is Professional or above, and includes Dynamic Translation.
2. Activate your choice of language or languages. For more information, see Activate a language. The language plugin also activates Localization Framework.
3. Activate the Dynamic Translation plugin (com.glide.dynamic_translation). For information, see Activate Dynamic Translation.
4. Sign up and create an account with a translation service provider. By default, the following translation service providers are partially preconfigured:
   - Microsoft. To sign up, see the Microsoft documentation. For more information, see Microsoft Azure Translator Service spoke.
   - Google. To sign up, see the Google website. For more information, see Google Cloud Translator Service Spoke and Set up Google Cloud Translator Service spoke.

     Note: The Google Cloud Translator Service spoke is installed from the ServiceNow Store.

   You can also configure any translation service provider of your choice. For information about custom configurations, see Integrate with a translation service provider.
5. Configure your translation service provider in Dynamic Translation.
   - After you have signed up with a translation service provider, do the following in your instance: create a connection, specify the credential information, then activate the translator configuration.
   - Set at least one translator configuration as the default for detection, to detect the language of the user-entered text.
   - Set at least one translator configuration as the default for translation request calls.
   - Dynamic Translation uses the ServiceNow® language codes and supports all the languages that the translation service providers support.

     Note: For languages where there is a difference in language codes, see Create a language code mapping to create a language code mapping record and associate it with the translator configuration record.
6. Configure your use cases as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To enable dynamic translation in a form field, configure the dictionary attribute. For more information, see Enable dynamic translation for a field.
- To enable dynamic translation in an activity stream, include the table name in the allow list property. For more information, see Dynamic translation on forms and activity streams.
- For other use cases, see the links in the Features column of the following Dynamic Translation benefits table.

Dynamic Translation benefits

Benefit	Feature	Users
Live translation on forms	Dynamic translation on forms and activity streams	Agent
Knowledge article translation	Together with Localization Framework, enable the translation of Knowledge Base articles.	Agent
Set your preferred translation services	Dynamic Translation spoke and integrating with third-party services	Administrator
Use an API and enable machine translation for multiple languages	DynamicTranslation API	Administrator
Translate text in conversations between end users and agents	Dynamic Translation for Agent Chat	End user, agent
Regulated market support	From the Zurich release, support for certain regulated markets is available. For information see KB0743854 on the Now Support portal.	Administrator, end user, agent
Self-hosted (on-premise) support	Dynamic Translation is available to self-hosted (on-premise) customers who permit integrations to machine translation vendors.	Administrator
Domain separation support	For information about domain separation with Dynamic Translation, see Domain separation and Dynamic Translation	Administrator

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring Dynamic Translation

Activate and configure Dynamic Translation to integrate with a third-party machine translation provider to enable live translation of user-generated content across the ServiceNow AI Platform.

Configuration overview

Activate dynamic translation and integrate with your preferred service provider.

Activate Dynamic Translation

Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to enable all the required APIs.

Before you begin

You must have the Glide Notification Translation (com.glide.notification.translation) plugin installed and enabled.

Role required: admin

About this task

Dynamic Translation plugin (com.glide.dynamic_translation) activates these related plugins if they are not already active.

Plugins for Dynamic Translation plugin (com.glide.dynamic_translation)

Plugin	Description
Flow Designer - Installer [com.glide.hub]	Supports the Flow Designer application.
ServiceNow IntegrationHub Runtime [com.glide.hub.integration.runtime]	Enables execution of IntegrationHub actions and flows.
ServiceNow IntegrationHub Action Step - REST [com.glide.hub.action_step.rest]	Action Step - REST
Microsoft Azure Translator Service Spoke [com.glide.microsoft_translation_spoke]	Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using Microsoft translation services.
ServiceNow Language Detection Service Spoke [com.glide.language_detection_spoke]	Uses ServiceNow® Language Detection service to provide the ability to detect the language of given text.
Dynamic Translation Spoke [com.glide.dynamic_translation.spoke]	Provides actions that enable the ability to translate text(s) from one language to other language(s) and to detect the language of given text.
Translation Commons [com.glide.translation.commons]	Common utilities for translation features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you activate the Microsoft Azure Translator Service Spoke plugin when the Dynamic Translation plugin (com.glide.dynamic_translation) is inactive, the subflows and actions of the Microsoft Azure Translator Service Spoke plugin are enabled. These subflows can be used in other flows and subflows. However, you cannot call Dynamic Translation APIs.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Available plugins and applications

Request for domain separation in Dynamic Translation

Enable the support for the Dynamic Translation framework in domain-separated instances.

Before you begin
Role required: admin

About this task
There are two ways to request a plugin.

- Access the Now Support Service Catalog directly by selecting **Automation Store** > **Service Catalog** > **Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

What to do next

For information about configuring domain separation in Dynamic Translation, see Domain separation and Dynamic Translation.

Available plugins and applications

Exclusion Framework in Dynamic Translation

Preserve text such as product names or technical terms during machine translation. With Exclusion Framework in Dynamic Translation, you can specify words and patterns that should not be translated.

Exclusion Framework is a set of rules ensuring that your designated text bypasses the machine translation process and appears unchanged in the resulting output. Dynamic Translation applies Exclusion Framework rules to your text before submitting the request to your machine translation provider. Two types of rules are supported: Exact Match (specific terms) and Pattern Match (regex).

Examples of text to consider for exclusion from machine translation

In response to your organization's business requirements, you can create Exclusion Framework rules for text strings such as the following.

Exclusion rule examples

Rule type	Examples
Exact match	• Product or company names • Acronyms, stock ticker symbols

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exclusion rule examples (continued)

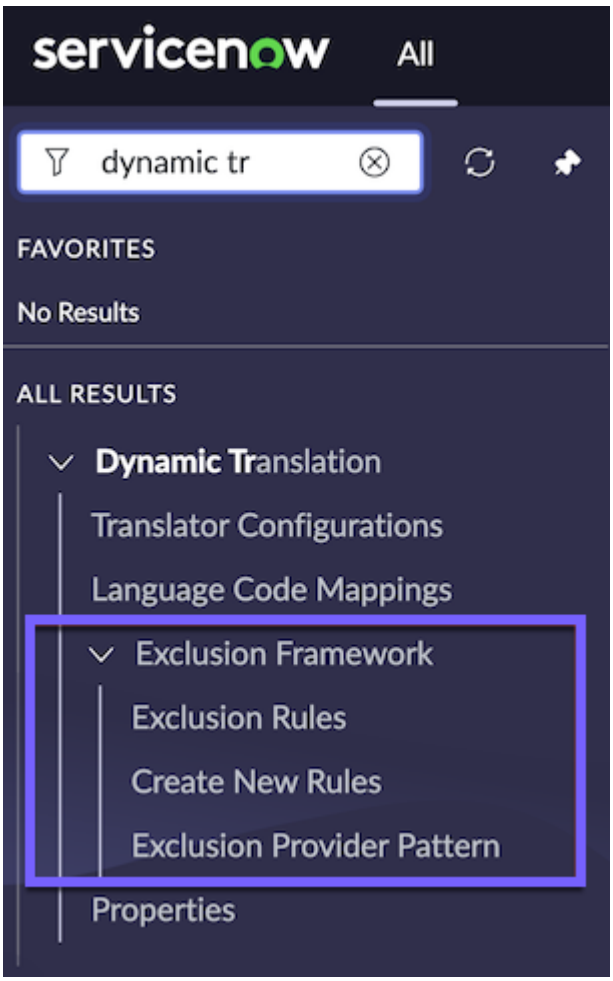
Rule type	Examples
	• Technical terms or identifiers • Terminology that has unique meaning in your organization
Pattern match	• Case numbers, incident numbers • KB article numbers • Sys IDs

Review your organization's glossaries and taxonomies to identify candidates for exclusion.

Activating Exclusion Framework

An upgrade to Xanadu Patch 3 or higher, when Dynamic Translation is active, includes activation of Exclusion Framework by default.

Note: Dynamic Translation requires a Professional or above subscription. For information see Activate Dynamic Translation.



An upgrade to Xanadu Patch 3 or higher also converts the Dynamic Translation flows from v3 to v4. The v4 flows contain subflows for working with Exclusion Framework. Translator configurations available by default are automatically upgraded to v4. For more information, see Migrate customized Translator Configurations to v4 flows.

A system property in **All** > **Dynamic Translation** > **Properties** enables you to activate or deactivate Exclusion Framework: sn_dt.dynamic_framework.enable_exclusion_framework.

Exclusion Framework appears as a module under Dynamic Translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Exclusion Framework module

By default Exclusion Framework provides several exclusion rules, and you can add your own rules during configuration.

Exclusion Rules | Order | Search | Actions on selected rows...

All

Name	Active	Rule type	Order	Exclusion term	Ignore Case	Description	Domain
KB numbers	true	Pattern Match		KB\d+	false	Matches any string that starts with "KB"...	global
Stock name	true	Exact Match		NOW	false		global

Configuring Exclusion Framework

Because Exclusion Framework is activated by default you can complete its configuration as follows.

1. Ensure that your third-party machine translation service has an active record in the Exclusion Provider Pattern [sn_dt_provider_exclusion_pattern] table. If you have chosen a custom translator service you must input their exclusion tags. For information see Add an Exclusion Provider Pattern.
2. Review any existing records in the Exclusion Rules [sn_dt_exclusion_rules] table to check whether they are appropriate for your needs. Rules that are provided by default can be deactivated by clearing the Active check box, but they can't be edited.
3. Add more exclusion rules according to your organizational requirements. For information see Add new rules to Exclusion Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exclusion Framework's operational process

After configuration, Exclusion Framework's subflows operate within Dynamic Translation. The Exclusion Framework process is outlined as follows.

1. Exclusion Framework searches the original text (before translation) to find any matches to terms and patterns that are active in the Exclusion Rules table.
2. Any matches are wrapped in exclusion tags. These tags are pulled from the relevant record in the Exclusion Provider Pattern table.
3. The tagged text is submitted to your machine translation provider.

Text that is wrapped in the exclusion tags is shielded from translation. It is written into the translation results in its original language, so the output contains unmodified text embedded in translated text.

Domain separation support in Exclusion Framework

Exclusion Framework supports domain separation. Each domain on an instance can have its own set of Exclusion Framework rules, so the rules apply at the domain level. Within a domain, each rule must be unique. Create rules in the domain where you want them to operate.

When multiple domains exist on one instance, Exclusion Framework is activated on all domains. Deactivating Exclusion Framework on a per-domain basis isn't supported. As an alternative, deactivate every rule in a domain where you want Exclusion Framework to be inactive.

Add new rules to Exclusion Framework

Add terms and patterns that shouldn't be machine translated to the Exclusion Rules table. You can create either exact match rules or pattern match rules, and you can edit your rules later.

Before you begin

Role required: admin

About this task

By default Exclusion Framework provides several activated rules in the Exclusion Rules table [sn_dt_exclusion_rule]. Before creating your own rules, review the default rules to check whether they are appropriate for your requirements. Navigate to **All** > **Dynamic Translation** > **Exclusion Framework** > **Exclusion Rules** and select a rule name to open its record.

Default rules can be deactivated but not edited, and they are in the Dynamic Translation application scope. The rules you create can be deactivated or edited.

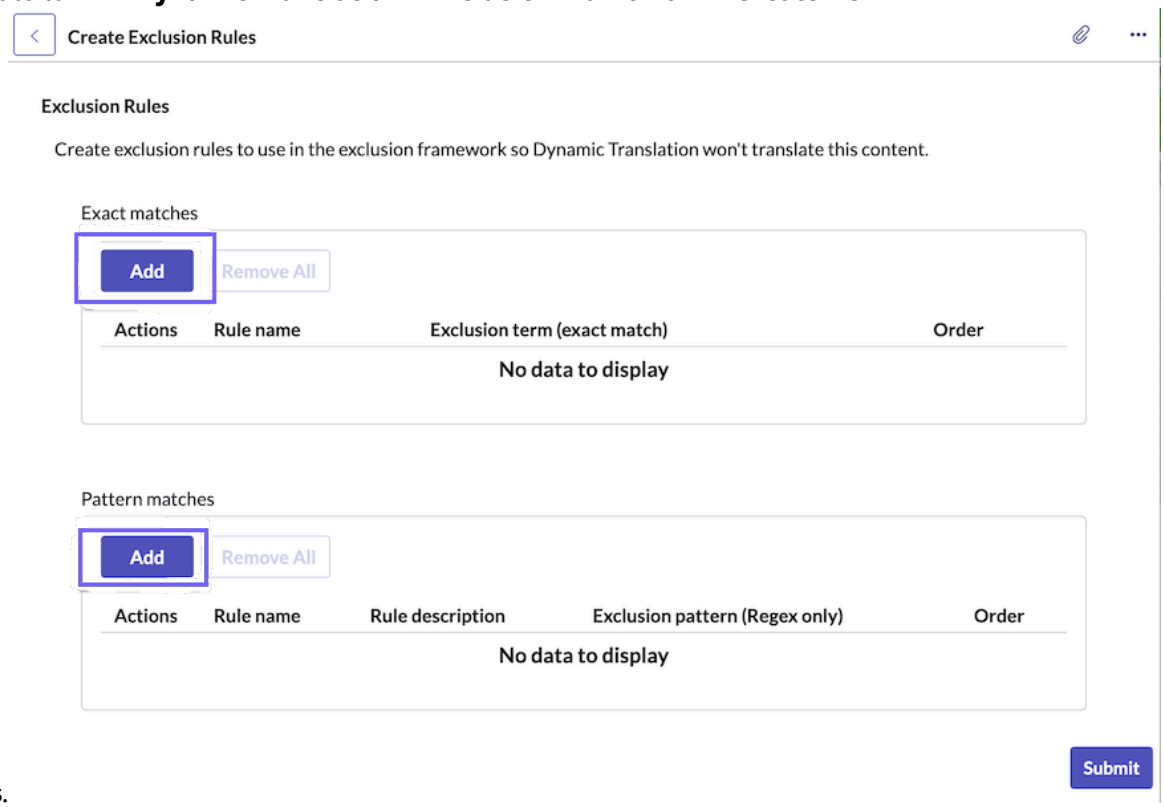
There are two types of exclusion rules.

- Exact match rules search for the term you input. Case sensitivity can be enabled for these rules using the **Ignore Case** check box.
- Pattern match rules use regular expressions (regex) to find text strings such as Sys IDs and KB article numbers. These text strings may contain varying combinations of characters but they follow a defined pattern. The **Add Row** form performs a basic validity check on the regex, displaying the error "The input is not a valid regex pattern" when the check fails.

Note: ServiceNow supports only Java regular expressions (regex), not Perl or other vendor options.

The **Create New Rules** module opens a record producer that supports adding multiple rules at one time. There is a maximum limit of 50 rules per type per submission. That limit applies only to the submission form, not to the Exclusion Rules table.

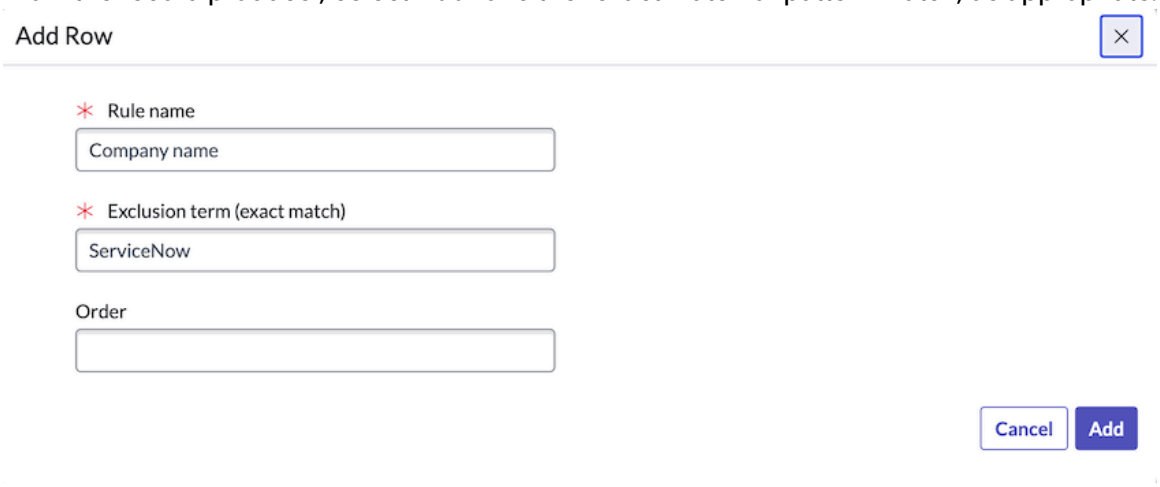
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Exclusion rules are applied to your text in sequence. When Exclusion Framework finds a match it stops, so later rules are not applied. You can set the order in which rules are applied by filling in the optional **Order** field.

1. Rules with a value in the **Order** field are evaluated from lowest number first (such as 1) to highest number last (such as 100).
2. Next, rules without a value in the **Order** field are evaluated according to age. The oldest rule is evaluated first, and the newest rule is evaluated last.

Exclusion rules must be unique within a domain. An attempted duplicate submission displays a banner with the message "Exclusion term and Domain combination already exists."



Procedure

1. Ensure that you are in the application scope that you want for your rules, then navigate to **All** > **Dynamic Translation** > **Exclusion Framework** > **Create New Rules**.

A modal for a record producer opens, so you can add multiple rules at one time.

2. From the record producer, select **Add** for either exact match or pattern match, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the **Add Row** form, configure the fields according to the following guidance.

Rule type	Fields
Exact Match	○ **Rule name** ○ **Exclusion term (exact match)**: You can enter terms that contain spaces. ○ **Order**: Optional. See the previous explanation.
Pattern Match	○ **Rule name** ○ **Rule description**: Describe what the regex pattern is looking for. ○ **Exclusion pattern (regex only)**: enter the pattern as a regular expression. ○ **Order**: Optional. See the previous explanation.

4. Edit or delete any rows as needed, then select **Submit**.
   Your rules are added to the Exclusion Rules table and activated.

What to do next

You can edit and deactivate your rules in the Exclusion Rules table. Navigate to **All** > **Dynamic Translation** > **Exclusion Framework** > **Exclusion Rules**, then select the rule name to open its record.

For exact match rules, you can modify the case sensitivity in its Exclusion Rules record.

- Select the **Ignore Case** check box to enable case insensitive matching (for example, the entry "hello" would match "Hello", "hEllo", "helLo" and so forth.)
- Clear the **Ignore Case** check box to match the entry exactly as it appears in the table, including its casing.

From the Zurich release, you can manually test your pattern. For more information see Test Exclusion Rule.

Test Exclusion Rule

Test Exclusion Rule in Dynamic Translation enables you to test your exclusion pattern manually. You can check whether the pattern accurately excludes a text string from translation.

Before you begin

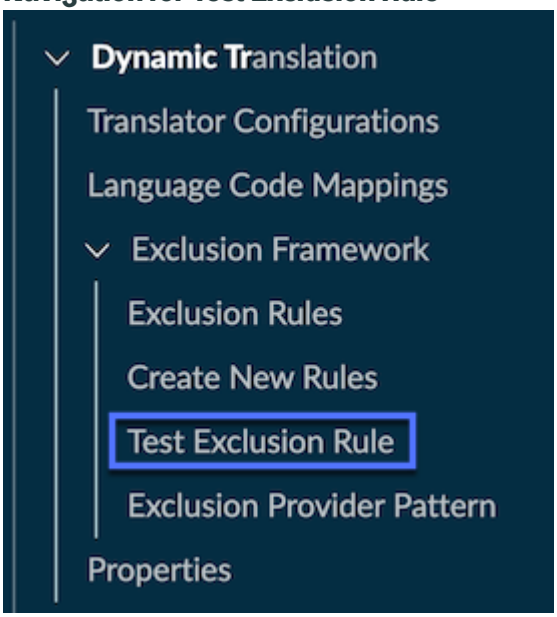
At least one additional language must be available on your instance. For more information about installing languages, see Activate a language.

Role required: admin

About this task

Test Exclusion Rule opens a record producer where your exclusion pattern can be tested manually on a text string that you enter. Several of the fields on the record producer change depending on the following choices.

- You can test an exclusion pattern before or after you create an exclusion rule (New or Existing rule).
- You can test either type (Exact match or Pattern match).



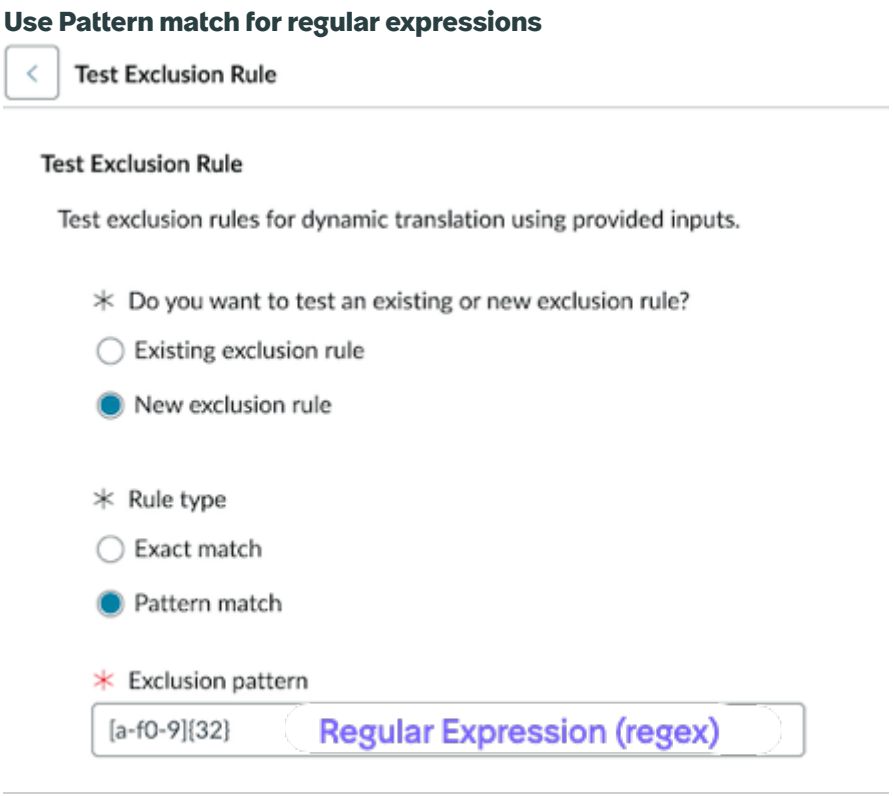
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you choose New exclusion rule, you can opt to create a new rule based on your test pattern.

You can select a target language from among the languages enabled on the instance. The target language is the language you want to translate into. The output shows the translation with the matching sequence displayed in bold font.

You can test iteratively to refine your exclusion pattern.

Navigation for Test Exclusion Rule

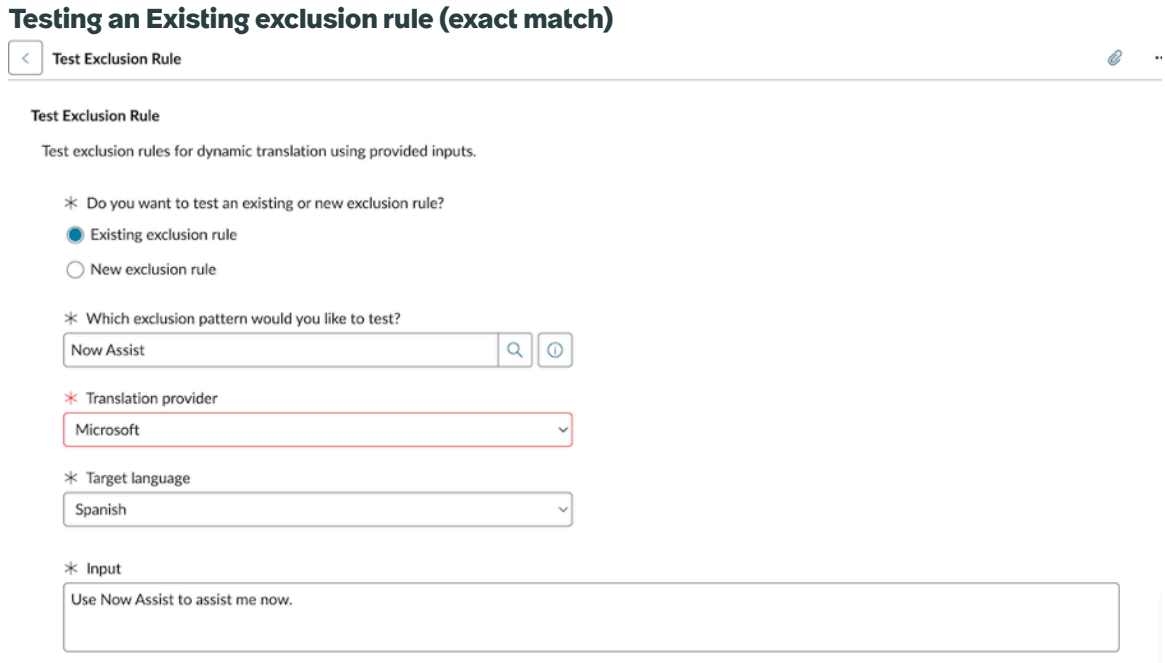


Procedure

1. Navigate to **All** > *Dynamic Translation* > **Test Exclusion Rule**.
   A record producer opens.
2. Select the appropriate option for the first question, **Do you want to test an existing or new exclusion rule?**

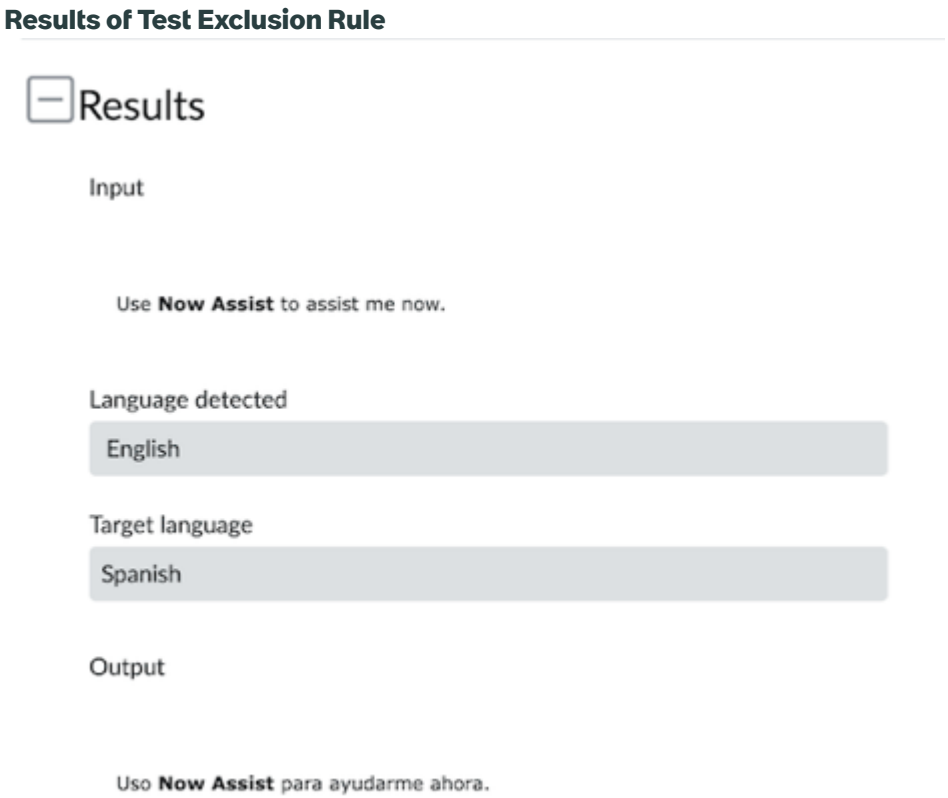
Option	Description
Existing exclusion rule	If you choose this option, the next field opens: **Which exclusion pattern would you like to test?** Select your pattern from the list, or use the field's search function. The information icon (ⓘ) offers a read-on ly summary of the selected rule.
New exclusion rule	If you choose this option, two fields and a but ton appear on the form. **a. Rule type**: Choose from ▪ **Exact match** ▪ **Pattern match** (regex) **b. Exclusion term** (for Exact match): enter a text string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Option	Description
	Exclusion pattern (for Pattern match): enter a regular expression (regex) pattern. c. **Create Rule**: You can optionally use this button to open a form for a new exclusion rule. The most recent exclusion pattern that you tested is imported into this form.

3. **Target language**: Select a language from the languages installed on your instance. This is the language you want to translate into.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Input**: In the source language, enter text containing the string that you want your exclusion pattern or term to match, then select **Submit**.

Result

The input is translated into the target language, but the part that matched the exclusion pattern remains in the source language. The result is a mix of translated and untranslated text. The match is highlighted in bold font.

If your test pattern did not match any part of the input, the result displays a translation with no bold font.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Your input might match other exclusion rules active on your instance. If this occurs, the result displays a mix of translated and untranslated text without bold font. Only matches to the current test pattern display bold font.

When testing variations of existing rules, temporarily deactivating similar rules could help focus on the test pattern.

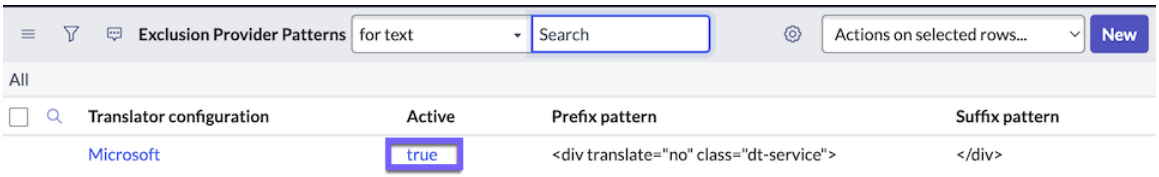
What to do next

If you chose **New exclusion rule**, you can create a rule based on the exclusion pattern that you tested. For more information see Add new rules to Exclusion Framework.

Add an Exclusion Provider Pattern

As part of the configuration of Exclusion Framework in Dynamic Translation, enter the tags used by your translation provider to mark text that should not be machine translated.

Before you begin



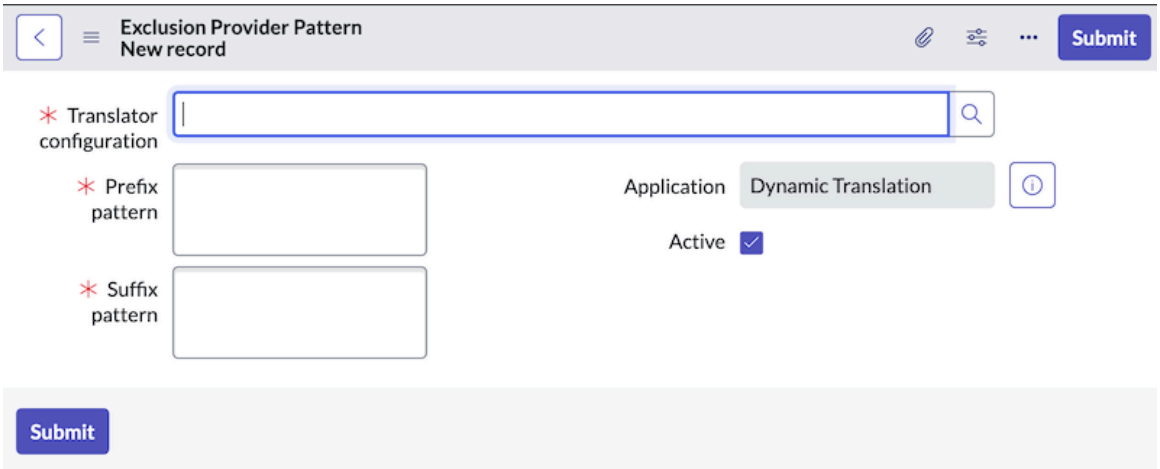
Consult your machine translator provider's documentation or account portal to obtain the tags it uses to mark text strings for exclusion from translation.

Role required: admin

About this task

The Exclusion Provider Pattern [sn_dt_provider_exclusion_pattern] table stores the exclusion tags used by machine translation providers. From this table's list view, select the value in the Active column to view a record. (Selecting the value in the Translator Configuration column opens the corresponding Translator Configuration table entry in Dynamic Translation).

To open a record, use the value in the Active column on the list view of Exclusion Provider Pattern



By default Exclusion Framework provides an Exclusion Provider Pattern record for Microsoft. If you have a different machine translation service, use the following procedure to add its exclusion pattern.

Procedure

1. Ensure that you are in the application scope that you want for your record, then navigate to **All** > **Dynamic Translation** > **Exclusion Framework** > **Exclusion Provider Pattern**.
2. Select **New** to open **Exclusion Provider Pattern New record**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The New record form on the Exclusion Provider Pattern table

3. On the form, configure the fields according to the following guidance.

Fields in the Exclusion Provider Pattern form

Field	Value
Translator Configuration	Select your third-party translation provider. You can use the look-up icon ( ), or start typing the name into the field. The available records are pulled from Dynamic Translation's Translator Configurations table.
Prefix pattern	The start or opening tag to mark a text string for exclusion.
Suffix pattern	The end or closing tag of an excluded text string.
Application	Displays the application scope in which this record was created. This value can't be edited.
Active	Select this check box to activate, or clear the check box to deactivate.

4. Select **Submit** to save the record.

Integration with other translation services

Enable machine translation on your instance by integrating third-party translator services with Dynamic Translation. You can configure one or more translation service providers of your choice.

Translator services are listed in the Translator Configurations [sn_dt_translator_configuration] table. By default several third-party translators are partially preconfigured in this table. You can complete the configuration of a default translator by providing your account credentials and connections.

Alternatively, you can also create a custom spoke. In addition to your account credentials and connections, you must configure flows and any needed language code mappings for your custom translator. See Integrate with a translation service provider.

Also listed in the Translator Configurations table is a default record for the **ServiceNow** translator. This translator can be used for language detection only, not for translation, so its **Mark as default for translation** check box is not selectable. This optional language detection service is included in your Dynamic Translation subscription.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you activate dynamic translation in the Generative AI Controller, a fully preconfigured spoke to Microsoft Azure OEM Translator Service is added as a row in Translator Configurations.

Consult your service provider's portal for details regarding data privacy policies, cost and usage structure, and other information related to your account with that provider. Test your integration in a non-production instance, including examining logs, before deploying to production.

Integrate with a translation service provider

Integrate with a third-party translation provider of your choice for machine translation of user-generated text.

Before you begin

- Create an account with your third-party translation service provider, and obtain the connection and credentials needed for integration.
- Role required: admin

About this task

By default Dynamic Translation provides partially preconfigured translator records for several third party services. However, you can also create your own custom integration for a different service provider.

Custom integrations require you to create subflows for language detection and translation, including actions, in Workflow Studio.

Use default subflows as examples when you build your own subflows. For example:

- Detect Language [detect_language_v4]
- Translate Text [translate_text_v3]

For background information, see Workflow Studio and Migrate customized Translator Configurations to v4 flows.

Procedure

1. Confirm your application scope, then navigate to **All** > **Process Automation** > **Workflow Studio**, and select **New**.
   To map error codes try using actions in subflows. For example, the Translate Text subflow has a Translate Text action. On that action, you can select **Open in Action Designer**. In the **Action Outline** section of the Action Designer, you can select **Error Evaluation**. You can overwrite the default error status that a step produces at runtime by entering new status code and status message values. See Action error evaluation.

   a. Map error codes from your machine translation provider to the error codes and standardized error messages supported by ServiceNow.

Standard error codes and message

Error code	Error message
40050	Error code to populate error messages from the machine translation provider instead of standardized error messages.
40051	Unknown error occurred.
40052	Text ('text' field) has exceeded its maximum length.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error code	Error message
40053	Source language is invalid.
40054	Target language is invalid.
40055	Request is not authorized because credentials are missing or invalid.
40056	Text cannot be translated to target languages.

b. Ensure that the inputs and output fields are in the following format for subflows.

Detect subflow

Field name	Description	Type
Inputs		
texts	Input texts whose language should be detected. Version v3 supports bulk detection (detection of multiple texts input in a single string). With the Xanadu Patch 3 release, version v4 supports Exclusion Framework as well as bulk detection.	Array.String
Outputs		
detections	Information about the code and confidence of the languages detected by the translator and their respective alternatives, error codes, and error messages. ▪ Code: Language code of the detected language as specified by the translation service provider. ▪ Confidence: Value that indicates the confidence in the result. The value is between zero and one. A low value indicates a low confidence. For example, French text with confidence of 0.93 `{ 'code' : 'fr', 'confidence' : '0.93' }` For more information refer to the getDetectedLanguages section of DynamicTranslation - Scoped.	Array.Object. Each element of the Object is a String value.
status	Status of the request.	Choice

Translate subflow

Field name	Description	Type
Inputs		
texts	Texts to be translated. Version v3 and above support bulk translation (translation of multiple texts input in a single string).	Array.String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field name	Description	Type
target_languages	Array of language codes to which the text needs to be translated. For example, `['fr','it']`	Array String. Each element of the array is a String value.
source_language	Language code of the source text. For example, `en`	String
additional_parameters	Array of additional parameters. For example, `[{'parameter_name': 'textType', 'parameter_value': 'html'}]`	Array.Object. Each element of the array is an Object with String values.
Outputs		
translations	Translated texts in the specified target languages. Each element of the array is an Object containing target language and the translated text. For example, `[ {'target_language':'fr', 'translated_text':'Bonjour'}, {'target_language':'it', 'translated_text':'ciao'} ]` For more information refer to the getTranslations section of DynamicTranslation - Scoped.	Array.Object. Each element of the array is an Object with String values.
status	Status of the request.	Choice

Note: Ensure that the **Run As** field is set to **User who initiates session** in the flow properties.

2. Create a custom translator configuration for your service provider in the Translator Configurations table, and set the record to active.
   When you create the record in the Translator Configurations table, search for the subflows you created in the previous step..
3. **Optional:** If your instance is on Xanadu Patch 3 or higher, and you intend to use Exclusion Framework, enter your translation provider's exclusion tags in the Exclusion Provider Pattern table.
   Refer to your provider's documentation to obtain these tags. For more information about entering the tags, see Add an Exclusion Provider Pattern.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Create a language code mapping to associate your provider's language codes to ServiceNow language codes.
   For more information, see Create a language code mapping.

What to do next
For information about APIs, see DynamicTranslation API.

Create a custom translator configuration

Configure Dynamic Translation for a third-party machine translation provider of your choice.

Before you begin
Ensure that the Dynamic Translation plugin (com.glide.dynamic_translation) is activated.

Create subflows for your custom translation provider. See Integrate with a translation service provider.

Create language code mappings as needed. For more information see Language Code Mapping in Dynamic Translation.

Role required: admin

About this task
By default, Google and Microsoft translator configurations are available and ready for you to add your account details. Also by default the ServiceNow translator configuration, for language detection only, is available and active.

However, you can also configure a custom translator with the following procedure.

Procedure
1. Complete the prerequisites and confirm your application scope, then navigate to **All** > **Dynamic Translation** > **Translator Configurations**.
2. Select **New**.
3. On the form, fill in the fields.

Translator Configuration form fields

Field	Description
Name	Identifier of the translator configuration.
Active	Option to activate the translator configuration.
Version	Version of the contract used in subflows. Version v3 is used in releases before Xanadu Patch 3. Version v4 is used in releases from Xanadu Patch 3.
Preferences	
Choose a translate subflow	Workflow Studio subflow that interacts with the translation service provider to translate the input text. Search for the subflow that you created in the previous procedure (Integrate with a translation service provider).
Mark as default for translation	Option to mark the translator configuration as the default configuration for translation. When no translator configuration is specified while translating the text, the default configuration is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The ServiceNow translator configuration is for language detection only, so this check box is not available on that record. ○ The translator configuration must be active to be marked as default. ○ You can select only one translator configuration as default for translation.
Choose a detect subflow	Workflow Studio subflow that interacts with the machine translation provider to detect the language of the input text. Search for the subflow that you created in the previous procedure (Integrate with a translation service provider).
Mark as default for detection	Option to mark the translator configuration as the default configuration for detection (determining the language of the submitted text). When no translator configuration is specified while detecting the text, the default configuration is used. ○ The translator configuration must be active to be marked as default. ○ You can select only one translator configuration as default for detection.
Language Code Mappings	
Language code mappings	Mapping codes for languages to associate with the translator configuration record. Associate with the translator configuration record by selecting the magnifying glass icon ( ), then selecting the language code mapping. ○ Only languages for which the language code mapping was created are available for selection. ○ You can select only one language code mapping per language. For more information, see Create a language code mapping.

4. Select **Submit**.

What to do next

If you are on Xanadu Patch 3 or above, and want to use Exclusion Framework in Dynamic Translation, add your translation provider's exclusion tags. For more information, see Add an Exclusion Provider Pattern.

Google Cloud Translator Service Spoke

Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using the Google translation service.

Request apps on the Store

Visit the ServiceNow Store to view all the available apps, and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Subscription

This spoke requires one of the following subscriptions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- Integration Hub subscription. For more information, see Legal schedules - IntegrationHub overview.

See the Google Cloud Translator Service Spoke in ServiceNow Store.

Spoke version

Google Cloud Translator Service Spoke v3.2.8 is the latest version. For version history of the spoke, see Google Cloud Translator Service spoke release notes.

Supported versions

Google Translate API version v3.

Scope of the spoke in the Dynamic Translation framework

To use Google Cloud Translator Service spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see Dynamic Translation.

Spoke flows

This spoke has no sample flows.

Spoke subflows

The Google Cloud Translator Service spoke provides subflows in the Published state to integrate with the Google translation service. These subflows can be used as part of other subflows and flows.

Subflow	Description
Detect Language	Contains a set of inputs, actions, and outputs to detect the language of the input text.
Translate Text To Multiple Languages	Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.

Spoke actions

The Google Cloud Translator Service spoke provides actions to integrate with the Google translation service. Available actions include:

Action	Description
Detect Language	Detects the language of the input text.
Translate Text To Single Language	Translates the input text to a single language.
Translate Text To Multiple Languages	Translates the input text to multiple languages.

Google account requirements

The Google Cloud Translator Service spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connection and credential alias requirements

Integration Hub uses aliases to manage connection and credential information, and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection.

This spoke uses the GoogleTranslation alias record (sn_google_trans.GoogleTranslation) to authorize actions. For information about setting up the spoke, see Set up the Google Cloud Translator Service spoke.

Set up the Google Cloud Translator Service spoke

Integrate your Google account with your ServiceNow instance.

Before you begin

- Request an Integration Hub subscription.
- Activate the Google Cloud Translator Service spoke.
- Create a service account on Google Cloud, generate a service account key of JSON type and download it. For information on creating the service account key, see the Google documentation.
- Enable the Cloud Translation API service. For information on enabling a service, see the Google documentation.
- Role required: admin

Create a Java KeyStore certificate

Encrypt the security certificates obtained from Google by creating a Java KeyStore (JKS) file.

Before you begin

- Role required: admin
- Download a JSON file containing the service account key from Google. For information on downloading the JSON file, see the Google documentation. Following is a sample JSON file:

```
{
  "type": "service_account",
  "project_id": "primeval-nectar-242610",
  "private_key_id": "0c6c7b1511f1c236c1300c5933d528bbf45314e5",
  "private_key": "-----BEGIN PRIVATE KEY-----\n...\n-----END
 PRIVATE KEY-----\n",
  "client_email":
 "service-now-google-trans-v3@primeval-nectar-242610.iam.gservi
ceaccount.com",
  "client_id": "113255944370425109391",
  "auth_uri": "https://accounts.google.com/o/oauth2/auth",
  "token_uri": "https://oauth2.googleapis.com/token",
  "auth_provider_x509_cert_url":
 "https://www.googleapis.com/oauth2/v1/certs",
  "client_x509_cert_url":
 "https://www.googleapis.com/robot/v1/metadata/x509/service-n
ow-google-trans-v3%40primeval-nectar-242610.iam.gserviceaccount
.com"
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the JSON file, perform the following for the `private_key` value.
   a. Unescape the `\n` characters.

      Tip: To unescape characters in a JSON file, you can parse a JSON string into a JavaScript object.

   b. Store the private key in a file with .pem extension.
2. In the JSON file, perform the following for the `client_x509_cert_url` value.
   a. Open the link specified for `client_x509_cert_url`.
   b. Unescape the `\n` characters for the certificate associated with the private_key_id mentioned in the JSON file.
   c. Store the certificate value in a file with .pem extension.
3. Use the openssl command to create a PKCS 12 file using the recently created private key and certificate files.

   ```
   openssl pkcs12 -export -in [path to certificate] -inkey
    [path to private key] -certfile [path to certificate ] -out
    testkeystore.p12
   ```

   For example, if certificate.pem is the certficate and privatekey.pem is the private key:

   ```
   openssl pkcs12 -export -in certificate.pem -inkey
    privatekey.pem -certfile certificate.pem -out testkeystore.p12
   ```

   A PKCS 12 file, testkeystore.p12, is created.
4. Specify an export password or source keystore password.

   Note: You should specify this password when creating a JWT key for Google Cloud Translator Service spoke.

5. Use the keytool command to create a JKS file from the PKCS 12 file.

   ```
   keytool -importkeystore -srckeystore testkeystore.p12
    -srcstoretype pkcs12 -destkeystore wso2carbon.jks
    -deststoretype JKS
   ```

   Note: testKeyStore.p12 is the PKCS 12 file and wso2carbon.jks is the JKS file.

6. Specify a destination keystore password.

   Note: You should specify this password when attaching a JKS certificate to Google Cloud Translator Service spoke.

Attach a Java KeyStore certificate to Google Cloud Translator Service spoke

Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service spoke.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Role required: admin
- Valid Java KeyStore certificate

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

X.509 Certificate form fields

Field	Description
Name	Identifier of the certificate.
Notify on expiration	Users to be notified when the certificate expires.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to activate the certificate.
Type	Type of the certificate. Select **Java Key Store**.
Expires in days	Number of days until the certificate expires.
Key store password	Password to access the certificate. Use the destination keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.
Short description	Summary about the certificate.

4. Click the manage attachments icon ( ) and attach a JKS certificate.
5. To validate the JKS certificate, click **Validate Stores/Certificates**.
6. Click **Submit**.

Create a JWT signing key for Google Cloud Translator Service spoke

Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JWT Keys form fields

Field	Description
Name	Identifier of the JWT signing key.
Signing Keystore	Valid JKS certificate for which you want to assign the key.
Key Id	Key ID to identify which key is used when multiple keys are used to sign tokens.
Signing Algorithm	Algorithm to sign with the key.
Signing Key Password	Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.
Active	Option to activate the key.

4. Click **Submit**.

Create a JWT provider for Google Cloud Translator Service spoke

Add a JSON Web Token (JWT) provider to Google Cloud Translator Service spoke.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Identifier of the JWT provider.
Expiry Interval (sec)	Number of seconds that indicate the lifespan of the JWT provider token. Specify `3600`.
Signing Configuration	JWT signing key.

4. Right-click the form header, and click **Save**.
5. In the Standard Claims related list, enter the values for these claims.

Claim

Claim name	Claim value
aud	https://www.googleapis.com/oauth2/v4/token
iss	*`client_email`* value from the JSON file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Custom Claims related list, create the **scope** claim and enter its value as `https://www.googleapis.com/auth/cloud-translation`.
7. Click **Update**.

Configure the credential for the GoogleTranslation alias

Authorize actions of Google Cloud Translator Service spoke by configuring the Google OAuth 2.0 credential.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the **OAuth Entity Profile** field.
4. In the **JWT Provider** field, specify the JWT provider that you want to use.
5. Click **Update**.
6. To verify if an OAuth Access token is generated to connect to Google's translation services, click the **Get OAuth Token** related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the GoogleTranslation alias

Connect to the Google's translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Before you begin
Role required: connection_admin

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connections**.
2. Open for the record for **Google**.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

HTTP(S) Connection form fields

Field	Value required
location	Location of the customer. If the value is not specified when creating an account on Google Cloud, then specify `global`.
project_id	Identifier of a project. Specify the *`project_id`* value from the JSON file.
version	API version that the related spokes are built for. The default value is `v3beta1`. Because Google now supports the v3 version, you can override this value as `v3`.

4. Right-click the form header and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Azure Translator Service spoke

Microsoft Azure Translator Service spoke provides subflows and actions to detect and translate user-entered text, using the Microsoft machine translation service. Dynamic Translation supports detection and translation of single texts and multiple texts.

https://player.vimeo.com/video/1019025021?h=e0b4f4b24b&badge=0&autopause=0&player_id=0&app_id=58479

Activation

Activate the Dynamic Translation plugin (com.glide.dynamic_translation) or the Microsoft Azure Translator Service Spoke plugin (com.glide.microsoft_translation_spoke).

Subscription

This spoke requires any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.

Supported versions

API version v3 and v4.

Spoke subflows

The spoke provides subflows in the Published state to integrate with Microsoft translation service. These subflows can be used as part of other subflows and flows.

Spoke subflows

Subflow	Description
Detect Language [detect_language_v3]	Contains a set of inputs, actions, and output to detect the language of the input text. Releases before Xanadu Patch 3 use v3 flows.
Detect Language V4 [detect_language_v4]	Contains a set of inputs, actions, and output to detect the language of the input text. Releases from Xanadu Patch 3 use v4 flows. For more information about v4 flows, see Migrate customized Translator Configurations to v4 flows.
Translate Text [translate_text_v3]	Contains a set of inputs, actions, and outputs to translate the input text to multiple languages. This subflow uses v3 for releases before and after Xanadu Patch 3.

Spoke actions

The spoke provides actions to integrate with Microsoft translation services.

Spoke actions

Action	Description
Detect Language [detect_language_v3]	Detects the language of the input text.
Translate Text [translate_text_v3]	Translates the input text to multiple languages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft account requirements

Ensure that you are registered with Microsoft and obtain the credential information. For more information, see Microsoft documentation.

For information on Microsoft Translator Text API, see the Microsoft documentation.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see Credentials and connection information.

To use the spoke connection aliases, create an associated connection record and a credential record for each alias.

This spoke uses the MicrosoftTranslation alias (sn_ms_trans_spoke.MicrosoftTranslation) to authorize actions.

The following are the connection alias requirements.

- Connection type: HTTP
- Connection URL: For example, `https://api.cognitive.microsofttranslator.com`.

> **Note:** The URL provided here is a sample only. Microsoft translation customers may need to use custom API URLs or virtual network type API URLs, even when they do not subscribe to a virtual network. Microsoft customers who use multi-service or regional translation services also need to know their Ocp-Apim-Subscription-Region attribute, and their API URL may contain a regional reference. Check your Azure portal for this information. Refer to the Microsoft documentation for further details.

Perform the following tasks to connect to the Microsoft machine translation service.

Create a credential for the MicrosoftTranslation alias

Authorize actions of Microsoft Azure Translator Service spoke by creating a credential for the MicrosoftTranslation connection and credential alias.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **API Key Credentials**.
4. In the API key Credentials form, fill the fields.

API key Credentials form fields

Field	Description
Name	Identifier of the credential.
Active	Option to activate the credential for use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies to	MID servers for which the credentials are applicable. Possible options are: ○ All MID servers in your network. ○ Specific MID servers. In this case specify the servers in the **MID servers** field.
MID servers	Specific MID servers for which the credentials are applicable. This field is displayed only when you select **Specific MID servers** for the **Applies to** field.
Order	Sequence in which the credential is applied.
API Key	Unique code that is passed to an API to identify the connection.
Credential alias	Alias to use the credential.

5. Select **Submit**.

Create a connection for the MicrosoftTranslation alias

Connect to the Microsoft translation service by creating a connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Before you begin

Ensure that you are in the application scope that you want for your connection. The default application scope is **Microsoft Azure Translator Service Spoke**.

Role required: connection_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Select the MicrosoftTranslation alias (sn_ms_trans_spoke.MicrosoftTranslation).
3. In the **Connections** tab, click **New**.
4. In the HTTP(S) Connection form, fill the fields.

HTTP(S) Connection form fields

Field	Description
Name	Name of the HTTP(s) connection.
Credential	Credential record used to authorize the connection.
Connection alias	Alias record to associate with the connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.
Active	Option to activate the connection.
Domain	Domain where the connection is applicable.
URL builder	Option to enable the system to build the connection URL. Clear this check box.
Connection URL	Base URL to connect to the Microsoft's translation service. For example, `https://api.cognitive.microsofttranslator.com`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This URL is a sample only. Microsoft translation customers may need to use custom API URLs or virtual network type API URLs, even when they do not subscribe to a virtual network. Check your Azure portal to obtain your API URL. For further information, refer to Microsoft documentation.
Use MID server	Option to use a MID Server for this connection.
Connection timeout	Timeout value in milliseconds. Overrides the global property for this usage.
Attributes	
Version	API version that the related spokes are built for. The default value is v3. Do not edit this value.
Ocp-Apim-Subscription-Region	Value of the regional translator resource. This value is optional when using a global translator resource. **Note:** This value is mandatory for customers using Microsoft's multi-service or regional translator resources. For information on supported regions, see the Microsoft documentation.

5. Click **Submit**.

Activate the Microsoft translator configuration

Make the Microsoft translation service available for use by activating the Microsoft translator configuration.

Before you begin

- Create an account with Microsoft Azure for machine translation services, and set up the integration. For information see Microsoft Azure Translator Service spoke and Create a connection for the MicrosoftTranslation alias.
- Role required: admin.

Procedure

1. Navigate to **All** > **Dynamic Translation** > **Translator Configurations**.
2. Select **Microsoft**.
3. Select the **Active** check box.
4. In the **Preferences** section, choose this translator as default for translation or detection, or for both.

Preferences

Field	Description
Mark as default for translation	Option to mark the translator as default for translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Mark as default for detection	Option to mark the translator as default for detection of the language of a text.

5. Select **Update**.

Migrate customized Translator Configurations to v3 flows

Implement the contract with subflows using complex objects in the input and output fields for dynamic translation of text.

Before you begin

Role required: admin

About this task

Important: With the Xanadu Patch 3 release, default Translator Configurations are automatically updated to v4 flows. For more information, see Migrate customized Translator Configurations to v4 flows.

The previous v3 flows are still supported as follows. However, Exclusion Framework functionality may not be available with v3.

After an upgrading to releases prior to Xanadu Patch 3, default translator configurations that are not customized are automatically updated to v3 flows.

You need to manually migrate to version v3 for the following translator configurations:

- Translator configurations that are available by default but customized from New York onwards.
- Custom translator configurations that you added to integrate with a third-party translation service provider.

For a translator configuration that you added to integrate with a translation service provider of your choice, implement Integration Hub subflows with complex objects in the input and output fields. These subflows are required to interact with the translation service provider for language detection and translation. For information on this implemention, see Integrate with a translation service provider.

Procedure

1. Navigate to **All** > **Dynamic Translation** > **Translator Configurations**.
2. Select a translator configuration.
3. In the Translator Configuration form, update these fields.

Translator Configuration form fields

Field	Description
Active	Activates the translator configuration to integrate with Dynamic Translation.
Version	Version of the contract used in subflows. Select **v3**.
Choose a translate subflow	Integration Hub subflow with complex objects in the input and output fields to translate the input text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ For the translator configurations that are available by default but customized, select Translate Text [translate_text_v3]. ○ For a translator configuration that you added to integrate with a translation service provider of your choice, select the subflow that you implemented with complex objects. The contract now supports multiple texts in a single method call.
Choose a detect subflow	Integration Hub subflow with complex objects in the input and output fields to detect the language of the input text. ○ For the translator configurations that are available by default but customized, select Detect Language [detect_language_v3]. ○ For a translator configuration that you added to integrate with a translation service provider of your choice, select the subflow that you implemented with complex objects. The contract now supports multiple texts in a single method call.
Mark as default for translation	Marks the translator as the default configuration for dynamic translation of text.
Mark as default for detection	Marks the translator as the default configuration to detect language of the input text.

4. Select **Update**.

Migrate customized Translator Configurations to v4 flows

Migrate your customized translator configurations to v4 flows. Version 4 flows for Dynamic Translation are available from the Xanadu Patch 3 release.

Before you begin
Role required: admin

About this task
After upgrading to Xanadu Patch 3 or above, the update to v4 flows is automatically applied to default translator configurations that are not customized.

You must manually migrate custom or customized translator configurations.

Using v4 flows ensures that the functionality of Exclusion Framework in Dynamic Translation is available.

Procedure
1. Navigate to **All** > *Dynamic Translation* > **Translator Configurations**.
2. Select the translator configuration that you want to migrate to v4 flows.
3. In the Translator Configurations form, update the fields according to the following guidance.

Translator Configuration form fields

Field	Description
Active	Activates the translator configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Version	Version of the contract used in subflows. Select v4.
Choose a translate subflow	The subflow to translate the input text. For default translator configurations that were customized, select Translate Text .
Choose a detect subflow	The subflow to detect the input text. For default translator configurations that were customized, select Detect Language .
Mark as default for translation	Marks the translator as the default provider for dynamic translation of text.
Mark as default for detection	Marks the translator as the default provider for detection of the language of the input text.

4. Select **Update**.

Translating with Dynamic Translation

Translate user-generated content live on your instance to streamline communication for your agents and end users.

After you activate the Dynamic Translation plugin (com.glide.dynamic_translation), you can do the following tasks using a translation service provider:

- Detect the language of the input text
- Translate user-entered text from a source language to a target language

For information on activating this plugin, see Activate Dynamic Translation.

Default translation service providers for Dynamic Translation

By default, Dynamic Translation supports the following Microsoft and Google service providers for machine translation.

- Connections and credential aliases and the corresponding connection attributes.

  Note: You should create a connection for each translation service provider and specify the credential information.

- IntegrationHub subflows and actions for these spokes.
  - Microsoft Azure Translator Service spoke
  - Google Cloud Translator Service spoke
- Translator configurations

Note: The Google Cloud Translator Service spoke for Dynamic Translation must be installed from ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Dynamic Translation

When your admin has configured Dynamic Translation, look for the translate icon ( ) next to fields on forms and in workspaces.

Dynamic translation on forms and activity streams

For a seamless localization experience on forms and activity streams, you can dynamically translate text based on the preferred language of a user.

Dynamic translation on forms

You can translate the field values on forms on the ServiceNow AI Platform and the configurable workspaces. For more information on Dynamic Translation support for configurable workspaces, see Dynamic Translation support for configurable workspace.

To enable dynamic translation at the field-level on Platform forms, see Enable dynamic translation for a field. After dynamic translation is enabled, select the translate icon ( ) to show or hide the translated content.

Dynamic translation in activity streams

You can enable dynamic translation in activity streams on the ServiceNow AI Platform, configurable workspace, and Service Portal. For more information on Dynamic Translation support for configurable workspaces, see Dynamic Translation support for configurable workspace.

Use the dynamic translation properties to enable or prevent the option for dynamic translation in the activity stream of the tables you list. When enabled, select the translate icon ( ) to show or hide the translated content for each comment or work note in the activity stream. For more information, see Dynamic Translation properties.

Length limitations for machine translation service providers

The following are the length limitations for some translation service providers. If you use a different third-party provider, check that provider's documentation.

- For Google, the recommended maximum length of each request is 5,000 characters. The maximum size of the input text can't exceed 30,000 code points. For more information, see the Google Documentation .
- For Microsoft, the input text for translation can't have more than 50,000 characters including spaces. The input text for detection also has a maximum of limit of 50,000 characters. For more information, see the Microsoft Documentation .

Note: Starting with the Rome release, you can use Dynamic Translation without the snc-internal role.

Enable dynamic translation for a field

Translate the dynamically generated text for a field on Platform forms by enabling the field-level dynamic translation. You can translate the text based on the preferred language of a user.

Before you begin
Role required: admin
Activate the Dynamic Translation plugin (com.glide.dynamic_translation).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Dynamic Translation supports only the following field types:

- String
- String (Full UTF-8)
- Multi Line Small Text Area
- Wide Text
- HTML

Note:

- The following are the length limitations for some translation service providers. If you use a different third-party provider, check that provider's documentation.
  - For Google, the recommended maximum length of each request is 5,000 characters. The maximum size of the input text can't exceed 30,000 code points. For more information, see the Google Documentation.
  - For Microsoft, the input text for translation can't have more than 50,000 characters including spaces. The input text for detection also has a maximum of limit of 50,000 characters. For more information, see the Microsoft Documentation.
- You cannot translate a field on Agent Workspace forms.

Procedure

1. Navigate to any form, for example, an Incident form.
2. Right-click the required field and select **Configure Dictionary**.
3. In the Attributes related list, click **New**.
4. In the Dictionary Attribute form, fill the fields.

Dictionary Attribute form fields

Field	Value
Attribute	Dynamic Translation Enabled
Value	true

5. Click **Submit**.
6. Click **Update**.

Dynamic translation for a field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A translate icon appears next to the field. The logged-in user can click this icon to translate the text to the user's preferred language using the default translation service provider specified in the translator configurations. For information about error messages during translation, see Error messages in Dynamic Translation.

Note: If you do not have any default translator configuration, you cannot view the translate icon .

Dynamic Translation for Agent Chat overview

Dynamic Translation for Agent Chat (DTAC) translates chat conversations from one language to another. This translating enables agents and requesters to have chat conversations with each other without the need of a shared language.

For example, a requester who speaks only French starts a chat conversation with a live agent who speaks only English. From the requester's view, the entire conversation is conducted in French, while from the agent's view, the entire conversation is conducted in English.

DTAC enables cross-locale support teams and merger and acquisition projects to save time and money by handling larger volumes of chat conversations from other regions.

Note:

- DTAC is supported on Agent Workspace, not on Connect Support.
- DTAC is currently not supported when autopilot is in progress. When the requester responds to prompts from autopilot topics, these responses are not translated for the agent, even if DTAC is turned on for that conversation. See Conversation Autopilot for more information.

How DTAC works

DTAC uses Dynamic translation and a translation service provider to translate chat conversations in real time. Available translation service providers include:

- Set up Google cloud translator service spoke
- Microsoft Azure Translator Service spoke
- Microsoft Azure OEM

Mobile clients

DTAC is available for requesters on Agent Chat in mobile for iOS and Android.

Translation support limited to one language

DTAC can only support translation from one language to another therefore additional agents or managers joining chat sessions should speak the same language as the primary agent.

- Agent chat transfers – Agents transferring a chat conversation should both speak the same language.
- Managers joining chat conversation – Managers joining chat conversation to monitor or assist agents should speak the same language as the primary agent.

Chat summarizations

DTAC also translates chat summarizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent presence states

DTAC does not translate agent presence states.

Attachments within DTAC

When inserting an attachment into a chat, DTAC does not translate the file name or the contents of the attachment.

Translate a knowledge article from a translation task

Start translating articles once they are published and assigned to you for translation.

Before you begin

- Activate the Dynamic Translation plugin (com.glide.dynamic_translation).
- Enable the *glide.knowman.translation.enable_translation_task* property. For more information, see Translation management.

Role required: admin, knowledge_admin, or knowledge

About this task

Note: This procedure has been superseded by the Localization Framework. For more information see Localization Framework support for Knowledge Base. This information is provided for legacy context.

For information about how administrators configure the translation API, see DynamicTranslation API.

Procedure

1. Navigate to **All** > **Knowledge** > **Translation Management** > **My Assigned Tasks**.
2. In the Knowledge Translation Tasks page, select one of the listed translation tasks assigned to you.
3. Select **Translate**.
   The **Translate from** and **Translate to** panes are side-by-side for easy comparison.
4. Select **Machine translate** to automatically translate to the targeted languages.
5. Select **Create draft article** to create a draft version of the translated article.
   If a translated article is already present for that language, a new draft version overwrites the existing translated content.
6. Select **Publish**.

Note: By default, the translated version is always created as v1.0 so that the parent version remain same for all the translated versions. For more information, see Translated KB articles always show Parent version 1.0 regardless of version used for translation.

Result

The newly created draft is listed in the **Translated Versions** tab.

DynamicTranslation API

You can use the *DynamicTranslation* API to translate text into multiple languages by connecting to your choice of machine translation service providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API is available for interactions with third-party translation service providers, as part of Server APIs, Client APIs, and Service Portal APIs. See DynamicTranslation - Scoped and DynamicTranslation - Client.

No matter what translation service provider you choose, this API works on a standard set of inputs and outputs, and displays standard error codes and messages. Test your integration in a non-production instance, including examining logs, before deploying to production.

Consult your service provider's portal for details regarding data privacy policies, cost and usage structure, and other information related to your account with that provider.

Most machine translation service providers enforce limitations such as an upper limit on the number of characters per request. For more information, see Limitations in Dynamic Translation.

Dynamic Translation spoke

The Dynamic Translation spoke provides actions to enable the ability to translate multiple texts from one language into one or more languages and detect the language of multiple texts seamlessly.

The Dynamic Translation APIs are accessible across the ServiceNow platform through the following access points:

- Server
- Platform Client
- Portal Client

In the Brazil release, the Dynamic Translation spoke enables you to access the Dynamic Translation APIs from the Workflow Studio.

The Dynamic Translation Spoke is a plugin (com.glide.dynamic_translation.spoke) that is available with activation of the Dynamic Translation plugin (com.glide.dynamic_translation).

The Dynamic Translation spoke contains actions that are built corresponding to the Dynamic Translation APIs.

The following actions are built in the Brazil release in Dynamic Translation spoke:

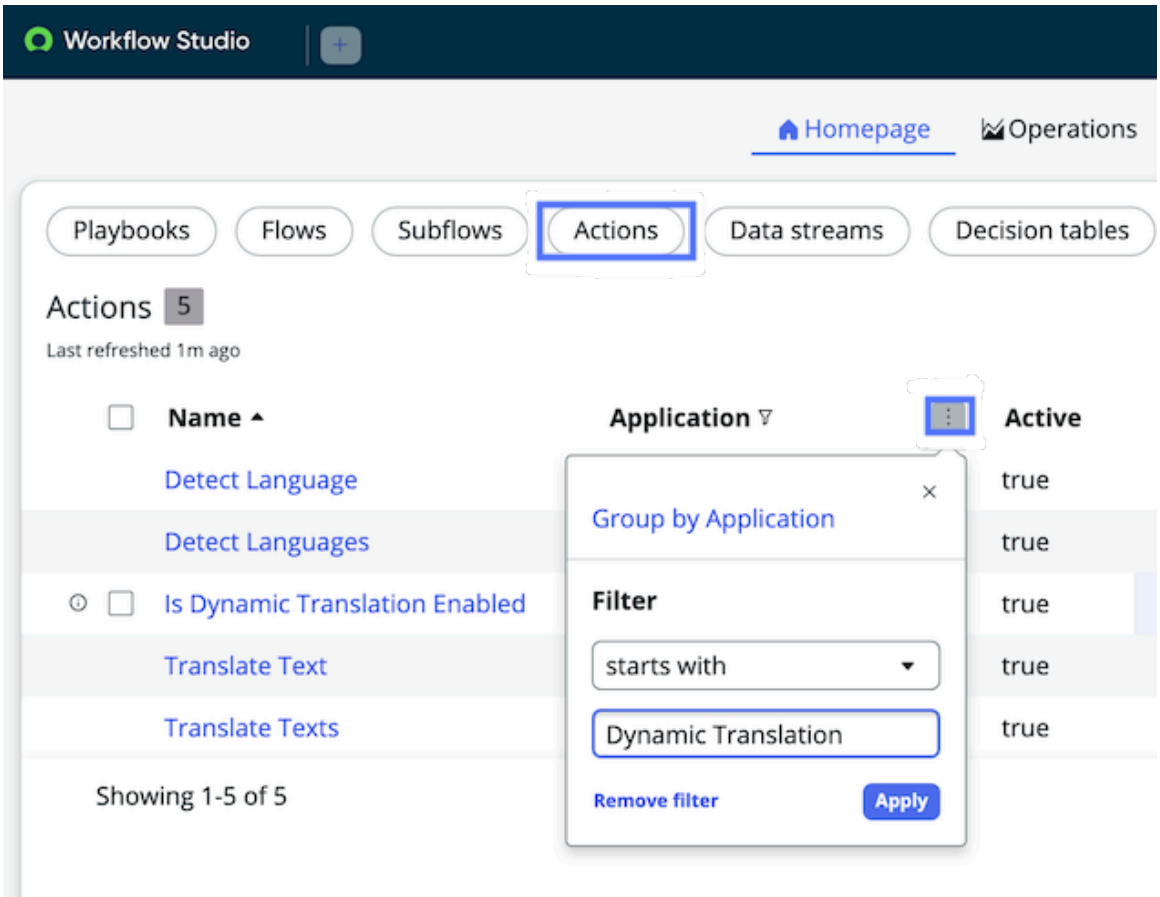
Dynamic Translation Spoke actions and APIs

Action Name	API
Detect Language	getDetectedLanguage()
Detect Languages	getDetectedLanguages()
Translate Text	getTranslation()
Translate Texts	getTranslations()
Is Dynamic Translation Enabled	isDynamicTranslationEnabled()

For more information about accessing the actions from the Workflow Studio, see Access Dynamic Translation spoke actions from Workflow Studio.

Access Dynamic Translation spoke actions from Workflow Studio

Access Dynamic Translation spoke actions from Workflow Studio to detect and translate user-generated text.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Dynamic Translation spoke (com.glide.dynamic_translation.spoke) is activated with the Dynamic Translation plugin (com.glide.dynamic_translation), and configure a machine translation service provider for both detection and translation.
- Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > *Workflow Studio*.
2. Select the **Actions** tab.
3. In the **Application** column, select the more options icon ( )and use the filter to search for Dynamic Translation.

All the actions built in the Dynamic Translation spoke are displayed.

For more information, see Actions in Dynamic Translation spoke.

Language Detection spoke

The ServiceNow Language Detection Service spoke is an in-house language detection service offered by the ServiceNow platform. It provides a single subflow and action to identify the language of a given text.

The ServiceNow Language Detection Service spoke plugin (com.glide.language_detection_spoke) is available with the activation of Dynamic Translation plugin (com.glide.dynamic_translation).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This spoke creates an entry named ServiceNow in Dynamic Translation's Translator Configurations (sn_dt_translator_configuration) table. By default, this entry is active and marked as default for detection. To configure your own language detection service, see Integration with other translation services.

Subscription

This spoke requires any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.

Supported versions

API versions v3 and v4.

Spoke subflow

The spoke provides the subflow in the Published state to integrate with the ServiceNow language detection service.

Spoke subflow

Subflow	Description
Inputs	
Detect Language [detect_language_v3] or [detect_language_v4]	Detects the languages of texts using ServiceNow Language Detection Service. The v4 flows for Dynamic Translation are supported from the Xanadu Patch 3 release. For more information, see Migrate customized Translator Configurations to v4 flows.

Spoke action

The spoke provides the action in the Published state to integrate with the ServiceNow language detection service.

Spoke action

Subflow	Description
Inputs	
Detect Language [detect_language_v3] or [detect_language_v4]	Detects the languages of texts using ServiceNow Language Detection Service. The v4 flows for Dynamic Translation are supported from the Xanadu Patch 3 release. For more information, see Migrate customized Translator Configurations to v4 flows.

The ServiceNow Language Detection service uses the following Dynamic Translation APIs to detect the language of the input texts:

- getDetectedLanguage: Provides text to identify the languages.
- getDetectedLanguages: Provides texts to identify the languages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see DynamicTranslation API.

Language Code Mapping in Dynamic Translation

Dynamic Translation enables you to add mapping between the ServiceNow® language codes and the language codes used by your third-party translation service provider.

- You can create a language code to map the ServiceNow® language code.
- You can view the default language code mapping records in the Language Code Mapping [sn_trans_commons_language_code_mapping] table.
- You can associate the language code mapping to a translator configuration record. For more information, see Create a custom translator configuration.

> **Note:** By default, language code mappings are included in the records of Microsoft Azure Translator Service and Google Cloud Translator Service. These preconfigured records for third-party providers are available in the Translator Configurations [sn_dt_translator_configuration] table.

To add a new language code mapping, see Create a language code mapping.

Create a language code mapping

Create a language code mapping to map the ServiceNow® language codes with the language codes of the translation service providers.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Dynamic Translation** > **Language Code Mappings**.
2. Click **New**.
3. On the form, fill in the fields.

Language Code Mapping form fields

Field	Description
Language code	Language for which a ServiceNow® language code mapping record is being created.
Mapped language code	Translation service provider's language code with which the ServiceNow® language code is being mapped.
Name	Identifier for the language and the mapping code. The name is auto-filled using the language code and the mapped language code in the "language code -> mapped language code" format. For example, fq -> fr-CA. Users can edit the fields if required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Submit**.

> **Note:** After creating the language code mapping, associate it with a corresponding translator configuration to map the existing ServiceNow® language code.

Reference for Dynamic Translation

Get details about Dynamic Translation domain separation, properties, actions, limitations, and error messages.

Domain separation and Dynamic Translation

Domain separation is supported in Dynamic Translation and is configured to apply to translator configurations and Exclusion Framework. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Activation information

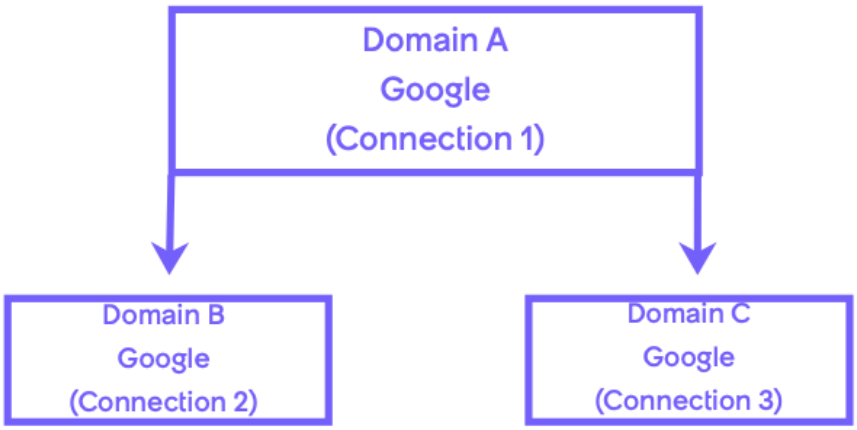
You should activate the Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions.installer). For information on how you can request for the plugin activation, see Request for domain separation in Dynamic Translation.

How domain separation works in Dynamic Translation

A service provider with domain separated instances can implement the Dynamic Translation framework so that users can use the translation service providers configured in the translator configurations specific to their domain. Translator configurations are process-separated in Dynamic Translation. All translation service providers configured in the translator configurations of the parent domain are available in child domains.

A translator configuration in the global domain is visible in all other domains. In any domain, a user can only view the translator configurations configured in the following domains:

- Current domain
- Parent domains
- Global domain



> **Note:** If there are multiple translator configurations in a domain for the same translation service provider, the translator configuration of the current domain or the closest parent domain is considered for dynamic translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Also, different connections can be configured for the same connection and credential alias of a translation service provider in multiple domains. However, Credentials and Connections are data-separated. So, a connection configured in a child domain is visible in parent domains. For information on domain separation for Connections and Credentials, see Domain separation for Credentials and Connections.

For example, consider the following scenario:

Connections for a translation service provider in multiple domains

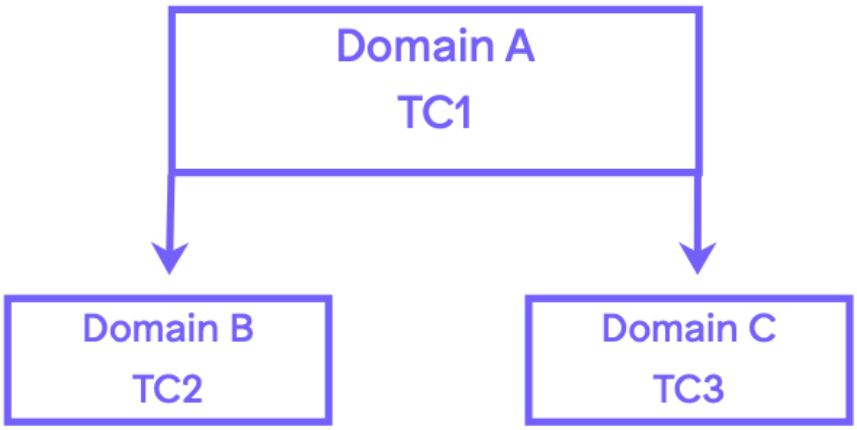
Different connections are configured for the same connection and credential alias of Google in multiple domains. When in Domain A, all the following connections are visible:

- Connection1
- Connection2
- Connection3

Note: When multiple active connections are visible for the same connection and credential alias in a domain, the connection with the highest order is given priority when the **Support Multiple Active Connections** check box is selected.

Domain-separated table

Translator Configuration [sn_dt_translator_configuration].



Default translator configuration for a domain

The default translator configuration of the current domain is always considered for dynamic translation. If the current domain does not have any default translator configuration, then the available default translator configuration of the nearest parent is considered.

A domain can have multiple default translator configurations. In this case also, the default translator configuration of the current domain is considered for dynamic translation. For example, let us consider the following scenario:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

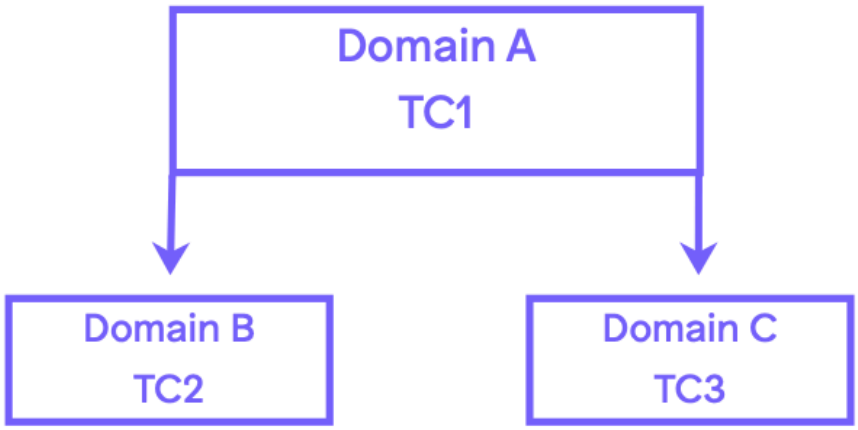
Domain separation in Dynamic Translation

In Domain B, both TC1 and TC2 are visible. From Domain B, TC2 is first set as the default translator configuration. From Domain A, TC1 is then overridden and set as the default translator configuration. This results in multiple default translator configurations in Domain B. In this case, when in Domain B, TC2 is used as the default translator configuration for dynamic translation.

Overriding a translator configuration

In any domain, you can override the translator configuration of that domain or the parent domain. The overridden translator configuration of a parent domain is also visible in child domains. However, the overridden translator configuration of a child domain is not visible in the parent domain.

After you override a translator configuration of the same domain, only the overridden translator configuration is visible in that domain.



After you override a translator configuration of a parent domain, the following scenarios happen:

- Only the overridden translator configuration is visible in the child domain.
- The **Overrides** field of overridden translator configuration refers to the original translator configuration of the parent domain.

For example, consider the following scenario:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation in Dynamic Translation

You can override a translator configuration TC1 from Domain B. After overriding, only the overridden configuration TC1 is available in Domain B and the **Overrides** field of TC1 refers to **TC1** of the parent domain.

Domain separation in Exclusion Framework

The Exclusion Framework module in Dynamic Translation supports domain separation. Each domain on an instance can have its own set of Exclusion Framework rules, so the rules are specific to one domain. Activation of Exclusion Framework on an instance applies to all domains on the instance. For more information see Exclusion Framework in Dynamic Translation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic Translation properties (continued)

Property	Description
	• Type: string • Default value: none
Block list tables sn.dt.activity_stream.block_list	List of tables (comma-separated) f to translate the content is inactive (work notes and comments). Example: `change_request,sn_hr_co` • Type: string • Default value: none
Exclusion Framework	
Exclusion Framework sn_dt.dynamic_framework.enable_exclusion_framework	Enables Exclusion Framework on t to enabled when Dynamic Transla On a domain-separated instance, to all of the domains. It is not poss Exclusion Framework on a per-dor
Virtual Agent	
Enables dynamic translation for html com.glide.cs.dynamic.translation.enable.html	Enables dynamic translation for ht Text controls that contain html, in V more information see Default inpu controls for a custom chat integrat Installed with the Dynamic Transla plugin (com.glide.cs.dynamic.trans For information see Language det machine translation in Virtual Age
Enables dynamic translation for messages that contain urls com.glide.cs.dynamic.translation.enable.translating.message.containing.urls	Enables dynamic translation for m URLs. Installed with the Dynamic Transla plugin (com.glide.cs.dynamic.trans For information see Language det machine translation in Virtual Age

Actions in Dynamic Translation spoke

Actions in the Dynamic Translation spoke are built to access the Dynamic Translation APIs from Workflow Studio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic Translation Spoke actions

Action	Description
Detect Language [detect_language]	Detects the language of the text using the configured translator.
Detect Languages [detect_languages]	Detects the languages of multiple texts using the configured translator.
Is Dynamic Translation Enabled [is_dynamic_translation_enabled]	Checks whether the Dynamic Translation plugin (com.glide.dynamic_translation) is installed and configured for a Translation Service Provider. • If the input is empty, checks whether a default Translation Service Provider is configured. • If a translator is provided, checks whether that Translation Service Provider is configured.
Translate Text [translate_text]	Translates text to multiple languages using the configured translation service provider. The action can translate a text string into multiple target languages.
Translate Texts [translate_texts]	Translate texts to multiple languages using the configured translation service provider. The action can translate an array of texts into multiple target languages.

Standard Error Codes

When an error occurs, error codes populate with the reason for the error. Refer to the following information for the standard error codes that appear while you work on the Dynamic Translation spoke actions corresponding to the Dynamic Translation APIs.

- Dynamic Translation - Scoped
- Dynamic Translation - Client

Limitations in Dynamic Translation

Learn about length and language support limitations when integrating with a machine translation service provider in Dynamic Translation.

Length limitations for machine translation service providers

The following are the length limitations for some translation service providers. If you use a different third-party provider, check that provider's documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For Google, the recommended maximum length of each request is 5,000 characters. The maximum size of the input text can't exceed 30,000 code points. For more information, see the Google Documentation.
- For Microsoft, the input text for translation can't have more than 50,000 characters including spaces. The input text for detection also has a maximum of limit of 50,000 characters. For more information, see the Microsoft Documentation.

Language support limitations for translation service providers

Not all translation service providers support the same languages that ServiceNow AI Platform supports.

For information about languages supported by Google for translation, see the Google documentation.

For information about languages supported by Microsoft for translation, see the Microsoft documentation.

Error messages in Dynamic Translation

You must be aware of a few error scenarios while using Dynamic Translation.

Error messages on forms and activity streams

Error messages are displayed when the text cannot be dynamically translated on forms activity streams.

Forms and activity streams

Scenario	Error message
Field has no value. **Note:** This scenario is applicable only for fields on the form.	No text to translate.
Text to be translated is already in the logged-in user's preferred language.	This content is written in your preferred language. No need to translate.
Text cannot be translated to the user's preferred language by the default translation service provider.	Text cannot be translated to your preferred language.
Credentials configured for the translation service provider under **Connections & Credentials** are not valid.	Credentials are missing or invalid. Contact your administrator.
Text to be translated has exceeded the maximum length supported by the default translation service provider.	Text has exceeded the maximum length.
Error during translation. Possible reasons are:	Unable to translate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Forms and activity streams (continued)

Scenario	Error message
• Credentials configured for the translation service provider under the **Connections & Credentials** sub module are missing. • Translation got timed out. • Any other issue with the translation service provider. For example, the exhaustion of credentials for more transactions.	

Error messages on translator configuration

Translator configuration

Scenario	Error message
When there is no valid subflow associated with the translator configuration.	Either a detect or a translate subflow is required for a valid translator configuration.
When multiple language code mappings are selected for the same language code	Multiple language code mappings cannot be selected for the same language code(s): xx.

Localization Framework

The ServiceNow® Localization Framework application standardizes and enhances the translation process of artifacts across the platform through configurable workflows. Such artifacts include ServiceNow® Service Catalog items, Virtual Agent topics, Natural Language Understanding models, and Document Templates of ServiceNow® HR Service Delivery.

Localization Framework overview

The Localization Framework streamlines the process of adapting and translating ServiceNow instances to meet the needs of different regions and languages. With this application, users can create and manage translation projects, assign tasks to translators, and track progress. The Localization Framework also supports the creation of language packs, which contain translated content for specific languages. Organizations can ensure that their ServiceNow instances are accessible and user-friendly for users around the world by reducing the time and effort needed for localization.

The localization process

Localization Framework benefits

Benefit	Feature	Users
Define and use custom language artifacts, in addition to installing artifact-specific product plugins.	Artifact configurations	Administrators
Tailor Localization Framework workflows and translation preferences	Localization Framework settings	Administrators
Request translations	Request translations	Administrators, editors,managers, and requestors
Manage translation projects	Create a localization project	Managers
Bundle translation projects together	Add localization requested items to a project	Managers
Perform translation projects	Fulfill a localization task	Fulfillers
Approve and publish localizations and translations	Approve a localization task	Fulfillers
Use artifacts in localization, with support for Virtual Agent and several other ServiceNow products.	Supported artifacts in Localization Framework	Administrators, managers, and users

Note: Localization Framework does not support Domain Separation.

Supported artifacts in Localization Framework

Localization Framework extends its framework capabilities to certain artifacts and translates the content of the artifact items.

With the activation of the Localization Framework Installer plugin (com.glide.localization_framework.installer), some artifacts are available by default. Some artifacts require the installation of the artifact-specific product plugins.

Artifacts available with Localization Framework installation

The following artifacts are available with the installation of Localization Framework:

- Catalog Item (Service Catalog)
- NLU Model (Natural Language Understanding Models)
- Surveys (Assessments and Surveys)

Artifacts available with artifact-specific plugins

The following artifacts are available with the installation of artifact-specific product plugins after the installation of Localization Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Virtual Agent Topic - available with the activation of the Glide Virtual Agent Lite plugin (com.glide.cs.chatbot.lite).
- Document Template Block Content - available with the activation of the Human Resources Scoped App: Lifecycle Events for Enterprise plugin [com.sn_hr_lifecycle_ent].
- HTML Document Template - available with the activation of the Human Resources Scoped App: Lifecycle Events for Enterprise plugin [com.sn_hr_lifecycle_ent].
- Knowledge Base article - available with the activation of Knowledge Management Advanced plugin [com.snc.knowledge_advanced] and set *glide.knowman.translation.enable_lf_article_translation* property to true.
- Email notifications, email templates and email layout - available with the activation of Glide Notification Translation plugin (com.glide.notification.translation).

Localization Framework support for Service Catalog items

Localization Framework enables translation of Service Catalog items when a catalog item is requested for translation into a language and a localization requested item (LRITM) is created.

Localizing Service Catalog items

You can do the following tasks in Localization Framework for translating the Service Catalog items.

- Select multiple languages from the available languages in the instance to configure settings with the Catalog Item artifact. To configure localization settings, see Localization Framework settings.
- Create LRITM's by requesting translations into one or more languages.
- Translate the content of the Service Catalog items directly using the edit translations option.
- Read, edit, and machine translate the content, send the content to TMS, send the content via email, export, and import the content of the Service Catalog item.

  Note: Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to use machine translation in Localization Framework.

- Approve and publish the translated content.
- Monitor the overall localization health of the Service Catalog items from the Localization Insights dashboard.

To request translations for a catalog item, see Request translations for Service Catalog items.

Localization Framework support for catalog builder in Service Catalog

Localization Framework enables translation of Service Catalog items directly from the catalog builder dashboard in Service Catalog.

You can do the following tasks on the Catalog Builder dashboard in Service Catalog when the Localization Framework installer plugin (*com.glide.localization_framework.installer*) is installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the **Translation status** tab that is displayed when a Service Catalog item is selected, to perform the following tasks:
  - View the list of all active languages.
  - Request the translation of the Service Catalog items directly using the **Request Translation** option if the *glide.sc.catalog_builder.localization.enable_request_translation_mode* property is set to true.

    Note: You can request translations for the items in the active languages only if the Localization Framework setting is available for the particular language.

  - View the translation status of the Service Catalog items.

    Note: The translation status of the Service Catalog items is based on the status and completion of the Localization Framework scheduler jobs.

  - Use the **Edit Translation** option in case the *glide.sc.catalog_builder.localization.enable_request_translation_mode* property is set to false, so that you can machine translate and publish the translations on the ad hoc UI.

    Note: Machine translate option is only available if the Localization Framework setting is available for that particular language.

- Request the translations of the Service Catalog items when creating the items.

For more information on the Localization Framework integration with catalog builder, see Localization Framework integration with Catalog Builder.

Virtual Agent Designer integration with Localization Framework

The integration of Virtual Agent Designer with Localization Framework enables you to translate Virtual Agent NLU topics using the translation modes supported by Localization Framework with or without a localization task.

Starting with the Brazil release, Virtual Agent for NLU is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Localizing Virtual Agent NLU topics

The integration of Virtual Agent Designer with Localization Framework enables you to do the following tasks.

- Select multiple languages from the available languages in the instance to configure settings with the Virtual Agent artifact. To configure localization settings, see Localization Framework settings.
- Translate the content directly from the Virtual Agent Designer using the edit option.
- Read, edit, machine translate, export, and import the content of the Virtual Agent topic from the Virtual Agent Designer if the Virtual Agent artifact is configured in the localization settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- **Note:** You need the localization_editor role to edit the translated content from the comparison UI of the Virtual Agent Designer directly. For more information about the localization_editor role, see Localization Framework Roles.
- Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to use machine translation in Localization Framework.

- Request translations from Virtual Agent Designer.

  Note: Requesting translations creates localization tasks. You need the localization_requester role to request translations.

- Approve and publish the translated content.
- Monitor the overall localization health of the Virtual Agent topics from the Localization Insights dashboard.

For more information about localizing the Virtual Agent topics in the Virtual Agent Designer, see Virtual Agent Localization.

Localization Framework support for Natural Language Understanding models

Localization Framework integrates with NLU Workbench to translate the Natural Language Understanding models along with their associated intents, utterances, and entities into multiple languages.

Localizing Natural Language Understanding models

The integration of Localization Framework with NLU Workbench enables you to do the following tasks.

- Auto-configure the NLU Model artifact in the Artifacts Configuration [sn_lf_config] table with the activation of the Localization Framework plugin (com.glide.localization_framework.installer).
- Select multiple languages from the available languages in the instance to configure settings with Natural Language Understanding models artifacts. To configure localization settings, see Localization Framework settings.
- Request translations for Natural Language Understanding Models and translate the content of the localization task using the translation modes.

  Note: Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to use machine translation in Localization Framework.

- Translate the content of the Natural Language Understanding models directly from the NLU Workbench.

  Note: Only users with the localization_editor role can translate content on the comparison UI of the Natural Language Understanding model in the NLU Workbench. For more information about the localization_editor role, see Localization Framework Roles.

- Approve and publish the translated content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The localization of Natural Language Understanding models requires mapping between the Natural Language Understanding models in one language and their counterpart in other languages to use the localization framework support.

For more information about localizing Natural Language Understanding models, see Translate NLU Models.

Localization Framework support for Surveys

Localization Framework enables the translation of surveys items when a translation request for a survey is created and when a localization requested item (LRITM) is created.

Localizing Surveys

The extension of the Localization Framework capabilities to surveys enables you to do the following tasks:

- Select multiple languages from the available languages in the instance to configure settings with the survey artifact. To configure localization settings, see Localization Framework settings.
- Create LRITMs by requesting translations into one or more languages.
- Translate the content of the surveys directly using the edit translations option.
- Read, edit, and machine translate the content. You can also send the content to TMS or via email. You can export and import the content of the survey elements.

  Note: Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to use machine translation in Localization Framework. For more information, see Exploring Dynamic Translation.

- Approve and publish the translated content.
- Monitor the overall localization health of the surveys from the Localization Insights dashboard.

For more information on requesting and editing translation for surveys, see Request translations for surveys and Edit translations for surveys.

Localization Framework support for Knowledge Base

Localization Framework enables the translation of Knowledge Base (KB) articles when a KB article is requested for translation into a language and when a localization requested item (LRITM) is created.

Localizing Knowledge Base

The extension of the Localization Framework capabilities to KB articles enables you to do the following tasks:

- Select multiple languages from the available languages in the instance to configure settings with the knowledge base artifact. To configure localization settings, see Localization Framework settings.
- Create LRITMs by requesting translations into one or more languages.
- Translate the content of the KB articles directly using the request translations option.
- Read, edit, and machine translate the content. You can also send the content to TMS or via email. You can export and import the content of the KB articles.

  Note: Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to use machine translation in Localization Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Approve and publish the translated content.
- Translate Knowledge Base articles in bulk in multiple languages.

For more information on translating the KB articles, see Knowledge base article localization.

Localization Framework support for email notifications

Localization Framework enables the translation of emails (notification, template, and layout) when an email artifact is requested for translation into a language and when a localization requested item (LRITM) is created.

Localizing Email Notifications

The extension of the Localization Framework capabilities to email enables you to do the following tasks:

- Select multiple languages from the available languages in the instance to configure settings with the email notifications, email template and email layout artifacts. To configure localization settings, see Localization Framework settings.
- Create LRITMs by requesting translations into one or more languages.
- Translate the content of the email notification directly using the edit translations option.
- Read, edit, and machine translate the content. You can also send the content to TMS or via email. You can export and import the content of the email notification.

  Note: Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to use machine translation in Localization Framework.

- Approve and publish the translated content.

For more information about localizing email notification, see Email notification localization.

Localization Framework support for HR Service Delivery

Localization Framework extends its framework capabilities to Document Templates and Document Template Block Contents in HR Service Delivery.

Localizing Document Templates

The extension of the Localization Framework capabilities to HR Service Delivery enables you to do the following tasks:

- Select multiple languages from the available languages in the instance to configure settings either with the Document Template Block Content or HTML Document Template artifacts. To configure localization settings, see Localization Framework settings.
- Translate the template content manually, through machine translation, or by using export and import.

  Note: Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to use machine translation in Localization Framework.

- Publish the translation.

For more information about translating the Document Templates, see Use Localization Framework for Document Templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Localization Framework Roles

Localization Framework uses different roles to manage different aspects of the application. The roles from Localization Framework are also used in Localization Workspace.

For more information about Localization Workspace, see Localization Workspace. To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Localization administrator [localization_admin]

Manage the following aspects of the Localization Framework application. This role is also used in Localization Workspace.

- Configures the supported artifacts and custom artifacts for Localization Framework.
- Configures localization settings for the activated languages.
- Can request translations into multiple languages for Service Catalog items, Virtual Agent topics, or for any custom artifacts from their respective artifact tables.
- Can request translations for Service Catalog items, Virtual Agent topics, or for any custom artifact for a particular language from their respective artifact reports in the insights dashboard.
- Can configure RWS and XTM TMS and can create and configure a custom TMS by inheriting the following roles:
  - flow_designer: Can edit the TMS subflows and can create a new TMS configuration record.
  - connection_admin: Can access the connections and credentials tables and records.
- Owns the localization insights dashboard and reports. Can execute the scheduled jobs to display the reports on the dashboard.
- Views the localization health of the system.
- Inherits the localization_editor, localization_fulfiller, localization_manager, and localization_requestor roles.

Contains Roles

List of roles contained within the role.

- localization_editor
- localization_fulfiller
- localization_manager
- localization_requestor

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note: Avoid granting an admin role when more specialized roles are available.

When working in Localization Workspace, the role sn_cd.content_admin is required to see Content Publishing artifacts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Localization requester [localization_requestor]

Request translations for all the configured artifacts into one or more languages. This role is used in Localization Framework and Localization Workspace.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note: Localization requester can fulfill translations by inheriting the localization_fulfiller role.

When working in Localization Workspace, the role sn_cd.content_admin is required to see Content Publishing artifacts.

Localization fulfiller [localization_fulfiller]

Provide translations for the requested artifact items and approve and publish the translations. This role is used in Localization Framework and Localization Workspace.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Fulfillers can translate a localization task in the following ways:

- Manually translate in the Localization Task web page.
- Use machine translation by submitting the item to a third-party translator configured in Dynamic Translation.
- Export source files to a third-party translator and import the returned translations.
- Send the source files for translation via email and receive the translated files via email.
- Send translatable items to a translation management system (TMS).
- Verify and approve the translations.
- Publish the translations if the language workflow has no approval flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Localization editor [localization_editor]

Localization editors can translate content without the need for a localization task. This role is used in Localization Framework and Localization Workspace.

Contains Roles

The Localization editor role contains the Localization Requester [localization_requestor] role.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Users assigned to this role can translate content from Virtual Agent Designer NLU Workbench, and Document Templates of HR Service Delivery.

A localization editor can translate the content using machine translation, and also by exporting and importing the content.

Localization manager [localization_manager]

Owns the localization projects and adds the localization requested items to the projects. Only a Localization manager has the authority to start the project. This role is used by Localization Framework and Localization Workspace.

Contains Roles

The Localization manager role contains the Localization fulfiller [localization_fulfiller] role.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

If the Localization Framework Hub and Spoke architecture is activated, the localization_manager role has access to the following tables on the hub instance:

- Localization Framework Hub Translation Request [sn_lf_hub_translation_request]
- Localization Framework Hub Translation Item [sn_lf_hub_translation_item]

For more information, see Localization Framework Hub and Spoke architecture.

Workflows in the Localization Framework

Workflows in the Settings table define the process for a localization task, including steps for approval and methods for translating and publishing.

Overview of workflows in the Settings table of Localization Framework

You can configure the path you want your localization task to follow, with available steps for approval, translation, and publishing. You can define these workflows for each language and artifact configured on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about navigating to the configuration web form for these workflows, see Configure the Localization Framework preferences.

Workflows in the Localization Framework

Workflows	Description
Translation → Publish	The localization task is translated manually or by using one of the translation modes. After translation, the content is published manually. Group needed: Assign the **Localization Fulfiller Group**.
Translation → Translation Approval → Auto Publish	The localization task is translated manually or by using one of the translation modes. After translation the task undergoes translation approval, then is auto-published. Groups needed: Assign the **Localization Fulfiller Group** and **Translation Approver Group**.
Auto Translation → Translation Approval → Auto Publish	The localization task undergoes auto-translation. After translation, the task undergoes translation approval, then is auto-published. Groups needed: Assign the **Localization Fulfiller Group**, **Auto Translation Mode**, and **Translation Approver Group**. Select an Auto Translation Mode.
Auto Translation → Publish	The localization task undergoes auto-translation and is published manually. Groups needed: Assign the **Localization Fulfiller Group** and **Auto Translation Mode**. Select an Auto Translation Mode.
Auto Translation → Auto Publish	The localization task undergoes auto-translation then is auto-published. Group needed: Assign the **Localization Fulfiller Group**. Select an Auto Translation Mode.
Business Approval → Translation → Publish	The localization task first requires business approval for localization. Next the content is translated manually or translated by using one of the translation modes. Finally the content is manually published.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

After activating Localization Framework, you can create custom artifacts and processing scripts, and adjust preferences for email, workflows, and other settings

Activating the Localization Framework

When you activate the Localization Framework Installer plugin (com.glide.localization_framework.installer), Localization Framework is available by default for the Service Catalog items and Virtual Agent topics, Natural Language Understanding models, and Document Templates for HR Service Delivery.

After you activate the Localization Framework Installer plugin (com.glide.localization_framework.installer), you can:

- Create configurations to onboard any other application to Localization Framework.
- Request translations of the artifacts into one or more languages.
- Translate content of the artifacts using manual translation or any of the supported translation modes.
- Approve translations by proofreading the translated content.
- Publish the translated content.
- Analyze the localization health of the system using the Localization Insights dashboard.
- Install optional plugins to set up Localization Framework Hub and Spoke architecture.

For more information on activating this plugin, see Activate Localization Framework.

Activate Localization Framework

You can activate the Localization Framework Installer plugin (com.glide.localization_framework.installer) for Localization Framework if you have the admin role. The application installs related plugins if they are not already installed. Optionally, you can activate plugins for the Localization Framework Hub and Spoke architecture on a set of instances.

Before you begin

Role required: admin

About this task

The Localization Framework Installer plugin (com.glide.localization_framework.installer) can be activated in two ways:

- Manual installation of the plugin.
- Auto-installation of the plugin.

  When a language plugin is installed, the Localization Framework Installer plugin (com.glide.localization_framework.installer) is automatically installed with the language plugin. For more information, see language plugins.

The following items are installed with Localization Framework :

- Plugins
- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Localization Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Localization Framework Installer plugin (com.glide.localization_framework.installer) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

Optionally, next you can install plugins for the Localization Framework Hub and Spoke architecture. This enables you to designate one instance as a hub to fulfill localization requests, and one or more instances as spokes that submit requests to the hub.

Decide which instance should function as the hub. On that instance, follow the above procedure to search for and install the Localization Framework Hub plugin [com.sn.localization_framework.hub].

Decide which instance(s) should function as spokes. On each of those instances, follow the above procedure to search for and install the Localization Framework Spoke plugin [com.sn.localization_framework.spoke].

Components installed with Localization Framework

The Localization Framework Installer plugin (com.glide.localization_framework.installer) activates several related plugins that are not already active. With installation of the core plugins, optional plugins for the Localization Framework Hub and Spoke architecture are available.

Plugins available with Localization Framework Installer plugin (com.glide.localization_framework.installer)

Plugin	Description
Localization Framework [com.glide.localization_framework]	Manage localization workflows across the platform and products.
Localization Framework for Service Catalog [com.glide.localization_framework.service_catalog]	Enables translation of Service Catalog items using Localization Framework.
Localization Framework for Virtual Agent Topic [com.glide.localization_framework.va]	Enables translation of Virtual Agent topics using Localization Framework.
RWS Translation Management System Spoke for Localization Framework [com.glide.localization_framework.sdl_spoke]	Integrates Localization Framework with the RWS Translation Management System.

© 2026 ServiceNow, Inc. All rights reserved.

Plugins available with Localization Framework Installer plugin (com.glide.localization_framework.installer) (continued)

Plugin	Description
XTM Translation Management System Spoke for Localization Framework [com.glide.localization_framework.xtm_spoke]	Integrates Localization Framework with the XTM Translation Management System.

Optional plugins for the Localization Framework Hub and Spoke architecture

Localization Framework Hub [com.sn.localization_framework.hub] Scope: sn_lf_hub	It's a framework that enables to fulfill the translation requests received from Localization Framework Spoke. After installation and configuration, the hub instance manages incoming translation requests. For more information, see Localization Framework Hub and Spoke architecture.
Localization Framework Spoke [com.sn.localization_framework.spoke] Scope: sn_lf_spoke	It's a framework that enables to fulfill the translation requests using Localization Framework Hub. After installation and configuration, the spoke instance submits its translation requests to the hub.

Tables installed with Localization Framework

Table label	Table name
Settings	sn_lf_setting
Artifact Configurations (Sn Lf Config)	sn_lf_config
Localization Insight (Sn Lf Insight)	sn_lf_insight
Localization Project (Sn Lf Project)	sn_lf_project
Loclization Requested Item (Sn Lf Requested Item)	sn_lf_requested_item
Localization Task (Sn Lf Task)	sn_lf_task
TMS Configuration (Sn Lf Tms Config)	sn_lf_tms_config

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with the optional Localization Framework Hub and Spoke architecture

The application scope for the following tables: Localization Framework Hub. For more information, see Localization Framework Hub and Spoke architecture.

Table label	Table name
Localization Framework Spoke Configuration (Sn Lf Hub Spoke Configuration)	sn_lf_hub_spoke_configuration
Localization Framework Hub Translation Item (Sn Lf Hub Translation Item)	sn_lf_hub_translation_item
Localization Framework Hub Spoke Settings (Sn Lf Hub Spoke Setting)	sn_lf_hub_spoke_setting
Localization Framework Hub Translation Request (Sn Lf Hub Translation Request)	sn_lf_hub_translation_request

Related topics

Find components installed with an application

Artifact configurations

You can configure the required artifacts and use the Localization Framework to fulfill the translation requests.

Any artifact configured in the Localization Framework application has its own record in the artifact configurations [sn_lf_config] table.

With the activation of the Localization Framework Installer plugin (com.glide.localization_framework.installer), a record for Service Catalog item and Natural Language Understanding Model are automatically created and configured in Localization Framework.

A record for the Virtual Agent topic is also created and configured in the framework, since Virtual Agent is automatically enabled with the base system. For more information, see Virtual Agent Lite.

Records for Document Template Block Content and HTML Document Template are created in the artifact configurations [sn_lf_config] table when you activate the Human Resources Scoped App: Lifecycle Events for Enterprise plugin [com.sn_hr_lifecycle_ent]. For more information about activating this plugin, see Activate Lifecycle Events for Enterprise.

You can also create and configure an artifact of your choice and a record for the same is created in the artifact configurations [sn_lf_config] table. For more information, see Create and configure a custom artifact.

Create and configure a custom artifact

Create and configure custom artifacts of your choice to use the Localization Framework functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Ensure that you are in the application scope that you want for your custom artifact.

Role required: localization_admin and script_include_admin.

About this task
From the Zurich release, your custom artifacts can be made available in Localization Workspace. For information about making custom artifacts selectable in Localization Workspace translation requests, see Dynamic artifact detection in Localization Workspace.

Procedure
1. Ensure that you are in the application scope that you want for your custom artifact, and navigate to **All** > **Localization Framework** > **Artifact Configurations** [sn_lf_config].
2. Select **New**.
3. In the Artifact Configuration form, fill in the fields.

Artifact Configuration form fields

Field	Description
Name	Identifier of the artifact record.
Internal name	An internal name for the artifact.
Table name	Identifier of the table where information of the artifact is stored. For example, Catalog Items [sc_cat_item] table.
Processor script	Extracts the translatable content associated with the translation request and saves the translations into the database.You can select a script include using the search icon, or you can create a new script include. The processor script contains the following functions: ○ getTranslatableContent: Extracts the translatable content. ○ saveTranslatedContent: Saves the translated content back to the system. For more information, see Processor script functions.To create a new processor script for the artifact, see Create a processor script. **Note:** Under **Related Links** on an existing artifact record, you can switch to **Legacy View** for script editing.
Application	Application scope. The value is the current application selected for the logged-in user session. For more information, see Select an application from the application picker.
Active	Option to activate the configuration record.
Generate insights	Option to turn on or turn off the localization insights for the artifact. For more information, see Localization Insights dashboard.

4. Select **Submit**.

What to do next
For examples of Localization Framework artifacts that you can set up, see the LF Artifact blog posts list on https://www.servicenow.com/community/international-localization/need-to-

© 2026 ServiceNow, Inc. All rights reserved.

translate-a-par-dashboard-check-this/ta-p/2839751 in the ServiceNow Community. These examples include Processor scripts.

Create a processor script

You can create a processor script to include in your custom artifact configuration to extract the translatable content and save the translated content.

Before you begin

Role required: localization_admin and script_include_admin

Procedure

1. Navigate to **All** > **Localization Framework** > **Artifact Configurations**.
2. Click **New** or open an artifact that you want to update the processor script for.
3. Click the **Create Processor Script** related link.
4. In the **Script include name** field, provide the script include name to integrate the artifact with Localization Framework.
5. Click **Submit**.

Processor script functions

The processor script contains functions that help you extract the translatable content and save the translated content which is included when you configure an artifact.

getTranslatedContent(params)

This function is responsible for extracting the translatable content for the Localization Framework to use and consume that content and contains the following parameters:

getTranslatedContent(params)

Name	Type	Description
tableName	String	The table name of the artifact record.
sysId	String	The sys_id of the artifact record.
language	String	The language into which the artifact has to be translated (target language).

Note: This script function is available by default when you configure the processor script. This script function requires that you configure its parameters to build the LFDocumentContent object.

saveTranslatedContent(documentContent)

This function is responsible for saving the translations back to the system and has a parameter which is an object of LFDocumentContent.

All the processor scripts extend LFArtifactProcessorSNC which defines the default implementation of this function, that is, saving the translations to standard tables. Defining this function in the processor script overrides the default behavior.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This script function is commented by default when a new processor script is created. For more information, see Read script helper functions for LFDocumentContentBuilder.

Create a UI action for the custom artifact

Create a UI action to request translations for the custom artifact.

Before you begin

Role required: localization_admin

Procedure

1. Navigate to the custom artifact table.
   Find the table using its table name. For example, **[sys_cs_topic]** is the table name for Virtual Agent topics.
2. Click the hamburger icon ( ) at any of the columns and navigate to **Configure UI Actions**.
3. Click **New**.
4. In the UI Actions form, fill in the fields.

UI Action form fields

Field	Description
Name	Name for the UI action. For example, **Request Translations**.
Client	Option to execute the script in the user's browser. When enabled, the **Onclick** field appears above the Condition field.
Condition	Condition to decide when to show this UI action.
Onclick	Provide the JavaScript function name as: `renderLanguagePickerModal();`
Script	Option to execute the script to run the request translations function. The script varies for **Form button** and **List choice**. ○ Form Button `function renderLanguagePickerModal() { var dlg = new GlideModal("sn_lf_language_picker"); dlg.setTitle(getMessage("Request Translations"));`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	dlg.setPreference("sys_id", g_form.getUniqueValue());
	
	dlg.setPreference("artifact_config_internal_name", "catalog_item");
	
	dlg.setPreference("request_type", "form");
	
	dlg.setPreference("focusTrap", true);
	dlg.render();
	}
	
	○ List choice
	
	function renderLanguagePickerModal() {
	var sys_ids = g_list.getChecked();
	if (!sys_ids || sys_ids.length == 0)
	return;
	var dlg = new GlideModal("sn_lf_language_picker");
	
	dlg.setTitle(getMessage("Request Translations"));
	
	dlg.setPreference("sys_id", sys_ids);
	
	dlg.setPreference("artifact_config_internal_name", "catalog_item");
	
	dlg.setPreference("request_type", "list");
	
	dlg.setPreference("focusTrap", true);
	dlg.render();
	}

Form button	Option to enable the UI action as a form button.
List choice	Option to enable the UI action in the choice list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Configure the form to see all the fields. For more information, see Create a UI action.

5. Click **Submit**.

Read script helper functions for LFDocumentContentBuilder

The `LFDocumentContentBuilder` provides utility functions to build document content. Use these functions to write the logic to extract the translatable content from any artifacts regardless of them using standard tables or not for translations.

initialize (version, targetLanguage, sys_id, tableName)

Use this function as a constructor for `LFDocumentContentBuilder` and includes the following parameters:

Name	Type	Description
Version	String	The version type of the document content to be generated. For Brazil, this value is v1.
targetLanguage	String	The target language of the localization task document content. The target language is the same as the language available from the read script function argument.
Sys_id	String	The sys_id of the artifact record.
tableName	String	The table name of the artifact record.

processString (string, groupName, label)

Use this function to add the LFDocumentContentElement in the document content for the given string and includes the following parameters.

Name	Type	Description
string	String	The value for which a document content entry is created.
groupName	String	The name of the group to which element should belong.
label	String	The unique label identifier for the created element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

processStringArray (stringArray, groupName, label)

Use this function to add elements (object of LFDocumentContentElement) in the document content for the given strings and includes the following parameters.

Name	Type	Description
stringArray	List of Strings	The list of values for which document content entry is created.
groupName	String	The name of the group these strings belongs to.
label	String	The unique label identifier for these strings.

processScript (scriptContent, groupName, label)

Use this function to add an element in the document content for the strings present as input of getMessage, gs.getMessage, or gs.getMessageLang in the provided Script. It has the following parameters:

Name	Type	Description
scriptContent	String	The Script to be processed to get the strings present as input of getMessage, gs.getMessage, or gs.getMessageLang.
groupName	String	The name of the group for this input.
label	String	The unique label identifier for this input.

For example,

```
var documentContentBuilder = new LFDocumentContentBuilder("v1",
 language, sysId, tableName);
Var name = "name";
documentContentBuilder .processScript("gs.getMessage('Hello {0},
 How are you', name)", "Script_Group", "Script_Label");
```

processTranslatableFieldsForSingleRecord (glideRecord, groupName)

Use this function to create elements for the given glideRecord object, in document content for all its translatable fields. These translatable fields can be of translated_field, translated_text or translated_html types. It includes the following parameters:

Name	Type	Description
glideRecord	GlideRecord	The GlideRecord object to be processed for translatable fields. The GlideRecord

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Type	Description
		should be pointing to the valid table record.
groupName	String	The name of the group for this input.

processTranslatableFieldsForMultipleRecords (tableName, encodedQuery, groupName)

Use this function to fetch all the qualified records for the given tableName and encodedQuery and adds elements (object of LFDocumentContentElement) in the document content for all the translatable fields. It includes the following parameters:

Name	Type	Description
tableName	String	The table to fetch records.
encodedQuery	String	The encoded query for filtering records from the processTranslatableFieldsForSingleRecord table.
groupName	String	The name of the group for this input.

processElement()

Use this function to add an element (object of LFDocumentContentElement) to LFDocumentContent object.

element	LFDocumentContentElement	Element to be added to the document content.

build()

Returns the LFDocumentContent object.

Note: The getFinalJSON function has been deprecated in the Brazil release and it is recommended to use the *build()* function.

A sample script to build the document content.

```
getTranslatableContent: function(params) {
    var tableName = params.tableName;
    var sysId = params.sysId;
    var language = params.language;
    var lfDocumentContentBuilder = new
 global.LFDocumentContentBuilder("v1", language, sysId,
 tableName);
    // This will create a new object of LFDocumentContent and
 stores it internally

 lfDocumentContentBuilder.processTranslatableFieldsForSingleReco
rd(gr, "Basic Info");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var field =
 LFDocumentContentHelper.createField(originalValue,
 translatedValue);
    field.setTextType(LFDocumentContentHelper.PLAIN_TEXT_TYPE);
    // All the other relevant attributes can be set
    var element =
 LFDocumentContentHelper.createElement(groupName, label);
    element.addField(field);
    lfDocumentContentBuilder.processElement(element); // Adds
 element to the LFDocumentContent object
    return lfDocumentContentBuilder.build(); // return the
 LFDocumentContent object
}
```

Sample script to extract data from the LFDocumentContent

```
saveTranslatedContent: function(documentContent) {
    // LFDocumentContent object is passed as an argument to the
 saveTranslatedContent
    var targetLanguage = documentContent.getLanguage();
    var version = documentContent.getVersion();
    var elements = documentContent.getElements(); // Array of
 LFDocumentContentElement objects
    for (var idx = 0; idx < elements.length; idx++) {
        var element = elements[idx];
        var groupName = element.getGroupName();
        var fields = element.getFields(); // Array of
 LFDocumentContentField objects
        for (var fieldIdx = 0; fieldIdx < fields.length;
 fieldIdx++) {
            var field = fields[fieldIdx];
            var originalValue = field.getOriginalValue();
            var translatedValue = field.getTranslatedValue();
            // Get all the other required members and process
 them appropriately
        }
    }
}
```

Localization Framework settings

You can define translation and workflow preferences for one or more languages and for one or all the available artifacts with Localization Framework settings.

Before you define the translation and workflow preferences, ensure that you have the required artifacts to define the localization settings. For more information, see Artifact configurations.

Note: Languages with no localization settings can't be selected for translation requests.

You can enable one or more of the following translation modes to define the translation preferences. For more information, see Translation modes.

- Activate the required translator if you want to use machine translation.

  Note: Machine translation in the Localization Framework application is powered by Dynamic Translation. Therefore, activating the Dynamic Translation plugin (com.glide.dynamic_translation) enables you to use the machine translation capability in Localization Framework

© 2026 ServiceNow, Inc. All rights reserved.

.

- Configure a TMS service of your choice if you want to send the content to a translation management system for translation. For more information, see Translation Management System configurations.
- Configure an email subflow if you want to use a subflow other than the default subflow for sending the translatable content file for translation via email. For more information, see Create a custom email subflow.

Create a custom email subflow

Create an email subflow according to your requirements. You can then select this subflow to define translation preferences for a language.

Before you begin

Roles required: localization_admin and flow_designer

About this task

The Localization Framework provides a default email subflow that you can customize.

Copy the existing email subflow configured for the Localization Framework and then customize it. Publish the customized subflow so that it is available for selection when setting up the translation preference for a language. For more information, see Create a subflow.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. In the Workflow Studio window, click **Subflows**.
3. Click **Send LF Email for Translation** subflow.
   The Send LF Email for Translation subflow opens in the Workflow Studio in read-only format. The inputs in this subflow are described in the following table:

Send LF Email for Translation input parameters

Name	Description	Type
lftask_record	Associated Localization Framework task record.	Reference.Localization Task [sn_lf_insight]
attachment_record	Contains a file related to the LFTASK that can be sent via Email for translation.	Reference.Attachment
send_to	Contains email addresses of the recipients to send the LF task file.	String
source_language	Language from which the localization task was created.	String
target_language	Language into which the content of the localization task gets translated into.	String

4. In the subflow header, click the more actions icon  and select **Copy subflow.**
5. In the **New subflow name** field, enter the name of the new subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To limit the application scope of the subflow, in the **Application** field, select the required application, otherwise select **Global**.
7. Click **Copy**.

   The new subflow is created and opens in the subflow designer editor. The inputs from the copied subflow appear.

   Note: Inputs are fixed and cannot be edited.

8. In the Actions section, click **Send Email**.
   This expands the Send Email section. The fields in the Send Email section are described below:

Send Email fields

Field name	Description
Action	Name of the action. Default: **Send Email**.
Target Record	Associated Localization Framework task record
Table	Name of the table where the localization task resides.
Include Watermark	Adds a watermark in the file associated with the localization task.
To	Contains email addresses of the recipients who should be addressed directly.
CC	Contains email addresses of the recipients who should see the list of recipients directly addressed in the email.
BCC	Contains email addresses of the recipients who are copied on the email but not displayed in the email.
Subject	The text about the email that its recipients can see.
Body	The text message about the localization task being sent for translation.

9. Click **Done**, when you have modified the fields as per your requirement.
10. Click **Copy Attachment**.
    The Copy Attachment action expands. The fields in the Copy Attachment section are described below:

Copy Attachment fields

Field name	Description
Action	Name of the action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field name	Description
	Copy Attachment is displayed by default.
Source Attachment Record [Attachment]	Translatable content file of the localization task.
Target Record	Represents the target record in the email.
Table	Represents the email table.

11. Click **Save**, to save the subflow in draft status.
12. Click **Publish**.

Result

Use the published subflow to define the translation preference for a language.

Translation Management System configurations

The Localization Framework supports integration with a translation management system to localize the content.

The TMS configuration table lists all the TMS services configured in the instance.

RWS and XTM TMS services are automatically enabled in Localization Framework with the activation of the Localization Framework Installer plugin (com.glide.localization_framework.installer) and appear in the TMS configuration [sn_lf_tms_config] table.

To use the RWS TMS service for localization of the artifacts, you must configure the connection and credentials. For more information about configuring RWS TMS, see RWS Translation Management System spoke.

To use the XTM TMS service for localization of the artifacts, you must configure the connection and credentials. For more information about configuring XTM TMS, see XTM Translation Management System spoke.

You can also sign up and create an account with a TMS service of your choice. To create and configure a custom TMS, see Create a custom translation management system.

RWS Translation Management System spoke

The RWS Translation Management System spoke provides subflows and actions to localize the artifacts using the RWS translation management system service.

Activate the Localization Framework Installer plugin (com.glide.localization_framework.installer) to activate the RWS Translation Management System Spoke for Localization Framework (com.glide.localization_framework.rws_spoke).

Subscription

The RWS TMS spoke requires any ServiceNow subscription that is Standard or above and includes the Localization Framework.

Supported versions

Version v1.

© 2026 ServiceNow, Inc. All rights reserved.

Spoke Subflows

The spoke provides subflows in the Published state to integrate with the RWS TMS service. These subflows can be used as part of other subflows and flows.

Spoke subflows

Subflow	Description
Request Translations [request_translations]	Contains set of inputs and outputs to request translations of the artifacts.
Retrieve Translations [retrieve_translations]	Contains set of inputs and outputs to retrieve translations of the translated artifacts.

Spoke actions

The spoke provides actions to integrate with the RWS TMS service.

Spoke actions

Action	Description
Create Project [create_project_on_sdl]	Creates a project on RWS for translation.
Get Project Details [get_sdl_project_details]	Fetches the project's details for the translation request.
Get Translated File [get_translated_file_from_sdl]	Fetches the translated file from RWS TMS after translations.
Mark File As Complete [complete_file_on_sdl]	Marks the file as complete, after getting the translated content.
Upload File [upload_file_on_sdl_tms]	Sends a file to RWS for translations.

RWS Translation Management System account requirements

Ensure that you are registered with RWS TMS and obtain the credential information. For more information on RWS Managed Translation API, see RWS documentation.

Connection and Credential alias requirements

The IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see Connections and Credentials Information.

To use the spoke connection aliases, use an associated connection record and a credential record created with the RWS spoke installation.

This spoke uses the RWS TMS alias (sn_sdl_spoke.SDL_TMS) to authorize actions.

The following are the connection alias requirements.

- Connection type: HTTP
- Connection URL: For example, `https://languagecloud.sdl.com`. This is a sample URL. Users can have a different URL based on their geographical preference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See Configure RWS TMS in the Localization Framework to connect to the RWS TMS services and use them to localize the artifacts.

Configure RWS TMS in the Localization Framework

Configure RWS TMS to use the RWS TMS service in the Localization Framework.

Before you begin

Roles required: connection_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
   A credential record for RWS TMS is created when the RWS TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
2. Open the RWS TMS credential record.
3. In the Connections related list, open the RWS connection record.
   A connection record for RWS is created when the RWS TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.

   All the form fields are populated with the information that is fetched through the RWS spoke installation during the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
4. In the Attributes section of the HTTP/HTTPS Connection form, provide the *project_option_id* connection attribute, and save the form.
   RWS provides an option to create automated or reviewed projects and provides the respective option IDs during RWS account creation.
5. In the **Credential** field, click the information icon ( ) and open the record.
   A record for OAuth 2.0 credentials is created when the RWS TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
6. In the **OAuth Entity Profile** field, click the information icon ( ) and open the record.
   An OAuth Entity profile is created when the RWS TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
7. In the **OAuth provider** field, click the information icon ( ) and open the record.
   An Application Registries record is created when the RWS TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
8. Provide the Client ID and Client Secret provided by RWS at the time of account creation, and save the form.
9. Open the OAuth 2.0 Credentials form again, and click the **Get OAuth Token** related link.
10. Provide the user name and password.
    RWS supports resource owner password credentials as the grant type. Provide these credentials to generate the token for the first time.

    Note: The user name and password do not persist in the ServiceNow instance.
11. Click **Get OAuth Token**.
    Once the OAuth token is created, the ServiceNow® platform regenerates the token until the refresh token expires.

XTM Translation Management System spoke

The XTM Translation Management System spoke provides subflows and actions to localize the artifacts using the XTM translation management system service.

Activate the Localization Framework Installer plugin (com.glide.localization_framework.installer) to activate the XTM Translation Management System Spoke for localization Framework (com.glide.localization_framework.xtm_spoke).

Subscription

The XTM TMS spoke requires any ServiceNow subscription that is Standard or above and includes the Localization Framework.

Supported versions

Version v1.

Spoke Subflows

The spoke provides subflows in the Published state to integrate with the XTM TMS service. These subflows can be used as part of other subflows and flows.

Spoke subflows

Subflow	Description
Request Translations [request_translations]	Contains set of inputs and outputs to request translations of the artifacts.
Retrieve Translations [retrieve_translations]	Contains set of inputs and outputs to retrieve translations of the translated artifacts.

Spoke actions

The spoke provides actions to integrate with the XTM TMS service.

Spoke actions

Action	Description
Create Project [create_project]	Creates a project on XTM for translation.
Get Project Details [get_xtm_tms_project_details]	Fetches the project's details for the translation request.
Get Translated File [get_translated_file_from_xtm_tms]	Fetches the translated file from XTM TMS after translations.

XTM Translation Management System account requirements

Ensure that you are registered with XTM TMS and obtain the credential information. For more information, see XTM documentation.

Connection and Credential alias requirements

The IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do

not need to update any actions that use the connection. For more information, see Connections and Credentials Information.

To use the spoke connection aliases, use an associated connection record and a credential record created with the XTM TMS spoke installation.

This spoke uses the XTM TMS alias (sn_xtm_spoke.XTM_TMS) to authorize actions.

The following are the connection alias requirements.

- Connection type: HTTP
- Connection URL: For example, `https://languagecloud.sdl.com`. This is a sample URL. Users can have a different URL based on their geographical preference.

See Configure XTM TMS in the Localization Framework to connect to the XTM TMS services and use them to localize the artifacts.

Configure XTM TMS in the Localization Framework

Configure XTM TMS to use the XTM TMS service in the Localization Framework.

Before you begin

Roles required: connection_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
   A credential record for XTM TMS is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
2. Open the **XTM TMS** (ID = sn_xtm_spoke.XTM_TMS) credential record.
3. In the Connection Attributes tab of the form, provide the *`template_id`* and *`customer_id`* attributes, and save the form.
4. In the Connections tab, open the XTM connection record by selecting the information icon ( ).
   A connection record for XTM is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation. All the form fields are populated with the information fetched through the XTM spoke installation.

   Note: In the **Connection URL** field, enter the URL of the XTM connection.

5. In the **Credential** column, select the value **XTM**to open the **OAuth 2.0 Credentials** [oauth_2_0_credentials] record.
   A record for OAuth 2.0 credentials is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
6. In the **OAuth Entity Profile** field, select the information icon ( ) to open the record.
   An OAuth Entity Profile is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
7. In the **OAuth provider** field, select the information icon ( ) to open the **Application Registries** [oauth_entity] record.
   An Application Registries record is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
8. Provide the Client ID and Client Secret provided by XTM at the time of account creation, and save the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Open the OAuth 2.0 Credentials form again, and select the **Get OAuth Token** related link.
10. Provide the username and password.
    XTM supports resource owner password credentials as the grant type. Provide these credentials to generate the token for the first time.

    Note: The username and password do not persist in the ServiceNow instance.

11. Select **Get OAuth Token**.
    Once the OAuth token is created, the ServiceNow® platform regenerates the token until the refresh token expires.

Integrate with a translation management system

Integrate with any translation management system of your choice to localize the artifacts requested for translations.

Before you begin

Role required: localization_admin

Procedure

1. Create subflows to request translations and to retrieve the translated content using Integration Hub subflows, actions, and connections and credentials.

   a. Ensure that the error messages and codes from the TMS provider are mapped correctly with the error messages and codes supported the ServiceNow platform.

   #### Standard error codes and messages

Error code	Error message
40510	Error while requesting translations.
40520	Error while retrieving translations.
40500	Authentication failed.

   b. Ensure that the input and output fields are in the following format for the subflows:

   #### Request translation subflow

Field Name	Description	Type
Inputs		
lftask_number	Associated localization task number.	String
xliff_1_2_content	Content of an artifact which must be translated in XLIFF 1.2 format. For example, `'csv', 'xliff 1.2'`	String
source_language	Language code of the source text.	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field Name	Description	Type
Inputs		
	For example, `'en'`	
target_language	Language code of the target text. For example, `'fr', 'it'`	String
Outputs		
project_info	The ID for the project created for an artifact configuration.	Object
status	Status of the request. For example, Success or Failure.	Choice
error_message	The reason for the error that populates when an error occurs.	String
error_code	The error code that populates when an error occurs.	String

Retrieve translation subflow

Field Name	Description	Type
Inputs		
lftask_number	Associated localization task number.	String
project_info	The ID for the project created for an artifact configuration.	Object
Outputs		
translated_xliff_1_2	Translated XLIFF file received from the TMS.	String
status	Status of the request. For example, Success or Failure.	Choice
error_message	The reason for the error that populates when an error occurs.	String
error_code	The error code that populates when an error occurs.	String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Create and configure a custom translation management system and activate it.

   See Create a custom translation management system.

   Note: Localization Framework depends on Integration Hub to build integrations with third-party systems.

Create a custom translation management system

Configure Localization Framework with a third-party translation management system of your choice to localize an artifact.

Before you begin

Roles required: localization_admin and flow_designer

Ensure that the Localization Framework Installer plugin (com.glide.localization_framework.installer) is activated.

Procedure

1. Navigate to **All** > **Localization Framework** > **TMS Configuration**.

   Note: By default, RWS, and XTM translation management system configurations are available.

2. Click **New**.
3. In the TMS Configuration form, fill in the fields.

TMS Configuration form fields

Field	Description
Name	Identifier of the TMS configuration.
Request translation subflow	IntegrationHub subflow that interacts with the third-party translation management system to request translations.
Retrieve translation subflow	IntegrationHub subflow that interacts with the third-party translation management system to retrieve translated content.
Application	The scope of the application. The default value is Global.
Version	Version of the contract used in subflows. The default value is **v1.**
Enable auto retrieval	Option to retrieve the translated content automatically. When selected, the translations are retrieved as per the scheduled jobs which run daily.

4. Click **Submit**.

Configure the Localization Framework preferences

Configure the preferences to request the translation in the activated languages.

Before you begin

Role required: localization_admin or localization_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Localization Framework** > **Settings**.
2. Select **New**.
3. On the form, fill in the fields.

Settings form

Field	Description
Name	Identifier of the translation setting.
Artifact	Artifact for the settings being defined. You can select either **All Artifacts** or an artifact of your choice, such as **catalog_item** or **nlu_model**. **Note:** To select Virtual Agent topics, Document Templates, Document Template Block Content, HTML Document Template, Knowledge Base or Email notification artifacts, you must activate specific plugins. For more information, see Supported artifacts in Localization Framework.
Languages	Target records of the languages available in the instance. All the available languages are populated based on the artifact selected.

4. Select the **Translation Preferences** tab.
5. On the form, fill in the fields.

Translation Preferences form

Field	Description
Machine Translation	
Enable machine translate	Option to enable the machine translation service for selected languages. **Note:** Dynamic Translation must be installed to use machine translation. For more information, see Activate Dynamic Translation.
Translator	List of the available translator services for machine translation. **Note:** Ensure that at least one third-party translator configuration record is integrated and active. For more information, see Integration with other translation services.
Translation Management System	
Enable TMS	Option to enable Translation Management System (TMS) for selected languages.
TMS	List of all the TMS services available for machine translation. By default, the **RWS** and the **XTM** TMS are available. You can also choose a configured custom TMS. For more information, see Translation Management System configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If you are configuring a spoke instance per the Localization Framework Hub and Spoke architecture, select `Localization Framework Hub` in this field. For more information, see Localization Framework Hub and Spoke architecture.
Send via Email	
Enable send via email	Option to enable email service for content localization for selected languages.
Email subflow	Available subflows for your email. Automatically, a subflow exists. To choose another subflow, create a subflow before setting up the translation preference.
Default file format	Option to select a file format to send and receive the content. By default, XLIFF 1.2 and CSV file formats are supported.
Default recipient(s) list	List of recipient email addresses through which the content is sent to the translator for translation.
Export/Import	
Enable export/ import	Option to enable the export and import of content for the translation of selected languages.
Default file format	Available options of file formats to send and receive the content. By default, XLIFF 1.2 and CSV file formats are supported.

6. Select the **Workflow Preferences** tab.
7. On the form, fill in the fields.

Workflow Preferences form

Field	Description
Workflow	List of all the workflows available for the translation process. For more information on the available workflows, see Workflows in the Localization Framework.
Business approver group	List of all the available business approver groups. This field appears only when a workflow that requires business approvals is selected from the **Workflow** field. **Note:** Ensure that the business approver group contains the localization_fulfiller role.
Localization fulfiller group	List of all the available localization fulfiller groups. **Note:** Ensure that the localization fulfiller group contains the localization_fulfiller role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Auto translation mode	Option to select the auto-translation mode. The available options are as follows: ○ **Machine Translate** ○ **Send to TMS**. If the instance has been set up as a spoke in the Localization Framework Hub and Spoke architecture, this setting will submit the translation request to the hub. ○ **Send via Email** For more information, see Translation Modes **Note:** Ensure that you have configured the Translation Preferences for the selected auto translation mode.
Translation approver group	List of all the available translation approver groups. This field appears only when a workflow that requires translation approvals is selected from the **Workflow** field. **Note:** Ensure that the translation approver group contains the localization_fulfiller role.

8. Select the **Project Preferences** tab.
9. On the form, fill in the fields.

Project Preferences form

Field	Description
Enable projects	Option to enable the creation of the localization projects. **Note:** If you are using Localization Workspace, select this option (set this option to on). In Localization Workspace you don't need to add items to the project manually. For Localization Framework: If this option is enabled, the localization requested items (LRITMs) are created upon request for translation of the artifact. You can then create a project and add the corresponding requested items to start the translation. You must have localization_manager role to create a project. This option helps in the bulk translation of the artifacts to be done at the same time by adding them to a project. Then, the translation progress of the LRITMs is monitored at the project level.
Enable auto creation	Option to enable the auto creation of the localization projects in Localization Framework. This option appears only when the Enable projects option is selected. **Note:** If you are using Localization Workspace, clear this option (do not set this option). For Localization Framework: When this option is enabled, translation requests for artifact items are created as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ A localization project is auto created. The corresponding localization requested items (LRITMs) are created, bundled, and added to the localization project. ○ The project starts automatically based on the Localization Framework settings.
Localization manager group	List of all the available user groups. **Note:** Ensure that the localization manager group contains the localization_manager role.

10. Select **Submit**.

Localization Framework Properties: Update Set Strategies

Use update sets to migrate your translations to another instance. Configure properties for update sets according to your business requirements.

Update sets enable you to transfer your artifact translations to other instances. For background information on update sets, see System update sets.

For localization tasks, previously the default was to create a dedicated update set per task in the scope of the artifact. Alternatively, with sys properties you can specify your update set strategy: bundle translations into one update set, or distribute into granular update sets.

The settings for update set strategies vary according to the type of translation, defined as follows:

localization tasks

Part of workflows that often include approval processes. These are based on tasks.

Property name: com.glide.sn_lf.update_set.strategy.request_translations.

adhoc

Edited and published directly by the localization editor, from the artifact record (such as a catalog item). The **Edit translation** button is visible to the editor, and it opens a UI page for translation. Adhoc translations are processed in the user context.

Property name: com.glide.sn_lf.update_set.strategy.edit_translations.

Update set strategy to use when translations are published from localization task

Save translation in update set created for each localization task	The system will create a dedicated update set for each task, using the task name. This strategy is most appropriate when there are a limited number of tasks.
Save translations in 'LF: Translations' update set	Granular update sets are not created. Instead, the system creates or reuses one update set named 'LF: Translations', and saves all tasks to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update set strategy to use when translations are published from localization task (continued)

	This strategy can be more convenient when there are many localization tasks.

Update set strategy to use when translations are published in adhoc way

Save translations in user preferred update set	The translations are written to the update set that the user has specified for a scope, because the processing happens in the user's context. When artifacts are in an application scope, their translations are saved to the user's preferred update set for that scope.
Save translations in 'LF: Translations' update set	The system creates or reuses one update set named 'LF: Translations', and all adhoc translations are written to it.

To set these properties, navigate to **Localization Framework** > **Properties**. Choose the appropriate strategy and select **Save**.

Localization Framework Hub and Spoke architecture

Enable one central instance to fulfill translation requests submitted from other instances using the Localization Framework Hub and Spoke architecture. Install optional Localization Framework plugins to configure one of your instances as a hub and other instances as spokes.

By default, translations are requested and fulfilled on the same instance. Alternatively, there is an available hub-spoke model for translation requests and fulfillment. With this architecture translation requests are a two-step process:

1. The spoke instance submits a translation request to the hub instance.
2. The hub instance manages the fulfillment of the request, such as by sending the content to a translation management system (TMS). The hub returns the translated contents to the spoke instance.

Consider the Localization Framework Hub and Spoke architecture when you want to limit fulfillers' access to one instance only.

To set up this architecture, use the admin role to install the following plugins:

- Localization Framework Hub [com.sn.localization_framework.hub]. Install this plugin on the instance you designate as a hub.
- Localization Framework Spoke [com.sn.localization_framework.spoke]. Install this plugin on the instances you designate as spokes.

For more information on installation, see Activate Localization Framework.

When both plugins are installed, use the admin or localization_admin role to configure the connection between hub and spoke instances. On the hub instance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Localization Framework** > **Hub** > **Spoke Settings.**
2. In the **Name** field, enter a unique name for each entry.
3. In the tab for **Translation Preferences**, find the **Translation Management System** (TMS) section. Enter the TMS service your organization uses.
4. In the tab **Workflow Preferences**, configure according to your requirements. Depending on the workflow you choose, different subfields are populated.
5. The tab **Project Preferences** is optional. If no project is entered, any request for translations into more than one target language is broken into separate tasks, one for each language.

Note: If Dynamic Translation is not installed, the option for machine translation is not available.

On a spoke instance:

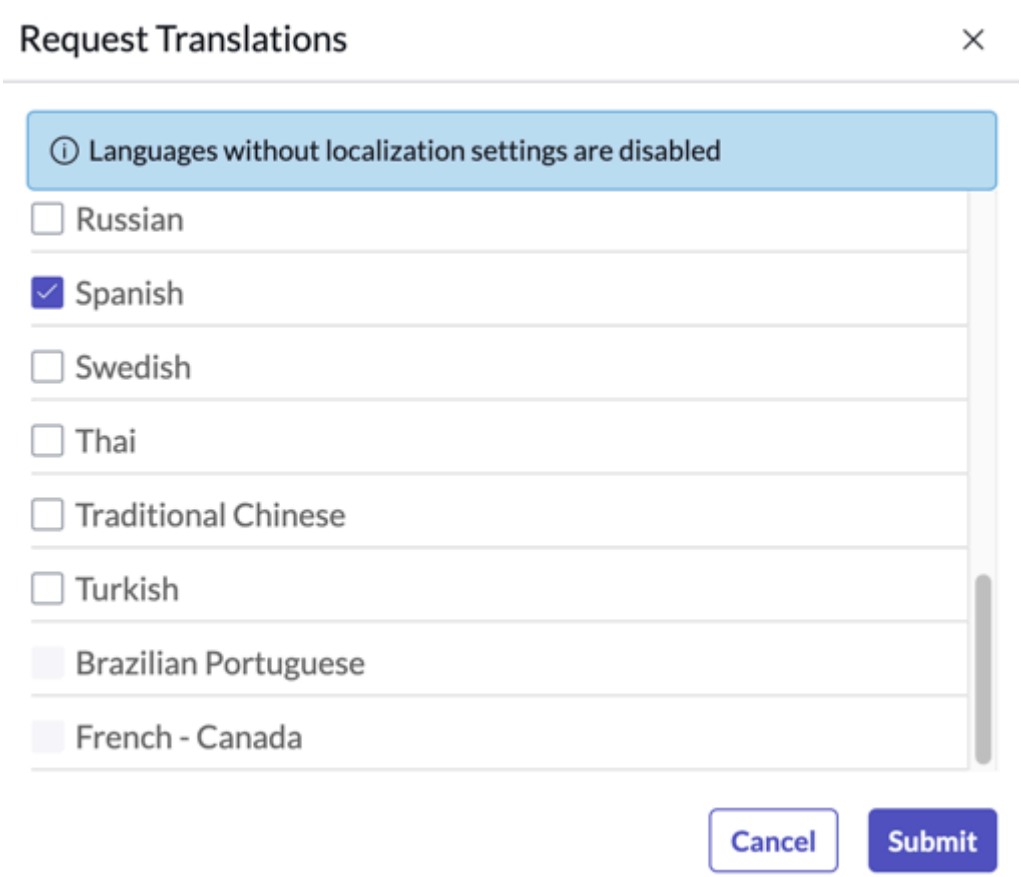
1. Navigate to the **Settings All Artifacts** table [sn_lf_setting].
2. In the tab **Translation Preferences**, find the **Translation Management System** (TMS) section.
   - **Enable TMS**: select.
   - **TMS**: Set to `Localization Framework Hub`.
   - **TMS Additional Info**: for **spokeSettingsName**, enter the name of the connection setting that has been configured on the hub.
3. Navigate to the **Connection & Credential Aliases** table. Find and open the record named *`Localization Framework`* **Hub TMS**.
4. Add the connection to the hub in the **Connections** tab. You can enter the URL to your hub in the **Connection URL** field. Set authentication and other attributes appropriate to your environment.

From the perspective of the spoke instance, the hub acts as a TMS. The application scope for the Hub and Spoke architecture is Localization Framework Hub.

Request translations

The Localization Framework provides the means to select one or more activated languages while requesting translations for artifacts from English into different languages.

Request translations in the Localization Framework



- Define localization preferences for the languages available in the instance to request translations.
- Lists only the activated languages in the instance to choose for localization of the content.

  Note: Before you request for translations, ensure to activate all the required languages in the instance. For more information, see Activate a language.

- Displays the translation status for each activated language only if translations have been requested for insights in those languages. The translation status is updated when the insights dashboard is generated.
- Enables you to request translations from English into the selected language from the localization dashboard for the selected insights records.
- Enables you to request translations for insights from English into one or more activated languages from their respective tables.

Fulfill a localization task

Approve a localization task

Request translations for Service Catalog items

Request translations for multiple Service Catalog items to localize them from English into one or more languages.

Before you begin

Roles required:

- localization_requestor: To request translations
- catalog_admin: To access the Service Catalog items [sc_cat_item] table.
- catalog_editor (or catalog_manager) if you are the editor or manager of the item that is being translated: To access the Service Catalog items [sc_cat_item] table.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. Select single or multiple items from the list or select the **Select All** check box.
3. From the **Actions on selected rows** drop-down list, select **Request Translations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Request Translations** dialog box, select the languages.
5. Select **Submit**.
   Localization requested items (LRITMs) are created for the selected items in all the selected languages. A success message with a link to the list of requested items is displayed. Click the link to see the list of requested items.

Request adhoc translation for Service Catalog items

Request adhoc translations for Service Catalog items to localize them from English into one or more languages using the edit translations option. After you make the changes, you can publish the translations.

Before you begin

The Localization Framework for Service Catalog plugin [com.glide.localization_framework.service_catalog] must be installed for the Edit Translations button to appear on the service catalog form.

Roles required:

- localization_editor: To request translations
- catalog_admin: To access the Service Catalog items [sc_cat_item] table.
- catalog_editor (or catalog_manager) if you are the editor or manager of the item that is being translated: To access the Service Catalog items [sc_cat_item] table.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. Select the item for which you want to request adhoc translations.
3. Click **Edit Translations**.
   The adhoc comparison UI of Localization Framework is displayed.
4. On the adhoc comparison UI of Localization Framework, you can use the followings options.

Option	Description
Machine Translations	Translate the catalog items using machine translations. You must configure machine translations in Localization Framework set tings to use this option. For more information about machine translation, see Create a trans lator configuration.
Export Source File	Option to export files for translation. To export files, click **Export Source File**, choose the file type, and then click **Export File**.
Import Source File	Option to import translated files to update the translation. To import files, from the **Ex port Source File** list, select **Import Translat ed File**.

Note:

The options displayed on the adhoc comparison UI of Localization Framework are based on the Localization Framework **Settings**.

5. After your changes are completed, click **Publish Translations**.

Create translation projects

The Localization Framework provides the means to assemble, manage, and complete localization and translation tasks, from single item assignments to large batch projects.

The **Localization Projects** feature enable users to bundle multiple localization request items (LRITMs) under one project. This allows bulk translation of requested items, thereby increasing the efficiency of the process. To work with Localization Projects, the feature needs to be enabled in Localization settings. A user with localization_manager role can enable the feature in Localization settings.

Localization tasks are not created automatically. The localization manager adds the requested items to a project and starts the project. All the requested items are then bundled under the localization tasks.

You can also automatically create a localization projects by enabling the **Enable auto creation** option in the Localization Framework settings. A localization project is auto created and the corresponding LRITMs are created, bundled, and added to the localization project. For more information, see Configure the Localization Framework preferences.

Each localization task has one or more requested items and is grouped in the following sequence:

1. Localization Framework **settings**: All the requested items are first grouped based on LF settings.
2. Source language: After the requested items are grouped according to the settings, then same source languages are bundled under one localization task.
3. Group of 150 requested items: If the number of requested items for a source language is more than 150, then for every group of 150 requested items, one localization task is created.

Create a localization project

Create localization projects to bundle multiple requested items under one localization task.

Before you begin

Enable Localization Projects in Localization Framework settings.

Role required: localization_manager

Procedure

1. Navigate to **All** > **Localization Framework** > **My Projects**.
2. Select **New**.
3. On the form, fill in the fields.

Localization Project

Field	Description
Number	Unique project number.
State	Current state of the project. Automatically it is set to **Draft**.
Assigned to	Person to whom this project is assigned to.
Assignment group	Group of the assigned person.
Short Description	Brief description of the project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

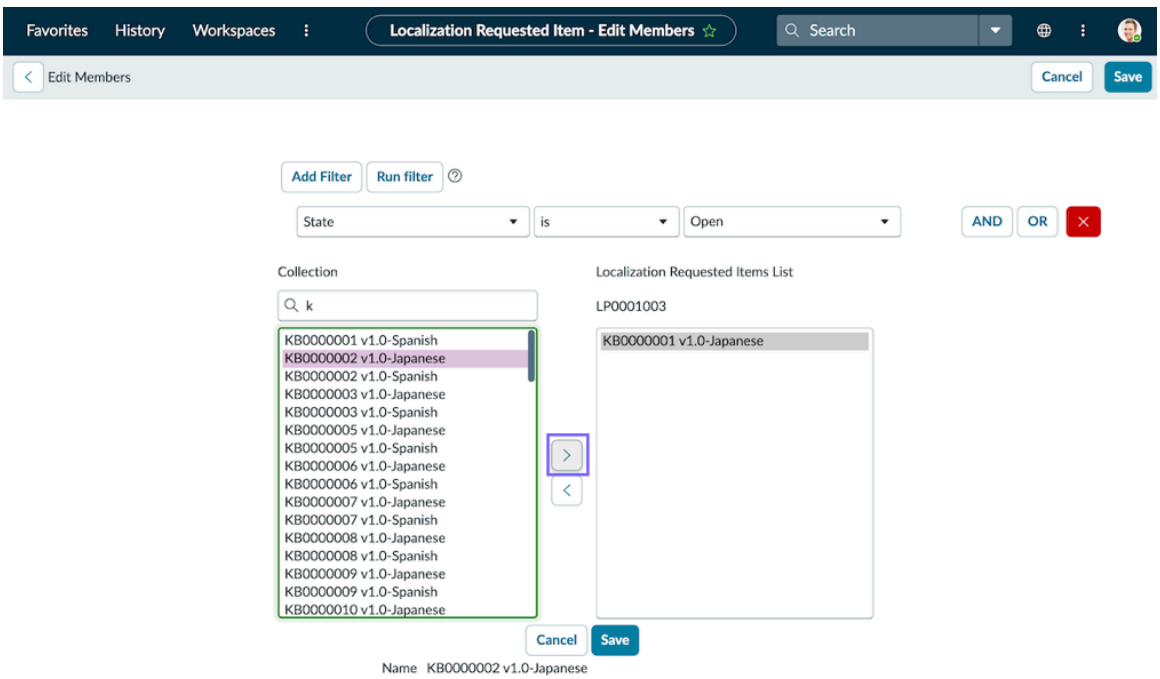
Field	Description
Work Notes	Notes regarding the project.
Additional comments (Customer Visible)	Notes that are visible to the customer.

4. Select **Submit**.

Add localization requested items to a project

Add multiple localization requested items (LRITMs) to a localization project so fulfillers can translate the items in bulk.

Before you begin



- Confirm that your localization project [sn_lf_project] is in the Draft state.
- Check the availability of your localization requested items by confirming that they are in the Open state. You can check by navigating to the table Localization Requested Items [sn_lf_requested_item]. Also, any items currently attached to another project might not be available for this procedure.
- Role required: localization_manager.

Procedure

1. Navigate to **All** > **Localization Framework** > **My Projects** [sn_lf_project].
2. Open the localization project to which you want to add requested items.
3. On the Localization Project record, select the **Localization Requested Items** tab from the related list.
4. Select **Edit**.

   Note: The Edit button is visible only when a project is in the **Draft** state.

5. **Optional:** Adjust the filter conditions for retrieving localization requested items, then select **Run filter**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Search for and select localization requested items under **Collection**.
7. Add the selected items to **Localization Requested Items List** using the right arrow icon.
8. Select **Save**.
9. On return to the Localization Project form, select **Start Project** in the form header.

The state of the project is changed to **In progress** and one or more Localization tasks are created based on settings and requested items.

After you start the project, you can't add more items to it.

Fulfill a localization task

Fulfill a localization task created for each selected language in the translation request.

Before you begin

Role required: localization_fulfiller

Procedure

1. Navigate to **All** > **Localization Framework** > **My Tasks**.
2. Select a localization task in the Open state.
3. On the Localization Task page, select **Translate** in the form header.

   Note: The **Translate** UI action is visible in all states except Awaiting Business Approval, Close Complete, and Incomplete.

   A two-column comparison UI page opens with the Source Language column on the left and the Target Language column on the right.

   Each Localization requested item has the following options:

   - **Expand all**: Expand all the groups on the comparison UI.
   - **Collapse all**: Collapse all the groups on the comparison UI.
   - **Show groups with missing translations**: See only the groups that have missing translations when the content is translated.
4. Translate the content manually or select one of the following translation modes from the task header.

Translation mode	Description
Machine Translate	Translates content using the translation service provider configured in the translation preferences. If there is more than one LRITM, then the operation is asynchronous.
Send to TMS	Sends the artifact to the translation management system configured in translation preferences for translation. If there are more than is LRITM, then the operation is asynchronous.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translation mode	Description
Export Source File	Exports the source file for translation in the file format configured in the translation preferences or as per the selected file format in the comparison UI.
Import Translated File	Imports the translated file in the file format configured in the translation preferences from the third-party translator. A merge conflict occurs when you have certain fields pre-populated with translations, but those fields get updated when you import the translated file. These conflicts are shown right below the fields updated with the latest translations.  To resolve the merge conflict, do the following: **a.** Click **See versions**. **b.** Choose a version that you want to retain. **c.** Click **Save**.
Send Source File via Email	Sends the source file to the email addresses configured in translation preferences for translation. If there is more than one LRITM, then the operation is asynchronous.

Note: When any translation mode is selected to translate the content, the content is saved as a draft to retain changes done by the user and then the translation process is initiated.

5. **Optional:** If you want to make any changes to the verified translations, click the lock icon ( ) beside the field with verified translations.
   Verified translations are pre-existing translations available in the database for the given text. The framework automatically fetches the existing translations and locks the fields.
6. **Optional:** Save the translated content by clicking **Save as Draft**.
   You can later revisit the content or send the content for translation approval.

   (Optional) This option moves the task state to Translation in Progress.
7. Click **Submit for Approval**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This option is available only for tasks where the workflow configured for the target language needs translation approval.

The task is sent for translation approval.

8. Click **Publish Translations**.

Note: This option is available only for tasks where the workflow configured for the target language has the **Publish** option.

Result

The translations of the localization task are published and the task is updated with the Closed Complete state.

You can move translation records across instances by using update sets. The translation-related XML files are saved to the update set specified in the settings. For more information, see Localization Framework Properties: Update Set Strategies.

Approve a localization task

Proofread the translated content and approve a localization task.

Before you begin

Role required: localization_fulfiller

Procedure

1. Navigate to **All** > **Localization Framework** > **My Tasks**.
2. Select a localization task in the **Open**state.
3. Select **Translate**.
   A list of all the requested items with the translation status is displayed. You can expand each requested item to see the details.
4. Select **Submit For Approval**.
   The state of the localization task is changed to **Under Review**. An approval localization task is created and assigned to an approver according to the approver group assigned in localization settings.
5. Select to open the approval localization task record.
   The state of the approval localization task is set to **Requested**.
6. From the form header, select **Verify Translations**.
   A list of all the requested items is displayed. Each requested expands to display the comparison UI.
7. On the form header, select **Approve**.
   All the translations are published and the states of the requested items, localization task, and the localization project is changed to **Closed Complete**.
8. On the form header, select **Request Changes** if you want to reject the translations.
   The approval localization task state is changed to **Rejected**. The requester needs to create another approval task and assign to the approval group.

Monitor the Localization Framework

Track localization performance and request translations with Localization Framework Dashboards.

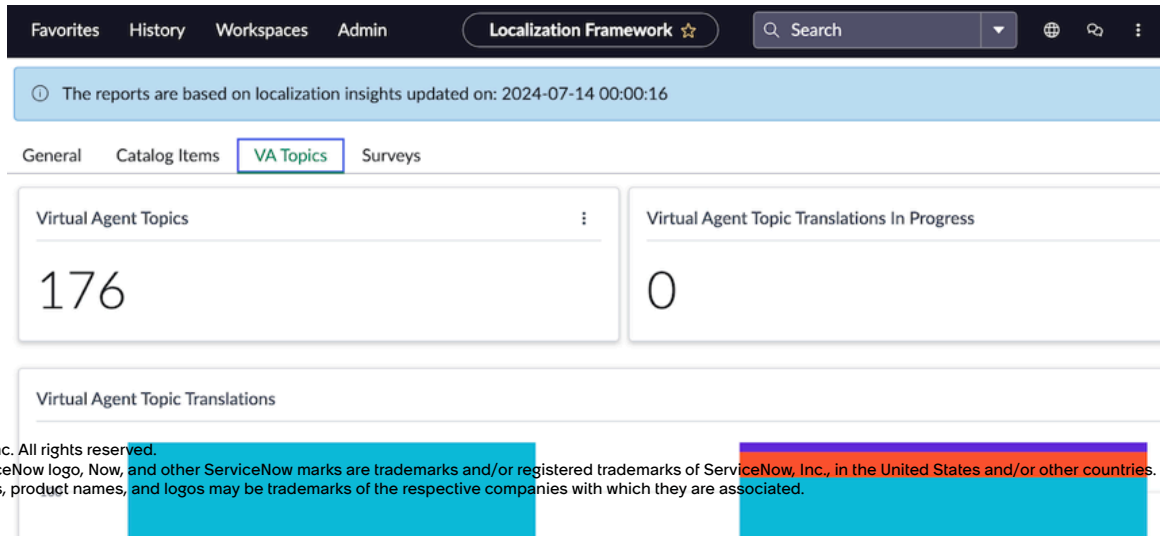
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Localization Insights dashboard

The Localization Insights dashboard provides reports on translations, grouped into tabs by artifact type. The reports are generated by scheduled jobs based on Localization Insights records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Localization Insights dashboard

- Access the dashboard by navigating to **All** > **Localization Framework** > **Insights Dashboard**.

> **Note:** In the Xanadu release, the Localization Insights dashboard is migrated to the Next Experience UI. Customers with existing dashboards who want to access the Core UI version can use this URL: `https://<instance name>.service-now.com/$pa_dashboard.do?sysparm_dashboard=6c7634c2732310103951 08b24ff6a7f6`.

- A banner on the Localization Insights dashboard shows the most recent update time of the reports.
- In Scheduled Jobs, you can configure the report update schedule (sn_lf_GenerateLocalizationInsightsRecords) by selecting **Configure Job Definition** under Related Links.
- The dashboard organizes artifact types into the following tabs:
  - General: Displays general translation information.
  - Catalog Items: Displays translation information related to Service Catalog items.
  - VA Topics: Displays translation information related to Virtual Agent (VA) topics.
  - Surveys: Displays translation information related to Surveys.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform role

You need the localization_admin or localization_requestor role to access the Localization Insights (sn_lf_insight) records for executing the scheduled jobs to generate the Localization Insights dashboard.

Use case

User	Dashboard use
Users with the localization_requester or localization_admin roles	View the status of localization requests. Make translation requests for your artifacts from the Localization Insights dashboard. For more information see Request translations from Insights Dashboard.

Data visualizations

Title	Type	Source table	Description
Languages Supported	Single Score	sys_language	The total number of activated languages in the instance.
Translations In Progress	Single Score	sn_lf_insight	The total number of translations in progress in the instance.
Language Preferences	Horizontal Bar	localization_insights_view	Provides information about the preferred languages of logged-in users.
Catalog Items	Single Score	sn_lf_insight	The total number of Service Catalog items in the instance.
Catalog Items Translation In Progress	Single Score	sn_lf_insight	The total number of Service Catalog items translations in progress in the instance.
Catalog Item Translations	Vertical Bar	sn_lf_insight	The total number of Service Catalog items requested for translations per language. It also indicates the following translation statuses with defined color legends:

Request translations from Insights Dashboard

Request translations for Service Catalog items or Virtual Agent topics from the insights dashboard to localize them into the selected language based on their translation status.

Before you begin

Role required: localization_admin or localization_requestor

Procedure

1. Navigate to **All** > **Localization Framework** > **Insights Dashboard**.

   The dashboard provides **Catalog Items Translations** report and **Virtual Agent Topic Translations** report by default using which you can request translations.

   If you have created a report for your custom artifact to display in the dashboard, you can also request translations for the custom artifacts. For more information, see Create a report for custom artifact.

2. In the **Catalog Items Translations** report or **Virtual Agent Topic Translations** report, click the vertical bar of the language into which you want to request translations.
   For example:
   - Select a language from the **Catalog Items Translations** report to request translations for the Service Catalog items in that language.
   - Select a language from the **Virtual Agent Topic Translations** report to request translations for the Virtual Agent topics in that language.
   - If you have a custom report created for an artifact, select a language from that report to request translations into the selected language.
3. Select one or more documents from the localization insights list.
   - You can click the **Select All** check box to request translations for all the items in the list.
4. From the **Actions on selected rows** list, select **Request Translations**.
5. Click **OK** in the Confirmation dialog box to submit the request.

Localization Framework reference

Reference topics provide information on components and technical aspects of the Localization Framework.

Translation modes

Localization Framework offers several translation modes for completing localization tasks. As a localization admin, you can select one or more of these modes when configuring the procedures for localization tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of translation modes in Localization Framework

Translation modes available to localization tasks include machine translation, translation management systems (TMS), send via email, and export/import. These modes apply to localization tasks that are not fulfilled manually, so they are described as Auto Translation.

As a localization admin, you can configure these modes when configuring localization tasks in the Settings [sn_lf_setting] table's web form. The modes that you enable and configure in the **Translation Preferences** tab become options for selection in the **Workflow Preferences** tab, under **Auto translation mode**.

- Before starting configuration of Translation Preferences in Settings, finish any applicable prerequisites such as setting up a machine translator service or TMS, enabling file formats for email, and so forth.
- Complete Translation Preferences in Settings before configuring the next tab, **Workflow Preferences**.

These translation modes also constrain the methods available to translation requests in Localization Workspace. Translation modes must be enabled in Localization Framework before they are available in the translation request wizard of Localization Workspace.

Machine Translation

Machine translation in Localization Framework is powered by Dynamic Translation.

Activate the required translation service provider in the instance to machine translate the content. For information, see Integration with other translation services.

Translation Management System

Localization Framework integrates with third-party Translation Management Systems (TMS) to localize the content.

RWS and XTM Translation Management Systems are supported by default and require configuration. For more information see, Configure RWS TMS in the Localization Framework and Configure XTM TMS in the Localization Framework.

Alternatively, you can configure a custom TMS of your choice. For more information, see Create a custom translation management system.

When the Localization Framework Hub and Spoke architecture is installed, the TMS must be configured accordingly. For more information, see Localization Framework Hub and Spoke architecture.

Zip attachments must be supported on the instance. For details on attachment configuration, see Configure system attachment properties.

Send via Email

Localization Framework provides **Send via Email** as a translation mode that can be used to send content for translation.

If you have more than one requested item in a task, then the requested CSV or XLIFF items are compressed into one ZIP file and attached to the email. Either the CSV or XLIFF attachment format must be supported on the instance. For details on attachment configuration, see Configure system attachment properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export/Import

Localization Framework supports the following translation modes:

- **Export**: Export the translatable content for translation to a TMS service. If you have more than one requested item in a task, the individual CSV or XLIFF files are compressed and downloaded as one zip file.
- **Import**: Import the translated content from a TMS service. If you have more than one requested item in the task, you can import individual CSV or XLIFF files or in a ZIP format. Any files unrelated to the task are skipped.

Either the CSV or the XLIFF attachment format must be supported on the instance. For details on attachment configuration, see Configure system attachment properties.

Translation Management System configurations

States of Localization Framework projects and tasks

In Localization Framework, the state of a localization project or of a task defines the status of the localization request. The states of the localization tasks change based on the workflow that is configured for translations.

Localization Framework Project States

State	Definition
Draft	Initial state when the localization project is created.
In progress	State when the localization project starts.
Closed Complete	State when all the tasks are closed complete.
Closed Incomplete	State when at least one of the tasks is closed incomplete.

Localization Framework Task States

State	Definition
Awaiting Business Approval	Localization task is awaiting business approval.
Error in Translation	Localization task has encountered an error while translating the content.
Closed Complete	Localization task has been fulfilled and the translations are published.
Closed Incomplete	Localization task has been closed without fulfilling the request.
Open	Localization tasks are not sent for translation.
In Progress	Translation of localization tasks is in progress.
Under Review	Approver is reviewing the translations.

Error messages in the Localization Framework

Error messages are displayed when the appropriate settings are not configured for the translation and workflow preferences.

Error messages in Artifact Configurations

Error message	Scenario
Internal name cannot be modified for the existing record.	When someone tries to modify the internal name of the existing artifact record.
Either a Processor script or a Read script is required for an active artifact configuration	When there is no processor script or read script available for the artifact configuration record.
A configuration record exists for the table: {table_name}	When you provide a table name for an artifact configuration record that exists for another artifact.
A configuration record exists with internal name: {internal_name}	When you provide an internal name for an artifact configuration record that exists for another artifact.

Error messages in Settings

Error message	Scenario
Contains invalid Email Address(es): {comma-separated email addresses}.	When some of the email addresses fail the validation.
Selected Localization Fulfiller group does not have localization_fulfiller role.	When the selected user group does not have the localization_fulfiller role.
Selected Business Approver group does not have localization_fulfiller role.	When the selected user group doesn't have the localization_fulfiller role.
Selected Translation Approver group does not have localization_fulfiller role.	When the selected user group does not have the localization_fulfiller role.
Ensure that the corresponding translation preference for your auto translation option is enabled.	When auto translate is selected in the workflow preference.
{Translator_name} translator is not of version v3.	When the corresponding translator version is not v3.
{Translator_name} translator has no translate subflow configured.	When the corresponding translator's translate subflow is empty.
Selected translator is not active.	When the corresponding translator configuration is inactive.
There are no languages available for the selected artifact. All the possible languages were configured in other localization setting records.	A warning message when there are no languages available for the selected artifact.
A setting record exists for the artifact - language pair(s): {pair of artifact and language}. Resolve the conflict(s) to proceed.	When a user tries to add a language or artifact in settings and that record exists in another record.
The Default recipient(s) list contains invalid email address(es): {comma_separated_email_adddresses}.	When the provided email addresses of the recipients are invalid.

Exploring Localization Workspace

Localization Workspace is a targeted translation management experience for content owners and translation requesters. With Localization Workspace you can manage and deliver multilingual content at scale.

Localization Workspace overview

Localization Workspace contains all the components and data a Localization manager needs to understand and manage which content types and activities are required to complete translations. It streamlines and automates task creation and translation workflows.

In the initial release, Localization Workspace supports translation requests when the sources are English and the targets are non-English languages. Translation requests for non-English texts (into any language including English) are not currently supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After configuration, translation requests follow a translation workflow through a Translation Management System (TMS) or a machine translation (MT) service. Localization Workspace leverages the project bundling capabilities of Localization Framework.

Localization Workspace is available for on-premise (self-hosted) customers. It has not been certified for regulated markets.

Localization Workspace users

Users

User	Description
Localization administrator	localization_admin
Localization editor	localization_editor
Localization fulfiller	localization_fulfiller
Localization manager	localization_manager
Localization requester	localization_requestor
Localization Workspace user	sn_lw.user
Terminology Manager	sn_lw.terminology_manager

For more information see Localization Workspace Roles.

Localization Workspace benefits

Localization Workspace benefits

Benefit	Feature	Users
Submit and manage translation requests from a single interface.	Localization Workspace enables you to request translations into multiple languages, using multiple different providers.	Localization Workspace user.
Select multiple types of content for translation.	When you select types of content to translate, Localization Workspace automatically identifies and collects all untranslated or partially translated content in scope.	Localization Workspace user.
Generate an informational cost estimate.	Informational cost estimates enable you to plan and control your localization budget.	Localization Workspace user.

- Localization Workspace reference

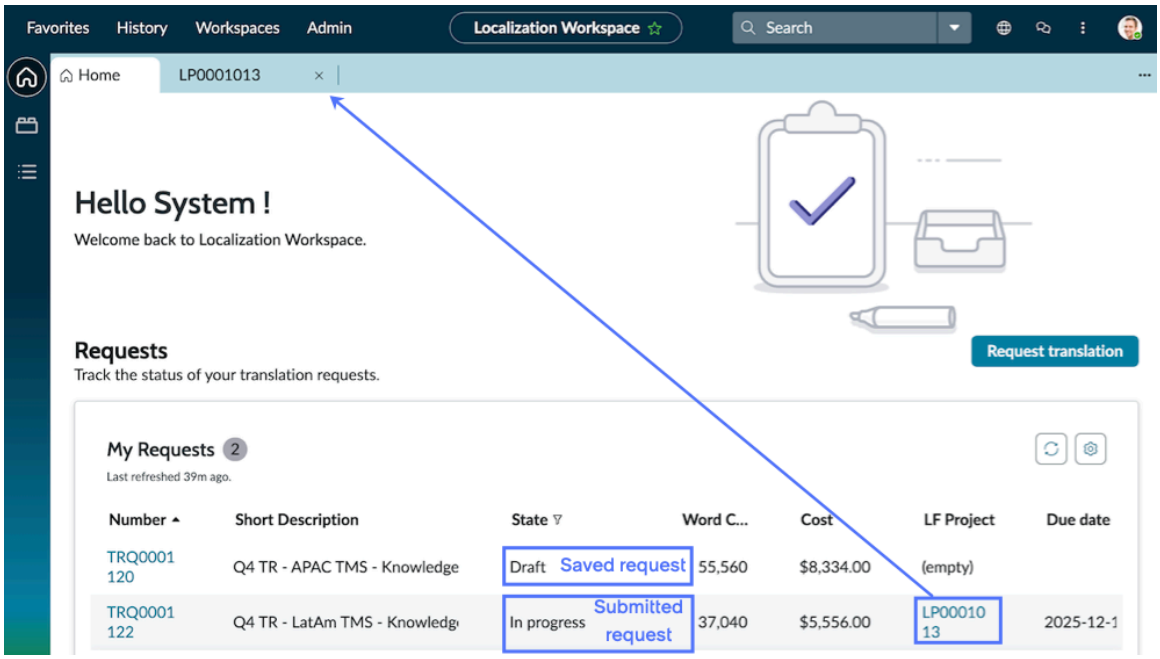
Localization Workspace Home and translation job status

Start a translation request and monitor the current status of your translation requests from the Localization Workspace Home screen.

Overview of Localization Workspace Home

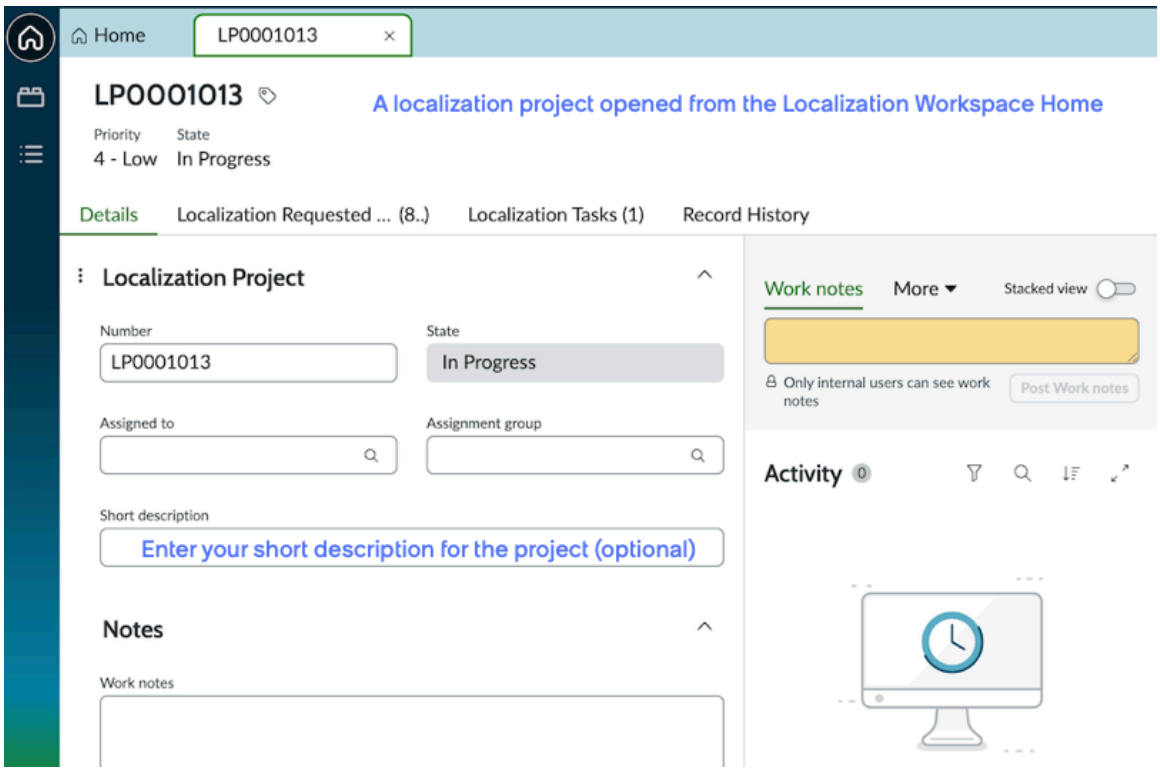
The Home screen of Localization Workspace is where you can launch a new translation request using the **Request translation** button.

Also you can track and manage the progress of translation requests in the Home screen's **My Requests** list.



- Get an overview of a request, including due date and status, at a glance.
- Open the Translation Request Details window from the request's Number.
- Archive a closed request, delete a draft request, or cancel an in-progress request from the **Action** column.

Guided Tours available from Help Center on Home



From version 3.0.0, two guided tours are available. One guided tour assists with configuring a language provider, and is accessible to users with the Localization administrator role (localization_admin). The other guided tour assists with configuring language groups, and is accessible to the Localization admin (localization_admin) and Localization requester (localization_requestor) roles. Find the guided tours by selecting the Help Center icon on the Home screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Projects

Localization Workspace extends and builds on projects in Localization Framework. When you create a translation request, the system creates a project in Localization Framework for you. You can open a tab for the translation request's project by selecting the **LF Project** number from the Requests list.

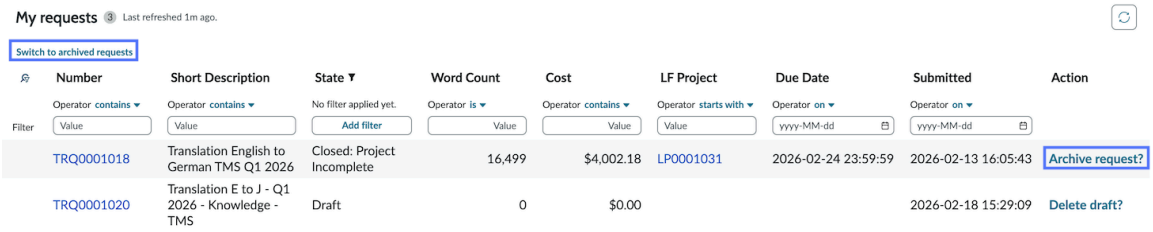
In the Localization Project tab you can drill down into project components such as Localization Tasks. You can fulfill a localization task using the **Translate** button in a Localization Task tab, when the project state is In Progress.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Any update you make here in Localization Workspace is saved to the underlying Localization Framework tables. Completed and archived projects can't be updated. For more information, see Fulfill a localization task in the Localization Framework documentation.

Translation request states

The **State** column of **My Requests** is where you can find the status of your translation requests. States in Localization Workspace correspond to Localization Framework projects as follows.



Translation request states in Localization Workspace

State	Description
Draft	The translation request is saved but not submitted. The **Save** button is available in each step of the translation request wizard. Draft requests can be re-opened and updated from My Requests by selecting the value in the Number column. **Action** column: The available action is **Delete draft**. From version 3.0.0. **Note:** Draft requests are not subject to the scheduled job Remove discarded Translation Requests. Corresponding Localization Framework status: Draft.
Submitted	The translation request has been moved to Localization Framework, where the project and its tasks are being created. Corresponding Localization Framework status: (N/A).
In progress	The translation project and its tasks have been successfully created in Localization Framework and sent to the selected translation provider. **Action** column: The available action is **Cancel request**. From version 3.0.0. Corresponding Localization Framework status: In Progress.
Complete	The translation project is complete and all tasks within the project are complete and closed. **Action** column: The available action is **Archive request**. From version 3.0.0. Corresponding Localization Framework status: Closed Complete.
Closed: Project Incomplete	The translation project is incomplete when at least one of the tasks within the project has been marked as closed but isn't complete.From version 3.0.0, when you select Cancel for a translation request, its status displays as Closed: Project Incomplete. **Action** column: The available action is **Archive request**. From version 3.0.0. Corresponding Localization Framework status: Closed Incomplete.

Archiving translation requests

From version 3.0.0 you can optionally archive your translation requests by selecting **Archive request** in the **Action** column. This is a table view of translation requests, so it isn't a status.

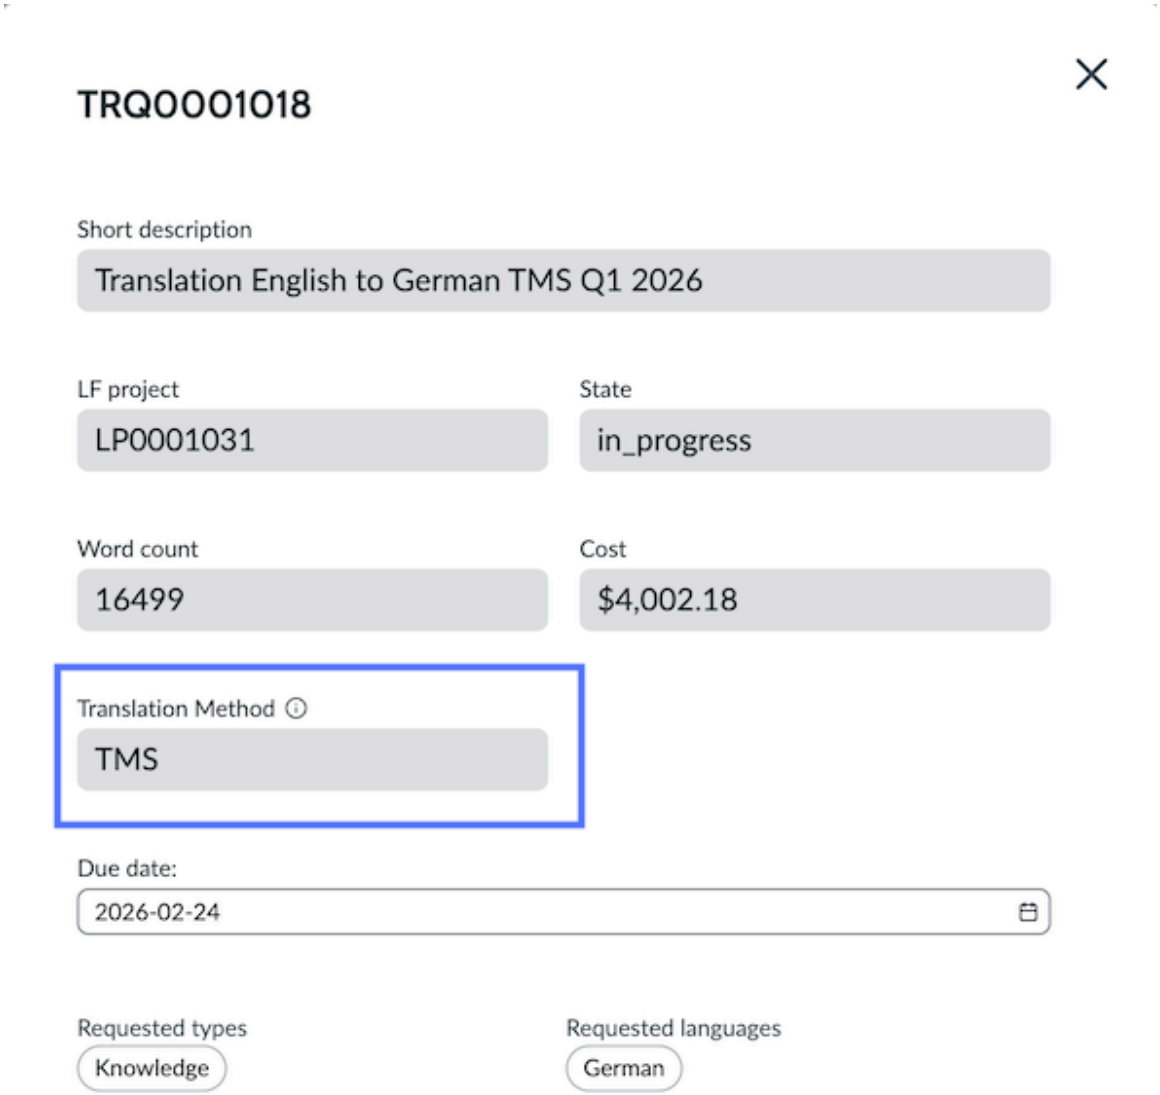
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select the **Switch to archived requests** link to view the list of archived requests. You can return to My Requests by selecting the link **Switch to my requests**.

- Only requests in a state of Complete or Closed: Incomplete can be archived.
- Archived requests are maintained indefinitely. They are not subject to the scheduled job Remove discarded Translation Requests.
- **Action** column: After archiving, selecting **Unarchive request** moves the row back to My Requests.
- Archived requests are read-only, so they can't be reopened or edited.

Translation request details

You can open a modal window displaying details about your translation request by selecting the value in the **Number** column. From version 3.0.0, the details window displays the request's translation method. Possible values are TMS, MT (machine translation), or Mixed.



Also in the details window you can modify the Due date for requests that are handled by a TMS. Select the Due date field to open a calendar picker.

- The Due date field is available after the translation request's project is fully created.
- Due dates can be postponed to a later date, but can't be moved to an earlier date.

After modifying the date, select Update to save the new date, or Cancel to abandon the modification.

Note: Notify your third-party providers directly regarding any changes to due dates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The display of Cost in the My Requests list

When displayed in the Requests list, the Cost uses a rate rounded up to the decimal place that is set in your Display Value Currency field. However, the base calculation of the informational cost estimate uses the actual rate that you have configured in Localization Workspace. The base calculation does not use the currency's display value. For more information, see Identify the FX Currency field and its display parameters.

Dynamic artifact detection in Localization Workspace

With Dynamic artifact detection, Localization Workspace identifies all translatable content, including your custom artifacts.

When you create translation requests, your custom artifacts can be selected in the content type stage. All untranslated or partially translated documents in the artifact's table are retrieved and displayed to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To make custom artifacts (content types) available for selection, you must configure them as follows.

- Create your translation artifact in the Artifact Configurations [sn_lf_config] table. For details see Create and configure a custom artifact.
- You must set Cross-scope privileges for your artifact's table and processor script. For information, see Cross-scope privileges for Localization Workspace.
- You may also need to set Restricted Caller Access for artifact resources. For information, see Restricted Caller Access for Localization Workspace.

Some preconfigured artifact types are already available when you install Localization Workspace. For information about translation artifacts that are available by default, see Types of Localizable content in Localization Workspace.

For examples of Localization Framework artifacts that you can set up, see the LF Artifact blog posts list on https://www.servicenow.com/community/international-localization/need-to-translate-a-par-dashboard-check-this/ta-p/2839751 in the ServiceNow Community. These examples include Processor scripts.

Configuring Localization Workspace

Before using Localization Workspace, configure prerequisites, dependencies, and translation service providers.

Configuration overview

Localization Workspace builds on the functionality of other ServiceNow AI Platform applications related to localization. These applications are activated with Localization Workspace if they are not already installed. You must complete the configuration of these applications before configuring Localization Workspace.

Note: From version 2.0.2, the Localization Workspace interface provides two Guided Setups to lead admins through the process of configuration, as follows.

- With the admin role, navigate to *Localization Workspace* > *Localization Framework Guided Setup* for the prerequisite application.
- Next, navigate to *Localization Workspace* > *Localization Workspace Guided Setup*.

After the initial setup, admins can make adjustments to configurations by using the Configuration Hub in Localization Workspace.

1. Install Localization Workspace.

   You can install the application (sn_lw) if you have the admin role. The application installs related applications and plugins if they are not already installed. Check your entitlements to determine whether you have access to Localization Workspace.

2. Configure prerequisites as needed.

   From the Zurich release, access to the Settings table [sn_lf_setting] is configured by default. However, in the Yokohama release, you must confirm access to the Settings table [sn_lf_setting]. The admin role is required for this step. See Confirm access to Settings table.

3. Configure dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Internationalization (i18n) and language plugins: Install language plugins as part of System Localization. Choose your instance's languages according to your business requirements.
- Localization Framework: Configure Localization Framework as follows.

  Assign roles. Localization Workspace uses roles from Localization Framework, along with roles specific to Localization Workspace.

  a. Add Localization Framework roles as needed. See Localization Framework Roles.

  b. Add the Localization Workspace user role sn_lw.user. This role is required for all users in Localization Workspace.

  c. Add the Terminology Manager (sn_lw.terminology) role for working with glossaries in Language Asset Management.

  Create at least one group in the Groups [sys_user_group] table and add roles to the group, then assign your localization users to the appropriate group.

  Configure artifacts. See Artifact configurations.

  > **Note:** The role sn_cd.content_admin is required to see Content Publishing items from Localization Workspace. If your users need to request translations for Content Publishing material, add sn_cd.content_admin to the appropriate group.
  >
  > The sn_cd.content_admin role is different from the content_admin role. From version 3.0.0, the sn_lw.user role contains the content_admin role.

  Configure settings, including for the workflows of translation tasks. See Localization Framework settings. Also on the Localization Framework settings table (sn_lf_settings), in the **Project Preferences** tab, ensure that check boxes are set as follows.

  - **Enable projects**: Selected.
  - **Enable auto creation**: Cleared (unselected).

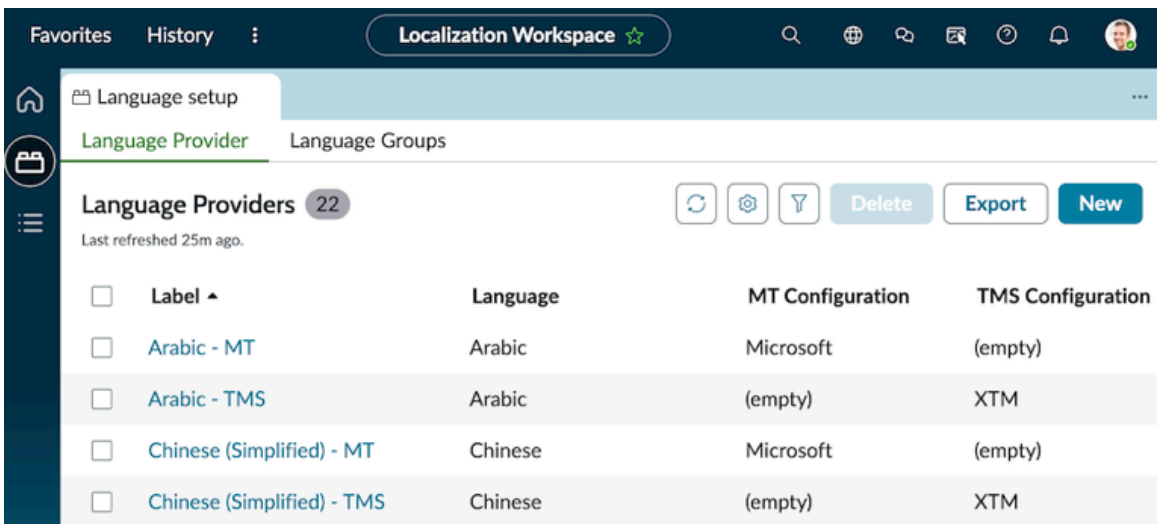
  Configure a Translation Management System if your organization uses one. See Translation Management System configurations.

- Dynamic Translation: If you use machine translation to fulfill translation requests, configure Dynamic Translation, including setting up a translator configuration. See Integration with other translation services.

4. Configure custom artifacts, if you plan to use your own artifacts in Localization Workspace. See Create and configure a custom artifact.

   Set cross-scope access privileges for your artifacts. For more information see Cross-scope privileges for Localization Workspace.

   Set Restricted Caller Access for Localization Workspace to enable access to artifact resources, if needed. The admin role is required for this step. See Restricted Caller Access for Localization Workspace.



5. Configure languages in Localization Workspace. Language providers in Localization Workspace are different from translator configurations in Dynamic Translation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: From version 3.0.0, two guided tours are available. One guided tour assists with configuring a language provider, accessible to users with the Localization administrator role (localization_admin). The other guided tour assists with configuring language groups, and is accessible to the Localization administrator role and the Localization requester role (localization_requestor). Find the guided tours by selecting the Help Center icon on the Localization Workspace Home screen.

6. Optionally provide glossaries in Language Asset Management.
7. Optionally activate the Generate Glossary skill if you intend to generate glossaries using AI. From version 4.0. See Globalization Terminology Agent.

Install Localization Workspace

You can install the Localization Workspace application (sn_lw) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed. Demo data isn't available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Localization Workspace application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Localization Workspace requires a Pro or Pro+ subscription.

Role required: admin

About this task

The following items are installed with Localization Workspace:

- Plugins
- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Localization Workspace.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Localization Workspace application (sn_lw) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.
6. **Optional:** For more information about investigating installed components, see Find components installed with an application.

What to do next

Configure the dependencies including Localization Framework, then configure Localization Workspace. For more information see Configuring Localization Workspace.

Confirm access to Settings table

As part of the configuration for Localization Workspace, confirm access to the Settings table of Localization Framework.

Before you begin

Localization Framework must be installed. It is included with Localization Workspace if not already installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin. The Localization admin role (localization_admin) can't complete this procedure.

About this task

Localization Workspace requires access to a Localization Framework table, Settings [sn_lf_setting]. The Settings table controls the ability to create and update translation projects. Confirm access using the following procedure.

Procedure

1. Navigate to **All** > **System Definitions** > **Tables**.
2. In the **Name** field, search for `sn_lf_setting`.
3. In the Table form, select the **Application Access** tab.
4. Select two check boxes: **Can read**, **Can update**.
5. Select **Update**.

Cross-scope privileges for Localization Workspace

After you create custom translation artifacts, set cross-scope privileges so that your artifacts can be accessed from Localization Workspace.

Before you begin

- Ensure that your custom artifact has a processor script which includes a method named getTranslatableContent.
- Confirm the name of the table where your custom artifact's records are stored. Also confirm the table's application scope. You can find this information in the artifact's record in [sn_lf_config]. Detailed table information can also be found in [sys_db_object].
- Set your application scope to Localization Workspace.
- Role required: admin. The localization_admin can't complete this procedure.

About this task

Your custom artifacts are located in different application scopes, so you must provide access to them from the Localization Workspace application scope. Completing this configuration makes your artifacts visible and selectable in translation requests.

For each artifact, set two entries in Cross scope privileges [sys_scope_privilege]:

1. A record for the artifact's table.
2. A record for the artifact's processor script.

The source scope for these records should be Localization Workspace.

Artifacts that are available by default don't need manual configuration of cross-scope privilege. For more information, see Types of Localizable content in Localization Workspace.

Procedure

1. Ensure that you are in the Localization Workspace application scope, and navigate to **All** > **System Applications** > **Application Cross-Scope Access**.
2. On the **Cross scope privileges** [sys_scope_privilege] list, select **New**.
   The Source Scope and Application fields are automatically set to Localization Workspace on the form.
3. On the form, fill in the fields to create a record for your artifact's table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cross scope privilege: Table

Field	Description
Target Scope	Enter the name of the application scope associated to your artifact table.
Target Name	Enter the name of the table where your artifact is stored (such as [kb_knowledge]).
Target Type	Select `Table` from the list.
Operation	Select `Read`.
Status	Select `Allowed`.

4. Select **Submit** to complete the record for the artifact's table.
5. Create another record for your artifact's Processor script by selecting **New** on **Cross scope privileges** [sys_scope_privilege].
6. On the form, fill in the fields to create a record for your artifact's processor script.

Cross scope privilege: Processor script

Field	Description
Target Scope	Enter the name of the application scope associated to your artifact.
Target Name	Enter the name of the processor script.
Target Type	Select `Script Include`.
Operation	Select `Execute API`.
Status	Select `Allowed`.

7. Select `Submit` to complete the record for the artifact's Processor script.

What to do next

You may also need to set Restricted Caller Access privileges to make restricted resources available to Localization Workspace. For more information see Restricted Caller Access for Localization Workspace.

Related topics

- Types of Localizable content in Localization Workspace
- Create and configure a custom artifact
- Create a processor script

Restricted Caller Access for Localization Workspace

Give Localization Workspace access to your content by setting Restricted Caller Access privileges. Setting these privileges is required only when target tables or scripts are restricted.

Before you begin

Set your application scope to Global.

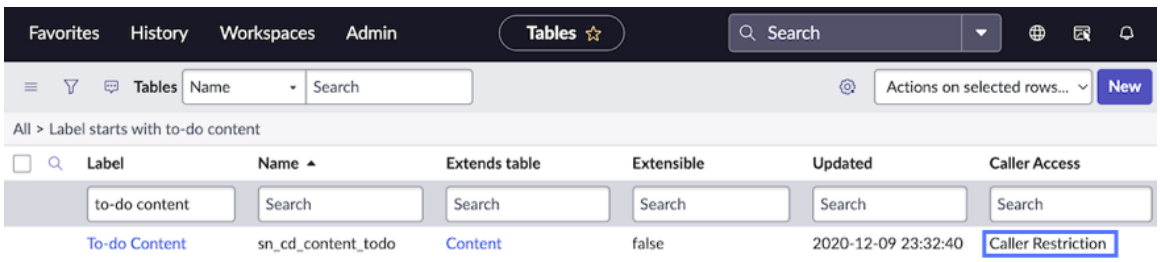
Role required: admin. The localization_admin role can't complete this procedure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Localization Workspace uses artifact records in the [sn_lf_config] table to make content types available for translation. If your target resources have Caller Restriction set, you must configure Restricted Caller Access to allow access from Localization Workspace.

Each artifact record contains two resources that might have Caller Access set to Caller Restriction:



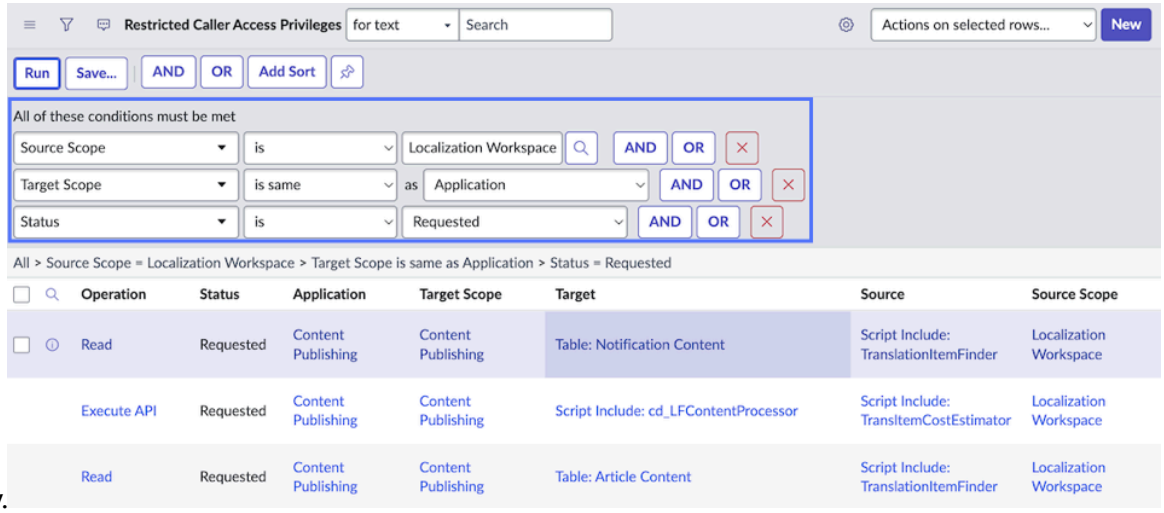
- a target table where translatable content is stored
- a Processor script which retrieves the translatable content

If you create a new (or custom) artifact but the target resource has Caller Restriction set, that artifact's content type is unavailable for selection in a Translation Request. Check whether Caller Restriction is set by querying the appropriate table, as follows.

Resource	Location to check
Artifact's table	Navigate to **System Definition** > **Tables**[sys_db_object] and search for your artifact table's name or label.
Artifact's processor script	Navigate to **System Definition** > **Script Includes**[sys_script_include] and search for the script's name.

In the list view of **Tables** or **Script Includes**:

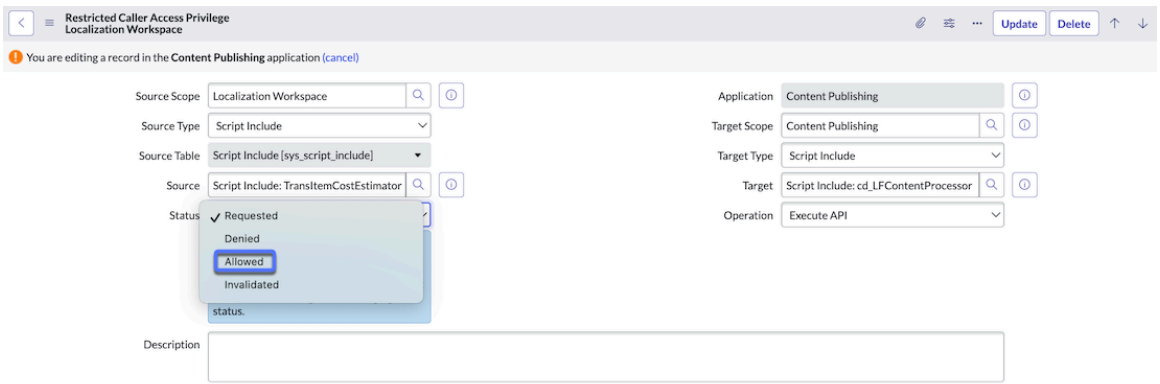
The following procedure is needed only when the **Caller Access** column has a value of `Caller Restriction`.



For further information see **Related Content** on this page.

Procedure

1. Set your application scope to Global, then navigate to **All** > **System Applications** > **Application Restricted Caller Access** [sys_restricted_caller_access].
2. In the list view of the **Restricted Caller Access Privileges** [sys_restricted_caller_access] table, open **Show/hide filter** using the icon .
3. Add the following conditions to the filter:
   - `Source Scope is` *`Localization Workspace`*
   - `Target Scope is same as Application`
   - `Status is Requested`



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Run** to execute the query.

5. In the list of results, open any record by selecting the value in the first column (by default the first column is Operation).
6. In the record's form, change the **Status** field from `Requested` to `Allowed`, then select **Update**.

> **Note:** Because most records are not in the Global application scope, you must select the link in the banner **To edit this record click here**.

7. Repeat this procedure so that all records in the list of results have a status of `Allowed`.

What to do next

Continue with setup of Localization Workspace. See Configuring Localization Workspace.

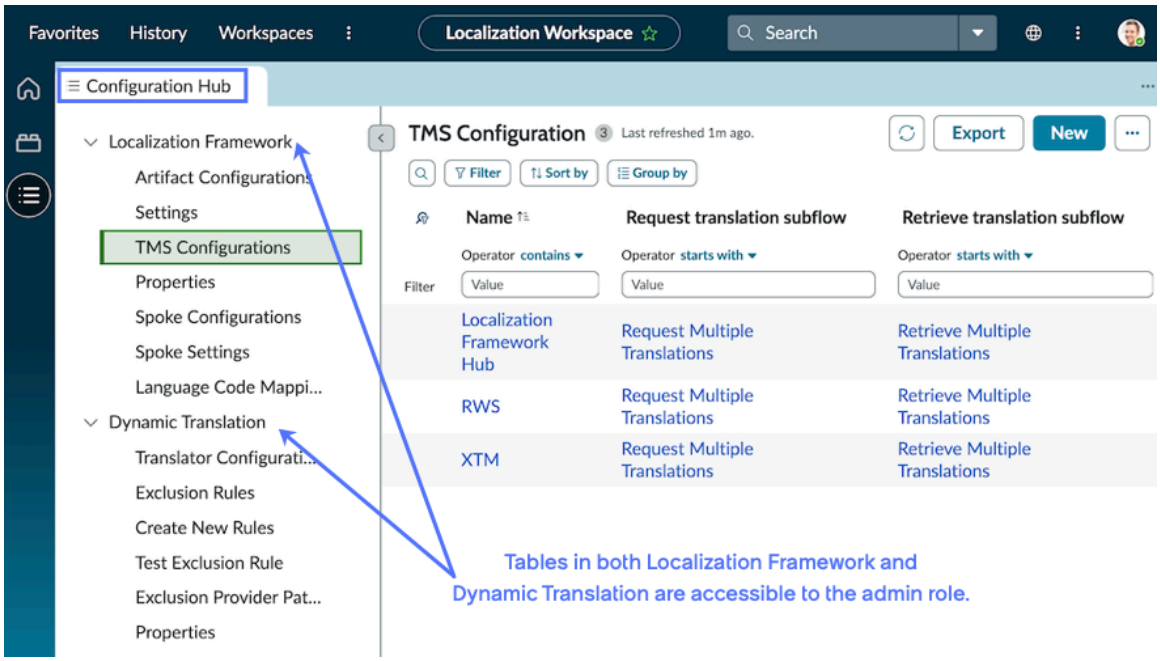
Related topics

- Application scope
- Artifact configurations
- Restricted caller access privilege settings

Configuration Hub in Localization Workspace

Configuration Hub provides centralized access to the tables and properties often used by admins. You can update the tables and properties of dependent applications such as Localization Framework without leaving the Localization Workspace interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Overview of Configuration Hub

Localization Workspace extends other ServiceNow AI Platform applications related to localization. Configuring these dependent applications is a prerequisite to working with Localization Workspace. From version 2.0.2, Configuration Hub gives admins access to tables and properties in these applications from the Localization Workspace interface.

Note: Any updates you make in Configuration Hub are saved to tables in the target application.

To open Configuration Hub:

With the localization_admin or the admin role, navigate to **All** > *Localization Workspace* > **Configuration Hub**. Alternatively, you can select the hub's icon while in the workspace. The navigation pane within Configuration Hub lists applications and their components. Select the name of a component to open its table in a workspace pane.

Note: In Configuration Hub, Dynamic Translation is displayed to the admin role only. The localization_admin role can't view Dynamic Translation.

Localization Framework

The following components of Localization Framework are available to the localization_admin or admin role, from Localization Workspace.

- Artifact configurations (the content types in Localization Workspace are built upon artifacts).
- Settings.
- TMS Configurations (required only if you use a TMS as your translation service provider).
- Properties (visible to the admin role only).
- Spoke Configurations (used for the hub and spoke architecture).
- Spoke settings (used for the hub and spoke architecture).
- Language Code Mappings (may be required if you use a custom third-party translation service).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic Translation

Dynamic Translation is required to use machine translation on your instance. The following components of Dynamic Translation are available to the admin role, from Localization Workspace.

- Translator Configurations.
- Exclusion Rules.
- Create New Rules.
- Test Exclusion Rule.
- Exclusion Provider Pattern.
- Properties.

Guided Setups are also available to the admin role, to outline the initial process of configuring Localization Workspace and its prerequisites. Navigate to **All** > *Localization Workspace* > *Localization Framework* **Guided Setup** or *Localization Workspace* **Guided Setup**.

Language Asset Management

Enhance localization in your instance with Language Asset Management in Localization Workspace. You can upload glossaries to Language Asset Management for editing and storage.

Glossaries in Language Asset Management

From version 3.0.0, the Language Asset Management area of Localization Workspace enables you to upload glossaries, which are lists of terms with translations that you provide. Each source term in a glossary can have translations into multiple languages. You can create multiple glossaries. In the Australia release, glossaries are available for storage and editing only.

From version 4.0, you can use an AI skill to generate a glossary of terms derived from Knowledge Base articles. For information see Globalization Terminology Agent.

When planning your glossary assets, consider the following points.

- You can have more than one glossary in Language Asset Management, so you can organize your glossaries according to business unit, function, or locale.
- Each glossary can be subdivided or filtered using the Product/Service category.
- One source term can be listed under different Product/Service or Part of Speech categories. A source term repeated in two different categories is considered to be two different records. Different translations can be assigned to each occurrence of the term per category. This enables a term to be translated differently depending on the context.
- Translations assigned to source terms can be provided for any language listed in the sys_language table, including self-localized languages.
- The included spreadsheet template (ServiceNow_Glossary_Template.xlsx) must be used with the upload method for creating glossaries. For details see Upload glossaries to Language Asset Management.
- Any editing or modification to the contents of existing glossaries can be done in the UI. For details see Edit a glossary in Language Asset Management.
- You can download your glossaries from version 3.1.0. For more information, see Export a glossary from Language Asset Management.
- There is no upper limit to the number of rows in a glossary, but the general guideline is for each glossary to have between 50 and 1500 rows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the spreadsheet template for the upload method, columns are provided for all languages supported by ServiceNow AI Platform in the sys_language table. You don't need to provide translations for all languages. Clear out (leave blank) all values for any languages you don't plan to use. You can upload glossary translations for languages that are active = false in sys_language, but inactive languages are not available for translation workflows.

You can include self-localized languages when uploading glossaries with the spreadsheet template. Create additional columns in the spreadsheet template for self-localized languages. For the label in the header row of the spreadsheet, use codes from the ID column of the sys_language table for the corresponding languages.

Note: With the following supported languages, the import transform handles mapping of the spreadsheet's language code to the ID code in sys_language. Do not modify or update the header row of the spreadsheet template for these languages.

- Brazilian Portuguese
- French - Canada
- Traditional Chinese

To activate languages in sys_language, install language plugins. To self-localize an unsupported language, see Create a language record.

Globalization Terminology Agent

Generate a glossary of terms based on your English-language Knowledge Base articles. Use the glossary of terms to enhance language governance, quality, and consistency across the platform. Available from version 4.0 of Localization Workspace.

Overview of the Globalization Terminology Agent

The Globalization Terminology Agent uses the generate glossary skill to analyze your Knowledge Base content and create a suggested English glossary. The generate glossary skill identifies and extracts key terms, generates definitions for the terms, and enables you to edit or remove terms before approval.

After approval your glossary is published to the list of glossaries in the Language Asset Management section of Localization Workspace.

The generate glossary skill is located in the AI Admin Hub. It can also be accessed from AI Skill Kit.

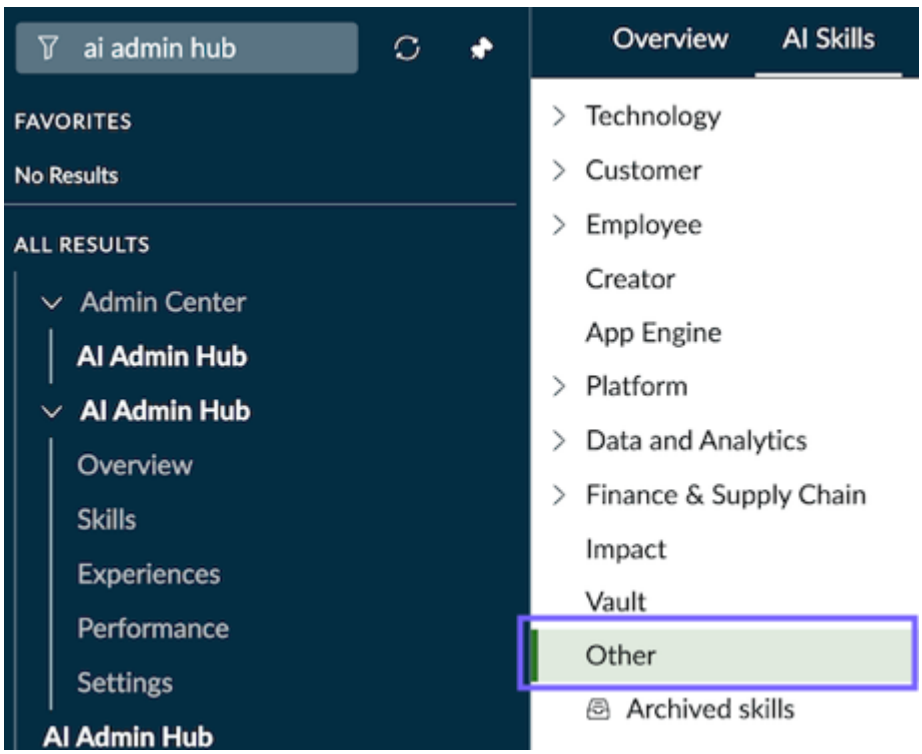
Benefits of the Globalization Terminology Agent

The Globalization Terminology Agent offers these benefits.

- Save time and manual effort during glossary creation.
- Review, edit, and approve the terms and their definitions before publishing.
- Update the glossary in Language Asset Management after creation, including adding translations into non-English languages.
- Export the glossary to share with stakeholders.

Prerequisites and conditions

The following prerequisites and conditions apply.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Only KB articles labeled as English in the Knowledge Base are included in the search. For information see Knowledge Center.
- Accessing and working with glossaries in Language Asset Management requires the Terminology Manager role (sn_lw.terminology_manager) with the Localization user role (sn_lw.user).
- The generate glossary skill must be activated in AI Admin Hub. After the skill is activated, the **Create Glossary** button becomes visible in Language Asset Management.

Other considerations

The maximum word count for scanning defaults to 25,000. The count of words does not map exactly to the number of tokens used. The wizard provides the option to limit retrieved articles by date range, minimum view count, and whether authored by the current user.

Activating the generate glossary skill

The generate glossary skill is included from version 4.0 of Localization Workspace, but it must be activated. The general procedure for activation of this skill is as follows.

1. Navigate to AI Admin Hub > Skills.
2. In the navigation panel of the AI Skills tab, select the category **Other**.
3. Select the **Available** tab and locate the **Generate Glossary** skill name.
4. Select **Activate skill** to turn on this skill.

For further information see AI Admin Hub and Activate an AI skill. Some configurations can be made to the skill in AI Skill Kit.

Create a glossary using AI

In Language Asset Management, generate a glossary containing terms extracted from Knowledge Base articles. The Globalization Terminology Agent uses an AI skill to scan your article content and create a list of suggested terms and definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Activate the generate glossary skill. For information, see Activate an AI skill.

Confirm the articles you want included in the scan. Articles must be labeled as English language and published in the Knowledge Base. For information see Knowledge Center.

Role required: sn_lw.terminology_manager (default)

About this task

The following procedure is divided into two broad stages:

- First, a search retrieves a list of possible knowledge articles. You can select articles from this list.
- Next, the generate glossary skill analyzes your selected articles to extract suggested terms and definitions. You can review and edit the suggestions.

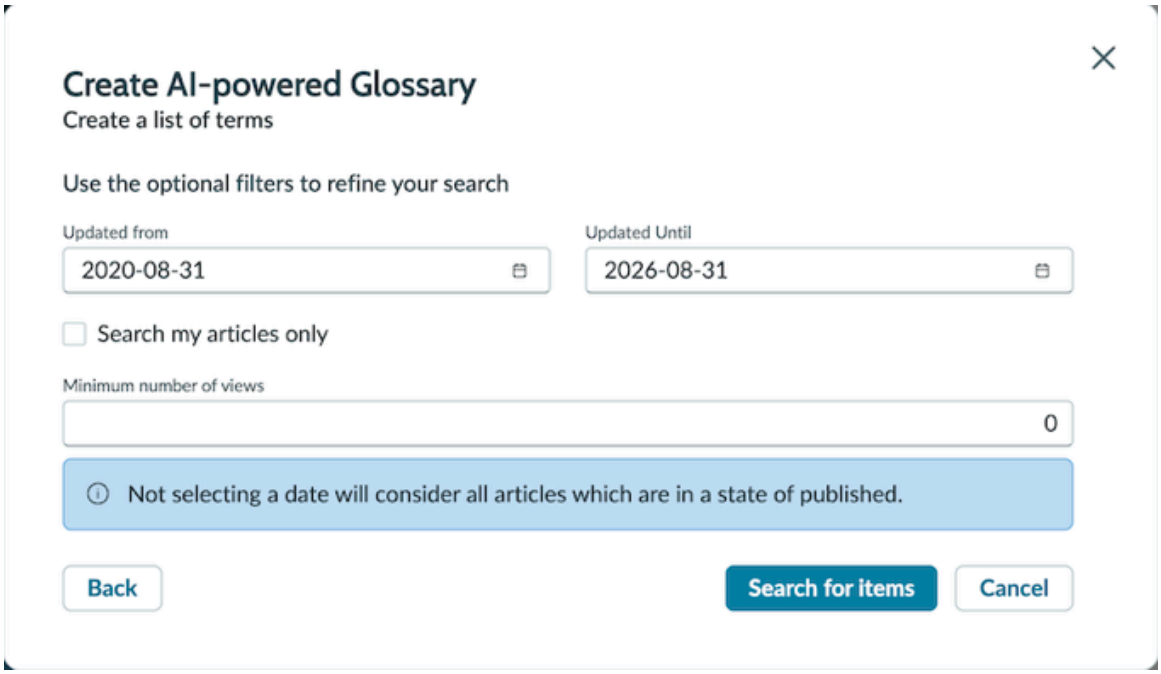
Both stages may take some time, depending on the count of articles and words. When each stage finishes the system sends an email to let you know that the results are ready for your review.

Procedure

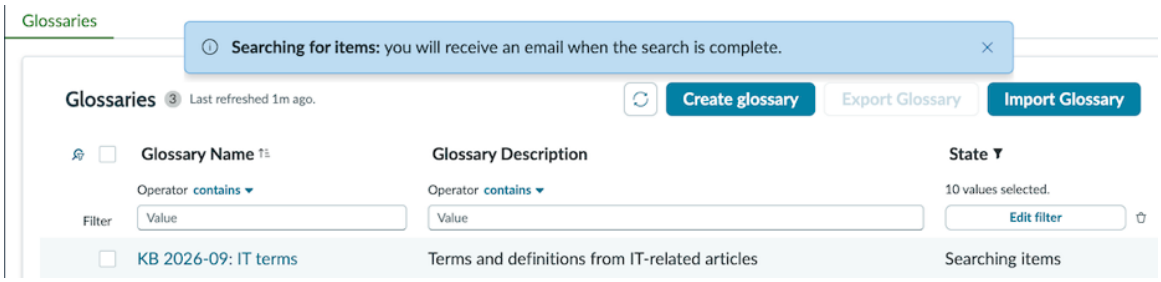
1. Navigate to **All** > *Localization Workspace* > **Language Asset Management**.
2. With the Glossaries tab open, select **Create glossary**.

   Note: This button is available only when the generate glossary skill has been activated.

3. In the **Create AI-powered Glossary** modal window, enter a unique name for your glossary and (optionally) a description.



4. Select **Next**.
5. **Optional:** In the **Use the optional filters to refine your search** step, you can adjust the following filters to limit the KB articles retrieved.



Option	Description
Updated from	You can choose a date range using the calen dar picker or by entering specific dates. ○ This limits the articles by the Updated date in the Knowledge [kb_knowledge] table. ○ If you don't apply a date filter, all published articles are candidates.

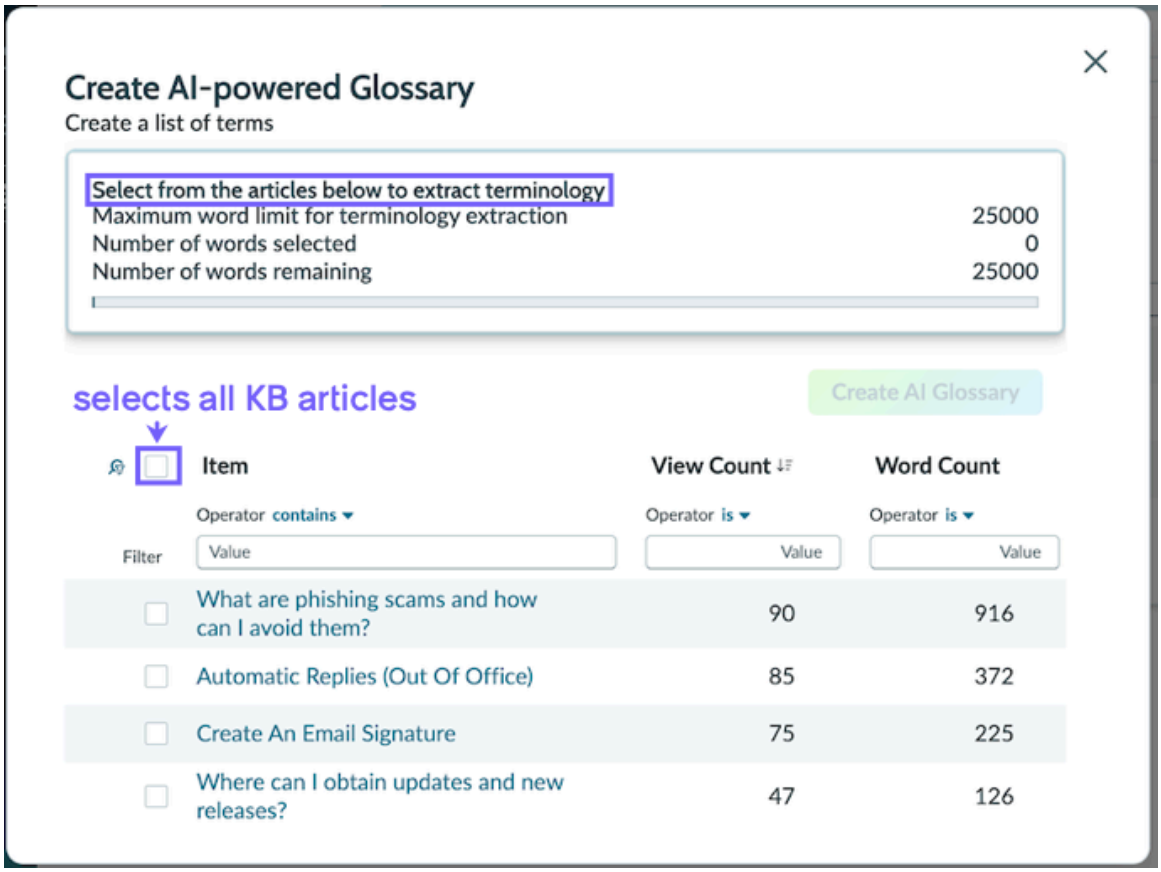
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

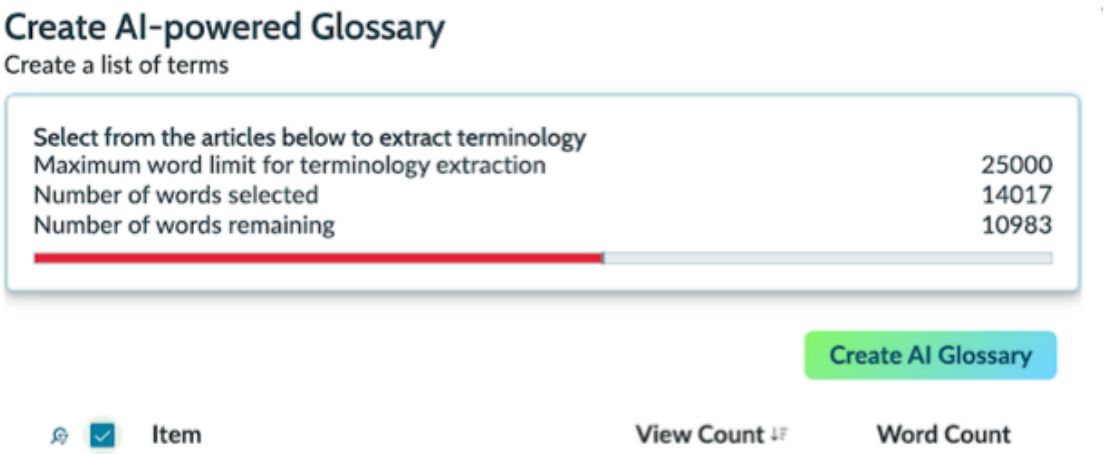
Option	Description
Search my articles only	When the check box is selected (checked), the search retrieves only articles authored by the current user.
Minimum number of views	You can enter a view count number. The search retrieves only articles with a view count greater than or equal to this number. (Optional) The default of 0 (zero) means that the search also retrieves articles that have never been viewed.

6. Select **Search for items** to retrieve KB articles.



The **Create AI-powered Glossary** modal window closes during the retrieval of KB articles. The search may take some time, so the system sends you an email when finished.

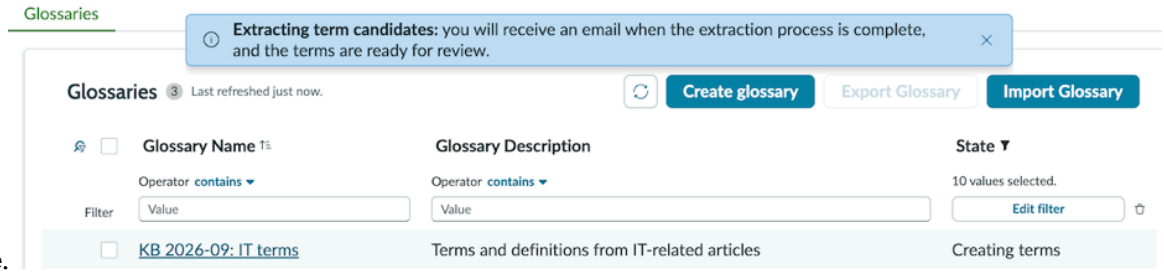
- In the list of Glossaries, the State of your glossary displays as **Searching items** while searching.
- The State changes to **Items available for selection** when the search is finished and the list of KB articles is ready.



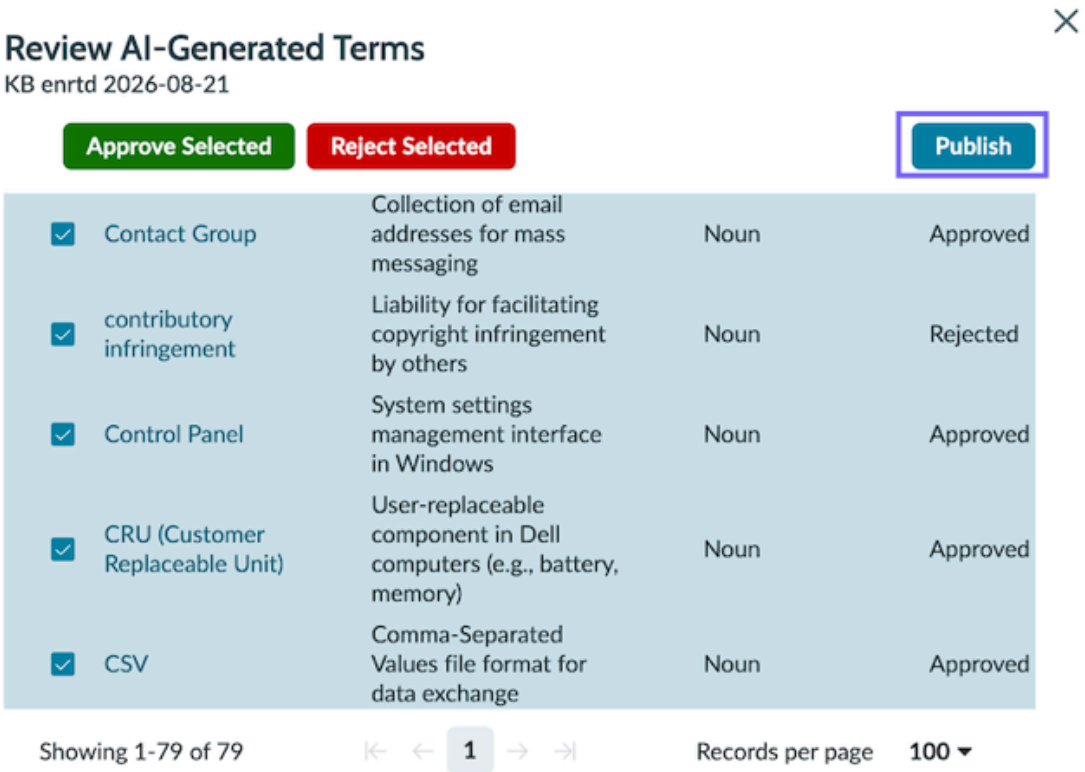
7. Select the name of your glossary from the list when its State has changed to **Items available for selection**.
8. In the **Create AI-powered Glossary** modal window, choose articles for scanning by selecting their check boxes in the Filter column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: You can bulk select all articles with the **Select all rows** check box in the header. You can also filter articles by terms in the article title, by view count, or by word count, using the column filter row.



9. **Optional:** Adjust the articles you select according to the maximum word limit for terminology extraction.
   The default maximum word limit for scanning is 25,000. The modal window provides a running total of words based on the articles you have selected, and also the remaining balance.



10. Select **Create AI Glossary**.
    The Create AI-powered Glossary modal window closes during the process of analysis. The State of your glossary displays as **Creating terms** in the Glossaries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

list. A banner informs you that you will receive an email when the process is complete.

11. When the email arrives and the State of your glossary changes to **Terms available for approval**, select the Glossary Name to open the **Review AI-Generated Terms** modal window. Initially all terms display **Pending Review** in the Status column.
12. **Optional:** Edit values in the Term, Definition, or Part of Speech columns by double clicking the text, modifying, then selecting **Apply**.
13. **Optional:** Reject rows by selecting their check boxes, then selecting **Reject Selected**. The Status changes to `Rejected`. Rejected rows aren't included in the final glossary. If all rows are rejected, the **Publish** button disappears.
14. Approve rows by selecting their check boxes, then selecting **Approve Selected**. Only approved rows are included in the published glossary. The Publish button appears when at least one row is approved.
15. Select **Publish** to finalize.

The Status of your glossary changes to **Completed**.

Result

Your published glossary is listed in the Glossaries table in Language Asset Management. You can access the list of terms from the Glossary Sources tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

You can modify your glossary, including adding translations to the terms. For information see Edit a glossary in Language Asset Management.

You can export your glossary for review by stakeholders. For information see Export a glossary from Language Asset Management.

Upload glossaries to Language Asset Management

Upload glossaries to the Language Asset Management area of Localization Workspace. Create a glossary by entering source terms and translations in the provided spreadsheet template, then uploading the completed spreadsheet to Language Asset Management.

Before you begin

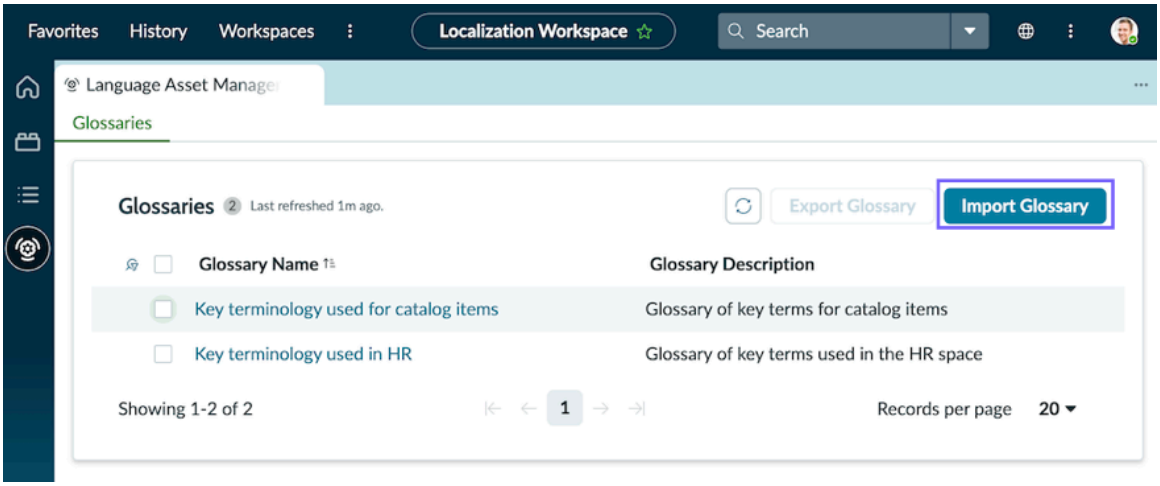
- Confirm that the Languages [sys_language] table in your instance contains an ID for every language that you plan to include in your glossary. Language IDs should be compliant with BCP 47. For more information and links see Language Asset Management.
- You must be able to work with and save files in the Excel Workbook (.xlsx) file format. This file format supports the UTF-8 encoding that is needed for special characters and non-alphabetic writing systems.
- Role required: sn_lw.user. From version 3.1.0, both the sn_lw.user and the sn_lw.terminology_manager roles are required.

About this task

From version 3.0.0, the Language Asset Management area of Localization Workspace enables you to upload glossaries for editing and storage.

- Glossaries consist of source terms and their translations. Each source term can have translations into one or more languages.
- After you initially create a glossary by uploading a spreadsheet, you can make updates or add new terms in the product UI. See Edit a glossary in Language Asset Management.
- The same source term can be listed in multiple glossaries. A source term repeated in two different glossaries is considered to be two different records, with different translations possible.

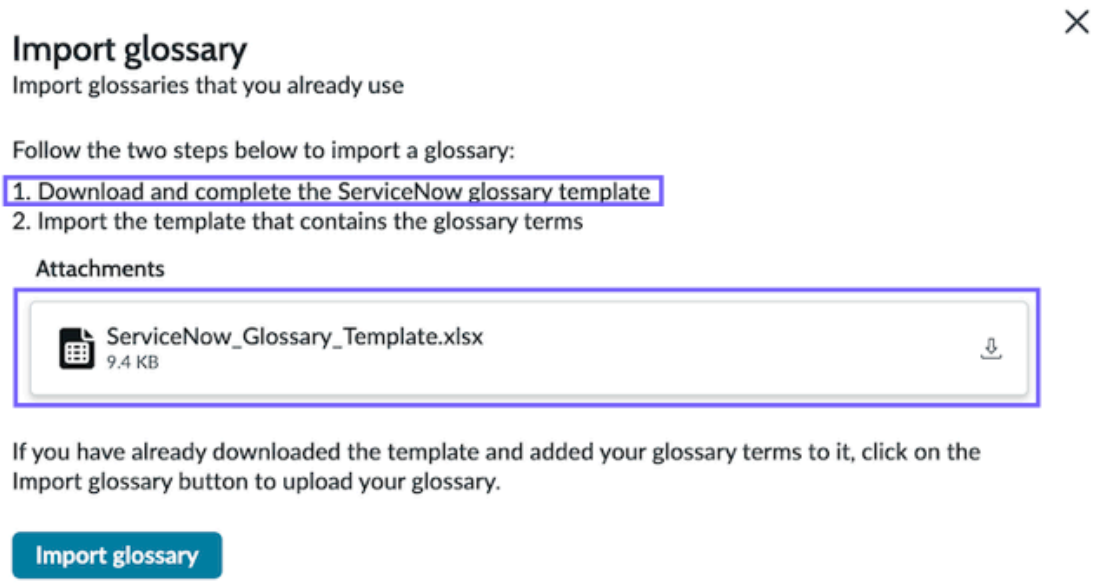
  Similarly, a source term can be repeated in one glossary if assigned to different categories within that glossary (Product/Service or Part of Speech). Repeated source terms are considered to be two different records, with different translations possible.



For information about using an AI skill to generate a glossary, see Globalization Terminology Agent (from version 4.0).

The following procedure involves downloading an Excel Workbook (.xlsx) spreadsheet template, filling it out, and uploading the completed file to your instance. Some of the columns have drop-down selections, as noted in the table in the procedure. For these columns, you must choose a value from the drop-down selection.

Procedure



1. Navigate to **All** > *Localization Workspace* > **Language Asset Management**.
2. Select **Import Glossary**.

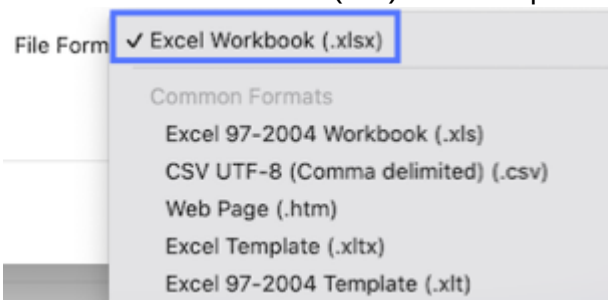
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you have a completed spreadsheet ready to upload, skip to the next **Import glossary** step in this procedure.

3. In the **Import glossary** modal window, select the **ServiceNow_Glossary_template.xlsx** attachment and download it.

4. Using one row for a source term and its translations, and using drop-down selections where applicable, fill in the spreadsheet according to the following guidance.

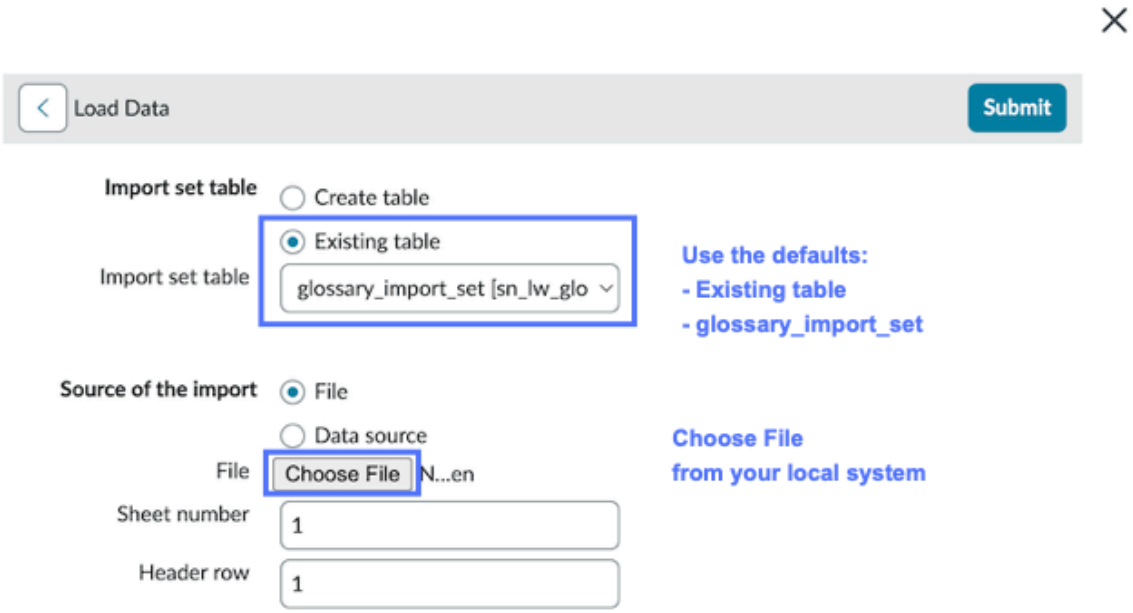
Column	Value
glossary_name	This is displayed as **Glossary Name** in the UI. Each row should have a value in the glossary_name column.
glossary_description	(Optional). Enter a description of the glossary. This value is displayed as **Glossary Description** in the UI.
product_service	This is displayed as **Product/Service** in the UI, and is a way to filter or subdivide a glossary. Use this if a source term has different translations depending on the Product/Service.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

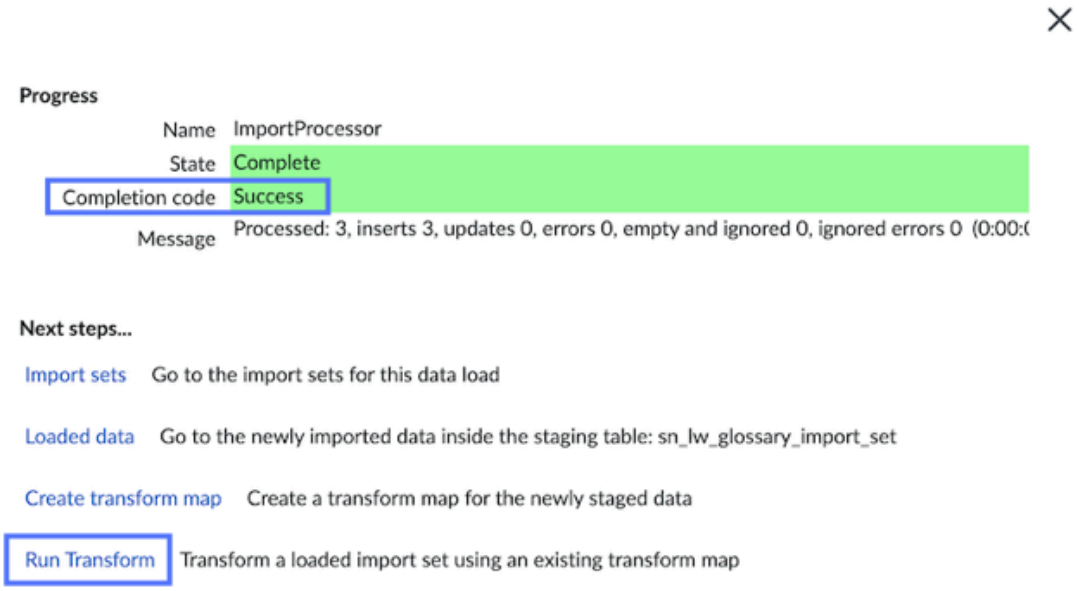
Column	Value
	Note: The same source term can be listed multiple times in one glossary when associated to different product_service values.
term	Enter the source term (the original word or phrase). Terms can contain spaces, special characters, and punctuation marks. Source terms can be written in languages other than English. However, translation requests in Localization Workspace must be from English to non-English languages. You can enter the same source term multiple times, but each variation must be assigned to either a different Part of Speech or a different Product/Service category.
definition	The definition for the source term.
part_of_speech	This is a drop-down selection in the template. Choose from noun, verb, and so forth. **Note:** The same source term can be listed multiple times in one glossary when associated to different part_of_speech values.
do_not_translate	This is a boolean drop-down selection in the template. Choose TRUE when terms shouldn't be translated.
source_language	This is a drop-down selection in the template. Choose the language ID of the source term.
(language ID codes)	Enter the translations in the same row as the source term. The template contains columns for each language supported in the platform. The column headers are BCP 47 language ID codes. ○ You can enter non-alphabetic terms and special characters. ○ You can leave values blank. ○ Clear the cell contents for any values you don't want applied to your glossary. This includes placeholder values such as "Translation1". You can add you own columns for self-localized languages. If you create a column, use

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



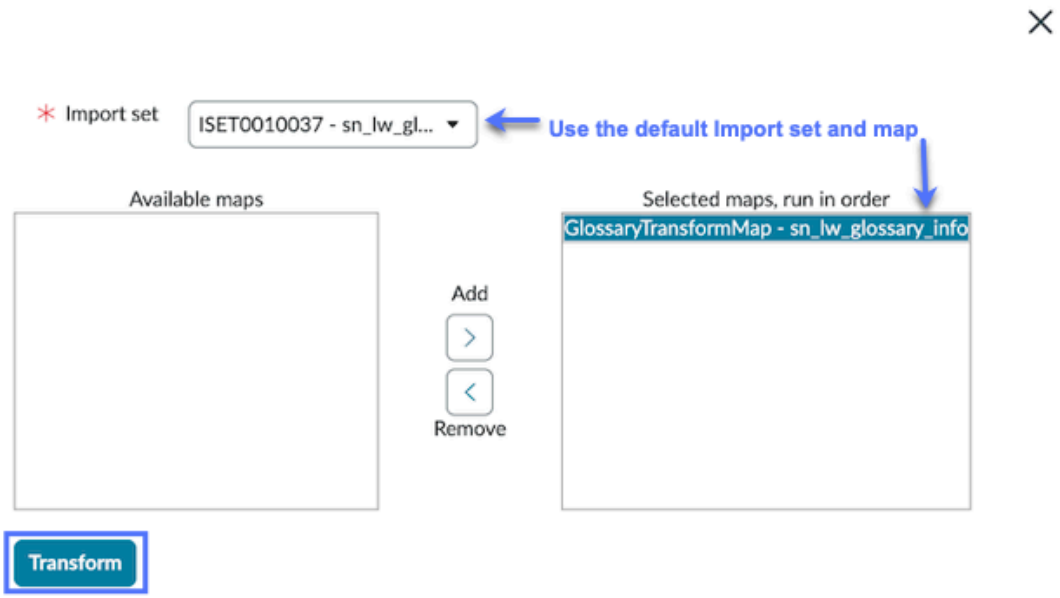
Column	Value
	only language ID codes that exist in your sys_language table as the column headers.

5. Save your completed spreadsheet in the Excel Workbook (.xlsx) format only, not other formats such as Comma delimited (.csv) or Strict OpenXML Spreadsheet (.xlsx) format.



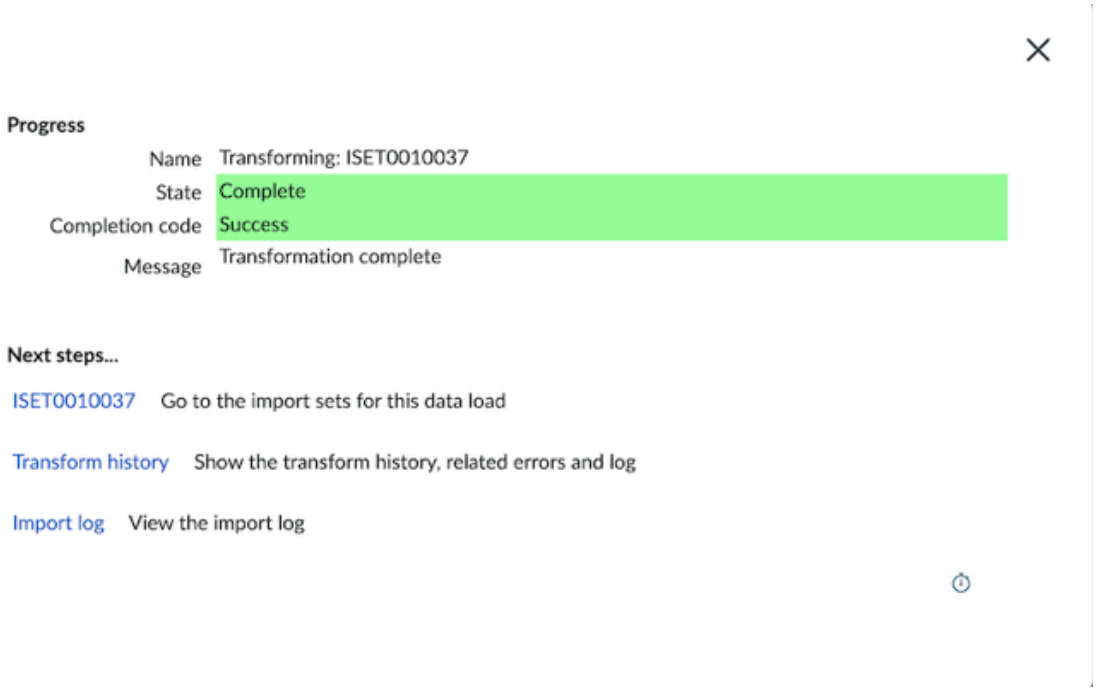
Because the value in the glossary_name column is used to label and organize your glossary in Language Asset Management, the spreadsheet's filename is unimportant.

6. In Language Asset Management, select **Import Glossary** to open the modal window.
7. On the modal window, select **Import Glossary** again.
8. On the **Load Data** window: use the default settings (Existing table = glossary_import_set and Source of the import = File), and select **Choose File**.



9. After choosing the completed spreadsheet file, select **Submit**.
10. When the **Progress** window displays Completion code: Success, select the **Run Transform** link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. At the **Specify Import set and Transform map** window, keep the default Import set and selected map (GlossaryTransformMap), then scroll down to select the **Transform** button.

12. **Optional:** You can view the import set, Transform history, or Import log by selecting the appropriate link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your new glossary appears in the list on the Glossaries tab of Language Asset Management.

What to do next

To add or edit source terms, or make any modifications after the initial upload, see Edit a glossary in Language Asset Management.

To download glossaries in a CSV or spreadsheet format, see Export a glossary from Language Asset Management.

Edit a glossary in Language Asset Management

Edit the contents of your glossary in Language Asset Management. Modify existing terms and translations or add more.

Before you begin

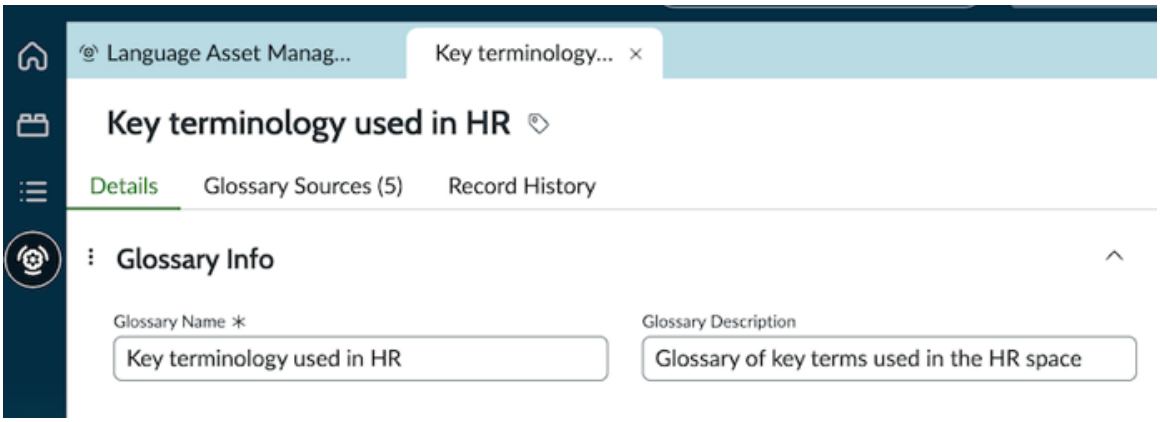
- First, create a glossary. You can use the upload method with the spreadsheet template provided in Language Asset Management. See Upload glossaries to Language Asset Management. Alternatively, you can Create a glossary using AI (from version 4.0).
- Role required: sn_lw.user. From version 3.1.0, both the sn_lw.user and the sn_lw.terminology_manager roles are required.

About this task

Initially you create a glossary in Language Asset Management by uploading a spreadsheet template or by generating with AI. After glossary creation, you can make the following modifications directly in the UI, using the procedure on this page:

- Add or edit source terms, including details (example: Part of Speech category).
- Add or edit translations of source terms.

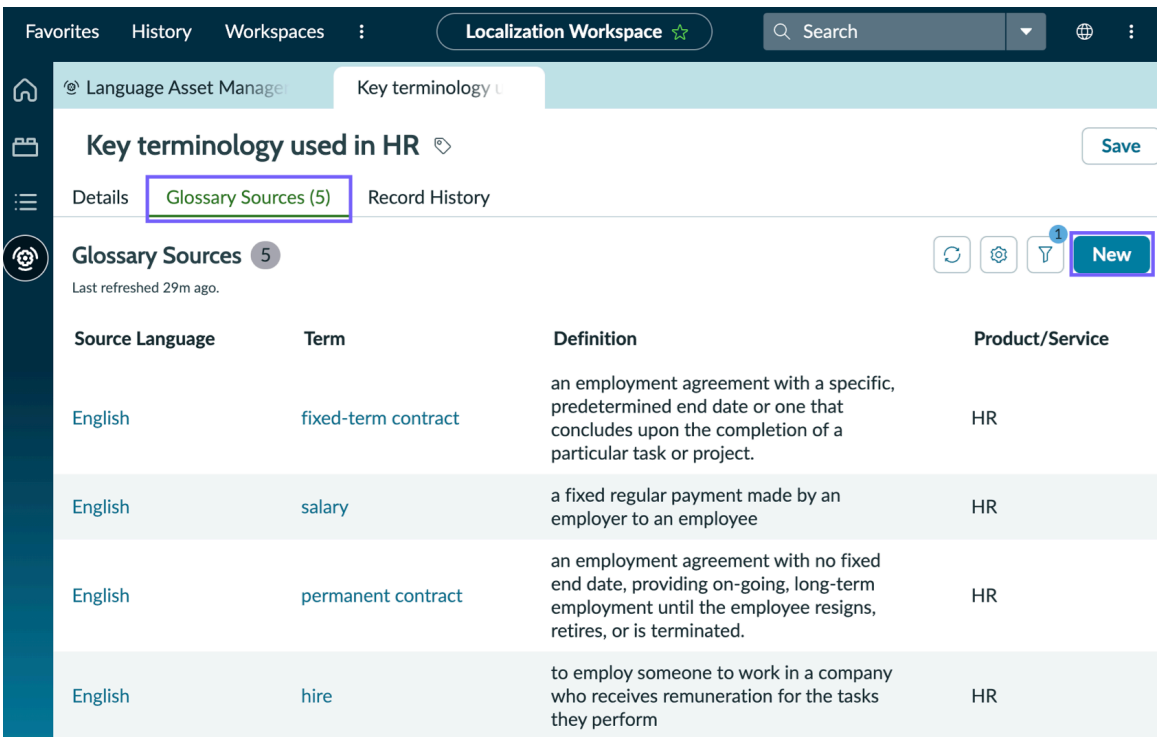
Note: The same source term may be repeated in a glossary if assigned to different Part of Speech or Product/Service categories. A source term repeated in two different categories is considered to be two different records. Any changes you make to a source term in one category aren't propagated to the same source term in other categories.



The following video demonstrates how to add a translation to a source term.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

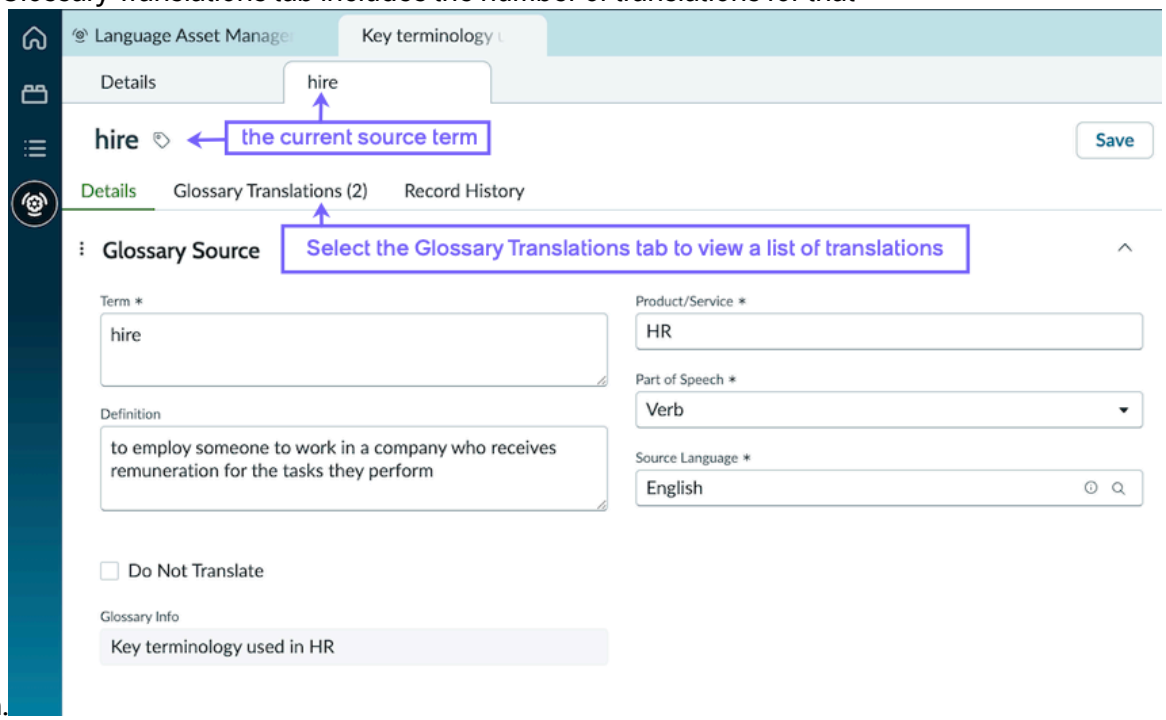
https://player.vimeo.com/video/1209754159?h=f53334e9c1&badge=0&autopause=0&player_id=0&app_id=58479



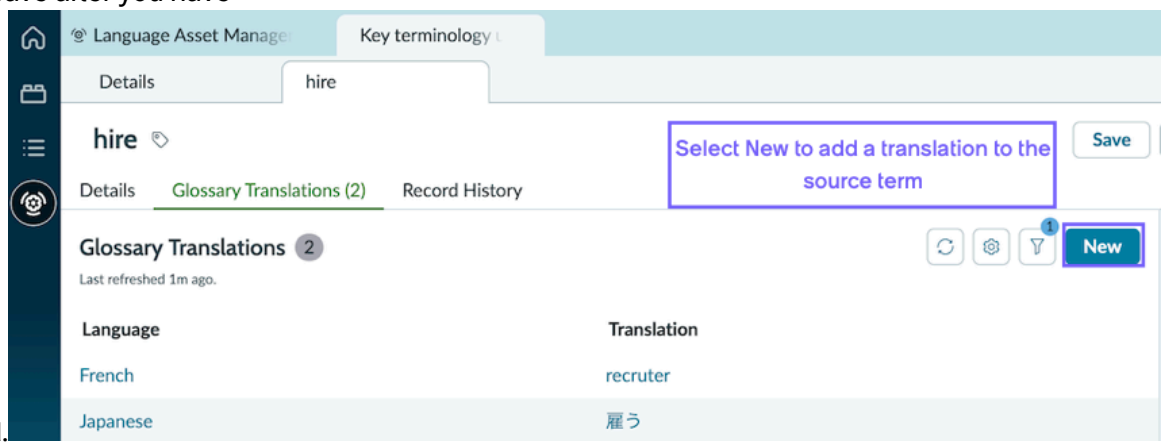
Procedure

1. Navigate to **All** > *Localization Workspace* > **Language Asset Management.**.
2. On the Glossaries tab, select your glossary from the values in the **Glossary Name** column.
3. From your glossary's default tab (**Details**), select the **Glossary Sources** tab to open a list of source terms.

4. To open information about a particular source term, select its value in the **Term** column.



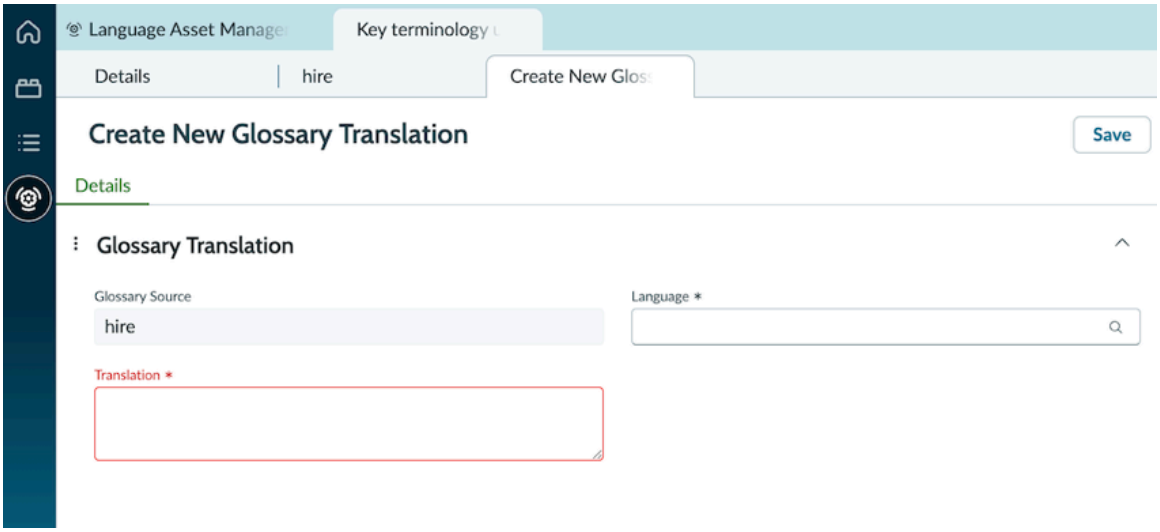
> **Note:** Because it's possible to have the same source term in different Part of Speech or Product/Service categories, be sure to select the desired source term.



5. **Optional:** On the source term's Details tab, modify any values (such as Definition, Product/Service, Part of Speech, or Source Language) then select Save.
6. Select the **Glossary Translations** tab to open a list of all translations for your source term.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Glossary Translations tab includes the number of translations for that term.



7. **Optional:** If you want to modify a translation: on the Glosssary Translations list, select the value in the Translation column to open a tab for the individual translation.
   Select Save after you have finished.

8. **Optional:** To add another translation for your source term, select New on the Glossary Translations list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. **Optional:** To add a source term to an existing glossary, select New on the Details tab of the glossary.

Adding a Source Term to your existing glossary

Field	Value
Term	Enter the source term (the original word or phrase). Terms can contain spaces, special characters, and punctuation marks. (Optional) Source terms can be written in languages other than English. However, translation requests in Localization Workspace must be from English to non-English languages. You can enter the same source term multiple times in a glossary. However, each variation must be assigned to either a different Part of Speech or a different Product/Service category.
Definition	The definition for the source term.
Product/ Service	You can filter or subdivide your glossary using this category. **Note:** The same source term can be listed multiple times in one glossary when associated to different Product/Service values. A source term repeated in two different Product/Service categories is considered to be two different records, with different translations possible.
Part of Speech	This is a drop-down selection. Choose from noun, verb, and so forth. **Note:** The same source term can be listed multiple times in one glossary when associated to different Part of Speech values. A source term repeated in two different Part of Speech categories is considered to be two different records, with different translations possible.
Source Language	This is a drop-down selection. Choose from among the languages installed on your instance.
Do Not Translate	This is a Boolean check box. The default is unchecked (cleared). Select this check box when the term shouldn't be translated.
Glossary Info	This read-only field confirms the name of the current glossary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: The same source term can be listed in more than one glossary. A source term repeated in two different glossaries is considered to be two different records, with different translations possible. To create a separate glossary, see Upload glossaries to Language Asset Management or Create a glossary using AI.

What to do next

You can delete a source term and its translations by selecting Delete from More Options ooo on the source term's Details tab.

You can also delete a translation from a source term using Delete from More Options ooo on the translation's Details tab.

You can export your glossaries. For information, see Export a glossary from Language Asset Management.

Export a glossary from Language Asset Management

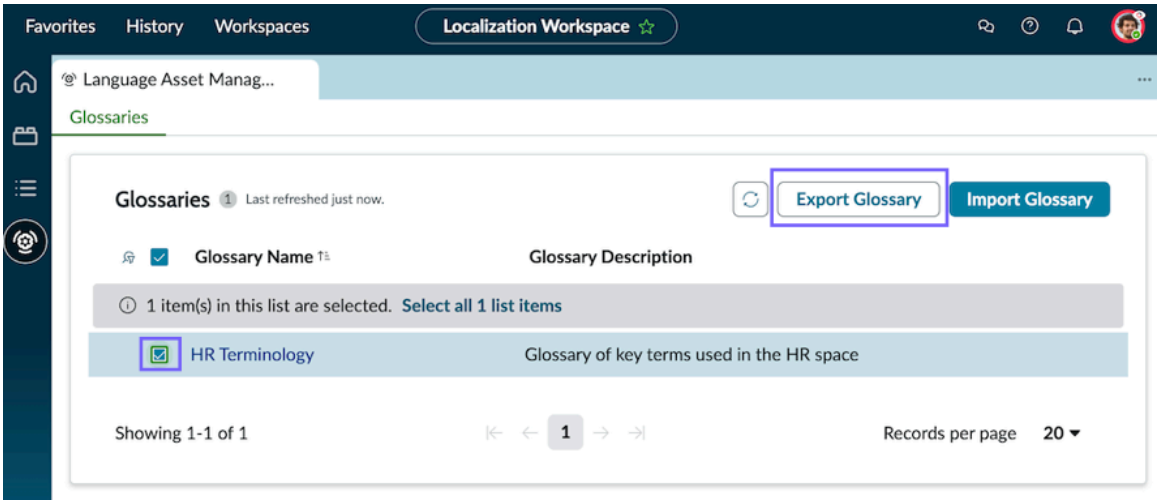
Download your glossary as a CSV or spreadsheet file to share with stakeholders, reviewers, or third-party translation service providers.

Before you begin

- Requires Localization Workspace version 3.1.0 or later.
- Roles required: both sn_lw.user and sn_lw.terminology_manager.

About this task

If you plan to export a glossary to a CSV (comma-separated values) file, confirm that your local settings support non-ASCII characters.



Translations into custom (self-localized) languages can't be exported. Only glossary translations into default supported languages can be exported using this method.

Glossaries can be exported regardless of source (upload method, or generated using AI).

Procedure

1. Navigate to **All** > *Localization Workspace* > **Language Asset Management**.
2. Select the **Glossaries** tab in Language Asset Management.
3. In the list view of Glossaries, select the check box of the glossary that you want to export.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip: You can select all available glossaries using the check box in the header row at **Glossary Name**.

4. Select **Export Glossary** to open the Export modal window.
5. Select either CSV or Excel at the drop-down **File Type** field.

6. Select **Export**.

Language setup in Localization Workspace

Language setup enables you to flexibly configure target languages and their third-party translation service providers. When your users create translation requests, they can select the languages and providers you have configured.

Note: From version 3.0.0, two guided tours are available. One guided tour assists with configuring a language provider, and is accessible to users with the Localization administrator role (localization_admin). The other guided tour assists with configuring language groups, and is accessible to the Localization administrator and the Localization requester role (localization_requestor). Find the guided tours by selecting the Help Center icon on the Localization Workspace Home screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to **All** > **Localization Workspace** > **Language setup**. The **Language Provider** tab opens by default, or you can select the **Language Groups** tab.

Roles in Language setup:

- The localization_admin role is required to create or edit a Language Provider.
- The sn_lw.user role can view Language Provider records, but can't create or edit them.
- The sn_lw.user role can create Language Groups by selecting from existing Language Providers.

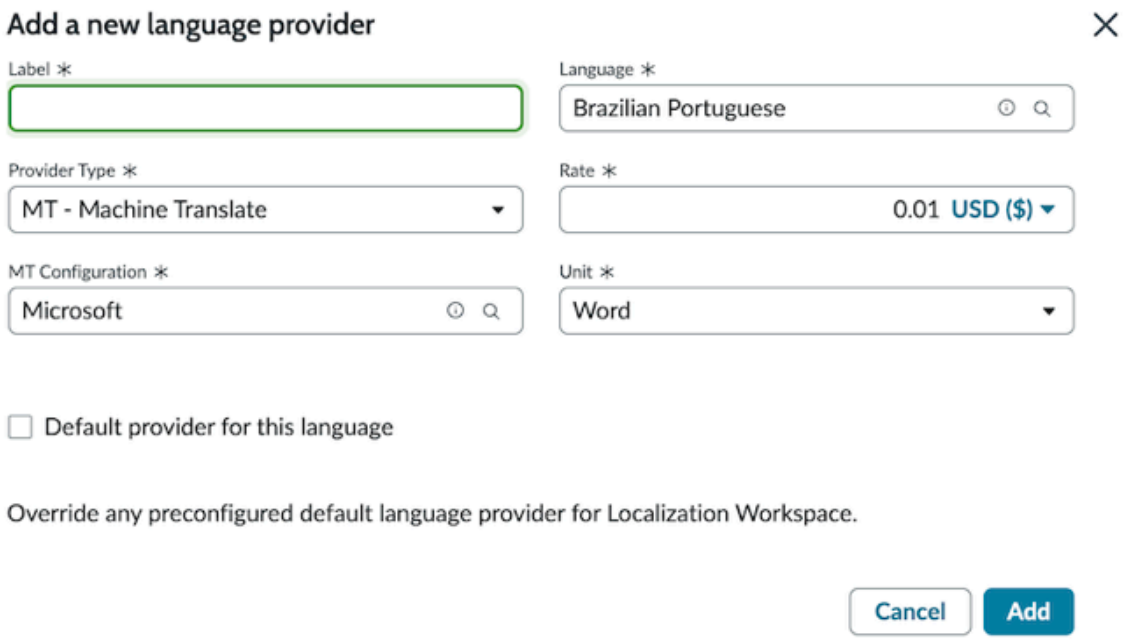
Configure a language provider

Set up language providers as part of configuring Localization Workspace. For each target language you can configure multiple providers with their pricing.

Before you begin

- Install at least one target non-English language on your instance.
- Configure at least one Translation Management System (TMS) in Localization Framework, or one machine translator configuration in Dynamic Translation. From version 2.0.2, you can access these tables in Configuration Hub in Localization Workspace
- Role required: localization_admin. The sn_lw.user role can view the language providers but can't create any.

About this task



In Localization Workspace, a language provider is a record that combines:

- a third-party service provider (such as a TMS or machine translation API)
- a target language
- a rate per unit (the price your third-party service provider charges per word or character translated)

The language provider record provides granular control over the execution of each task in your translation project, and supports the possibility of more than one service provider per target language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This record also enables the calculation of the informational cost

estimate.

Note: From version 3.0.0, a Guided Tour is available to assist localization admins with the setup of a language provider. Access the guided tour by selecting the Help Center icon on the Home screen.

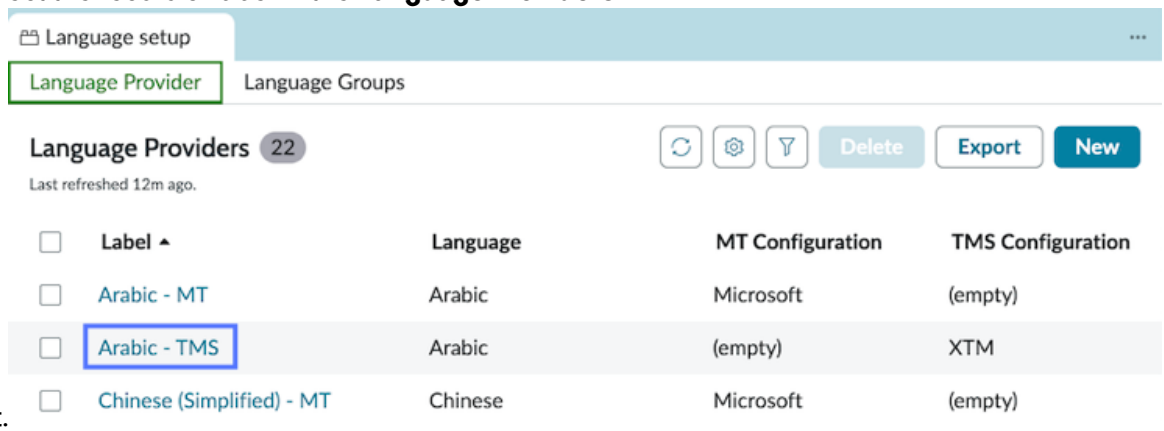
Procedure

1. Navigate to **All** > *Localization Workspace* > **Language setup** > **Language Provider**.
2. Select **New**.
3. In the **Add a new language provider** window, enter the following information.

Field	Value
Label	Enter a descriptive name. This label is dis played in the **Language Providers** list.
Language	Enter a language. You can search from among the languages you have configured on the in stance.
Provider Type	From the list, choose TMS (Translation Man agement System) or MT (Machine Transla tion). These provider types are available after you preconfigure them on your instance.
Rate	Enter the base rate charged by your third-par ty service provider per word or character, with out any volume discounts or overages. For more information see Request translations in Localization Workspace: Estimate and Due Date. You can choose a currency that is not in your user preferences. However, the informational cost estimate is displayed in the currency of the translation requester's user session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	This rate is used to calculate the informational cost estimate. **Note:** When displayed on the Home page of Localization Workspace, the **Cost** uses a rate that is rounded up to the decimal place that is set in your **Display Value Currency** field. However, the calculation of the informational cost estimate for a translation request uses the actual rate that you have configured in Localization Workspace. The calculation does not use the currency's display value. For more information, see Identify the FX Currency field and its display parameters.
TMS (or MT) Configuration	This field is dependent on your selection for **Provider Type**. Select from available providers that you have configured. For example, if you selected TMS as the Provider Type, and you have configured the XTM third-party provider, then **XTM** is available in the list.
Unit	The Unit count multiplied by the Rate equals the informational cost estimate. Choose from **Word** or **Character**, according to the billing policy of your third-party service provider. The term Character in Localization Workspace corresponds to Unicode code point, which is the unit commonly used by machine translation service providers. Check your service provider's documentation to confirm the unit used for pricing. For details about the pricing of Google Cloud Translator Service, see https://cloud.google.com/translate. For details about Microsoft Azure Translator, see https://azure.microsoft.com/en-us/pricing/details/cognitive-services/.
Default provider for this language	(Optional) Select this check box to set this provider as the default for this language in Localization Workspace. **Note:** The default provider in Localization Workspace is not related to the default translator in Dynamic Translation.



4. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

With the localization_admin role, edit an existing record as follows (the sn_lw.user role can view a record but not edit).

1. Navigate to **All** > *Localization Workspace* > **Language setup** > **Language Provider** tab.
2. Select the record's Label in the **Language Providers** list.

3. The **Edit language provider** window opens. Modify any values.
4. Save the record by selecting **Update**.

To delete a provider, select the check box next to its label, then select the **Delete** button.

Note: Updates to a provider are not applied to any translation requests currently in progress.

After you have configured individual language providers, you can optionally define Language Groups. Your users save time when creating translation requests by selecting a group rather than adding each language individually. For more information see Configure language groups.

Configure language groups

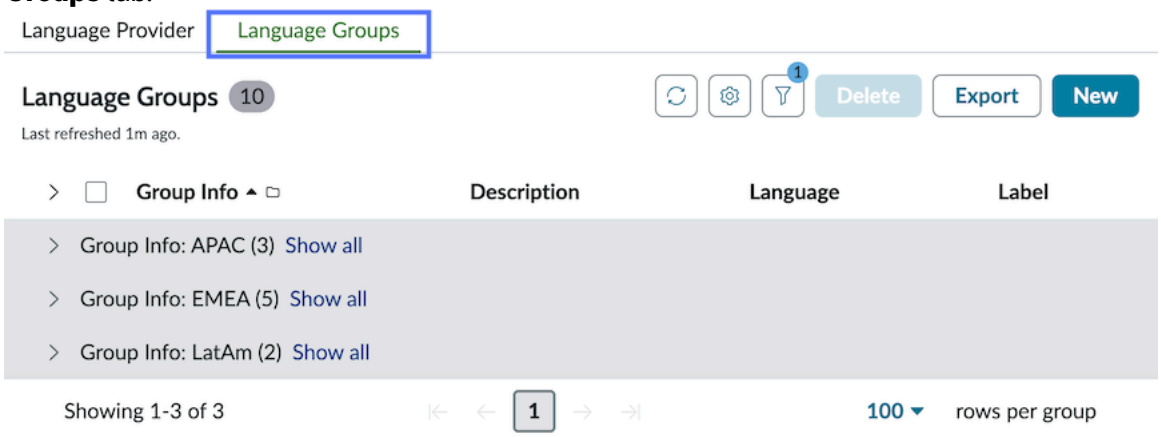
After setting up individual language providers, you can define one or more language groups. Configuring language groups is an optional way to streamline the creation of translation requests.

Before you begin

- Configure all individual language providers. The localization_admin role is required to create a language provider. See Configure a language provider.
- Role required: sn_lw.user. The sn_lw.user role can create a language group by selecting from existing language providers.

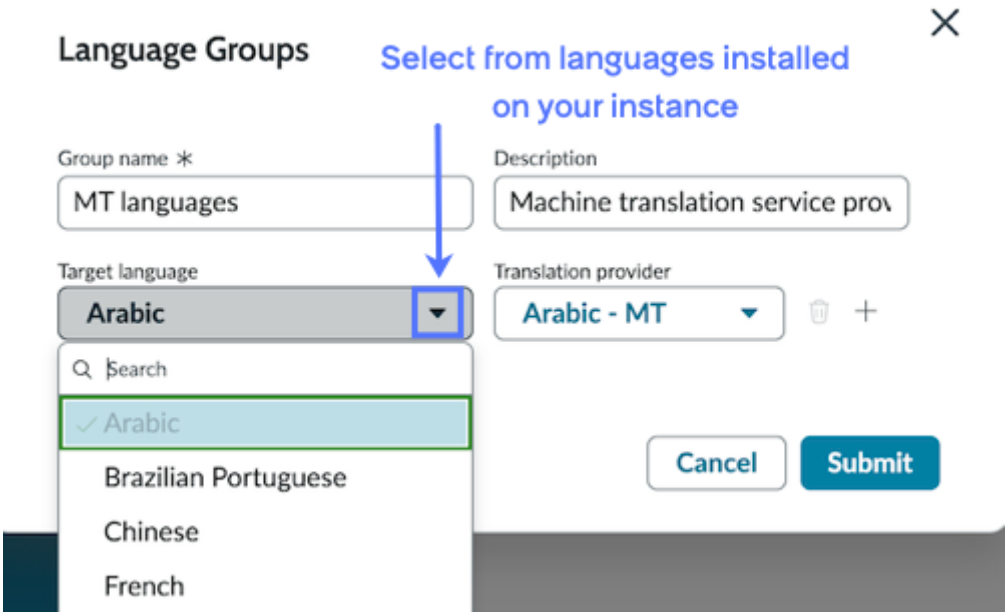
About this task

From version 2.0.2: When your users create translation requests, they can select configured language groups rather than adding each language individually to the request.



Individual languages may be included in more than one language group. If a language is included multiple times in one translation request, Localization Workspace clears out the preconfigured value for translation service provider. Then the translation requester must manually select the desired translation service provider.

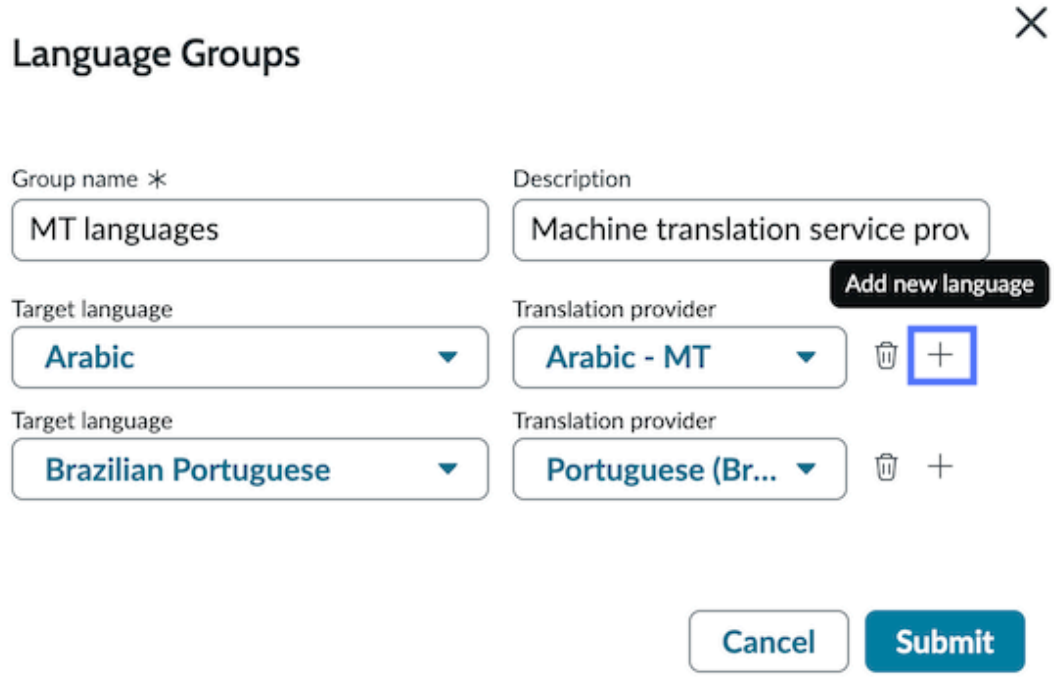
Note: From version 3.0.0, a Guided Tour is available to assist localization admins and localization requesters (localization_admin and localization_requestor) with the setup of a language group. Access the guided tour by selecting the Help Center icon on the Home screen.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > *Localization Workspace* > **Language setup**, then select the **Language Groups** tab.

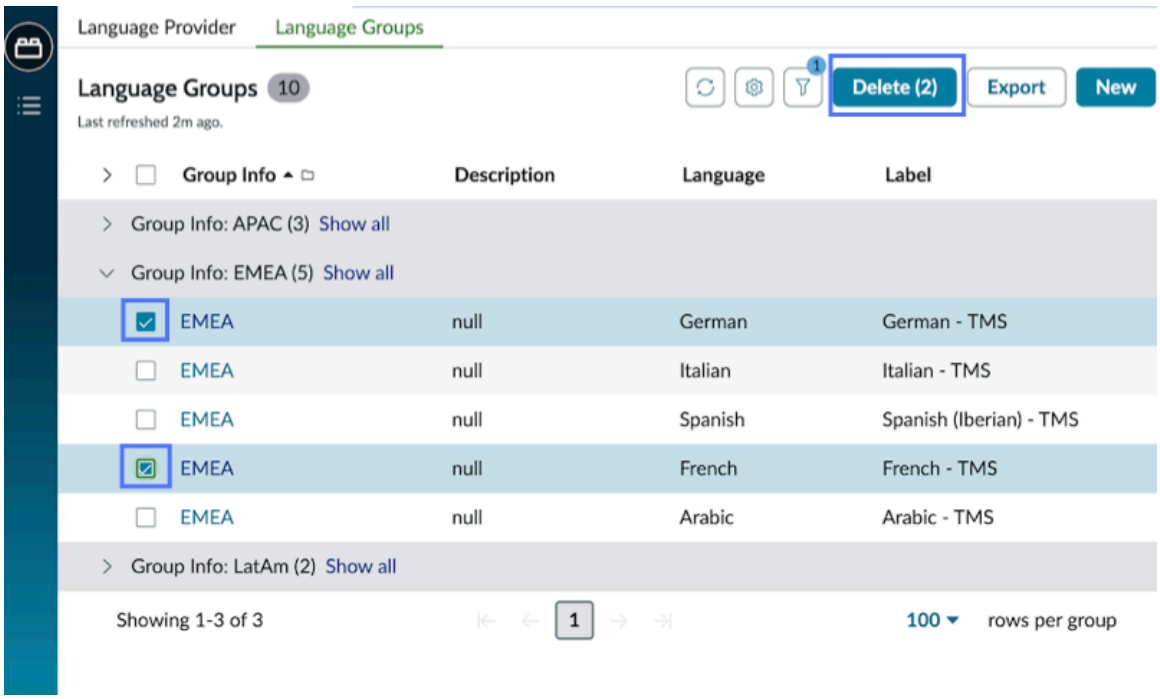


2. Select the **New** button to open the **Language Groups** modal window.
3. In the modal window, enter a name for your group and an optional description.
4. Select a Target language and its Translation provider.

5. Select the **Add new language** icon + to add another row.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

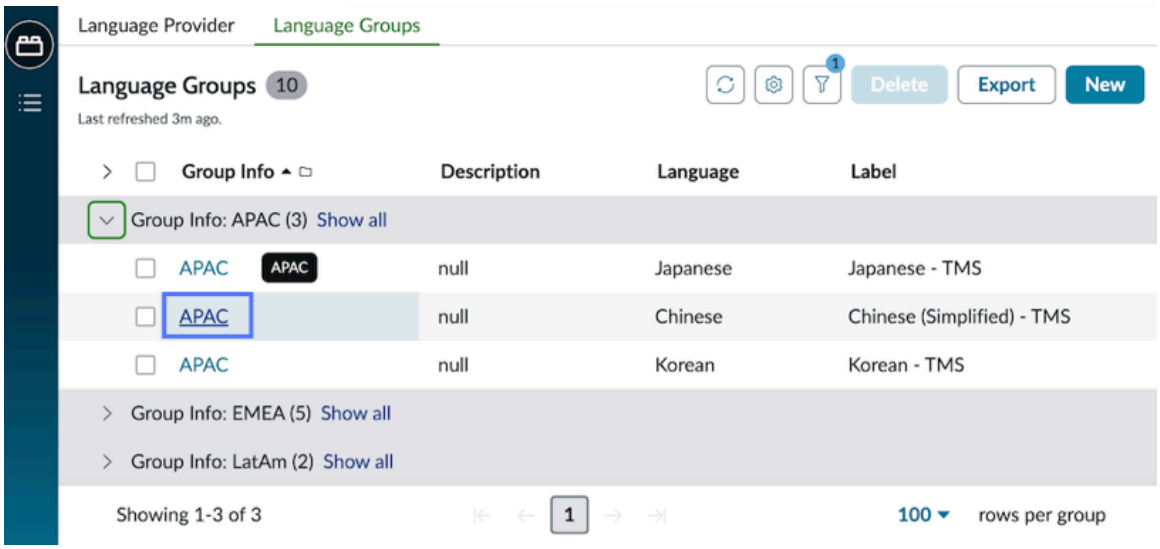
Language groups must have a minimum of at least two



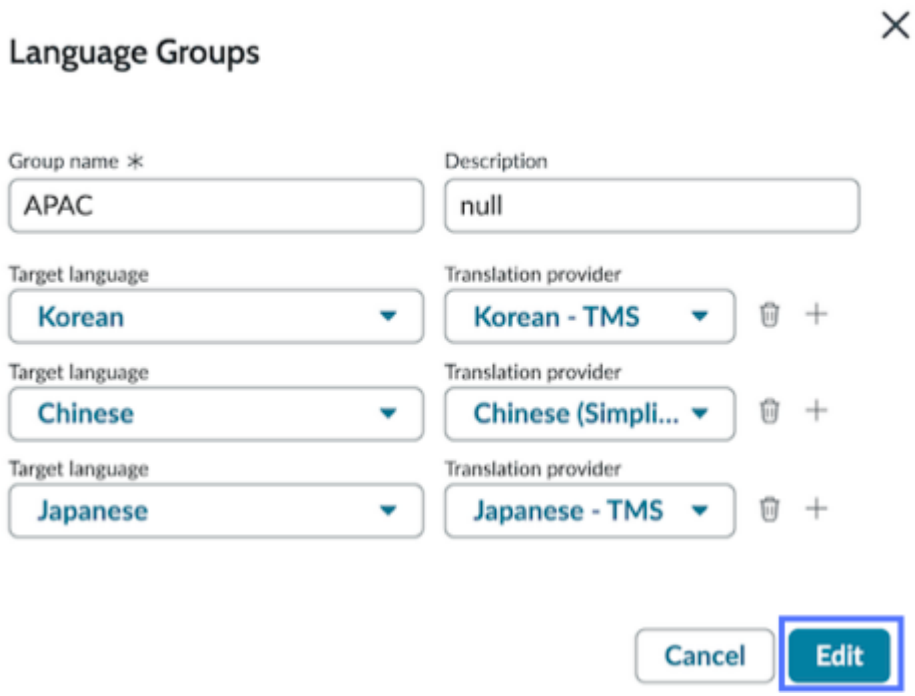
members.

6. Select **Submit** when you have finished adding all rows you want to include in the group.
7. **Optional:** You can export the list of language groups into your choice of file formats (Excel, CSV, JSON, PDF) by selecting **Export** on the list view of Language Groups.
   The exported list can either be downloaded as a file or attached to an email. Select **Delivery Type** in the Export modal window to switch from file download (default) to the email attachment option.

What to do next



You can delete rows (individual languages) from Language Groups as follows.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. In the list of language groups, expand a group to display its rows.
2. Select the check box of the row you want to delete.
3. Select the **Delete** button. This button displays the count of rows you have selected.
4. (Optional) You can delete the entire language group by selecting and deleting all of its rows. If you delete only one language, the rest of the group remains.

You can edit a group as follows.

1. In the list of language groups, expand a group to display its rows.
2. Select the name of the group in any one row. The group opens in a modal window.
3. Select new values from drop-down lists. Use icons to add (+) or delete (🗑) rows.
4. Select **Edit** to save your updates.

- Preview email notifications

Create email notifications for completed translation jobs

Configure email notifications so you can be informed when Localization Workspace translation jobs are completed.

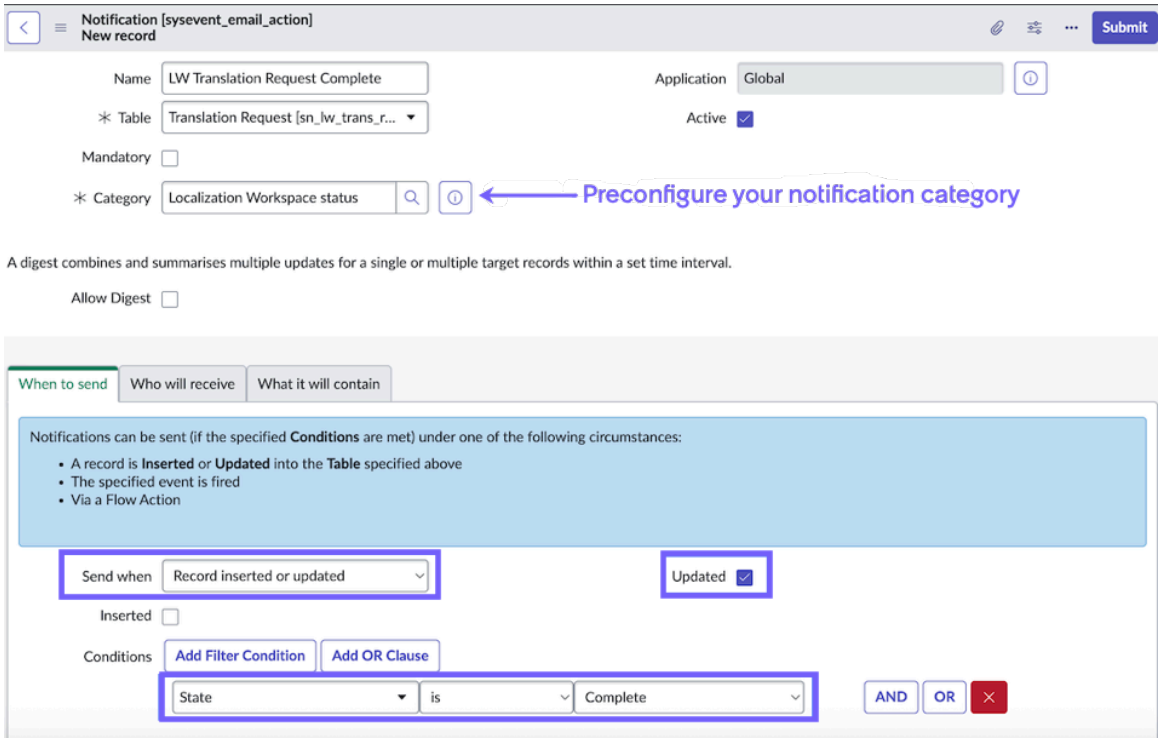
Before you begin

Create your own notification category to identify and group your notifications related to Localization Workspace translation projects. For instructions see Create notification categories.

Role required: admin.

About this task

From Zurich Patch 1, along with tracking the progress of translation jobs in Localization Workspace, you can set up email notifications to be alerted upon completion of translation jobs.



For detailed information about configuring email notifications, see Create an email notification. The following procedure is specific to notifications for Localization Workspace jobs.

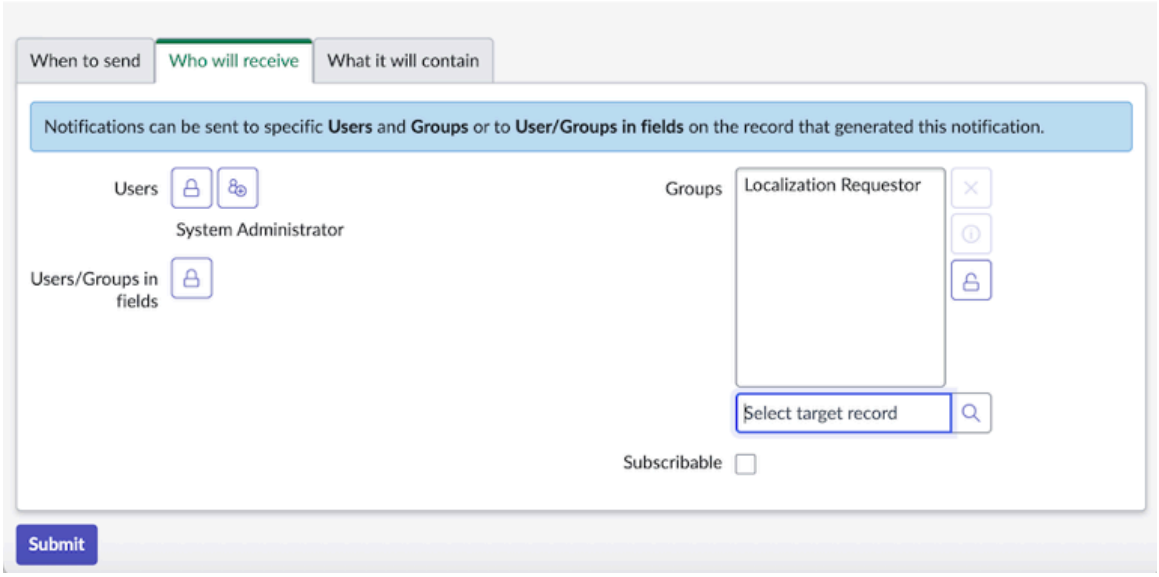
Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Select **New**.
3. Fill in the fields according to the following guidance.

Field	Description
Name	Enter a unique, descriptive name for these no tifications.
Table	Select the Translation Request [sn_lw_trans_ request] table from the list of tables.
Category	If you have already set up your own category for these notifications, you can select it from the drop-down list. For information see Create notification categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the **When to send** tab, fill in the fields.



Field	Description
Send when	Select `Record inserted or updated`.
Updated	Select this check box.
Inserted	Clear this check box.
Conditions	Set one row to `State is Complete`.

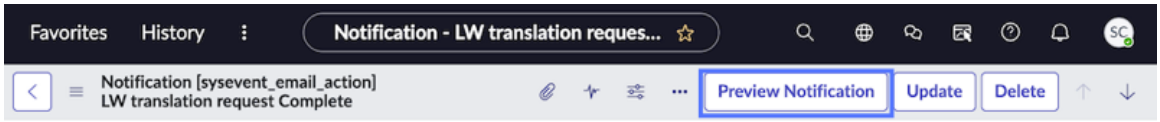
5. On the **Who will receive** tab, fill in the fields according to your organizational requirements.

Field	Description
Users	Select the lock icon to add an individual user from the User [sys_user] table.
Users/Groups in Fields	Select the lock icon to add recipients from fields in the Translation Request [sn_lw_trans_request] table.
Groups	Select the lock icon to add a group of users, such as Localization Requestor, from the Group [sys_user_group] table.
Subscribable	Option to enable all users to subscribe to the notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Recipients can receive email about records that they can't normally access from the user interface, so con sider the sensitivity of the information before selecting this option.

6. On the **What it will contain** tab, fill in the fields according to your organizational requirements.



Field	Description
Email template	You can search for an existing template.
Subject	You can use variables from the Translation Re quest [sn_lw_trans_request] table, available under **Select variables**.
Message HTML	You can use variables from the Translation Re quest [sn_lw_trans_request] table, available under **Select variables**. Example variables from this table: ○ `${lf_project.number}` is the corre sponding number from Localization Frame work. ○ `${sys_created_by}` is the person who submitted the translation request.

7. Select **Submit** (or **Update** if you are editing) to finish the record.

What to do next

After creating a new notification, you can review its record in the Notifications [sysevent_email_action] table. From that finished record you can select **Preview Notification** to open an example of the email notification. Use this function to confirm how the notification appears to recipients.

For more information, see Preview email notifications.

Create email notifications for translation request due dates

As an admin, you can create email notifications triggered by translation request due dates.

Before you begin

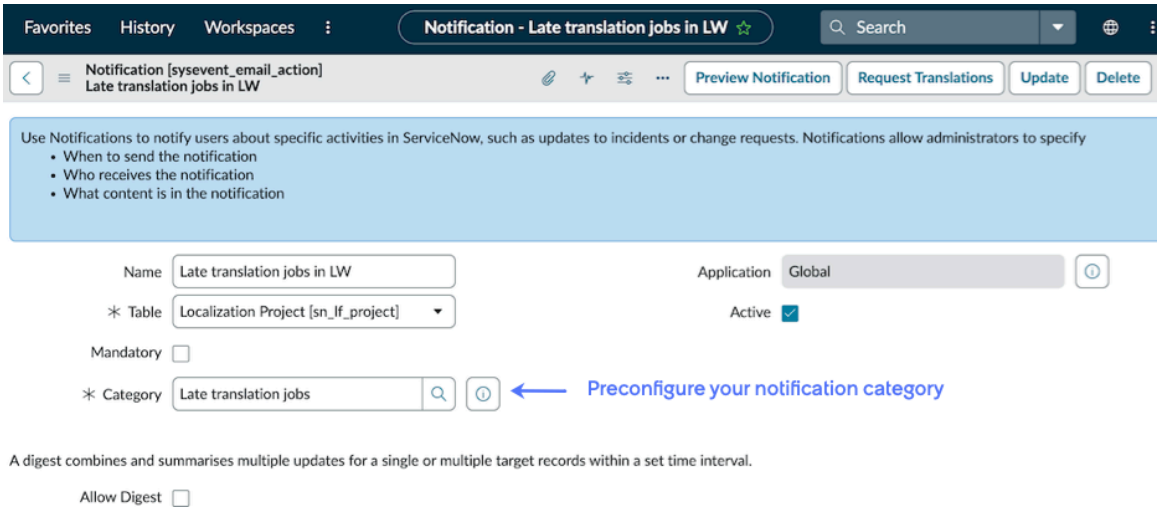
Create your own notification category to identify and group your notifications related to Localization Workspace translation projects. For instructions see Create notification categories.

Role required: admin

About this task

From version 2.0.2, your users may set a due date when requesting translations in Localization Workspace. You can reference these due dates to send email notifications.

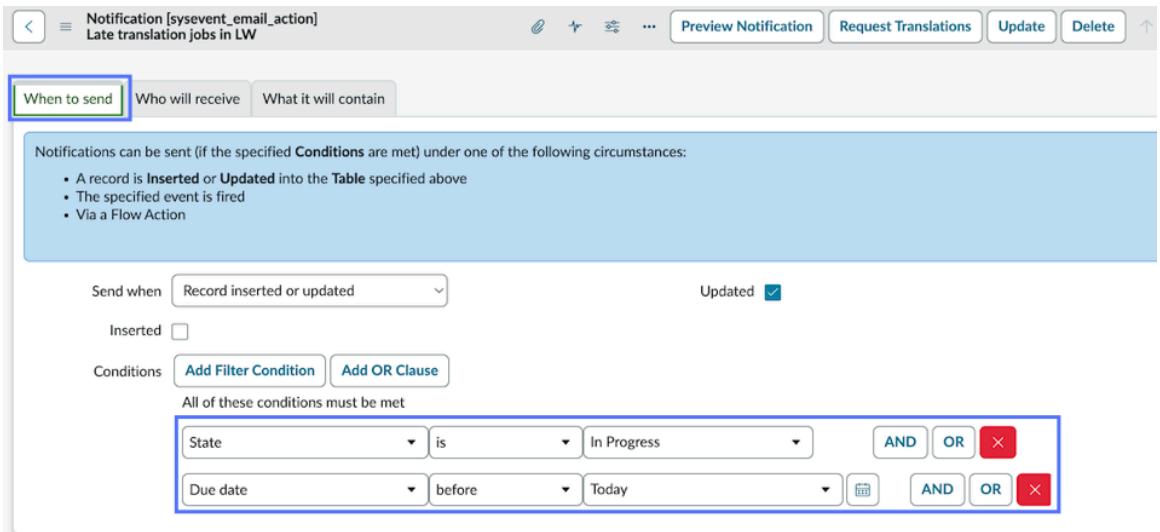
For more information see Request translations in Localization Workspace: Estimate and Due Date. For background information about configuring email notifications, see Create an email notification.



The following procedure is specific to notifications for Localization Workspace translation request due dates. In the example scenario, a notification is sent when a translation request is past due (the request is still in progress after its due date).

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Select **New**.
3. Fill in the fields according to the following guidance.



Field	Description
Name	Enter a unique, descriptive name for these no tifications.
Table	Select the Localization Project [sn_lf_project] table from the list of tables.
Category	If you have already set up your own category for these notifications, you can select it from the drop-down list. For information see Create notification categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the **When to send** tab, fill in the fields.

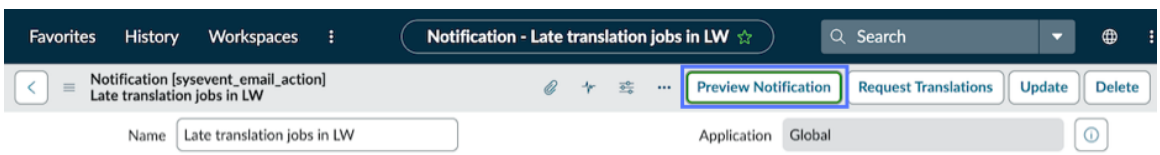
Field	Description
Send when	Select `Record inserted or updated`.
Updated	Select this check box.
Inserted	Clear this check box.
Conditions	In the example, two conditions are set: **a.** `State is In Progress` **b.** `Due date before Today`

5. On the **Who will receive** tab, fill in the fields according to your organizational requirements.

Field	Description
Users	Select the lock icon to add an individual user from the User [sys_user] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Users/Groups in Fields	Select the lock icon to add recipients from fields in the Localization Project [sn_lf_project] table.
Groups	Select the lock icon to add a group of users, such as Localization Requestor, from the Group [sys_user_group] table.
Subscribable	Option to enable all users to subscribe to the notification. **Note:** Recipients can receive email about records that they can't normally access from the user interface, so con sider the sensitivity of the information before selecting this option.



6. On the **What it will contain** tab, fill in the fields according to your organizational requirements.

Field	Description
Email template	You can search for an existing template.
Subject	You can use variables from the Localization Project [sn_lf_project] table, available under **Select variables**.
Message HTML	You can use variables from the Localization Project [sn_lf_project] table, available under **Select variables**. Example variables from this table: ○ `${short_description}` for Short De scription ○ `${due_date}` for due date ○ `${made_sla}` for Made SLA

7. Select **Submit** (or **Update** if you are editing) to finish the record.

What to do next

After creating or updating a notification, review its record in the Notifications [sysevent_email_action] table. You can select **Preview Notification** to open an example of the email notification. Use this function to confirm how the notification appears to recipients.

For more information, see Preview email notifications.

Requesting translations in Localization Workspace

Create and submit translation requests in Localization Workspace. Generate informational cost estimates for review and set a due date before submitting the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of creating translation requests

As a localization requester, you can create translation requests for multiple content types into multiple languages, all in one interface.

You can save or modify a translation request before submitting it. When you submit the translation request, Localization Workspace creates and packages a project in Localization Framework. Creating the project might take several minutes depending on the number of documents. When the project is ready, Localization Workspace sends the translation request to your third-party service provider.

Note: From version 3.0.0, you can cancel a TMS translation request after submitting it. However, Localization Workspace does not contact your service provider. You should notify your provider directly regarding any cancellations.

On the Localization Workspace home page, the **Request Translation** button opens a wizard displaying a four-step process.

1. Request translations in Localization Workspace: Languages

   Start a translation request by selecting available target languages or language groups.

2. Request translations in Localization Workspace: Types

   Add content types to a translation request. You can select multiple types of documents from tables across your instance. The system retrieves all available translatable documents for each selected content type.

3. Request translations in Localization Workspace: Scope

   Select or deselect specific documents from the retrieved list of content. Different documents can be selected for each language in the request.

4. Request translations in Localization Workspace: Estimate and Due Date

   Generate an informational cost estimate as the last step in the Request Translation wizard. Review the estimate to plan and control your localization budget. Optionally add a due date for the request.

Tracking translation requests

When you save or submit a translation request, its record is displayed on the Home screen of Localization Workspace in the **My Requests** list. You can edit, archive, or cancel a translation request from My Requests. For more information, see Localization Workspace Home and translation job status.

Translation request due dates

In the Estimate step of a translation request, the system suggests due dates based on the type of service provider. You can optionally accept the suggested due date, or you can use the calendar picker to choose another date. You can't choose a date that is earlier than the suggested date, however.

From version 3.0.0, intelligent due dates are offered when requests are submitted through a TMS. Localization Workspace suggests a due date based on the target language's word or character count, using the following industry-standard formula.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Due Date formula

Target language type	Formula used
Words	Divide the total word count by 1500. Then add 2. The result is the expected number of days to complete the translation. Add that number to the current date.
Characters	Divide the total character count by 15,000. Then add 2. The result is the expected number of days to complete the translation. Add that number to the current date.

Note: The Estimate step of a translation request displays Word counts, not Character counts, even when the target language has been configured as character-based. However, the intelligent due date suggestion uses the Characters formula for languages configured as character-based.

When using a TMS to translate into multiple target languages in one request, the formula assumes that the languages are processed concurrently, not sequentially. This means that the language with the highest word or character count is used to calculate the due date suggestion.

For machine translation service providers, the default due date is the current date. Due dates in Localization Workspace correspond to the Localization Framework Project due dates.

Example: Due date calculation for a TMS request

The following example illustrates the due date calculation when the word count is 62,453.

1. Divide the word count by 1500.

   62453 / 1500 = 41.6.

2. Truncate (round down or take the floor) to the nearest whole integer.

   41.6 becomes 41.

3. Add 2 days.

   41 + 2 = 43.

4. Add the number of days to the current date.

   The suggested due date is 43 days from the current date.

Request translations in Localization Workspace: Languages

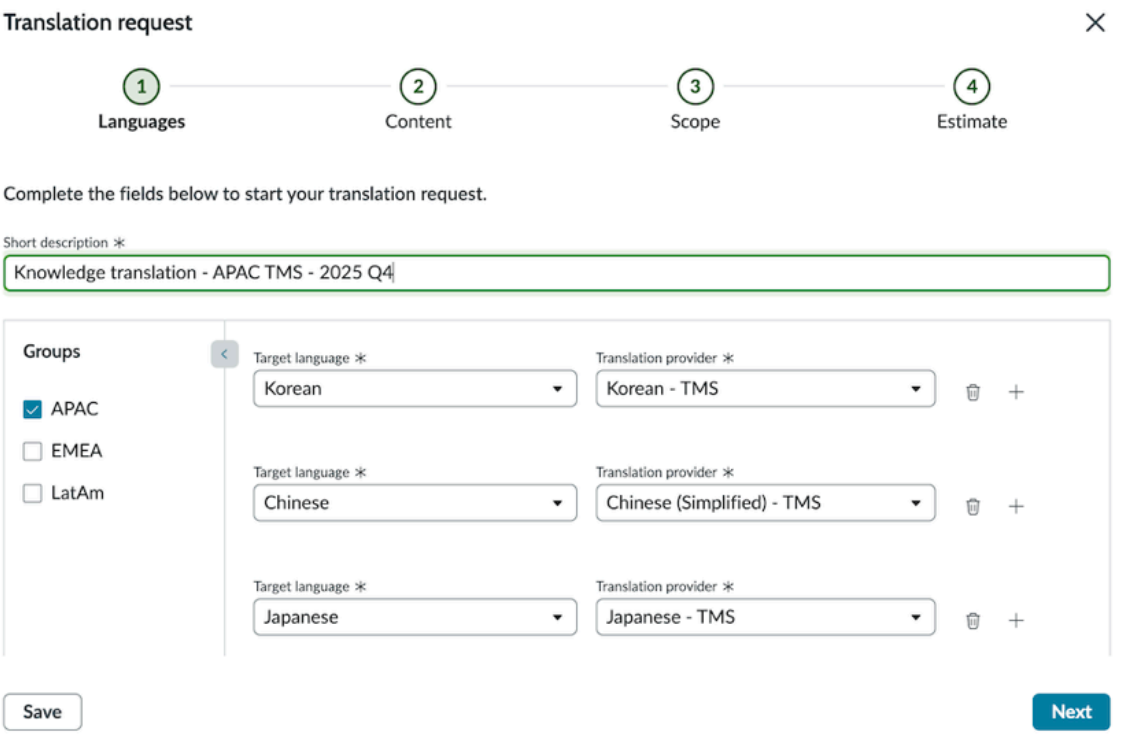
Add target languages to a translation request in Localization Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the languages you intend to add to your translation request have been installed on your instance.
- Ensure that the language providers that you intend to use have been configured. See Configure a language provider.
- Role required: sn_lw.user

About this task



Your translation request can bundle multiple target languages and multiple content types. Each language in the request can include different target documents.

Note: In the Brazil release, only requests from English into non-English target languages are supported. Requests from non-English source languages are not supported.

The following procedure covers step one of four steps in the Translation Request wizard.

Procedure

1. Navigate to **All** > *Localization Workspace* > **Home**.
2. Select **Request Translation** to open the

wizard.
The **Translation request** wizard opens at the first step, **Languages**.

3. In the **Short Description** field, enter a name for the translation request.
The Short Description is displayed in the **My Requests** list on the Home screen, so you can find and monitor your request later. For information see Localization Workspace Home and translation job status.
4. Select target languages or language groups according to the following guidance.

Option	Description
Language	To select an individual language:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	a. In the **Target language** field, select an available language from the drop-down list. **b.** In the **Translation provider** field, select a name from the list of providers available for the language you chose. You can add more than one language to a request.
Groups	When you select a check box for a language group, the Target language and Translation provider fields auto-populate. ○ You can add more than one language group to a translation request. ○ After you add a language group to request, you can manually delete individual languages from it. Deletion in the wizard applies only to this request; the definition of the language group doesn't change. ○ You can include a mix of language groups and individual languages in one request. ○ If a language is included multiple times in one request, Localization Workspace clears the value of the Translation provider field. You must then manually select the desired Translation provider for that language.

5. **Optional:** Add another language by selecting the plus icon +, or add another language group by selecting its check box.
6. **Optional:** Select **Save**.
   A saved translation request has a status of `Draft` in the **My Requests** list on the Home screen.
7. Select the **Next** button to proceed to the Types step of translation request creation.

What to do next

Advance to the next step in the wizard, **Types**, to select content for translation.

Request translations in Localization Workspace: Types

Add content types to a translation request in Localization Workspace. Your translation request can include multiple types of documents from tables across your instance.

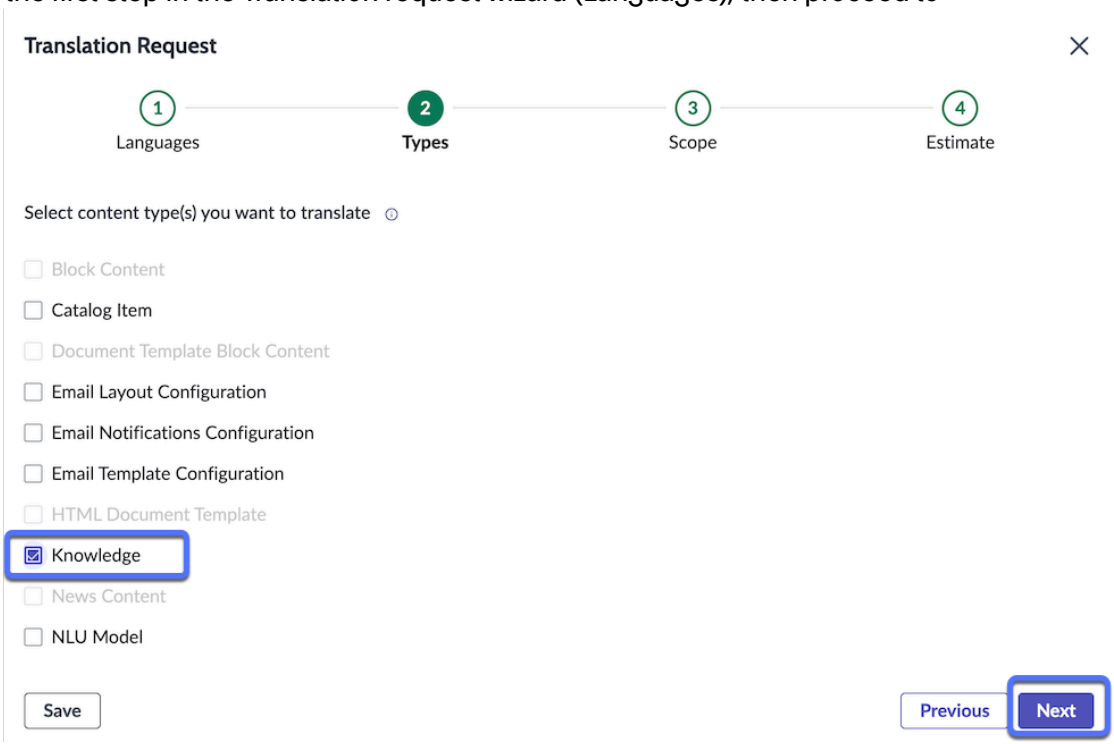
Before you begin

- Content types correspond to tables. For details about making your content available to Localization Workspace, see Types of Localizable content in Localization Workspace.
- Complete the first step in the Translation Request wizard, then proceed to this step. See Request translations in Localization Workspace: Languages.
- Role required: sn_lw.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you choose content types to include in your request, Localization Workspace retrieves all untranslated or partially translated documents from the tables. Then in the next step of the wizard (Scope), the retrieved list is displayed so that you can select or deselect specific documents.



A document may be considered partially translated when its original is updated after it was translated. In such cases it may be possible to synchronize the translated versions to the English original by translating only the new portion of the text.

Items currently in the translation process can't be selected or resubmitted until the current translation finishes.

The following procedure covers step number two in the Translation Request wizard.

Procedure

1. Complete the first step in the Translation request wizard (Languages), then proceed to **Types**.

2. Choose the content types you want to translate by selecting the appropriate check boxes.

   Note: Content types that are not selectable may require table or role permissions. Ask your administrator to enable access. For more information see Types of Localizable content in Localization Workspace.

3. **Optional:** Select **Save**.
   A saved translation request has a status of `Draft` in the **My Requests** list on the Home screen.
4. Select the **Next** button to advance to the Scope step of translation request creation.

What to do next

Advance to the third step in the wizard, **Scope**, where you can select specific documents for inclusion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request translations in Localization Workspace: Scope

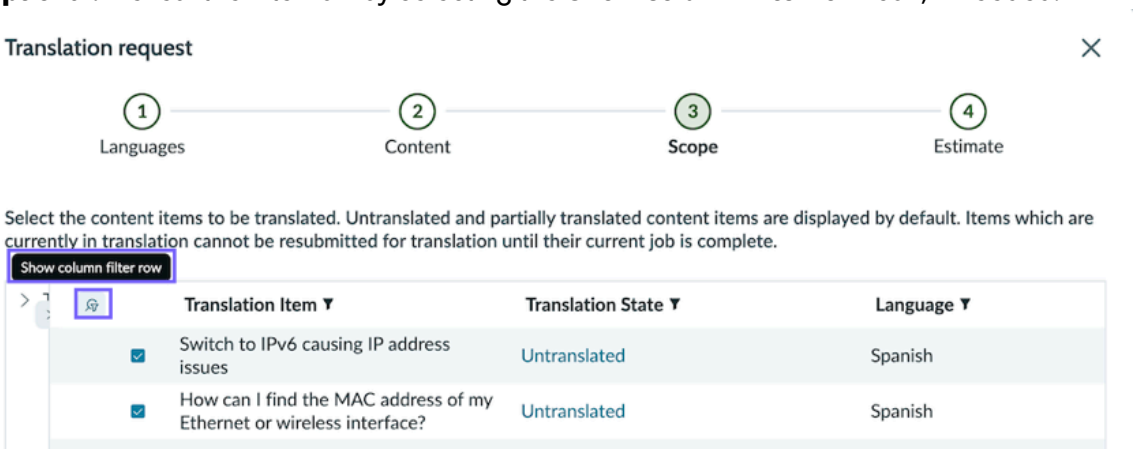
Select specific documents to add to a translation request in Localization Workspace.

Before you begin

Role required: sn_lw.user

About this task

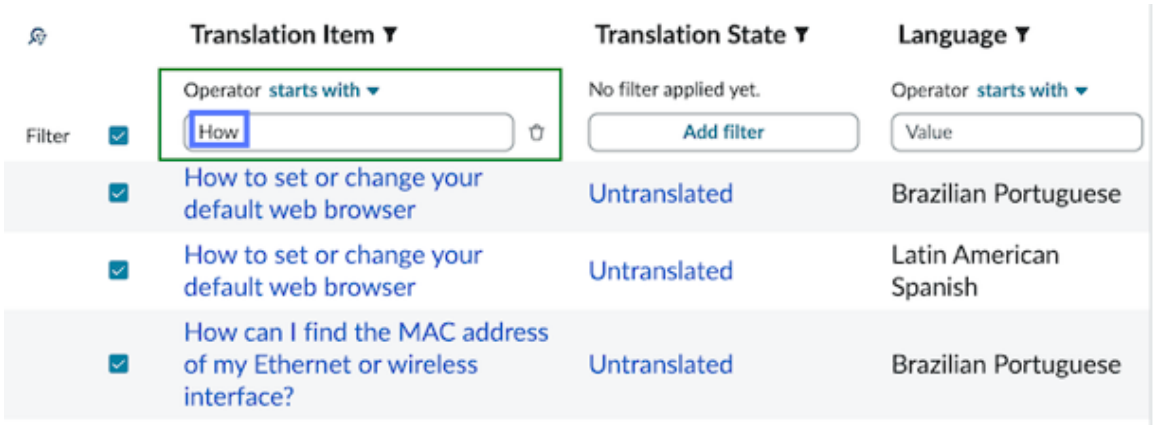
In the Scope step of a translation request, you can drill down to select or deselect specific documents from the list of translatable items collected by the Types step.



- When the Scope screen first opens, all of the retrieved items are selected by default.
- Items that are currently in the translation process aren't retrieved.
- If you don't want an item to be included in the translation request, deselect that item by clearing its check box.
- It's possible to select a document for one target language, and deselect the same document for a different target language.
- From version 2.0.2, you can use a text filter in the column filter row. Filter operators are the same as other tables in your instance (such as **starts with**, **contains**, and so forth).
- If you search for a term in the filter under the Translation Item column, the system searches for that term only in the titles of documents, not in contents.
- From version 2.0.2, a bulk select/deselect check box is available in the Filter row.

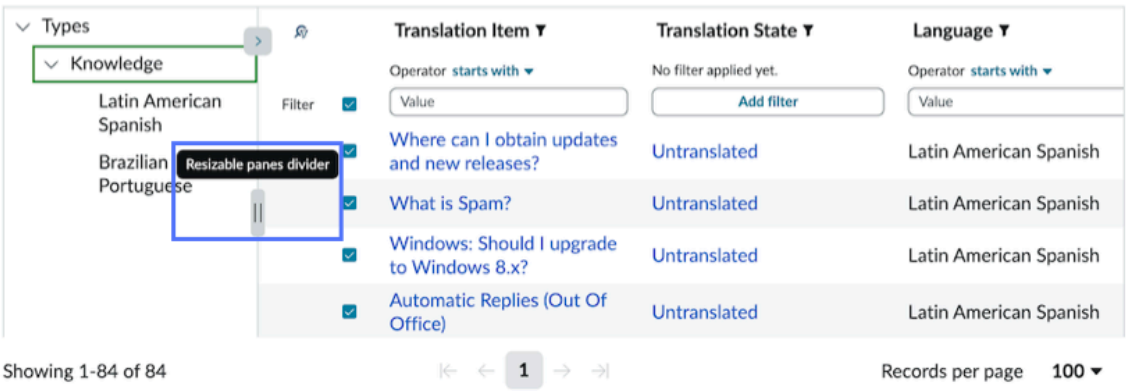
> **Note:** Bulk selection/deselection applies only to the set of items that you have selected in the Types pane. Review and confirm the items in a translation request before submitting.

The following procedure covers step three of four steps in the Translation Request wizard.

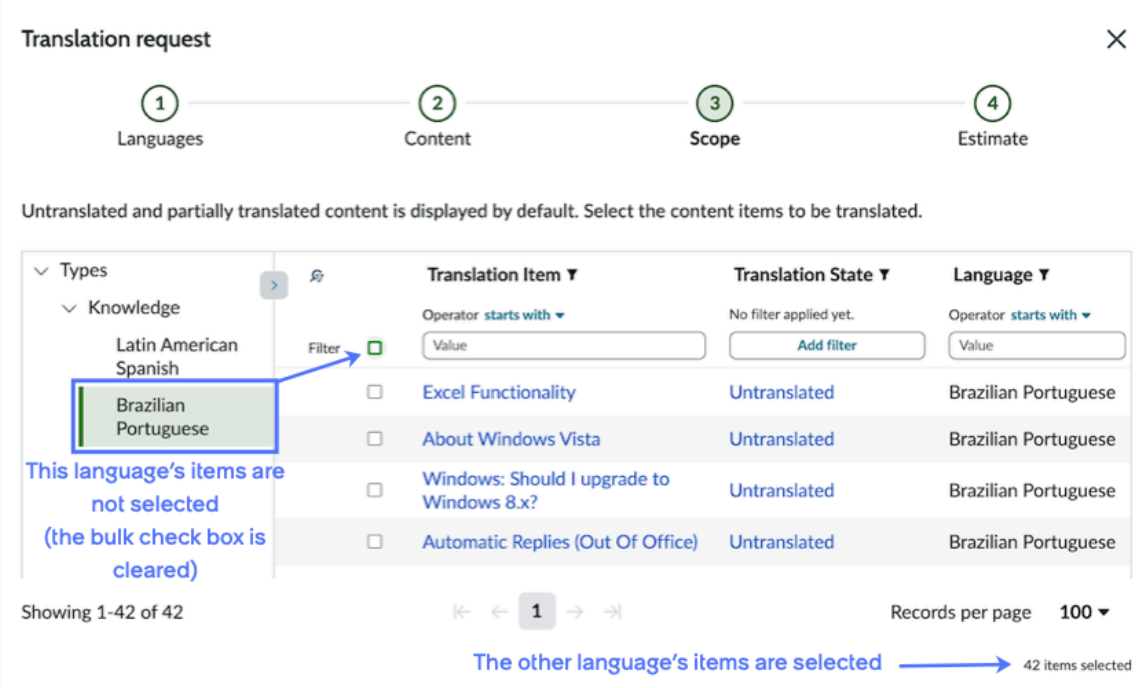


Procedure

1. Complete steps one and two in the Translation request wizard, then proceed to this one, **Scope**.
2. **Optional:** Reveal the filter row by selecting the **Show column filter row** icon, if needed.



3. **Optional:** Filter the list according to terms in the document titles (Translation Item), or by Translation State or Language.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Reveal the Types pane by opening the **Resizable panes divider**, then expand Types by selecting the caret icon.

5. **Optional:** Deselect any retrieved documents that you don't want to include in your request by clearing the item's check box.
   You can use the bulk select/deselect check box in the Filter row to select (or clear) a set of items. If anything is highlighted in the Types pane, bulk selection/deselection applies only to the highlighted type or language.

6. **Optional:** Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A saved translation request has a status of `Draft` in the **My Requests** list on the Home screen.

7. Confirm the items you have included or excluded, then select **Next** to proceed to the **Estimate** step of the Translation Request wizard.

What to do next

Advance to the next step in the Translation Request wizard, **Estimate**, where you can review projected costs and set a due date for the translation request.

Request translations in Localization Workspace: Estimate and Due Date

As the final step in creating a translation request, you can review an informational cost estimate and optionally set a due date. The due date can be used to trigger email notifications.

Before you begin

- If you want to use the optional due date field to trigger an email notification, confirm that your admin has configured notifications. For more information see Creating email notifications for Localization Workspace.
- Role required: sn_lw.user

About this task

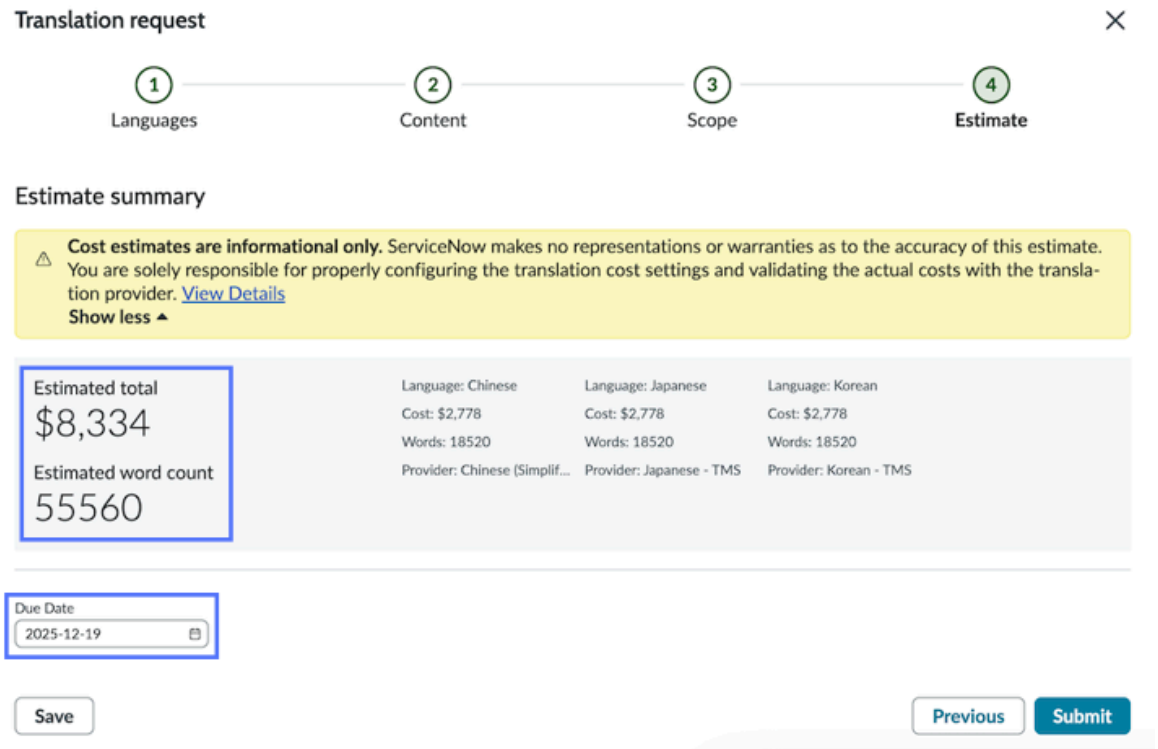
Important:

Cost estimates are informational only. ServiceNow makes no representations or warranties as to the accuracy of this estimate. You are solely responsible for properly configuring the translation cost settings and validating the actual costs with the translation provider.

The informational cost estimate is calculated by multiplying the total number of words (or characters) by the cost per word (or character). The following conditions apply.

- Your third-party translation service provider charges you directly for translation services provided. ServiceNow has no involvement with billing or payment.
- Each translation service provider has its own definition of how to count words for billing purposes. Your provider's word count might be different from ServiceNow's estimated word count.
- You must input and maintain accurate costs per word in the Language Provider record in Localization Workspace.
- This estimate is not generated by a call to the API of your translation service.
- The term character in the Localization Workspace interface corresponds to a Unicode code point.
- The **Estimated total** value is rounded down to a whole number, so decimal places are not included.
- The informational cost estimate is calculated and displayed in the currency of the translation requester's user session.
- When you input the cost per word from your translation service provider, use the base rate before any volume discount is achieved. Localization Workspace is not able to calculate volume discounts or overages, so the informational cost estimate displayed in this wizard might be different from actual charges.

Consult your provider's documentation. For details about the pricing of Google Cloud Translator Service, see https://cloud.google.com/translate/pricing. For details about Microsoft Azure Translator, see https://azure.microsoft.com/en-us/pricing/details/cognitive-services/translator/.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

From version 2.0.2, an optional due date field is available in the Estimate step. It can be used to trigger email notifications. (Notifications require configuration by an admin).

- The due date corresponds to the Localization Framework Project due date.
- From version 3.0.0: when submitting to a TMS, the system suggests a due date based on the word count. For details about intelligent due dates see Requesting translations in Localization Workspace.
- For machine translation service providers, the default due date is the current date.
- You can use the calendar picker to choose a date that is later than the default or suggested due date, but you can't choose an earlier date.

Procedure

1. Complete the first three steps (Languages, Types, and Scope) in the Translation request wizard, then select **Next** to proceed to **Estimate**.
   Larger translation requests take longer to generate informational cost estimates.

2. Review the generated informational cost estimate.
   The estimate includes total cost and word count for the entire translation request. Also included is a breakdown of the cost and word count per language.

   Note: The UI displays Word counts, not Character counts, even when the target language has been configured as character-based. However, any underlying calculations (such as intelligent due date suggestions) use the actual character count for character-based languages.

3. **Optional:** Enter a due date for the project by selecting the Due Date field.
   Selecting this field opens a calendar date picker. You can choose a date that is later than the suggested (or default) due date, but you can't choose a date that is earlier.
4. **Optional:** Use the **Previous** button to modify the estimate by returning to earlier steps and removing documents from your request.
5. **Optional:** Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A saved translation request has a status of `Draft` in the **My Requests** list on the Home screen.

6. Select **Submit** to create the bundled translation request and send to your translation service providers.

Note:

- When you submit a translation request, the system first creates a Localization Framework project. During the creation of the project, the Due Date field doesn't contain any value. The due date is available after project creation.
- The larger the translation request, the longer it takes to create its project. The process may take several minutes for very large requests.
- When the translation request's project is finished, the system sends the packaged documents to your third-party service provider. You can cancel a translation request after submitting, but Localization Workspace does not contact your service provider. You should notify your provider directly regarding any cancellations.

What to do next

You can view translation request records in list format on the Home page of Localization Workspace.

Note: When displayed in the Requests list on the Home page, the **Cost** is rounded up to the decimal place that is set in your **Display Value Currency** field. However, the calculation of the informational cost estimate for a translation request does not use the currency's display value. The calculation uses the actual rate that you have configured in Localization Workspace. For more information, see Identify the FX Currency field and its display parameters.

Localization Workspace reference

Reference topics provide additional information you can use to configure and administer Localization Workspace.

Components installed with Localization Workspace

Several types of components are installed with activation of the Localization Workspace plugin, including tables, user roles, and scheduled jobs.

Components from Localization Framework used in Localization Workspace

Localization Workspace builds on functionality from Localization Framework, including tables and roles. Installing Localization Workspace also installs Localization Framework if it isn't already activated. For detailed information see Components installed with Localization Framework.

Roles installed

For detailed information about roles installed see Localization Workspace Roles.

Scheduled jobs installed

Scheduled job	Description
Remove discarded Translation Requests	Runs daily to delete any abandoned translation requests (translation requests which have been initiated but not updated for 10 days).

Localization Workspace Domain Separation

Domain separation is unsupported for Localization Workspace. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Types of Localizable content in Localization Workspace

Localization Workspace collects available translatable content from across your instance when you create a translation request. You can make your content available by configuring permissions and creating an artifact record.

Prerequisites for availability

The availability of a content type is subject to its table and application scope permissions. Localization Workspace retrieves untranslated or partially translated documents when the following prerequisites are fulfilled.

- If you have created a custom artifact, set cross-scope privileges to ensure that the corresponding content type can be selected in Localization Workspace. For more information see Cross-scope privileges for Localization Workspace.
- If the target tables are restricted, set Restricted Caller Access privileges to ensure that a content type can be selected in Localization Workspace. For more information see Restricted Caller Access for Localization Workspace
- For Content Publishing material, add the role sn_cd.content_admin to your Localization Workspace group in the sys_user_group table. This role is needed to access Content Publishing items from Localization Workspace.

Translatable content

A document may be considered partially translated when its original is updated after translations were produced. In such cases it may be possible to synchronize the translated versions to the updated original by translating only the new portion of the text.

Content available by default

The following table lists the content types that are available by default when you install Localization Workspace. These are preconfigured with artifact records and cross-scope permissions.

You can also configure your own custom artifacts. For more information, see Create and configure a custom artifact.

In this table the **Filter** column shows the query used to retrieve untranslated or partially translated content.

Localization Workspace Roles

Localization Workspace is installed with these roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Localization Framework roles used in Localization Workspace

Many roles used in Localization Workspace are inherited from Localization Framework. For detailed information about the following, see Localization Framework Roles.

Roles from Localization Framework

User	Name
Localization administrator	localization_admin
Localization editor	localization_editor
Localization fulfiller	localization_fulfiller
Localization manager	localization_manager
Localization requester	localization_requestor

Terminology Manager (sn_lw.terminology_manager)

Upload, review, and manage glossaries in the Language Asset Management area of Localization Workspace.

Contains Roles

List of roles contained within the role.

- *import_transformer*
- *content_admin*
- *import_set_loader*

Groups

List of groups this role is assigned to by default.

None.

Special considerations

The sn_lw.terminology_manager role is available from version 3.1.0 of Localization Workspace. With version 3.1.0, the following roles that had previously been contained in sn_lw.user are transferred to sn_lw.terminology_manager: import_transformer, content_admin, import_set_loader.

This role does not contain the sn_lw.user role. Be sure to also assign sn_lw.user to any user working in Localization Workspace.

Localization Workspace user (sn_lw.user)

Assign this role to any user working in Localization Workspace.

Contains Roles

List of roles contained within the role, before version 3.1.0.

- *import_transformer*
- *content_admin (from version 3.0.0)*

Exploring System Localization

Learn about support for localizing ServiceNow instances as part of your globalization strategy.

System Localization overview

Localization is the process of making an instance specific to a given region or locale without impacting functionality.

System localization includes the language and locale settings for an instance and is a ServiceNow AI Platform feature that is active by default (com.glide.i18n.core). Translations for several languages are available through additional internationalization (I18N) language plugins (for example, com.snc.i18n.spanish). These language plugins install the I18N: Internationalization plugin (com.glide.i18n), which provides the elements necessary for translating an instance.

Languages and translation

The I18N language plugins contain translations of the UI string content that ServiceNow provides by default in your instance. Whenever you have customized UI strings that you want to translate, you have to identify and translate these strings manually. In addition, you can create translations for languages for which ServiceNow doesn't provide a plugin.

> **Note:** Using the Localization Framework application is recommend for translating to an unsupported language or translating large amounts of custom UI string content in a supported language.

Locales, locations, and regions

Locale settings support displaying dates, times, and currencies properly based on your location. In addition, you can configure locations to identify users, assets, incidents, and more on the instance. Configure regions to organize languages in language selectors.

Related applications

Localization Framework

Using the Localization Framework application is recommend for translating to an unsupported language or translating large amounts of custom UI string content in a supported language. Localization Framework also supports using Dynamic Translation for live translation of form fields, translating knowledge articles, and integrating with third-party translation services.

Localization Workspace

Localization Workspace is a targeted translation management experience for content owners and translation fulfillers. With Localization Workspace you can manage and deliver multilingual content at scale.

Translation management for Knowledge Management

Knowledge article translation uses a separate system that relies on the I18N: Knowledge Management Internationalization plugin. If this plugin isn't activated, knowledge article translation falls back on System Localization, with translations kept in the Translated Text [sys_translated_text] table.

Language internationalization support

The ServiceNow platform supports multiple languages.

Language support is available when at least one language plugin has been activated, as described in Activate a language.

When a user logs in, the language for the instance session is determined by the following logic:

1. If the language selection at login is enabled, that language is used.
2. If not, the language preference selected using the language picker in the header bar is used.
3. If not, the language setting in the User [sys_user] table is used.
4. If none of the above are true, the system default language is used.

You can also enable a fallback language to use if a translation isn't available in the preferred language, as described in Set a fallback language.

Some parts of the system aren't translated and remain in the language used to create them:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Journal fields
- Report titles
- Any field that stores free-form text

Additionally, plugin names and spoke names aren't translated. The English version of plugins and spoke names is always kept, even when they're used in other contexts. Feature names are translated, however.

Beginning in the Washington DC release, new product and application names are localized in all supported languages. Existing product and application names are being localized incrementally.

FAQ

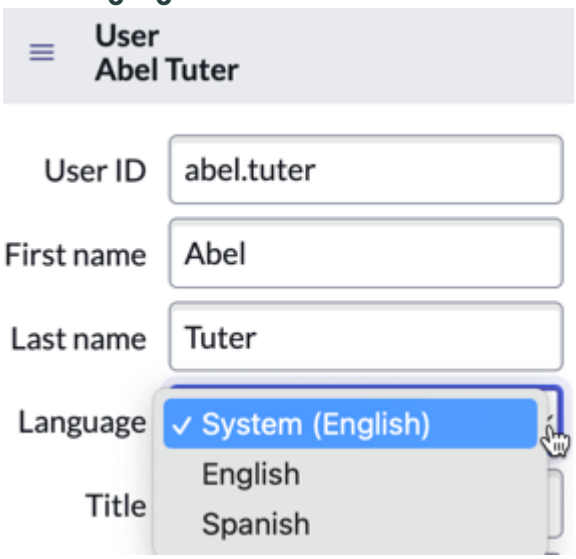
Question	Answer
Will fields that I created or edited myself be translated?	The ServiceNow AI Platform does not perform translations. ServiceNow only provides translations of strings that the company itself has created. When you create a field, a message, or other textual UI content, translate this content manually.
I am not seeing journal fields translated.	Translation tables are not provided for user-defined string fields, such as short description, additional comments, and report titles. These fields can appear only in the language they were created in.

Related topics

Locating translatable UI strings

User specific language

The user has several choices for identifying the language to be used for the instance, as described here.



To enable user-specific languages, first activate the I18N Translation plugins for the desired languages.

- *Language picker at login:* If user-specific language is enabled, users see a choice list on the login page to select their language. To control display of the choice list on the login page, navigate to **All** > **System Properties** > **UI Properties** and use the property *Show the language select box on the login page to allow the user to specify the language they would like to be logged in with*.
- *Language picker in the user menu (Next Experience UI):* Users can select their language from the user menu by navigating to **Preferences** > **Language & Region**. The user menu is located in the Next Experience Unified Navigation.
- *Language picker in the System Settings window (Core UI):* Users can select their language in the General tab of the System settings window. Access this window by clicking the gear icon on the right edge of the banner.
- *Language setting on the user table:* If you have users that require a different language in addition to the global language, you can specify a language for them in **All** > **User Administration** > **Users**. If the **Language** field isn't already on the form, you can configure the form and add it.

The **Language** field in the User [sys_user] table overrides the default global language for that user's sessions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User language

Note: Setting the language for the system guest user sets the language for both the login page and all users without a user role.

Localizing currency and price fields

You can localize currencies for item prices and options.

Standard currency fields display the same price in different currencies based on the user's language. A price field is similar to a currency field, but with special features for conversion and display.

The system has the concept of a reference currency based on the instance locale. All currency values are automatically converted to the reference currency before aggregation or conversion. Do not change the global locale setting after you have data in the system. Changing the global locale setting after adding data to the system can cause aggregations to calculate and display incorrectly. For information about configuring the instance locale, see Configuring locales.

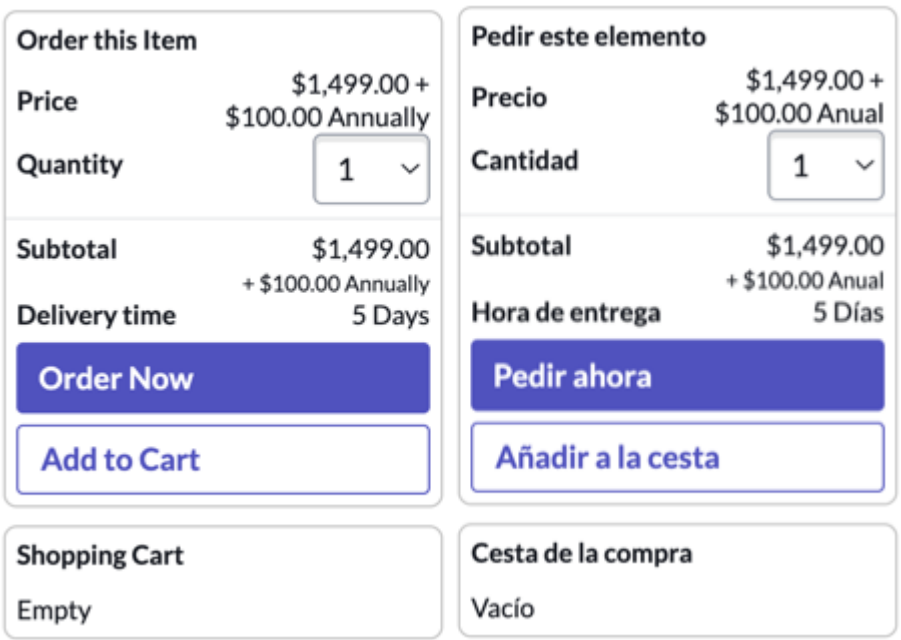
Translating the knowledge base

The knowledge base has its own Translation Management system. However, when this is disabled, knowledge base articles use translated_html fields for translated content.

When any of the internationalization (I18N) plugins are enabled, the Knowledge Management Internationalization plugin is enabled. This plugin allows knowledge article authors to create language-specific articles and to translate and access articles. For more information about Knowledge Management internationalization, see Translation Management in the Knowledge Management documentation.

If the Knowledge Management Internationalization plugin is disabled, knowledge base articles use translated_html fields for article content. This type of field displays the translation based on the language of the user, if multiple translations are stored. To learn about using translated_html fields, see Translating text fields.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translating Service Catalog cart labels

You can specify language-specific labels in these Service Catalog screens: Cart, Edit Cart, and Check Out (including workflows and approvals).

The text for the labels is stored on the Messages [sys_ui_message] table. Localized Message records for these labels are included in the I18N Internationalization language plugins. The application is Global. You can add a record for an unsupported language, or edit an existing record. If you edit an existing record, export the record to another application, edit it in that application, and re-import it. Otherwise, your edits may be overwritten when your instance is zbooted or updated. For more information about exporting translation records, see Export and edit translation records.

Service catalog cart labels

Configuring System Localization

Configure the locales, languages, regions, and locations needed to accommodate your users.

Configuration overview

The following list is a high-level overview of the workflow to get started localizing an instance. However, there may be use cases where performing these steps in a different order is preferred.

1. Set the instance locale

   By default, the instance locale is the United States (en.US). You should set the instance locale before a system has gone into production and not change it after.

2. Activate a language

   Activate any of the ServiceNow® internationalization (I18N) language plugins to get translations of base system UI strings in the languages your users need. American English is the default language and doesn't need to be activated.

3. Set the default language for an instance

   Select a default language for an instance if it should be a language other than American English.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Set a fallback language

   Specify the fallback language for another language so that if UI text isn't translated in a language, the text displays in the fallback language instead. By default, if a UI string isn't translated in the preferred language of an instance session, it displays in English.

5. Set up locations

   Configure the locations that your organization supports to help identify users, assets, incidents, and more by location.

6. Create regions for language selection in portals

   Map languages to regions to organize the language selector for guest users.

7. Ensure that translated choices appear for applications added by plugins

   If you activate other application plugins after having activated language plugins, translated choices in lists might not appear for the applications or features installed by their plugins. Ensure that translated choices appear for those applications by activating translated choice records after corresponding English choice records have been added by plugins.

After you configure your instance using the localization options and supported languages, you might need to translate custom content or translate the instance to an unsupported language. For more information, see Translating custom content and Translating to an unsupported language.

Configuring locales

Specify a locale for an instance so information such as dates, times, and currencies display properly based on your location.

By default, the base system uses US standard formatting. For example, the currency default is the US dollar sign ($) displayed with two decimal places: $100.00. By customizing your locale, you can make things such as currency appear as you expect. For example, in France, you may want to see 100,00 € instead of $100.00.

Set the instance locale

Set the instance locale using a locale code.

Before you begin
Role required: admin

About this task
You should set the instance locale before a system has gone into production and not change it after it goes into production. If a user's locale must be changed, update the **Country code** field on the user record.

> **Important:** The value of this property determines the system's default currency, or reference currency, into which all prices are automatically converted before other sums or conversions are performed. Changing this property after any price or currency fields have been given a value (for Service Catalog items, Assets, Project Tasks, etc.) may result in improper conversion or prices that sum incorrectly.

Procedure

1. Navigate to **All** > **System Properties** > **System Localization**.
2. Enter the locale code to use under **Locale code to use for localization**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Format is [language code].[country code] (e.g. en.GB for Britain fr.FR for France, de.DE for Germany, or ja.JP for Japan).

Common locales

Country	Locale code
United States	en.US
Great Britain	en.GB
France	fr.FR
Germany	de.DE
Japan	ja.JP

3. Select **Save**.

Activate a language

By default, the language supported by the platform is American English. You can activate plugins for other supported languages if you have the admin role.

Before you begin

Role required: admin

About this task

The following plugins are currently available:

- I18N: Arabic Translations
- I18N: Brazilian Portuguese Translations
- I18N: Czech Translations
- I18N: Dutch Translations
- I18N: Finnish Translations
- I18N: French Canada Translations
- I18N: French Translations
- I18N: German Translations
- I18N: Hebrew Translations
- I18N: Hungarian Translations
- I18N: Italian Translations
- I18N: Japanese Translations
- I18N: Korean Translations
- I18N: Latin American Spanish Translations
- I18N: Norwegian Translations
- I18N: Polish Translations
- I18N: Portuguese Translations
- I18N: Russian Translations
- I18N: Simplified Chinese Translations
- I18N: Spanish Translations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- I18N: Swedish Translations
- I18N: Thai Translations
- I18N: Traditional Chinese Translations
- I18N: Turkish Translations

In addition, the I18N: Internationalization plugin (com.glide.i18n) provides the elements necessary for localizing an instance without any language translation preloaded. This plugin is useful for localizing an instance to a language other than those listed above. For more information on using the I18N: Internationalization plugin to translate an instance into a custom language, see Translating to an unsupported language.

Note:

- Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).
- Product and Application Names are kept in English in localization plugins. Feature names are translated.
- After installation, localization plugins can't be uninstalled.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Set the default language for an instance

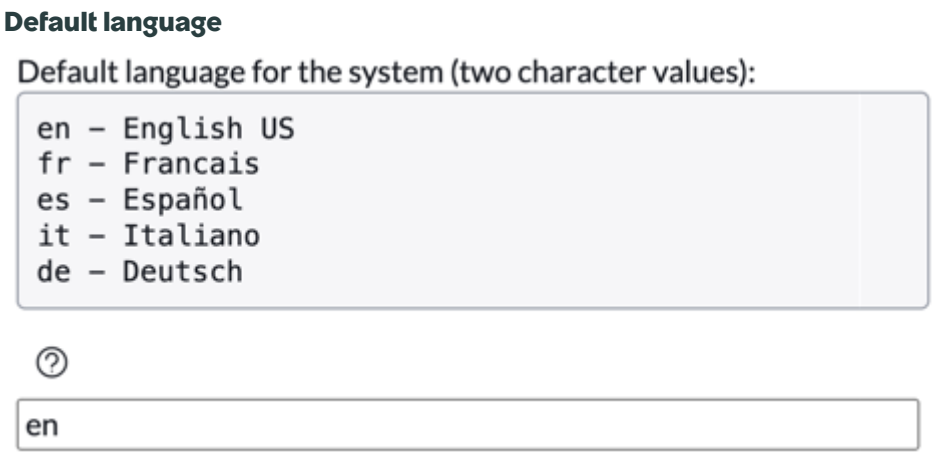
Change the language that appears by default for an instance.

Before you begin

Activate the languages that your users need. For more information, see Activate a language for supported languages or Translating to an unsupported language for custom translations.

Role required: admin

About this task



This property defines the language that users with a role see if a language is not specified in their user record. Users without a role see the default guest language, as described in User specific language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **System Localization**.
2. In the **Default language for the system (two character values)** field, enter a two-character language code.

   You can set the default language to any language that is active on the instance. The following language codes and languages are examples of possible values.

3. Select **Save**.

Set a fallback language

Set a fallback language to be used when user interface text is not translated in the user's preferred language to accommodate the language needs of your users.

Before you begin

Activate the languages that your users need. For more information, see Activate a language for supported languages or Translating to an unsupported language for custom translations.

Role required: admin

About this task

By default, if a UI string is not translated in the preferred language of an instance session, it displays in English. Setting fallback languages creates a three-level hierarchy in which an intermediate language is used before defaulting to English. Setting a fallback language also means you don't need to add custom translations for UI strings that are suitable in the fallback language and users get UI strings in the languages most appropriate for them.

For example, you could set the fallback language for Mexican Spanish to Spanish. If a UI string is not translated in Mexican Spanish, it displays in Spanish instead. If a Spanish translation is not available either, the UI string displays in English. As an admin, you would need to provide custom translations of UI strings in Mexican Spanish only when the translation differs from the Spanish translation.

Note: To turn off fallback languages and always fall back to English, add the *glide_i18n.language_fallback_enabled* property to the System Properties [sys_properties] table and set the value to `false`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Localization** > **Languages**.
2. In the Languages [sys_language] table, select the name of an active language.
3. In the **Fallback** field of the language record, select the name of the fallback language.
   You can select only an active language as the fallback language. You cannot set English as the fallback language because it is the default fallback language.
4. Select **Update**.

Set up locations

If your organization supports more than one distinct location, you can configure these locations in the platform to help further identify users, assets, and incidents.

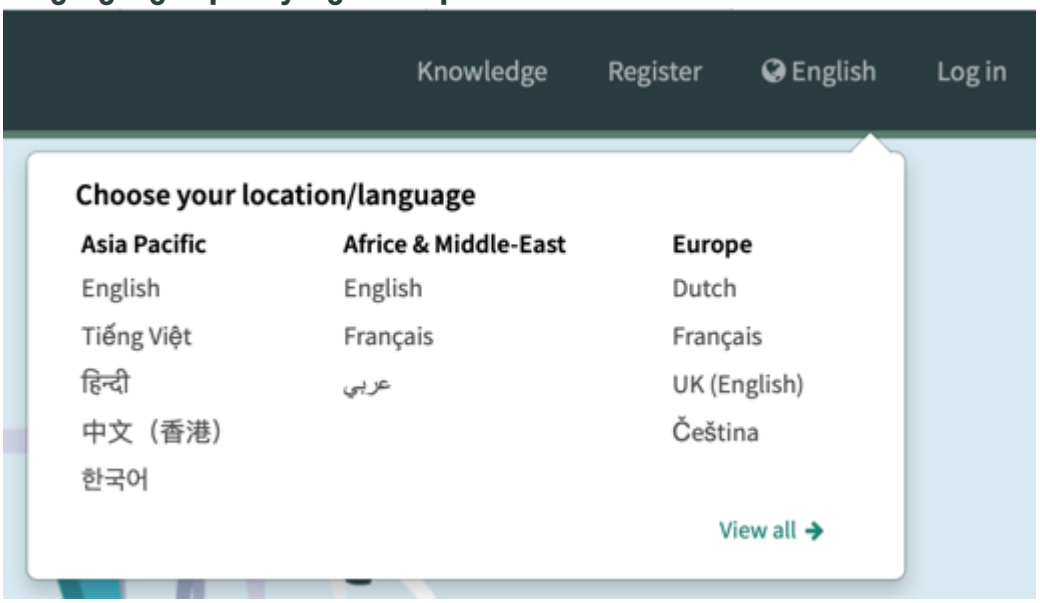
Before you begin
Role required: admin

Procedure

1. In the application navigator, navigate to **All** > **User Administration** > **Locations**.
2. Select **New**.
3. On the Location form, enter the location name, address, contact, and other location details.
4. Select **Submit**.

Result
The new location is available as a reference anywhere you can specify one.

Create regions for language selection in portals



Create regions to group languages in the language selector in portal headers.

Before you begin
Role required: admin

About this task
In portal headers, the language selector displays the current language selection of the user and a menu of languages that the user can choose from. If languages are assigned to regions, languages display according to the configured region groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Languages grouped by region in a portal header

For more information about the language selector in portal headers, see Enable a language selector in portal headers.

Procedure

1. Create regions.
   a. Navigate to **System Localization** > **Regions**.
   b. Select **New**.
   c. In the **Region** field, add a name for the region.
   d. In the **Order** field, assign a numerical value in multiples of hundred for the region. The order controls where the regions appear in the language selector, with the lowest ordered region on the left and the highest ordered region on the right.
   e. Select **Submit**.
   f. Repeat these steps to create additional regions.
2. Assign languages to regions.
   a. Navigate to **System Localization** > **Language Regions**.
   b. Select **New**.
   c. In the **Region** field, select a region from the list.
   d. In the **Language** field, select a language to assign to the region from the list.
   e. Select **Submit**.
   f. Repeat these steps to assign additional languages to regions.

Activate country choices for users

Select from additional countries in the Next Experience language and region preferences or a user record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
By default, you can select from only a limited list of countries in the Next Experience language and region preferences or in a User record. To allow users to select from additional countries, administrators can activate choices for the Country code [country] field on the User [sys_user] table. For more information about the Country user preference, see Configure Next Experience language and region preferences.

Procedure
1. In the navigation filter, enter `sys_choice.list`.
2. From the Choices list, use the condition builder to enter the following condition statement: **[Table] [is] [sys_user] AND [Element] [is] [country] AND [Inactive] [is] [true]**.
3. Select **Run**.
4. Select the Choice record for the country that you want to activate.
5. From the Choice record, clear the **Inactive** option.
6. Select **Update**.

Related topics
- Choice table
- User administration

Create country choices

Create additional country choices to select from in the Next Experience language and region preferences or a user record.

Before you begin
Role required: admin

About this task
By default, you can select from only a limited list of countries in the Next Experience language and region preferences or in a User record. Beginning with the Australia release, administrators can activate additional choices for the Country code [country] field on the User [sys_user] table. However, if the base system country choices were previously customized, the additional choices aren't available to activate after upgrading. Follow this procedure to create additional choices for countries that aren't available.

Procedure
1. In the navigation filter, enter `sys_choice.list`.
2. Select **New**.
3. On the form, fill in the fields.

Choice form

Field	Value
Table	User [sys_user]
Element	country

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Language	Enter a BCP 47 language identifier. This field can contain a language code or a language code followed by a country or region code. For example, tr for Turkish or es-MX for Mexican Spanish.
Label	Enter the name of the country in the specified language as you want it to appear in choice lists.
Value	Enter the two-letter ISO 3166-1 alpha-2 code for the country. For example, BR for Brazil.
Sequence	Enter a number to determine what order the option appears in the list if you don't want to list choices alphabetically.
Inactive	Leave cleared for the country choice to appear in the Next Experience language and region preferences or in a User record.

For more information about this table, see Choice table.

Example
The following choice lets users select Canada as their country when the user or instance language is English.

- **Table**: User [sys_user]
- **Element**: country
- **Language**: en
- **Label**: Canada
- **Value**: CA

4. Select **Submit**.

Ensure that translated choices appear for applications added by plugins

Ensure that translated choices appear for applications by activating translated choice records after corresponding English choice records have been added by plugins.

Before you begin
You must have activated a language and then activated a plugin that includes the corresponding English choice records. For more information, see Activate a language and Activate a plugin.

Role required: admin

About this task
When you activate plugins after having activated languages, translated choices in lists might not appear for applications or features installed by the plugins. Translated choice records installed by a language plugin that don’t already have corresponding English records in the Choices [sys_choice] table are set to **Inactive** by default. If you activate plugins that include those corresponding English choice records later, you need to make these records active to display translated choices for any applications or features installed with the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Localization** > **Languages**.
2. In the Languages [sys_language] table, select the name of any active language.

   You can select any language because this process updates choice records for all languages.
3. In the Related Links section, select **Repair non-english sys_choice records**.
4. In the Repair Non-English Choices? dialog box, select **Yes**.
   A job that makes the **Inactive** field for all translated choice records match their corresponding English choice records runs 15 minutes after you make this choice.

Result

Translations for all choices with corresponding English choice records appear for applications or features installed with plugins.

Set case and accent sensitivity on a per-column basis

Set locale text match to provide case and accent sensitivity when searching the text of table columns. The default behavior for text searching in table columns is insensitive to case and accent (diacritic) variations, but you can enforce sensitivity using locale text match.

Overview of locale text match

By default, text searching in table columns is insensitive to case (example: A vs. a) and accent or diacritic (example: A vs. Å).

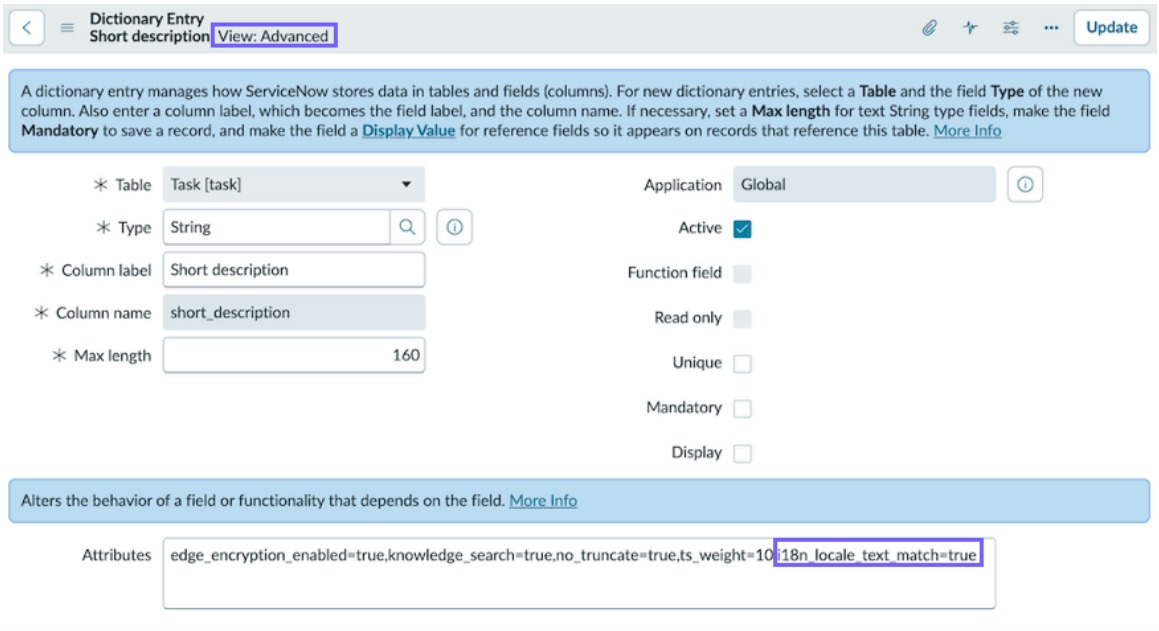
As an admin, you can modify this behavior for the fields you specify by setting the column attribute **i18n_locale_text_match** and a sys property **com.glide.db.ui_i18n_locale_text_match**. When set to true, text search on the column retrieves only exact matches for case and accent.

Locale text match is available from Zurich Patch 9 and Australia Patch 2.

Consider the following points when using the locale text match feature.

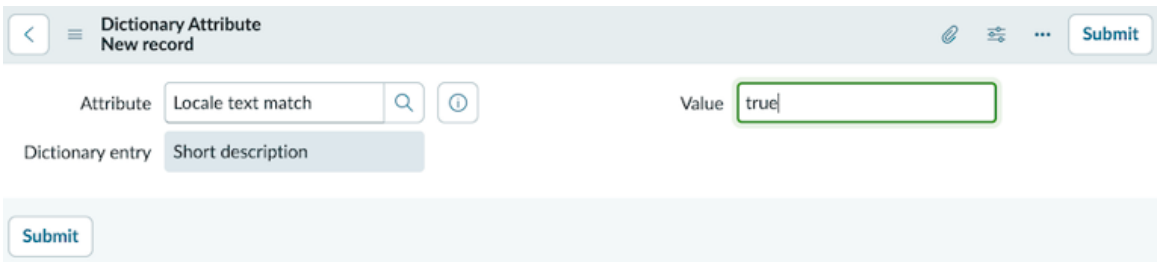
- Setting locale text match overrides the collation of SQL queries for the specific column.
- You can't set the **i18n_locale_text_match** column attribute when the following attribute is set on the same column: **i18n_session_language_sortable** or if property **com.glide.db.session_language_collation_feature**=true. For more information see Sorting according to the session language.
- Test the case and accent sensitive behavior thoroughly. When the **i18n_locale_text_match** column attribute is set, the behavior is applied to all queries including ACLs, business rules, and so forth.

Setting the column attribute i18n_locale_text_match



The default behavior is i18n_locale_text_match=false. Set the column attribute to true as follows.

Note: For text searches in tables in the product UI, both the column attribute and the sys property **com.glide.db.ui_i18n_locale_text_match** are required. See the Global property step in the Other methods for locale text match section of this page.



1. With the admin role, navigate to sys_dictionary.list.
2. Search for the name of your table and the name of the column to which you want to add this attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Open the dictionary entry, and confirm the column's Type. This attribute can be added to **String**, **Translated Text**, or **Translated Field** types.
4. In the Attributes field of the column, add `i18n_locale_text_match=true`. Use a comma separator without spaces. (You might need to switch to the Advanced view of the record to see the Attributes field).

5. As an alternative to the previous step, open the Attributes tab in Related Links, then select New. In the Attributes field search for `locale text match`, then set the Value field to True.

6. Select Update or Submit.

Other methods for locale text match

There are several methods for controlling locale text matching in specific situations, as follows.

Note: These methods can be applied only to a field which has the column attribute i18n_locale_text_match set to true.

1. GlideRecord: setLocaleTextMatch (Boolean isLocaleTextMatch)
   - Where: Used in scripts, such as for background transactions.
   - Use case: Temporarily activate or deactivate locale text match (case and accent sensitivity) for a specific GlideRecord query
2. URL parameter: sysparm_locale_txt_match

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Where:
  - Add `sysparm_locale_txt_match=true` or `sysparm_locale_txt_match=false` as an extra parameter in a URL.
  - Table API. For information see Explore the REST API for a table.
- Use case: When the parameter is added, activate or deactivate locale text match (case and accent sensitivity) for queries that display data in platform lists.

3. Global property: com.glide.db.ui_i18n_locale_text_match
   - Where: Create a property in sys_properties, if it doesn't exist already.

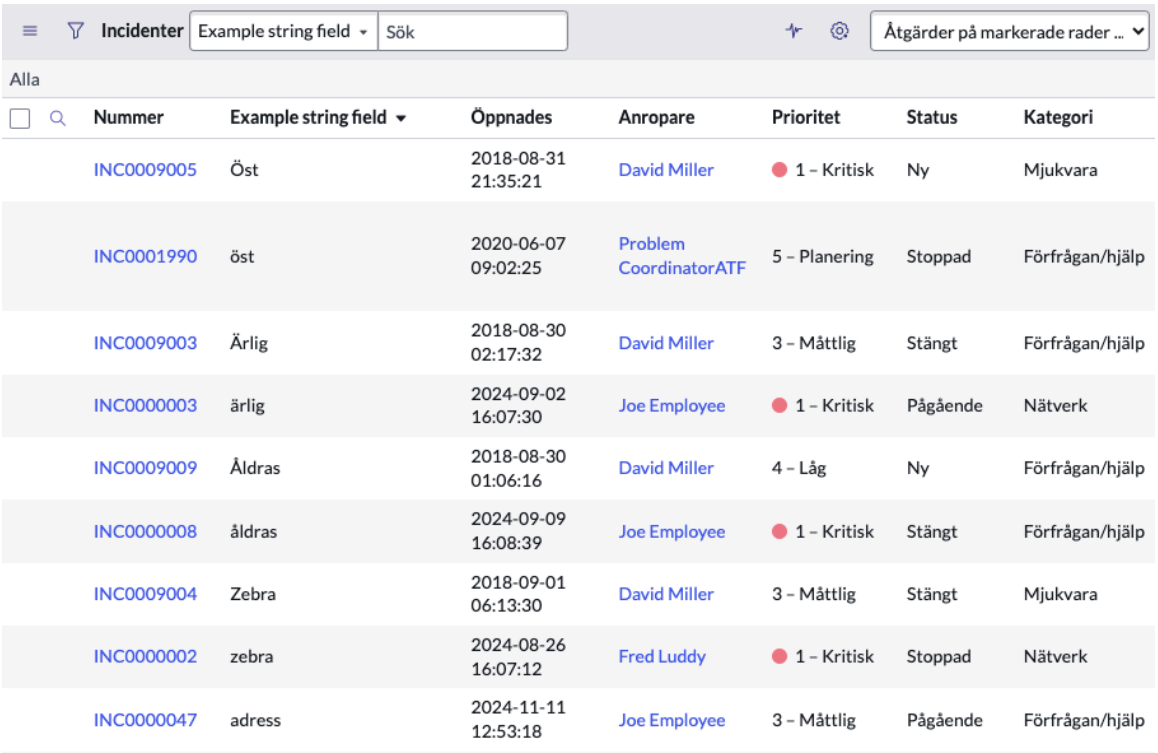
     Name: com.glide.db.ui_i18n_locale_text_match.

     Type: true | false.

     Value: either true or false according to your business requirements. For text searches in tables in the product UI, both this property and the column attribute should be set to true.
   - Default: false
   - Use case: Activate or deactivate locale text match (case and accent sensitivity) for queries that display data in the platform lists.

The following order determines how locale text match settings are applied. Higher priority settings override lower ones.

1. URL parameter: sysparm_locale_txt_match (highest priority).
2. Global property: com.glide.db.ui_i18n_locale_text_match (lowest priority).



Sorting according to the session language

Order string values according to the user's session language when sorting a column in a list.

By default, when sorting columns in lists, string values are ordered according to the English alphabet. To support sorting a column according to the user's session language, you can configure the instance behavior and the behavior of individual columns.

In the following example, the user's session language is Swedish. The Example string field column is sorted in descending order with the values ordered from Ö to A according to the Swedish alphabet.

INC0009004	Zebra	2018-09-01 06:13:30	David Miller	3 – Måttlig	Stängt	Mjukvara
INC0000002	zebra	2024-08-26 16:07:12	Fred Luddy	1 – Kritisk	Stoppad	Nätverk
INC0000047	adress	2024-11-11 12:53:18	Joe Employee	3 – Måttlig	Pågående	Förfrågan/hjälp

Note: This column attribute can't be set to true when the following column attribute is also set to true: Locale text match. For more information see Set case and accent sensitivity on a per-column basis.

The availability of this functionality for a supported language depends on the availability of a collation in the underlying Relational Database Management System (RDBMS) used in the instance. For a list of available collations for each language and RDBMS, navigate to the DB Collation Info [sys_db_collation_info] table. To add a collation for an unsupported language, see Add collation information for an unsupported language.

Enable sorting according to the session language

Enable sorting string values in columns according to the user's session language.

Before you begin

Role required: admin

About this task

Note: Sorting lists when the user's session language isn't English might take longer than with English, particularly for tables with large amounts of records (100,000 or greater).

Procedure

1. Navigate to **All** > **System Properties** > **System Localization**.
2. Select the **Enable sorting (for lists) in the user's session language when the language is other than English** option.
3. Select **Save**.

Result

When sorting a column in a list, the string values are ordered according to the user's session language. If needed, you can turn off this behavior for individual columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure sorting for a column

Configure whether the values in columns are sorted according to the user's session language.

Before you begin

Enable sorting according to the user's session language for the instance.

This column attribute can't be set to true with locale text match. For more information see Set case and accent sensitivity on a per-column basis.

Role required: admin

Procedure

1. Navigate to a field on a form, select and hold (or right-click) the field, and select **Configure Dictionary**.
   The field must be a string field.
2. From the Related Links, select **Advanced view**.
3. In the Attributes field, add the `i18n_session_language_sortable` attribute and specify a value of true or false.
   - Enter `i18n_session_language_sortable=false` to turn off sorting the column by the user's session language. The column is sorted according to the English alphabet instead.
   - Enter `i18n_session_language_sortable=true` to enable sorting the column by the user's session language. To turn off sorting according to the user's session language for all other columns, see the following step.
4. **Optional:** If you added the `i18n_session_language_sortable=true` attribute for one or more columns and want to change the default behavior of all other columns to sort according to the English alphabet, complete the following steps.

   a. In the navigation filter, enter `sys_properties.list`.

   b. Select **New**.

   c. On the form, fill in the fields.

Field	Value
Name	com.glide.db.i18n_session_language_sortable_default
Type	true|false
Value	false

   d. Select **Submit**.

What to do next

Configure the sorting behavior for any additional columns as needed.

Translating custom content

Translate content you create or modify to a supported language or add an unsupported language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Using the Localization Framework application is recommend for translating to an unsupported language or translating large amounts of custom UI string content in a supported language. For more information, see Localization Framework.

ServiceNow provides translations of the base system UI strings in supported languages through the internationalization (I18N) language plugins. For applications you create and modifications you make to the ServiceNow AI Platform® content, you must provide your own translations. You can also provide any translations to unsupported languages that ServiceNow does not provide translations for. The ServiceNow AI Platform does not provide any automatic translation capability.

The translation method depends on the material that you are translating. Repeat the translation process whenever you edit or update content.

Translation methods and use cases

What needs translation	Approach to take	Resources
Field labels in a table for a customer-created application	1. Create English versions for all fields in the table. 2. Locate the records for the table in the application. 3. Open the Field Labels translation table. 4. Export the records, translate the appropriate fields, set the language field, and reimport through an import set.	• Export and edit translation records • Alternatively, follow the procedure for translating individual labels in Translate a field label.
HTML in a UI page in a customer-created application	1. Create the English version. When creating the HTML in the UI Page form, wrap any translatable text in `gs.getMessage` calls. 2. Create a Message [sys_ui_message] record for each English message with a corresponding key/value pair. 3. Create additional Message records for each message for each other language.	Translate a client script message

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translation methods and use cases (continued)

What needs translation	Approach to take	Resources
Service Catalog items	1. Navigate to **All** > **System Properties** > **System Localization** and set **Display translation prefix on translatable strings** to **Yes**. 2. Create the item in English. 3. Change the preferred language to a different language. 4. Translate all the translatable items, now identified by translation prefix. 5. Save the record.	• To activate translation prefixes, see Debug translations. • For translatable text fields, which are common in Service Catalog items, see Translating text fields.
Service Portal widget	1. Create the English version. Externalize any translatable text by surrounding the text with `${}` wrappers. 2. Create a Message [sys_ui_message] record for each English translatable text with a corresponding key/value pair. 3. Create additional Message records for each piece of translatable text for each other language.	• Translate a client script message • Internationalize a widget in Service Portal documentation • For unofficial advice, see Building multi-lingual service portals
Playbooks	1. Activate any playbook that you want to translate. 2. Create translations for each translatable text in a playbook's process definition [sys_pd_process_definition].	Add translations for Playbooks
Edit a translation provided in a plugin	1. Export the records from the translation table. 2. Edit them outside the translation table and reimport them. Do not edit the records directly, because your	Export and edit translation records

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translation methods and use cases (continued)

What needs translation	Approach to take	Resources
	changes could be overwritten when you upgrade or zBoot your instance.	
Translate an instance to an unsupported language	1. Create a Choice [sys_choice] record for that language. 2. Add other translation records through the Export and import set approach.	Translating to an unsupported language
Support Chat texts	Support Chat is mostly translated through the I18N language plugins. If you customize any Support Chat texts, follow the procedure for Service Portal widgets.	Internationalize a widget in Service Portal documentation
Notifications and surveys	System Localization does not cover platform notifications or surveys. The usual approach is to create a separate version of each survey or notification in each language and use business rules to send the right language version to the right end user.	—

Locating translatable UI strings

Locate individual untranslated strings to provide your own translation of customer-created and customer-edited strings, such as field names and messages.

The internationalization (I18N) language plugins contain only translations of the UI content that ServiceNow provides by default in your instance. If you have customized UI strings that you want to translate, you can identify and translate these strings manually. To perform these translations, you must first take the following actions:

- Identify the strings that need to be translated.
- Identify which translation tables contain the strings.

To identify strings that have not been translated into any language and their translation tables, see List untranslated items.

If you know where a string appears in the UI and only have a small amount of material to translate, consider using the debug functionality to identify which strings are translatable and their translation tables. This functionality consists of prefixes that appear before all translatable strings and identify the translation table that the strings are in. For more information, see Debug translations.

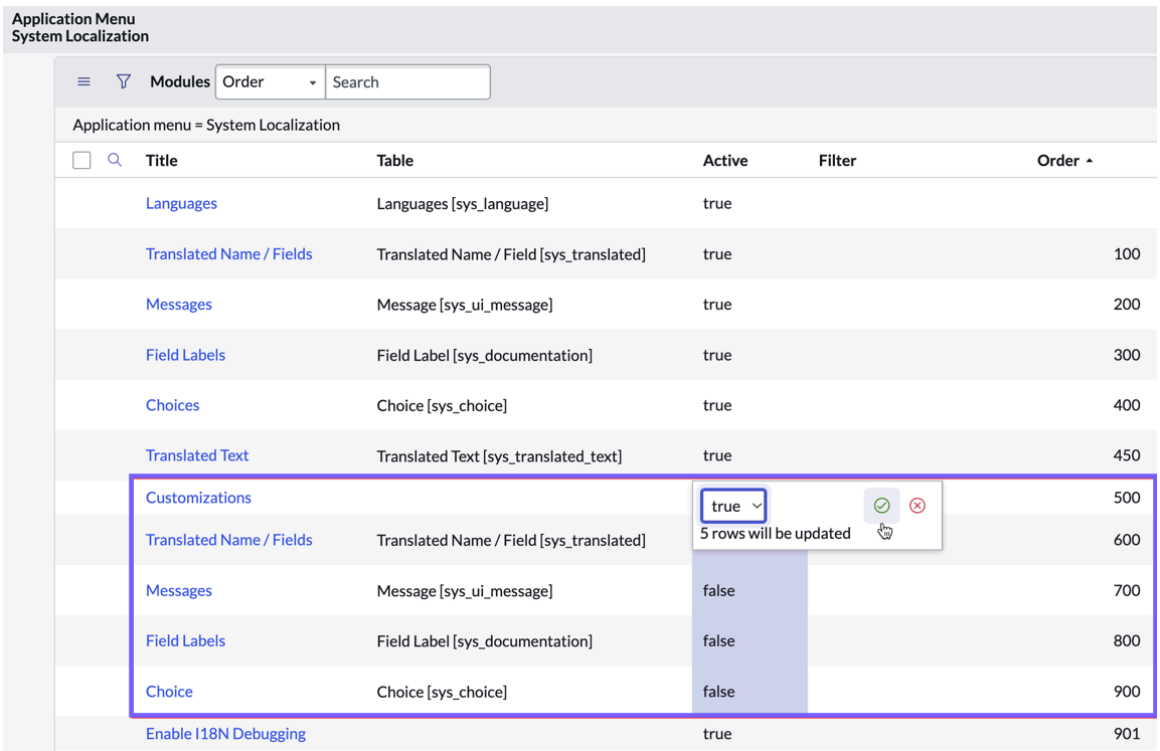
List untranslated items

Get a list of all custom UI strings that have not been translated into any language (English only) to provide your own translations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
This procedure activates modules corresponding to the following translation tables that list records with only an English version.



- Translated Name / Fields
- Messages
- Field Labels
- Choices

This method of listing untranslated items does not identify strings that have been translated into at least one non-English language but are missing translations in other languages.

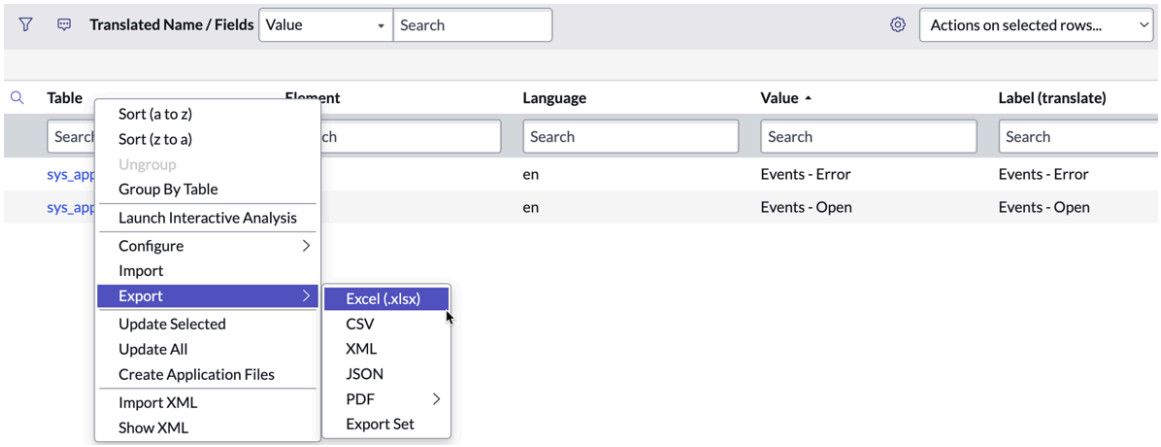
Note: This process works best with a small number of untranslated items. For information about a workaround for large numbers of untranslated items, see the Inefficient load of customizations for System Localization -> Non-Translated Items [KB0813304] article in the Now Support Knowledge Base.

Procedure
1. Navigate to **All** > **System Definition** > **Application Menus**.
2. Select the **System Localization** application menu.
3. From the **Modules** list in the **System Localization** record, update the **Customizations**, **Translated Name/Fields**, **Messages**, **Field Labels**, and **Choice** modules to set the **Active** field to **True** using the list editor.

   When the list is sorted by **Order**, the modules appear in order from 500 to 900.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Instead of **Customizations**, your list might show a record titled **Non-translated Items**. When you activate the **Customizations** module, the title changes to **Non-translated Items**.



After the application navigator refreshes, the modules appear in the filter navigator beneath **Non-translated Items**.

4. From the application menu, open each module and export their lists to any supported format, such as Microsoft Excel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
For example, select **Non-translated Items** > **Translated Name/Fields**, right click any column, and export the list.

What to do next
You can translate the fields in an external application and reload the translations as an update set. For more information see, Export and edit translation records. If you have a small number of strings to translate, you can translate them individually. For more information, see Translating individual UI strings.

Debug translations

Show which UI strings are translatable and their translation table to debug translations.

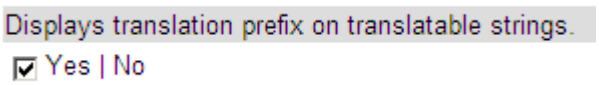
Before you begin
Role required: admin

About this task
You can set translation prefixes to appear only in the current user session or to appear in all sessions.

Translation prefixes map to translation tables as follows.

Translation prefixes mapped to tables

Prefix	Table	Navigation
TRF	Translated Name / Fields [sys_translated]	**System Localization** > **Translated Names / Fields**
MSG	Messages [sys_ui_message]	**System Localization** > **Messages**
GMLD	Field Label [sys_documentation]	**System Localization** > **Field Labels**
TRT	Translated Text [sys_translated_text]	**System Localization** > **Translated Text**
CHC	Choice [sys_choice]	**System Localization** > **Choices**

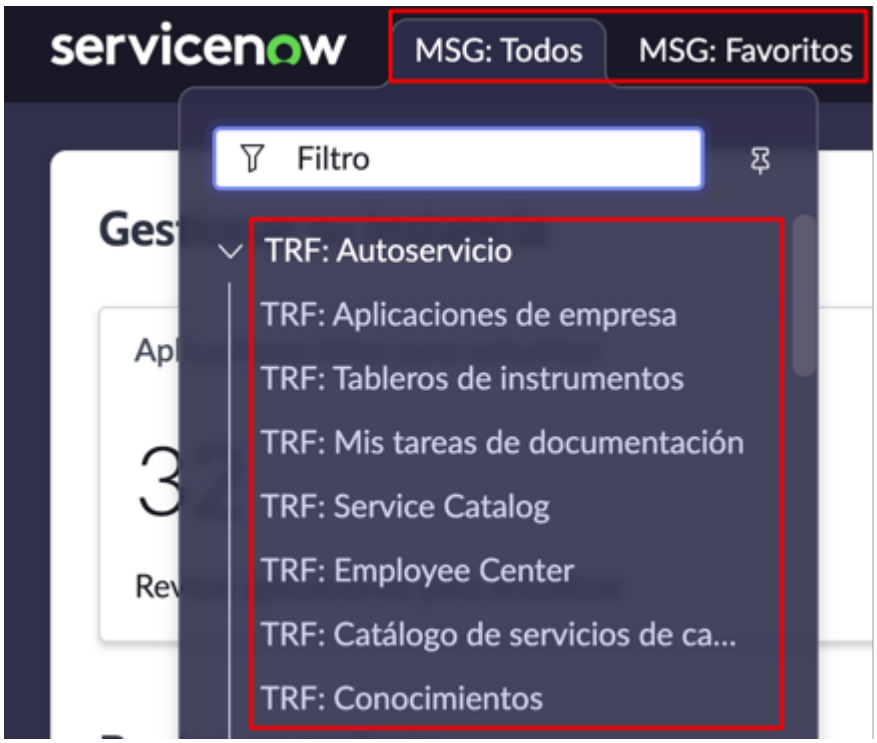


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: A few strings may not display translatable prefixes. In this case, the string is not stored on any of these tables. Examples of this behavior include:

- Text embedded in images, such as the buttons in the Service Catalog.
- Text defined by properties, such as the text which follows the banner.

Procedure



1. Enable translation prefixes on field labels.
   - To enable prefixes for the current user session, navigate to **All** > **System Localization** > **Enable I18N Debugging**.
   - To enable prefixes for all sessions, navigate to **All** > **System Properties** > **System Localization** and set **Display translation prefix on translatable strings** to **Yes**.

2. Refresh the page or change your user language to one of the non-English languages installed on your instance to see the prefixes.

Result

When enabled, translation prefixes appear before translatable UI strings.

What to do next

When you are done debugging, disable the translation prefixes.

- To disable prefixes for the current user session, either log out of the session or navigate to **All** > **System Localization** > **Disable I18N Debugging**.
- To disable prefixes for all sessions, navigate to **All** > **System Properties** > **System Localization** and set **Display translation prefix on translatable strings** to **No**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translating individual UI strings

When translating just a few UI strings, such as when you add customizations to a translated instance, use the procedure that applies to the type of text being translated.

UI strings include field names and values, related list names, and messages.

Fields and related lists

Three types of fields support translated strings for fields and related list names:

Translated_field

Stores field labels, related list names, and certain field values. The value of the translated_field replaces the label, list name, or field value when the user selects the matching language. Translated_field values have a one-to-many relationship with their associated keys. As a result, multiple records can reference one translated_field value. For more information, see the following topics:

- Translate a field label
- Translate a related list name
- Translate a field value for the Classic Environment

Translated_text

Stores long text values in plain text. The value of the translated_text replaces the plain text when the user selects the matching language. Translated_text values have a one-to-one relationship with their associated keys. As a result, only one record can reference a translated_text value. For more information, see Translating text fields.

Translated_html

Stores long text values in HTML. The value of the translated_html replaces the HTML when the user selects the matching language. Translated_html values have a one-to-one relationship with their associated keys. As a result, only one record can reference a translated_html value. For more information, see Translating text fields.

The translated values are stored as separate records and display the proper value according to the end user's language. To determine the field type, right-click the field on the form, select **Configure Dictionary**, and check the **Type** field.

Messages

Informational messages, confirmation messages, error messages, and other types of system messages across the platform can be translated. Messages that support translation come from HTML in a UI page in a customer-created application or Service Portal widget messages when these texts are wrapped correctly. When a client script contains a getMessage call or a server script contains a `gs.getMessage` call, the system checks the Messages [sys_ui_message] table for a translation. Fore more information, see Translate a client script message.

Translate a field label

Field labels are the names that appear on forms and lists to describe the type of information the field contains.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following procedure works best for translating individual field labels, such as those added with a customization. To translate large numbers of field labels, use the procedure described in Export and edit translation records.

Procedure

1. Navigate to the field on the form.
2. Right-click the field label and select **Configure Label**.
3. In the *Field Label* form, replace the English text with the text of the target language in the *Label*, *Plural*, and *Hint* fields.
4. Enter the BCP 47 code of the target language.
5. Right-click the header bar and select **Insert**.
   Selecting **Insert** creates a new record in the Field Label [sys_documentation] table for this field label in the selected language. For more information about this table, see Field Label table.

Translate a field value for the Classic Environment

Field values are the text entries that are used for fields with the type translated_field, such as the *Title* or *Hint* field in the Module [sys_app_module] table.

Before you begin

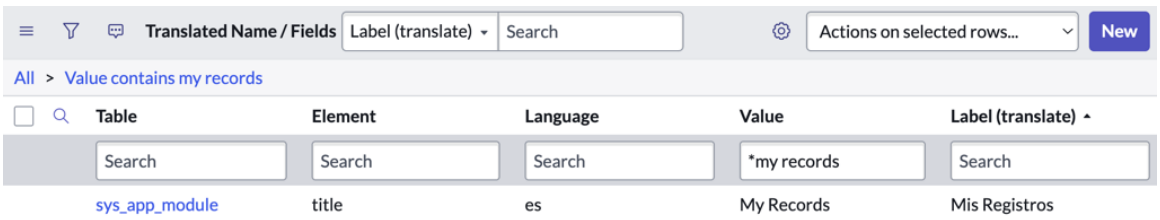
Role required: admin

About this task

The following procedure works best for translating values for individual fields, such as those added with a customization. To translate large numbers of field values, use the procedure described in Export and edit translation records.

Procedure

1. Use the language picker in the header bar to switch to the desired target language.
2. Navigate to the field on the form.
3. Update the field value with the text translated into the target language (Spanish).



4. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This creates a new record in the Translated Name / Field [sys_translated] table for the selected language or updates the existing record if a translation already exists. For more information about this table, see Translated Name / Field table.

Translated field

Translate a choice label

Translate the labels of choices in a list.

Before you begin

Role required: admin

About this task

To translate a choice in a list, you must create a choice record for each language that you want to support in the Choice [sys_choice] table. For more information about this table, see Choice table.

Procedure

1. Navigate to **All** > **System Localization** > **Choices**.
2. Select **New**.
3. On the form, fill in the fields.

Choice form

Field	Description
Table	The name of the table that contains the choice.
Element	The column name for the field that contains the choice.
Language	The BCP 47 code of the language for the translated choice. The identifier can contain a language code or language code followed by a country or region code. For example, *tr* for Turkish or *es-MX* for Spanish Mexico.
Label	The label for the choice in the specified language.
Value	A key that is the same for the choice in each language. For example, you could use the English label or the sequence number as the value for all languages to map them to each other.
Sequence	A number that determines in what order the option appears in the list if you don't want to list choices alphabetically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
The following record translates the "Email" choice in the subcategory field on the Incident table into Spanish.

- **Table**: Incident [incident]
- **Element**: subcategory
- **Language**: es
- **Label**: Correo electrónico
- **Value**: email

4. Select **Submit**.
5. **Optional:** From the context menu, select **Insert and Stay** and update the form to translate the choice into another language.

Translating text fields

Translate long pieces of text into the language of the user.

Translated text fields allow the same field to display different content based on the language of the user.

There are two different translated text fields:

- Translated Text: Stores long text values in plain text.
- Translated HTML: Store long text values in HTML.

These fields operate the same as normal text and HTML fields respectively, except that they can store multiple inputs in multiple languages. The most frequent use of translated text fields is Service Catalog names, descriptions, or variables.

Note: There is a slight performance penalty associated with changing a normal HTML or text field into a translated HTML or text field. It is best only to use translated fields if the translated capability is required.

For translated text and HTML fields, the English language text is stored in the main table, but the values of other languages are stored in the Translated Text [sys_translated_text] table. Each translated field on every row has one or more entries in the Translated Text table: one per language for which ServiceNow provides a translation. For more information, see Translated text table.

Note: Knowledge article translation uses a separate system that relies on the I18N: Knowledge Management Internationalization Plugin. If this plugin is not activated, knowledge article translation falls back on the system described here, with translations kept in the Translated Text [sys_translated_text] table. For more information about Knowledge Management internationalization, see Translation management in the Knowledge Management documentation.

Translate long text content

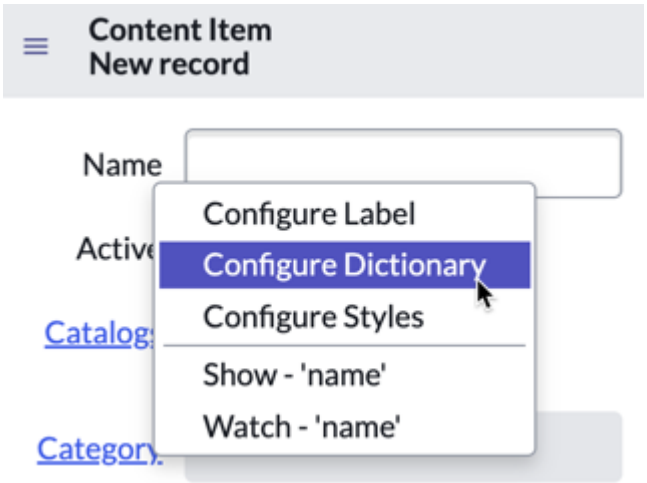
Translate the content of translated text and HTML fields directly in the form where the content is specified.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Use the following procedure to translate the content for customer-created text fields. To edit existing text translations, export the records from the Translated Text table and follow the procedure in Export and edit translation records.



Procedure

1. Open the record with the field that you want to translate.
2. Verify that the field whose content you want to translate is a translated_text or translated_html field.
   The following steps are one possible way to verify a field type:

   a. Right-click the label of the field and select **Configure dictionary**.

   Example
   In this example, the context menu has been opened for the **Name** field for a record in the Record Producer [sc_cat_item_producer] table.

   Context menu for field

   b. In the **Dictionary Entry** record that opens, confirm that the **Type** field is **Translated Text** or **Translated HTML**.

   Example
   In this example, you see that the **Name** field is of the type **Translated Text**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary entry for field

c. Navigate back to the form.

3. Use the language picker to switch to the desired language.
4. In the relevant field, replace the English text with the text of the target language.
5. Select **Submit**.
   A new record in the Translated Text [sys_translated_text] table for the active language is added. For more information about this table, see Translated text table.

Translate a related list name

Related lists appear at the bottom of forms. You can translate a related list name by configuring the list control.

Before you begin

Role required: personalize_control

Procedure

1. Use the language picker to switch to the desired language.
2. Navigate to the related list on the form.
3. Open the list control for the related list by performing the appropriate action for the list version.

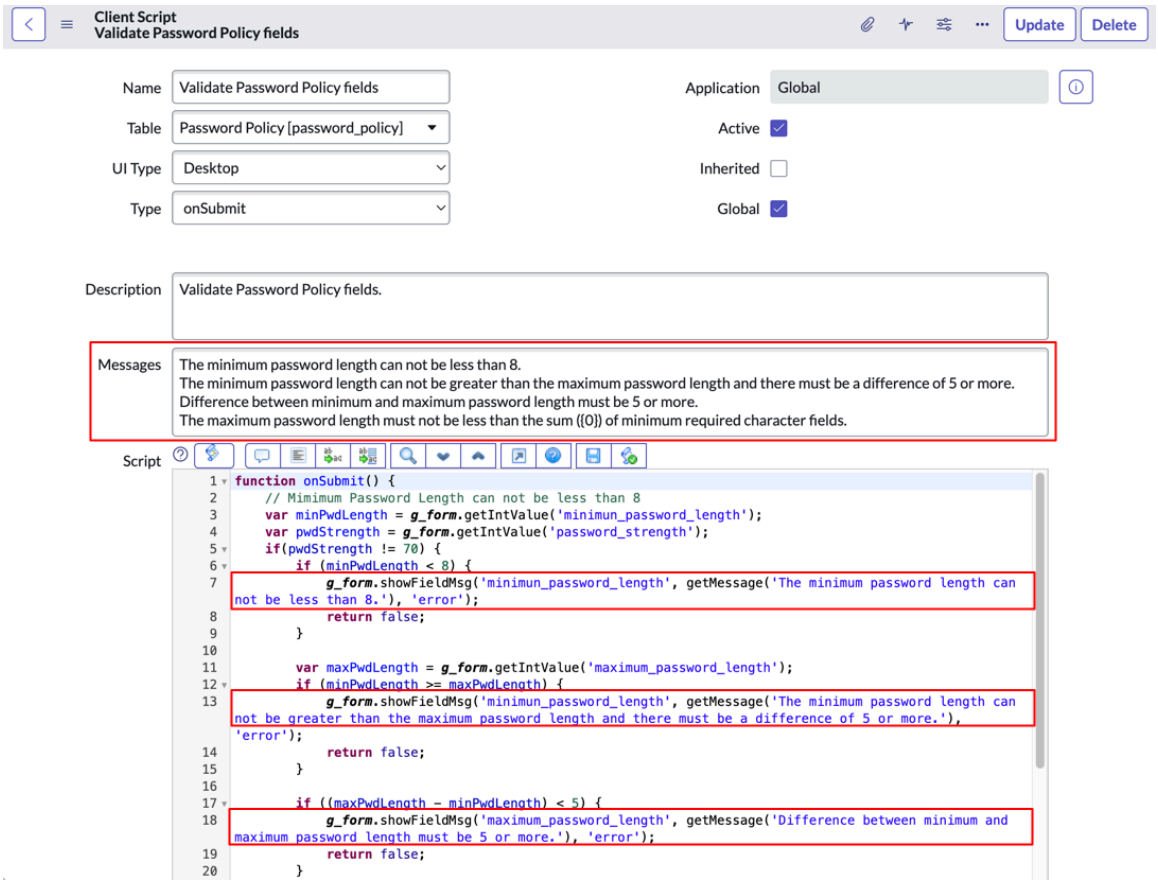
Version	Action
List v2	Right-click any column heading and select **Configure** > **List Control**.
List v3	Open the list title menu and select **List Control**.

4. On the List Control form, replace the existing *Label* with the text of the target language.
5. Select **Submit** or **Update**.
   The system creates a new entry in the Translated Name / Field [sys_translated] table or updates the existing entry for this language. For more information about this table, see Translated Name / Field table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translate a client script message

Translate the messages used by client scripts.



Before you begin

Create a client script that contains messages. For information about creating client scripts, see Client scripts.

Role required: admin

About this task

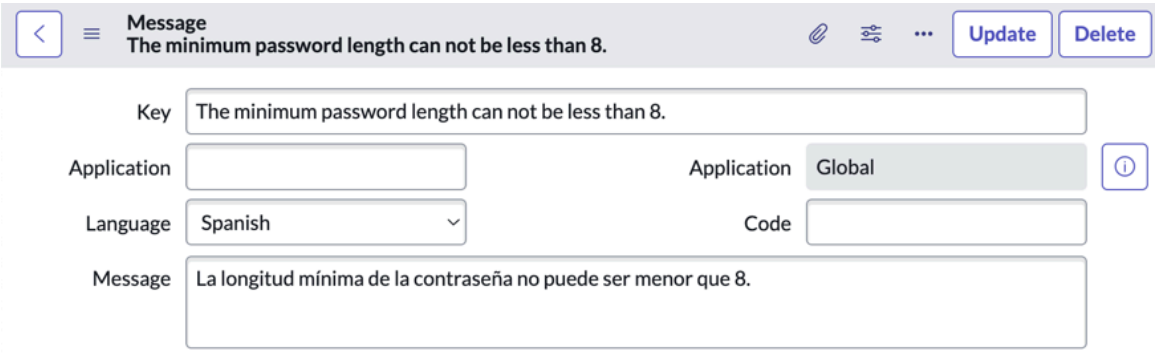
Client scripts include a multi-line *Messages* field, which is for message strings that the client script can use as a key to look up a localized message alternative from the Message [sys_ui_message] table. Each message key in a client script is on a separate line in the *Messages* field. The instance looks for a localized message string anytime the client script makes a getMessage(msg) call where the msg string matches a key in the *Messages* field in the client script.

For example, if you add the string `Please populate the Reason` field to the *Messages* field in the client script, then the instance will look for a localized string from the Message `[sys_ui_message]` table any time the client script calls:

```
getMessage("Please populate the Reason field")
```

Note: If you create a record in the Message [sys_ui_message] table that uses an existing key and the same language, the message for existing references using the key can change. For example, if a record exists with "Refresh" for the key, English for the language, and "Refresh" for the message, and you create another record with the same key and language but a different message of "Refresh the screen", existing UI strings using the "Refresh" key will display the new "Refresh the screen" message. Records in this table are created in the global scope and aren't scope-restricted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **System Localization** > **Messages**.
2. Select **New**.
3. On the form, fill in the required fields.

Message form

Field	Description
Key	The internal unique identifier for this message.
Language	The language the message is translated into.
Message	The translated text that users see.

Example

4. Select **Submit**.
   A new record is added to the Message [sys_ui_message] table for the localized message key string. For more information about this table, see Message table.

Add translations for Playbooks

Make Playbooks available in multiple languages during runtime, to support worldwide business processes.

Before you begin

- Role required: admin or playbook.admin
- To enable custom translations for playbooks, install the 27.1 app version or later.
- Activate any playbooks that you want to translate.
- To learn more about translating custom content in general, see Translating custom content.

About this task

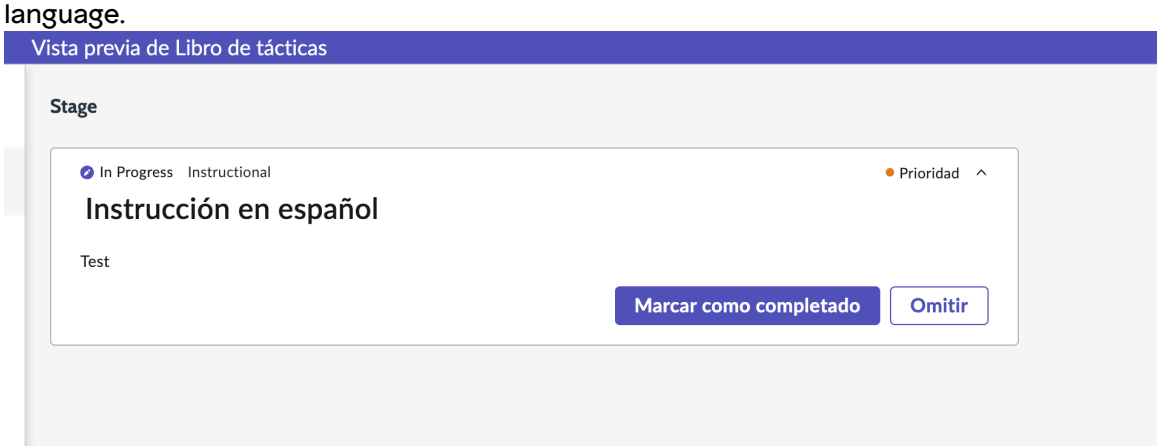
UI Message records are used to translate the text in your playbooks to different languages at runtime, similar to the way system messages are translated on the platform. To learn more about the Message table [sys_ui_message] in general, see Message table.

The playbook text that you can create translations for are:

- Playbook Label
- Stage Label
- Activity Label

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Activity Description
- HTML and string Activity UI Layout properties



Note: Automation inputs such as text used to create emails or records are not translated. Only text that is shown at runtime within a Playbook Experience is translatable.

Procedure

1. Navigate to Workflow Studio, open playbook, activate playbook.
2. Open the **All** menu.
3. In the filter bar, type and enter **sys_pd_process_definition.list**.
4. Select the playbook that you want to add translations for.
5. Open the **Translated Messages** tab.
   All of your playbook text is listed here.
6. Open a piece of text that you want to translate.
7. From the **Language** drop-down, select the language that you want to translate to.
8. In the **Message** field, enter the translation.
9. Right-click on the form header to open the context menu, and select **Save**.
   Your translation is saved.
10. Repeat steps 1-8 to add more translations.

Result

When the playbook runs, the translated content appears for agents in their user session language.

Export and edit translation records

Export translation records to translate to additional languages in your preferred translation environment and import the new or edited translation records through import sets.

Before you begin

Note: Using the Localization Framework application is recommend for translating to an unsupported language or translating large amounts of custom UI string content in a supported language. For more information, see Localization Framework.

Role required: admin

About this task

In the following cases, translate strings in the UI outside of the ServiceNow AI Platform and import them through import sets:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You have a significant amount of customer-created UI components and you want to translate these components into other languages.
- You want to modify translations that ServiceNow provides in internationalization plugins.
- You want to translate an instance into a language that ServiceNow does not support with internationalization plugins. For more information, see Translating to an unsupported language.

All translatable UI strings items are stored in translation table records. The only time you would translate UI directly in translation records is when you have a small amount of customer-created UI components and you know exactly where they are. For more information about translation tables, see Translation tables and Translating individual UI strings.

Procedure

1. If you are translating customer-created UI components, locate the translatable strings.
   For more information, Locating translatable UI strings.
2. Export the relevant translation table records into a format (such as Excel) that can be easily manipulated.
   For more information about exporting a list of records, see Export data from a list.
3. Within the exported document, translate the following fields in each row, depending on the translation table:

Translation table	Fields to translate
Field Labels	Label, Plural, Hint
Translated Name/Field	Label (translate)
Message	Message
Choices	Label
Translated Text	Value

4. Within each row, change the "Language" column to the BCP 47 code of the new language. In Translated Text and Message records, type the full name of the language instead of the BCP 47 code.
5. Save your changes.

What to do next
Import the translated document back into the instance as an import set.

Import a translation from an Excel spreadsheet

The System Import Sets application contains import tables and corresponding transform maps to assist with importing translations from an Excel spreadsheet.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Import Sets** > **Load Data**.
2. Select **Use Existing** and the **Table name** that matches the type of data being imported, as follows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For choices, select the `[u_sys_choice]` table.
- For field labels, select the `[u_sys_documentation]` table.
- For translated names and fields, select the `[u_sys_translated]` table.
- For messages, select the `[u_sys_ui_message]` table.
- For translated text, select the `[u_sys_translated_text]` table.

3. Select **Upload an Excel file**, and then click **Browse** to select the source Excel spreadsheet.
4. If appropriate, specify the *Work sheet* and *Header row number*.
5. Select **Go**.

   The translations are now available in the appropriate *Import Set Table*.

6. Navigate to **All** > **System Import Sets** > **Table Name** and review the imported information to verify that the import was successful.
7. To transform the imported data into the corresponding table, navigate to **All** > **System Import Sets** > **Run Transform**.
8. Select the appropriate transform map, as follows.

   Note: Make sure you choose a transform map that has the **Run Business Rule** option selected. If the transform map does not have this option selected, any customized translations you have may be overwritten during the next upgrade.

   - For choices, select the **Sys Choice Translation Map**.
   - For field labels, select the **Sys Documentation Translation Map**.
   - For translated names and fields, select the **Sys Translated Translation Map**.
   - For messages, select the **Sys UI Message Translation Map**.
   - For translated text, select the **Sys Translated Text Translation Map**.

9. Select **Transform**.

Translating to an unsupported language

Translate the interface of an instance to a language for which ServiceNow does not provide an internationalization (I18N) plugin.

Before you begin

You can download a file containing translatable strings from the Translate an unsupported language - File Containing strings in the English Language [KB0860203] article in the Now Support Knowledge Base.

Role required: admin

About this task

All interface items are stored as translatable strings in the translation tables. By default, these translation tables contain only English strings. To populate these tables with translated strings in an unsupported language, use the following workflow.

There is a very large number of translatable strings on the platform. Exporting all of them and translating them manually is probably not a realistic possibility. Consider exporting filtered subsets of the strings from each table and then translating them. To download a file of translatable strings, see KB0860203.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the Localization Framework application to translate to an unsupported language or to translate large amounts of custom UI string content in a supported language. For more information, see Localization Framework.

Procedure

1. Create a language record for the unsupported language.
2. Export and translate the strings that you want to translate, as described in Export and edit translation records.
3. Import the translated document back into the instance as an import set, as described in Import a translation from an Excel spreadsheet.
4. Create a language choice for users to select the new language.

Translation tables

Create a language record

Add a record for a language not provided by an internationalization (I18N) plugin to associate new translations with.

Before you begin
Role required: admin

About this task
To translate the interface of an instance to a language for which ServiceNow does not provide an internationalization plugin, you must create a language record for a new translation in the Languages [sys_language] table. For more information about this table, see Languages table.

Procedure

1. Navigate to **All** > **System Localization** > **Languages**.
2. Select **New**.
3. Provide the language information.
   - **Name**: The name of the language, for example, Turkish.
   - **ID**: The BCP 47 code for the language, for example, tr.
   - **Text Direction**: The direction that the instance should use to display the language: Left-to-Right or Right-to-Left.
   - **Active**: Option to activate the language for the instance.
   - **Fallback**: The name of another active language to use as a fallback language. For more information about fallback languages, see Set a fallback language.
4. Select **Submit**.

Create a language choice for users

Allow users to select the language as a valid option in the language picker or a user record.

Before you begin
Role required: admin

About this task
You must create a choice record for a new translation in the Choice [sys_choice] table. For more information about this table, see Choice table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Localization** > **Choices**.
2. Select **New**.
3. Enter the following fields.

Choice record fields to select the new language

Field	What to enter
Table	`sys_user`
Element	`preferred_language`
Language	Enter an identifier that complies with BCP 47. The identifier can contain a language code or language code followed by a country or region code. For example, *tr* for Turkish or *es-MX* for Spanish Mexico.
Label	Enter the name of the new language selection as you want it to appear in the language picker. For example, Mongolian.
Value	Enter an identifier that complies with BCP 47. The identifier can contain a language code or language code followed by a country or region code. For example, *tr* for Turkish or *es-MX* for Spanish Mexico.
Sequence	Enter a number to determine what order the option appears in the choice list if you do not want to list choices alphabetically. For example, 5.

Example
The following record allows a user who is using the Dutch localization of their instance to change languages to Mongolian:

- **Table:** User [sys_user]
- **Element:** preferred_language
- **Language:** nl
- **Label:** Mongoolse
- **Value:** mn

4. Select **Submit**.

Configure a language as reading from right to left

Use the Text Direction field to configure a language that reads from right to left, such as Hebrew.

Before you begin
Activate the languages that your users need. For more information, see Activate a language.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Right-to-left language support is available only in the main user interface and on live feed. Other user interfaces and applications, such as the graphical Workflow Editor, reporting, CMS, chat, and the ServiceNow documentation sites, are not supported.

Procedure
1. Navigate to **All** > **System Localization** > **Languages**.
2. Select **New**.
3. Enter the **Name** of the language, such as Hebrew.
4. Enter the BCP 47 code for the language.

   Example
   For example, Hebrew is `he`.
5. In the Text Direction field, select **Right-to-Left**.
6. Select **Submit**.

Add collation information for an unsupported language

Add collation information for an unsupported language to enable sorting columns in lists according to the language.

Before you begin
Add a record for a language not provided by an internationalization (I18N) plugin to associate new translations with and translate content into that language. For more information, see Translating to an unsupported language.

Role required: admin

About this task
Collation information must come from the underlying Relational Database Management System (RDBMS) used by the instance: MariaDB, RaptorDB, or Oracle. To determine which RDBMS an instance uses, navigate to **All** > **System Diagnostics** > **Database** > **Information**. Refer to the documentation provided by the RDBMS to determine if the database includes a collation for a given language and the name of the collation.

Procedure
1. In the navigation filter, enter `sys_db_collation_info.list`.
2. Select **New**.
3. On the form, fill in the fields.

DB Collation Info form

Field	Description
Language	The BCP 47 code for the language.
Collation Name	The name of the collation provided by the Relational Database Management System (RDBMS).
Application	The application scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Database	The Relational Database Management System (RDBMS) to which the collation applies: MariaDB, RaptorDB, or Oracle.

4. Select **Submit**.

Result

When sorting columns according to the session language is enabled, users can sort columns according to the collation of the unsupported language. For more information, see Sorting according to the session language.

System Localization reference

Reference topics provide additional information about configuration properties, tables, and more.

System Localization properties

System Localization properties configure translation, currency, and locale settings on the instance for users from multiple countries.

Some localization properties only appear after the I18N: Internationalization plugin is activated. Some properties are available on the System Localization properties page, but some lesser-used properties are available only from the System Properties [sys_properties] table.

Access the following properties by navigating to **All** > **System Properties** > **System Localization**.

Property	Description
Enable sorting (for lists) in the user's session language when the language is other than English *com.glide.db.session_language_collation_feature*	Enable sorting string values in a column according to the rules of the user's session language. If this option isn't selected, field values are sorted according to the English alphabet. • Options: Yes | No • Default value: No • When this property is set to Yes, and Locale Text Match is true, then the `i18n_session_language_sortable` column attribute must be set to false. See Set case and accent sensitivity on a per-column basis. • Learn more: Sorting according to the session language
Show the language select box on the login page so the user can specify the language they would like to be logged in with. *glide.ui.login.language.select*	Enables language selection upon login. • Options: Yes | No • Default value: Yes • Dependency: The I18N: Internationalization plugin must be active
Text Search stemming language.	Selects the language to match derived words in text search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.ts.stemming_language	• Options: English, German, and French • Default value: English • Dependency: The I18N: Internationalization plugin must be active • Learn more: Zing matches derived words with stemming
Displays translation prefix on translatable strings. *glide.ui.i18n_test*	Adds a translation prefix on translatable fields to indicate where to find the string for translation. • Options: Yes | No • Default value: No • Learn more: Debug translations
Use a single currency model. Display all currencies in the same currency code, regardless of a user's locale, country, or language code. *glide.i18n.single_currency*	Enable single currency mode. • Options: Yes | No • Default value: No • Learn more: Currency administration
Default language for the system (two character values) *glide.sys.language*	• Options: en, fr, es, it, de • Default value: en
If using the single currency model, display all currencies using this currency code. Currency codes use the ISO 4217 three letter format. *glide.i18n.single_currency.code*	• Options: ISO 4217 three-letter currency code • Default value: USD • Learn more: Currency administration
Locale code to use for localization. *glide.system.locale*	Determines the system's default currency into which all prices are automatically converted before other sums or conversions are performed. Changing this property after any price or currency fields have been given a value may result in improper conversion or prices that sum incorrectly. • Options: [language code].[country code] (for example, en.GB for Britain, fr.FR for France, de.DE for Germany, or ja.JP for Japan) • Default value: None • Learn more: Locale settings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Note: After you have set a value on this system property and your system has gone into production, do not change this value. If a user's locale must be changed, update the "Country code" field on the user record.
Determines whether the platform displays dates and times formatted according to the user's locale. *glide_i18n.date.default_to_locale*	Determines whether the platform displays dates and times formatted according to a user's locale when no date or time format has been selected in user preferences. If this option isn't enabled, dates and times are formatted using patterns set in the *glide.sys.date_format* and *glide.sys.time_format* properties. • Options: Yes | No • Default value: No • Learn more: Locale settings
For guest users, enables using their IP address to try to set the user's initial language. *glide_i18n.ip_geolocation*	Determines the platform's default language used from the country associated with the user's IP address if locale can't be determined from other settings. If this option isn't enabled, the platform language defaults to English for guest users whose locale can't be determined. • Options: Yes | No • Default value: No • Learn more: Locale settings
Spell checker dictionary to use for English users. *glide.spell.dictionary.en*	Sets the spell checker dictionary used in the system for English users. • Options: Brazilian Portuguese, Dutch, English US, English UK, French, German, Italian, Portuguese, Russian, Spanish, and Thai • Default value: English US • Learn more: Locale settings

Access the following properties by entering `sys_properties.list` in the navigation filter to open the System Properties [sys_properties] table.

Property	Description
com.glide.db.i18n_session_language_sortable_default	Option to set the default behavior of column sorting. If true, the default behavior of columns is to sort according to the user's session language. If false, the default behavior of

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	columns is to sort according to the English alphabet. • Type: true | false • Default value: true • Dependency: The *com.glide.db.session_language_collation_fe* property must be set to true. • Learn more: Sorting according to the session language
glide_i18n.language_fallback_enabled	Option to allow setting fallback languages for the instance. Setting fallback languages creates a three-level hierarchy in which an intermediate language is used before defaulting to English when user interface text is not translated in the user's preferred language. • Type: true | false • Default value: true • Learn more: Set a fallback language

Translation tables

ServiceNow stores translation information in these tables.

- Languages [sys_language]
- Translated Name / Field [sys_translated]
- Messages [sys_ui_message]
- Field label [sys_documentation]
- Choice [sys_choice]
- Translated Text [sys_translated_text]

To see which table contains a specific translated label, enable the display of translation prefixes. For more information, see Debug translations.

Note: The Languages table is available only after at least one I18N:Internationalization plugin has been activated.

Related topics

Activate a language

Languages table

The Languages [sys_language] table contains a list of the languages for which translated text is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To enable translation to a new language, add a record to the Languages table. The main fields for this table are:

- Name: Language name
- ID: BCP 47 code for the language
- Text Direction: Direction of text in this language
- Active: Indicator that shows whether the language has been activated (true) for this instance or not (false)
- Fallback: Name of the language that the instance uses if a translation is not available

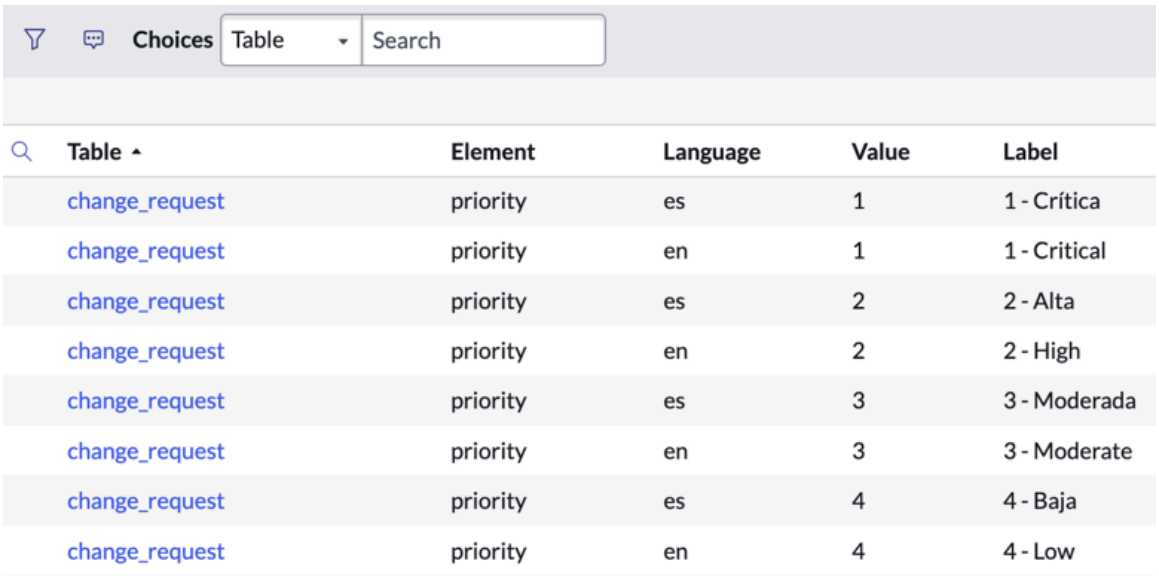
Choice table

The Choice [sys_choice] table contains translated text for options that appear in lists.

The main fields for this table are:

- Table: The name of the table this translation applies to.
- Element: The name of the field this translation is used for.
- Language: The BCP 47 code of the language for the translated choice.
- Value: A key that is the same for the choice in each language. For example, you could use the English label or the sequence number as the value for all languages to map them to each other.
- Label: The label for the choice in the specified language.
- Sequence: A number that determines in what order the option appears in the list if you don't want to list choices alphabetically.

Choice list



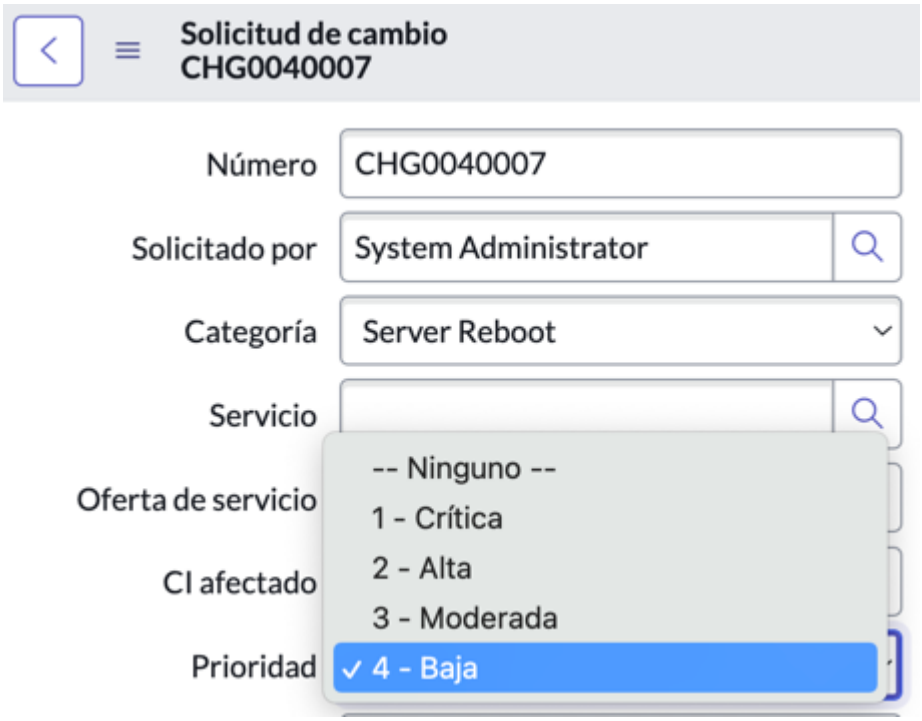


Table	Element	Language	Value	Label
change_request	priority	es	1	1 - Crítica
change_request	priority	en	1	1 - Critical
change_request	priority	es	2	2 - Alta
change_request	priority	en	2	2 - High
change_request	priority	es	3	3 - Moderada
change_request	priority	en	3	3 - Moderate
change_request	priority	es	4	4 - Baja
change_request	priority	en	4	4 - Low

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translated choices

Translated Name / Field table

The Translated Name / Fields [sys_translated] table stores translated values for text fields where the field type is translated_field (see the dictionary entry).

This option is available for text fields up to 255 characters in length. Some examples are names, titles, and short descriptions. The main fields for this table are:

- Table: name of the table this translation applies to.
- Element: name of the field this translation applies to.
- Label (translate): translated text that users see on forms and lists.
- Language: BCP 47 code of the language for this translated text.
- Value: English value that causes this translated text to be displayed.

Translated Name/Fields table

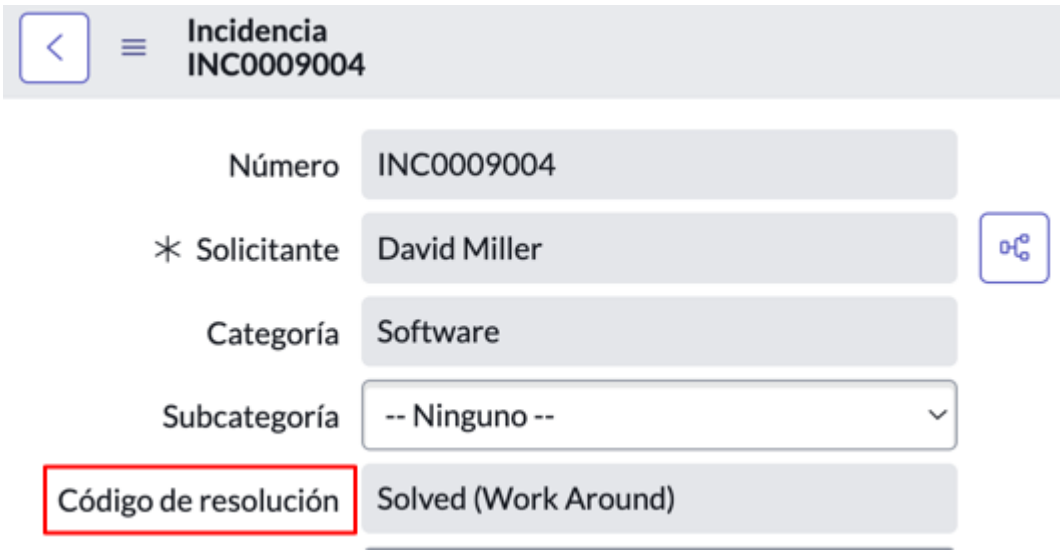
Translated Name / Fields | Value | Search | Actions on selected rows...

Table	Element	Language	Value	Label (translate)
sys_collection	label	es	Access to	Acceso a
sys_app_module	title	es	Access Types	Tipos de acceso
sys_app_module	title	es	Accommodation Types	Tipos de adaptaciones
sys_app_module	title	es	Accommodations	Adaptaciones
sys_uib_toolbox_component	label	es	Accordion Item	Elemento del menú

Field Label table

The Field Label [sys_documentation] table stores the text of table names along with the singular and plural labels for each field in the table.

For each table name and field label, the Field Label table contains a record for each installed language. ServiceNow uses the table and field names from this table to display lists and forms in the proper language. The main fields for this table are:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

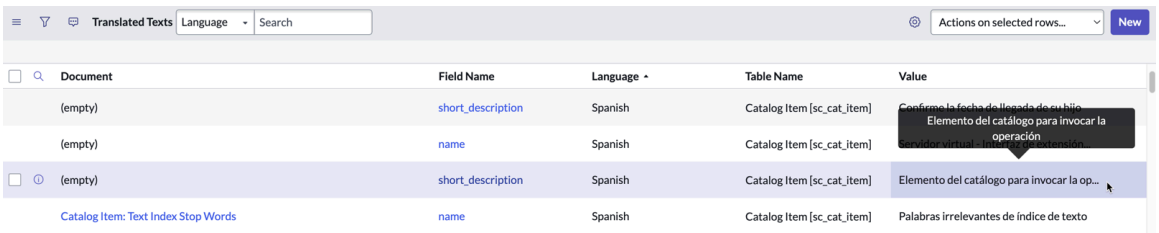
- Table: name of the table this translation applies to.
- Element: name of the field this translation applies to.
- Language: BCP 47 code of the language for the translated text.
- Label: translated text that users see.
- Plural: plural of the label.
- Help: reserved for future use. A question mark (?) icon appears next to hint labels when accessibility mode is enabled.
- Hint: text that pops up when the cursor rests on the field.
- URL: URL for a web page that provides information about the field. When a URL is provided, the text appears blue and underlined to indicate the label is clickable.

Field label

Translated field

Translated text table

The Translated Text [sys_translated_text] table stores translations for fields with the field type translated_text or translated_html (see the dictionary entry).



This field type is typically used for long text fields, up to 65,000 characters in length, such as survey name and introduction. The main fields for this table are:

- Document: internal identifier of the record this translation applies to.
- Field name: field this translated text appears in, for example, Close notes.
- Language: language the text is translated into.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Table Name: table this translation applies to.
- Value: translated text that the user sees.

Translated text list

Related topics

Translating text fields

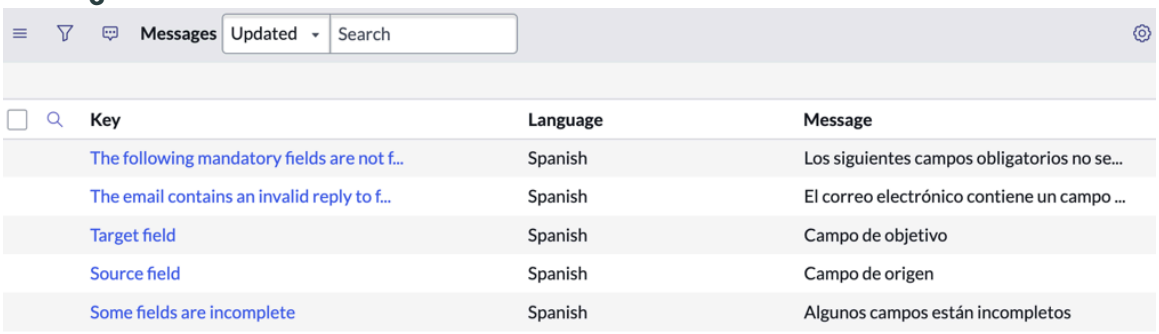
Message table

The Message [sys_ui_message] table contains the translations for informational messages, confirmation messages, error messages, and other types of system messages across the platform.

The Message table contains custom translatable text from the following sources when these texts are wrapped correctly:

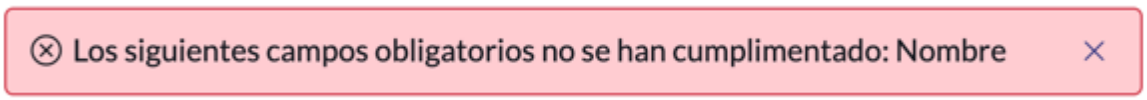
- HTML in a UI page in a customer-created application
- Service Portal widget messages (including in surveys)
- Playbook text:
  - Playbook Label
  - Stage Label
  - Activity Label
  - Activity Description
  - HTML and string Activity UI Layout properties

ServiceNow checks this table for translated text when a client script contains a getMessage call or a server script contains a `gs.getMessage` call. The main fields for this table are:



- Key: internal, case-insensitive, unique identifier of this message.
- Language: language the message is translated into.
- Message: translated text that users see.

Note: If you create a record in the Message [sys_ui_message] table that uses an existing key and the same language, the message for existing references using the key can change. For example, if a record exists with "Refresh" for the key, English for the language, and "Refresh" for the message, and you create another record with the same key and language but a different message of "Refresh the screen", existing UI strings using the "Refresh" key will display the new "Refresh the screen" message. Records in this table are created in the global scope and aren't scope-restricted.



For more information about translatable custom content in the Message table, see Translating custom content.

ServiceNow AI Platform integrations

Integrate third-party applications into the ServiceNow AI Platform.

Integration with third-party applications and data sources

Connect with external services and configure your enterprise perfectly through the ServiceNow AI Platform. ServiceNow systems integrate easily with third-party apps, using industry standard technologies such as SOAP, REST, WSDL, and API, as well as several others such as Web Services, JDBC, and more. Load external data using XML, CSV, XLS, and other file types, all through multiple data sources including HTTPS, FTPS, and SCP. Integration between instances is even easier, due to shared integration points on the platform.

Integration with third-party applications and data sources

ServiceNow integrates with many third party applications and data sources.

The most common integrations are with CMDB, Incident Management, Problem Management, Change Management, User Administration, and Single Sign-on. A variety of techniques can be used, most notably Web Services, JDBC, LDAP, Excel, CSV, and Email, as well as any industry standard technologies that use SOAP, REST, or WSDL. Additionally, API and command-line integrations can be done using a MID Server. ServiceNow has performed the following integrations with enterprise systems and platforms.

Technologies

The ServiceNow platform is based on service-oriented architecture (SOA), in which all data objects can use web services to access bi-directional data-level integration. The interface is also direct and dynamic because all modifications to existing objects and all new objects are automatically published as a Direct Web Service. A more indirect web service creation and usage can be achieved through Mapped Web Service where a transform map is used to gather incoming web service data into the final targeted tables. Finally, an advanced Scripted Web Service technique is available for defining process-based web services, where data is irrelevant, but serves more as a trigger for a process or a composite of actions that execute at the server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additionally the platform offers a rich interface for loading external data using import sets. Using this feature, you can load from various data sources such as HTTPS, FTPS, and SCP using file formats such as XML, CSV, and Microsoft Excel XLS files. Information can also be pulled from a data source using a direct JDBC connection, provided the network connectivity allows.

Information can be pulled from the platform to an external platform using an ODBC driver.

Forms, lists, and reports on the platform can be accessed directly using a URL, which facilitates integration on the UI level between two or more web applications.

A handful of single sign-on technologies is identified and implemented out of the box to allow fast integration with your portal, however, the technique is customizable in a script to allow for flexibility in the different SSO environments our customers have.

Integration between ServiceNow Instances

There are times when you find you need to perform a specific integration between your instance and another ServiceNow instance. Instance-to-Instance integrations are a snap because all of the integration points exist between the two instances.

Integration options

Nearly all ServiceNow customers obtain additional value by integrating with third-party applications.

ServiceNow customers have the following options for integrating with third-party applications.

- Activate a ServiceNow provided integration.
- Install a certified integration from the ServiceNow Store.
- Install an integration from Share.
- Contact your sales representative for available custom-built integrations.
- Build your own custom integration using the platform's integration interfaces.

Note: Certified integrations have passed a set of interoperability, security, and performance test criteria defined by ServiceNow.

ServiceNow provided integrations

ServiceNow provides many integrations as part of the platform.

These integrations are considered part of the platform and are provided at no additional charge.

Provided Integrations

Integration	Type	Integration Point
Altiris (version 6.5)	MID Server	CMDB
Google Maps	Web services	Varies

Set up Google Maps API

You enable the geolocation feature using the appropriate entries from a Google Maps API for Business license, or a Google Maps JavaScript API Key.

Before you begin

Role required: admin

About this task

You can generate maps using basic JavaScript, and they are flexible enough to display even the most complicated of queries. These maps use standard Google Maps API for Business or Google Maps JavaScript API Key mapping features, including various link types to records in your instance. Use of this feature requires installation of the Google Maps plugin.

Important: Starting May 2026, Google is deprecating the use of Client ID for authenticating requests to Google Maps. From this date onward, API keys will be the only supported authentication method. If your application continues to use client-id (for example, via the *google.maps.method property*), Google Maps requests will fail. For more information, see Client ID Migration Guide.

Update your configuration to authenticate using an API key only (that is, set *google.maps.method* to `key`). Refer to the descriptions of *google.maps.key* and *google.maps.key.geocoding* properties for more information on API key–based authentication.

Procedure

1. Google Maps APIs for Business licenses are no longer available from Google, so, depending on whether have an existing license, use one of the following procedures.

   Note: You are required to use your own Google Maps JavaScript API Key from Google and not use any ServiceNow AI Platform® generated key.

Existing Google Maps API for Business license available?	Tasks
Existing license available	**a.** In the **System Properties** > **Google Maps** property form: ▪ In the **google.maps.client** field,enter the Client ID for your organization. This ID is from Google and starts with `gme-`, such as `gme-mycompanyname`. ▪ In the **google.maps.client.key** field, enter the private key for Google Maps API for Business. An example of an encoded key is `vNIXE0xscrmjlyV-12Nj_BvUPaw=`. The ServiceNow AI Platform® requires this key to retrieve accurate driving time estimates from Google for some Geoloca tion features. ▪ Fill out the remaining values on the form. **b.** Configure your maps using the property def initions from the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Existing Google Maps API for Business license available?	Tasks
	Important: The Google Maps Client ID–based configuration is being deprecated. Client ID authentication will not be supported starting May 2026, and configurations relying on it will no longer work.
No license available	**a.** Obtain a Google Maps JavaScript API Key from Google. **b.** In the **System Properties** > **Google Maps** property form, enter the API key into the **google.maps.key** field. Geolocation in the ServiceNow AI Platform® uses the API Key, which Google Maps also uses for Geolocation and map view billings. **c.** Fill out the remaining values on the form. **d.** Configure your maps using the property definitions from the table.

To learn more about Google Maps API for Business, and Google Maps JavaScript API Key, see https://developers.google.com/maps/gmp-get-started.

2. After you complete and save the configuration, create Map pages, or use the default pages included with the plugin.
Map pages define what data appears on the map, and the appearance of the links. For a tutorial on how to view all of the markers that link to your records, see the Display Map Markers on Google Maps blog post on the ServiceNow Community.

Property	Description
google.maps.method	Defines which method of authentication should be used for Google Maps. ○ Type: string ○ Default value: key ○ Location: **System Properties** > **Google Maps**
google.maps.auto_close	If true, automatically closes a map information window before opening a new one. ○ Type: true/false ○ Default value: true ○ Location: **System Properties** > **Google Maps**
google.maps.client	Client ID for Google Maps API for Business.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	○ Type: string ○ Default value: gme-servicenow ○ Location: **System Properties** > **Google Maps**
google.maps.map_id	Map ID for Google Maps used for the cloud-based maps styling, vector maps, and advanced markers. To obtain your Map ID, see How to create map IDs. ○ Type: string ○ Default value: empty ○ Location: **System Properties** > **Google Maps**
google.maps.client.key	Private key for Google Maps API for Business. This key activates the geolocation feature, which locates users in the system precisely, using data from their mobile devices. ○ Type: string ○ Default value: empty ○ Location: **System Properties** > **Google Maps**
google.maps.version	Version number of the current installation of Google Maps API for Business. ○ Type: string ○ Default value: current version number ○ Location: **System Properties** > **Google Maps**
google.maps.key	Google Maps API for Business or Google Maps JavaScript API Key that ties to the URL of the server. This key authorizes development use of Google Maps API. ○ Type: string ○ Default value: empty ○ Location: **System Properties** > **Google Maps**
google.maps.key.geocoding	Google Maps API for business or Google Maps JavaScript API key that ties to the URL of the server. This key is used for making geocoding requests. ○ Type: string ○ Default value: empty ○ Location: **System Properties** > **Google Maps**
google.maps.latitude	Starting latitude of the map. This value determines the starting position displayed in Google Maps. ○ Type: string ○ Default value: 36.008522 ○ Location: **System Properties** > **Google Maps**
google.maps.longitude	Starting longitude of the map. This value determines the starting position displayed in Google Maps pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	○ Type: string ○ Default value: -95.221764 ○ Location: **System Properties** > **Google Maps**
google.maps.max_items	Maximum number of items to display on the map. ○ Type: integer ○ Default value: 500 ○ Location: **System Properties** > **Google Maps**
google.maps.table	Table used by the map. The table needs the following fields: name, longitude, latitude. ○ Type: string ○ Default value: cmn_location ○ Location: **System Properties** > **Google Maps**
google.maps.zoom	Starting zoom level of the map (1 is the lowest) ○ Type: string ○ Default value: 4 ○ Location: **System Properties** > **Google Maps**

3. Perform these configurations:

   a. Navigate to **System Properties** > **All**.

   b. Set values for these system properties:

System property	Description
google.maps.refresh.latlong.duration	Number of days after which the location details are updated. **Note:** The maximum value is 30.
google.maps.refresh.latlong.record_count_per_table	Maximum number of records in a table that can be processed using the scheduled job in one refresh.

   c. Specify the tables that store the location details in the Map Coordinates Refresh Configuration [cmn_coordinate_refresh_config] table.

   d. If there are no fields to track when the coordinates are last retrieved in your tables:

      i. Create the **coordinates_retrieved_on** field of the type **Date/Time** in your tables.

      ii. Ensure that the value of the field that tracks time when the coordinates are last retrieved, is populated correctly in the Map Coordinates Refresh Configuration [cmn_coordinate_refresh_config] table. Refer to the sample fix script *`Update coordinates updated on field`* to update values in the **coordinates_retrieved_on** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Navigate to **System Definition** > **Scheduled Jobs**.

f. Open the record, **Refresh Latitude Longitude info of Records**.

g. Select the **Active** check box.

h. Specify the frequency at which the location details should be refreshed by providing frequency details in **Run** and **Repeat Interval**.

Note: Ensure that you refresh the location details at least once every 30 days.

4. **Optional:** To access Google Maps from the ServiceNow instance based on your region, perform these configurations.

a. Navigate to **User Administration** > **Users**.

b. Select and assign the relevant **Country Code** for the required user.

Note: If the required **Country Code** isn't available, add the dictionary entry. Ensure that you use the ISO 3166-1 country codes. For example, the country code of Morocco is MA.

c. Navigate to **System Properties** > **Google Maps**.

d. Select the **Yes** check box for **Enable this property only when you want to alter the Google map's behavior based on a region. The region is populated from the current User's 'Country code' field value in sys_user record. The Country code value on the sys_user record should be consistent with the expectations from the Google Map's region code. Most Unicode region identifiers are identical to ISO 3166-1 codes, with some notable exceptions. Check the codes properly before making any changes.**

e. Click **Save**.

Microsoft SCCM integration

The Microsoft SCCM integration is a one direction import of SCCM data into the ServiceNow Configuration Management Database (CMDB).

Scheduled imports bring relevant SCCM data into the ServiceNow instance from an SQL Server database and map it to tables in the CMDB. You can configure either a full or incremental data import. The import is achieved using a JDBC connection via the MID Server. The integration keeps the ServiceNow CMDB synchronized with the SCCM SQLServer database, so that only relevant data is imported from the SCCM database to the CMDB. The SCCM database is considered an authoritative source and is not written to.

Supported versions

The Microsoft SCCM legacy plugin is deprecated and no longer supported or available for new activation. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base. Recommendation for all customers to migrate to the new Service Graph connector for Microsoft SCCM.

These are the plugins for the currently supported SCCM versions, all of which support Asset Intelligence and Incremental Software Reconciliation:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Microsoft SCCM 2007
- Microsoft SCCM 2012 v2
- Microsoft SCCM 2016

Note: If you upgrade your instance to a version of the Now Platform that does not provide support for your version of SCCM, you can continue to use that version. However, all new instances require the use of a supported SCCM version.

The Integration - Microsoft SCCM 2016 (com.snc.integration.sccm2016) plugin is compatible with SCCM versions 1606, 1906, 1910, and 2002.

Service Graph connector for Microsoft SCCM

To import SCCM data into the CMDB, you can use the Service Graph connector for Microsoft SCCM instead of using the legacy SCCM connector.

Using the Service Graph SCCM connector provides these advantages:

- Adherence to the Common Service Data Model (CSDM) data model.
- Use of Identification and Reconciliation engine (IRE) to avoid duplicate records.
- Support for removed software detection and delta detection.
- Use of the IntegrationHub ETL (2.2.1) which allows for easy data mapping and customizations.
- Higher performance during data processing.

For information on how to update from using the Microsoft SCCM connector plugin to using the Service Graph connector for Microsoft SCCM, see Update Microsoft SCCM 2016 plugin for Service Graph connector for Microsoft SCCM.

Available modules

- **Setup**:
  - Configure the data sources.
  - Specify database server settings and the MID Server.
  - Test the configuration.
- **Scheduled Import**: Schedule the import or execute the import immediately.
- **Data Sources**: A list of the pre-configured data sources defining the external CMDB database.
- **Progress**: The progress log for scheduled imports.
- **Transform History**: A log of transformations performed by scheduled imports.
- **CI Identification**: Identifiers used by SCCM to match import set data with the CMDB.
- **Import Set Data**: Tables that store imported SCCM data.
- **Web Services**: List of web services used to add or remove fields in the transform maps.

Asset intelligence

Asset Intelligence is an SCCM feature that can filter, normalize and clean up software records. When enabled, it populates normalized software data in a separate table within the SCCM database. You can target this separate table instead of the raw software data table. When you import software records into the CMDB with this feature enabled, you get a cleaner set of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

software data. To use this feature, you must Activate SCCM Asset Intelligence scheduled imports in the target ServiceNow instance, as well as in the source SCCM database.

Activate a supported Microsoft SCCM plugin

The SCCM plugins can be activated by an administrator and requires the Integration - JDBC and CI Identification plugins. These dependent plugins are activated automatically with SCCM activation.

Before you begin

For a complete listing of the plugins that need to be activated, see Activate SCCM Asset Intelligence scheduled imports.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

SCCM data import process and source tables

The Microsoft SCCM versions supported in the ServiceNow® platform offer identical features and the same imported data.

Data import process

1. A schedule called **SCCM System <version> Import** determines when the SCCM tables are imported into the ServiceNow® instance. Imports can be executed immediately or scheduled to run at defined intervals.
2. A MID Server retrieves the SCCM data and imports it into staging tables on the instance.
3. Transforms run on the data in the staging tables and map the SCCM data to existing fields in the CMDB.

SCCM data imported

This table shows the SCCM source tables, the corresponding import set staging tables in the ServiceNow® instance, and the target tables in the CMDB.

SCCM table	Staging table	CMDB table
• v_GS_Computer_System • v_GS_Workstation_Status	SCCM <version> Computer Identity [imp_sccm<version>_computer_id]	Computer [cmdb_ci_computer]

© 2026 ServiceNow, Inc. All rights reserved.

SCCM table	Staging table	CMDB table
• v_GS_System • v_GS_PC_Bios • v_GS_Operating_System • v_GS_Computer_System_Product • v_GS_System_Enclosure • v_GS_Baseboard		
v_GS_Disk	SCCM <version> Disk [imp_sccm<version>_disk]	Disk [cmdb_ci_disk]
v_GS_Network_Adapter_Configuration	SCCM <version> Network [imp_sccm<version>_network]	Network Adapter [cmdb_ci_network_adapter]
v_GS_Operating_System	SCCM <version> Operating System [imp_sccm<version>_os]	Computer [cmdb_ci_computer]
v_GS_Processor	SCCM <version> Processor [imp_sccm<version>_processor]	Computer [cmdb_ci_computer]
• v_GS_Add_Remove_Programs • v_GS_Add_Remove_Programs_64	SCCM <version> Software [imp_sccm<version>_software]	• Software [cmdb_ci_spkg] • Software Installation [cmdb_sam_sw_install] (when Software Asset Management is enabled*)

*For more information about Software Asset Management and how to enable it, see Request Software Asset Management.

SCCM data sources

The ServiceNow® SCCM integration uses JDBC data sources to import software data from the SCCM database. Each data source contains the connection specifics for the SCCM database and names the MID Server the instance will use to import the data. The transforms that map the SCCM fields to the CMDB are defined in a related list in each data source record.

Transform maps

Transform maps are accessed from the **Transforms** related list in each data source record. The source fields in SCCM and the target fields in the CMDB are listed in the **Field Maps** related list in each Table Transform Map record. The SCCM integration uses the transform map utility provided with the ServiceNow® platform. For instructions on editing or creating a transform map, see Transform maps.

The SCCM integration provides two transform maps for incremental software imports. Only one transform map can be enabled (**Active**) at a time.

- **Incremental Import**: Enabled by default. This map should be configured as **Active** when ServiceNow® Software Asset Management is not enabled on the instance.
- **Incremental Import (SAM enabled)**: If the Software Asset Management plugin is activated, set this transform to **Active**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: To force a one-time full import of all software data from the SCCM database, clear the value in the**Last run datetime** field on the data source. This operation can take a long time to execute, so the most efficient method is to use an incremental transform after the first full import.

Transforming the assigned user

The SCCM <version> Computer Identity transform script attempts to set the **Assigned to** field in the CMDB record by looking up the name of the user in the SCCM source table and comparing the value with the matching field in the ServiceNow sys_user table. If a match is found, that user is assigned to the record. If no match is found, the **Assigned to** field is left blank. The matching field is controlled by the *glide.discovery.assigned_user_match_field* system property, which is set to **user_name** by default.

Identifiers

The SCCM integration uses CI identification to update CIs created from data imported from SCCM with a resource ID. The Hardware Rule identifier returns the resource ID of a computer from SCCM and stores it in the Source [sys_object_source] table. When resource IDs are first imported, either from SCCM or Discovery, the [sys_object_source] table is populated with IDs for each CI it identifies. In subsequent imports, if an incoming ID matches that of an existing CI, IRE (Identification and Reconciliation Engine) updates the information for that CI in the CMDB. If the incoming resource ID does not match that of an existing CI, IRE creates a new CI and populates it with the resource ID.

For more information about CMDB Identification and Reconciliation and IRE, see CMDB Identification and Reconciliation.

Upgrades from pre-Geneva versions still preserve the legacy identifiers, but you can switch to the new identifiers using a property: `glide.discovery.use_cmdb_identifiers`. If you upgraded from a pre-Geneva version, you must manually add this property and set it to `true` to use the new identifiers. If you upgraded from Geneva, this property is available in the System Properties [sys_properties] table. To preserve functionality in custom legacy identifiers, convert them to the new CMDB identifier rules format before enabling this property. The system does not reconfigure your custom identifiers to the new framework automatically.

Scripts

Data population scripts populate the related data in the CMDB for each target CI discovered by the Hardware Rule identifier.

Software

The Microsoft SCCM integration reconciles the software package count in the records for a CI and removes a software instance from the Software Instance [cmdb_software_instance] table if the software package is uninstalled from the CI. For a full software import, the transform populates the Software [cmdb_ci_spkg] and Software Instance [cmdb_software_instance] tables. If the Software Asset Management plugin is enabled, the transform populates the Software Installation [cmdb_sam_sw_install] table.

Note: The table data imported from SCCM must contain complete data for the CI. The instance assumes that the import represents all relationships that exist and adjusts the CMDB accordingly. Partial data received from SCCM tables can cause the deletion of active relationships.

Configure the SCCM integration and schedule an import

Importing data from Microsoft SCCM requires a connection to the SCCM database via a JDBC data source and a schedule that tells the MID Server when to fetch the data.

Before you begin

You must have sufficient credentials to query the SQL Server that contains the SCCM database. Create a SQL Server account in order to connect to the SCCM database on the MID Server to use the data sources.
Connect to your SCCM SQL Server and configure the following:

1. Create a new login user name and password for SQL Server authentication.
2. Choose the SCCM database that ServiceNow data sources will connect to.
3. Assign the 'db_datareader' role membership to the new user.

Role required: admin

About this task

The system uses the details of the database connection you create in this procedure to configure the default SCCM data sources automatically.

Note: If you want to configure the JDBC data source to authenticate on your SQL Server database using the Windows MID Server service user, select the **Use integrated authentication** box on each of the existing data sources.

Procedure

1. Navigate to **All** > **Integration - Microsoft SCCM <version>** > **Setup**.
2. Complete the required fields to configure connection to the SCCM SQL database, including a valid MID Server that has access to the SQL database server.
3. Under Related Links, click **Test data source connections** to test the connection to the SCCM database.
4. If the data source connects to the SCCM database, navigate to **Integration - Microsoft SCCM** > **Scheduled Import**.
   The Scheduled Data Import form appears for your version of the SCCM integration. The Computer Identity data source runs first. The other data sources listed on the form run in sequence, based on their default order.
5. Select a calendar interval (Day, Week, etc.) in the **Run** field and specify the time of day the import should run.
   Your selection displays additional fields required to complete the schedule.
6. Click **Update** to schedule the import or click **Execute Now** to perform the import immediately.

   After the instance imports data using the **SCCM <version> Computer Identity** data source, the other data sources run in the order configured to retrieve the remainder of the SCCM data.

Activate SCCM Asset Intelligence scheduled imports

To prevent duplicate software imports, activate either the Asset Intelligence (AI) or the non-AI scheduled import.

Before you begin

Role required: admin

About this task

Make sure to limit the software import frequency to be no greater than the frequency of the table cleanup that tracks deleted software in SCCM.
Asset Intelligence is supported in these SCCM plugins:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Integration - Microsoft SCCM 2007
- Integration - Microsoft SCCM 2012 v2
- Integration - Microsoft SCCM 2016

Important: To improve the performance of your initial SCCM import, you can prevent the system from checking against deleted software prior to the import date. Navigate to **Integration - Microsoft SCCM <version>** > **Data Sources** > **SCCM <version> Removed Software** and enter the current date in the **Last run datetime** field, using the format **yyyy-mm-dd 00:00:00.0**. This field is populated automatically for each subsequent run of the removed software data source, so it is not necessary to alter the value after the initial import.

Procedure

1. Navigate to the **System Import Sets** > **Administration** > **Scheduled Imports**.
2. Set **Active** to **false** for these data import schedules:
   - SCCM <version> Software
   - SCCM <version> Removed Software
3. Set **Active** to **true** for these data import schedules:
   - SCCM <version> Software (with AI)
   - SCCM <version> Removed Software (with AI)

Related topics

Configure the SCCM integration and schedule an import

Upgrade the SCCM integration version

If you're using an earlier version of an System Center Configuration Manager(SCCM) plugin, you can switch over to a later version to take advantage of new features.

Before you begin

Role required: admin

About this task

The ServiceNow SCCM integrations are self-contained and can exist independently. They each use their own import set tables, data sources and transform maps. However, all SCCM integrations will transform data into the same tables within the ServiceNow CMDB. To avoid the data being overwritten by another source:

- Use one SCCM integration and disable all other SCCM scheduled imports.
- Perform a full import to clear the cmdb_software_instance table, the cmdb_sam_sw_install table, and other tables of old SCCM data.

Note: It is possible to configure each plugin to integrate with SCCM 2007 or 2012 because the mechanism of the integration is actually the same, which is to leverage Java Database Connectivity (JDBC) imports. However, a data source must be modified if it is used for an SCCM version for which it was not written. Use the plugin version that corresponds to the SCCM version for which the data source is intended.

To change the SCCM integration:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Disable the current integration by deactivating the SCCM import schedule.
- Activate the new SCCM plugin.
- Reimport all the software records when you're switching to an integration that supports incremental imports of removed software.

To disable the SCCM import schedule:

Procedure

1. Navigate to **All** > **Integration - Microsoft SCCM 20xx** > **Scheduled Import**.
2. Clear the **Active** check box.
3. Select **Save** or **Update**.
4. To activate the new SCCM plugin, navigate to **All** > **Admin Center** > **Application Manager**.
5. Search for ***SCCM** to see all the available SCCM integrations plugins.
6. Activate the plugin.

SCCM data import process and source tables

Migrate the Verizon eBonding Integration to a Production System

This topic outlines the tasks required for moving the Verizon eBonding integration from a Dev/Test environment to a Production environment.

This process requires coordination with your assigned Verizon implementation manager.

General Tasks

The following work can be performed any time:

- Obtain a production SOAP password from Verizon. Your Verizon SOAP user ID is the same as that used against the Verizon test broker.
- Create an integration user for Verizon in the ServiceNow Production instance. Use the same user name and password that was created for the development instance, so that the communication between Verizon and ServiceNow is properly authenticated.

Migrating to a Production Environment

Perform these tasks in order.

- Task 1: Request the Verizon eBonding plugin for the production instance. When the plugin is installed, the only immediate user interface change is an additional **Category** field named **VZ eBonding**. All of the triggers for the integration are dependent on the category being set to **VZ eBonding**. Enabling the plugin on the production instance should not affect your users. If you wish to take additional precautions, disable the **VZ eBonding** category from the list when the plugin is activated for the instance.
- Task 2: Set up the Verizon certificate and keystore. Copy these directly over from the Dev instance or regenerate them so that you have separate versions for the Dev and Production instances.
- Task 3: Configure the integration properties to work with the Production Verizon eBonding system. This is userID, password, and other properties provided by your Verizon representative.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Task 4: Change all the Verizon eBroker SOAP Message functions to use Verizon's production SOAP Endpoint. In most cases, the endpoint URL will be: https://pubwebsvc.vzbi.com:443/Trouble_Management_v3r0. Verify this URL with the Verizon implementation specialist.
  - In the **SOAP Message Functions** related list, click each function, clear the **Lock** check box, and enter the production endpoint.
  - Configure the **SOAP Message Functions** related list and add the **SOAP endpoint** column. In the **SOAP Message Functions** list view, unlock and update the endpoint for all records by Edit multiple records in a list using the list editor.
- Task 5: Apply any customizations. If customizations to the integration on the Dev system were captured in an update set, apply that update set to the Production system.
- Task 6: Provide Verizon with the production SOAP Endpoint. The SOAP endpoint should look something like this: https://yourproductioninstance.service-now.com/ETMSPublish.do?WSDL.
- Task 7: Coordinate a Production turn up with your Verizon representative to do basic testing.

Warning: Do not create test tickets against the production system without working with the Verizon team. Any tickets created are treated as real tickets.

Supported integration interfaces

ServiceNow provides a number of interfaces to be able to directly integrate with the platform. These interfaces are considered part of the platform and are provided at no additional charge.

Supported Integration Interfaces

Interface
Email
JDBC
JSONv2 Web Service
LDAP integration
SOAP web service
REST API
SAML
Digest token authentication
ODBC driver
Data Export
CTI
Syslog probe

Computer Telephony Integration

Computer Telephony Integration (CTI) is accomplished by the CTI client on the user machine sending a URL to the instance.

The URL must have the following components:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The base URL. For example: `https://<instance name>.service-now.com/cti.do?` would get to the instance and ask for CTI processing. The URL is accessible to authenticated users only.
2. Parameters identify which parts of the incident form appear.
   - *sysparm_caller_name*=name where 'name' is the name for a user.
   - *sysparm_caller_phone*=phone where 'phone' is the user's phone number. Either a name or phone should be provided if you want to identify the user on the call. Other parameters may be supplied to identify the user as discussed later.
   - *sysparm_task_id*=taskID where 'taskID' identifies an existing issue that the caller is calling about.
   - *sysparm_view*=view where 'view' is the name of the view to be used to display the data.
   - *sysparm_xxxx*=value where 'xxxx' is the name of a field within the 'incident' record that you want to populate with the specified 'value'. For example sysparm_priority=1 would result in the priority field set to value of 1 when the new incident screen is shown.
   - *sysparm_cti_rule*=name where 'name' is the name of a function to be invoked for CTI processing rather than using the default script. The function must be defined in a sys_script entry marked client callable. If the function needs to insert, update, or delete any GlideRecord(s), it must call a separate non-client callable function to perform the update(s).

     Note: While the CTI Processing script has been changed to be client callable, the code implementing the task view has been commented out. You must implement a new non-client-callable function for the code that performs the *task.update()*.

     To make a script client-callable check the client-callable checkbox on the form that displays when the sys_script entry is displayed. The client-callable checkbox might not show by default. To show the client-callable checkbox, you may need to modify the fields that show on the form using the gear icon and slushbucket mechanism.

     Parameters on the URL are available to the business rule as global values. For example:

     ```
     var name = sysparm_caller_name;
     ```

     The business rule you specify must return the URL for the pop-up screen, and set the 'answer' global variable.

An example URL to open the screen for user Don Goodliffe would look like the following. `https://<instance name>.service-now.com/cti.do?sysparm_caller_name=Don%20Goodliffe` Multiple sysparm parameters can be used, separated by ampersands (&).

CTI Processing script

When the *sysparm_cti_rule* parameter is not specified, the system uses the CTI Processing script to provide the following functionality.

The CTI Processing script does the following:

1. Tries to identify the user by the *sysparm_caller_name* value if it was supplied.
2. If no user has been found, the script tries to identify the user by the *sysparm_caller_phone* value if it was supplied.
3. If a user has been identified then one of the following is done

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. If the user has open incidents, the pop-up screen shows information about the current caller and all the user's open incidents.

b. If the user does not have any open incidents, the pop-up screen shows a new incident with information provided in the URL shown.

4. If a user was not identified and an existing taskID is given, then nothing happens. The code to handle this case is commented out. To show the pop-up screen with task details, modify the CTI Processing script. Put the functionality in a separate non-client-callable function.

Integrating ServiceNow with your Intranet

You can add a ServiceNow login link to your intranet.

To deliver ServiceNow content from a web page, see Service Portal.

JDBCProbe

A JDBC probe runs on the MID Server to query an external database via JDBC and returns results to ServiceNow.

Before you begin

Role required: admin

About this task

Probes interact with the MID Server through the ECC Queue. The JDBC probe response returns as an XML payload in an input ECC Queue record. By default, each response payload contains up to 200 rows. To change this limit, set the *jdbcprobe_result_set_rows* probe parameter to the desired number.

Contact Customer Service and Support to activate the **Integration - JDBC** (com.snc.integration.jdbc) plugin.

Procedure

1. Navigate to **System Definition > Plugins**.
2. Right-click the plugin name on the list and select **Activate/Upgrade**.

   If the plugin depends on other plugins, these plugins and their activation status are listed.

3. **Optional:** Select the **Load demo data** check box.

   (Optional) Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.

4. Select **Activate**.

Direct JDBC Probe

A direct JDBC probe specifies all the parameters necessary in the outbound ECC Queue XML payload.

It is a standalone probe that is decoupled from a JDBC Data Source and does not insert into an import set. The required field in the ECC Queue record for a direct JDBC probe is **Topic** and it must equal **JDBCProbe**. The **Source** field is reserved for the `sys_id` of the data source record in the case of a JDBC data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you have ServiceNow Discovery enabled on your platform, add the *skip_sensor* parameter to the probe to avoid the discovery sensors from processing the probe and resulting in a "No sensors defined" error.

XML Structure

A direct JDBC probe has the following XML payload structure

```
<parameters><parameter name = "skip_sensor" value =
 "true" /><parameter name = "parameter_name" value =
 "parameter_value" />
  ...
  <parameter name = "work" ><select  ... >
      ...
    </select></parameter></parameters>
```

Related topics

JDBCProbe

JDBC Probes via Data Source

JDBC probes are executed via a JDBC data source when an import is running against the data source.

A JDBC data source JDBC probe is described by the JDBCProbe Topic and the `sys_id` of the data source in the Source field of the ECC Queue output record.

An ECC Queue output probe is created when you load from the data source.

Select * JDBC Probe short cut

Alternatively, you may specify a *table_name* parameter instead of a work element and the following query could be executed.

```
select * from <table_name>
```

For example, using the following XML payload

```
<?xml version= "1.0" encoding= "UTF-8" ?><parameters><parameter
 name = "jdbc_driver" value =
 "com.microsoft.sqlserver.jdbc.SQLServerDriver" /><parameter
 name = "connection_string" value =
 "jdbc:sqlserver://
xxx.service-now.com;databaseName=SMS_CRICKET;user=sms;password=s
ms" /><parameter name = "table_name" value =
 "System_DATA" /></parameters>
```

Counting Rows

To count the number of rows in a table, you can indicate a select count(*) type query by including the count_rows parameter with a value of true.

For example

```
<?xml version= "1.0" encoding= "UTF-8" ?><parameters><parameter
 name = "jdbc_driver" value =
 "com.microsoft.sqlserver.jdbc.SQLServerDriver" /><parameter
 name = "connection_string" value =
 "jdbc:sqlserver://
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
xxx.service-now.com;databaseName=SMS;user=sms;password=sms" /
><parameter name = "count_rows" value = "true" /><parameter name
 = "table_name" value = "System_DATA" /></parameters>
```

The resulting response XML payload

```
<parameters>
  ...
  <result query = "SELECT count(*) as row_count
 FROM System_DATA" ><row id = "1" ><row_count class
 = "java.lang.Integer" length = "11" type = "4"
 >2312</row_count></row></result>
  ...
</parameters>
```

Related topics

JDBCProbe

Parameters

The following parameters are available in a direct JDBC probe.

Parameter	Description
jdbc_driver	Required. Java class name for the JDBC driver to use, the currently supported drivers are: • Oracle: `oracle.jdbc.OracleDriver` • Microsoft SQL Server: `com.microsoft.sqlserver.jdbc.SQLServerDriv` • MySQL: `com.mysql.jdbc.Driver`

Example

```
com.microsoft.sqlserver.jdbc.SQLServerDriver
```

Parameter	Description
connection_string	Required. The JDBC connection string/ URL for defining the connection usually contains information about the database server and name, the user ID, and password for connecting to the database. The syntax is vendor-specific. See the following links for reference:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	• Oracle: `[jdbc:oracle:thin:<username/password>@<database>]` • Microsoft SQL Server: `[jdbc:sqlserver://localhost;user=MyUserName;password=*****;]` • MySQL - `[jdbc:mysql://localhost/database?user=username%26password=passwd]`

Example

```
jdbc:sqlserver://xxx.service-now.com;
databaseName=SMS;
user=sms_user;
password=sms_password;
```

Parameter	Description
work	Required if not using the *table_name* parameter short cut. Parent element of an XML fragment describing the SQL command to execute.

Example

```
...
  <parameter name= "work" ><select table = "System_DATA" where =
 "InstanceKey=692" ><MachineID /><SMSID0 /></select></parameter>
  ...
```

Parameter	Description
query_timeout	Optional during SELECT. Number of seconds the JDBC driver waits for a `query (SELECT)` to complete. Zero means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an error state.

Parameter	Description
table_name	Optional (except required during `count_rows == true`). Alternate way of executing a `select *` query; instead of using the *work* element. Equivalent to executing `select * from <table_name>`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
count_rows	Optional. Indicates whether a `select count(*)` query should return the number of rows (true/false). The result of the count is returned as a *row_count* element in the *result* element.

Parameter	Description
query	Optional. Type of query. Possible choices are "All Rows from Table" or "Specific SQL." If "Specific SQL", the sql_statement will be required to specify the SQL statement.

Parameter	Description
sql_statement	Optional. Use a specific SQL query. The presence of this element executes a direct query specified in the value attribute.

Example

```
...
  select * from any_table where id = 123
  ...
```

Parameter	Description
skip_sensor	Optional. Determines if Discovery attempts to process the ECC input from the JDBCProbe. Default = true

For example, to query a table using a direct JDBC probe, requires the following parameters:

- JDBC driver class name
- JDBC connection string
  - Database server
  - Database name
  - User name
  - User password
- The table name

Using the Work Element

The work element encodes SQL statements to be executed by the probe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This API can only be used by the following:

- Development users who have the rights to edit scripts to insert records to the ecc_queue.
- Admin users to insert records through the UI.

There's no backend sanitization of any SQL statements, table names, or column names. It's the development users' responsibility to sanitize them if non-trusted users can manipulate them to execute malicious queries.

The following are the valid work child elements.

- select
- update
- insert
- delete

SELECT

Retrieve rows from the specified table in the database specified by the JDBC connection string. The simplest select work just specifies the table name and will retrieve all fields in a row, for example:

```
...
 <parameter name= "work" ><select table =
"System_DATA" /></parameter>
 ...
```

To specify a search criteria, specify the where attribute on the select element, for example:

```
...
 <parameter name= "work" ><select table = "System_DATA" where =
"InstanceKey=692" /></parameter>
 ...
```

To specify the fields you want returned, embed the fields as child elements of the select element, for example:

```
 ...
 <parameter name= "work" ><select table = "System_DATA" where =
"InstanceKey=692" ><MachineID /><SMSID0 /></select></parameter>
 ...
```

To use a direct SQL statement, specify it in the **query** parameter

```
...
 <parameter name= "query" value= "Specific SQL" /><parameter
name = "sql_statement" value = "select * from any_table where
value='test'" />
 ...
```

UPDATE

An **update** SQL can be executed by specifying the **table**, optional where clause and required child elements for the fields and their values to update.

```
...
<parameter name= "work" ><update table =
 "alerts.status" where = "ServerName %= 'NCOMS'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 AND ServerSerial=3935" ><Agent>ServiceNow -
 INC10020</Agent><URL>http://
Macintosh-9.local:8080/glide/incident.do?sys_id=17a31f380a0a0bae
0048ca875c8891d0</URL><Severity quoted = "false"
 >3</Severity><Acknowledged quoted = "false"
 >0</Acknowledged></update></parameter>
...
```

INSERT

An **insert** SQL can be executed by specifying the **table**, and required child elements for the fields and their values to insert.

```
...
<parameter name= "work" ><insert table
 = "alerts.status" ><Agent>ServiceNow -
 INC10020</Agent><URL>http://
Macintosh-9.local:8080/glide/incident.do?sys_id=17a31f380a0a0bae
0048ca875c8891d0</URL><Severity quoted = "false"
 >3</Severity><Acknowledged quoted = "false"
 >0</Acknowledged></insert></parameter>
...
```

DELETE

A delete SQL can be executed by specifying the table and optional where clause.

```
...
<parameter name= "work" ><delete table = "alerts.status" where =
 "ServerName %= 'NCOMS' AND ServerSerial=3935" /></parameter>
...
```

JDBCProbe

Syslog probe

The ServiceNow Syslog probe uses the MID Server to deliver log messages from a ServiceNow instance to another machine, such as a dedicated log server, using the syslog protocol over an IP network.

How the Syslog probe works

The syslog probe is launched by a ServiceNow Script includes (called Syslog) that can be invoked from a Business rules, event, or Orchestration activity and is launched by a MID Server. A syslog server or any server that can receive messages using the syslog protocol must be installed on the recipient (target) machine. Typically, a dedicated log server in the network is configured to receive all internal syslog messages. Some products that accept syslog messages are:

- ArcSight
- Splunk
- LogLogic
- syslog-ng

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

The Acme Corporation wants to send a log message from their ServiceNow instance to an ArcSight syslog server inside their corporate firewall each time a user login fails. The system administrator uses the login.failed event to trigger a business rule that invokes the Syslog Script Include each time a login fails. Acme's MID Server checks the ECC Queue for work and picks up the syslog probe, which contains the log entry. The MID Server then sends the log message to the ArcSight server, which gathers log messages from all the machine in the internal network.

Code sample

The following code sample, included in an event or a business rule, directly calls the Syslog Script Include and sends a syslog message to a designated syslog server:

```
var sl = new Syslog('FQDN of your syslog server',
 'mid.server.Eclipse', 16);
sl.log('This is a sample log message', 6);
```

This code does the following:

- Sends the log message to facility **16**
- Sets the priority to **6** (informational)
- Sends the message to your syslog server
- Launches the probe via the MID Server named "Eclipse"

Managing integration sessions

Manage access to an instance by configuring how long integration sessions last before expiring.

Similar to user sessions, you can secure your instance by configuring when to time out an integration session after a period of inactivity and a maximum active session time. By default, integration session time out after five minutes of inactivity.

Configure a maximum active time for integration sessions

Secure your instance by enforcing a maximum time for sessions regardless of integration activity.

Before you begin

Role required: admin

About this task

By default, sessions expire only after a period of inactivity. Enforcing a maximum active session time ends sessions regardless of if an integration has been active recently. The active session timeout should be greater than the value configured for the inactive session timeout. For example, if sessions are configured to time out after 30 minutes of inactivity, the active session timeout should be greater than 30 minutes.

Note: Sharing a single service account across integrations and applications can prevent the system from enforcing maximum active session times. To resolve issues that keep sessions active, see the Resolving Extended Session Duration and Performance Issues with Shared Service Accounts [KB1770913] article in the Now Support Knowledge Base.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

System Property form

Field	Description
Name	`glide.active.session.timeout.invalidate.ses`
Description	`Specifies whether integration sessions can be invalidated by configuring a maximum active session time.`
Type	**true | false**
Value	`true`

4. Select **Submit**.
5. From the System Property [sys_properties] list, open the *`glide.integrations.active.session.life_span`* property.
6. In the **Value** field, enter the number of minutes before integration sessions time out regardless of user activity.
   The value should be greater than the value of *`glide.integration.session_timeout`* for inactive integration session timeout. By default, the inactive session timeout for integration sessions is five minutes.
7. Select **Update**.

Result

Integrations are logged out of the instance after the time specified and their credentials must be entered again to access the instance. This setting helps secure an instance using integrations, such as the REST API.

Related topics

Configure a maximum active time for user sessions

Modify integration session timeout after inactivity

Specify when to time out integration sessions after a period of inactivity.

Before you begin

Role required: admin

About this task

By default, after one minute of inactivity, the platform ends an integration session and logs the user out automatically.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Select **New**.
3. On the form, fill in the fields.

Modify user session timeout after inactivity

Domain separation in third-party application and data source integration

This is an overview of domain separation and integration of third-party applications and data sources. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic-Standard

The Basic-Standard level of domain separation is achieved through data visibility as well the integration design.

Basic

- There is business logic to ensure data goes into the proper domain for the application's service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Standard

- Includes **Basic** level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Overview

Team should define a few examples with data-driven properties. There should be three different buckets with short description for each one

Limit sending emails to IDs that are known to generate bounces as per RFC3463 and allowing the admins to control blocked ids	Email bounce management

Email administration

All email notifications use the email properties that you define for your instance and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

Email accounts

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow - provided email accounts or create your own accounts for your own email services.

Email properties

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

Email service size restrictions

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

- Standard email configurations – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.
- Alternate email configurations – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see KB0521772.

Email service availability

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

continue to process email during an upgrade. For a possible explanation for undelivered emails, see this blog post by a ServiceNow Technical Support Engineer in the ServiceNow Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in Email and SMS notifications.

Instance-to-instance communication via email

Use Web services to communicate between two instances.

Designate untrusted and trusted email domains

Using Instance Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate untrusted and trusted email domains.

Next steps after enabling email

After enabling email on your instance, consider performing several of these important tasks.

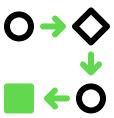
- Test the email configuration by routing all email to a single user (set the *glide.email.test.user* property).
- Review the baseline notification categories, email notifications, and templates to determine if they meet your business needs.
- Review the baseline inbound email actions to determine if they meet your business needs.
- Determine if you want to use email layouts to add consistent content elements.
- Determine if you want to use email filters to restrict the email the instance receives.
- Determine if you want to implement a retention policy to archive and destroy email at certain intervals.
- Determine what kind of watermarks outbound email uses to associate records with email messages.
- Determine if you want to create users when the instance receives an email from an unrecognized user.
- Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the *glide.smtp.precedence_bulk* property).
- Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.
- Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

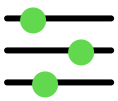
System mailboxes

Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email [sys_email] table.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about the fields that are shown in the System Mailbox, see System email log and mailboxes. You can configure the layout of a system mailbox to show any of the email log fields, not only the ones that are shown by default.

- **Inbound emails**: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the Received state. If the email message matches the criteria in an inbound email action, the email is changed to Processed. If not, it is changed to Ready. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.
- **Outbound emails**: All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to Sent (if sent) or Skipped (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

Configure email administration

Setup basic and advanced email, configure email properties, activate email filter and services and grandt non admin user access to email APIs.

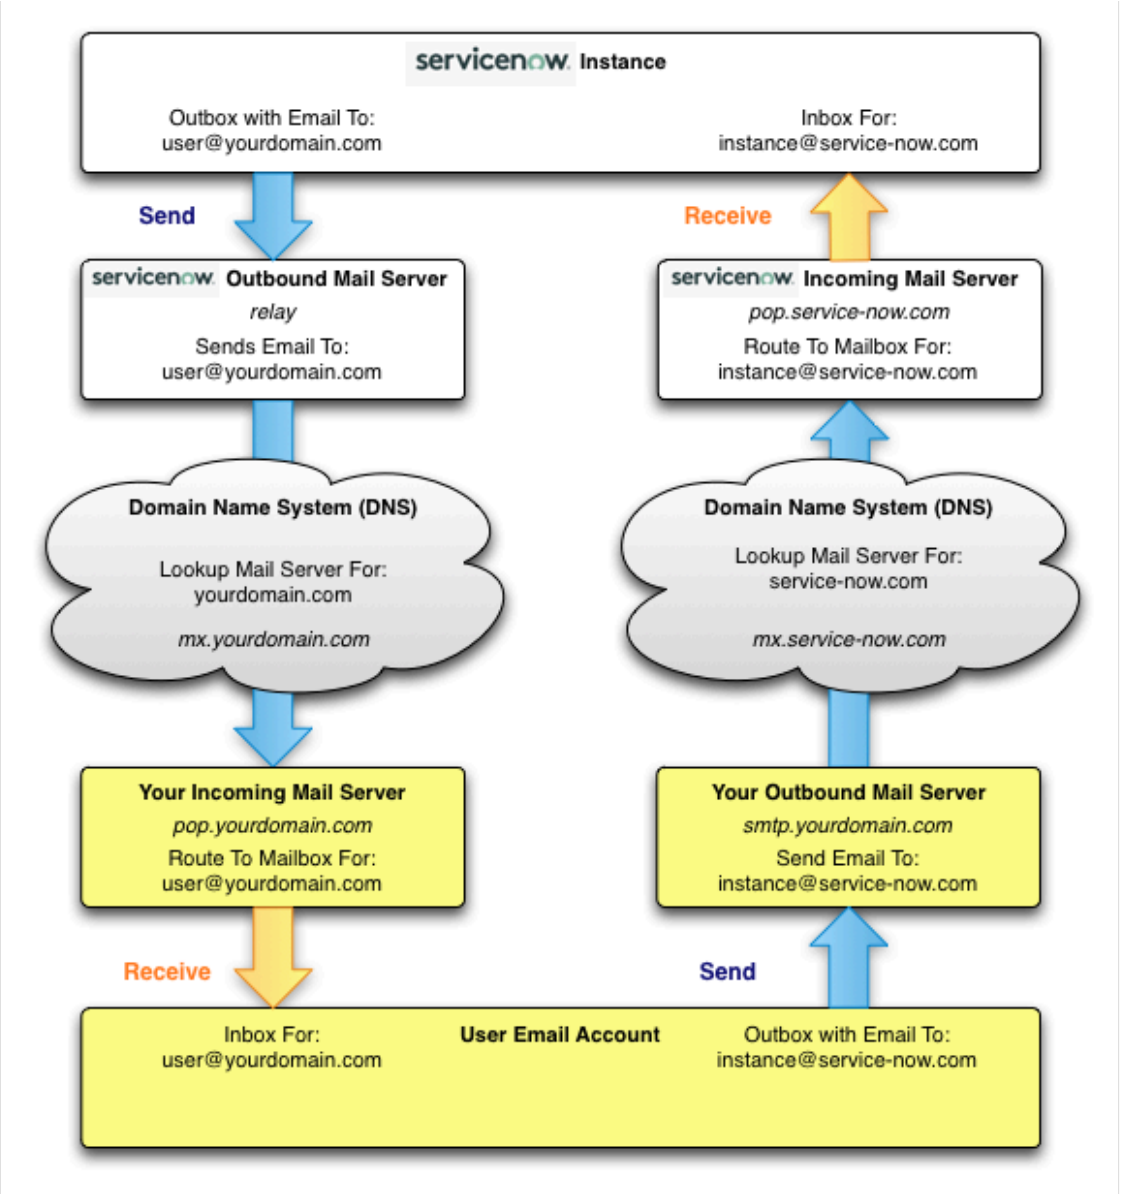
Basic email setup



All production instances can send and receive email using ServiceNow - provided resources. The instance has an email address of instance@service-now.com.

Network layout for standard email configuration

Below is an example of a basic email network with ServiceNow as the domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic email network

Basic email services and features

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.

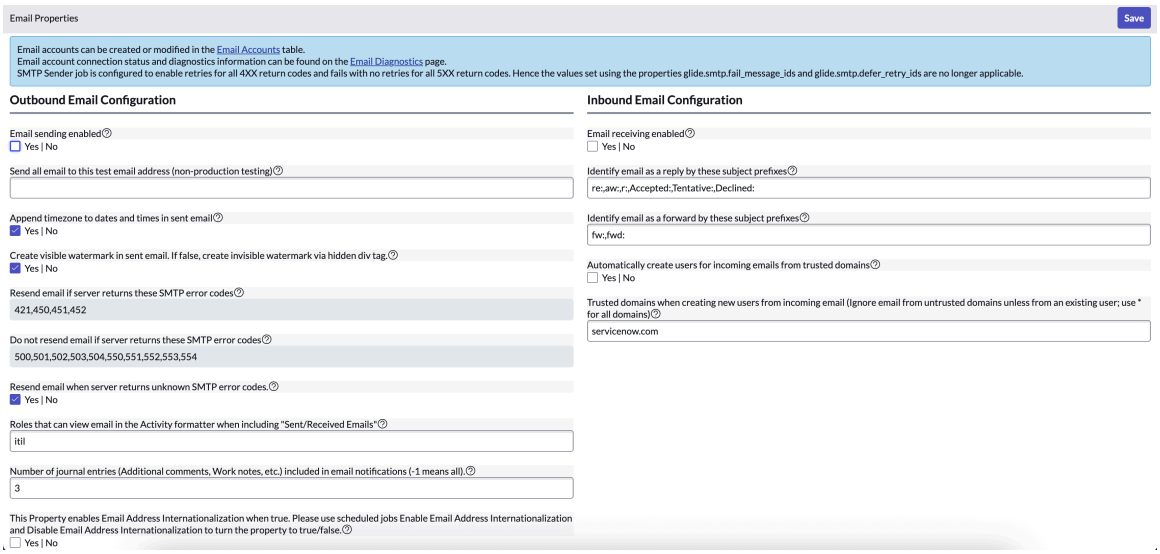
    If your internal mail servers send and receive messages via a TLS-encrypted channel, ServiceNow mail servers support that communication.
  - Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
  - An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.
  - A POP3 account receives email sent to your instance email address of instance@service-now.com.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

Enable basic email



Enable basic email to use ServiceNow - provided email servers and accounts.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. Configure these email properties and select **Save**.

Email property descriptions

Property section	Label	System property	Setting required
Outbound Email Configuration	Email sending enabled	glide.email.smtp.active	Yes
Inbound Email Configuration	Email receiving enabled	glide.email.read.active	Yes

Advanced email setup

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture. You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
- Use your own POP3 server to receive email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use your own SMTP and POP3 servers to send and receive email.
- Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
- Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

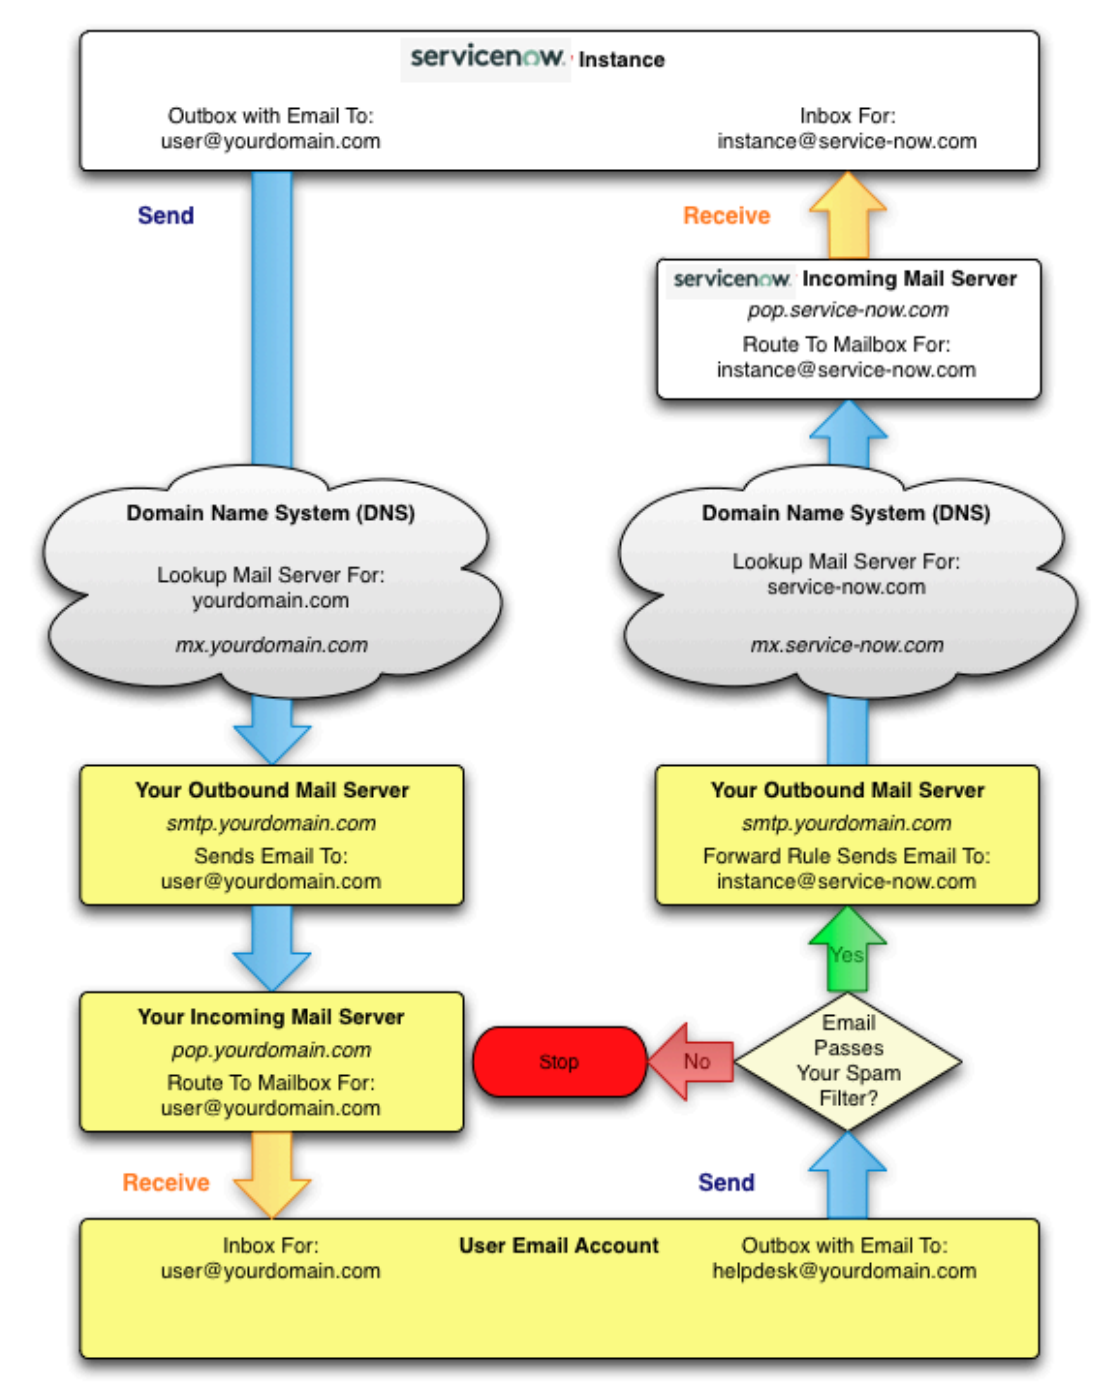
The following procedures assume that you enabled basic email properties.

Enable using your own SMTP server

Enable using your own SMTP server so that you can leverage the existing filtering, retention, or compliance aspects of your own SMTP server while also using the ServiceNow POP3 server.

Before you begin

- Role required: admin
- Email server required: SMTP
- Basic email properties: enabled



About this task

You can combine your own internal email architecture with the ServiceNow email architecture to handle email. The following diagram demonstrates how you would use your own SMTP server alongside the ServiceNow POP3 server.

Note: Supports only one active SMTP account at a time (for outbound emails).

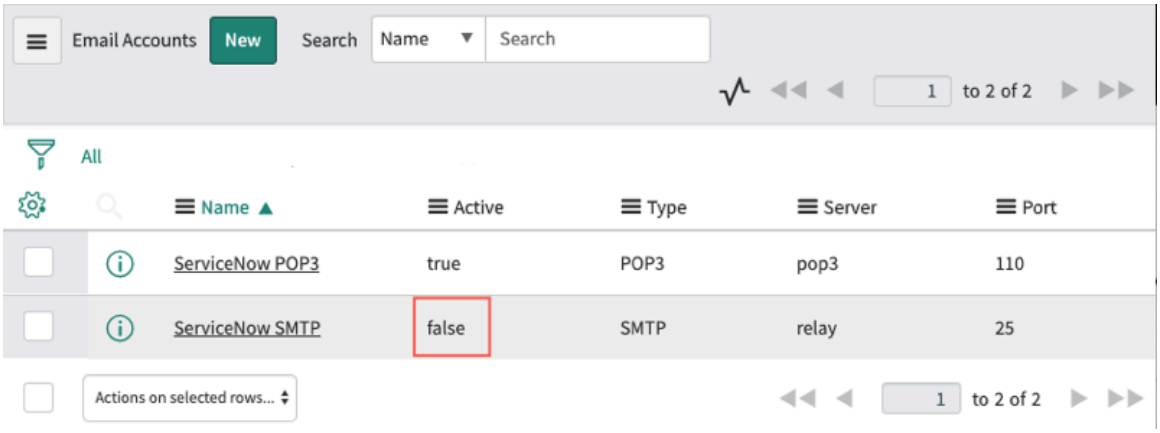
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Sending email using your own SMTP server

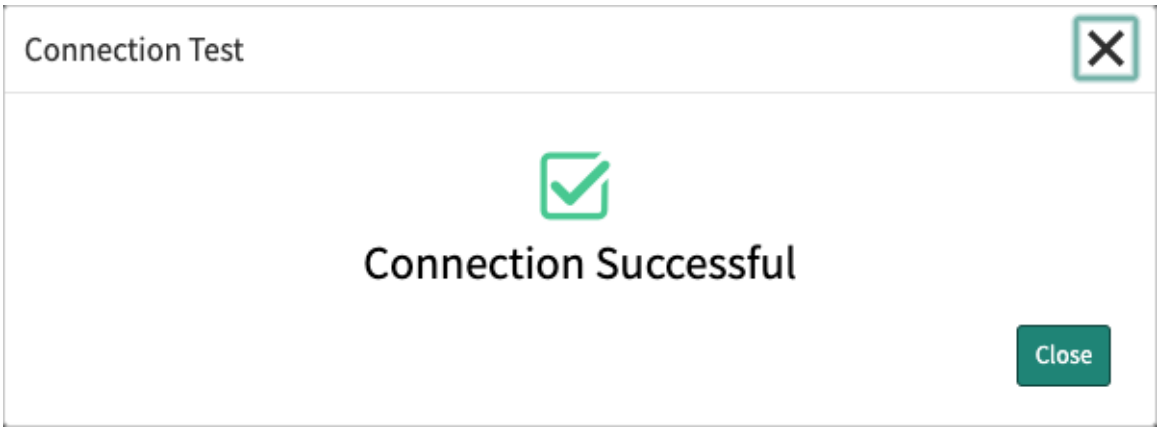
Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Accounts**.
   The system displays the list of available email accounts.
2. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **New**.
4. Create an email account record for your SMTP server where the **Type** is **SMTP**.
5. On the form, fill in the fields.

Field	Description
Name	Name of the email account.
Type	Type of mail server.
Authentication	Type of authentication used for the email account to connect to the email server. You can select one of the following: ○ –- None -- ○ Password ○ OAUTH ○ OAUTH 2.0
Server	Remote server to which this account connects. To activate a server for an on-premises installation, enter the full address (FQDN) of the node (for example, `node.customerdomain`).
User Name	Username or ID to authenticate an email address.
Password	Password when the **Authentication** type is **Password**.
Connection Security	Type of secure connection. Choose a setting: **None** No secure protocol is used. **STARTTLS** Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	SSL/TLS Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server. ⚠ **Warning:** Selecting a less secure protocol like **STARTTLS** or **None** may expose your data. To better ensure the security of data in your email server, select **SSL/TLS**.
Port	Connection TCP port.
System Address Filter	System address filter to apply to the email account. If left blank, the system uses the default system address filter for inbound or outbound email. For more information, see System address filters.
Active	Option to activate the email account.
ServiceNow Configured	Identifier of whether this account is provisioned by ServiceNow. If you create an account, this option is not selected.
Enable Debug Logging	Option to create node logs for the raw data that is exchanged with the email server. You can review the node logs by navigating to **System Logs** > **Utilities** > **Node Log File Browser**. You can enable this field temporarily to diagnose issues related to receiving or sending email.

6. From **Related Links**, click **Test Connection**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the email account is valid, the system returns a success message.

What to do next

Configure the SMTP server in your internal email architecture to forward email from the custom email address to the instance email address. Implement a spam filter on the custom email address.

Related topics

Create an email account

Enable using your own POP3 server

You can use your own POP3 server to store and receive email for the instance.

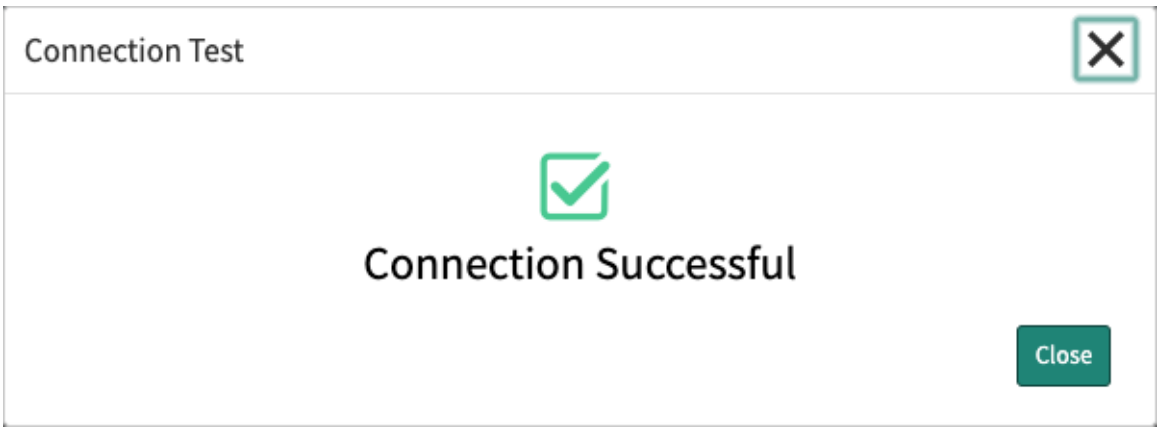
Before you begin

- Role required: admin
- Email server required: POP3
- Basic email properties: enabled

Procedure

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for `service-desk@company.com`.
2. Navigate to **System Mailboxes** > **Administration** > **Email Accounts**.
   The system displays the list of available email accounts.
3. **Optional:** If you do not want to receive, email sent to the instance@service-now.com mailbox, locate the record for **ServiceNow POP3** and change **Active** to **false**.
   An instance can receive email from multiple POP3 accounts at the same time. Leaving the **ServiceNow POP3** account active permits the instance to receive email sent to the default email address.
4. Click **New**.
   The system displays an empty email Account form.
5. Create an email account record for your POP3 server where the **Type** is **POP3**.
6. On the form, fill in the fields.

Field	Description
Name	Name of the email account.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	Type of mail server.
Authentication	Type of authentication used for the email account to connect to the email server. You can select one of the following: ○ –- None -- ○ Password ○ OAUTH ○ OAUTH 2.0
Server	Remote server to which this account connects. To activate a server for an on-premise installation, enter the full address (FQDN) of the node (for example, `node.customerdomain`).
User Name	Username or ID to authenticate an email address.
Password	Password when the **Authentication** type is **Password**.
Connection Security	Type of secure connection. Choose a setting: **None** No secure protocol is used. **STARTTLS** Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS. **SSL/TLS** Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server. ⚠ **Warning:** Selecting a less secure protocol like **STARTTLS** or **None** may expose your data. To better ensure the security of data in your email server, select **SSL/TLS**.

Example:

Receiving email using your own POP3 server

Enable using your own SMTP and POP3 servers

You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.

Before you begin

- Role required: admin
- Email servers required:

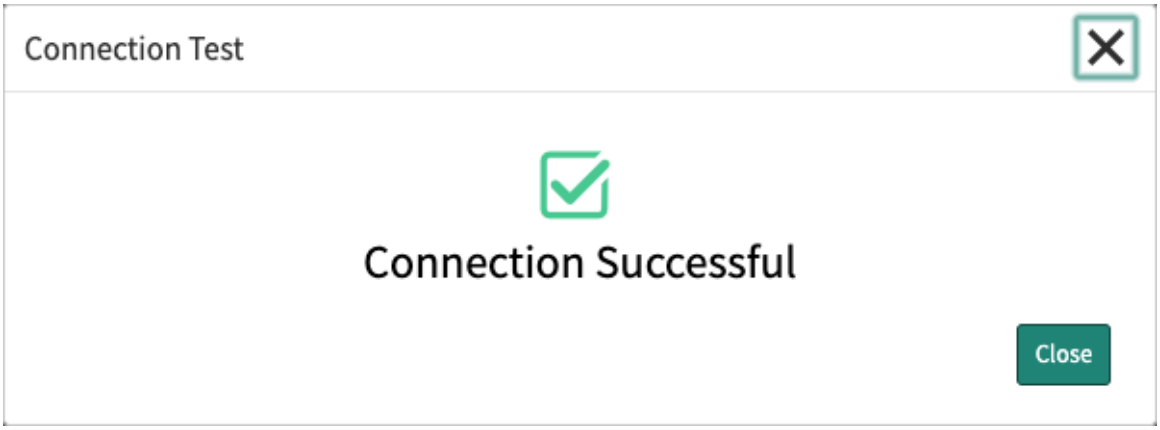
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SMTP
- POP3

- Basic email properties: enabled

Procedure

1. On your POP3 server, create a mailbox for your instance.
   For example, create a mailbox for `service-desk@company.com`.
2. Navigate to **System Mailboxes** > **Administration** > **Email Accounts**.
   The system displays the list of available email accounts.
3. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.
4. **Optional:** If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for **ServiceNow POP3** and change **Active** to **false**.
   An instance can receive email from multiple POP3 accounts at the same time. Leaving the**ServiceNow POP3** account active means that the instance receives email sent to its default email address.
5. Click **New**.
   The system displays a blank Email Account form.
6. Create an email account record for your SMTP server where the **Type** is **SMTP**.
7. On the form, fill in the fields.



Field	Description
Name	Name of the email account.
Type	Type of mail server.
Authentication	Type of authentication used for the email account to connect to the email server. You can select one of the following: - -- None -- - Password - OAUTH - OAUTH 2.0
Server	Remote server to which this account connects. To activate a server for an on-premise installation, enter the full address (FQDN) of the node (for example, `node.customerdomain`).
User Name	Username or ID to authenticate an email address.
Password	Password when the **Authentication** type is **Password**.
Connection Security	Type of secure connection. Choose a setting: **None** No secure protocol is used. **STARTTLS**

Email bounce management

Help prevent sending emails to addresses that are known to generate bounces by monitoring and filtering them out while sending emails.

Email bounce

An email bounce signifies the non-delivery of your email message according to RFC3464. When an email gets bounced, the sender receives a delivery status email with the reason for the bounce and the associated status code. For more information about these status codes, see Status codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An email address is blocked after it reaches a certain threshold of bounced emails. The default count for blocking the bounced email addresses is 10.

To view the bounce email addresses, navigate to **All** > **System Logs** > **Bounce Email Addresses**.

Each bounce email address record includes a **Bounce Email Address Logs** related list with an **Original Email** field that provides access to the original email associated with the bounce.

Important: Disabling bounce management is not recommended as it may lead to slow delivery or blocking of emails by the email provider.

Status code

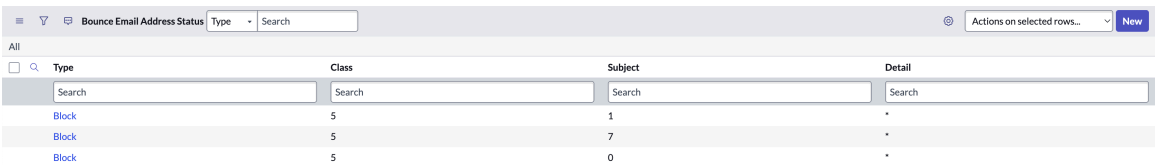
The syntax of the status codes is defined as the following:

```
status-code = class "." subject "." detail

      class = "2"/"4"/"5"

      subject = 1*3digit

      detail = 1*3digit
```



The first subcode indicates whether the delivery attempt was successful. The second subcode indicates the probable source of any delivery anomalies. The third subcode indicates a precise error condition.

Example: Status codes

Code 5.1.1

Code	Summary	Description
5.1.1	Bad destination mailbox address	The mailbox specified in the address doesn't exist. For email names, this means the address portion to the left of the "@" sign is invalid.

The default status codes that are used for blocking bounced email addresses are 5.0.*, 5.1.* and 5.7.*, where the asterisks (*) could be any number in the series according to the status code specification.

Note: There is a possibility that some email providers may use non-standard RFC status codes, potentially leading to functional email addresses being blocked. Administrators action is required to unblock these status codes and email addresses.

To view the blocked status codes, navigate to **All** > **System Mailboxes** > **Administration** > **Bounce Email Address Status**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Configure bounce email address status

Check the status of bounced email addresses

Configure bounce email address status

Configure a bounced email address status according to type, class, subject, and details.

Before you begin
Role required: admin

About this task
For detailed information on status codes and explanations of the components, see RFC Status codes.

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Bounce Email Address Status**.
2. Select **New**.
3. Select the **Type** and enter the **Class**, **Subject**, and **Detail**.

   Note: For example: Status code patterns for 5.1.* are blocked by default, if 5, 1, and 2 are entered as the Class, Subject, and Detail, the Type is selected as unblocked then only 5.1.2 is unblocked. All other status codes patterns for 5.1.* are still blocked.

4. Select **Submit**.

Related topics

Check the status of bounced email addresses

Resend all blocked emails

Unblock the bounce email address and resend all blocked emails.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Logs** > **Bounce Email Addresses**.
2. Select the record from the list.
3. In the record, update the State field to **Unblock**.
4. Select **Save**.
5. To send all blocked emails, select **Resend All Blocked Emails** from **Related Links**.
6. To resend a single or multiple blocked emails, select **Blocked Emails** tab.
   a. Hover on the email and select the email or emails.
   b. From the **Actions on selected rows** drop-down, select **Resend Blocked Emails**.

OAuth email authentication

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth enables an instance to receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

Note: Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See KB0546976 for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

Note: For configuring SMTP and IMAP email accounts with Microsoft Office 365 using OAuth 2.0, see KB0816072.

See Outbound REST with OAuth 2.0 profile tutorial - integrating with Google Contacts API for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see OAuth 2.0 for more information on OAuth 2.0 support in the instance.

Activate OAuth email authentication

You can activate the Email:OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP plugin (com.glide.email.oauth) for Notifications if you have the admin role.

Before you begin

Role required: admin

About this task

The following items are installed with Email:OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP:

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Email:OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP plugin (com.glide.email.oauth) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

© 2026 ServiceNow, Inc. All rights reserved.

Enable OAuth 2.0 for email

Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.

Before you begin

- Role required: admin
- Plugin required: Email - OAUTH support for IMAP and SMTP

Procedure

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.
2. Obtain the following from your third-party email account:
   - client ID
   - client secret
   - authorization URL
   - token URL
   - redirect URL
   - token revocation URL
3. Navigate to **System OAuth** > **Application Registry**.
4. Click **New**.
5. Click **Connect to a third party OAuth Provider** to create an application registry record that email uses.
6. Use the information you obtained from your third-party email account to fill in the fields on the form.
   See Use a third-party OAuth provider for instructions.
7. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.
8. Click **Submit**.
9. Navigate to **System Mailboxes** > **Administration** > **Email Accounts**.

   Note: Port and Connection Security information is provided by the provider.

   The system displays the list of available email accounts.
10. **Optional:** If you do not want to receive email sent to the default instance email address, locate the record for **ServiceNow POP3** and change **Active** to **false**.
    The system can receive email from multiple POP3 and IMAP email accounts.
11. Locate the records for **ServiceNow SMTP** and change **Active** to **false**.
12. Click **New**.
13. Create an email account record for your OAuth 2.0 SMTP server where the **Type** is **SMTP**.
14. For **Authentication**, select **OAuth 2.0**.
15. For **OAuth Profile**, select the application registry record you created.
16. Click **Authorize Email Account Access** to obtain the access and refresh tokens.

    Another browser window opens asking you to authorize the account access on the third-party email account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

17. Authorize the access.

    After the authorization is successful and the tokens are saved to the instance, the **Authorize Email Account Access** button no longer appears on the Email Account form.

18. Click **New**.

19. Create an email account record for your OAuth 2.0 IMAP server where the **Type** is **IMAP**. Use the same **Authentication** and **OAuth profile** settings as the OAuth SMTP email account.

System address filters

Prevent your system from communicating with untrusted domains and email addresses.

System address filters control who can communicate with your instance via email. You can improve email security by filtering domains and email addresses that you find suspicious.

For example, you might identify `example.com` as a suspicious domain. You can stop receiving emails from `example.com` by specifying the domain in a system address filter. You can also use another system address filter to prevent your system from sending emails to `example.com`.

There are two types of system address filters:

Outbound

Controls which domains and email addresses can receive email from your instance.

Inbound

Controls which domains and email addresses can send email to your instance.

When setting up system address filters, you can create one default outbound filter and one default inbound filter. A default outbound filter applies to all active SMTP email accounts automatically. A default inbound filter applies to all active IMAP or POP3 email accounts automatically.

To control senders and recipients for a specific email account, create a non-default filter and then apply it to the account.

Before setup

Before you set up system address filters, consider doing the following:

- Monitor your email to identify suspicious domains and email addresses.

  Using Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate untrusted and trusted email domains.

- Designate someone to set up system address filters by assigning them the email_account_admin role.

Setting up system address filters

To set up system address filters for your instance, complete the following tasks:

1. Set email address filters

   Specify which domains and email addresses are allowed or disallowed.

2. Create a system address filter

   Define how email address filters apply to inbound and outbound email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Next steps

After you set up system address filters, configure email filters for an added layer of security. Email filters enable you to ignore an inbound email or move it to a particular mailbox. For more information on configuring email filters, see Email filters.

Set email address filters

Specify which domains and email addresses are allowed or disallowed.

Before you begin

Role required: email_account_admin

About this task

You can specify two types of email address filters:

- Allow List: A list of allowed domains and email addresses
- Deny List: A list of disallowed domains and email addresses

You can also specify exceptions to the allowed or disallowed domains and email addresses.

Procedure

1. Navigate to **System Mailboxes** > **Administration** > **Email Address Filters**, and then select **New**.
2. Enter the **Name** of the address filter.
3. Select the filter **Type**:
   - Allow List: Allow all specified domains. All other domains are disallowed.
   - Deny List: Disallow all specified domains. All domains that don't match the denied list domains are allowed.
4. In the **Domains** field:

   a. Select the lock icon to unlock it and access the domains controlled by this filter.

   b. Select an existing domain or enter a new domain:

   - If the filter **Type** is Allow List, select the Search icon. Select the domains for which all email addresses are allowed. To add a new domain, select **New**, enter the **Domain**, and select **Submit**.
   - If the filter **Type** is Deny List, select the Search icon. Select the domains for which all email addresses are disallowed. To add a new domain, select **New**, enter the **Domain**, and select **Submit**.

   Note: You can specify a wildcard (*) in the domain name, for example `*.com`. If you create an email configuration that has multiple email address filters, all the filters evaluate the given email addresses. The filters determine whether the addresses are valid and the message can be sent as outbound email.

   By default, the maximum number of domains that you can associate with an email address filter is 100. You can reconfigure this limit by setting the *`glide.email_address_filter.max_domains`* property.

   c. Select the lock icon to lock the **Domains** field.

5. Specify any email addresses that are **Exceptions** to the domains specified in Step 4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the lock icon to open the Email Address Filter Exceptions [sys_email_address_filt_except] table.

b. Click the search icon to choose an existing email address.

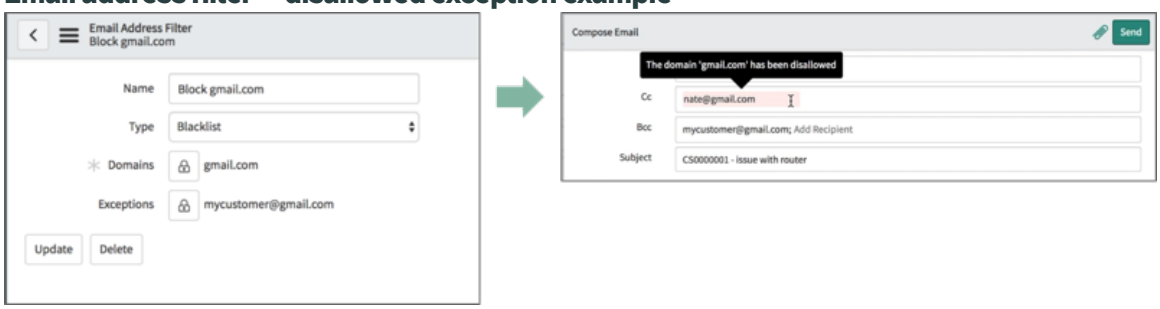
c. To add a new email address, select **New**, enter the email address exception, and select **Submit**.

Note: You can specify a wildcard (*) in an email address exception.

By default, the maximum number of exceptions that you can associate with an email address filter is 1000. You can reconfigure this limit by setting the *glide.email_address_filter.max_exceptions* property.

d. Select the lock icon to lock the **Exceptions** field.
The exception is added to the Email Address Filter Exceptions [sys_email_address_filt_except] table.

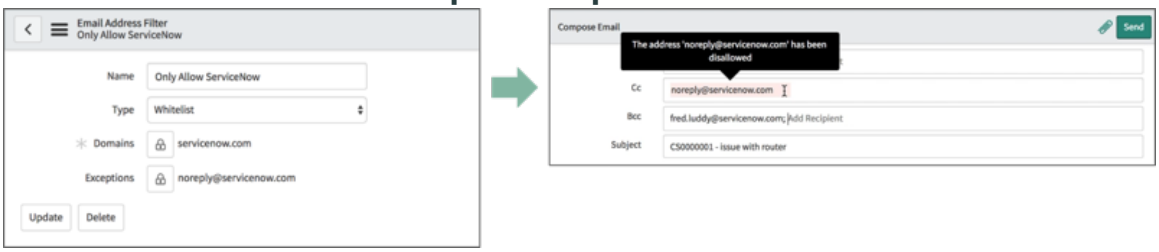
6. Select **Submit**.
The email address filter is added to the Email Address Filters [sys_email_address_filter] table.



Example: Email address filter

Note: After the email address filter is added to the Email Address Filters [sys_email_address_filter] table, Create an email client configuration.

Email address filter — allowed exception example



Email address filter — disallowed exception example

Example:

Email address filter — allowed exception example

Email address filter — disallowed exception example

What to do next

Apply the email address filter to a system address filter. For more information, see Create a system address filter.

Read or send emails using Microsoft Graph

Use Microsoft Graph endpoints to read or send emails from Microsoft Exchange Online.

Using Microsoft Graph with ServiceNow

In addition to the standard IMAP, SMTP, and POP3, the ServiceNow AI Platform supports Microsoft Graph as an email type.

Email account administrators, which are users who have the email_account_admin role, can configure

- ServiceNow AI Platform to read emails from an Microsoft Exchange Online tenant using Graph Endpoints by authenticating with a client ID and client secret or with certificates.
- ServiceNow AI Platform to send emails from an Microsoft Exchange Online tenant using Graph Endpoints by authenticating with a client ID and client secret.

Note: Antispam and malware scanning are managed by the customer and not ServiceNow.

To receive and email, go to the **Email Account** form, select, **Microsoft Graph (Receive)** in the **Type** field.

To send and email, go to the **Email Account** form, select, **Microsoft Graph (Send)** in the **Type** field.

Activate Email - Support for Email Processing by Microsoft Graph API

You can activate the Email - Support for Email Processing by Microsoft Graph API plugin (com.glide.email.graph) for Notifications if you have the admin role.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Email - Support for Email Processing by Microsoft Graph API plugin (com.glide.email.graph) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Reading email using Microsoft Graph

Use Microsoft Graph API to retrieve emails from Microsoft Exchange Online and save them to sys_email table.

In the **Email Account** form, select, **Microsoft Graph (Receive)** in the **Type** field.

Configure an OAuth profile to use a client ID and secret for token generation

Configure an OAuth profile using a client ID and client secret to create an email account for using Microsoft Graph (receive) in your email account type.

Before you begin

Create an Microsoft Azure account to configure OAuth profile.

Complete the set up steps using your Microsoft Azure Developer account. See the Microsoft Azure product documentation for instructions on creating and configuring custom applications.

Role required: admin and Microsoft Azure portal administrator

Procedure

1. Log in to the Microsoft Azure registration portal with your organization credentials.
   For more information, see the Microsoft Azure registration portal documentation.
2. Register a new custom application by filling in the application name, supported account type, and redirect URI, and select **Register**.

   Note: Enter the redirect URI in the following format: `https://<instance>/oauth_redirect.do`.

   An overview of the application's basic information is displayed.
3. Copy the client ID to a text file.
   You will use this ID and the client secret value generated in the next steps to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to your instance.
4. Enable the **Mail.ReadWrite** permission.
   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.
   b. Select **Add a permission**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the Microsoft Graph tile.
d. Select **Application Permissions**.
e. In the **Select permissions** field, enter `Mail.ReadWrite`.
f. Select the **Mail.ReadWrite** check box.
g. Select **Add permissions**.

5. Select **Grant admin consent for <your organization name>**.
6. Select **Yes** to confirm.
7. Add a client secret.
   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.
   b. Select **New client secret**.
   c. Provide a description and an expiration date and select **Add**.
8. Copy the value (secret value) to a text file.
9. Navigate to **Overview** > **Endpoints** and copy the **OAuth 2.0 token endpoint (v2)** to a text file.

Register an application as an OAuth provider

Use the information generated during Microsoft Azure account configuration to register an application as an OAuth provider.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
3. On the **What kind of OAuth application** screen, select **Connect to a third-party OAuth Provider**.
4. On the form, fill in the fields.

Application Registries form

Field	Value required
Name	Name to uniquely identify the record.
Client ID	Application ID of the application you created in Microsoft Azure.
Client Secret	The client secret you generated when you created the application in Microsoft Azure. **Note:** When using certificates, the **Client Secret** is a dummy value.
OAuth API Script	OAuth API script name. For more information see, OAuth API Script. **Note:** This is required only while using certificates.
Default Grant type	Client Credentials.
Token URL	Token URL copied after configuring the Microsoft Azure account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value required
Redirect URL	`https://<instance>./oauth_redirect.do` **Note:** This URL should be the same as the URL in Microsoft Azure.

5. Right-click the form header and select **Save**.
   An OAuth Entity Profile record is created.
6. In the OAuth Entity Scopes related list, add scopes to match the permissions you defined when you configured the application.
7. Select **Insert a new row**.
8. Enter `Default` as the name and `.default` as OAuth scope.
9. Right-click the form header and select **Save**.
10. In the OAuth Entity Profiles embedded list, select the profile created by default.
11. In the OAuth Entity Scopes embedded list, add a new row and select the **Default** scope.
12. Select **Update**.

What to do next

Create an email account for Microsoft Graph (receive) using the OAuth profile.

Configure an OAuth profile to use certificates for authentication with Microsoft Azure

Configure an OAuth application profile to authenticate using certificates.

Before you begin

Create an Microsoft Azure account to configure OAuth profile.

Complete the set up steps using your Microsoft Azure Developer account. See the Microsoft Azure product documentation for instructions on creating and configuring custom applications.

Role required: admin and Microsoft Azure portal administrator

Procedure

1. Log in to the Microsoft Azure registration profile with your organization credentials.
   For more information, see the Microsoft Azure registration portal documentation.
2. Register a new custom application by filling in the application name, supported account type, and redirect URL, and then select **Register**.

   Note: Enter the redirect URL in the following format: `https://<instance>/oauth_redirect.do`.

   An overview of the application's basic information is displayed.
3. Copy the client ID to a text file.
   You will use this ID and the secret value generated in the next steps to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.
4. Enable the **Mail.ReadWrite** permission.
   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.
   b. Select **Add a permission**.
   c. Click the Microsoft Graph tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Application Permissions**.

e. In the **Select permissions** field, enter `Mail.ReadWrite`.

f. Select the **Mail.ReadWrite** check box.

g. Select **Add permissions**.

5. Select **Grant admin consent for <your organization name>**.
6. Select **Yes** to confirm.
7. Upload the certificate
   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.
   b. Select **upload certificate**.
   c. Provide a description, a start date, and an expiration date and upload the certificate.
8. Copy the client ID and directory ID to a text file.
9. Navigate to **Overview** > **Endpoints** and copy the **OAuth 2.0 token endpoint (v2)** to a text file.

What to do next

Configure a JWT provider

Configure a JWT provider

Configure a JWT provider on the ServiceNow AI Platform to configure an OAuth application profile to authenticate using certificates.

Before you begin

Upload a Java Key Store certificate. Attach a JKS certificate containing the certificate uploaded on Microsoft Azure to your instance to use when enabling the JWT client authentication. For more information, see Upload Java Key Store certificate.

Create a JWT signing key to assign to your Java KeyStore (JKS) certificate. For more information, see Configure a JWT signing key.

Role required: admin

Procedure

1. Add a JWT provider to your ServiceNow instance and fill in the claim values.

Claim Name	Claim Value
aud	https://login.microsoftonline.com/{tenantId}/oauth2/v2.0/token **Note:** Tenant ID is the directory ID copied from Microsoft Azure.
iss	Client ID copied from Microsoft Azure
sub	Client ID copied from Microsoft Azure

   For more information, see Create a JWT provider with a JWT signing key.
2. From the JWT Provider record menu, select **Copy sys_id** and copy the JWT provider sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Generate a SHA-1 thumbprint

Generate a SHA-1 thumbprint

Generate a SHA-1 thumbprint using the JWT provider's sys_id and JKS certificate's sys_id and certificate's alias to be added to the GraphCertificateOAuthTemplate script.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Scripts-Background**.
2. Paste the following script to generate the SHA-1 thumbprint value.

```
var certId = "<sys_id of the certificate record>";

var certAlias = "<alias name for the certificate>";

var gce = new GlideCertificateEncryption();

var thumbprint = gce.getThumbPrintFromKeyStore(certId,
 certAlias,"SHA-1");

gs.log(thumbprint);
```

3. Select **Run script**.

What to do next
Create an OAuth API script

Create an OAuth API script

Create and duplicate an OAuth API script for application registry.

Before you begin
Generate a SHA -1 thumbprint. For more information see Generate a SHA-1 thumbprint.

Ensure you have the Email - Support for Email Processing by Microsoft Graph API plugin (com.glide.email.graph) installed.

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Select and open **GraphCertificateOAuthTemplate**.
3. Duplicate the script by changing the name in the **Name** field,select **Insert and Stay** from the record menu.

   Note: The name should begin with **OAuth**.

   The script is copied and created with a different name.
4. In the script, enter the JWT provider sys_id and SHA -1 thumbprint.
5. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Register an application as an OAuth provider.

Create an email account for Microsoft Graph (receive)

Create an email account for reading emails from Microsoft Exchange Online using Microsoft Graph Endpoints.

Before you begin
Role required: email_account_admin

About this task
Antispam and malware scanning are managed by Microsoft Graph account and not ServiceNow

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Email Accounts form

Field	Description
Name	Name of the email account.
Type	Microsoft Graph (Receive)
Authentication	OAUTH 2.0 - Type of authentication used for the email account to connect to the email server.
Inbox email address	Address of the inbox for reading emails.
OAuth Profile	OAuth profile configured during application registry.
Active	Option to activate the email account.
Enable debug output	Option to create node logs for the raw data that is exchanged with the email server. You can enable this field temporarily to diagnose issues related to receiving or sending email.

4. Select **Submit**.
5. Select the test connection link at the bottom to test the account.

Sending email using Microsoft Graph

Use Microsoft Graph endpoints to deliver emails through Microsoft Exchange Online using the SMTP Sender.

In the **Email Account** form, select, **Microsoft Graph (Send)** in the **Type** field.

Configure OAuth profile to use a client ID and secret for token generation

Configure an OAuth profile using a client ID and client secret to create an email account for using Microsoft Graph (send) in your email account type.

Before you begin
Create an Microsoft Azure account to configure OAuth profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Complete the set up steps using your Microsoft Azure Developer account. See the Microsoft Azure product documentation for instructions on creating and configuring custom applications.

Role required: admin and Microsoft Azure portal administrator

Procedure

1. Log in to the Microsoft Azure registration portal with your organization credentials.
   For more information, see the Microsoft Azure registration portal documentation.
2. Register a new custom application by filling in the application name, supported account type, and redirect URI, and select **Register**.

   Note: Enter the redirect URI in the following format: `https://<instance>/oauth_redirect.do`.

   An overview of the application's basic information is displayed.
3. Copy the client ID to a text file.
   You will use this ID and the client secret value generated in the next steps to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to your instance.
4. Enable the **Mail.ReadWrite** permission.
   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.
   b. Select **Add a permission**.
   c. Select the Microsoft Graph tile.
   d. Select **Application Permissions**.
   e. In the **Select permissions** field, enter `Mail.Send`.
   f. Select the **Mail.Send** check boxes.
   g. In the **Select permissions** field, enter `Mail.ReadWrite`.
   h. Select the **Mail.ReadWrite** check boxes.
   i. Select **Add permissions**.
5. Select **Grant admin consent for <your organization name>**.
6. Select **Yes** to confirm.
7. Add a client secret.
   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.
   b. Select **New client secret**.
   c. Provide a description and an expiration date and select **Add**.
8. Copy the value (secret value) to a text file.
9. Navigate to **Overview** > **Endpoints** and copy the **OAuth 2.0 token endpoint (v2)** to a text file.

Register an application as an OAuth provider

Use the information generated during Microsoft Azure account configuration to register an application as an OAuth provider.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
3. On the **What kind of OAuth application** screen, select **Connect to a third-party OAuth Provider**.
4. On the form, fill in the fields.

Application Registries form

Field	Value required
Name	Name to uniquely identify the record.
Client ID	Application ID of the application you created in Microsoft Azure.
Client Secret	The client secret that you generated when you created the application in Microsoft Azure. **Note:** When using certificates, the **Client Secret** is a dummy value.
OAuth API Script	OAuth API script name. For more information see, OAuth API Script. **Note:** This is required only while using certificates.
Default Grant type	Client Credentials.
Token URL	Token URL copied after configuring the Microsoft Azure account.
Redirect URL	`https://<instance>./oauth_redirect.do` **Note:** This URL should be the same as the URL in Microsoft Azure.

5. Select and hold (or right-click) the form header and select **Save**.
   An OAuth Entity Profile record is created.
6. In the OAuth Entity Scopes related list, add scopes to match the permissions you defined when you configured the application.
7. Select **Insert a new row**.
8. Enter `Default` as the name and `.default` as OAuth scope.
9. Select and hold (or right-click) the form header and select **Save**.
10. In the OAuth Entity Profiles embedded list, select the profile created by default.
11. In the OAuth Entity Scopes embedded list, add a new row and select the **Default** scope.
12. Select **Update**.

Create an email account for Microsoft Graph (send)

Create an email account for sending emails from Microsoft Exchange Online using Microsoft Graph Endpoints.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Antispam and malware scanning are managed by Microsoft Graph account and not ServiceNow

Procedure
1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Email Accounts form

Field	Description
Name	Name of the email account.
Type	Microsoft Graph (Send)
Authentication	OAUTH 2.0 - Type of authentication used for the email account to connect to the email server.
Email user label	Name of the sender.
OAuth Profile	OAuth profile configured during application registry.
Active	Option to activate the email account.
Enable debug output	Option to create node logs for the raw data that is exchanged with the email server. You can enable this field temporarily to diagnose issues related to receiving or sending email.

4. Select **Submit**.
5. Select the test connection link at the bottom to test the account.

Sending email using client credential flow

Use the client credential flow to send emails from Microsoft Exchange Online.

Email account administrators, who are users that have the email_account_admin role, can configure ServiceNow AI Platform to send emails from an Microsoft Exchange Online tenant. The email account administrators can use SMTP by authenticating with a client ID and client secret or with certificates.

Activate OAuth support

You can activate the Email:OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP plugin (com.glide.email.oauth) for Notifications if you have the admin role.

Before you begin
Role required: admin

About this task
The following items are installed with Email:OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Email:OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP plugin (com.glide.email.oauth) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Configure client credential flow for SMTP OAuth2 using a client id and secret

Configure outbound email accounts in a ServiceNow instance using a client id and secret.

Before you begin

Create an Microsoft Azure account to configure an OAuth profile.

Complete the setup steps using your Microsoft Azure Developer account. See Microsoft Azure product documentation for instructions on creating and configuring custom applications.

Role required: Microsoft Azure portal administrator and admin

Procedure

1. Log in to the Microsoft Azure registration portal with your organization credentials.
   For more information, see the Microsoft Azure registration portal documentation.
2. Register a new custom application by filling in the application name, supported account type, and redirect URL, and select **Register**.

   Note: Enter the redirect URL in the following format: `https://<instance>/oauth_redirect.do`.

   An overview of the application's basic information is displayed.
3. Copy the client ID to a text file.
   You'll use this client ID and the client secret value generated in the next steps to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to your instance.
4. Enable the **SMTP.SendAsApp** permission.
   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.
   b. Select **Add a permission**.
   c. Select the Microsoft Office 365 tile.
   d. Select **Application Permissions**.
   e. In the **Select permissions** field, enter `SMTP SendAsApp`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Select the **SMTP SendAsApp** check box.

g. Select **Add permissions**.

5. Select **Grant admin consent for <your organization name>**, then select **Yes** to confirm.
6. Add a client secret.
   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.
   b. Select **New client secret**.
   c. Provide a description and an expiration date, then select **Add**.
7. Copy the value (secret value) to a text file.
8. Register service principals in Microsoft Exchange using PowerShell.
   a. Run the following commands.

```
Install-Module -Name ExchangeOnlineManagement -allowprerelease
Import-module ExchangeOnlineManagement
Connect-ExchangeOnline -Organization <tenantId>
```

   For more information, see Authenticate SMTP connection using OAuth

   b. Register an Microsoft Entra ID application's service principal by running the following command.

```
New-ServicePrincipal -AppId <APPLICATION_ID> -ObjectId <OBJECT_ID>
```

   Important: For the OBJECT_ID value, go to **Overview** > **Managed applications in local directory** and copy the Object ID.

   c. Add permission to user email ID using the following command.

```
Add-MailboxPermission -Identity "<email_id>" -User <object_id>
 -AccessRights FullAccess
```

9. Navigate to **Overview** > **Endpoints** and copy the **OAuth 2.0 token endpoint (v2)** to a text file. You use the **OAuth 2.0 token endpoint (v2)** when registering an OAuth provider. For more information, see Register an OAuth provider.

What to do next

Register an OAuth provider

Register an OAuth provider

Use the information generated during the Microsoft Azure account configuration to register an application as an OAuth provider.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
3. On the **What kind of OAuth application** screen, select **Connect to a third-party OAuth Provider**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

Application Registries form

Field	Description
Name	Name to uniquely identify the record.
Client ID	Application ID of the application that you created in Microsoft Azure.
Client Secret	The client secret that you generated when you created the application in Microsoft Azure. **Note:** When using certificates, the **Client Secret** is a dummy value.
OAuth API Script	OAuth API script name. For more information see, OAuth API Script. **Note:** This field is required only while using certificates.
Default Grant type	Client Credentials
Token URL	Token URL that you copied after configuring the Microsoft Azure account.
Redirect URL	`https://<instance>./oauth_redirect.do` **Note:** This URL should be the same as the URL in Microsoft Azure.

5. Select and hold (or right-click) the form header and select **Save**.
An OAuth Entity Profile record is created.
6. In the OAuth Entity Scopes related list, add scopes to match the permissions that you defined when you configured the application.
7. Select **Insert a new row**.
8. Enter `smtp` as the name and `https://outlook.office365.com/.default` as the OAuth scope.
9. Select and hold (or right-click) the form header and select **Save**.
10. In the OAuth Entity Profiles embedded list, select the profile created by default.
11. In the OAuth Entity Scopes embedded list, add a new row and select the **smtp** scope.
12. Select **Update**.

What to do next
Use the OAuth profile to create an email account with SMTP OAuth2.0. For more information, see Create an email account with SMTP OAuth2.0.

Configure client credential flow for SMTP OAuth2 using certificate-based authentication

Configure an OAuth application profile to authenticate using certificates for outbound email.

Before you begin
Create an Microsoft Azure account to configure an OAuth profile.

Complete the setup steps using your Microsoft Azure Developer account. See Microsoft Azure product documentation for instructions on creating and configuring custom applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: Microsoft Azure portal administrator and admin

Procedure

1. Log in to the Microsoft Azure registration profile with your organization credentials.
   For more information, see the Microsoft Azure registration portal documentation.
2. Register a new custom application by filling in the application name, supported account type, and redirect URL, and then select **Register**.

   Note: Enter the redirect URL in the following format: `https://<instance>/oauth_redirect.do`.

   An overview of the application's basic information is displayed.
3. Copy the client ID to a text file.
   You'll use this client ID and the secret value generated in the next steps to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.
4. Enable the **SMTP.SendAsApp** permission.
   a. In Microsoft Azure, navigate to **Manage** > **API permissions**.
   b. Select **Add a permission**.
   c. Select the Microsoft Office 365 tile.
   d. Select **Application Permissions**.
   e. In the **Select permissions** field, enter `SMTP.SendAsApp`.
   f. Select the **SMTP.SendAsApp** check box.
   g. Select **Add permissions**.
5. Select **Grant admin consent for <organization name>**, then select **Yes** to confirm.
6. Upload the certificate.
   a. In Microsoft Azure, navigate to **Manage** > **Certificates & secrets**.
   b. Select **upload certificate**.
   c. Provide a description, a start date, and an expiration date, then upload the certificate.
7. Copy the client ID and directory ID to a text file.
8. Register service principals in Microsoft Exchange using PowerShell.

   a. Run the following commands.

   ```
   Install-Module -Name ExchangeOnlineManagement -allowprerelease
   Import-module ExchangeOnlineManagement
   Connect-ExchangeOnline -Organization <tenantId>
   ```

   For more information, see Authenticate SMTP connection using OAuth

   b. Register an Microsoft Entra ID application's service principal by running the following command.

   ```
   New-ServicePrincipal -AppId <APPLICATION_ID> -ObjectId <OBJECT_ID>
   ```

   Important: For the OBJECT_ID value, go to **Overview** > **Managed applications in local directory** and copy the Object ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Add permission to user email ID using the following command.

```
Add-MailboxPermission -Identity "<email_id>" -User <object_id>
 -AccessRights FullAccess
```

9. Navigate to **Overview** > **Endpoints** and copy the **OAuth 2.0 token endpoint (v2)** to a text file. You use the **OAuth 2.0 token endpoint (v2)** when configuring a JWT provider. For more information, see Configure a JWT provider.

What to do next
Configure a JWT provider

Configure a JWT provider

Configure a JWT provider on the ServiceNow AI Platform to configure an OAuth application profile to authenticate using certificates.

Before you begin
Upload a Java Key Store (JKS) certificate. Attach a JKS certificate containing the certificate uploaded on Microsoft Azure to your instance to use when enabling the JWT client authentication. For more information, see Upload Java Key Store certificate.

Create a JWT signing key to assign to your JKS certificate. For more information, see Configure a JWT signing key.

Role required: admin

Procedure
1. Add a JWT provider to your ServiceNow instance and fill in the claim values.

Claim Name	Claim Value
aud	https://login.microsoftonline.com/{tenantId}/oauth2/v2.0/token **Note:** The tenant ID should be replaced with the directory ID copied from Microsoft Azure.
iss	Client ID copied from Microsoft Azure
sub	Client ID copied from Microsoft Azure

For more information, see Create a JWT provider with a JWT signing key.

2. From the JWT Provider record menu, select **Copy sys_id** and copy the JWT provider sys_id.

What to do next
Generate a SHA-1 thumbprint

Generate a SHA-1 thumbprint

Generate an SHA-1 thumbprint using the JWT provider's sys_id, the Java Key Store (JKS) certificate's sys_id, and the JKS certificate's alias to the GraphCertificateOAuthTemplate script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Scripts-Background**.
2. Paste the following script to generate the SHA-1 thumbprint value.

```
var certId = "<sys_id of the certificate record>";

var certAlias = "<alias name for the certificate>";

var gce = new GlideCertificateEncryption();

var thumbprint = gce.getThumbPrintFromKeyStore(certId,
 certAlias,"SHA-1");

gs.log(thumbprint);
```

3. Select **Run script**.

What to do next
Create an OAuth API script

Create an OAuth API script

Create and duplicate an OAuth API script for application registry.

Before you begin
Generate an SHA-1 thumbprint. For more information, see Generate a SHA-1 thumbprint.

Generate a sys_id when you configure a JWT provider. For more information, see Configure a JWT provider.

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Select and open **EmailCertificateOAuthTemplate**.
3. Duplicate the script by changing the name in the **Name** field, select **Insert and Stay** from the record menu.

   Note: The name must begin with **OAuth** to create an OAuth script.

   The script is copied and created with a different name.
4. In the copied script, enter the JWT provider sys_id and SHA-1 thumbprint.
5. Select **Update**.

What to do next
Register an OAuth provider.

Create an email account with SMTP OAuth2.0

Create an email account from Microsoft Exchange Online with SMTP OAuth2.0.

Before you begin

Role required: email_account_admin

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Accounts**.
2. Select **New**.
3. On the form, fill in the fields.

Email Accounts form

Field	Description
Name	Name of the email account.
Type	SMTP
Authentication	Select **OAUTH 2.0**. Type of authentication used for the email account to connect to the email server.
Server	Server used for creating the email accounts.
Email user label	Display value used for outgoing messages. This field is for SMTP type accounts only.
User name	User name or ID to authenticate an email address. The value in this field is also the **From** address when the instance sends an email. If you're using SMTP, the value must be a full email address. The value in the **From** field can override this field for SMTP accounts.
From	The From email address used for notifications sent with this account. This address takes precedence over the **User name** field. If nothing is present in this field, the User name is used as the return address for notifications sent from the instance. **Note:** This value is for SMTP only.
OAuth Profile	OAuth profile configured during application registry.
Connection Security	If your email server supports TLS, an insecure connection is upgraded to a secure connection using the SSL/TLS encryption protocol.
Port	Connection TCP port.
Active	Option to activate the email account.
ServiceNow Configured	Identifier of whether this account is provisioned by ServiceNow. If you create an account, this option isn't selected.
Enable debug output	Option to create node logs for the raw data that is exchanged with the email server. You can enable this field temporarily to diagnose issues related to receiving or sending email.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.
5. Test the connection by selecting the **Test Connection** link.

Personal corporate mailbox

Enables sales agents to integrate their personal corporate mail boxes to send and receive emails.

A personal corporate user mailbox refers to an individual employee's official email account provided by their organization (for example, user@company.com). This mailbox is used for business communication and is uniquely associated with a single user, unlike shared or departmental mailboxes. It can be integrated with enterprise systems to support workflows around sending and receiving email notifications.

Set up personal corporate mailbox

Set up your personal corporate mailboxes with ServiceNow platform.

Before you begin

The User Mailbox Integration (com.glide.email.user_mailbox.integration) plugin must be installed.

Role required: user_email_account

Procedure

1. From the user menu, navigate to **Preferences** > **Notifications** and then select the **Advanced Preferences** link.
2. Select the **Delivery Channels** tab.
3. If no devices are configured, follow these steps to add an email device.
   a. In the Email channel section, select **+Add**.
   b. Expand the **Channel info** section and provide the channel name and email address in the fields.
   c. Select **Save**.
4. Set up personal mailbox.
   a. In the Set up personal mailbox section, select the **Set up personal mailbox** option.
   b. In the Create dialog, select **Password** or **OAuth 2.0** from the Authentication drop-down list. For **Password** as the authentication type, enter the App password provided by your email service provider in the **App password** field.
   c. In the **User email** field, enter the email address of the mailbox that you want to connect.
   d. Select a template from the list of configured user email account templates. To configure a new template aside from the preconfigured templates, see Configure templates for personal corporate mailboxes.
   e. Review the information.
   f. Integrate the mailbox by selecting the **I acknowledge** option.
   g. Select **Connect**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. Optional: Expand the Set up personal mailbox section to view the connected mailboxes.

Note: At least one mailbox must be connected to view the connected mailboxes.

Configure templates for personal corporate mailboxes

Configure personal corporate mailboxes in the ServiceNow platform to enable users and agents to send and receive emails.

Before you begin

The email account should be created and connected. For more information, see Create an email account.

The User Mailbox Integration (com.glide.email.user_mailbox.integration) plugin must be installed.

Role required: admin

Procedure

1. Create an email client template.
   To configure an email client template, see Create an email client template.
   a. On the **Sender Configuration** tab, for the **From Generation Type** select **User Email Addresses**.
   b. To include shared email address, select the **Include Shared Email Address** check box.
   c. Select **Submit**.
2. Apply an email client template.
3. Navigate to **All** > **User Mailboxes** > **Administration** > **Server Configuration**.
4. Select **New**.
5. On the form, fill in the fields.

User Email Account Server form

Field	Description
Name	Name of the email account.
Server	Remote server to which this account connects.
Type	Type of mail server. Select **SMTP**. **Note:** The system can use only one active SMTP account at a time.
Port	Connection TCP port.
Connection Security	Type of secure connection. Choose a setting: **None** No secure protocol is used. **STARTTLS** Upgrades an insecure connection to a secure connection using the SSL/TLS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	encryption protocol, if your email server supports TLS. **SSL/TLS** Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server. ⚠ **Warning:** Selecting a less secure protocol like **STARTTLS** or **None** may expose your data. To better ensure the security of data in your email server, select **SSL/TLS**.

6. Select **Submit**.
7. Navigate to **All** > **User Mailboxes** > **Administration** > **Template Configuration**.
8. Select **New**.
9. On the form, fill in the fields.

User Email Account Template

Field	Description
Name	Name of the email account.
Authentication Type	Type of authentication used for the email account to connect to the email server. You can select one of the following: ○ -- None -- ○ Password ○ OAUTH ○ OAUTH 2.0 The Email: OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP (com.glide.email.oauth) plugin must be active for the OAuth options to be visible.
Mail Server	Remote server to which this account connects.
OAuth profile	OAuth application registry record for this account. This field appears if you select **OAuth 2.0** as the authentication type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Domain	Enter a domain name to identify your email service (for example gmail.com).

10. Select **Submit**.

Integrate personal corporate mailbox for receiving emails

Integrate your personal corporate mail boxes with ServiceNow to receive emails in your personal corporate mailbox.

Before you begin

Role required: email_admin

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Accounts**.
2. Select the Type.
   For more information, see Create an email account.
3. From **Account type**, select **Forwarding Address**.
4. Select **Update**.
5. From your personal mailbox, set up forwarding rules for your personal mailbox (for example forwarding rules for Microsoft Outlook or Gmail).

Email properties

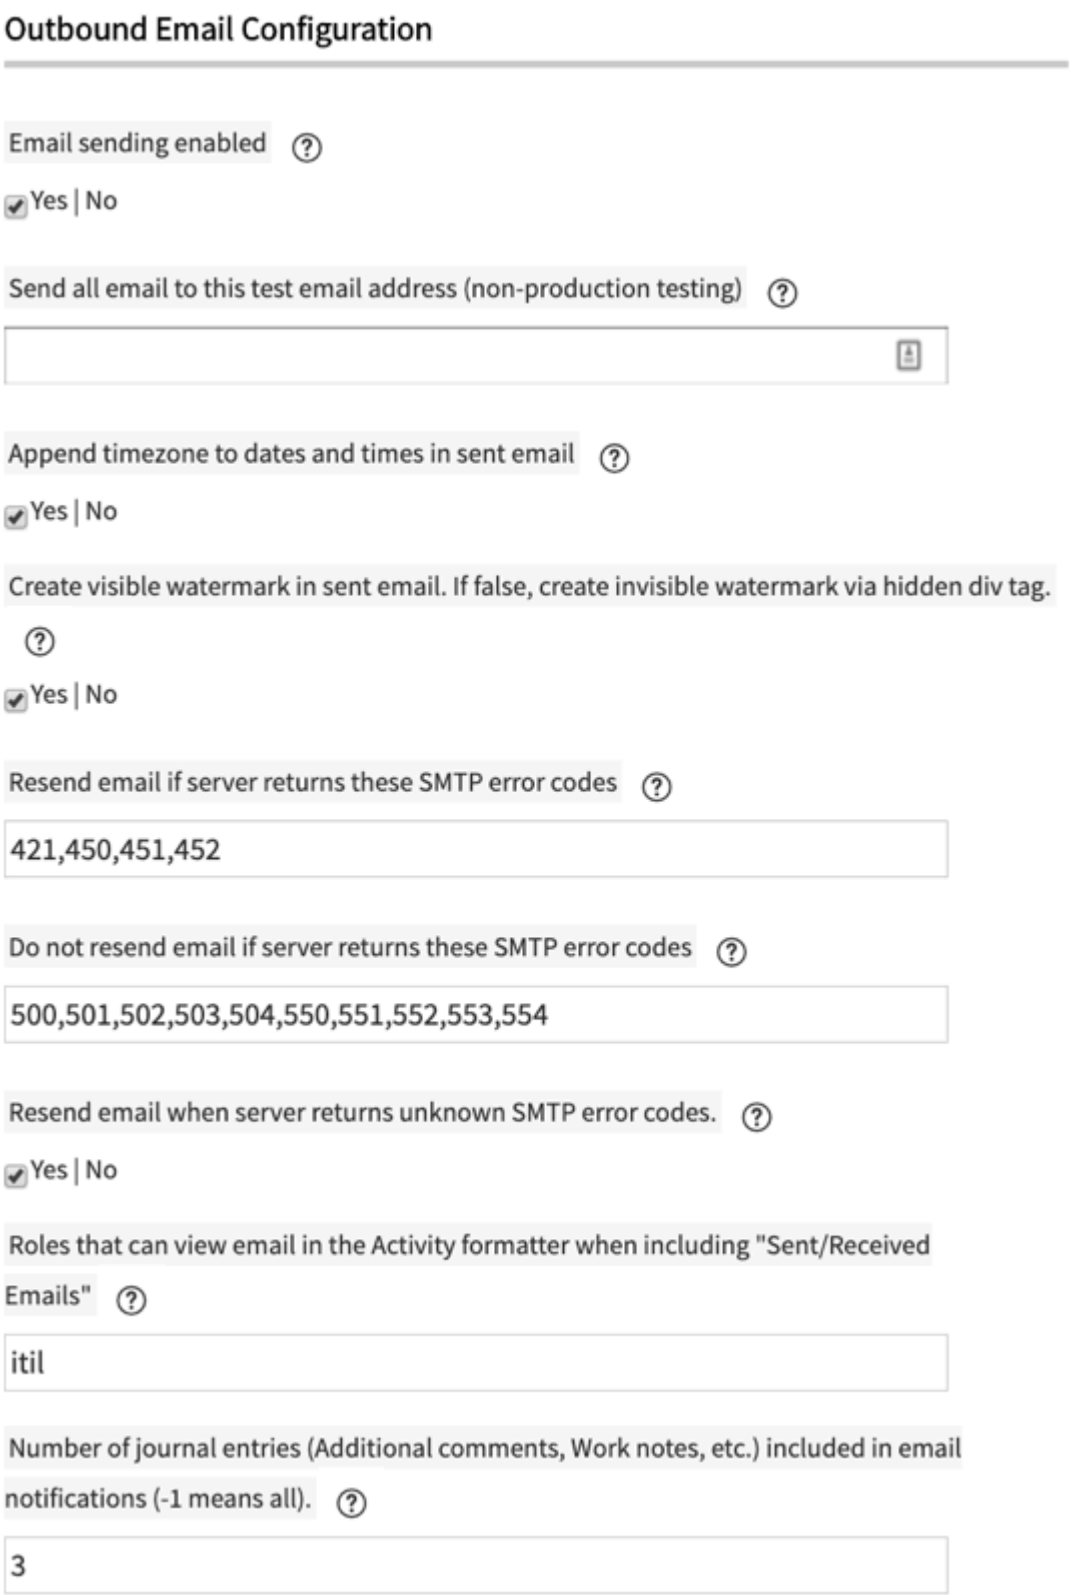
The Email Properties page is where you can configure settings for inbound and outbound email.

Email properties are available from either of these modules:

- **System Mailboxes** > **Email Properties**
- **System Properties** > **Email Properties**

Email accounts are configured in the **System Mailboxes** > **Administration** > **Email Accounts** module. For more information and instructions, see Create an email account.

Email diagnostics are available from the **System Mailboxes** > **Email Diagnostics** module.



Note: To learn more about the security properties that affect email processing, see SMTP authentication (deprecated) in Instance Security Hardening Settings.

Outbound email configuration

The **Outbound Email Configuration** section of the Email Properties page contains properties for sending email.

Outbound email properties

Property	Label	Description
glide.email.smtp.active	Email sending enabled	Specifies whether to enable or disable the outgoing mail server. • Type: true | false • Default value: true
glide.email.test.user	Send all email to this test email address (non-production testing)	Specifies the comma-separated list of email addresses to which the instance sends all email messages. Typically used in non-production instances for testing purposes. • Type: string • Default value: none
glide.email.append.timezone	Append time zone to dates and times in sent mail	Specifies whether to append the system time zone to date and date/time values in outbound emails. For example, 2010-07-02 04:01:14 PST. • Type: true | false • Default value: true
glide.email.watermark.visible	Create visible watermark in sent mail. If false, create invisible watermark via hidden div tag.	Indicates whether the watermark in email notifications is visible (true) or wrapped in a hidden div tag (false). • Type: true | false • Default value: false
glide.smtp.defer_retry_ids	Resend email if server returns these SMTP error codes	Specifies the comma-separated list of SMTP error codes that force the instance to resend email. • Type: string • Default value: 421,450,451,452
glide.smtp.fail_message_ids	Do not resend email if server returns these SMTP error codes	Specifies the comma-separated list of SMTP error codes that prevent the instance from resending email. • Type: string • Default value: 500,501,502,503,504,550,551,552,553,554
glide.smtp.default_retry	Resend email when	Enables (true) or disables (false) resending email when an unknown SMTP error

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outbound email properties (continued)

Property	Label	Description
	server returns unknown SMTP error codes.	code is encountered. The instance only recognizes the SMTP error codes defined in the *glide.smtp.defer_retry_ids* property. • Type: true | false • Default value: true
glide.ui.activity.email_roles	Roles that can view email in the Activity formatter when including "Sent/ Received Emails"	Specifies the comma-separated list of roles that can view email in the activity formatter. • Type: string • Default value: itil
glide.email.journal.lines	Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all).	Specifies the number of entries from a journal field, such as Additional comments or Work notes, included in email notifications. A value of -1 includes all journal entries. • Type: integer • Default value: 3 • Learn More:Restrict the Number of Entries Sent in a Notification

Inbound email configuration

The **Inbound Email Configuration** section of the Email Properties page contains properties to control inbound email.

Inbound email properties

Property	Label	Description
glide.email.read.active	Email receiving enabled	Specifies whether to enable or disable the inbound mail server. • Type: true | false • Default value: true
glide.email.reply_subject_prefix	Identify email as a reply by these	Specifies the comma-separated list of prefixes in the subject line that identify an email reply.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inbound email properties (continued)

Property	Label	Description
	subject prefixes	• Type: string • Default value: re:,aw:,r:,Accepted:,Tentative:,Declined: **Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.
glide.email.forward_subject_prefix	Identify email as a forward by these subject prefixes	Specifies the comma-separated list of prefixes in the subject line that identify a forwarded email. • Type: string • Default value: fw:,fwd: **Note:** The case of the forward prefix in the email, for example fw:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Fwd: prefix and only fwd: is defined in the property, the email will not be recognized as a forward. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as FWD:, Fwd:, and so on.
glide.pop3readerjob.create_caller	Automatically create users for incoming emails from trusted domains	Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to **true**, the instance creates a new user record for the email address and places that new user in the **Caller** field of any tickets created. If the property is set to **false**, the instance places **Guest** in the **Caller** field of any tickets created.

Inbound email properties (continued)

Property	Label	Description
		• Type: true | false • Default value: false • Learn More:Enabling Automatic User Creation
glide.user.default_password	Default password for users created from email sent from trusted domains. (must reset upon login)	Specifies the password for new users created from incoming email. Users must reset the password at first login. • Type: string • Default value: password • Learn More:Enabling Automatic User Creation
glide.user.trusted_domain	Trusted domains when creating users from incoming email.	Comma-separated list of trusted domains for which the instance automatically creates a user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a "guest user" but it does not create a guest user in the instance. • Type: string • Default value: servicenow.com • Learn More:Enabling Automatic User Creation

Email image filtering properties

Use email image filtering properties to control how inbound email images attach to a target record.

When a user sends an email to the system, email images (such as logos or email signatures) attach to the target record by default. These images are also visible in the activity stream of the target record. The system then replicates these images, which can cause duplicate image attachments to the target record and also duplicate images in the activity stream.

To filter images from emails and reduce duplicate image attachments to target records, configure the following properties in the System Properties [sys_properties] table. Use these properties to:

- Specify the email image sizes eligible for filtering.
- Choose an action that controls image attachment behavior and image visibility in the activity stream.

Note: These properties do not delete attachments. You can verify attachment records in the Attachments [sys_attachment] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email image filtering properties

Name	Description
glide.email.inbound.image_sys_attachment.min_image_size_bytes	Set the minimum image size in bytes for inbound email images to attach to the target record. Any image that is below this size limit is subject to the image filtering behavior that you set in the *glide.email.inbound.image_sys_attachment.fi* property. To disable image filtering entirely and attach all email images to the target record, set the minimum byte size to 0. • Type: Integer • Default value: 0
glide.email.inbound.image_sys_attachment.filtering_behavior	Specifies the image filtering behavior. **Note:** Regardless of the action you select, the image is visible when you choose to **Preview HTML Email** or **Show Email Details** in the activity formatter. • Type: Choice list ○ AttachTarget - Associate the image to the target record. The image is visible in the activity formatter and in the attachment to the target record. ○ AttachEmail - Attach the image to the email record. The image is not visible in the activity formatter of the target record nor in the attachment to the target record. ○ AttachNone - Do not attach the image to a record. You can select this option to attach the image manually at a later time. • Default value: AttachEmail

Add a system property

Email digest properties

Several properties are available to manage digest intervals for email digests.

The following properties are available for the email digest feature.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for email digest intervals

Property	Description
glide.email.digest.default_interval	The sys_id of the default email digest interval available to users. • **Type**: string • **Default value**: 28d157e07f1332007f005212bdfa9116 • **Location**: System Property [sys_properties] table
glide.email.digest.max_intervals	The maximum number of email digest intervals that can be defined. • **Type**: integer • **Default value**: 100 • **Location**: System Property [sys_properties] table • **Learn more**: For details on digest intervals, see Create or modify email digest intervals.

Advanced email properties

Use advanced email properties to fine-tune the way your instance sends or receives email.

Add these properties to the System Property [sys_properties] table before they can be used to overwrite the defaults.

com.glide.email.max_read

Specifies the maximum number of emails a POP3 reader should process concurrently.

- Type: integer
- Default value: 20

com.snc.on_call_rotation.reminders.showtz

Specifies whether to show a user's time zone.

- Type: true | false
- Default value: false

glide.cms.use_email_override_url

Forces the system to use the *glide.email.override.url* property, rather than the *glide.servlet.uri* property, when a notification has a link to a CMS page in an instance.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.email_address_filter.max_domains

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sets the maximum number of domains that can be associated with a single email address filter.

- Type: integer
- Default value: 100

glide.email_address_filter.max_exceptions

Sets the maximum number of exceptions that can be associated with a single email address filter.

- Type: integer
- Default value: 1000

glide.email.allow_duplicate_message_ids

Allows storing of emails with duplicate message IDs and adds error message "Duplicate message-id encountered, prevented loop."

- Type: true | false
- Default value: false

glide.email.append.timezone

Appends the user time zone to all date and time values in outbound email messages (for example, 2018-07-02 04:01:14 PST). The time zone does not show if the system property *glide.sys.time_format* does not have a "z" value. For more information on configuring the time zone in email notifications, see Time zone for email notifications.

- Type: true | false
- Default: false

glide.email.email_client.check_attachment_availability

Enables a system scan of each file that a user attaches to an email draft in the email client. If a file is found to be infected with a virus, the user can't send the email with the attached file. The user must remove the attachment to send the email.

- Type: true | false
- Default value: true

glide.email.email_with_no_target_visible_to_all

Email that is missing a target record or whose target record is the email are made visible to any user regardless of their roles. By turning this property to false, the user is restricted unless they sent in the record or have an admin role.

- Type: true | false
- Value: true

glide.email.inbound.calendar_behavior

Specifies how the system stores calendar data, such as an invitation or an invitation response. Enter one of these options (not case sensitive):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Attach: Store the calendar data as an attachment on the associated record, such as the incident or change that triggers an invitation.
- Ignore: Discard the calendar data.
- Inline: Store the calendar data as text in the email Body field.
- Type: string
- Default value: Attach

glide.email.inbound.check_attachment_availability

Prevents users from downloading and using virus-infected files that are attached to inbound emails.

The system detects infected files in an email by checking the ServiceNow virus header. If there are multiple email attachments, the system scans the files via Antivirus Scanning. All attachments that are found to be infected are made unavailable for use.

- Type: true | false
- Default value: true

glide.email.inbound.convert_html_inline_attachment_references

Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.

- Type: true | false
- Default value: true

glide.email.inbound.generate.missing.html.part

Enables the system to generate HTML text for inbound emails that contain only a plain text message.

- Type: true | false
- Default value: true

glide.email.inbound.generate.missing.text.part

Enables the system to generate plain text for inbound emails that contain only an HTML message.

- Type: true | false
- Default value: true

glide.email.inbound.max_attachment_count

Sets the maximum number of attachments allowed per inbound email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

glide.email.inbound.max_body_chars

Sets the maximum body size in characters allowed per inbound email.

- Type: integer
- Default value: 524288

glide.email.inbound.max_total_attachment_size_bytes

Sets the maximum total attachment size in bytes allowed per inbound email.

- Type: integer
- Default value: 18874368
- Location: System Property [sys_properties] table

glide.email.inbound_action_set_email_ignored_when_user_disabled

Sets email to received ignored when met with one of two conditions:

- User account (guest or any other account used to run the inbound email action) is inactive.
- The user account (guest or any other account used to run the inbound email action) is locked out and the glide.pop3.process_locked_out property is set to false.

- Type: true | false
- Default value: true

glide.email.mail_to

Specifies the email address for sending notifications that use the ${mailto:} variable.

- Type: string
- Default value: SMTP email address that is active by default

glide.email.name_split

Specifies the delimiter used between first and last names in an email address. For example, a delimiter of "." (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.

- Type: string
- Default value: period (.)

glide.email.notification.save_when_no_recipients

Controls whether a notification-generated `sys_mail` record is saved even if there are no recipients. Used along with other notification recipient logging properties, this property enables investigating problems with notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false

glide.email.outbound.check_attachment_availability

Prevents users from sending emails that contain virus-infected files.

If an outbound email contains an attachment that was previously marked as infected via Antivirus Scanning, then the system doesn't send the email. An event is created to indicate that the email attachment is not available for use.

- Type: true | false
- Default value: true

glide.email.outbound.header.auto_submitted

Stores the value used in the "Auto-submitted" outbound email header. Clear the property value to remove the "Auto-submitted" header from all outbound emails. Some spam filters flag auto-generated email as spam.

- Type: string
- Default value: auto-generated

glide.email.outbound.max_attachment_count

Sets the maximum number of attachments allowed per outbound email.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

glide.email.outbound.max_body_chars

Sets the maximum body size in characters allowed per outbound email.

- Type: integer
- Default value: 524288

glide.email.outbound.max_total_attachment_size_bytes

Sets the maximum total attachment size in bytes allowed per outbound email.

- Type: integer
- Default value: 18874368
- Location: System Property [sys_properties] table

glide.email.override.url

Sets the URL to use in emailed links in place of the instance URL.
The URL should end with nav_to.do. An example value is `https://servicenow.customerdomain.com/production.nav_to.do`. This property is suitable for customers who use custom redirect URLs for their instances.

- Type: string
- Default value: instance URL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.email.remove_illegal_address_quotes

Removes invalid quotation marks from an inbound email address, thus allowing the inbound email address to be accepted as valid. For example, when you set the property to true, the address "john.doe@example.com" is changed to john.doe@example.com. However, only addresses that are formatted as John Doe <'john.doe@example.com'> are removed entirely.

- Type: true | false
- Default: false

glide.email.smtp.max_recipients

Specifies the maximum number of recipients the instance can list in the To:, CC:, BCC: lines combined for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.

- Type: integer
- Default value: 100

glide.email.smtp.max_send

Specifies how many emails to send through each new SMTP connection. If there are more emails to send than the specified value, the instance establishes a new SMTP connection.

- Type: integer
- Default value: 100

glide.email.smtp.max_recipients_overall

Specifies the overall maximum number of recipients an email can be sent to. Specifies the maximum number of recipients the instance can list in the To:, CC:, BCC: lines for a single email notification.

- Type: integer
- Default value: 100000

glide.email_system_address_filter.max_address_filters

Sets the maximum number of email filters that can be associated with a single system address filter.

- Type: integer
- Default value: 100

glide.email.text_plain.strip_xhtml

Converts the XML of both outbound and inbound emails that are shown in comments to plain text. If false, the system preserves the XML.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enables or disables logging all reasons a recipient was excluded. If set to true, the subsequent properties dealing with the exclusion of logging are enabled. If false, the properties are disabled. This property cannot suppress log messages generated by the *glide.email.test.user* property.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.device_inactive

Logs recipients who are excluded because their chosen notification device record is marked as inactive.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.device_schedule

Logs recipients who are excluded based on the **Schedule** field on the Notification Device [cmn_notif_device] record for their chosen notification device.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.event_creator

Logs recipients who are excluded because they initiated the notification event, such as updating an incident record. The **Send to Event Creator** check box is then cleared on the notification record.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.invalid_email

Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_calendar_integration_disabled

Logs recipients of calendar invitations who are excluded. Recipients are excluded because the **Calendar Integration** field is set to **None** on the user record.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_inactive

Logs recipients who are excluded because the **Active** check box is cleared on the user record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_notification_disabled

Logs recipients who are excluded because the **Notification** field is set to **Disabled** on the user record.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging

Enables or disables logging all reasons a recipient was included. If set to true, the subsequent properties dealing with the inclusion of logging are enabled. If false, the properties are disabled.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.delegate

Logs recipients who are included because they are delegates of another user.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.event_parm

Logs recipients who are included because they are in the **parm1** or **parm2** fields of the event record.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_fields

Logs recipients who are specified in the **Users/Groups in Field** field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, to include an incident assignee as a recipient, set the **Users/Groups in Field** field to **Assigned to**.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.group_email

Logs users who are included in a notification that is sent to a group. The property also logs users in the event **parm1** or **parm2** field.

- Type: true | false
- Default value: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

glide.notification.recipient.include_logging.recipient_groups.manager

Logs recipients who manage a recipient group. The property also logs users in the event **parm1** or **parm2** field.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_groups.membership

Logs recipients who are part of a notification recipient group. The property also logs users in the event **parm1** or **parm2** field.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.recipient_users

Logs recipients who are included via notification record's **Users** field (recipient_users).

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging.subscription

Logs recipients because they are subscribed via the user notification preferences.

- Type: true | false
- Default value: true

glide.pop3.parse_start

Specifies the text that indicates the beginning of the email body section. The instance parses name:value pairs within this section to set or update field values when processing inbound email actions.

- Type: string
- Default value: none

glide.pop3.parse_end

Text indicating the end of the email body section where the instance should parse name:value pairs to update field values when processing inbound email actions.

- Type: string
- Default value: none

glide.smtp.dateformat

Specify the date format to use for outgoing email notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: string
- Default value: date format listed in email sender's user record `[sys_user.date_format]`

glide.smtp.precedence_bulk

Specifies whether outbound email includes the header "Precedence: bulk". Some spam filters flag bulk email as spam. Set the value to **false** to remove this header from outbound email.

- Type: true | false
- Default value: true

glide.smtp.send_partial

Splits outgoing email between valid and invalid recipients. The email is sent only to the valid recipients. A new email containing the invalid recipients is created in the **send-ready** state and attempts to send again.

- Type: true | false
- Default value: true

glide.smtp.timeformat

Specify the time format to use for outgoing email notifications.

- Type: string
- Default value: time format listed in email sender's user record `[sys_user.time_format]`

glide.ui.activity.email.use_display

Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.

- Type: true | false
- Default value: false

glide.activity.rule.sys_email.expand_max_body_size

Specifies the limit of the volume of data which can be processed via a single click of Expand All or getEmailBodies operation. If limit value is hit the user is notified that The maximum allotted email text threshold has been reached and some mails are not expanded.

glide.ui.email_client.email_address.disambiguator

Sets the columns from the User `[sys_user]` table that the auto-complete list displays. Separate each column name with a semicolon character (;).

- Type: string
- Default value: name

glide.ui.incident_activity.max_addresses

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

- Type: string
- Default value: 5

NotifyAffectedCI.max_rel_level

Sets a value that is used by the **Affected ci notifications** business rule. The business rule notifies subscribers when tasks affect configuration items (CIs). The business rule generates notifications for parent CIs up to the level defined by this property. You can adjust the property value according to the complexity and depth of your CI relationships.

- Type: integer
- Default value: 5

glide.email.inbound.attachment_extensions_blacklist

Restrict attachments with questionable file extensions for inbound email.

glide.email.smtp.claim.lookback.hrs

Sets the default value of 24 hours. Any email older than 24 hours will not be sent by the system. This protects the system from having a huge number of sent emails at a time or if the outbox has a large number of emails waiting to be sent.

Set to a value greater than 24 (hours) and increase it in intervals to not send a large number of emails at one time. Depending on how big the backlog of emails is and how spaced out they are created in time, you might want to start with a value of 36 (1.5 days worth), let those go out, then set the value again to maybe 48 (two days), and keep increasing the value until all of the older emails are sent.

- Type: integer
- Value: 24

glide.email.outbound.static_translation.enabled

Enables the system property for static translation of notifications for the global application.

- Type: true | false
- Default value: true

glide.notification.translation.dynamic

Enables the system property for dynamic translation of notifications for the global application.

- Type: true | false
- Default value: true

glide.security.file.mime_type.validation.inbound_email

When set to `true`, validates the mime type of attachments in the inbound email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false

Activate email administration

Activate email filter and email service.

Activate email filters

Administrators can activate the Email Filters plugin (com.glide.email_filter).

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next
Create an email filter

Activate Email Service

Users with the admin role can activate the Email Service plugin (com.glide.email.service) to enable the Email API.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

List of plugins (Brazil)

Grant access to the Email API

To grant non-admin users access to the Email API, administrators must create an access control and assign a special role.

Before you begin

Role required: admin

About this task

For additional details, see Email API .

Procedure

1. Elevate privileges to security_admin.
2. Navigate to **System Security** > **Access Control (ACL)**.
3. Click **New**.
4. Create an access control for the Email [sys_email] table.

Access control values

Field	Value
Type	record
Operation	create
Admin overrides	Selected
Name	sys_email
Requires role	email_api_send

5. Assign the email_api_send role to the non-admin user.
6. Verify the non-admin user either has read access to all records in the notification target table or has read access to a specific record in the table.
   For example, to work with incident notifications the non-admin user needs access to the Incident table. You can provide record access by:
   - Granting the user an appropriate role, such as the itil role.
   - Selecting a specific incident that was opened on behalf of the user.

Creating an email account

Use email administrator to create email accounts, email filter, and create an email account for Microsoft Graph.

Email accounts

Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow - managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

Note: The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the `sys_email_account` table. Create separate email accounts to send and receive email. Use email properties to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address instance@service-now.com. Likewise, the ServiceNow SMTP server sends email from the address instance@service-now.com. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.

Emails received via a POP3 or IMAP server account are stored in the Email [sys_email] table and then deleted from the account.

Note: ServiceNow has exclusive access to an account you configure. After a mail is read from a POP or IMAP account that you have configured, ServiceNow deletes the email from the server.

Create an email account

You can create email accounts in addition to the accounts provisioned for you.

Before you begin

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
  - IMAP

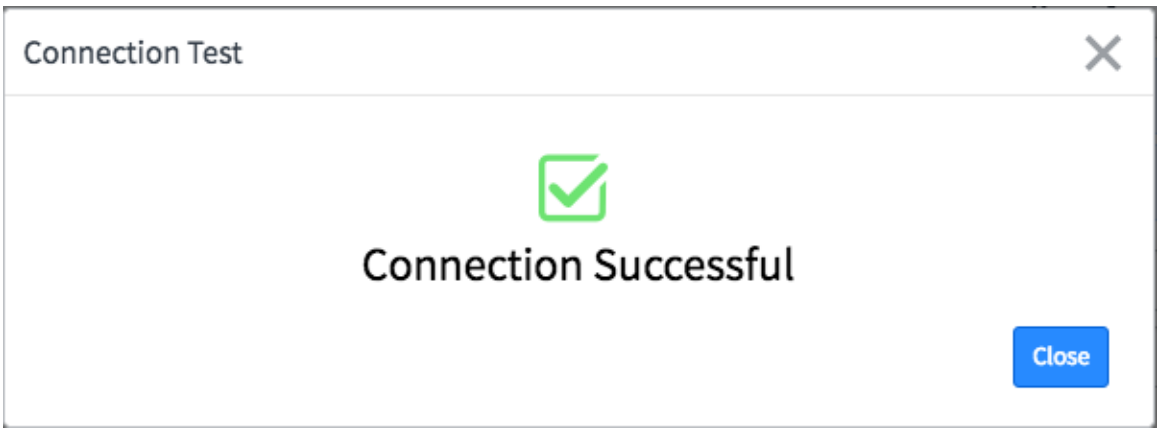
Warning: An SMTP server that uses a localhost or loopback (127.0.0.1) IP address is not accepted as a compatible email server. For more information, see KB0724199.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Accounts**, and then select **New**.
2. On the form, fill in the fields.

Field	Description
Name	Name of the email account.
Account type	**Shared Address** A shared address refers to a shared mailbox that multiple users or team members can access. **Forwarding Address** A forwarding address is an email address where emails are automatically redirected or forwarded from another account. **Note:** Account type is specific to personal corporate mailbox. For more information,see Personal corporate mailbox.
Type	Type of mail server. You can select one of the following: ○ POP3 ○ IMAP ○ SMTP **Note:** The system can use only one active SMTP account at a time.
Authentication	Type of authentication used for the email account to connect to the email server. You can select one of the following: ○ –- None -- ○ Password ○ OAUTH ○ OAUTH 2.0 The Email: OAUTH support for IMAP, Microsoft Graph (Receiving), and SMTP (com.glide.email.oauth) plugin must be active for the OAuth options to be visible.
OAuth Provider	OAuth application registry record for this account. This field appears if you selected **OAuth 2.0**.
Server	Remote server to which this account connects. To activate a server for an on-premise installation, enter the full address (FQDN) of the node (for example, `node.customerdomain`).
Active	Option to activate the email account.
ServiceNow Configured	Identifier of whether this account is provisioned by ServiceNow. If you create an account, this option is not selected.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Enable debug output	Option to create node logs for the raw data that is exchanged with the email server. You can review the node logs by navigating to **System Logs** > **Utilities** > **Node Log File Browser**. You can enable this field temporarily to diagnose issues related to receiving or sending email.
Email user label	Display value used for outgoing messages. This field is for SMTP type accounts only.
User name	User name or ID to authenticate an email address. The value in this field is also the **From** address when the instance sends email. If you are using SMTP, this must be a full email address. The value in the **From** field can override this (for SMTP accounts). **Note:** The address in the **From** field on the Notification [sysevent_email_action] form takes precedence over this field.
Password	Password when the **Authentication** type is **Password**. **Note:** You may need to increase the size of this field to accommodate longer passwords. By default, this field has a size of 40 characters.
From	(SMTP only) The From address used for notifications sent with this account. This address takes precedence over the **User name** field. If nothing is present in this field, the User name is used as the return address for notifications sent from the instance.
Connection Security	Type of secure connection. Choose a setting: **None** No secure protocol is used. **STARTTLS** Upgrades an insecure connection to a secure connection using the SSL/TLS encryption protocol, if your email server supports TLS. **SSL/TLS** Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server. **Warning:** Selecting a less secure protocol like **STARTTLS** or **None** may expose your data. To better ensure the security of data in your email server, select **SSL/TLS**.
Port	Connection TCP port.
System Address Filter	System address filter to apply to the email account. If left blank, the system uses the default system address filter for inbound or outbound email. For more information, see System address filters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Submit**.
4. Select the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

   The system displays a pop-up window with the results of the connection test.

   If the test succeeds, select **Close** to return to the email account record. If the test fails, select **View Logs** to display more information about the test results.

Result
The system uses the email account to send or receive email.

What to do next
Enable the system to send or receive email.

Multiple email readers

Organize POP3/IMAP email accounts into email account groups (subsets of email accounts) that can be processed by multiple email reader jobs. To improve the performance of inbound email account processing, you can incrementally add email account groups and if needed, email reader jobs to process email account groups concurrently.

How email account group processing works

By default, the email reader job processes POP3/IMAP email accounts serially, which can result in longer processing times when you have many email accounts. It can also be difficult to identify any problematic email accounts that might contribute to slower processing times.

To reduce email account processing time, you can create one or more email account groups that contain subsets of your email accounts. Organizing your email accounts into groups enables the default email reader job to process each email account group separately. After creating one or more email account groups, you can then add another email reader job to process account groups concurrently.

Use the *glide.email.inbound.account_group_processing* system property to activate email account group processing.

During email account group processing:

- The system stores the email accounts in the Email Account Groups [sys_email_account_group] table.
- The default email reader job runs every two minutes. The email reader chooses the account group to be processed based on the account group processing state and the date and time that the group was last processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - Claimed state: If an account group has a claimed state, the email reader is processing the account group. If you defined other email reader jobs, no other email reader job can claim the group for processing.
  - Unclaimed state: If an account group is unclaimed, the account group is available for processing by the email reader.
- The email reader job processes the email accounts contained in the selected account group.
- The email reader job chooses the next available account group for processing and continues processing that account group.

You can monitor the processing of each email account group by using the Email Account Groups [[sys_email_account_group]] table. Each account group record includes the processing duration (how long it takes for the email reader to process all the accounts in the group).

After you review the processing times for your email account groups, determine whether to make further adjustments in email account group processing. For example, you can create another email account group or create another email reader job to process your email account groups in parallel. You define additional email reader jobs using the Schedule [sys_trigger] table.

Set up email account group processing

To set up email account group processing, you must have the email_account_admin or admin role.

1. **Create email account groups.**

   Define one or more email account groups that contain a subset of your POP3/IMAP email accounts. Your base system includes a default email account group. Any POP3/IMAP accounts not contained in an email account group are processed as part of the default email account group.

2. **Enable email account group processing**

   Navigate to sys_properties.list and locate the *glide.email.inbound.account_group_processing* system property. Set the **Value** to **true**. The email reader job starts processing the email account groups that you created.

3. **Monitor email account group processing.**

   Check the status of your email account groups to see if processing time has been reduced. Determine whether the additional groups sufficiently reduce account processing time or consider adding another email reader job to further reduce processing time.

4. **Create an email reader job.**

   As part of fine-tuning email account group processing, create an email reader job to process email account groups concurrently, in addition to the default email reader job.

Create email account groups

Define an email account group that contains a subset of your POP3/IMAP email accounts. The email reader job automatically processes each email account group as scheduled.

Before you begin
Role required: admin or email_account_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Account Groups** and click **New**.
2. Fill in the form.

Field	Description
Name	The name of the account group.
Email Accounts	A subset of POP3/IMAP email accounts. Select the email accounts that make up the group. **Note:** When you add an email account to a group, it cannot be reused in other account groups.
Active	Check box that enables the email account group for processing. New account groups are active by default.
Default	Read only. Check box that indicates the account is the default email account.
Status	Read only. Processing state of the email account group: Unclaimed or Claimed.
Claimed by	Read only. ID of the email reader job currently in progress.
Last Processed	Read only. The last time that the email reader job processed this group.
Processing Duration	Read only. The length of time taken by an email reader job to process the account group.

3. Click **Create**.
   The system updates the Email Account Group [sys_email_account_group] table with the new account group. Use the this table to monitor email account group processing.

What to do next

- Review email account group processing.
- Determine if you want to continue fine-tuning email account processing. You could add another email account group or another email reader job to process email account groups concurrently.

Enable email account group processing

Enable the email reader job to start processing your email account groups so that you can reduce the time it takes to process inbound email accounts.

Before you begin

Create email account groups.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Add a system property with the following settings:

- Name: *glide.email.inbound.account_group_processing*
- Type: true | false
- Value: **true**

What to do next

Check the status of your email account groups to see if processing time has been reduced. For more information, see Monitor email account groups.

To further reduce processing time, consider creating another email reader job to process inbound email accounts. For more information, see Create an email reader job.

Monitor email account groups

Use the Email Account Groups [sys_email_account] table to check the status of email account groups processed by email reader jobs.

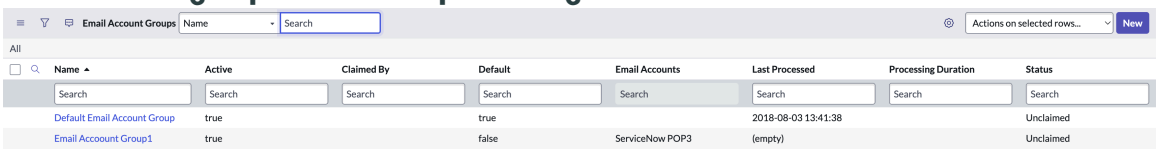
Before you begin

1. Create email account groups.
2. Enable email account group processing.

Role required: email_account_admin or admin

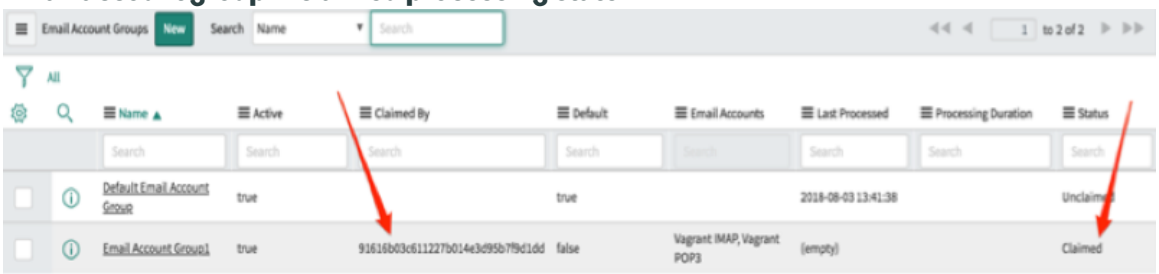
Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Account Groups**.
2. Review the processing details for each account group:



Field	Description
Name	The name of the email account group.
Active	The operational state of the email account group. The value true indicates that the account is enabled for email account processing.
Claimed by	The ID of the email reader job if the job is running on the account group.
Default	The default indicator. The value true indicates that the email account group is the default.
Email Accounts	The names of the email accounts contained in the email account group.
Last Processed	The day and time that the email reader job last processed this account group.
Processing Duration	The length of time (in hours, minutes, seconds) to process the account group.
Status	Processing state of the email account group:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
	○ Unclaimed: The account group is available for processing by the next email reader job. ○ Claimed: An email reader job is processing the current account group.

Example:

Email account group — unclaimed processing state

Email account group — claimed processing state

What to do next

If fine-tuning email accounts, consider doing one of the following:

- Create another email account group.
- Create another email reader job to process email account groups concurrently.

Create an email reader job

If you created email account groups to fine-tune inbound email account processing, you can create an email reader job to process those account groups concurrently, in addition to the default email reader job.

Before you begin

1. Create email account groups.
2. Enable email account group processing

Role required: email_account_admin or admin

Procedure

1. In the Navigation filter, type `sys_trigger.list`.
2. In the sys_trigger table, select the Email Reader job record.
3. In the Email Reader job form:
   a. Enter a unique name for the email reader job to be added so that you can differentiate it from the default email reader job.
   b. If needed, change the time interval for this email reader job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. From the form context menu, click **Insert**.
   Another email reader job is created. This job runs concurrently with the default email reader job to process email account groups.

What to do next

Monitor email account group processing and determine if the additional reader job reduces processing time. If needed, you can continue fine-tuning email account processing. For example, you might consider adding another email account group.

Email filters

Specify which inbound emails to ignore or move to a particular mailbox.

When an email is ignored, the email is saved to your instance but is not processed. You can access an ignored email by viewing its Email [sys_email] record.

The Email Filters (com.glide.email_filter) plugin is active by default for releases after Kingston, for releases before Kingston, it needs to be activated, for more information see Activate email filters.

Default email filters

By default, the following filters are available from the **System Mailboxes** > **Administration** > **Filters** module:

Default email filters

Filter	Description
Ignore VCAL	Ignores all email containing vCalendar requests. This filter prevents inbound email actions from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.
Ignore header	Ignores email that contains specific headers. This filter overrides the *glide.pop3.ignore_headers* property.
Junk email - sender equals recipient	Filters out emails that are from the same user as the SMTP user to the Junk folder.
Ignore subject	Ignores email with specific terms or phrases in the subject line. This filter overrides the *glide.pop3.ignore_subjects* property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.
Move spam to junk folder	Moves email identified as spam to the Junk folder. This filter checks for the value of the ServiceNow spam header. If the header is `X-ServiceNow-Spam-Status: Yes`, the filter moves the email to the Junk folder

Note: Filter action should be configured to indicate how the system should react when the conditions of this filter evaluate to true. The two choices in the base system are: Mark as Ignored and Move to Junk. You can use the Action script to perform additional email tasks.

To learn more about enabling spam scoring and filtering, see Email spam scoring and filtering (instance security hardening) in Instance Security Hardening Settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email filter script include

Email filters use a script include called `EmailUtils` that contains a simple utility function to determine if `vCalendar` is in the body of the response email. The results of this query are used in a condition script in the *Ignore VCAL* email filter.

Spam scoring and virus scanning

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin.

The system also adds the `X-ServiceNow-Virus:INFECTED` header to an email that contains one or more virus-infected attachments. The system ignores the email.

Spam scoring and virus scanning are available only for instances that use the ServiceNow email infrastructure. For more information on spam scoring and filtering, see KB0549426.

Related topics

Create an email filter

Create an email filter

You can create email filters to apply a custom action script or filter actions when email matches your filter's conditions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Filters**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Name of the email filter.
Application	Application scope of the email filter.
Order	Priority that the email filter takes over other filters for the same table. To give the filter higher priority over other filters, enter a lower number.
Active	Option to activate the email filter.
Short description	Description of what the filter does.
Conditions	Conditions to define which emails to filter.
Condition script	Script to define which emails to filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.
Action script	Script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	script is used to produce the error string that is published to the email log (**System Logs** > **Email**).

4. Right-click in the header bar and select **Save** from the context menu.

   The *Filter Actions* related list appears.

5. Click **New** in the related list.
6. Select how the system should react when the conditions of this filter evaluate to true.

   The two choices in the base system are: *Mark as Ignored* and *Move to Junk*. You can use the *Action script* to perform additional email tasks.

   Note: Before creating additional email actions with a script, see Inbound Email Actions. Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

Email service

The `Email Service` API provides endpoint to install the Email API on the instance.

By default, `Email Service` only allows admin users to access the Email API. Administrators can grant access to the Email API by:

1. Adding an access control for creating records in the Email [sys_email] table linked to the email_api_send role.
2. Assigning the email_api_send role to the non-admin user.
3. Verifying the non-admin user has read access to the notification target table. For example, an email notification for an incident, requires read access to the Incident table.

Non-admin users with the email_api_send role can access the `Email` API from the REST API Explorer.

Create a system address filter

Define how email address filters apply to inbound and outbound email.

Before you begin

Complete the steps in Set email address filters.

Role required: email_account_admin

About this task

You can use a combination of allowed list and denied list email address filters in a system address filter.

A system address filter blocks a domain or address that appears only on denied lists and never on allowed lists. To ensure that a system address filter effectively blocks a certain domain or address, check for the following:

- The domain or address is included in at least one denied list
- The domain or address is not included in any allowed list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **System Address Filters**, and then click **New**.
2. On the form, fill in the fields.

Field	Description
Name	Name of the system address filter.
Active	Option to activate the system address filter.
Type	Type of system address filter. Select one of the following: **Outbound** Control which domains and email addresses can receive email from your instance. Select this option if you plan to use the system address filter for an SMTP server. **Inbound** Control which domains and email addresses can send email to your instance. Select this option if you plan to use the system address filter for an IMAP or POP3 server.
Application	Application scope of the system address filter.
Default	Option to use this system address filter as the default inbound or outbound filter. To control senders and recipients for a specific email account, leave this field cleared.
Short description	Description of the system address filter.
Email Address Filters	Email address filters to apply to the system address filter. By default, the maximum number of email address filters that you can associate with a single system address filter is 100. You can reconfigure this limit by setting the *glide.email_system_address_filter.max_address_filters* property.

3. Click **Submit**.

Result

A default outbound filter applies to all active SMTP email accounts automatically. A default inbound filter applies to all active IMAP or POP3 email accounts automatically.

For a non-default filter, the next step is to apply the filter to an email account manually. For more information on applying a filter to an email account, see Create an email account.

Email encryption - S/MIME protocol

Secure/Multipurpose Internet Mail Extensions (S/MIME) is an end-end encryption protocol for sending digitally signed and encrypted emails that support data confidentiality, authenticity, and integrity.

Introduction to S/MIME

An administrator with privileges can enable and configure S/MIME. Understanding of the following is required when using the full capabilities of S/MIME:

- Digital signatures and signature verification
- Message encryption and decryption
- Public key
- Digital certificates

Digital signatures and verification

With digital signature, S/MIME verifies the identity of the sender of the email. This verification ensures the following:

- Message in the email is the exact message sent by the sender.
- Message is received from the right sender and not someone pretending to be the sender.

Message encryption and decryption

S/MIME uses encryption to protect the content of the email, which ensures that only the receiver can decrypt the content. Encryption creates coded information so that it cannot be read or understood until it is decoded and readable. Message encryption helps with the two key security factors of confidentiality and data integrity.

Public key

S/MIME uses key pairs and asymmetric cryptography. A private key in a key pair belongs only to the sender. If the private key has been used, the owner of that key has used it.

Public key cryptography ensures secure communication between the sender and the receiver. Both have a key-pair, with one being private and the other public.

Public keys are shared between the sender and the receiver. A public key is paired to only one private key. The corresponding public key is used to identify its paired private key and only its paired private key. A public key can be used by multiple recipients.

A key pair can be used to

- Sign and verify a signature
- Encrypt and decrypt the content of an email

S/MIME digital signatures and encryption require each sender and recipient to have it enabled. They also need to send or exchange public keys though digital certificates to identify each other.

For more information about key management and cryprographic module, see Key Management Framework Reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Digital certificates

Digital certificates help in delivering the public key in the key pair. A digital certificate is a digital credential that provides information about the identity, validity, and any other required information. Digital certificates are issued by a certification authority (CA) and are valid for only a specific period of time.

Note: ServiceNow® does not provide S/MIME certificates for ServiceNow mail infra users. Users should get their S/MIME certificates issued from the third party S/MIME certificate solution providers.

S/MIME outbound emails

Signing outbound mails

The ServiceNow AI Platform uses the private key of the sender (instance email account) and the receiver uses the public key to verify signatures.

Encrypting outbound mails

The ServiceNow AI Platform uses public keys of the recipients to encrypt the emails and every recipient uses their private key to decrypt the email.

S/MIME for inbound email

Sign verification for inbound mails

The sender uses a private key to sign the email and the ServiceNow AI Platform uses the public key of the sender to verify the signature.

Decrypting inbound mails

The sender uses the public key to encrypt the email and the ServiceNow AI Platform uses the private key to decrypt the email.

Activate S/MIME Email

You can activate the S/MIME Email plugin (com.glide.email.smime) for Notifications if you have the admin role.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the S/MIME Email plugin (com.glide.email.smime) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

Import an S/MIME key pair

Setting up S/MIME for email

S/MIME is a protocol for sending digitally signed and encrypted emails to ensure the confidentiality, authenticity and integrity.

Set up S/MIME for outbound mails (signing and encryption)

You can use S/MIME for outbound mails for the following purposes:

- Digital signature
- Encryption
- Digital signature and encryption

To set up S/MIME, the admin must have the following:

- email_account_admin and sn_kmf.cryptographic_manager roles
- Key pair (private key and public key)
- CA certificate
- Email certificate

Upload the instance email account key pair and email certificates, and enable outbound S/MIME properties. For more information, see Enable S/MIME.

If there are multiple recipients and some of the recipients do not have valid certificates, the email will be sent only to recipients with a valid certificate.

Set up S/MIME for inbound mails (sign verification and decryption)

S/MIME for inbound mails can be used for the following:

- Signature verification
- Decryption
- Signature verification and decryption

For information about enabling inbound S/MIME properties, see Enable S/MIME.

If the system fails to decrypt a message, no inbound actions will run on the email and it is moved to the received-ignored status.

To set up the system to ignore inbound signed emails if the signature cannot be verified or is invalid, admins can create the *`email.inbound.smime.ignore_unverified_emails`* and set it to true.

For more information about key management and cryprographic module, see Key Management Framework Reference.

© 2026 ServiceNow, Inc. All rights reserved.

Import an S/MIME key pair

Import an S/MIME key pair consisting of the private key and certificate to sign outbound emails or decrypt emails.

Before you begin

Role required: email_account_admin and sn_kmf.cryptographic_manager

Upload the private-public key pair corresponding to the instance email account.

You must have the key alias.

Note: When you create a PKCS12 file, ensure that it's created with a key alias.

Make sure the file format is PKCS #12.

About this task

This video shows you how to perform the following procedure.

Procedure

1. Navigate to **All** > **System Mailboxes** > **Administration** > **Email Accounts**.
2. Select the email account.

   Note: The keypair is associated with the email address and not the email account.

3. Select the **Import SMIME Key Pair** related link.
4. Select the **Crypto Specifications** tab and select the key alias.
   The algorithm definition screen is displayed.
5. Complete the Algorithm Definition form.

Algorithm Definition form

Field	Description
Crypto module	Read only. Name of the selected cryptographic module displays.
Crypto purpose	SMIME Crypto Purpose
Algorithm	Type of algorithm used to accomplish the crypto purpose. The algorithm also controls the key origin. Adjusts automatically based on the selected crypto purpose.
Enroll module for resource exchange	Allows clones or backups to get their own unique keys. **Note:** Do not check the box.

6. Select **Next**.
7. In the **Lifecycle Definition** screen, select a Key Lifecycle from the Applies to column.

Key Lifecycle fields

Applies to	Selected key that the lifecycle applies to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For field	Control for the key that the lifecycle applies to.
Type	Select if the valuation for the key lifecycle is a relative value or an absolute value or none. Relative value depends on other data entries in the system, such as key generation, activation, and deactivation. Absolute value is an exact value, such as a date.
Lifecycle default	Read only. Displays a value if set.
Order	Enter the sequence in which to process the key lifecycle state for the crypto specification.
Relative duration	Number of years, months, or days the key is valid.
Relative duration type	Duration of the lifecycle: Years, Months, or Days.
Relative operation	**Before** or **After**.
Relative to	Field the duration is relative to. Displays if a relative duration or operation is selected.

8. Select **Update**.
9. Select **Next**.
10. In the Key Origin screen, in the **Origin** field select **Import from PKCS12** and enter the key alias in the **Key Alias** field.
11. Select **Next**.
12. In the Key Creation screen, select **Import Key**.
13. In the Import Keystore/Certificate dialog box, provide the keystore password and import the keystore/certificate.
    a. Provide the password in the **Enter Keystore Password** field.
    b. In the **Import Keystore/Certificate** field, select **Browse** and select the certificate to be imported.
    c. Select **OK**.
14. Select the **Module Keys** tab to view the keys.

    Secure information for the keys will be stored on the Module Keys tab along with the private key and public key. The **Key lifecycle state** is set to **Active**.

Upload a CA certificate

Upload a digital CA (Certificate Authority) certificate to validate email certificates for secure communication.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Notification** > **SMIME** > **CA Certificate**.
2. Select **New**.
3. Select the attachment icon to upload the CA certificate.
4. On the form, fill in the fields.

Fields	Descriptions
Name	Unique name for the CA certificate.
Type	The type of CA certificate.
Expiration notification	Option to enable expiration.
Warn in days to expire	Number of days to send a warning prior to the expiration date.
Active	Option to enable the CA certificate.
Short description	Description for the CA certificate.

5. Select **Submit**.

What to do next

Upload an email certificate.

Upload an email certificate

Upload an email certificate to validate a signature for inbound email or encrypt an outbound email or both for secure communication.

Before you begin

- To enable signing in the instance, upload the private-public key pair corresponding to the instance email account.
- To enable encryption in the instance and send encrypted email to a recipient's email address, upload the public key/certificate corresponding to the recipient’s email address.

Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **SMIME** > **Email Certificate**.
2. Select **New**.
3. Select the attachment icon to upload the email certificate.
4. On the form, fill in the fields.

S/MIME email certificate form

Fields	Descriptions
Email	Email address for sending the email.
Expiration notification	Select the check box to enable expiration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Descriptions
Notify on expiration	Add yourself to be notified before expiration.
Warn in days to expire	Number of days to send the warning prior to the expiration date.
Active	Check box to enable the email certificate.
Key store password	Key password to protect PKCS #12 file.
Short description	The description for this email certificate.

5. Select **Submit**.

What to do next

EnableEnable S/MIME.

Enable S/MIME

Configure S/MIME settings for inbound and outbound email.

Enable S/MIME for Inbound and Outbound emails

You can configure email properties from the Email Properties page through the **System Mailboxes** or **System Properties** module.

Email properties are available from either of these modules:

- **System Mailboxes** > **Email Properties**
- **System Properties** > **Email Properties**

Outbound S/MIME configuration

For encryption, you must upload the email certificate for the recipients in PEM format and the CA certificates for the issuing authority. For more information, see Upload an email certificate and Upload a CA certificate.

For signing, you must upload the email account key pair in P12 format. For more information, see Import an S/MIME key pair.

Outbound S/MIME configuration properties

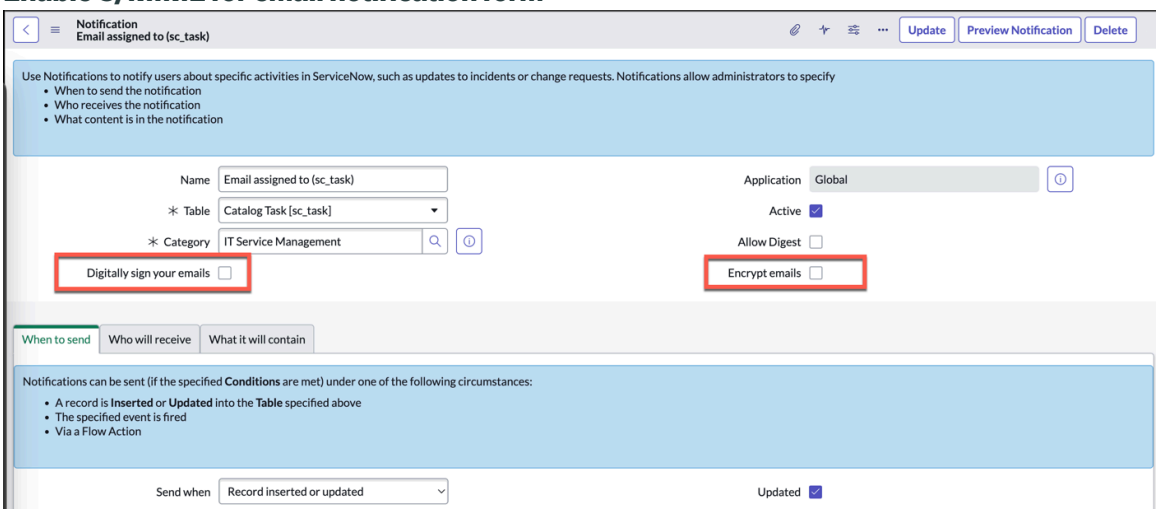
Configuration	Related property
Digitally sign your outbound emails.	email.outbound.smime.signing.enabled
Send a public certificate in the outbound email.	email.outbound.smime.signing.send_public_cert
Encrypt message contents and attachments.	email.outbound.smime.encryption.enabled
Encryption algorithm. Select **AES-CBC** or **AES-GCM**. **Note:** Before selecting AES-GCM, check whether GCM is supported by the client for S/MIME.	email.outbound.smime.encryption.algo

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inbound S/MIME configuration

For decryption, you must upload the email certificate for the recipients in PEM format and the CA certificates for the issuing authority. For more information, see Upload an email certificate and Upload a CA certificate.

For signature verification, you must upload the email account key pair in P12 format. For more information, see Import an S/MIME key pair.



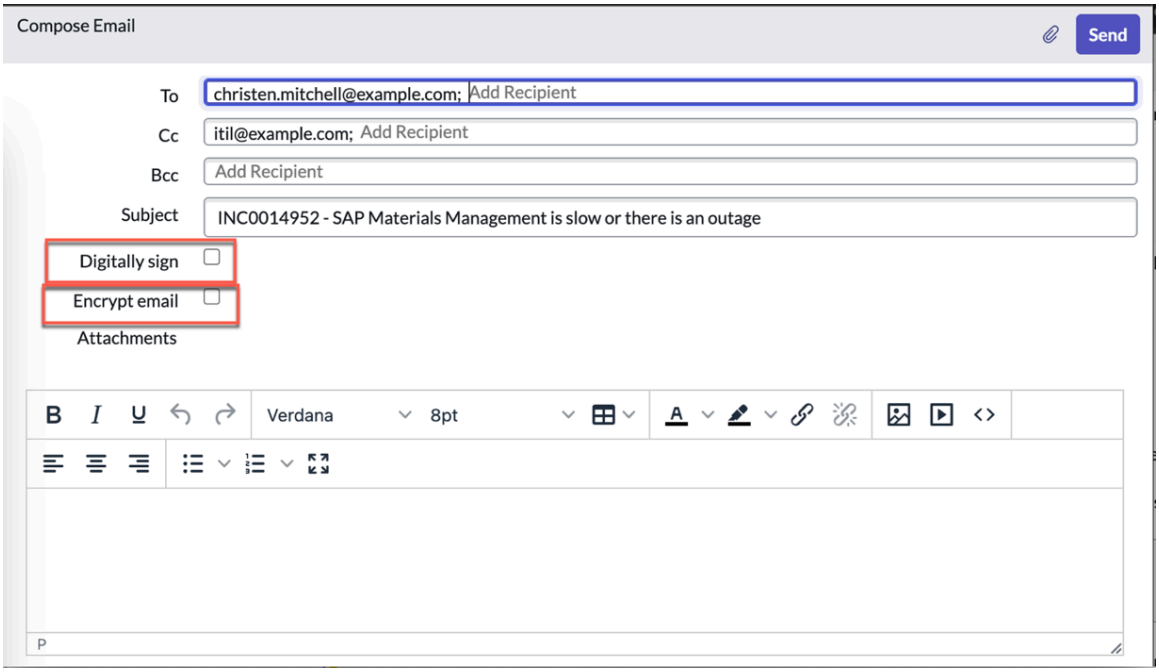
Inbound S/MIME configuration properties

Configuration	Related property
Verify the signature for inbound emails.	email.inbound.smime.verify_sign
Decrypt inbound emails.	email.inbound.smime.decrypt

Enable S/MIME for email notification form

To digitally sign or encrypt your emails, go to **All** > **Email** > **Notifications**, select **New** and select the **Digitally sign your emails** check box for digitally signing emails and **Encrypt emails** check box for email encryptions.

Enable S/MIME for email notification form



For more information, see Create an email notification.

Enable S/MIME for email client

In the compose email form, select the **Digitally sign your emails** check box for digitally signing emails and **Encrypt emails** check box for email encryptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable S/MIME for email client

Reference

Reference section provides additional information about email administration.

Email size limits

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

An email or attachment that exceeds the system capacity may not be processed as expected. To ensure that your emails and attachments are processed as expected, you can configure properties that limit the size of emails and attachments.

Message body size limit properties

Add properties to control the maximum email body size allowed for inbound and outbound email messages.

Properties

By default, the system processes up to 524,000 characters in the email **body** and **body_text** fields.

You can add and configure system properties *glide.email.inbound.max_body_chars* and *glide.email.outbound.max_body_chars* to increase or decrease the email body size limits. The system truncates the email body when it exceeds the configured limit. For example, if you configure the body size limit of *glide.email.inbound.max_body_chars* to 1,000 characters but receive an inbound email that is 2,000 characters, then the system truncates the email body at 1,000 characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message body size limit properties

Name	Description
glide.email.inbound.max_body_chars	Sets the maximum body size in characters allowed per inbound email. • Type: integer • Default value: 524288
glide.email.outbound.max_body_chars	Sets the maximum body size in characters allowed per outbound email. • Type: integer • Default value: 524288

Note: A different property, *com.glide.attachment.max_size*, sets the maximum file size allowed for any attachment in the system and overrides any larger values of *glide.email.inbound.max_total_attachment_size_bytes* and *glide.email.outbound.max_total_attachment_size_bytes*.

Inbound email body processing

For inbound emails, the system enforces the maximum body size as set by the *glide.email.inbound.max_body_chars* property. When the body size exceeds the configured value:

- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: `Email set to receive-ignored because its size exceeds the value set in` *glide.email.inbound.max_body_chars*.

Outbound email body processing

For outbound emails, the system enforces the maximum body size as set by the *glide.email.outbound.max_body_chars* property. When the body size exceeds the configured value:

- The system does not send the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this: `Email set to send-ignored because its size exceeds the value set in` *glide.email.outbound.max_body_chars*`. 1337 character(s) were truncated from the body field.`

Attachment limit properties (continued)

Name	Description
	Email Attachment Processing
glide.email.outbound.max_total_attachment_size_bytes	Sets the maximum total attachment size in bytes allowed per outbound email. To send an email, the system must encode the contents of the email. This process may significantly increase the size of the email, including any attachments. It is best to set this property to a value well below the maximum email size. • Type: integer • Default value: 18874368 • Learn more: Outbound Email Attachment Processing

Note: A different property, *com.glide.attachment.max_size*, sets the maximum file size allowed for any attachment in the system and overrides any larger values of *glide.email.inbound.max_total_attachment_size_bytes* and *glide.email.outbound.max_total_attachment_size_bytes*.

Inbound email attachment processing

For inbound emails, the system enforces the maximum number and size of attachments as set by the *glide.email.inbound.max_attachment_count* and *glide.email.inbound.max_total_attachment_size_bytes* properties. When an attachment for an inbound email exceeds either value, the attachment is discarded. A record is created in the Email Attachments [sys_email_attachment] table containing the discarded file name and the reason it was discarded. The discarded file remains in the Email [sys_email] record. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When an inbound email attachment is discarded, the system also fires the *inbound.email_attachments.discarded* event. You can use the event to trigger a notification that alerts the email sender. For an example of a notification that can be triggered by the event, see the inactive "Demo Email Attachment(s) Discarded" notification.

Inbound email attachments are prevented from attaching to the target record if an identical attachment exists.

Outbound email attachment processing

For outbound emails, the system enforces the maximum number and size of attachments as set by the *glide.email.outbound.max_attachment_count* and *glide.email.outbound.max_total_attachment_size_bytes* properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email [sys_email] table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

The log message for such an email might look like this: `Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.`

Emails for notifications, scheduled reports, and exported tables

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

Check the status of bounced email addresses

Choose the email address record that you want to modify, and update the state field as needed.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Logs** > **Bounce Email Addresses**.
2. From the state of the mail address, select the state and choose the desired state to block or unblock the email address

   Important: Before modifying the status, address the reason for the failure of that particular email address.

3. Select the confirm icon () to confirm the status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User criteria form

User criteria enables you to allow access to users based on role, department, group, location, or company. Administrators can control access by creating and applying user criteria. User criteria records define conditions that are evaluated against user records. When user criteria is defined, records are only visible to users who pass the defined conditions.

User Criteria form

Field	Description
Name	Name of the user criteria.
Users	Users who can access the quick link when you apply the user criteria. Click the Unlock users icon to select users. Click the Add me icon to add yourself as a user. Click the Add email address icon to add a user's email address.
Groups	Groups who can access the quick link when you apply the user criteria. Click the Unlock Groups icon to select the groups. **Note:** Use Groups instead of the Advanced user criteria to get your data cached.
Roles	Roles who can access the quick link when you apply the user criteria. Click the Unlock Roles icon to select the roles.
Advanced	Option to create a script for the user criteria. **Note:** Use Groups instead of the Advanced user criteria to get your data cached.
Application	This field is automatically set.
Active	Option to activate this user criteria for use.
Companies	Companies who can access the quick link when you apply the user criteria. Click the Unlock Companies icon to select the companies.
Locations	Locations which can access the quick link when you apply the user criteria. Click the Unlock Locations icon to select the locations.
Departments	Departments who can access the quick link when you apply the user criteria. Click the Unlock Departments icon to select the departments.
Match All	Option to make every condition required when the user criteria is applied. The conditions are set in the previous fields, such as Companies, Locations, Departments, and so on.

Granular admin roles for Notifications

Granular admin roles enable organizations to assign specific administrative permissions based on functional responsibilities, replacing broad admin access with targeted role assignments. Use the new admin roles to grant users administrative capability without using the admin role.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Granular admin roles for Notifications

Role name	Functionality	Description	Plugin
email_bounce_admin	Email Bounce	Provides access to configure email bounce related tables.	com.glide.email.bounce_management
smime_certificate_admin	SMIME	• To install a private key in the KMF module, the user needs the sn_kmf.cryptographic_manager role • To install a CA or Email certificate, the user requires the smime_certificate_admin role • To check SMIME logs, the user must have the email_log_viewer role	com.glide.email.smime
email_log_viewer	Email logs, SMIME logs	Provides access to view email logs and SMIME logs.	com.glide.mailbox
email_digest_admin	Email digest	Provides access to sys_email_digest_part_user and sys_email_digest_part tables.	com.glide.email_digest
notification_classification_admin	Notification classification	Provides access for adding add Notification classification to sys_notification_classification table.	com.glide.notification.classification
notification_category_admin	Notification category	Provides access for adding add Notification category to sys_notification_category table.	com.glide.notification.preference.servic
push_admin	Push credential	Provides access for push_admin to sys_push_instance_credential table.	com.glide.push_proxy
portal_notification_pref_admin	Widget preference	Provides access to sys_recipient_user_mapping table.	com.glide.notification.unify.preference.s

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Granular admin roles for Notifications (continued)

Role name	Functionality	Description	Plugin
notification_admin	Notifications	Provides access to configure notifications through the sysevent_email_action table,with access to the sys_email_layout and sysevent_email_template tables. Additionally,they can set the digest interval. For Request Translation user needs to have localization_requestor role.	com.glide.notification
email_admin	Resend email, Reprocess Email	Provides access to reprocess inbound emails and resend outbound emails. Additionally, to view logs, they must have the email_log_viewer role.	com.glide.mailbox
oauth_admin	Authorize Email Account Access, Test Connection	Provides access to authorize an email account and do test connection. To view logs, they must have the email_log_viewer role.	com.glide.mailbox

System notifications

Set up notifications to alert users of record changes that may concern them. You can notify users via email, SMS text message, push notification, or messaging app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started

Email and SMS Notifications	Push Notifications	Notifications in Messaging Applications
		
Use email notifications to send selected users email or SMS notifications in the system	Push notifications to mobile devices	Use the Now Actions app to configure the messaging apps for your instance

Troubleshoot and get help

- Troubleshooting Notification emails
- Ask or answer questions in the Platform community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Email and SMS notifications

Use email notifications to send selected users email or SMS notifications about specific activities in the system, such as updates to incidents or change requests.

Important: Service providers such as AT&T and Verizon may soon be deprecating the **email-to-text** functionality. See Using Notify with SMS for SMS delivery.

Email notifications allow administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification
- Whether the notification can be delivered in an email digest and if so, the digest content

Additional email notification options are available. You can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To avoid broken links, items like images and incidents, that are linked with URLs relative to an instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The rich HTML format is the default for all new email notifications.

Note: Instances can't send or receive encrypted email messages. The system strips out the body of the encrypted email because it can't process the encrypted content in plain text or HTML.

An email notification can also send as an SMS notification if the recipient has subscribed to the notification on an SMS channel. The system uses the subject line of the email notification and converts it to an SMS message. If the administrator doesn't want to use the email notification subject for the SMS notification, they can define an alternate SMS message in the email template form or email notification form. For more information, see Create an email notification.

For more information on creating an SMS channel, see Create notification channels.

For more information on setting up SMS notification see KB0712569.

If you want to change how the instance processes incoming email, see Inbound email actions. See System email log and mailboxes for examples of messages the system displays when notifications or inbound email actions aren't processed.

Create notification categories

You can create notification categories to identify and group related notifications that are listed in the notification settings for your users.

Before you begin
Role required: admin

About this task
Before adding new categories, review the base system notification categories in the Notification Categories [sys_notification_category] table to determine if you need a new category.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notification Categories**.
2. Select **New**.
3. Enter the **Name** of the category to identify the family of notifications.
   Provide a category name that is meaningful to your users, so that they can easily find their notifications under the appropriate category in their notification settings.
4. Enter a **Short description** to identify the category.
5. Select **Submit**.

Result
The system adds the new category to the Notification Categories [sys_notification_category] table. After you create at least one, active notification that uses the new category, the category and notification are listed in the Notification preferences for users (**User Menu** > **Preferences** > **Notifications** > **System Notifications**).

Create an email notification

Create an email notification specifying when to send it, who receives it, what it contains, and if it can be delivered in an email digest.

Before you begin
Role required: admin
Consider the following items when you create or update a notification:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Your notification recipients must be active users and have a valid email address defined.

  ServiceNow users or members of groups must be defined as active users in the User [sys_user] table. They must also have a valid email address defined for their primary channel (device) in the Notification Device [cmn_notif_device] table. If users don't have an active profile and a valid email address, the notifications won't be received.

- Your notification recipients must have the appropriate notification preferences enabled.

  If the notification is subscribable, each ServiceNow user or group member must have the notification and channels (devices) for the notification enabled in their notification preferences. Admins can impersonate users to review and configure their notification preferences.

- To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see Create notification channels.
- After you create or update the notification, use the **Preview Notification** option to examine it. For example, you can test links that you may have added and verify the notification recipients. For details, see Preview email notifications.
- For information on operators available for filters and queries, see Operators available for filters and queries.

About this task

Watch the video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users.

https://player.vimeo.com/video/995190091?badge=0&autopause=0&player_id=0&app_id=58479

Use the following tabs in the Notification form to configure an email notification:

- **When to send** — Conditions required to send the notification.
- **Who will receive** — Recipients of the notification.
- **What it will contain** — Contents of the notification.
- **What Digest will contain** — Contents of the email digest if the notification can be delivered in a digest.

Note: If you don't see all the fields on the form, switch to the **Advanced** view.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Select **New**.
3. Fill in the fields at the top of the Notification form, as appropriate.

Field	Description
Name	Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened & Unassigned.
Table	Select the database table to link the notification to, for example Incident [incident].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Important: Don't select the Task [task] table. This table is for extending other tables. Notifications that run on the Task table directly aren't supported. **Note:** Only tables and database views that are in the same application scope appear in the list.
Type	Select the type of notification that you're creating: EMAIL or Meeting Invitation.
Active	Select the check box to enable the email notification.
Category	Select the category to which this notification belongs. A category identifies and groups related notifications. This notification, if active and subscribable, is listed in the selected **Category** in the notification preferences for each user (**Notifications** tab in the System Settings window). **Note:** Don't leave the category as **Uncategorized**, as users may not be able to find the notification in their list of notifications. If you need a new category, see Create notification categories.
Allow Digest	Select the check box if an email digest is to be created for the notification. If selected, the **What Digest will contain** tab is displayed for creating the digest content.
Description	Type a description for this notification.

4. Fill in the fields on the **When to send** tab.

Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

Field	Description
Send when	Select under what condition that the notification is sent: ○ When a record is inserted or updated ○ When a particular event is fired ○ When Notification step in Flow Designer
Weight	[Required] Set a numerical value for the notification priority relative to duplicate notifications. Notifications that have the same target table and recipients are considered duplicates if the weights are different. If weights are same, an additional evaluation is done to check if the subject and the body (excluding watermark) are same to qualify as duplicate notification. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to send the notification (assuming the conditions are met).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification. **Note:** The SMTP Sender scheduled job determines how often to send email. By default, this job runs every minute.
Conditions	Use the condition builder to select the conditions under which this notification is sent. For example, select **Priority** > **greater than** > **3 - Moderate** to send the notification only for High and Critical priority incidents.
Inserted	Select the check box to enable email notification when a record is inserted. This field appears when you set the **Send when** field to **Record inserted or updated**.
Updated	Select the check box to enable email notification when a record is updated. This field appears when you set the **Send when** field to **Record inserted or updated**.
Event name	Select the event that triggers this notification. This field appears when you set the **Send when** field to **Event is fired**.
Advanced condition	Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. The advanced condition script must return **true** or set a global answer variable to **true** to send the notification. The advanced condition script uses the following global variables: ○ *current*: Contains the current record from the table to which the notification is linked. ○ *event*: Contains the event that triggered the notification. **Note:** The **Advanced condition** field is evaluated in addition to other conditions that you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

5. Fill in the fields on the **Who will receive** tab.

   The following example shows the default view of the tab. The advanced view contains additional fields (see table).

   Tip: Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property *glide.email.smtp.max_recipients*.

Field	Description
Users	Select the users that you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Users/ groups in fields	Select fields from the target record that reference the User [sys_user] or Group [sys_user_group] tables. The system sends the notification to users or groups in each field that you select. For example, if a notification uses the Incident [incident] table, you can select the **Opened by** field to send the notification to users or groups who opened the incident. This list of users or groups is variable and depends upon the values of the associated task record. You can also select a field that includes an email address string to send a notification to that address. **Note:** You can dot-walk to values in reference fields by selecting the plus sign in the field selector and then selecting the related field. If you address the notification to a user with an inactive record in the User [sys_user] table, the system doesn't send the notification to that user.
Groups	Select the groups that you want to receive the email notification from. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static. **Note:** Group members receive individual notifications only if **Include members** is selected in the group record.
Exclude delegates	Select this option to help prevent the instance from sending email notifications to delegates of the users and members of the groups you selected.
Send to event creator	Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator isn't specified in one of the recipient fields, the event creator doesn't receive a notification regardless of the setting in this field. For new notifications, this option is selected by default. If you want to know why you may not be receiving certain email notifications, see the blog post Troubleshooting email notifications- Send to the Event Creator by a ServiceNow Technical Support Engineer in the ServiceNow Community.
Event parm 1 contains recipient	Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the **Send when** field is set to **Event is fired**.
Event parm 2 contains recipient	Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the **Send when** field is set to **Event is fired**.
Subscribable	Select this check box to enable all users to subscribe to this notification. See Subscription-based notifications for more information. **Note:** If the record contains sensitive or protected data, consider restricting the recipient list only to those users and groups who normally have access to it, and don't enable the **Subscribable** option. You can also configure your notification content so that private or sensitive data isn't exposed. For example, you could insert a link back to the associated record, so that details aren't revealed in the notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system doesn't exclude recipients based on access controls. Recipients can receive email about records that they can't normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally don't have access to these records. If a notification includes the record details, verify that all recipients need these details.

Note: By default, the system doesn't send email notifications to itself. For example, an email notification from instanceABC@service-now.com doesn't send to instanceABC@service-now.com. The system helps prevent this behavior to avoid looping.

6. Fill in the fields on the **What it will contain** tab.
The following example shows the default view of the tab. The advanced view contains additional fields (see table).

Field	Description
Email template	If you want to reuse existing content, select an email template to add content to the email notification. You can only select an email template that meets one of the following conditions: ○ shares the same scope and table as the notification ○ shares the same scope but has no specified table ○ shares the same table and is in the global scope
Subject	Enter the subject line for the email message. The subject can include variables from the **Select variables** column. If empty, the system uses the **Subject** value from the **Email template**. If you enter a value in this field, it overrides the template value. If your recipients subscribe to the email notification on an SMS channel, then the system sends the email notification subject as an SMS message. To send a different SMS message, fill in the **SMS alternate** field on the email template form or the email notification form.
Message HTML	Enter the content of the email notification message. The message can include variables from the **Select variables** column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. The **Message HTML** field is visible only if you set the content type to **HTML and plain text** or **HTML only**. If empty, the system uses the **Message HTML** value from the **Email template**. If you enter a value in this field, it overrides the template value. To avoid adding extra `<p>` and `<div>` elements to your email notifications, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the ServiceNow Community.
SMS alternate	Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If empty, the system uses the **SMS alternate** value from the **Email template**. If you enter a value in this field, it overrides the template value. If you don't fill in the **SMS alternate** field on this form or the email template, then the system uses the email notification subject as the SMS message.
Importance	Set the importance of the email message to low or high.
Content type	Select the content type for the email notification: ○ HTML and plain text ○ HTML only ○ Plain text only By default, **HTML only** is enabled.
Include attachments	Select this check box to send all attachments from the triggering record as email attachments.
Omit watermark	Use this check box to apply or remove the watermark attached to each email. If the email doesn't contain a watermark, the system reviews the conditions of the inbound actions to create or update task records. For more information, and an alternative way to hide watermarks, see Watermarks on notification emails.
Message Text	Enter the notification message to send in plain text. This field appears when you set the content type to **HTML and plain text** or **Plain text only**. If empty, the system uses the **Message Text** value from the **Email template**. If you enter a value in this field, it overrides the template value.
From	Enter the email address that you want the email notification to use in the From field. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address may require an advanced email setup such as enabling email forwarding, for example when using Sender Policy Framework (SPF) records for spam detection.
Reply to	Enter the email address that you want people to use when replying to the email notification. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field. You can add no more than one email address in this field. Changing this address requires an advanced email setup such as enabling email forwarding.
Push message only	Select this option to send this notification only as a push notification to a mobile device. The Push Notification feature must be active.
Push messages	Associate one or more push messages with this notification. The Push Notification feature must be active. **Note:** The push message and notification must be for the same table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. If you selected the **Allow Digest**check box, fill in the fields on the **What Digest will contain** tab to create the email digest content for the notification.
The following example shows the default view of the tab. The advanced view contains additional fields (see table).

Field	Description
Digest Template	If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.
Digest Subject	Enter the subject line for the email digest. The subject can include variables from the **Select variables** column. If empty, the system uses the **Subject** value from the **Email template**. If you enter a value in this field, it overrides the template value.
Digest HTML	Enter the recurring content for the email digest. The digest content can include variables from the **Select variables** column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. To avoid adding extra `<p>` and `<div>` elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the ServiceNow Community.
Digest Separator (HTML)	Use the line to separate each item summarized in the digest.
Digest From	Enter the email address to be used in the From field of the email digest. For example, helpdesk@yourcompany.com. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.
Digest Reply To	Enter the email address that you want people to use when replying to the email digest. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.
Digest Text	Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to **HTML and plain text** or **Plain text only**.
Digest Separator (text)	[Optional] Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to **HTML and plain text** or **Plain text only**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you save or update the notification, the email **Digest**option is available for the notification in the notification settings of your users.

8. When you finish creating the notification, select **Submit** or, if you're done modifying the notification, select **Update**.

What to do next

Use the **Preview Notification** option to check your notification, for example, you can see:

- How the **Subject** and **Message** fields are displayed.
- Which users will or won't receive the notification, including the reasons why the users won't receive it.

Convert legacy email notifications to rich HTML

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Before you begin

Role required: admin

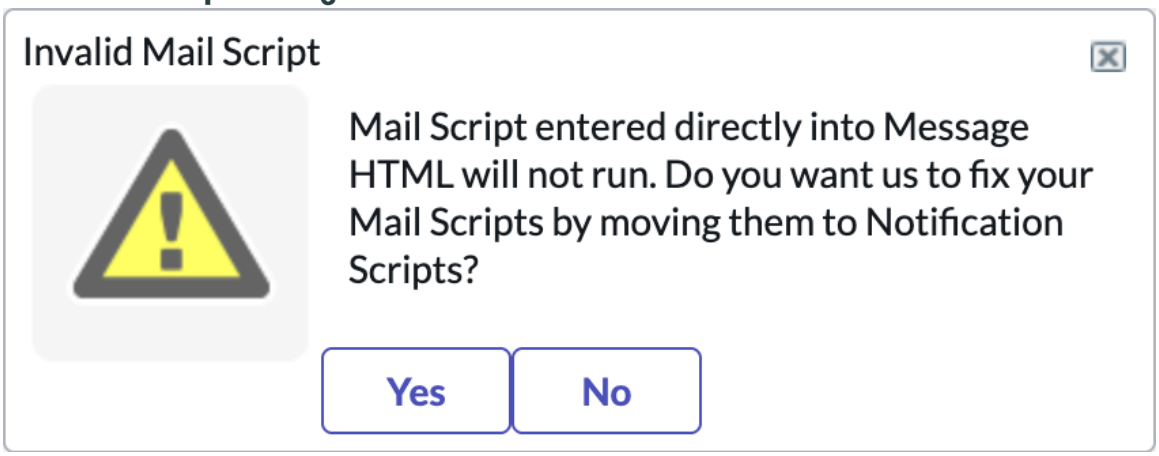
Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. On the **Email Notifications** list screen, click the name of the email notification you want to convert.
3. Click the **What it will contain** tab.
4. Click **Switch to Rich HTML Editor**.

The system copies any raw HTML from the **Message** field and converts it to rich HTML in the **Message HTML** field. Additionally, any mail scripts in the body are automatically saved to the Email Script `[sys_script_email]` table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.

Note: The string "div" at the bottom of the screen shows the location of your cursor within the **Message HTML** field. In this case, the cursor is in a line containing an HTML `<div>` tag.

What to do next



When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script [sys_script_email] table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using **System Notification** > **Email** > **Notification Email Scripts**. When the scripts are completed, add a `${mail_script:script name}` embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by `<mail_script> </mail_script>` in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invalid mail script message

In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the **Show Notification Scripts** related link.

Control visibility to email records generated by notifications

Define conditions that restrict read access to target email records containing sensitive information.

Before you begin

Role required: admin

About this task

Use the Email Access Restriction [email_access_restriction] table to define conditions that control read access to an email record generated by a notification containing sensitive information. These conditions are processed by the base system ACL for the Email [sys_email] table.

When you specify conditions to restrict access for a notification, the email records are visible only to users that match the conditions specified for the notification.

Procedure

1. Navigate to **All** > **System Notification** > **Email Access Restriction**.
2. Click **New**.
3. Complete the form.

Field	Description
Notification	Choose the notification that generates the email record that should be restricted.
Application	Displays the application scope.
Table	Displays the target table for the notification that you selected.
Condition	Use the condition builder to determine who can access the email record. The conditions must evaluate to true to enable read access to the email record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Enter a short description of the read access restriction.

4. Click **Submit**.

Advanced conditions for email notifications

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

To send a notification using an advanced condition, you can:

- Call a function that returns a value, or
- Set the global variable `answer` using a script

For example, in the following code, you call a function to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group:

```
(function() {
  var groupMember = gs.getUser();
  return !groupMember.isMemberOf('XYZ');
})();
```

Alternatively, you can script the same advanced condition by using the `answer` variable:

```
var groupMember = gs.getUser();
  if(groupMember.isMemberOf('XYZ')){
    answer = false;
  } else {
    answer = true;
  };
```

Note that the script must set the `answer` variable to **true** to send the notification. If you script no conditionals, the value of `answer` is equal to the last value that you set for the variable.

You can add a script-based condition in the **Advanced condition** field by configuring the Email Notification form and adding the field. You can access the field in the **Advanced** view without configuring the form.

The advanced condition script uses the following business rule global variables:

- current: contains the current record from the table to which the notification is linked.
- event: contains the event that triggered the notification.

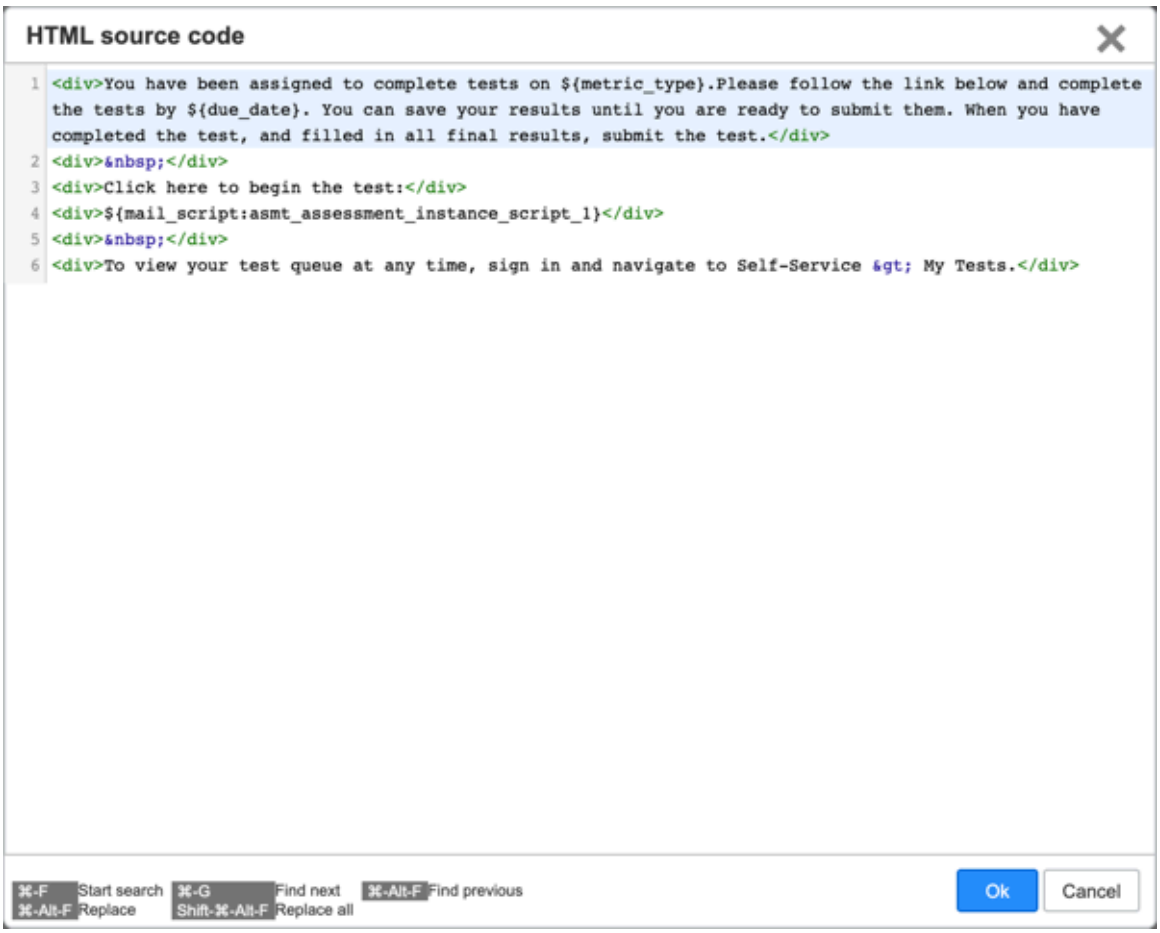
Note: The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the **Condition** and **Advanced condition** must evaluate to true in order to send the notification.

Related topics

Create an email notification

Edit HTML content in an email notification

For added control over the content of an email notification, you can edit the underlying HTML.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Open an email notification record.
3. On the form, open the **What it will contain** tab.
4. In the **Message HTML** field, click the source code icon (< >) to open the HTML source code editor.

5. Make the needed changes to the HTML.
6. On the window, click **Ok**.
7. On the form, click **Update**.

Document attachments on an email notification

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, go to **Advance view** and select the check box for the **Include attachments** under **What will it contain** tab. The email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding. For details on MIME encoding, see Email service size restrictions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attaching documents with scripting

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.

Linking to an attachment

You can add an attachment to a notification by linking to the attachment record in the message of the notification. Upon clicking the link, email recipients log in to the instance to view the attachment record.

Linking to attachment records in this fashion requires using email notification scripting. For example:

```
template.print ( 'Attachment: <a
 href="/sys_attachment.do?sys_id=' + now_GR. sys_id + '">' +
 now_GR. file_name + '</a>\n ' ) ;
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```
${report:X:Y}
```

where:

X is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).

Y is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- ${report:reportID:<abc123>}
- ${report:gaugeID:<abc123>}
- ${report:dashboardID:<abc123>}
- ${report:chartID:<abc123>}

Note: Multilevel pivot reports can't attach to email notifications.

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates.

To provide control over line breaks, a **Newlines to HTML** check box is available in the **Email Script** form.

Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, add correct HTML line breaks to template.print() statements.

If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTML line breaks in new scripts

When writing new scripts, insert explicit HTML line breaks and clear the **Newlines to HTML** check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace template.print("\n") JavaScript function calls with template.print("
"). This replacement gives you better control over the HTML formatting of your email notifications.

Preview email notifications

You can preview what notifications look like before you actually enable the instance to send them.

Before you begin

Role required: admin

About this task

You can preview both types of notifications as specified by the **Send when** field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as the expiration of a certificate or an inbound email action, triggers the notification.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Open the notification or create one.
   You must save the record before you can view the preview accurately.
3. Click **Preview Notification** on the form header.
4. On the Notification Preview window, verify that the notification works as expected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Preview records for this breakdown source	The type of event that triggers the notification. This list appears if you preview an event-triggered notification. Select one of the following: ○ **Generated Event**: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record. ○ **Existing Event**: Preview with an existing event record in the instance. If you select this option, select the event in the **Event Record** field.
Event Record	An existing event to preview an event-created notification. This option appears if you select **Existing Event** as the event type (for event-triggered notifications only).
Event Creator	The user triggering the notification for the preview. The event creator defaults to the user who clicked **Preview Notification**. You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content.
Preview Record	The record triggering the notification for preview. The preview record defaults to one of the records in the table specified in the **Table** field on the Email Notification form. You can change the preview record as needed to see the changes in the notification content.
Users	The users who will receive the notification, as specified in the **Who will receive** section of the Email Notification form: ○ All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text. ○ Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user's notification settings are turned off.
Subject and Body	The content of the notification as defined by the template. The **Subject** and **Body** sections on the preview display the content in the corresponding **Subject** and **Message** fields on the template. If the template includes a link to the record that triggered the notification, the **Preview Record** link is used. Click the link to go to that record.

5. After you have reviewed the notification, exit the preview window.
6. Make the necessary changes to the notification or template, if necessary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Time zone for email notifications

A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property `glide.email.append.timezone` controls whether to append the time zone. If true, the system time zone of the instance is appended to any Date/Time fields in outbound email messages (for example, 2018-07-02 04:01:14 PST).

Specify alternative outbound email addresses for notifications

By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

Before you begin

Role required: admin

About this task

For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.
   For more information on how to construct the From address, refer to section 3.6.2 of RFC 2822.
6. Add a different email address than the**From** address to the **Reply to** field if you want replies to this notification to go to a different address.

   The system checks the **From** field for an address. If this field is empty, then the system uses the default address for the instance. If the **Reply to** field is empty, then all replies are sent to the address from which the notification was sent. If the **Reply to** field contains an email address, then the system sends all replies to the notification to this address.
7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.

   For example, if the **Company** is a certain value, then the notification comes from a unique email address entered in the **From** field.
8. Click **Update**.

Specify an outbound email address for a particular language

You can specify a different email address for each language your instance supports.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create or copy a notification record for the desired event.
2. In the **What will it contain** section, enter a new email address in the **From** field.
3. Create the **Subject** and **Message** content in the desired language.
4. In the **When to send** section, create a condition as follows:
   a. In the list of **Condition** fields, select **Show Related Fields** from the bottom of the choice list.
   b. From the choice list of **Related Fields**, select the field that identifies the recipient.

      For example, select **Caller** > **User** fields to send the notification to the user who called in an incident, or **Assigned to** > **User** fields to send the notification to the user to whom an incident is assigned.

   c. From the choice list of user fields, select **Language**.
   d. Select the **is** operator.
   e. Complete the condition by selecting the language of the desired user.
5. Click **Update**.
   All notifications for that event originate from the specified email address and go out in the language of the recipient.

Notification variables

Use notification variables to display dynamic information in the body of a notification such as a field value, a link to a record, or a link to system preferences.

Syntax

Specify a notification variable using this syntax:

```
${variable-name+variable-parameters}
```

The *variable-name* portion is always required. Not all notification variables support the *variable-parameters* portion. When available, most variable parameters are optional. See the list of available notification variables for variable names and available parameters.

Available variables

The system provides these notification variables.

Available notification variables

Variable	Description	Available parameters
${field-name}	Display the value of the specified field.	None
${image-field-name}	Display an image associated with a record. This variable is typically used with HTML to specify the source of an image element.	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available notification variables (continued)

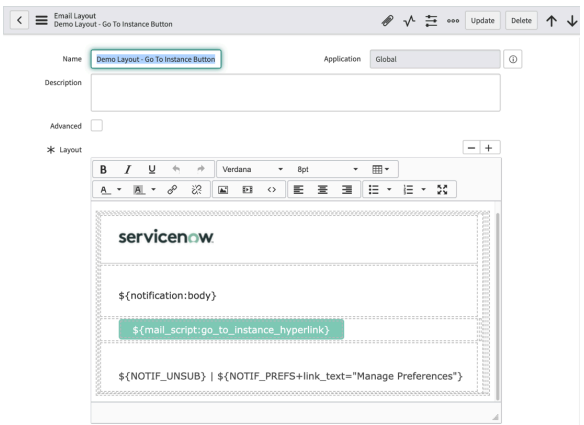
Variable	Description	Available parameters
• ${URI} • ${URI_REF}	Display a link to the current record. • *URI*: The link text is the word `LINK`. • *URI_REF*: The link text is the display value of the record. **Note:** These variables don't apply to records in Workspace. To link to a record in Workspace, create a mail script that prints a URL to a notification. For more information, see Linking to a record in Workspace.	Any valid *sysparm* URL parameter. For example: • sysparm_scriptlet • sysparm_view
• ${`reference-field`.URI} • ${`reference-field`.URI_REF}	Display a link to the record listed in a reference field. • *URI*: The link text is the word `LINK` • *URI_REF*: The link text is the display value of the record.	Any valid *sysparm* URL parameter. For example: • sysparm_scriptlet • sysparm_view
${CMS_URI}	Display a link to the specified record within a CMS page.	*<CMS-site>/<CMS-page>*: The required relative path to the CMS page.
${notification:body}	Display the body contents of an email template or email notification. Use this notification variable to specify where to display body content in an email layout.	None
${mail_script:`script-name`}	Run the specified mail script.	None
${NOTIF_UNSUB}	Display a link unsubscribe from this notification.	*link_text*: specify the text to display as a link within quotation marks.
${NOTIF_PREFS}	Display a link to set notification preferences.	*link_text*: specify the text to display as a link within quotation marks.
${comments:n}	Display the most recent comments that were made on the target record. The number of comments to display is n. For example, ${`comments:3`} displays the last three comments that were made to the record. To display all comments, use the variable ${`comments`}.	Any number greater than 0.

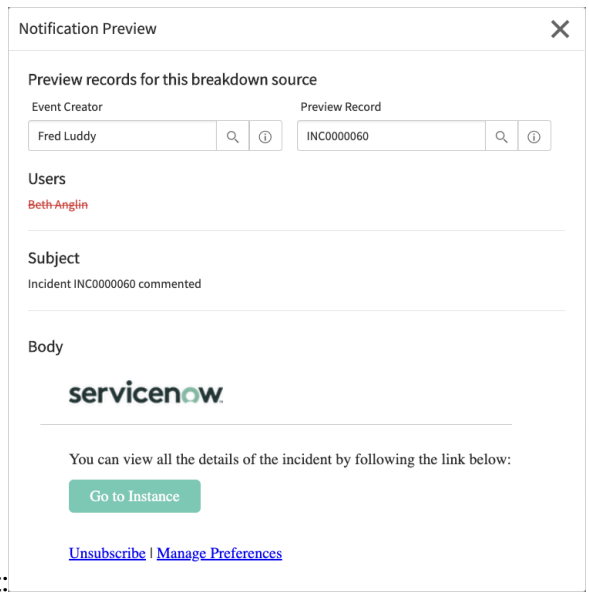
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available notification variables (continued)

Variable	Description	Available parameters
${comments_and_work_notes:n}	Display the most recent comments and work notes that were made on the target record. The number of comments and work notes to display is n. For example, `${comments_and_work_notes:3}` displays the last three comments and work notes that were made to the record. To display all comments and work notes, use the variable `${comments_and_work_notes}`.	Any number greater than 0.

Examples





Refer to the following examples to see how each notification variable is rendered in the output:

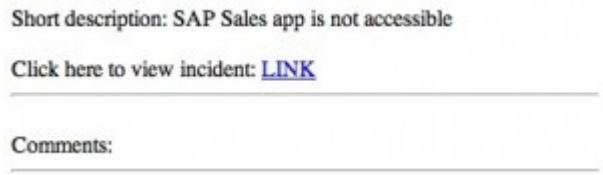
Variable	Example
`${field-name}`	Source: `Incident ${number} - comments added` Output: `Incident INC1000001 - comments added`
`${image-field-name}`	Source: `<img src='${picture}?t=medium'/>`  Output:
• ${URI} • ${URI_REF}	${URI} Source: `Click here to view incident: ${URI}` ${URI} Output: Click here to view incident: LINK

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable	Example
	${URI_REF} Source: `Click here to view incident: ${URI_REF}` ${URI_REF} Output: Click here to view incident: INC0000055

• `${reference-field.URI}`
• `${reference-field.URI_REF}`
	Source:
	`Click here to view Incident: ${URI_REF}`
	`Click here to view Related Problem: ${problem_id.URI_REF}`
	
	Output: Click here to view Incident: INC0010002
	Click here to view Related Problem: PRB0040001

${CMS_URI}	Source: `${CMS_URI+ess/incident_detail}` Output: a link to a target CMS page such as `https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56`
${notification:body} ${mail_script:`script-name`} ${NOTIF_UNSUB} ${NOTIF_PREFS}	Source:  Output: 



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Links to records in email notifications

Adding the *${URI}* parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

Link displayed by ${URI} parameter

The ${URI} parameter has an extension called the ${URI+} format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
&sysparm_scriptlet_condition=current.assigned_to.nil()
&sysparm_view=incident_active}
```

This example executes the JavaScript:

```
current.assigned_to=gs.getUserID()
```

when the condition of

```
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

Linking to a record in Workspace

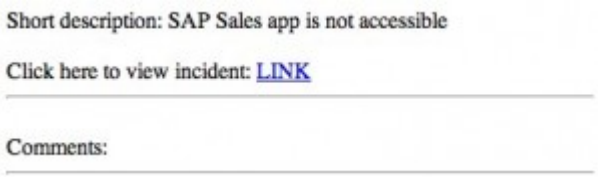
The `${URI}` and `${URI_REF}` variables don't apply to records in Workspace. To link to a record in Workspace, create a mail script and reference it in your notification. For more information on using mail scripts, see JavaScript in emails.

The mail script that you create should print a URL to the notification. The URL must have the following format:

```
https://<instance_name>/now/workspace/<workspace_name>/record/<table_name>/<sys_id>
```

The following example script shows the logic that a mail script must include to create a link to a record in Workspace.

```
// Dynamically construct an Agent Workspace URL and insert a
 link in the notification
  var agentURL = '<a href="' +
 gs.getProperty('glide.servlet.uri') +
 '/now/workspace/agent/record/'+ current.getTableName() + '/' +
 current.sys_id + '">' + current.number + '</a>';
  template.print(agentURL + "<br />");
```



Enable links to records

Adding the special *${URI}* parameter to an outbound email body or template creates a link to a specific record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a user clicks the word **LINK**, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

URI email notification

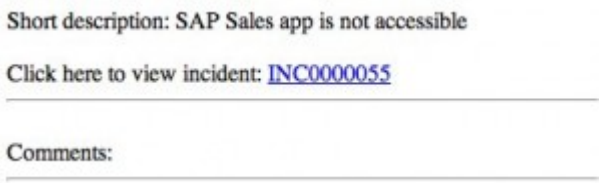
The *${URI}* parameter has an extension called the *${URI+}* format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
&sysparm_scriptlet_condition=current.assigned_to.nil()
&sysparm_view=incident_active}
```

This example executes the JavaScript:

```
current.assigned_to=gs.getUserID()
```

The JavasScript is executed when the condition is satisfied:



```
current.assigned_to.nil()
```

Additionally, the script sets the view to *incident_active*.

Change the link text

To show the display value of the record as the link text instead of the word LINK, use the ${URI_REF} parameter instead of the ${URI} parameter.

URI_REF email notification

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

Link to related records

A notification can link to a related record by specifying a reference field in front of the *${URI}* or *${URI_REF}* parameters.

Format the related record link as follows:

- `${<reference field that contains the related record you want to display>.URI}`
- `${<reference field that contains the related record you want to display>.URI_REF}`

For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related records

Related record to provide link to	Notification record table	Reference field	Samples
Related task record to be approved from an approval notification	Approval [sysapproval_approver]	Approval for [sysapproval]	• ${sysapproval.URI} • ${sysapproval.URI_REF}
Related problem record in an incident notification	Incident	Problem [problem_id]	• ${problem_id.URI} • ${problem_id.URI_REF}

For example, the following notification template produces the email links in the picture below:

```
Click here to view Incident: ${URI_REF}
Click here to view Related Problem: ${problem_id.URI_REF}
```

Related record link

Click here to view Incident: INC0010002
Click here to view Related Problem: PRB0040001

Content page links in email notifications

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages.

The link takes the following format: *${CMS_URI+<site>/<page>}*.

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: *${CMS_URI+ess/incident_detail}*

The resulting email URL has this format: `https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56`

Email unsubscribe links

Administrators can enable your users to stop receiving particular email messages by adding unsubscribe links to notifications.

Note: Base system notifications include unsubscribe and notification preferences links.

The two types of unsubscribe links are:

- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

The available parameter for both of these unsubscribe links is *link_text*, used to specify the text to display as a link within quotation marks.

Available unsubscribe macros

Unsubscribe type	Macro used	Description
Unsubscribe by email	${NOTIF_UNSUB}	The system generates an HTML *mailto* hyperlink. When users select the link, their

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available unsubscribe macros (continued)

Unsubscribe type	Macro used	Description
(Unauthenticated)		browser or email client creates a preformatted unsubscribe email message to the instance.
Unsubscribe by notification preferences (Authenticated)	${NOTIF_PREFS}	The system generates an instance link directly to the notification preferences for this notification type.

Administrators can add unsubscribe macros to the following notification record types:

- Email layouts
- Email templates
- Email notifications

Unsubscribe by email

You can enable users to unsubscribe from emails either by using the list unsubscribe header or a preformatted email message.

- **Unsubscribe using list unsubscribe header**

  Unsubscribing from email notification using the list unsubscribe header provides users with an unsubscribe link that appears next to the email address. It sends an unsubscribe request and a preformatted email message is automatically sent.

  Note: The unsubscribe option or the placement of the button can vary based on the email client being used.

- **Unsubscribe with preformatted email message**

  Unsubscribing by email requires the user email client or browser to create a preformatted email message containing the following elements:

  - The **To** field includes the email address of the instance.
  - The **Subject** starts with the string **Unsubscribe from**.
  - The **Body** has a JSON string with a name-value pair consisting of *`Unsubscribe`* and an array value that contains two more name-value pairs.
    - The *`notification_id`* parameter specifies the sys_id of the notification that the user wants to unsubscribe from.
    - The *`unsub_token`* parameter specifies an instance ID that the system uses to verify that the email came from a ServiceNow instance.

Note: Some email clients and web browsers, such as Gmail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser doesn't support mailto links.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification. Unsubscribing by email message doesn't require users to authenticate with the instance first.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For translation-enabled emails, if the unsubscribe option does not work, follow these steps:

1. Create a system property named *glide.email.translation.unsubscribe.prefix* and set it to **true**. Enabling this property adds the prefix **[UNSUB] :** to the preformatted email subject line.
2. Activate the **Unsubscribe from Translated Notifications** inbound email action, or update the existing **Unsubscribe from Notification** inbound email action to include the **[UNSUB] :** prefix in the subject line using conditions or a script.

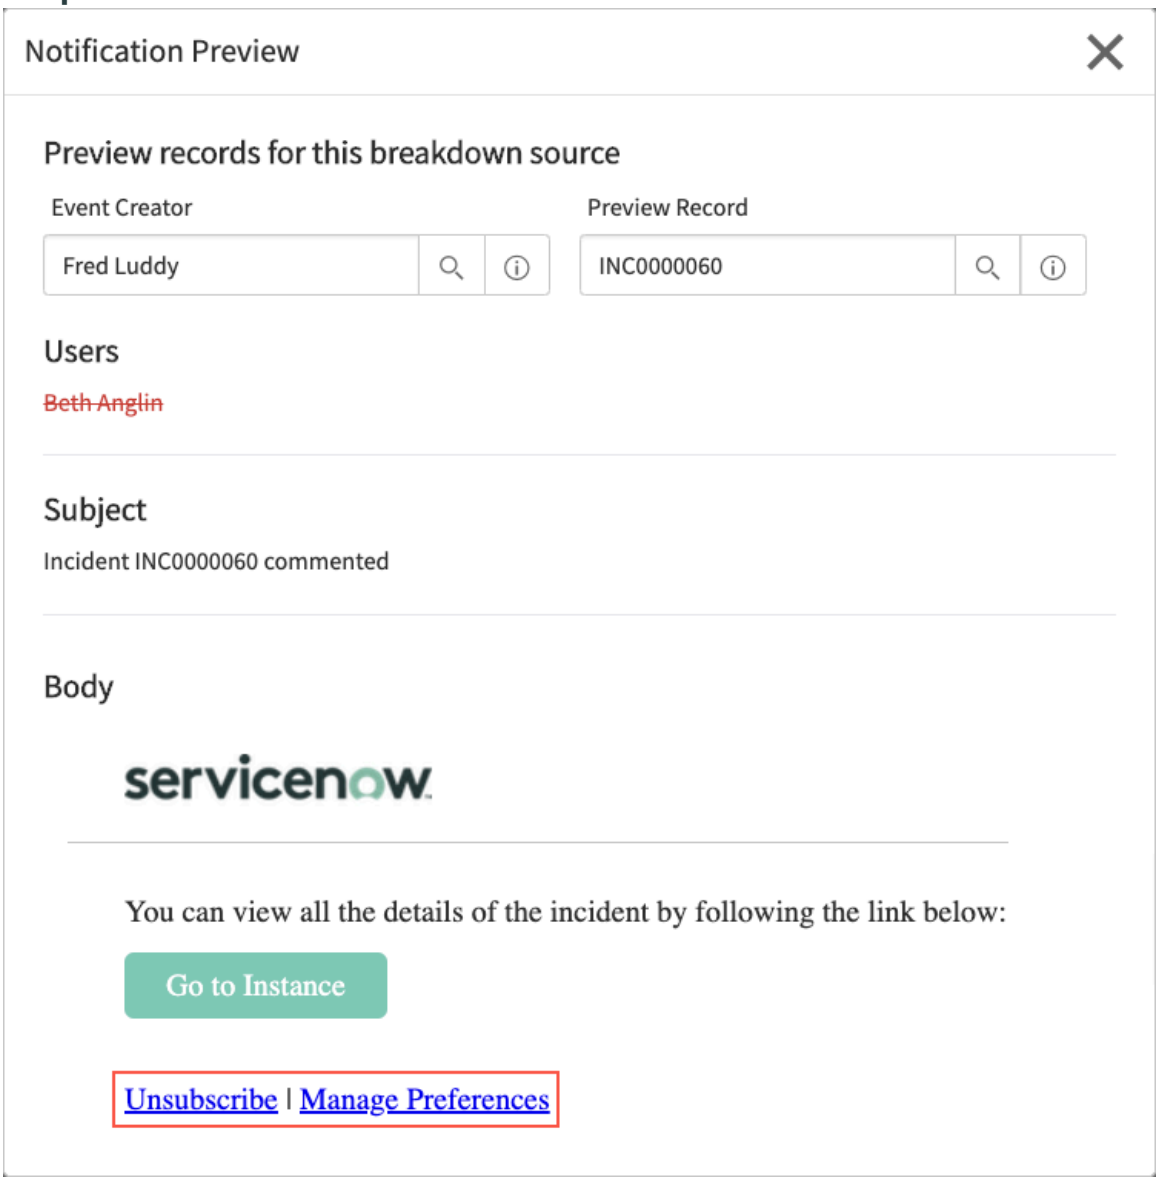
Note: Users with multiple subscribed email addresses who unsubscribe from the primary email address are automatically unsubscribed from all other email addresses. Unsubscribing through secondary email addresses is supported beginning with the Xanadu release. The request is fulfilled only for that secondary email address.

Unsubscribe by notification preferences

Unsubscribe by notification preferences requires the user's browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

You can set preferences for this notification such as disabling notifications for a particular device and save the notification preferences for changes to take effect.

Example: Unsubscribe links



This email layout adds several unsubscribe links to the bottom of each email notification.

```
${NOTIF_UNSUB} from this notification by email or
 ${NOTIF_UNSUB+link_text="click
      here"}.
Manage your ${NOTIF_PREFS} or ${NOTIF_PREFS+link_text="click
 here"}.
```

When rendered in an email notification, the unsubscribe links display only the link text.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample unsubscribe by email message

Scripting for email notifications

Email scripts enable you to use business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts enable you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

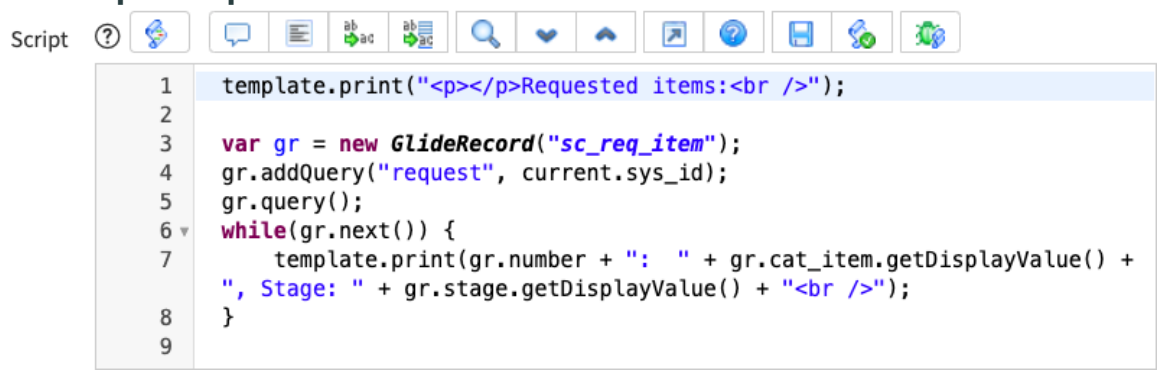
You can use the same scripts in multiple email notifications or templates by adding an `${mail_script:script name}` embedded script tag to the body of the email notification or template, replacing *`script name`* with the name of the script you created.

If you manually enter a mail script bounded by `<mail_script>` and `</mail_script>` in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag (`${mail_script:script_name}`).

When you manually enter a mail script enclosed in `<mail_script>` and `</mail_script>` tags in the body of a new or converted email notification or template and save the record, you will be prompted to convert the mail script.

In many cases, mail scripts that are not converted fail to run within the HTML editor. If you select **Yes**, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag (`${mail_script:script_name}`).

If you enter a mail script inside `${{mail_script:script name}}` and the HTML sanitizer configuration is done, the output of the mail script will be HTML sanitized. For more information about HTML sanitizer, see HTML Sanitizer.



JavaScript in emails

Create mail scripts in **System Notifications** > **Email** > **Notification Email Script**, and refer to them by using `${mail_script:script name}` in the script field.

To print text into the body of the message, use the *`template.print("a string")`* function.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JavaScript in templates

The *event.parm1* and *event.parm2* parameters that come from the originating event can also be used.

For additional information on creating mail scripts, see Notification Email Scripts on the Developer Site.

Mail script variables

Certain variables are available when processing mail_script scripts.

For examples of mail scripts, see Example scripting for email notifications.

Mail script variables

Variable	Object Description

template	Handles printing from the mail script to the email message.
	
	`template.print("message"); //outputs message to the email body.`
	
	`template.space("number of spaces"); //outputs spaces to the email body.`

email_action	GlideRecord object for the email notification (sysevent_email_action).
event	GlideRecord object for the event that fired the notification (sysevent).
email	EmailOutbound object Available methods: • `addAddress(String type, String address, String displayname)` : type can be cc or bcc. • `setFrom(String address)` : override the sender address. • `setReplyTo(String address)` : override the reply to address. • `setSubject(String subject)` : override the subject of the message. • `setBody(String message)` : override the body of the message. The email address that is passed by `setFrom` and `setReplyTo` needs to be in a valid form such as `helpdesk@sn.com` or `Display Name <helpdesk@sn.com>`. If the email address includes a 'Display Name', then that value overrides the instance's display name.

Mail script variables (continued)

Variable	Object Description
	For more information, see GlideEmailOutbound - Scoped.

Example scripting for email notifications

Examples of scripting for email notifications.

Scripting examples for email notifications

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```
template.print("Incident number - "+ current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```
template.print("Summary of Requested items:<br />");
var now_GR = new GlideRecord("sc_req_item");
now_GR.addQuery("request", current.sysapproval);
now_GR.query();
while(now_GR.next()) {
  template.print(now_GR.number + ":  " + now_GR.quantity + " X "
 + now_GR.cat_item.getDisplayValue()
                  + " at " +
 now_GR.cat_item.price.getDisplayValue() + " each <br />");
}
```

To dynamically change field values within an email, use the following functions within <mail_script> syntax:

```
...
email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
...
```

Using the *instance_name* property ensures that the notification still works when migrated between instances.

```
dothis();

function dothis(){
    var now_GR =new GlideRecord('sys_attachment');
    now_GR.addQuery('table_sys_id',current.sys_id);
    now_GR.query();while(now_GR.next()){
        template.print('Attachment: <a href="https://'+
 gs.getProperty('instance_name')+'
           .service-now.com/sys_attachment.do?sys_id='+
 now_GR.sys_id+'">'+ now_GR.file_name+'</a>');}}
```

You can specify copied and blind copied recipients by using the email object within a mail script.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//email.addAddress(type, address, displayname);
    email.addAddress("cc","john.copy@example.com","John
 Roberts");
    email.addAddress("bcc","john.secret@example.com","John
 Roberts");
```

The following is an example script to add users from *watch_list* as copied recipients.

```
if(!current.watch_list.nil()){
   //get watch list addresses and add to cc
   var watcherIds = current.watch_list.split(",");

   //get user records
   var user = new GlideRecord("sys_user");
   user.addQuery("sys_id", watcherIds);
   user.addQuery("notification",2);
   //email
   user.addQuery("email","!=","");
   user.query();

   while(user.next()){
      //add to cc list
      email.addAddress("cc", user.email,
 user.getDisplayValue());}}
```

Useful attachment scripts

This is a searchable version of the Useful Attachment Scripts.

Warning: The customization described here was developed for use in specific instances, and is not supported by Now Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

Copy attachments from record to record

Use the following script to copy an attachment from one record to another record:

```
GlideSysAttachment.copy('sourcetable','sys_id','destinationtable
','sys_id');
```

Note: GlideSysAttachment.copy copies all attachments; it cannot select specific attachments.

Delete duplicate attachments

Use the following script in a business rule, scheduled job, or background script to delete duplicate attachments located in the Attachments [sys_attachment] table:

```
function fixDuplicateImages(){
  var now_GR = new GlideRecord('sys_attachment');
  now_GR.addQuery('table_name','LIKE','ZZ_YY%');
  now_GR.orderBy('table_sys_id');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  now_GR.orderByDesc('sys_created_on');
  now_GR.query();
  var lastID ='not_a_match';
  var lastFile ='not_a_match';
  while(now_GR.next()){
    var isDuplicate = (lastID == now_GR.table_sys_id)&&(lastFile
 == now_GR.file_name);
    lastID = now_GR.table_sys_id;
    lastFile = now_GR.file_name;
    gs.print(now_GR.table_sys_id + ' ' + now_GR.table_name +
 ' ' + now_GR.file_name + ' ' + now_GR.sys_created_on + ' ' +
 isDuplicate);
    if(isDuplicate)
      now_GR.deleteRecord();
  }
}
```

Display whether tasks have attachments in list view

Use the following script in a business rule to display whether tasks have attachments when viewed in the record list view. Note that the script needs a custom field on the Has Attachments [u_has_attachments] table.

```
checkAttachment();

function checkAttachment(){
  // if inserting then the task has an attachment
  if(current.operation()=='insert') {
    hasAttachment('true'); // if deleting attachment check for
 other attachments
    if(current.operation()=='delete') {
      var timeNow3 =new GlideDateTime();
      gs.log('has_attachment br: gliderecord query start date
 time is: '+ timeNow3.getNumericValue(),'jwtest');
      var attachCount = new GlideAggregate('sys_attachment');
      attachCount.addQuery('table_sys_id',current.sys_id);
      attachCount.addAggregate('COUNT');
      attachCount.query();
      var numAttachments ='0';

      // if no other attachments task does not have attachment
      if(attachCount.next()){
        numAttachments = attachCount.getAggregate("COUNT");
        if(numAttachments >0){
          hasAttachment ='true';
        } else {
          hasAttachment('false');
        }
        var timeNow4=new GlideDateTime();
        gs.log('has_attachment br: gliderecord query start date
 time is: '+ timeNow4.getNumericValue(),'jwtest');
      }

function hasAttachment(answer){
  var task = new GlideRecord('task');
  task.addQuery('sys_id',current.table_sys_id);
  task.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  if(task.next()){
    task.u_has_attachment= answer;
    task.autoSysFields(false);  //Don't set the lastUpdatedTime
 or the Simultaneous Update Alert will likely get triggered
    task.setWorkflow(false);  //Don't allow other business rules
 to run, otherwise multiple notifications will likely be sent
    task.update();
  }
}
```

Note: Schedule the business rule to run after insert/delete.

Link to attachments in an email notification

Use the following script in an email notification or template to include links to attachments:

```
printattachments();

function printattachments(){
  var now_GR =new GlideRecord('sys_attachment');
  now_GR.addQuery('table_sys_id',current.sys_id);
  now_GR.query();
  while(now_GR.next()){
    template.print('Attachment: <a
 href="http://'+gs.getProperty("instance_name")+'.service-now.c
om/sys_attachment.do?sys_id='+ now_GR.sys_id+'">'+
 now_GR.file_name+'</a>');
  }
}
```

Note: Replace "instance_name" with your instance name.

Attachment Logging

Whenever a user downloads an attachment, the action writes an *attachment.read* event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the *current* variable must point to a sys_attachment record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

Baseline email notifications

The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.

Note: The below table list is not an exhaustive list. Products can create their own notifications.

Note:

Notification example: notify an assignment group of updates to Priority 1 Incidents

Notify users by email when there are updates to high priority incidents.

Before you begin

Role required: admin

About this task

Send emails to an assignment group whenever there are updates to an incident in which the **Priority** is **1 - Critical**. Include information that is of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**, and then click **New**.
2. On the email notification form, enter the following values:

Field	Value
Name	Priority 1 Incident Updated
Table	Incident [incident]
Active	Selected
Category	Incident Alert
Send when	Record inserted or updated
Inserted	Selected
Updated	Selected
Conditions	[Priority][is][1 - Critical] AND [Updated][changes]
Users/Groups in fields	Assignment group
Subject	`Priority ${priority} Incident updated` **Note:** In this notification, the variable ${priority} returns the value **1 - Critical**.

3. In the **Message HTML** field, enter the following message and script:

```
Short Description: ${short_description}
Click here to view incident: ${URI}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Incident number: ${number}
Category: ${category}
Assigned to: ${assigned_to}
Assignment group: ${assignment_group}
<hr/>
Comments:
${comments}
```

4. From the form context menu, click **Save**.
5. Preview the email notification to ensure it includes all the needed information.
   a. On the notifications form, click **Preview Notification**.
   b. Note that the email includes the following information:
      - Short description
      - A link to the incident record
      - Incident number
      - Category
      - The name of the user to whom the incident is assigned
      - The group assigned to the incident
      - Comments from the incident record
6. Test that the email notification sends to an assignment group when its Priority 1 Incident is updated.
   a. Create a user who has an email address that you can monitor, and then create a group that includes the user that you created.
   b. Navigate to **Incident** > **Open**, and then open an incident in which the **Priority** is **1 - Critical**.
   c. In the **Assignment group** field, enter the group that you created.
   d. From the form context menu, click **Save**.
   e. Add comments to the form to update the incident, and then click **Update**.
   f. Check the email account of the user member in the assignment group.

Notification example: notify task assignees

Notify users who are assigned a Task [task] record.

Before you begin

Role required: admin
Set up your email as a test email address. Navigate to **System Properties** > **Email Properties**, and then enter your email address under **Send all email to this test email address**.

Procedure

1. Navigate to **System Notification** > **Email** > **Notifications**, and then click **New**.
2. On the form, enter the following values:

Field	Value
Name	Task Assigned

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Table	Task [task]
Active	Selected
Category	Uncategorized
Send when	Record inserted or updated
Inserted	Selected
Updated	Selected
Conditions	[Assigned to][changes]
Users/Groups in fields	Assigned to
Subject	Task Assigned

3. In the **Message HTML** field, add a message to send to whomever the task is assigned to.
4. From the form context menu, click **Save**.
5. To see a mock version of the system email that you created, click **Preview Notification** on the notification form.
6. Test the notification sends to a task assignee.
   a. Assign some task records.
   b. Check your email for assignment notifications.

Email notifications dashboard

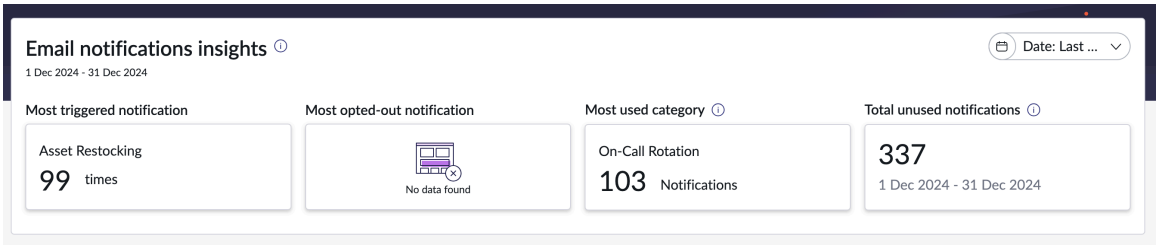
The email notification dashboard provides visibility into key metrics and enables admins to configure the dashboard to enable access to other users.

To access Email notifications dashboard, navigate to **All** > **System Notification** > **Email** > **Email notifications dashboard**

The dashboard enhances visibility and supports proactive management of email notifications, and includes highlights about:

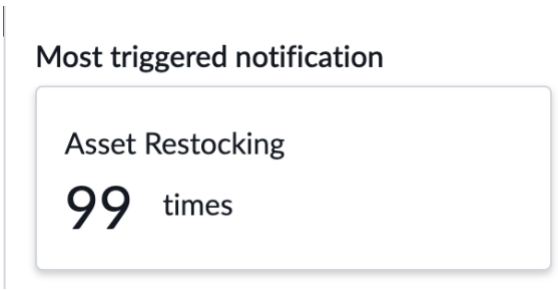
- Email notification insights
- Active notifications
- Notification trends
- Top 10 email notifications by usage, users, and tables

https://player.vimeo.com/video/1091898176?h=a555c32cca&badge=0&autopause=0&player_id=0&app_id=58479



Data collection is triggered by configuring and executing jobs. For more information, see Configure jobs for email notifications dashboard.

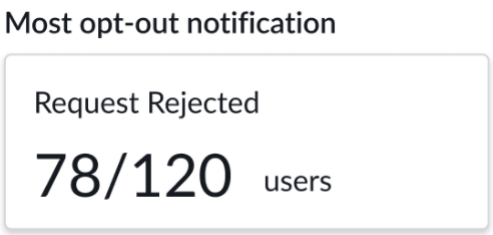
Note: Configuration of jobs is required for data to be displayed on the dashboard.

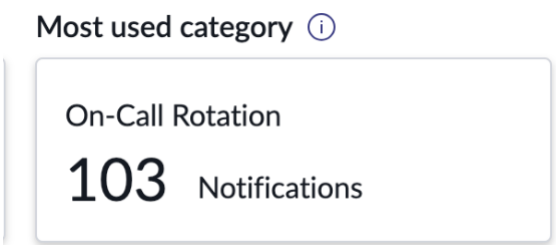


Key insights

Email notification insights highlights and shows the system notification sent over emails for the selected time period.

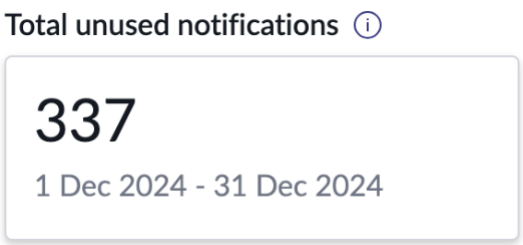
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





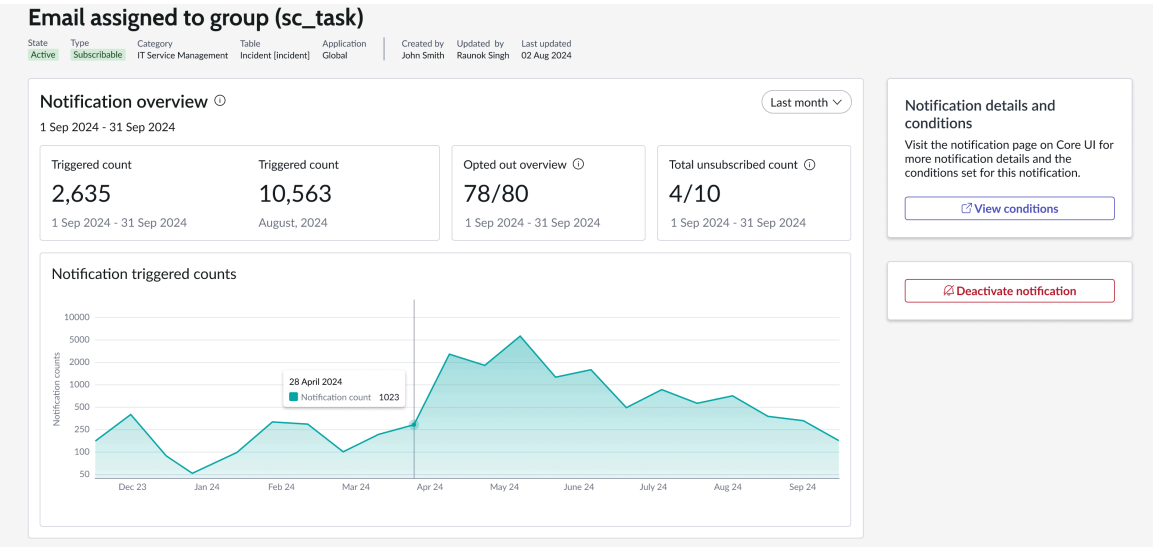
Email notifications insights

UI component	Description
Date	Select the time period for the data that you want to view. • Last 3 months • Last month • Last quarter • Last week • Yesterday
Most triggered notification	 The most triggered notification in the selected time period. In the above example the Asset Restocking notification has been triggered 99 times. Clicking on **Most triggered notification** gives more insight into the notification overview for the selected period which includes: • Triggered count: Comparison for the selected period • Opted out overview: The overview of the fraction of users who have opted out from a notification and the total number of users who have received at least once • Total unsubscribed count: Highlights the total number of users who unsubscribed after subscribing through custom notifications



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email notifications insights (continued)



UI component	Description
	• Conditions: View the notification details and condition set • Activate or Deactivate: Option to activate or deactivate the notification
Most opted-out notification	 The overview of all recipients receiving the notification vs. the users who opted out of the notification. In the above example 120 users were receiving the notification and out of the 120 users, 78 users have chosen to opt out from receiving the notification. Clicking on **Most opted-out notification** gives the notification overview for the selected period which includes: • Triggered count: Comparison for the selected period and the prior period (for example, the same month or the previous month or quarter) • Opted out overview: The overview of the fraction of users who have opted out from a notification and the total number of users who have received at least once • Total unsubscribed count: Highlights the total number of users who unsubscribed after subscribing through custom notifications • Conditions: View the notification details and condition set • Activate or Deactivate: Option to activate or deactivate the notification
Most used category

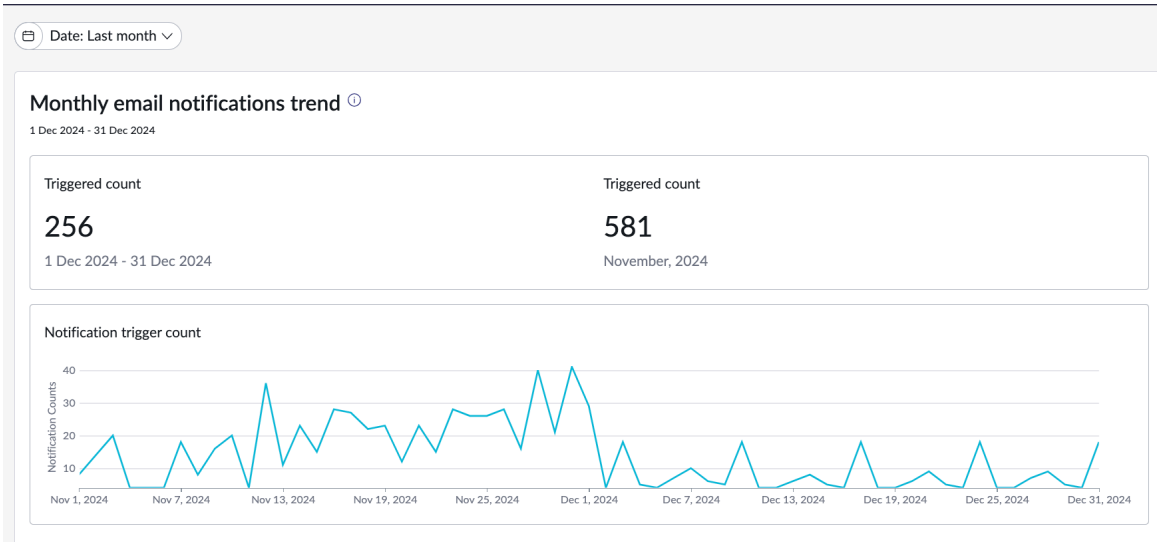
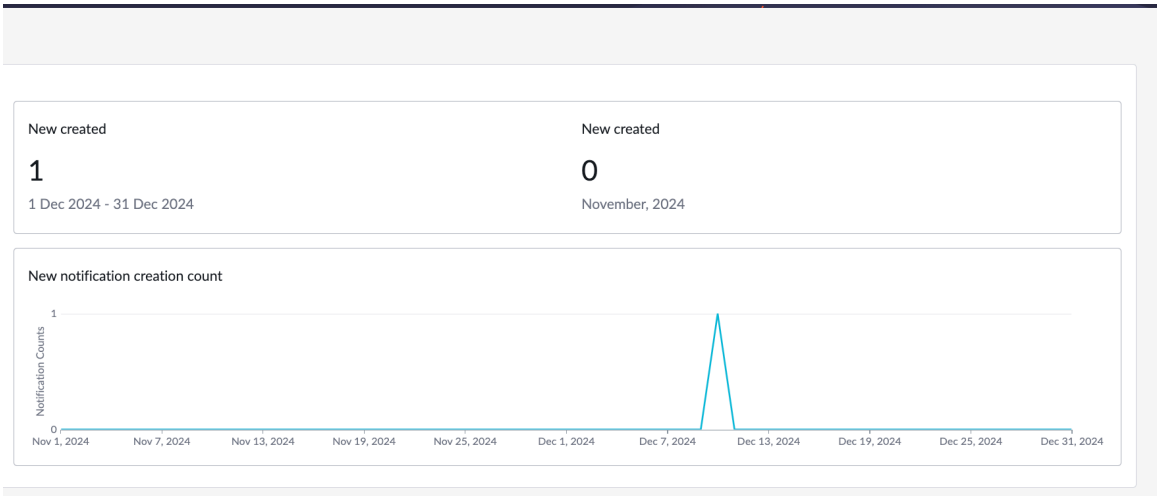
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active notifications



Active notifications shows the number of total notifications where true represents the number of active notifications and false represents the number of inactive notifications.

Notifications trend



Monitor notifications trend on triggered counts and newly created notifications. It shows the trend for the selected time period, comparing the current triggered count to the previous period (for example, the same month or the previous month or quarter). It also provides an overview of how the triggered count has evolved over time, with a graphical representation for better visualization of the trend. You can view the email notification trends by:

- Triggered count

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The top 100 notifications for Most triggered, Last triggered, Most opted-out and Unused notifications can be filtered and viewed by Date, Category, Table, and State.

To view all the email notifications, select **View all email notifications**.

Configure jobs for email notifications dashboard

Configure data collection jobs for the email notification dashboard.

Before you begin

Data collection is triggered by configuring and executing jobs, except **Run as** field all other fields are preconfigured.

Role required: admin or notification_dashboard_admin

Procedure

1. Navigate to **All** > **Platform Analytics Administration** > **Indicators** > **Automated Indicators**.
2. From Indicators, search for **Email Notifications Sent**.
3. Select and open **Email Notifications Sent**.
4. Scroll down and select the **Jobs** tab.
5. Select and open **Daily job to fetch Email Indicator Data and Email Notifications created**.
   a. From the **Run as** field, select the user that has the access to run this job.
   b. Select and hold (or right-click) the form header and select **Save**.
   c. Select **Execute Now**
6. Go back to the **Jobs** tab.
7. Select and open **Job to fetch Historical Email Indicator Data**.
   a. From the **Run as** field, select the user that has the access to run this job.
   b. Select and hold (or right-click) the form header and select **Save**.
   c. Select **Execute Now**
8. Go back to Indicators, search and select **Email Notifications Created**.
9. Scroll down and select the **Jobs** tab.
10. Select and open **temporary job for collecting Email Notifications Created**.
    a. From the **Run as** field, select the user that has the access to run this job.
    b. Select and hold (or right-click) the form header and select **Save**.
    c. Select **Execute Now**
    Once the jobs are completed and the data is collected, the data is visible in the email notifications dashboard.

Email diagnostics dashboard

The email diagnostics dashboards provide visibility in to email delivery metrics that can help in improving the email health by identifying errors and areas that need deeper investigation.

To access Email diagnostics dashboard, navigate to **All** > **System Notification** > **Email** > **Email notifications dashboard** > **Diagnostics**.

Email diagnostics are available in a new tab within the Email Notifications dashboard for admins to track the following areas:

- Bounce management
- Email delivery metrics
- SMTPSender jobs health
- Error metrics and connection status

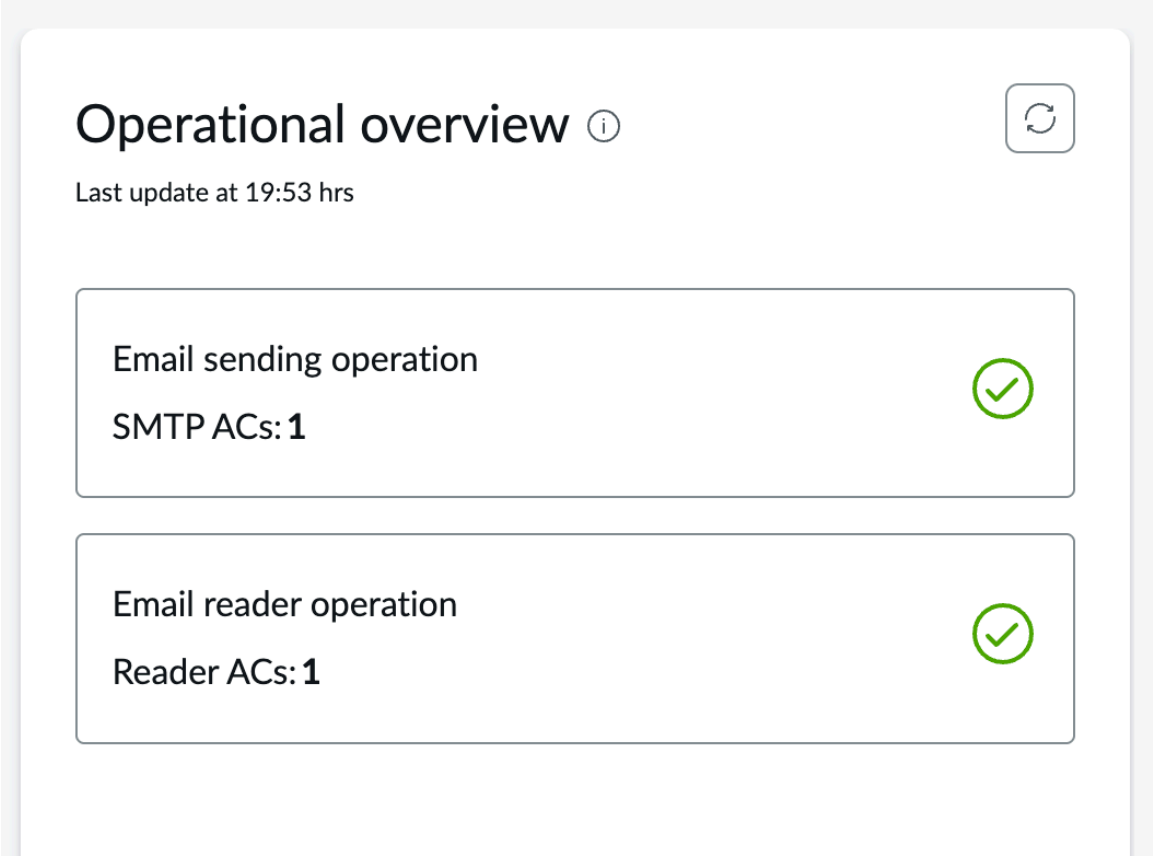
Data is displayed for the last six hours and can be refreshed at any time.

https://player.vimeo.com/video/1123333012?h=6347b03782&badge=0&autopause=0&player_id=0&app_id=58479

Analytics

Analytics provides comprehensive insights into the status and performance of your email metrics and enables you to monitor for all the email-related operations within your instance.

Email health overview



UI component	Description
Email status	Email status is the total count of emails in each status category within the email queue for the displayed time frame.
Bounce management	Bounce management shows the total number of hard and soft bounces received due to delivery failures within the displayed time frame.
Throughput rate	The average number of emails sent per minute during the displayed time frame.
Avg Latency per email	The average time taken to move emails from send-ready state to sent state within the displayed time frame.
Avg Job processing time	The average time taken by an SMTP sender job to complete the email processing within the displayed time frame.
Avg email sending time	The average time taken for an email to be relayed to the SMTP server within the displayed time frame.

Operational overview

The operational overview gives the overview of email sending and reader operations for the displayed time and can be refreshed to fetch the latest updated status.

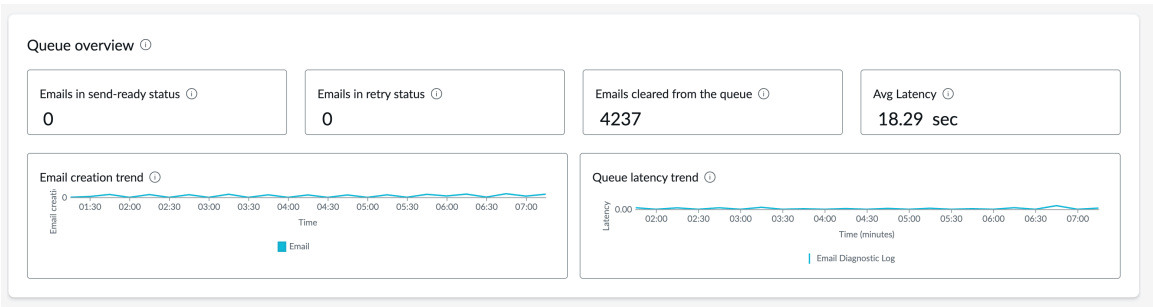
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Operational overview

Queue overview

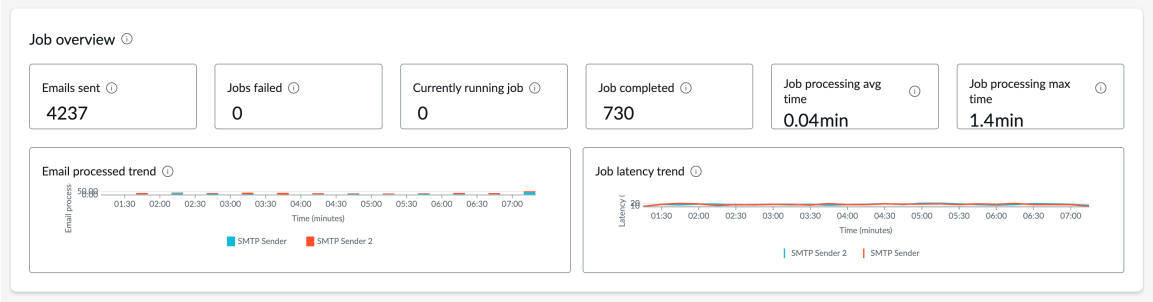
Queue overview gives insights into all email records including the records pending for processing and their status.

Queue overview

Queue overview

UI component	Description
Emails in send-ready status	The number of emails that are ready to be picked up for processing.
Emails in retry status	Then number of emails that encountered delivery failures and are scheduled for reprocessing.
Emails cleared from the queue	The number of emails processed successfully during the displayed timeframe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Queue overview (continued)

UI component	Description
Avg Latency	The average time taken to process each email successfully and move it out of the queue.
Email creation trend	The trend of email records created in sys_email table at various intervals.
Queue latency trend	The average latency trend at various intervals for all jobs within the displayed timeframe.

Job overview

A Job Overview is a consolidated view that displays the status, performance, and metrics, giving administrators and users a quick insight into their operational state. Only processed jobs insights are displayed and jobs that are currently in execution are excluded.

Job overview

Job overview

UI component	Description
Emails sent	The number of emails sent successfully within the displayed timeframe.
Jobs failed	Total number of jobs that failed during execution within the displayed timeframe.
Currently running job	Jobs currently in execution during the displayed timeframe (real-time status).
Job completed	Jobs that completed execution within the displayed timeframe.
Job processing avg time	Average time taken to process emails per job within the displayed timeframe.
Job processing max time	Maximum time taken by a job to process emails within the displayed timeframe.
Email processed trend	Displays the trend of emails processed by all sender jobs within the displayed timeframe.
Job latency trend	Displays the trend of average latency at various intervals for all jobs within the displayed timeframe.

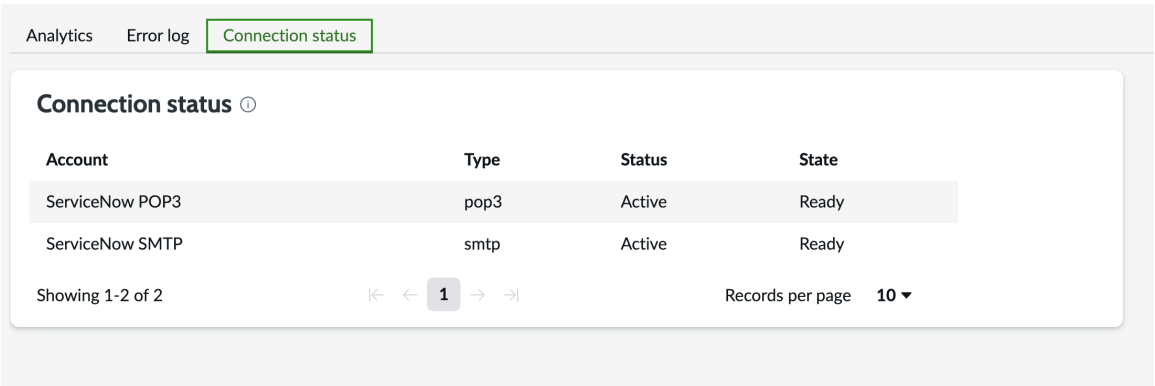
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error log overview

Provides a quick, visual summary of all the errors occurrences, types, and trends to enable quick identification of issues.

Error overview



UI component	Description
No. of errors	Displays total number of errors during the displayed timeframe.
Blocked email addresses	Count of email addresses that are blocked due to bounces during the displayed timeframe.
Hard bounce	Count of hard bounces within the displayed timeframe.
Soft bounce	Count of soft bounces within the displayed timeframe.
Top errors	Displays the top 5 errors with their counts within the displayed timeframe.
Bounce trend	Displays the hard and soft bounces received over the period displayed in the timeframe.

Error Log

An error log captures and provides information about issues, failures, or unexpected events that occur within the instance.

Connection status

Connect status

Connection status displays the real time status of all email accounts configured in an instance.

Email templates

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.

Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.

Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

Create an email template

You can create an email template with rich HTML formatting, rather than plain text.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Notifications** > **Email** > **Templates**.
2. Click **New**.
3. Fill in the form fields (see table).

Field	Description
Name	Enter a unique name for the template. For example, `change.update.risk`.
Application	The type of scoped application.
Email layout	If the message body for the template is to be formatted using a predefined email layout, select the layout.
Table	Select the name of the table involved. For example, **Change Request** `[change_request]`.
Subject	Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the **Select variables** column. For example: `${sys_class_name} ${number} with ${risk} risk has been assigned to you.`
Message HTML	Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the **Select variables** column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. Notes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ When a template is applied to a notification, the contents of this field are used when you select **HTML and plain text** or **HTML** in the **Content Type** field in the Email Notification form. ○ You cannot use HTML code to control the appearance of the contents in the `${comments}` variable. ○ If you want to include a link to the record that triggered the notification, see Enable links to records.
Message Text	Enter the notification message to send in plain text. **Note:** When a template is applied to a notification, the contents of this field are used when you select **HTML and plain text** or **Text** in the **Content Type** field in the Email Notification form.
SMS alternate	Create a different message to be delivered to an SMS device. Enter a brief message, showing the most important information only. If this message field is blank, the contents of the **Message Text** field are used for the SMS message. **Note:** The message in this field is used when the message is sent to a device configured as SMS.

Related topics

Create an email layout

Apply a template to an email notification

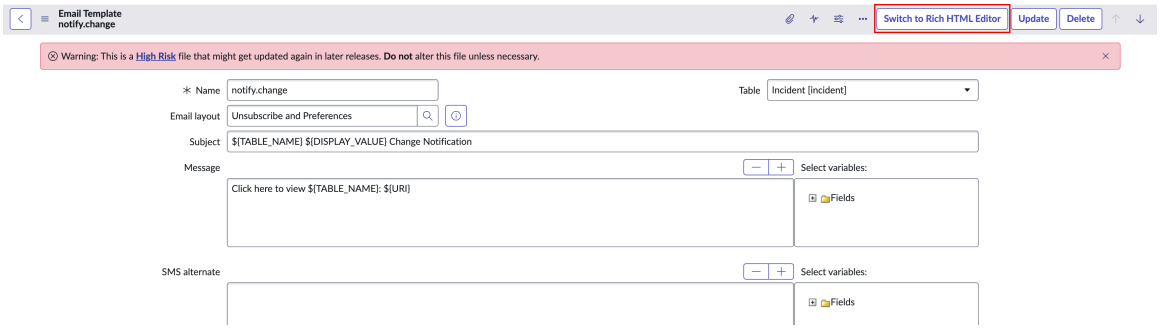
After you create an email template, you can apply it to a notification.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Open the email notification record that should use the template.
3. Navigate to the **What it will contain** section.
4. From the **Email template** field, select the appropriate template.
5. Click **Update**.

Convert an email template to rich HTML

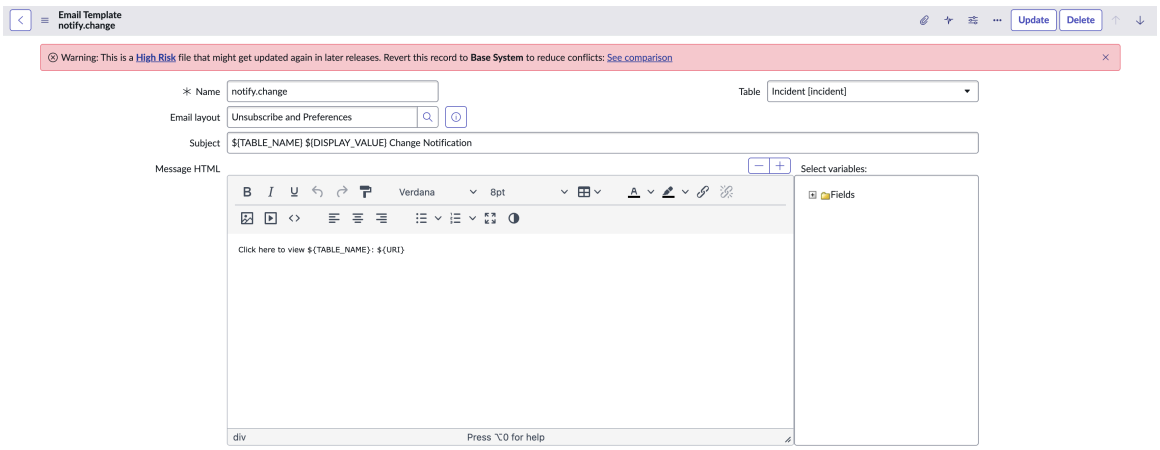


If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Templates**.
2. Open the email template you want to convert.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Switch to Rich HTML Editor**.

   When content is converted, these changes are made to the content:

   - HTML Editor: Any raw HTML in the **Message** field is rendered as WYSIWYG text in the **Message HTML** field. The content can be edited in a feature-rich HTML editor.
   - Simplified Mail Scripts: Any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.

4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

   Note: The letter "P" at the bottom of the screen shows the location of your cursor within the **Message** field. In this case, the cursor is in a line containing an <HTML> tag.

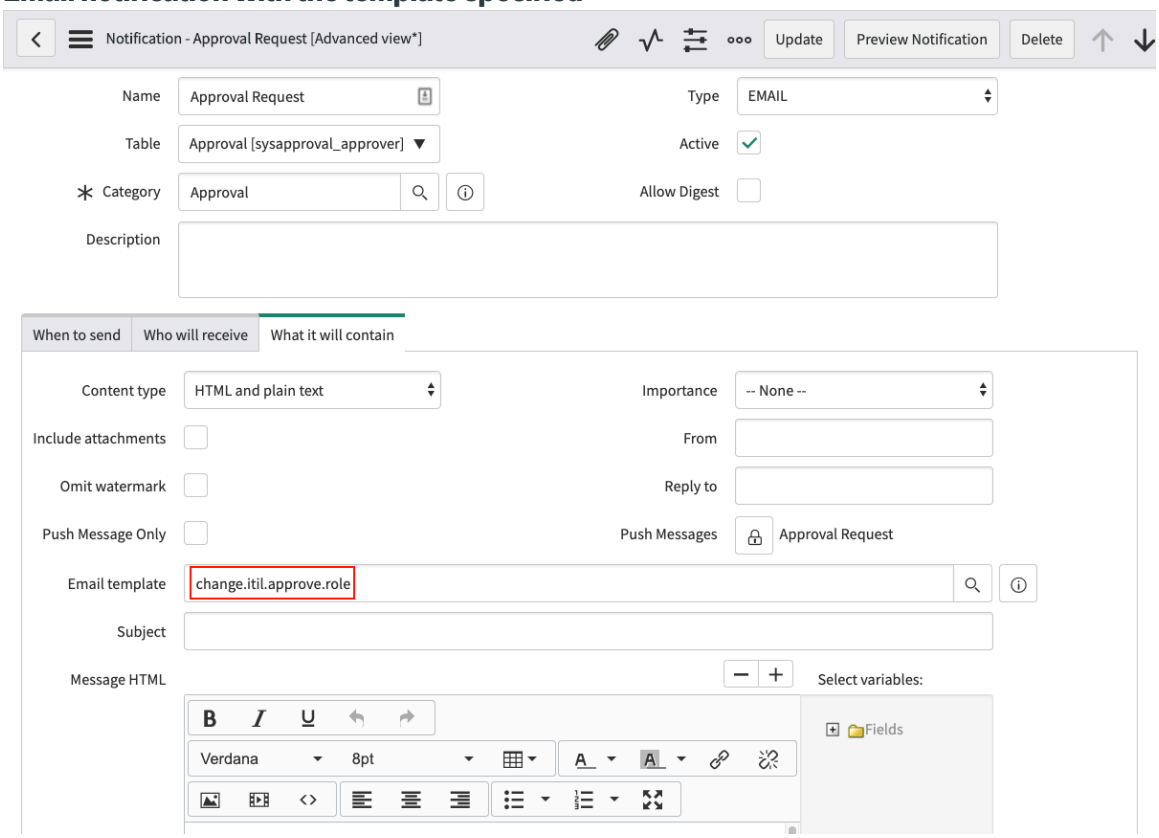
   Note: Email templates that are already formatted with rich HTML do not show the **Switch to Rich HTML Editor** button.

Example:
Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in **System Notification** > **Email** > **Notification Email Scripts**. When the scripts are completed, a `${mail_script:script name}` embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that must be copied and pasted from one template to the next is the embedded script tag.

If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag.



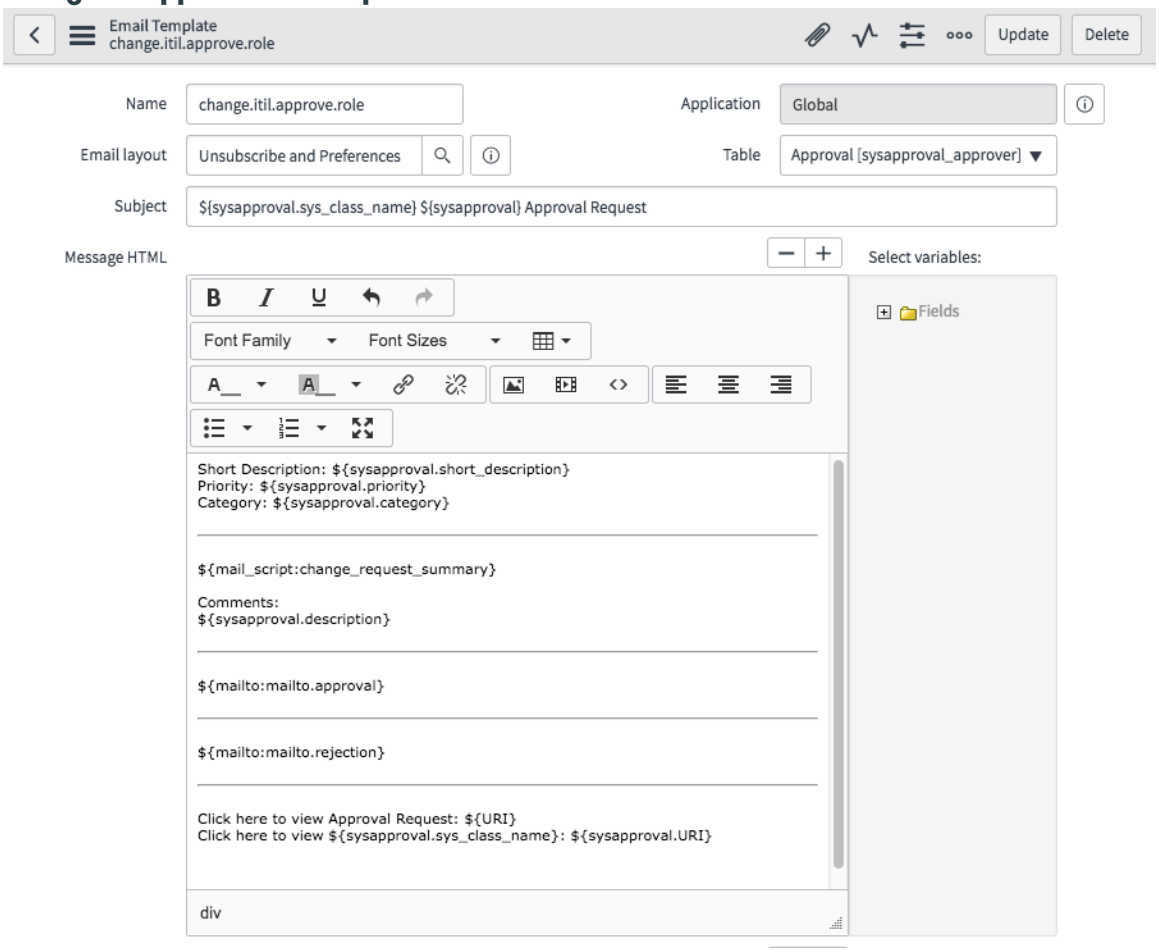
You can view the mail scripts in their original form by opening the email template and clicking the **Show Notification Scripts** related link.

Construct an email message with a template

Email templates provide a list of the fields from database tables that are available for constructing an email message.

An email template can include a **mailto** automatic response link, which enables the email recipient to simply choose a link that sends a preformatted response back to the instance. An example is the email template used for notification that an approval is required. The following example shows the base email:

Email notification with the template specified

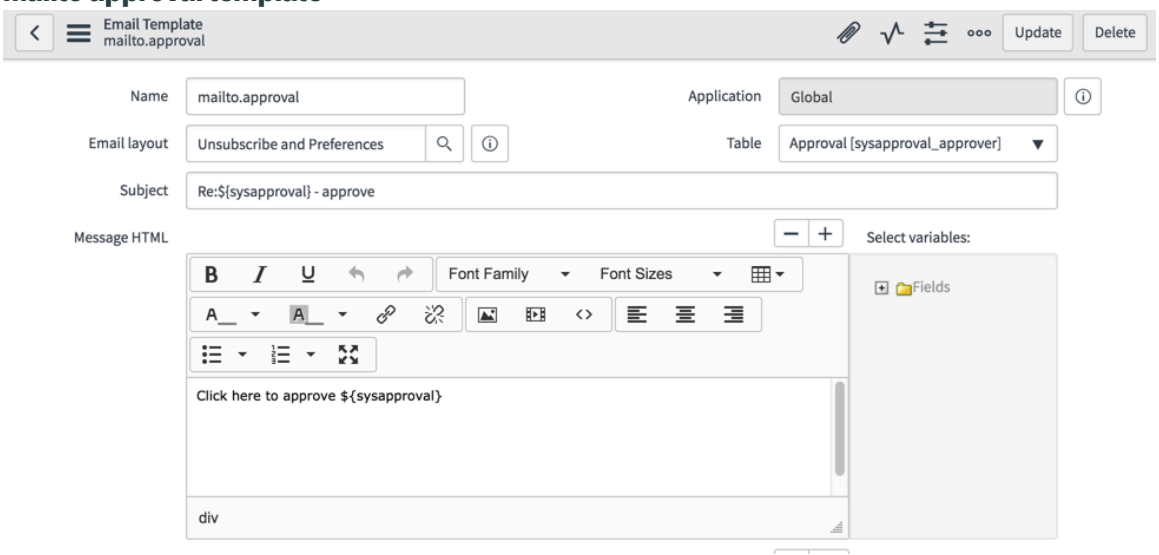


In this case, when a change request approval is requested, an update is made to the `sysapproval_approval` table. The "approval events" business rule is then executed, which creates the "approval.inserted" event. The "Approval Request" email event is defined to process the approval.inserted event, and this email event is defined to use the following change.itil.approve.role email template. Notice that this template has two mailto: items specified. One for "mailto.approval" and one for "mailto.rejection." This email template builds an automatic response that lets the email receiver simply click a link in the email to either approve or reject the change request.

Here is what the **change.itil.approve.role** template looks like using the rich HTML editor:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

change.itil.approve.role template

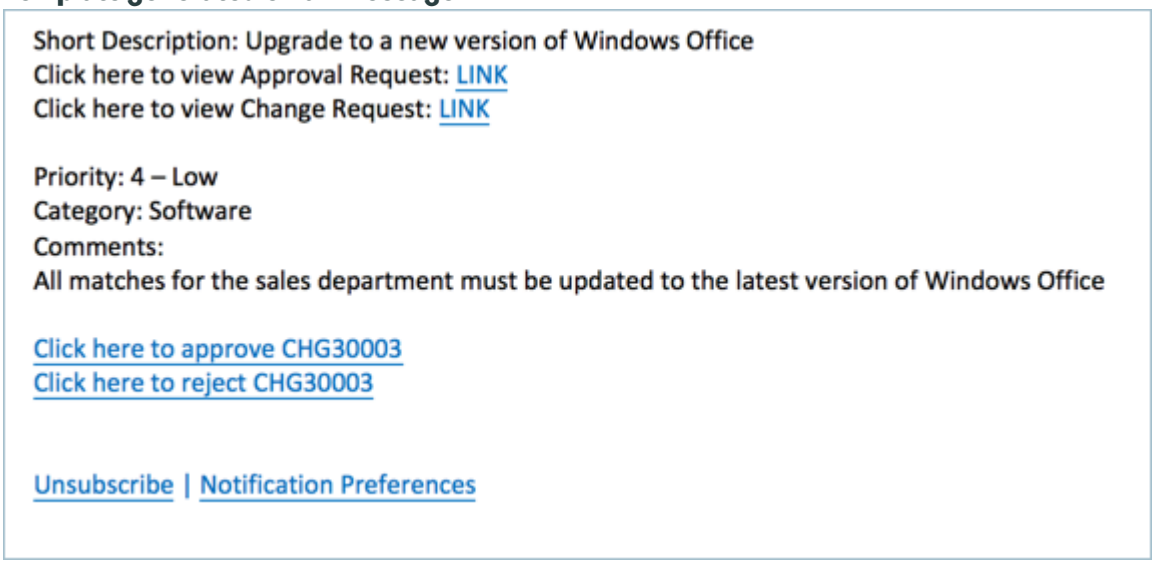


The selection list on the right shows the available fields from the `sysapproval_approver` table.

Notice the **change.itil.approve.role** template also uses a predefined email layout (Unsubscribe and Preferences), which provides links for the recipient to unsubscribe from approval notifications and set notification preferences.

And here is the **mailto.approval** template:

mailto approval template



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you put text on the lines following the **Click here to approve ${sysapproval}** line, this text forms the actual body of the email.

The combination of templates used would generate an email similar to the following example:

Template generated email message

Notice that the email recipient can use the following links in the mail:

- A link to view all the details of the change request
- A link to view the approval record
- A link that generates an automatic email response to approve the change
- A link that generates an automatic email response to reject the change
- A link to unsubscribe from approval notifications and another link to set notification preferences

Related topics

Email layouts

Add blank lines in an email template

You can easily add blank lines in an email template using HTML tags.

Judicious use of these HTML tags can make your email easier to read.

- You can use **
** to insert a line break
- You can wrap paragraphs in ** ... ** tags to format your email nicely.

Calendar integration

With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the **Message Text** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable	Description
${dtstart}	Start Date
${dtend}	End Date
${location}	Location
${alarm_time}	Alert or reminder time

By default, the instance computes the value of iCalendar variables using import and export maps for the Appointment [itil_appointment] and Change Request [change_request] tables. The instance also uses import and export maps for other tables, depending on which plugins you activate. For example, if you activate the Incident (com.snc.incident) plugin, the instance uses the import and export maps of the Incident [incident] table.

Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.

The instance uses the **External Name** value as the variable name in the email template. For example, the icalendar.change_request import export map defines the *dtstart* and *dtend* variables.

External name	Associated variable name	Table	Field mapped	Field label
dtstart	*${dtstart}*	change_request	start_date	Planned start date
dtend	*${dtend}*	change_request	end_date	Planned end date

Map date fields to iCalendar variables

You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the *dtstart* and *dtend* variables in the import export map for the iCalendar invitation.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter `sys_impex_map.list`.
2. Open a map to edit.
3. In the Field Maps related list, click either the **end_date** or **start_date** mapped field to change the mapping for *dtstart* or *dtend*, as needed.
4. Change the **Database** field to the field you want to use to set the start date or end date.
5. Click **Update**.

Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create the custom table and fields using the **Date/Time** field type for the fields that map to the *${dtstart}* and *${dtend}* variables.
2. In the navigation filter, enter `sys_impex_map.list`.
3. Click **New**.
4. Set the following fields:
   - **Name**: Use the following naming convention: `icalendar.<table name>`. For example, **icalendar.u_my_custom_table**.
   - **Table**: Select the custom table you created.
   - **Type**: Select **icalendar**.
5. Right-click the form header and select **Save**.
6. In the Field Maps related list, click **New**.
7. In the Mapping Entry Wizard, select **Mapping to a Database Field**.
8. Create field mappings for *dtstart* and *dtend*.

   Example
   For example, map the **External Name** *dtstart* to the**u_meeting_start_time** field in u_my_custom_table.

   Note: These variables are required.

9. Click **Submit**.
10. Create field mappings for any of the following iCalendar fields as necessary.
    - dstart
    - dtend
    - location
    - alarm_time
11. Click **Update**.

    Here are sample field mappings between iCalendar variables and custom fields in a custom table, u_my_custom_table:

    Sample field mappings

External name	Database field	Type	Map
dtstart	u_meeting_start_time	field	icalendar.u_my_custom_table
dtend	u_meeting_end_time	field	icalendar.u_my_custom_table

12. Create an email template that defines what to include in the iCalendar invitation.

    a. Set the **Table** field to the custom table you created.

    b. In the **Message** text field, use the following format to define the iCalendar invitation.

```
BEGIN:VCALENDAR
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
SUMMARY:${u_meeting_summary}
END:VEVENT
END:VCALENDAR
```

Note: Mail script is not allowed or processed in meeting invitation email templates.

iCalendar invitation template details

iCalendar template line	Required?	Notes
BEGIN:VCALENDAR	Yes	
PRODID:-//Service-now.com// Outlook 11.0 MIMEDIR//EN	Yes	
VERSION:2.0	Yes	
METHOD:REQUEST	Yes	
BEGIN:VEVENT	Yes	
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}	Yes	The ${to} contains the recipients as defined in the notification.
DTSTART:${dtstart}	Yes	You must use the import export map to map dtstart to a start time field on the custom table.
DTEND:${dtend}	Yes	You must use the import export map to map dtend to an end time field on the custom table.
UID:${sys_id}	Yes	You must provide the name of a field that uniquely identifies the record, such as the sys_id or the record number field.
DTSTAMP:${dtstamp}	Yes	
SUMMARY:${u_meeting_summary}	No	To include a summary from a text field on the custom table, provide the name of the field, such as u_meeting_summary. The summary field value must not contain line breaks. You do not need to create a field mapping.
END:VEVENT	Yes	
END:VCALENDAR	Yes

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:

    - **Table**: Select the custom table.
    - **Type**: Select **Meeting Invitation**.
    - **Content type**: Select **Plain text** only.
    - **Email template**: Select the template you created.

Email layouts

Create reusable content for the message body of email templates.

Email layout overview

Administrators can use email layouts to:

- Ensure all email notifications have a consistent layout such as always displaying a header, body, and footer.
- Display static content on all email notifications such as a company logo or a background.
- Declare inline styles available for use in the message body of an email template such as setting a text font, size, and color.
- Provide users with links to common response actions such as unsubscribe from a notification or manage notification preferences.

> **Note:** To display dynamic content such as mail scripts, use email templates. For more information, see Create an email template.

Email layouts insert HTML elements into the message body of email templates. Any style elements you define in the email layout are available to the email template. Email layouts support style sheets in these formats.

- Internal style sheets defined within a `<style>` element.
- Inline styles within a `style` attribute.

By default, the system includes several sample layouts administrators can use to create their own layouts. Administrators can create email layouts using an inline HTML editor or manually entering HTML code. The system stores email layout records in the Email Layout [sys_email_layout] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If there is no content in the notification from either the notification record or the template, the layout won't be applied.

Create an email layout

Create an email layout to specify the HTML content you want to appear in the body of one or more email templates.

Before you begin

- Role required: admin
- Record required: email template record

Procedure

1. Navigate to **All** > **System Policy** > **Email** > **Layouts**.
   The system displays the list of existing email layouts.
2. Click **New**.
   The system displays a blank email layout form.
3. Fill in the form.

Email layout fields

Field	Description
Name	Specify a unique name for the record.
Application	Lists the parent application to which this record belongs.
Description	Specify an optional description of the layout.
Advanced	Select whether to display the **Advanced Layout** field.
Layout	Use the inline editor to add HTML elements. The system displays HTML from this field in the body of any email template that uses the layout. Include notification variables to show content from the related record. For more information notification variables see Notification variables. **Note:** The editor automatically formats any HTML code you enter from the **Source code** view.
Advanced Layout	Use this field to manually enter HTML code. The system displays HTML from this field in the body of any email template that uses the layout. **Note:** To enter text in this field, select **Click here to disable syntax highlighting and script formatting**.

4. Click **Submit**.
   The system creates the email layout record.
5. Navigate to **System Notification** > **Email** > **Templates**.
   The system displays the list of existing email templates.
6. Select the email template which you want to use an email layout.
   The system displays the email template record.
7. In **Email layout**, select the email layout you want to use to format the body of email messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Update**.
   The email template uses the selected email layout to format the body of email messages.

Email retention

You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.

Email retention is available starting with the Helsinki release.

Email archive and destruction plugins

The email archiving and destruction feature uses the Data archiving and Email Retention plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email Retention plugin provides a set of rules that specify when the system archives and destroys email records.

Note: The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.

If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.

Archiving and destroying email records

Archiving means moving records from the Email [sys_email] table to the Archive Email [ar_sys_email] table when they exceed the archive rule time limit. Destroying means deleting records in the Archive Email table when they exceed the destroy rule time limit.

Note: When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

Default archive and destroy rules

Email Retention provides this email archive rule:

Email - Over a year old or Ignored: archives email message records that were created more than 365 days prior to the current date and are of type **received-ignored** or **sent-ignored**.

Email Retention also provides this email destroy rule:

Email Archive - Over a year old: destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

Note: By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.

Note: For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, Email Received section is no longer visible in the work notes though it still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a **Sent Email** section with a link to the email message. If the system archives the email message, the activity formatter removes **Sent Email** section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.

Note: Set the archive time length long enough so your users can access sent emails though the activity formatter.

Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the **In-Reply-To** field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.

Activate Email Retention

The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

Before you begin
Role required: admin

About this task
The Email Retention plugin requires these plugins:

- Data archiving
- System Mailboxes

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Archive email manually

You can archive email messages manually on demand instead of waiting for the instance to archive them based on a scheduled job.

Before you begin
Role required: admin

About this task
Email Retention provides this email archive rule:

You can manually archive email messages that meet these archive rules or any additional archive rules that you create.

Note: An archive record must be active for the instance to be able to process records with it.

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Rules**.
2. Open the email archiving rule that you want to modify.
3. Select **Recalculate Archive Estimate** to see how many records in the Email [sys_email] table are going to be archived.

   Note: The estimate appears in the **Record estimate** field.

4. Select **Run Archive Now**.

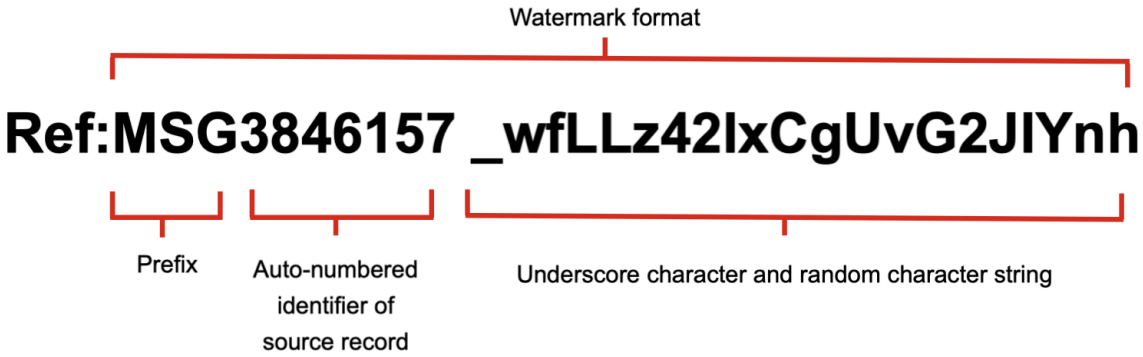
   Note: You can also Create an archive rule.

Watermarks on notification emails

By default, a unique watermark label will be generated at the bottom of each notification email to allow matching incoming email to existing records.

Starting with the Jakarta release, randomized watermarks will be automatically generated for notification emails in base systems. The random character string succeeded by an underscore reduces the possibility of a watermark being guessed or coincidentally matching the watermark of an email from another instance.

Note: If you are upgrading from a release before Jakarta, random watermark support is optional and requires the Random Watermark Support plugin to be activated.



Watermark format

The email watermark always begins with "**Ref:**" to identify the label as a watermark. After this identifier, the default label is 31 characters in length and consists of:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A customizable prefix — The default prefix is **MSG**.
- An auto-numbered identifier — The numeric string identifying the source record, such as incident, problem, or change request.
- An underscore character followed by a random character string.

Randomized watermark example

When inbound emails are processed, the system matches random watermarks to the appropriate source records.

Watermark configuration

Watermarks are always generated, but you can configure them as follows:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Use custom prefix characters after MSG.
- Hide all email watermarks globally.
- Omit watermarks from individual email messages.

If watermarks are omitted from email notifications, inbound email actions might not work properly. Without a watermark, the system processes inbound email messages as described in Criteria for matching email to inbound actions.

Note: Email clients that use the plain text version of the email still show the watermark.

Create a custom watermark prefix for email notifications

By default, email notifications use the watermark prefix **MSG**, but you can create a custom watermark prefix.

Before you begin

Role required: admin

About this task

Any email notifications that are forwarded from one instance to another might be more easily distinguished with different prefixes for each instance. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.

Note: Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Number Maintenance**.
2. Open the **MSG** record in the Email Watermark [sys_watermark] table.
3. Enter the unique **Prefix** for this instance.
4. Click **Update**.

Result

Your custom watermark applies to all new email notifications. Email notifications that existed before you created a custom watermark keep the same watermarks as before.

Omit an email notification watermark

You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Select the email notification to update.
3. Click the **Advanced View** related link.
4. In the **What it will contain** section, select the **Omit watermark** check box.

What to do next

When incoming email does not contain a watermark, the system searches the subject line and message body for a record number. The system attempts to match any record number that it finds to an existing record. If there is a matching record number, the system updates the record with the values in the incoming email. To ensure that response email messages don't update records, remove the record number variable `${number}` from the **Subject** and **Message HTML** fields.

Hide email watermarks globally

Rather than omitting watermarks, it is possible to hide watermarks for global application using HTML markup.

Before you begin

Role required: admin

About this task

Watermarks can only be hidden in the HTML message for the global application. The text version of the message, because it does not have markup allowing show/hide semantics, will always have the watermark.

Procedure

1. In the **Filter Navigator**, enter `sys_properties.list`.
2. Select **New** to create a new property.
3. In the **Name** field, enter `glide.email.watermark.visible`.
4. From the **Type** drop-down list, select **true | false**.
5. In the **Value** field, enter false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Submit**.

   This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

Parse an email thread

When an email is received, parse the most recent message in an email thread by creating **Email Reply Separators** using specified string or regular expressions.

Before you begin

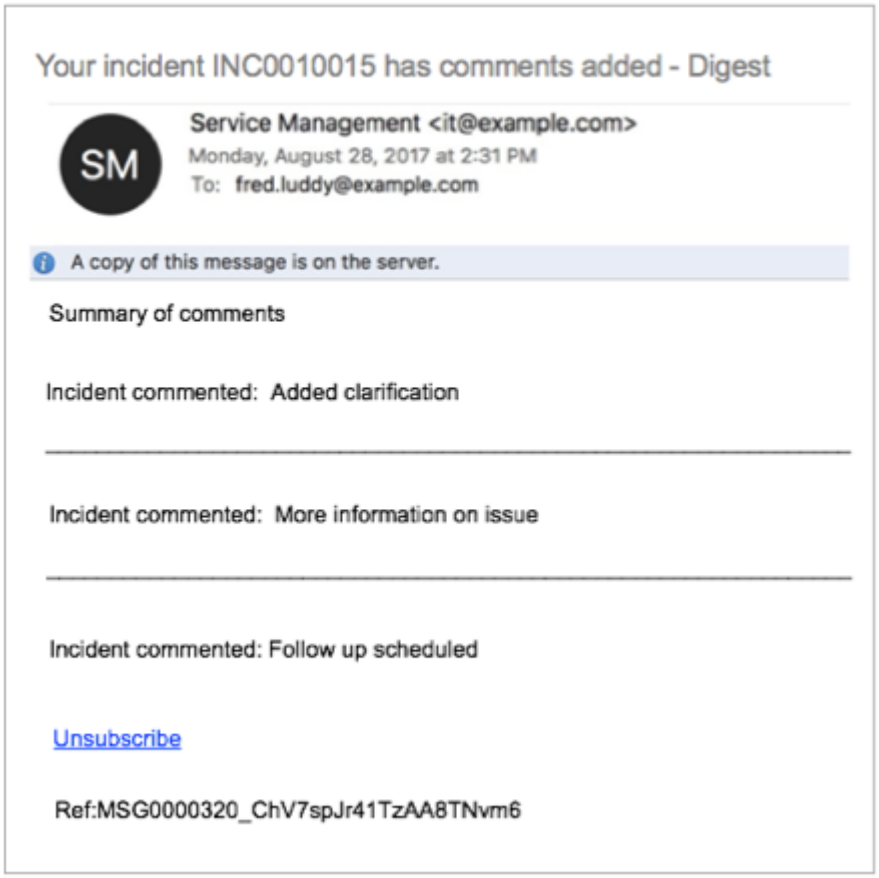
Role required: admin

Procedure

1. Navigate to **All** > **System Policy** > **Email** > **Email Reply Separators**.
   A list of email reply separators shows up.
2. Click **New** to create a new email reply separator.
3. On the **Email Reply Separator** form, fill in the fields.

Fields	Description
Name	Name of the separator.
Application	Scope of the separator.
Active	Option to activate the separator.
Type	Type of separator. ○ String: Searches for the specified string to parse out an email thread. ○ Regex: Searches for the specified regular expression to parse out an email thread. **Note:** Complex regular expressions may take time to evaluate the email thread. In such cases, the regular expression evaluation is timed out after 10 seconds and skipped for that regular expression and the email processing is continued.
Order	Priority of the separator.
Separator	Separator value based on the selection of the **Type**.
Short description	Description about the separator.
Language	Language of the reply separator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Fields	Description
	Note: All email clients don't indicate a language, so all active reply separators are applied to locate a separator in the email message.

4. Click **Submit**.

Email digests

An email digest is a single email that summarizes the activity for a selected notification and its target records during a specified time interval. You can enable an email digest to reduce the number of notifications received when frequent updates to the associated records occur within a short time period.

Example email digest

Note: Email digests apply to email notifications only and are not supported for SMS messages, push notifications, and activity streams.

How email digests work

In new and upgraded instances, the Email digest (com.glide.email_digest) plugin is activated by default. Your instance must use the Core UI interface, since the email digest feature involves setting user notification preferences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Admins determine which notifications can be delivered in an email digest and configure the digest content for those notifications. They also set the intervals for digests. An interval is the length of time that notifications are collected for the digest, such as daily or hourly.

Users enable the digest and select the digest interval for a specific notification in their notification preferences. The system accumulates the notifications that normally would be sent during the specified interval and summarizes them in the email digest.

When processing an email digest, the system:

- Stores the digest configuration for the notification in the Notifications [sysevent_email_action] table.
- Temporarily stores the notification content accumulated for a user in the Email Digest Parts [sys_email_digest_part] table and the Email Digest Part Users [sys_email_digest_part_user] table.
- Runs an email digest job every 15 minutes to check when a digest is ready to be sent to a user.

  The system uses the digest interval to determine when the digest is ready to be sent. The digest interval begins when the first notification is triggered for the user and stops at the end of the interval time.

- Sends the email digest to the user soon after the selected digest interval ends.

  For example, if a user selects an hourly digest interval and the first notification is triggered at 08:15, the interval starts at 08:15. When the digest interval ends, the system generates the email digest approximately one hour later, at about 09:15 or shortly after, depending on when the email digest job ran.

Set up email digests

What to do — admins

1. Review the base system digest intervals and if needed, create or modify intervals.

   The base system digest intervals are one day (24 hours), one hour, every four hours, and seven days (weekly).

2. Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

   When determining which notifications are appropriate for an email digest, consider the notification content and intervals that your users can select. For example, digests that can be generated weekly might be better suited for notifications that are non-urgent.

What to do — all users

For a notification that can be delivered in an email digest, enable the email digest in your notification preferences (**Notifications** tab in the System Settings window). You also specify the interval time that the notifications are accumulated.

Next step

If you are an admin, begin the digest setup process by reviewing the base system email digest intervals and create or modify the intervals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create or modify email digest intervals

Admins can create or modify the email digest intervals (length of time) during which activity for a selected notification is accumulated in an email digest. Users select a digest interval when they enable an email digest in their notification preferences.

Before you begin

Role required: admin

About this task

Before adding an email digest interval, review the base system digest intervals in the Digest Intervals [sys_email_digest_interval] table. You can modify intervals, including the base system intervals, which are one day (24 hours), one hour, every four hours, and seven days (weekly).

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Digest Intervals**.

Action	Description
To add an interval	Select **New**.
To modify an interval	Select the interval to be changed.

2. Enter the new or changed interval information:

Field	Description
Name	Interval name that describes the interval length of time, for example: Every 2 hours.
Interval	Length of the interval, either number of **Days** or **Hours** (hours, minutes, and seconds). The minimum time length allowed is one hour, and the maximum time length allowed is seven days (one week).

3. If you created an interval, select **Submit**, or if you changed an interval, select **Update**.
   The system updates the Digest Intervals [sys_email_digest_interval] table with the new or modified interval. The digest interval is listed as an option in the notification preferences (From your user profile, navigate to **Preferences > Notifications** when a user enables a digest for the notification.
4. To delete an interval, select the interval to be deleted in the Digest Intervals [sys_email_digest_interval] table and select **Delete**.

   Note: If the interval is in use, the system does not remove the interval.

What to do next

Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure email digests

Use the Notification form to create or modify the content of an email digest for a notification. You can also disable the email digest for a notification so that it isn't available in the notification preferences of your users.

Before you begin

Role required: admin

About this task

When you create or update a notification, use the **What Digest will contain** tab of the Notification form to configure the email digest for the notification. After you define the digest content, the digest option for the notification is available in the notification settings of your users.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.

Action	Description
To create a notification	Select **New** to open the Notification form.
To modify a notification	Select the notification to be changed.

2. In the Notification form, select the **Allow Digest** check box to display the **What Digest will contain** tab and define the digest content.
3. Select the **Digest type**.

Digest Type	Description
Single target record	Allows this notification to be sent in an email digest when it is triggered multiple times dur ing the selected interval for a single target record, for example INC001 only.
Multiple target record	Allows this notification to be sent in an email digest when it is triggered multiple times dur ing the selected interval for a multiple target record, for example INC001, INC002, and more.

4. **Optional:** To enforce a notification as digest, select the **Enable by default** check box.
5. Select the **Default Interval**.
6. Select the **What Digest will contain** tab.
7. Fill in the fields. in the **What Digest will contain** tab.
   The image shows the default view of the tab. The advanced view contains additional fields (see table).

Field	Description
Digest Template	If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Digest Subject	Enter the subject line for the email digest. The subject can include variables from the **Select variables** column. If empty, the system uses the **Subject** value from the **Email template**. If you enter a value in this field, it overrides the template value. **Note:** For email digest with multiple target records enabled, it's recommended to use a subject text without any dynamic variables.
Digest HTML	Enter the recurring content for the email digest. The digest content can include variables from the **Select variables** column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. To prevent adding extra `<p>` and `<div>` elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the ServiceNow Community.
Digest Separator (HTML)	Use the line to separate each item summarized in the digest.
Digest From	Enter the email address to be used in the From field of the email digest. For example, helpdesk@yourcompany.com. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.
Digest Reply To	Enter the email address that you want people to use when replying to the email digest. For example, helpdesk@yourcompany.com. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.
Digest Text	Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to **HTML and plain text** or **Plain text only**.
Digest Separator (text)	[Optional] Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to **HTML and plain text** or **Plain text only**.

8. When you finish creating the notification, select **Submit**.
   The email **Digest** option is displayed in the notification settings of your users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The email recipients identified in the **Who will receive** tab will receive the digest after they enable the digest in their notification preferences. If the user isn't a designated recipient for the notification, a digest isn't generated even though the user may have the digest enabled for a notification. In this case, the user receives the actual notifications when they're generated.

9. **Optional:** To disable the email digest for a notification, unselect the **Allow Digest** check box and select **Update** when you finish your changes to the notification.
   When you disable the digest content, the digest option is also no longer available for the notification and isn't listed in the notification preferences for your users. If a user previously enabled the digest option for the notification, the system stops collecting those notifications for a digest and doesn't generate the digest.

   Note: If you turned off the digest and want to make the digest available again, select the **Allow Digest** check box. The system retains the previously saved digest content and displays it in the **What Digest will contain** tab.

Email digests

Create or modify email digest intervals

Enable an email digest in Core UI

Enable email digest in Next Experience

Reduce the number of email notifications you receive by enabling email digest notifications. An email digest is a single email that summarizes the activity for a selected notification and its target record during a specified time interval.

Before you begin
Role required: none

About this task
Notifications do not include the option to be received as an email digest by default. Only admins can create an option to enable email digest for a selected notification.

Procedure

1. From the user profile, navigate to **Preferences** > **Notifications** and then select **Advanced Preferences**.
2. Select **System Notifications**.
3. Expand the notification.
4. Enable **Email Digest** and select the digest interval in which you want to receive the notification communication.

Enable an email digest in Core UI

Reduce the number of notifications you receive for a selected target record during a specified time interval by enabling an email digest. The digest is a single email that collects individual notifications for a targeted record generated during the specified interval. The email digest of two different target records will not be clubbed in a single email.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The email digest option is available only if your admin configured email digest content for that notification.

Procedure

1. Select the gear icon () in the banner frame to open the System Settings window, and select the **Notifications** tab.
2. Select the notification:
   a. In the Notifications By Category section, select the row or right arrow (**>**) of the category that you want to view.
   b. In the list of notifications for the category, select the row or right arrow (**>**) next to the notification that you want to edit.
3. To enable or disable an email digest for the notification, if an email digest is available:
   a. Select the **Email Digest** switch.
   The email digest is enabled when the switch is green and disabled when the switch is grey.
   b. If you enabled the digest, select the **Interval** (length of time) during which the notifications are accumulated.

   The digest interval begins with the first occurrence of notification activity. For example, if you select the daily (1 Day) interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day.

Soon after the interval ends, the system sends the email digest to you instead of sending the individual notifications generated during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications for the digest and does not send the email digest. The system resumes sending the notifications as they are generated.

Apply notification conditions

Email digests

Configure email digests

Multilingual email notifications

Using multilingual email notifications, you can send email notifications in the recipient's preferred language and can easily manage notification content in different languages.

Email notification translation

You can customize email notifications for users across multiple regions based on their preferred language. For example, a recipient whose language is set to French will receive notification emails in French, while a German requester would be notified in German.

Two types of translations are available for email notifications:

- Static translation

  Customize email notifications for recipients across multiple regions based on their preferred language. With static translations, the translation request goes to a translator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Dynamic translation

  Customize email notifications automatically for users across multiple regions based on their preferred language.

You can also send emails using a combination of both static and dynamic translation. For example, if an email has to be sent in English, French, Spanish, and German and the translated templates for French and Spanish already exist, then the dynamic translation will only happen for German.

User preference for email translation

The preferred language set is honoured when the property is set to true. To set user preference for email translation:

- Set the *glide.email.translation.honour.user_preference* property to `true`.
- Navigate to **User menu** > **Preferences** > **Language & region**, select and set the preferred language.

Groups

If there is no group email ID, a notification triggered for a group with multilingual recipients can send a group email to different people with different language preferences.

If there is a group email ID, an email is sent in a single language to all the recipients in the group. The recipient's preferred language is not considered.

Email notification translation plugins

Activate the glide notification translation plugin to send multi-lingual emails based on the recipient's preferred language. The localization framework plugin is activated by default along with the Glide notification translation plugin.

Activate the translated email retention plugin to archive emails.

Activate Glide Notification Translation

You can activate the Glide Notification Translation plugin (com.glide.notification.translation) for Notifications if you have the admin role.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Glide Notification Translation plugin (com.glide.notification.translation) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Translated Email Retention

You can activate the Translated Email Retention plugin (com.glide.email_retention.translation) for Notifications if you have the admin role.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Translated Email Retention plugin (com.glide.email_retention.translation) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Static translation

Using static translation, you can customize email notifications for recipients across multiple regions based on their preferred language.

About static translation for email notifications

Author localized content for the various content fields on notifications, email templates, and email layout forms using static translation after activating the translation plugin.

For static translation, the translation request goes to a translator. The translator provides translations for notification content in different languages.

Not all of the fields on the notification forms are translatable.

Translatable fields

Table name	Translatable fields
Email Notification	Subject, message, message_html, and message_text

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Translatable fields (continued)

Table name	Translatable fields
Email Template	Subject, message, message_html, and message_text
Email Layout	Layout

Note:

- The static content that needs to be translated in mail scripts must be present inside **gs.getMessage()** and translations for the strings must be available in the Message [sys_ui_message] table.
- You can stop the translation of tokens by creating the *glide.email.outbound.static_translation.session.language.change.enabled* system property and setting it to false.

Localization Framework

Use the Localization Framework settings to request translations for the following artifact configurations:

- Email Layout Configuration
- Email Notification Configuration
- Email Template Configuration

Related topics

Request a translation for an email notification, template or layout

Enable static translation

Enable static translation of notifications for the global application.

Before you begin

Role required: admin

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
Name	Name for the system property, which is `glide.email.outbound.static_translation.ena`
Application	Application for the system property. **Global** applies the system property to all applications when the system property is set to true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description displayed in the System Properties list.
Choices	Description displayed in the System Properties list.
Type	Type of system property, either true or false.
Value	Value for the **Type** selected, which should be set to true.
Ignore cache	Option to ignore the cache.
Private	Option to keep the system property private.
Read roles	Roles that can read the system property.
Write roles	Roles that can modify the system property.

4. Select **Submit**.

Request a translation for an email notification, template or layout

Request a translation to send an email in the recipient's preferred language.

Before you begin

An email notification must exist. For more information, see Create an email notification.

You must activate the Glide Notification Translation (com.glide.notification.translation) plugin.

The Localization Framework settings should be configured to request the translation for the artifact configurations and add languages.

Role required: admin

About this task

Notification recipients must be defined as active users in the User [sys_user] table and have a valid email address defined for their primary channel (device) in the Notification Device [cmn_notif_device] table.

Procedure

1. Navigate to the email item for which you want to request a translation.
   - For notifications, navigate to **All** > **System Notification** > **Email** > **Notifications**
   - For templates, navigate to **All** > **System Notification** > **Email** > **Templates**.
   - For layouts, navigate to **All** > **System Policy** > **Email** > **Layouts**.

   Note: Static translation is not supported for email notifications of type **Meeting Invitation**.

2. Select the item you want to translate from the list.
3. Select **Request Translation** and select the languages to translate into.
4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dynamic translation

Using dynamic translation, you can customize email notifications automatically for users across multiple regions based on their preferred language.

About dynamic translation for email notifications

Dynamic content notifications are user-specific. You can use dynamic translation to translate notifications automatically based on the language selected by the recipient.

For example, a requester whose language is set to French will automatically receive notification emails in French, while a Spanish requester would be notified in Spanish.

Using dynamic translation involves the following tasks:

1. Activate Dynamic Translation
2. Set system property for dynamic translation
3. Enable dynamic translation

After dynamic translation is enabled, you can send emails and view or preview the translated email in the preferred languages of the recipients by accessing the **Translated Email Contents** tab.

Note: The language preference of users mentioned in **cc** and **bcc** fields is not considered.

Enable dynamic translation

Enable dynamic translation of notifications for the instance.

Before you begin

Role required: admin

You must activate the Glide Notification Translation (com.glide.notification.translation) plugin.

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Select **New**.
3. On the form, fill in the fields.

Enable dynamic translation form

Field	Description
Name	Name for the system property, which should be `glide.notifications.translation.dynamic`.
Application	Application for the system property. **Global** applies the system property to all applications when the system property is set to **true**.
Description	Description displayed in the System Properties list.
Choices	Description displayed in the System Properties list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	Type of system property, which should be **true | false**.
Value	Value for the **Type** selected, which should be. `true`.
Ignore cache	Option to ignore the cache.
Private	Option to keep the system property private.
Read roles	Roles that can read the system property.
Write roles	Roles that can write the system property.

4. Select **Submit**.

Configure the note banner for translated emails

Configure the content for a translated email note banner displayed at the top of the page to display a customized message to the recipient.

Before you begin
Role required: admin

Procedure

1. Enter `sys_properties.list` in the navigation filter.
2. Search for and select the properties to configure and customize the note banner.

System property	Description
glide.email.translation.dynamic.note.display.body	Displays the message as a header for the translated email html body.
glide.email.translation.dynamic.note.text	Adds the message to the text body of the translated email body text.
glide.email.translation.dynamic.note.style	Applies CSS styles to the note.

Note: If you want to disable the note banner, set the *glide.email.translation.dynamic.note.enabled* system property to false.

Enable dynamic translation for email notifications

Enable dynamic translation for a notification to send dynamically translated emails to recipients in their preferred language.

Before you begin
An email notification must exist. For more information, see Create an email notification.

You must activate the Glide Notification Translation (com.glide.notification.translation) plugin.

Set the system property for the dynamic translation. For more information see, Enable dynamic translation.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Notification recipients must be defined as active users in the User [sys_user] table. They must also have a valid email address defined for their primary channel (device) in the Notification Device [cmn_notif_device] table.

Procedure

1. Navigate to **All** > **System Notifications** > **Email** > **Notifications**.
2. Select the name of the email notification you want to send.
3. Select the **What it will contain** tab.
4. If **Advanced view** is not already selected, select it.
5. Select the **Enable Dynamic Translation** check box.

What to do next

Preview email notifications

Domain separation and Notifications

Domain separation is supported in the Notifications application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation is specifically supported in Notifications but not in email accounts. Notifications are not data-separated but they are process-separated. Notifications are also triggered by specific actions.

Note: Subscription-based notifications are not domain aware and cannot support domain-specific settings.

How domain separation works in Notifications

There are two basic components of domain separation and Notifications.

- Notifications are process-separated (not data-separated).
- Notifications are triggered in two main ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. When a record is Inserted or Updated

   Notifications with matching conditions AND in the same domain and global domain as the inserted/updated record are processed.

2. When an event defined in the notification is triggered
   a. Events typically have a target record. For example, [incident.inserted] event references the incident record being inserted.
   b. When an event is fired, notifications configured for that event in the same domain and global domain as the event's target record are processed.

Domains and email accounts

Domain separation is not supported in email accounts for these reasons:

1. Sending mail: There is only one SMTP sender per account. This prohibits providing domains for each account, and they are not configurable.
2. For receiving Inbound mail: You can set up multiple email accounts but cannot meaningfully set the domain of an inbound email action. Inbound Actions are processed in the domain of the user who sent the email. For example: User_A in Domain A sends an email to a ServiceNow email account which executes the "Create an incident" inbound email action. The resulting new incident created by the inbound action is in Domain A.

To learn more see Inbound email actions.

Note: If the number of email accounts exceeds 20, reception of email slows down.

Use case

If an instance is using the Domain separation plugin and a new email notification is defined for a domain that has the same event as the notification on the global domain, the user receives two emails for the same event.

Solution: Set the [sys_overrides] field on the notification that belongs to the domain so it overrides the setting on global. For more information, see Delegated administration.

Domain separation for service providers

Email FAQs and troubleshooting notification emails

Logs and diagnostics are provided to help determine whether notification emails are being sent and received successfully, what any issues are, and who receives the email.

Diagnostics help monitor the overall health of the system and troubleshoot general problems, such as not receiving any incoming mail. Logs help identify problems with individual emails, and different logs are useful for diagnosing different types of problems.

Log checking scenarios

Problem	Log
Need to check whether an individual notification email was successfully sent	Check the **Sent** System Mailbox for that email. Also check the **Failed** System Mailbox for failure notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem	Log
Individual email failed	• Check the message log of the individual email. • Check the **Error string** field of the email record. ⚠ **Warning:** Some email servers do not return error strings
Email not received by end user	• Check the **Junk** System Mailbox for notifications about returned emails. These emails also appear in the Emails log with a **Type** of received-ignored. • Check the **Error string** field of the email record. ⚠ **Warning:** Some email servers do not return error strings • Check the message log of the individual email for the reasons different recipients were included or excluded.

Email FAQs

Troubleshooting resources

See the following resources on troubleshooting inbound and outbound email problems.

Error or symptom	Solution
Inbound Email FAQ	See KB0957760.
Instance not receiving inbound email	See Inbound email troubleshooting, ServiceNow KB0524472 and KB0520595. These KB articles also provide links to a video series on troubleshooting inbound emails.
Instance not sending outbound email	See Troubleshooting Outbound email, ServiceNow KB0521382. This KB article also provides links to a video series on troubleshooting outbound emails.
Email from Outlook produces an empty Incident record containing an attachment named winmail.dat.	Configure the local Outlook client or Exchange server not to send Rich Text formatted (RTF) data to the instance.
Emails are getting set to type send-	See KB0790932.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Error or symptom	Solution
ignored for no obvious reason	
Duplicate emails generated by the instance	See Troubleshooting duplicate emails generated by the instance, KB0529413.
SMTP Sender Job Stuck	See SMTP Sender Job Stuck > 30 Mins alert, KB0755061.
Connection to smtp.office365.com failed	See KB0825391.
IMAP with OAuth error AUTHENTICATE failed	See KB0963959.
Error connecting the POP email account on secure port	See KB0829289.
Inbound email processing is stuck alerts	See KB0855277.
Email Reader / SMTP Sender job stuck	See KB0679998.
Email Reader Job stuck/running for more than 2 hours alerts	See KB0755063.
SMTP retries	The SMTPSender job is responsible for sending emails from the instance and at times there can be delivery failures during transmission. Emails that aren't successfully delivered might need retries. Exponential back-off retries is a mechanism to redeliver them in the interval (1, 5, 10, 20, 40, 60, 120, 120) between the retries. The exponential retries continue until the lookback period mentioned in the *glide.email.smtp.claim.lookback.hrs* system property is lapsed. The retries are attempted for 4xx status codes and for all other status codes such as 5xx are considered as permanent failure. The *glide.smtp.fail_message_ids* and *glide.smtp.defer_retry_ids* system properties aren't considered. Retried emails type is set to **send-retry-backoff**.

Exponential back-off retries

Emails that aren't successfully delivered might need retries. Exponential back-off retries is a mechanism to redeliver them in the interval (1, 5, 10, 20, 40, 60, 120, 120) between

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the retries. The exponential retries continue until the lookback period mentioned in the *glide.email.smtp.claim.lookback.hrs* system property is lapsed.

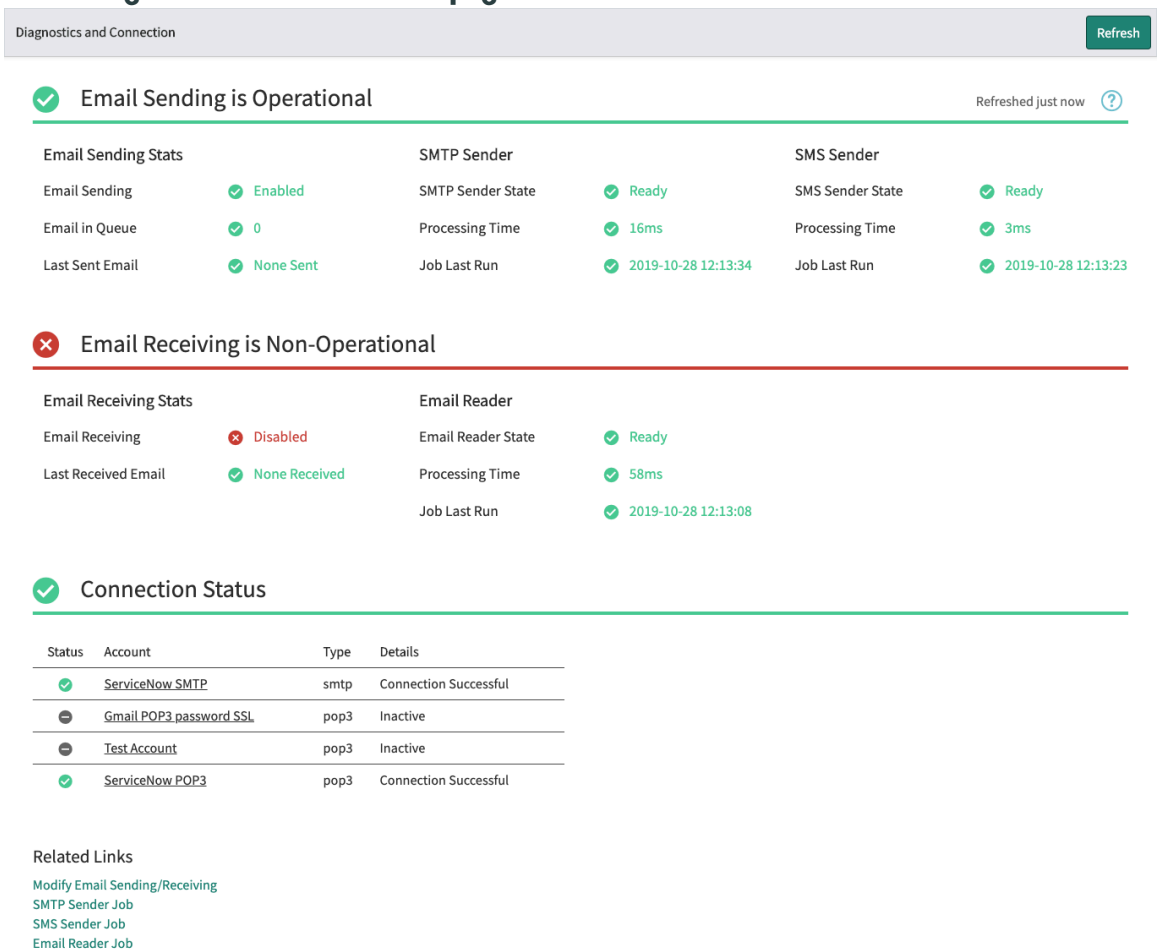
The retries are attempted for 4xx status codes and fail for 5xx status codes during the email delivery. The *glide.smtp.fail_message_ids* and *glide.smtp.defer_retry_ids* system properties aren't considered.

Retried emails type is set to **send-retry-backoff**.

Note: Address validation errors that occur during the email delivery are handled differently. The type of email record is set to **send-retry-delayed** and the email delivery is retried in fixed intervals of 30 minutes until the lookback period is lapsed.

Email diagnostics

The Diagnostics and Connection page provides information on the current state of your email configuration. This page includes status on email properties, scheduled jobs, and email account connections that affect how your instance receives and sends email.



Email diagnostic information can help you identify problems with inbound or outbound email. The following video shows different steps to determine why your instance is not receiving inbound emails. One of the steps uses email diagnostics to check the email connection status and email reader scheduled job.

Navigate to the Diagnostics and Connection page from either of these modules:

- **System Mailboxes** > **Email Diagnostics**
- **System Diagnostics** > **Email Diagnostics**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email Diagnostics and Connection page

For quick status on a field, point to the green check mark or red X icon. The check mark icon indicates that the item is operational or healthy, while the X icon indicates that the item is not operational or within the expected range.

Mail diagnostics

Diagnostic	Description
Email Sending is [Status]	
Email Sending	Status of outbound email as either **Enabled** or **Disabled**. To change the status, click the **Modify Email Sending/Receiving** related link, and in the Email Properties form, update the *`Email sending enabled`* property.
Email in Queue	Number of email messages that are ready to be sent.
Last Sent Mail	Date and time the last email message was sent.
SMTP Sender State	Current state of the SMTP Sender job, which sends email on a recurring schedule. By default, this job runs every minute. To update the SMTP Sender state, click the **SMTP Sender Job** related link, and in the Schedule table, open the SMTP Sender record to be changed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mail diagnostics (continued)

Diagnostic	Description
SMTP Processing Time	Duration of the last SMTP Sender job run. This value should be shorter than the SMTP Sender interval.
SMTP Job Last Run	Date and time when the SMTP Sender job last ran.
Default SMTP Status	Indication of whether the SMTP connection was successful, shown only if the email accounts feature is active. Click **Default SMTP** to change your SMTP account settings.
SMS Sender State	Current state of the **SMS Sender** job, which sends SMS notifications on a recurring schedule. By default, this job runs every minute. To update the SMS Sender job, click the **SMS Sender Job** related link, and in the Schedule table, open the SMS sender record to be changed.
SMS Sender Processing Time	Duration of the last **SMS Sender** job run. This value should be shorter than the **SMS Sender** interval.
SMS Sender Job Last Run	Date and time when the **SMS Sender** job last ran.
Email Receiving is [Status]	
Email Receiving	Status of inbound email as either **Enabled** or **Disabled**. To change the status for email receiving, click the **Modify Email Sending/ Receiving** related link, and in the Email Properties form, update the *`Email receiving enabled`* property.
Last Received Email	Date and time the last email message was received.
Email Reader Status	Current state of the email reader job, which downloads any email waiting on the mail server and creates email.read events. To update the Email Reader Status job, click the **Email Reader Job** related link, and in the Schedule table, open the email reader record to be changed.
Email Reader Processing Time	Duration of the last reader job run. This value should be shorter than the reader interval.
Job Last Run	Date and time when the reader job last ran.
Connection Status	
{Accounts}	The result of the test connection to the accounts. The connection is tested every time you load the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs

System email log and mailboxes

The system email log records all emails that the instance creates or receives. System mailboxes are filtered views of this log.

Every notification email that the instance creates or receives is recorded in an Email [sys_email] record. You can navigate to a log of these records at **System Logs** > **Emails**.

The System Mailboxes are filtered views of the Emails [sys_email] table. The instance assigns an email record to a system mailbox depending on the values of the **Type** and **State** fields. For more information, see System mailboxes.

The following fields can be included in the layout of the system log and any of the system mailboxes:

Email log

Field	Description
Mailbox	The system mailbox that lists this email record. The instance sets the value of this field according to the values of the **Type** and **State** fields.
State	The current state of the email (Error, Ignored, Processed, or Ready).
Receive type	The type of inbound email (None, Forward, New, or Reply).
Type	The status of the email. Choices are: • received: The server received this email. • received - ignored: The server received this email, but it was ignored by the instance for inbound email action purposes. Typically, these emails are either spam or auto-replies. See the Error String field for details. • send - failed: The server has attempted to send the email and failed. See the Error String field for details. • send - ignored: The server skipped sending this email. Typically, this is for an email which was generated but lacked a recipient email address or is a duplicate email. See the Error String field for details. • send - ready: The email is ready to be sent, but has not been sent out by the mail server. Typically, an email remains in this state for only a short time. • send - translation - ready: The email is generated during email translation and sent out. Typically, an email remains in this state for only a short time. • sent: The email was sent by the instance without any errors or issues.
Target	A Document ID reference to the record if the email is generated by an insert, update, or delete of a particular record.
User	The name of the user, from the user record, of the instance from which the email notification was sent. **Note:** This is a string field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email log (continued)

Field	Description
Notification Type	The type of notification. Choices are: • None • SMS • SMTP
UID	The unique ID of the email stored on the server.
Created	The date and time of the email activity for the locale of the machine running the instance.
Deleted	For inbound email, indicates whether the email was deleted from the email server.
Weight	The weight of the email, which determines the sending priority relative to other notifications on the same table.
Importance	An indication that the email was sent with a changed level of importance, such as Urgent.
Originating Event and Notification	For emails generated by notifications, an embedded list that stores the event and notification that created the email.
Subject	The email subject. For notifications, you create the subject text in **System Notification** > **Email** > **Notifications**.
Error String	The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.
Recipients	The email addresses of the recipients.
Body	The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.
Content type	The email content type.
Headers	Any headers embedded in the email.

Message logs for individual emails

The email log entries for an individual notification email are accessible as a related list in the email record. The **Error string** field in the email record can provide additional information.

Every email record contains an **Email Log** related list. This list shows the Email Log Entry [syslog_email] records. For troubleshooting purposes, the most useful fields are probably **Level** and **Message**.

To diagnose problems with outbound emails, also examine the **Error string** field in the email record. However, not every receiving email server sends back an error string.

Note: The Email Log Entry record is available for only 7 days after the email record is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inbound actions on received emails

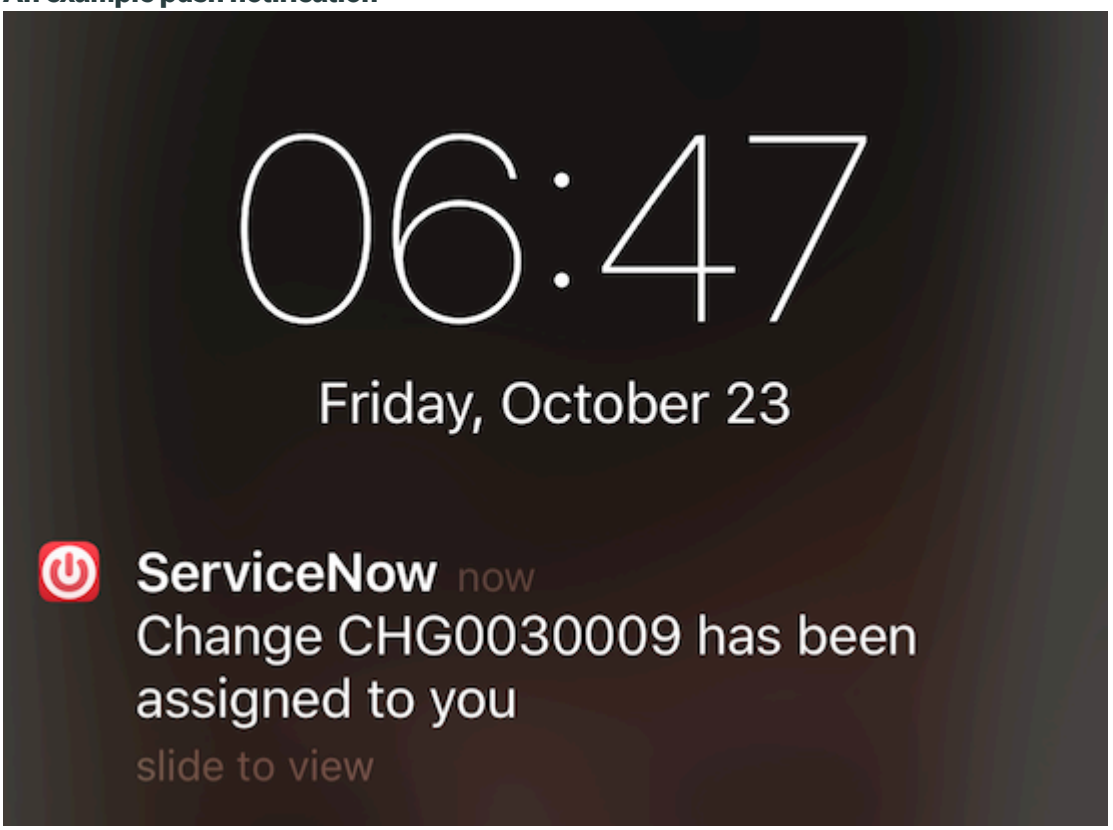
Check these logs as the first step to diagnose issues with inbound actions. The logs show which inbound action did or did not apply and for what reason.

Note: If an inbound action did not update any field on the target record, the log indicates that the inbound action was skipped.

Reasons for including or excluding recipients

For outbound notifications, the email system log provides reasons that recipients were included or excluded.

Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.



A series of system properties can be used to fine-tune the information to be logged. Two properties, *glide.notification.recipient.include_logging* and *glide.notification.recipient.exclude_logging*, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.

Push notifications

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices.

A push notification is a text message that appears on a user's mobile device to alert them about something important or to ask them to perform an action. Your instance supports push notifications.

An example push notification

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by acting on the related records. For example, you can have the instance send an approval request for a Change to a user. You can let the user approve or deny the Change by clicking a response button on the push notification. The user's response can then update the status of the Change record.

You can set up push notifications in a similar manner to email and SMS notifications. Determine:

- who to send the notification to
- when it should be sent
- what it should contain

The ServiceNow mobile app is available as ServiceNow Classic and as Mobile Agent. By default, ServiceNow Classic supports push notifications, but you can also develop your own push application and configure your instance to send push notifications to it. For more information on setting up push notifications in Mobile Agent, go to Mobile push notifications.

Push notification setup

Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see: Push notification setup with a custom push application for ServiceNow mobile apps. If you create your own application, you must understand how push notifications and the Apple Push Notification Service system work. For more information, see the APNs Overview in theLocal and Remote Notification Programming Guide for Apple developers.

Important: Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the Local and Remote Notification Programming Guide for Apple developers.

Push notification system

The push notification system involves several key elements that manage the delivery of push messages and push notification responses.

Customer instance

Your ServiceNow instance.

Push proxy

An instance that collects all push notifications that go to the ServiceNow Classic mobile application and forwards them to the ServiceNow applications for Apple iOS or Android. If you create a custom push application, you do not use the push proxy.

Push provider

The provider of push messages, which is the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service, for the ServiceNow Classic mobile app or custom mobile apps.

Push application on a mobile device

The application, such as the ServiceNow Classic mobile application. You can also build and customize your own push application.

Push notification process

The push notification process is as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Activity on the instance triggers a push notification.
2. The instance looks for who to send the notification to and checks the user notification preferences to find their push device settings.
3. The instance sends the push notification to the push notification service, either the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service. If you are using the ServiceNow Classic mobile app, the instance sends the notification through a push proxy instance, which then forwards the notification to the APNs or FCM service.
4. The push notification service sends the notification to the user's push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID. This information ensures that a response to the notification is sent back to the correct instance. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.
5. The instance identifies a script to run to handle the response.
6. The script performs an action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

Push notification system with the ServiceNow Classic mobile app

Push notification responses

With custom push applications, you can have your users act on records in the instance by responding to a push notification.

The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

```
https://{instance_name}/api/now/v1/push/{application
 Name}/action/{action}
```

The application name is the push application the user is using. The application name must match the application name in the Push Application [sys_push_application] table. The action is the Sys ID of the action in the Push Notifications Actions [sys_push_notif_act_script] table.

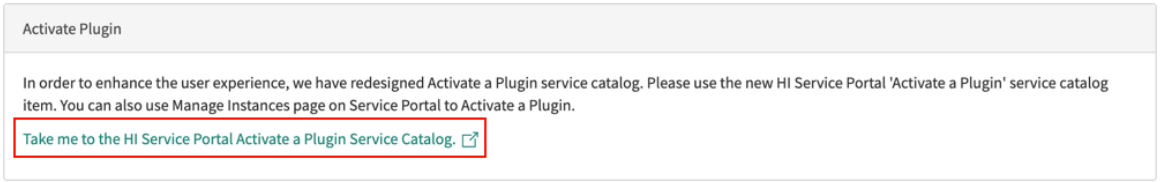
Activate push notifications

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.glide.ui.m) plugin active, push notification plugins are automatically activated.

Before you begin

Role required: admin

About this task



Ensure the following plugins are active on your instance:

- Push Notification: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- Notification System Push Addon: Adds support for push notifications to the existing notification system.
- Push Feedback: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the request form on Now Support.
3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.

4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the form, fill in the fields.

Activate Plugin request form

Field	Description
Target Instance	Instance on which to activate the plugin.
Plugin Name	Name of the plugin to activate.
Specify the date and time you would like this plugin to be enabled	The date and time must be at least two business days from the current time. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/ Comments** field.
Reason/Comments	Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.

7. Select **Submit**.

Enable push notifications for logged-out users

Enable push notifications for users when they're logged out to deliver timely critical updates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important: Avoid including sensitive information or actionable notifications in push notifications sent to logged-out users.

Role required: admin

Procedure

1. Install the Send Push Notifications to logged-out users (com.glide.push.logged_out.users) plugin.
   This is a maint-only plugin. Request the plugin through the Now Support Service Catalog.

   a. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.

   b. Select **Request plugin**.

   c. On the form, fill in the fields.

   Activate Plugin request form

Field	Description
What is your target instance	The instance that you want to activate the plugin on.
Plugin Name	The value should be set to `Send Push Notifications to logged-out users (com.glide.push.logged_out.users)`.
Select Maintenance Date and Time	The date and time to activate the plugin.

   d. Select **Submit**.
   After the Now Support maintenance window timeframe, the plugin will be installed on your instance.

   e. **Optional:** Confirm the installation by viewing the applications listed in the **Installed** tab in the Application Manager.

2. Navigate to **All** > **System Notification** > **Push** > **Push Notifications**.
3. From the list of notifications, select the notification that you want to enable for logged-out users.
4. In the form, select the **Push to inactive users** check box.
   If the **Push to inactive users** check box is not visible, configure the form layout. For more information, see Configuring the form layout.
5. Select **Update**.
6. **Optional:** Configure the number of days users can receive notifications after they log out.

   a. Navigate to **All** and enter `sys_properties.list` in the navigation filter.

   b. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the form, fill in the fields.

System Property form

Field	Value
Name	`com.glide.push.logged_out.users.threshold_`
Type	String
Value	The number of days up to which you want users to receive notifications after they log out. The default value of this property is 10.

d. Select **Submit**.

Installed with push notifications

Several types of components are installed with the push notifications plugins.

Tables installed with push notifications

These tables are installed with push notifications.

Table name	Description
Push Applications [sys_push_application]	Push applications registered to the instance to receive push messages.
Push Default Registrations [sys_push_notif_default_reg]	Contains all the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.
Push Feedbacks [sys_push_feedback]	Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or on a central instance that uses a REST call to tell your instance which push applications to deactivate.
Push Message Attribute Definitions [sys_push_notif_msg_attr_def]	The attribute definitions used for push message content specification.
Push Message Attribute Values [sys_push_notif_msg_attr_val]	The values associated with push messages.
Push Notifications [sys_push_notification]	The push notifications that the instance attempted to send to users.
Push Notification Actions [sys_push_notif_act_script]	The action scripts that the instance uses in response to an actionable push message.
Push Notification Installations [sys_push_notif_app_install]	The devices with push apps where users agreed to receive push notifications. This table lists the records by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Description
	are created in this table when a user logs on an instance with the push app. The Mobile Devices [sys_mobile_devices] table, which is installed with the Mobile UI plugin, contains all the user devices that logged in to the instance with the ServiceNow mobile application.
Push Notification Messages [sys_push_notif_msg]	Messages customized for push notifications. These messages can be associated with a notification.
Push Notification Message Contents [sys_push_notif_msg_content]	The entire content, including JSON, for push messages.
Push Platforms [sys_push_platform]	The platforms that are supported for push notifications, and the maximum payload size.

Business rules installed with push notifications

These business rules are installed with push notifications.

Business rule	Table	Description
Build Device and Subscriptions	Push Installation [sys_push_notification_installation]	Automatically creates a notification device on a user's notification preferences when the user registers a mobile application with the instance.

Outbound REST messages installed with push notifications

These outbound REST messages are installed with push notifications.

REST message	Description
ServiceNowMobileApp Push	The REST message that you can use with your custom iOS mobile app.

Roles installed with push notifications

These roles are installed with push notifications.

Role	Description
push_admin	Can create and modify push notifications.

Push components installed with push notifications

These components are installed with push notifications.

Push applications installed with push notifications

Push application	Description
ServiceNowPushApp	The push application record for the ServiceNow ServiceNow mobile application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push applications installed with push notifications (continued)

Push application	Description
	Note: The ServiceNow mobile app automatically subscribes users to several push notifications. You can see the list of these notifications in the Push Default Registrations related list on the ServiceNowPushApp application record.

Message content installed with push notifications

Message content	Description
ConnectMessageContent	The payload for ServiceNow connect messages.
Generic Approval (Background)	The payload that provides an approval and rejection option to the user receiving the push message.
Generic Approval (Foreground)	The payload that provides an approval and rejection option to the user receiving the push message.
Generic Record Payload	A generic payload that you can use to send push messages to users.

Push notification actions installed with push notifications

Push notification action	Description
Approval - Approve	Allows an administrator to approve a request.
Approval - Reject	Allows an administrator to reject a request.

Push notifications installed with push notifications

Push notifications	Table	Description
ConnectMessagePushNotification	Live Feed Message [live_message]	Sends a push notification when a new live feed message

Push notification properties

Push notifications provides several properties to customize the setup.

Add these properties to the System Properties [sys_properties] table.

`glide.push.apns.version`

Controls which version of the Apple Push Notification service (APNs) to use in your instance. You can use APNs version 1 or 2. The system uses APNs version 2 by default. To use APNs version 1 instead, set the value to **1**.

- Type: integer
- Default value: 2

`glide.push.debug`

Creates entries in the system log for push notification errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: true | false
- Default value: false

glide.push.enabled

Enables or disables push notifications.

- Type: true | false
- Default value: true

glide.push.feedback.debug

Creates entries in the system log for feedback sent by the APNs for custom iOS push applications.

- Type: true | false
- Default value: false

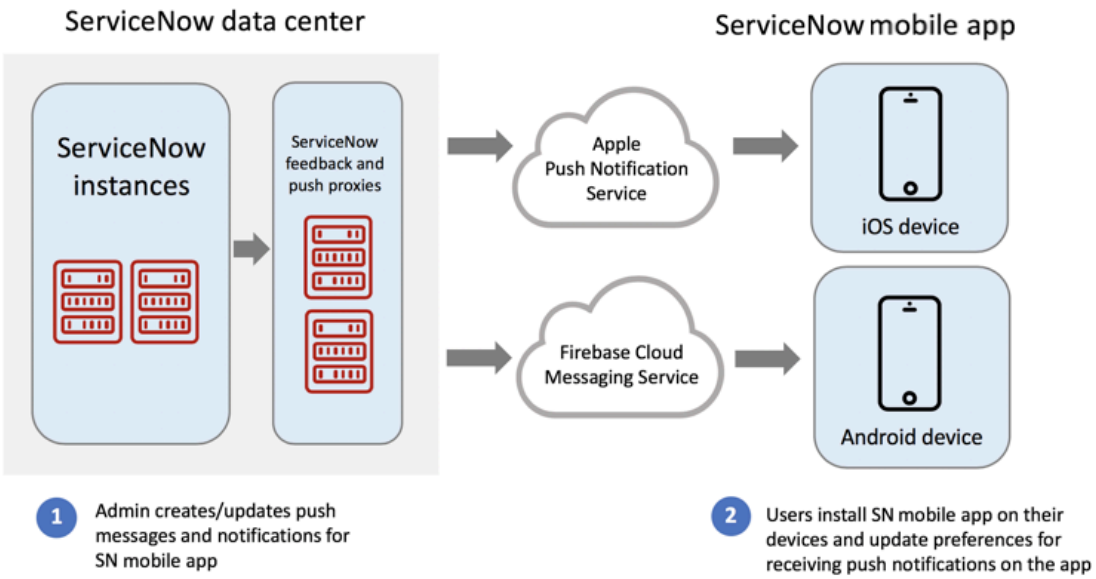
glide.push.notification.ttl_seconds

Specifies the number of seconds after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the Push Notifications log for more information.

- Type: integer
- Default value: 21600

Push notification setup with the ServiceNow mobile app

The ServiceNow mobile application automatically enables push notifications and configures mobile devices for push notifications when users initially log in to the instance.



Note: Push notifications with the ServiceNow mobile application are not supported in on-premise instances.

Setting up push notifications involves both the system administrator and users.

- Admin creates or updates push notifications for the ServiceNow mobile app. The admin does not need to set up the mobile devices for users nor update their user preferences for receiving push notifications.
- Users install the ServiceNow mobile mobile on their iOS or Android mobile devices and set their preferences for receiving notifications on the ServiceNow mobile app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push notification setup tasks for the ServiceNow mobile app

What to do — admins

Admins create push notifications, similar to setting up email notifications. A push notification has two main parts: the push message and the notification, which includes the push message.

Note: The push message and notification must be for the same table.

Create the push message

Before creating a push notification, create the push message with the actual message content (JSON payload) to be included in the push notification.

Create the push notification that includes the push message

Create the push notification that includes the push message and message content. A push notification specifically sends the push message. You can update a standard platform notification and use it as a push notification that includes the push message.

Add the new push notification to the Push Default Registration table

To ensure that a new push notification is included and enabled in the notification preferences of your users, register a new push notification in the Push Default Registration table. The notification is listed in the notification preferences of your users the next time that they log in to the ServiceNow mobile app.

What to do — ServiceNow mobile app users

Download the ServiceNow mobile app

Install the ServiceNow mobile app on an iOS or Android mobile device.

Agree to accept push notifications

After installing the ServiceNow mobile app, users are asked to accept push notifications. When the instance receives the push notification acceptance message from a user, it creates a record in the Push Notification Installations [sys_push_notif_app_install] table. This record is what the instance uses to identify the device + mobile application combination necessary to identify a push notification recipient.

The device then performs the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Obtains a token that identifies the device.
- Triggers the creation of the device in the user notification preferences.

Log in to the company instance from the ServiceNow mobile app

Logging in automatically subscribes users to the push-specific notifications registered in the Push Default Registration table.

Update preferences for receiving notifications on the ServiceNow mobile app

Users can enable and disable through **Notification Settings** in the ServiceNow mobile app. They can set additional notification preferences, such as conditions or filters that affect notification delivery, by using the System Settings window on a desktop or mobile browser. For details, see Setting notification preferences in Core UI.

Next steps

If you are an admin, review the base system notifications and determine if new push message content and push notifications are needed.

Create a push message

Before you create a push notification, create the push message with the actual message content for the notification.

Before you begin

The Push notification plugin must be active. The plugin is active by default.

Role required: admin

About this task

The push message and notification must be for the same table.

Procedure

1. Navigate to **All** > **System Notification** > **Push** > **Push Messages** and select **New**.
2. Fill out the fields on the form (see table).
3. Select **Submit**.

Push Notification Message form fields

Field	Description
Name	Enter a descriptive name for the message.
Push App	Select the ServiceNow mobile application.
Push Message Content	Select the JSON content to be included in the push notification payload. For example, you can specify predefined button pairs (Yes/No, Approve/Reject, Accept/Decline) as part of the push message content.
Message	Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Related list	
Push Message Attribute Values	Optional. Select the attributes that apply to this notification. For details, see Create an attribute value or action for a push message.

What to do next

Set up the push notification that contains the message created or update an existing push notification to use the push message.

Create a notification using a push message

Email administrators can create a notification that specifically sends a push notification.

Before you begin

Configure the push message before performing these steps.

Role required: admin

About this task

You can associate a push message with a standard notification. A push message specifies the text the system sends as part of the push notification to the mobile device.

Procedure

1. Navigate to **All** > **System Notification** > **Create Push Notification**.
2. Fill out the notification form as necessary (see Create an email notification for descriptions of the form fields.
3. Select the **What it will contain** tab.
4. Next to **Push Messages**, select the lock icon and select a push message.

   Note: The push message and notification must be for the same table.

5. Select **Submit**.

   If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.

What to do next

Add the push notification to the Push Defaults Registrations table so that the push notification is listed in the notification preferences for users. Users can then select which notifications they want to receive for the ServiceNow mobile app.

Add a push notification to the Push Default Registrations table

After you create a new push notification, add it to the Push Default Registration table. Push notifications registered in this table are listed and automatically enabled in the notification settings of your ServiceNow mobile app users.

Before you begin

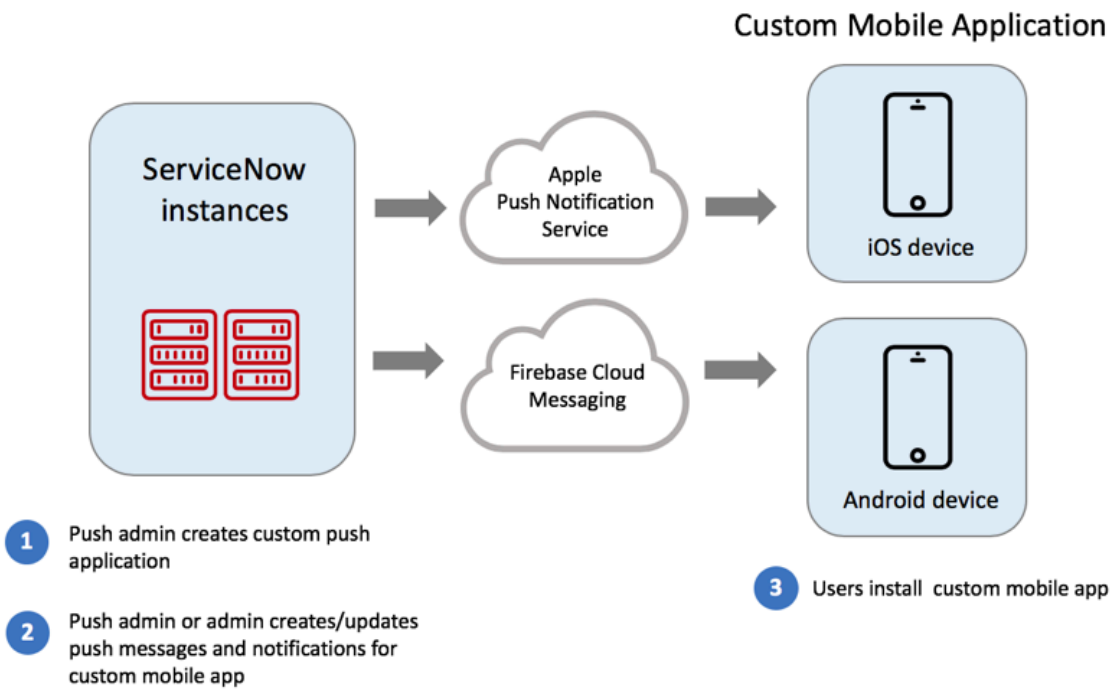
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Notification** > **Push** > **Push Application**.
2. Select the **ServiceNow Mobile Application**.
3. In the Push Application form for the ServiceNow mobile app, select the **Push Default Registrations** tab and click **New**.
4. In the Push Default Registration New record, select the notification to be registered.
5. Click **Submit**.
   The next time that users log in to their instance, the new push notification is included in their list of notifications.

Push notification setup with a custom push application for ServiceNow mobile apps



If you are using your own custom mobile or push application, you must configure your app for use and set up the push contents.

Setting up a push notification infrastructure that uses a custom push app involves a push admin (also called push app developer or mobile app developer) and system administrator. When push admins create a customized push app, they also configure the app, its push message content (payload generators), and optional attributes, such as push action scripts. The admin creates and updates the push notifications for the custom push app. After users install the custom push app and initially log in to their instance from their mobile device, the system automatically creates a device (channel) for the custom app.

Note: These instructions are intended for users who develop their own customized push application. You do not need to configure the ServiceNow mobile push application.

This process describes configuration used in the ServiceNow mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

Push notification setup tasks for a custom push app

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Complete the steps in Activate push notifications.

Assign the push_admin role to your organization's mobile app developer.

What to do — push admin

Configure push notifications for your custom push app. This process differs for iOS and Android devices.

1. (iOS only) Upload a push certificate to your instance

   Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

2. Create a push application record for your custom app

   Register your customized mobile application with your instance to receive push notifications for the application. The instance uses this push application record to identify the device + push application combination necessary to determine a push notification recipient.

3. Create push message content

   Create a JSON content payload for different types of push notifications. The content determines how a push notification appears on the push application, and whether the user can send a message in response to the push notification. The push admin can create attribute definitions that specify a default push action script or string, for use in the push message content.

4. (Optional) Create a push message attribute definition

   Push message attribute definitions allow you to create reusable properties for push message content specification.

5. (Optional) Create an attribute value or action for a push message

   You can create attribute values that override the default attribute definitions used in the push message content.

6. (Optional) Create a push action

   A push action is a server-side script that runs when the instance receives a response to an actionable push message.

What to do — admin

Create the push messages and push notifications: The administrator creates the push messages, sets up push notifications for the custom push app, and if desired, the content.

Next steps

Use the Push Installation API to opt users in to receive push notifications. For more information, see Push Installation API.

Upload a push certificate to your instance

Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Using your Apple developer environment, create a push certificate and convert it to a PKCS (.p12) file. For details on generating the .p12 file with the required certificate and private key, see Enable push notifications and Communicate with APNs using a TLS certificate in the Apple documentation.

Note: Ensure that your certificate is a push certificate and not a developer certificate. Also, if you're developing an app for testing purposes, ensure that you create a Sandbox certificate. If you're developing an app that you plan to launch in the Apple App Store, ensure that you create a Production certificate.

Role required: push_admin or admin

Note: This process describes configuration used in the ServiceNow mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

About this task

After you create a PKCS (.p12) file that contains the iPhone developer certificate and the private key used to sign the certificate, you need to upload the file to your instance. The system uses the information in the PKCS file to communicate with the APNs.

Procedure

1. Navigate to **All** > **System Definition** > **Certificates**, and then click **New**.
2. On the form, fill in the following fields:
   - Name: Enter a certificate name.
   - Type: Select **PKCS12 Key Store**.
3. Attach the PKCS (.p12) file to the record.
4. Click **Submit**.

What to do next

Create a push application record for your custom app

Create a push application record for your custom app

Register your customized mobile application with your instance to receive push notifications for the application.

Before you begin

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance

Role required: admin or push_admin

Note: This process describes configuration used in the ServiceNow mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

About this task

Push notifications are application-specific: They are sent to one type of mobile application, regardless of how many users have this application installed. If you develop your own mobile application, you must configure it for use by creating a record for it in the Push Application

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[sys_push_application] table. By default, ServiceNow mobile applications are automatically set up and ready to use.

Procedure

1. Navigate to **All** > **System Notification** > **Push** > **Push Application**, and then click **New**.
2. On the form, fill in the fields.

Field	Description
Display Name	Name of the push application.
Name	Database name of the push application. Enter a name that doesn't include spaces.
Push	Type of push service to enable for the application. Because you're setting up a custom push app, select **Direct**.
Feedback	Type of push feedback to use for the application. Because custom push apps don't receive push feedback, select **None**.
Apple	
Certificate	The X.509 certificate that you created on the Apple notifications portal. The certificate enables a device to talk to the APNs.
Sandbox Certificate	Sandbox certificate that you created on the Apple notifications portal. The certificate enable a device to talk to the APNs.
APNS Bundle Id	Bundle ID included in the certificate that you created on the Apple notifications portal. The system populates this field automatically after you specify a certificate.
Google	
API key	FCM API key you obtained from Google for the Android push notification.

3. Click **Submit**.

What to do next

Create push message content that contains the JSON content in the push notification payload.

In the Push Default Registrations related list, you can select the notifications that you want automatically subscribed to users who use this application. Users are subscribed to only active notifications.

Create push message content

Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

Before you begin

Complete the following:

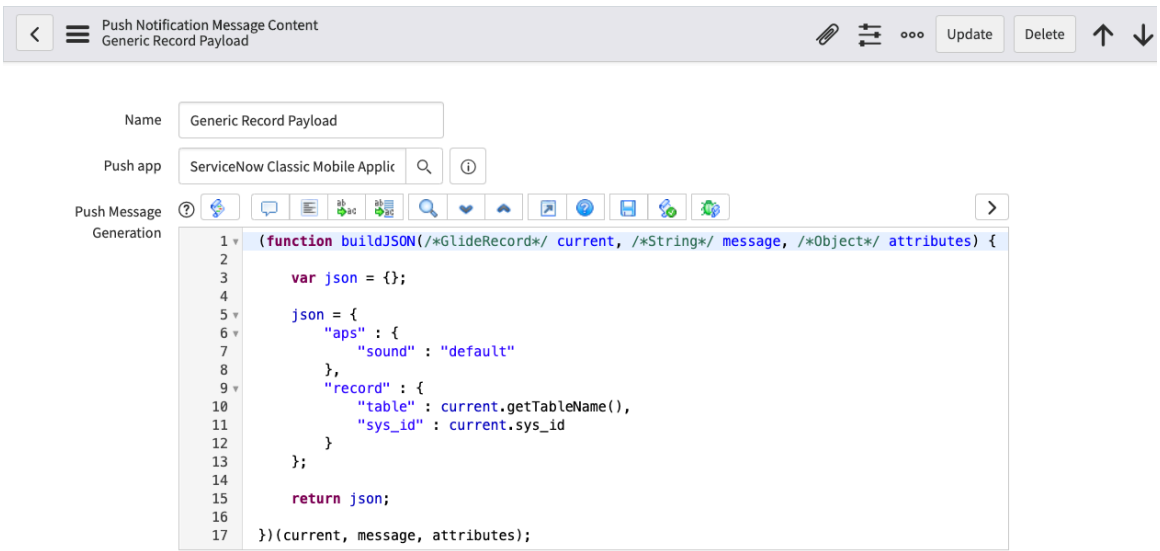
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app

You must know how to use JSON with push messages.

Role required: admin or push_admin

Note: This process describes configuration used in the ServiceNow mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications



About this task

Push message content defines the style of push notification that can be sent out for your custom app. You can add custom content, such as a picture, icons, or action buttons for the user to respond to the notification. Use the following variables in the script:

- `current`: properties of the current record.
- `message`: push message sent as the body of the entire push content.
- `attributes`: object of the push message attributes that you define.

Procedure

1. Navigate to **All** > **System Notification** > **Push** > **Push Message Content**.
2. In the Push Notification Message Contents table, click **New**.
3. Fill out the fields on the Push Notifications Message Content form (see table).
4. Click **Submit**.

Notification Message form fields

Field	Description
Name	Enter a descriptive name for the message content.
Push app	The push application the content can be used with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Push Message Generation	Enter a script that determines the message content. See the example scripts.
Related list	
Push Message Attribute Definitions	Select the attributes that apply to this notification. Attributes can be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See Create a push message attribute definition for information on creating attributes.

Example:
The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```
var json = {
  "table" : current.getTableName(),
  "sys_id" : current.sys_id,
  "template" : {
    "type": "2 button",
    "button1" : {
      "title" : "Approve",
      "action" : attributes.button_action,
      "parameters" : {
        "response" : "approve"
       }
     },
     "button2" : {
       "title" : "Decline",
       "action" : attributes.button_action,
       "parameters" : { "response" : "decline"
       }
     }
   }
};
json;
```

What to do next
Define a push message attribute to specify a default push action script or string that you can use in the push message content.

Create a push message attribute definition

Push message attribute definitions allow you to create reusable properties for push message content specification.

Before you begin

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app
4. Create push message content

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin or push_admin

Note: This process describes configuration used in the ServiceNow mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

About this task

Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

You can override these attributes by creating any push message attribute values.

Procedure

1. Navigate to **All** > **System Notification** > **Push** > **Push Message Content**.
2. Select a content record or script record.
3. In the Push Message Attribute Definitions related list, click **New**.
4. Fill out the fields on the form (see table).
5. Click **Submit**.

Push Message Attribute Definition form fields

Field	Description
Attribute Name	Enter a descriptive name for the layout.
Attribute Type	Select the type of attribute: ○ **Action**: An action to take on the instance, as defined by a script. ○ **String**: An arbitrary string to send as part of the message content. The string can specify items like a button label in the message.
Default Script	Select the mobile action script that tells the instance what to do when it receives a response from the push notification. This option appears if you select **Action** for the **Type**.
Default Value	Specify an arbitrary string value to be placed in the attribute that is used by the message content. For example, the string could specify a button label. This option appears if you select **String** for the **Type**.

What to do next

If you want to override default attribute definitions, see Create an attribute value or action for a push message.

Create an attribute value or action for a push message

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

Before you begin

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Create push message content
5. Create a push message attribute definition

Role required: admin or push_admin

Note: This process describes configuration used in the ServiceNow mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

About this task

These push message attribute values override values that you set in an attribute definition on the Push Content form.

Procedure

1. Navigate to **All** > **System Notification** > **Push** > **Push Messages**.
2. Select a message.
3. In the Push Message Attribute Values related list, click **New**.
4. Fill out the fields on the form (see table).
5. Click **Submit**.

Push Message Attribute Values form fields

Field	Description
Attribute	Select a push message attribute definition.
Value/ Action	Enter the value for the attribute or select the push action. This field changes to Value or Action depending on the type of attribute you select in the Attribute field.

What to do next

(Optional) Create a push action to perform an action on the instance.

Create a push action

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

Before you begin

Complete the following:

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app
4. Create push message content
5. Create a push message attribute definition
6. Create an attribute value or action for a push message

Role required: admin or push_admin

Note: This process describes configuration used in the ServiceNow mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the **Approval** field on the relevant Change Request record.

You can use global variables or, optionally, current variables and parameters passed through the JSON content.

Procedure

1. Navigate to **All** > **System Notification** > **Push** > **Push Action**.
2. Fill in the form fields (see table).
3. Click **Submit**.

Push Notification Action form fields

Field	Description
Name	Enter a descriptive name for the action.
Script	Enter the script.

Requeue failed push notification messages

Push notification delivery might fail for various reasons. You can view which messages failed and requeue them to be sent out if necessary.

Before you begin

Role required: admin

About this task

Note: There is no way for the instance to guarantee or confirm push message delivery. For more information on how Apple handles push notifications, see the Local and Remote Notification Programming Guide for Apple developers.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a system property to control how long the instance queues a push notification after it is triggered.

Push notification message payload size is limited by provider:

- Apple iOS: 2,048 bytes
- Google: 4,096 bytes

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. For details on Apple payload limitations, see the Local and Remote Notification Programming Guide for Apple developers.

Procedure

1. Navigate to **All** > **System Logs** > **Push Notifications**.
   By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **failure**: The message could not be sent.
- **pending**: The message is queued for processing.
- **success**: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting **Re-queue failed push notifications** from the choice list.
3. If some push notifications continue to fail, consider increasing the value in the *glide.push.notification.ttl_seconds* property.
   See Push notification properties for more information.

Push notification retention

You can archive and eventually destroy push notifications that you no longer need or if your Push Notification table is excessively large.

Push notification retention is available starting with the Jakarta release.

Push notification archive and destruction plugins

The push notification archiving and destruction feature uses the Data Archiving and Push Retention plugins. The Data Archiving plugin must be active to archive and destroy push notification records. The Push Retention plugin provides a set of rules that specify when the system archives and destroys push notification records.

In new instances, the Push Retention plugin and associated archive and destroy rules are active by default. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. Be sure to review and approve the archive and destroy rules before activating them.

If your instance already has a process for managing push notification records, you do not need to activate the Push Retention plugin. If you want to replace your current process with Push Retention, be sure to deactivate the current process before activating the archive and destroy rules.

Archiving and destroying push notification records

Archiving means moving records from the Push Notification [sys_push_notification] table to the Push Notification Archive [ar_sys_push notification] table when they exceed the archive rule time limit. Destroying means deleting records in the Push Notification Archive table when they exceed the destroy rule time limit.

Default archive and destroy rules

Push retention provides the following push archive rules:

- **Push Notification - Over a year old:** archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old:**destroys push notification records that have been archived for more than 365 days prior to the current date.

With these default settings, your messages are kept on the instance for a total of two years: one year in the Push Notification table, and one year in the Push Notification Archive table. At the end of the period, the system deletes the expired notification records from the Push Notification Archive table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

Compatibility with other record management implementations

If you are already using another method for managing push notification records, such as table cleaners, you do not have to use the Push Retention feature. To prevent unexpected record deletion, avoid using multiple push notification management processes on the same instance at the same time.

Note: For assistance replacing your existing record management implementation with push notification retention, contact your professional services or sales representative.

Activate the Push Retention plugin

The Push Retention plugin (com.glide.push_retention) provides the retention policy for push notifications, so that you can specify when the system archives and destroys push notification records.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

List of plugins (Brazil)

Archive push notifications manually

You can manually archive push notifications on demand instead of waiting for the instance to archive them based on a scheduled job.

Before you begin

Role required: admin

About this task

Push retention provides these push notification archive rules:

- **Push Notification - Over a year old:** archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old:**destroys push notification records that have been archived for more than 365 days prior to the current date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can manually archive push notification messages that meet the default archive and destroy rules or any additional archive rules that you create.

Procedure

1. Navigate to **All** > **System Archiving** > **Archive Rules**.
2. Open the push notification archiving rule, for example Push Notification - Over a year old
3. Click **Recalculate Estimate** to see how many records in the Push Notification [sys_push_notification] table are going to be archived.
   The estimate appears in the **Record estimate** field.
4. Click **Run Archive Now**.

Notifications in messaging applications

Enable users to receive their ServiceNow platform notifications in Slack or Microsoft Teams messaging applications. Use the Now Actions app to configure the messaging apps for your instance.

Admin setup

To enable ServiceNow notifications within Slack or Microsoft Teams, you must be an administrator for both ServiceNow and the third-party application.

1. Request Integration Hub

The Slack and Microsoft Teams spokes require a Starter subscription to Integration Hub. To activate Integration Hub and view available subscription types, see Request an Integration Hub plugin.

2. Request the Messaging Notification plugin

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

3. Install the Now Actions messaging app for Slack or Microsoft Teams

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

Note: The primary owner of a Slack workspace or organization owns and manages the application. To avoid losing admin access to the workspace or organization, transfer primary ownership before any administration changes occur. If you transfer primary ownership, update the JSON payload for the Slack installation in the Notification Integration page. For more information about editing the Slack installation, see Install the Now Actions messaging app.

If the Now Actions app is uninstalled, the workspace or team displays as inactive in the Notification Integration page. To view the Notification Integration page, navigate to **System Notification** > **Messaging** > **Messaging Integration Configuration**.

4. Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

5. Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

Note: Message Channel Sync Job can sync more than 1000 channels using pagination.

User setup

To enable individual ServiceNow notifications in Slack or Microsoft Teams, and to take action on notifications, configure your system settings and link your user accounts.

Link your ServiceNow user account to your Slack or Microsoft Teams account

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

Configure system settings

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels.

Notification channels

In ServiceNow, a notification channel is a method or device for receiving notifications. For example, in the base system you can elect to receive notifications through email or SMS channels. If messaging applications are enabled on your instance, you can enable notifications to Slack and Teams using Notification Channels in your system settings.

Actions and events

The Message Actions [messaging_observer_handler] table processes communication channel events, such as adding or deleting a Slack channel, to keep the instance and the third-party application in sync. Only developers creating Slack or Teams applications should add actions to this table. Register new actions with the instance through the Message Event Registry [messaging_observable] table. To remove a base system action, clear the active flag instead of deleting the record.

Logging

The Inbound and Outbound message logs contain information on actions, events, and activities between ServiceNow and the third-party application. Use the logs to identify the content, state, and origin of communications to and from your instance.

Request the Messaging Notification plugin

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by selecting **Automation Store** > **Service Catalog** > **Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.
3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

4. Select **Submit**.
After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Install the Now Actions messaging app

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

Before you begin

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active. For more information, see Request the Messaging Notification plugin.

Roles required:

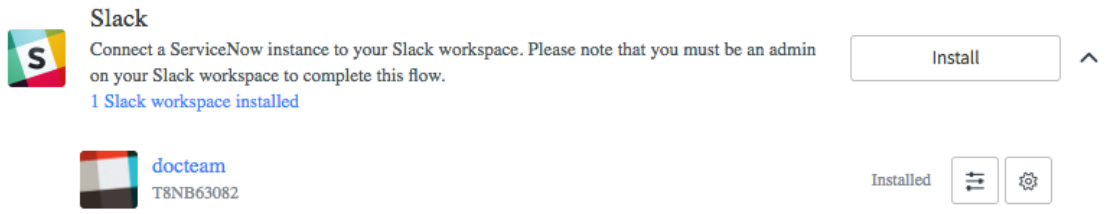
- Admin or messaging_admin in ServiceNow
- Administrator for Slack or Teams

Install the Now Actions messaging app for Slack

Install the Now Actions messaging app from the Slack App Directory and associate the app with your instance.

Before you begin

Role required: admin.



Procedure

1. Install the Now Actions app from the Slack App Directory.
   a. Find and install the Now Actions app in the Slack App Directory.
   b. Click Authorize when prompted.
   c. **Optional:** Enter a customized name, app description, and icon.
   d. Configure your Now Actions web address.
   This is the base URL for your instance.

   Example
   For example, `https://<instance_name>.service-now.com/`.

   e. Copy the JSON configuration found in the **Add your Slack credentials to your app** section for use in later steps.
2. Associate your Slack app with your instance.
   a. Navigate to **System Notification** → **Messaging Integration Configuration**.
   b. Click the **Install** button next to Slack.
   c. In the JSON Configuration pop-up, paste in the JSON configuration you copied in earlier steps.
3. Check for installation verification.
   The Slack workspace should appear below the Slack heading on the Notification Integration page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

During installation, the instance synchronizes with all public Slack channels in the workspace. New public channels added after installation will automatically synchronize with the instance. You can browse to **System Notification** > **Messaging Channels** on your instance to verify that the new channel appears on the instance.

What to do next

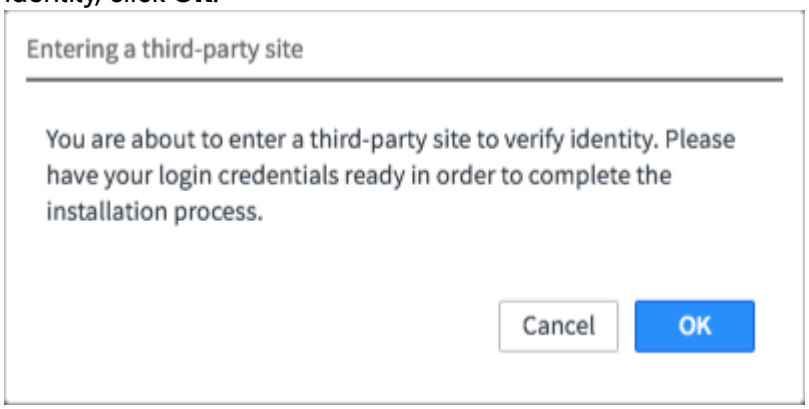
To update the app after installation, use the **Configure JSON Payload** and **Settings on Slack** icons on the Notification Integration page. You can view the JSON payload, view app credentials, change app appearance, or delete the app.

Install the Now Actions messaging app for Microsoft Teams

Associate the Now Actions messaging app with your instance.

Before you begin

Role required: admin.



Procedure

1. Associate your Microsoft Teams app with your instance.

   a. Navigate to **System Notification** → **Messaging Integration Configuration**.

   b. Click the **Install** button next to Microsoft Teams.

   c. When a pop-up message appears to confirm redirection to Microsoft Teams to verify your identity, click **OK**.

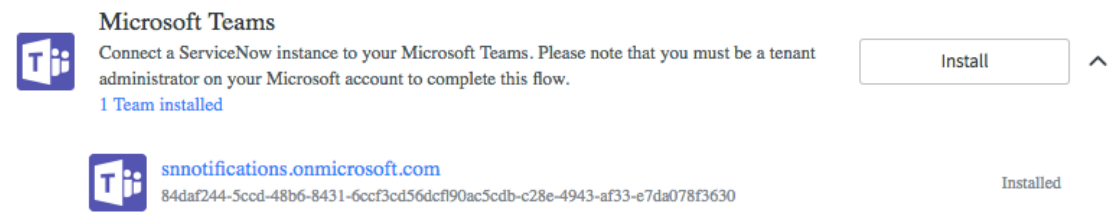
   d. When prompted, log in to Microsoft Teams with your Teams admin account.

   e. Click *Accept* to accept the permissions for the app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. If the selected workspace has already been assigned, either click **Override** to change the workspace, or click **Cancel** to leave the current assignment in place.
After authentication, installation will start in the background. Once installation completes, a message appears confirming the installation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



g. Click the **app package** link to access a knowledge base article KB0690098, which contains the application package for Microsoft Teams.

h. Follow the steps in the article to make this package available for your Microsoft Teams users.

2. Check for installation verification.

During installation, the instance synchronizes with all public Teams channels. To add channels created after the install, open Microsoft Teams and @mention the app from the new channel. You can browse to **System Notification** > **Messaging Channels** on your instance to verify that the new channel appears on the instance.

The new team should appear below the Teams heading on the Notification Integration page.

What to do next

To receive a ServiceNow notification in Microsoft Teams, create a message and a notification. See Configure message content and Create a messaging notification.

Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow.

Before you begin

Role required: admin or messaging_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To enable users to take actions in Slack or Teams, use the Buttons message type and define scripted behavior. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

Procedure

1. Navigate to **All** > **System Notification** > **Messaging Content**.
2. Open an existing notification record or click **New** to create a new record.
3. Fill in or modify the fields as appropriate.

Messaging content fields

Field	Description
Name	Enter a unique name for the message.
Type	Select a type of message. ○ **Simple**: Send an informative message to an entire Team or Slack channel. ○ **Buttons**: Send a message to an individual user in Slack or Teams and define the desired behavior in the **Script** field. Associate buttons in the message with actions in ServiceNow. Use the Approval Request as an example.
Target table	To use record content in your message, select the appropriate table. **Note:** Notifications running on the Task [task] table are not supported. Instead, use a table extended from task.
Fields	Select which fields from the **Target table** appear in a simple message. Changing the order of the fields changes the display order in the notification.
Message heading	Enter text to appear at the top of the message.
Message	Enter the content of the message. Use notification variables to include dynamic information in your message. For example, use `Incident ${number}` to include the incident number in the message. For available variables, see Notification variables.
Buttons	Select or create buttons to use on the form. After selecting or creating a button, you must define button behavior in the **Script** field. Only visible when Buttons is selected in the **Type** field
Script	This field is only visible when Buttons is selected in the **Type** field. Enter a script to define what happens in your instance when a user selects a button in Slack or Microsoft Teams. Use the `actions.get` method to return the name of the button selected by the user. `if (actions.get('button') == 'Approve') { target.state = 'approved'; target.update(); }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	In this example, the script conditionally executes when the "Approve" button is selected.
	
	Use the method `sn_notification.Messaging.send` to send information to the messaging window.
	
	`var content = new GlideRecord("messaging_content");`
	`content.get("1bb10839572213007f004758ef94f9c4"));`
	`sn_notification.Messaging.send(application, userId, content, target);`
	
	In this example, the script stores a Message Content record in the `content` variable. It then posts a message from that Message Content record.

Application	Select the application scope for this notification.

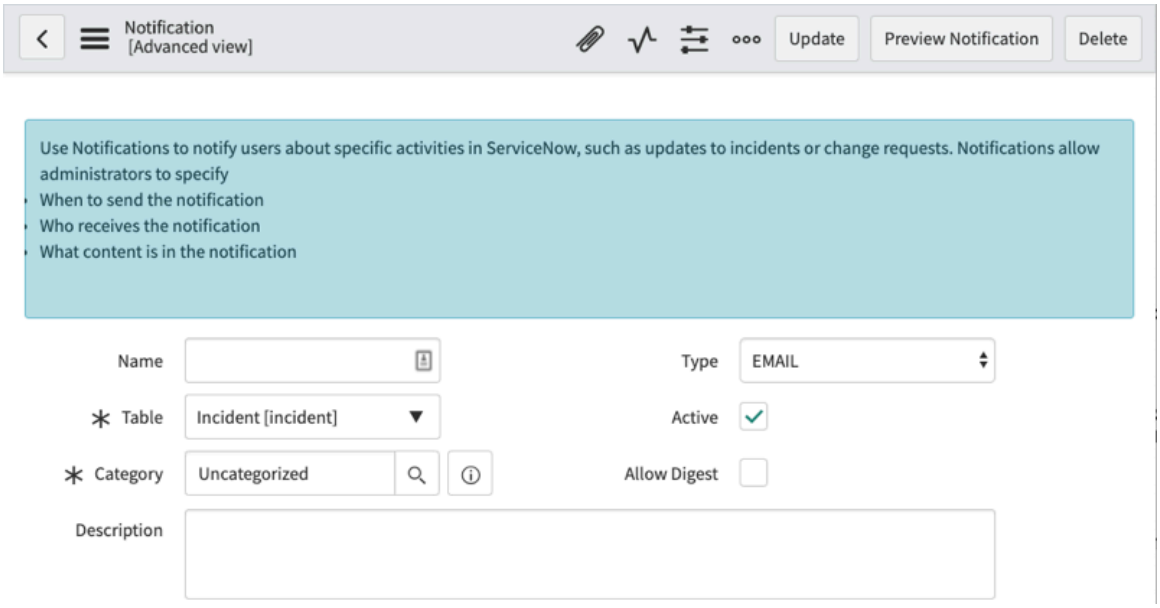
4. Click **Submit**

Example:

This example shows the output of a message in Microsoft Teams. This message is of the buttons type, which shows buttons and performs scripted actions based on the user selection. In this case, the script uses the `sn_notification.Messaging.send`method to display the change in state for the record.

What to do next

Use the message in a notification. For more information about creating notifications, see Create a messaging notification.



Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

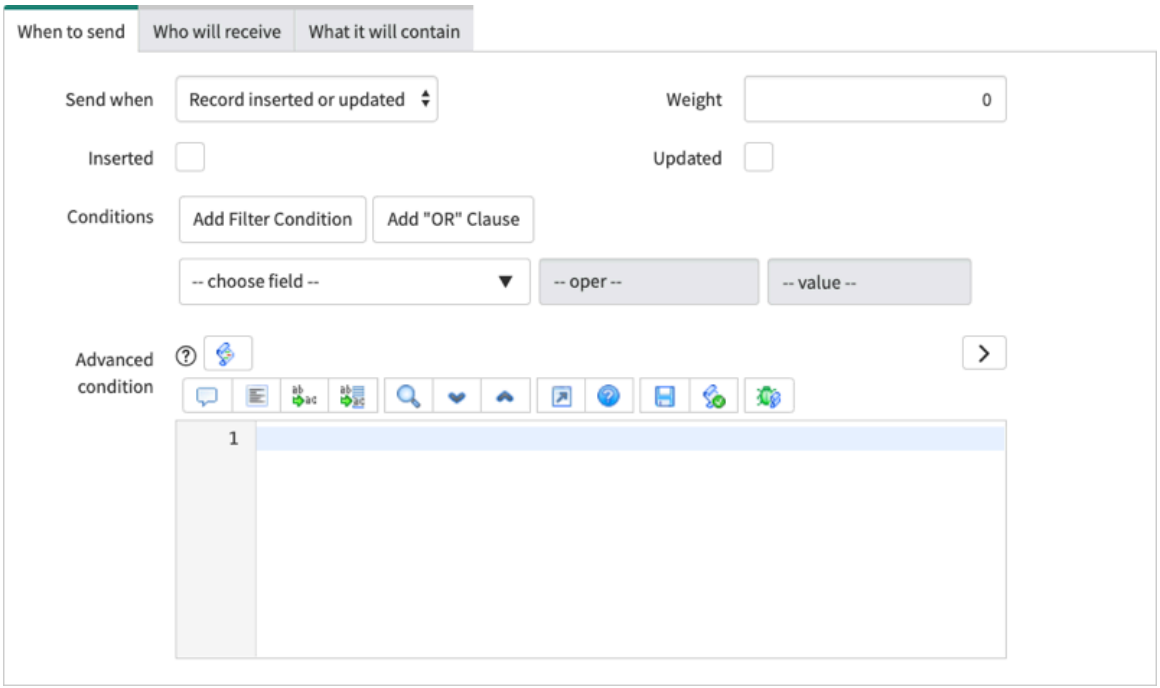
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System Notification** > **Messaging** > **Messaging Notifications**.
2. Click **New**.
3. Fill in or modify the fields as appropriate.

Messaging notification fields

Field	Description
Name	Enter a unique name for the notification. Use descriptive names to ensure that your users are able to easily distinguish between notifications.
Table	Select a table to trigger the message. Must be a table or database view within the same application scope. **Note:** Notifications running on the task [task] table are not supported. Instead, use a table extended from task.
Category	Select a category for the notification. A category groups related notifications in the system settings. **Note:** Do not leave the category as **Uncategorised**, as users may not be able to find the notification in their list of notifications.
Description	Enter a description for this notification.



Note: Notification records are shared between messaging, email, and push notifications. Some fields on the form are not relevant to messaging notification records. Leave fields not described here at their default values.

4. Click**Advanced view** under **Related links** to switch the advanced view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Switching to the Advanced view saves the current record.

5. Open the **When to send** tab and complete the form.

Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

Field	Description
Send when	Select under what condition the notification is sent: ○ When a record is inserted or updated ○ When a particular event is fired ○ When Notification step in Flow Designer
Weight	Set a numerical value for the notification priority relative to other notifications with the same target table and recipients. The system only sends the notification with the highest weight. The default value 0 causes the system to always send the notification (assuming the conditions are met).
Conditions	Use the condition builder to select the conditions under which this notification is sent. For example, select **Priority** > **greater than** > **3 - Moderate** to send the notification only for High and Critical priority incidents.
Inserted	Select the check box to enable messaging notification when a record is inserted. This field appears when you set the **Send when** field to **Record inserted or updated**.
Updated	Select the check box to enable messaging notification when a record is updated. This field appears when you set the **Send when** field to **Record inserted or updated**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Event name	Select the event that triggers this notification. This field appears when you set the **Send when** field to **Event is fired**.
Advanced condition	Create a script to define more filter conditions, like sending a notification based on the current messaging record, changing field values, or changing system properties. The advanced condition script must return **true** or set a global answer variable to **true** to send the notification. The advanced condition script uses the following global variables: ○ *current*: Contains the current record from the table to which the notification is linked. ○ *event*: Contains the event that triggered the notification. **Note:** The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

6. Open the **Who will receive** tab and fill in or modify the following fields.

Field	Description
Messaging Channels	Select the messaging channels to receive the messaging notification. Only complete this field if creating a simple notification to send to a channel. Simple notifications use a Messaging Content record of Type **Simple**.
Users	Select the users you want to receive the messaging notification. Only complete this field if creating a notification that requires user action. Notifications that require user action use a Messaging Content record of Type **Buttons**.
Users/ groups in fields	Select users or groups from reference fields. For example, if a notification uses the Incident [incident] table, you can select users or groups from incident fields like **Opened by** and **Assignment group**. **Note:** You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field. If you address the notification to a user with an inactive record in the User [sys_user] table, the system does not send the notification to that user.
Groups	Select the groups you want to receive the messaging notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.
Send to event creator	Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification, regardless of the setting in this field. For new notifications, this option is selected by default.
Event parm 1	Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the **Send when** field is set to **Event is fired**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
contains recipient	
Event parm 2 contains recipient	Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the **Send when** field is set to **Event is fired**.

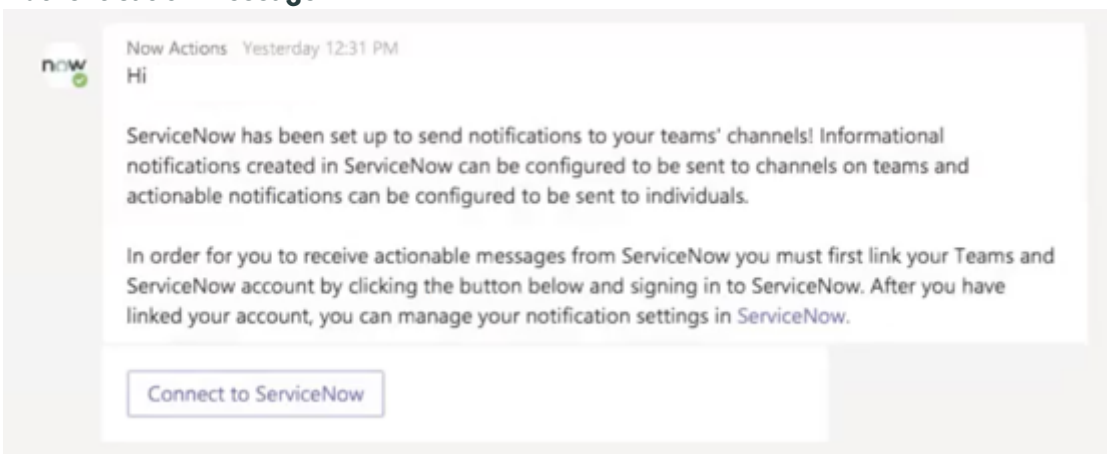
7. Open the **What it will contain** tab and fill in or modify the following fields.

Field	Description
Messaging content	Select a messaging content record to be used in this notification.

8. Click **Update**.

Link your ServiceNow user account to your Slack or MS Teams account for Now Actions

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.



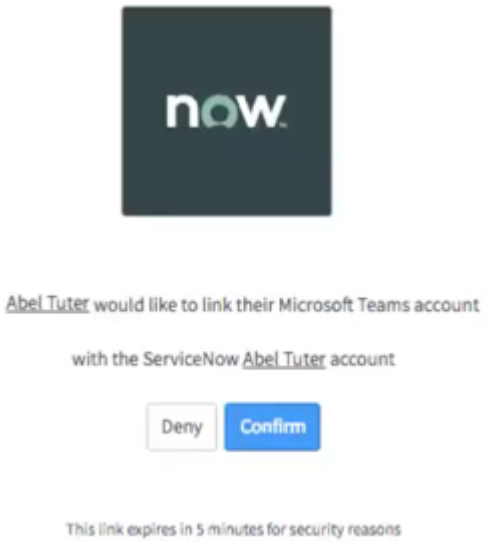
Before you begin

Role required: none

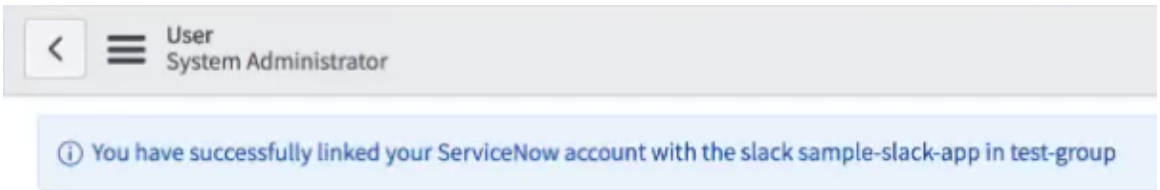
Procedure

1. Open the Slack or Teams application
2. Navigate to the Now Actions bot, which can be found in the left panel of Slack under Apps, and in the left panel of Teams in the **Chat** tab.
3. Start a conversation with the Now Actions bot.
   The bot then presents a link to authenticate.

Authentication message



4. Click the **Connect to ServiceNow** link.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A new browser tab opens and prompts the user to Deny or Confirm the connect between your Slack or Teams account and your ServiceNow account. This link will expire five minutes after it is displayed.

5. Click **Confirm** to link the accounts.

6. After confirmation, you are directed to the instance user record.
   A confirmation message is displayed at the top of the screen.

Unlink your ServiceNow user account from your Slack or MS Teams account for Now Actions

Unlink your ServiceNow account from your Slack or MS Teams account to stop receiving actionable ServiceNow notifications in Slack or Teams.

Before you begin

Role required: none

About this task

If you unlink your account to a messaging app for Now Actions, you must also disable the corresponding messaging channel in your notification preferences.

Procedure

1. Navigate to **All** > **Self-Service** > **My Profile**.
2. Click the **View Linked Accounts** related link.
3. In the Linked Accounts page, check the selection box for the messaging integration to be unlinked.
4. Select **Actions on selected rows...**, then click **Unlink account**.
   Your ServiceNow account is unlinked from the Now Actions messaging integration (the link is inactive).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Even though you unlinked your account, you still receive notifications in any group channels to which you belong.

5. Disable the messaging channel in your Notification Preferences.
   a. Select the gear icon in the banner frame to access the System Settings window.
   b. Under Notification Channels, disable the appropriate messaging channel.

Note: If you want to link your ServiceNow account again, follow the steps in Link your ServiceNow user account to your Slack or MS Teams account for Now Actions.

Set up notifications for a custom Slack app

Send ServiceNow notifications to users via your own Slack bot.

Before you begin

- Request Integration Hub
- Request the Messaging Notification plugin
- Create a custom application for Slack

Role required: admin or messaging_admin

Procedure

1. Create a JSON for your custom Slack application.

   Ensure that your JSON matches the following example format:

```
{
"bot_user_id" : "U9TLFR6TA",
"scope" : "bot,channels:read",
"client_id" : "294380102274.335446283495",
"client_secret" : "ed0da5fe1f844fdac15a9e1ac1b0b831",
"verification_token" : "YXSNsRhioCeU8h9Fm2k4ACuO",
"app_id" : "A9VD48BEK",
"access_token" :
 "xoxp-294380102274-295238228534-335452648487-2fac31f923dadd7ff
30f2bc8c852809d",
"bot_access_token" :
 "xoxp-333695856928-6pNwnO3Y6vNSGI7KCAIPwv6V",
"team_id" : "T8NB63082",
"team_name" : "sn-notif-ext-test",
"user_id" : "U8P706QFQ",
"bot_username": "empdmyers1snnotifext"
}
```

   To get the Bot User ID, copy the member ID of the bot user in the Slack app.

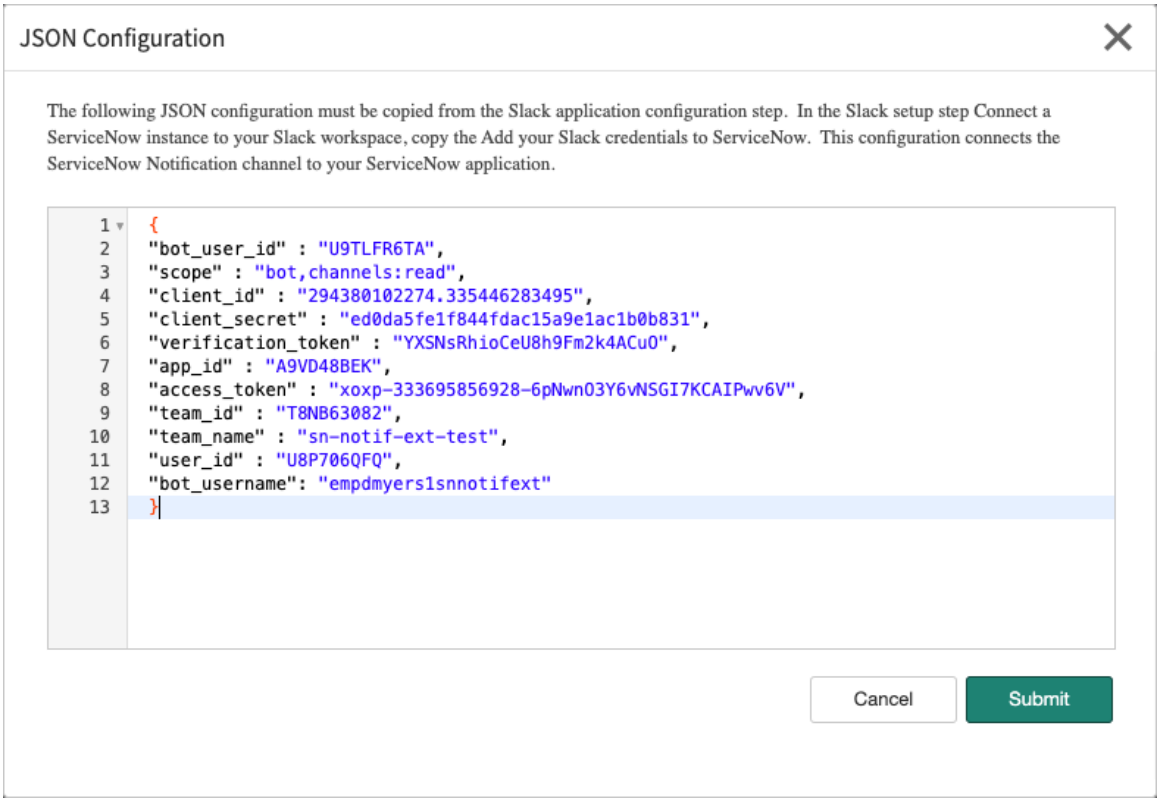
   The Scope is always `bot,channels:read`.

   To get the Client ID, Client Secret, and Verification Token, see the Basic Information page in your Slack workspace.

   To get the App ID, copy the 9-character identifier from the app URL in your Slack workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To get the Access Token and Bot Access Token, see the OAuth & Permissions page in your Slack workspace.

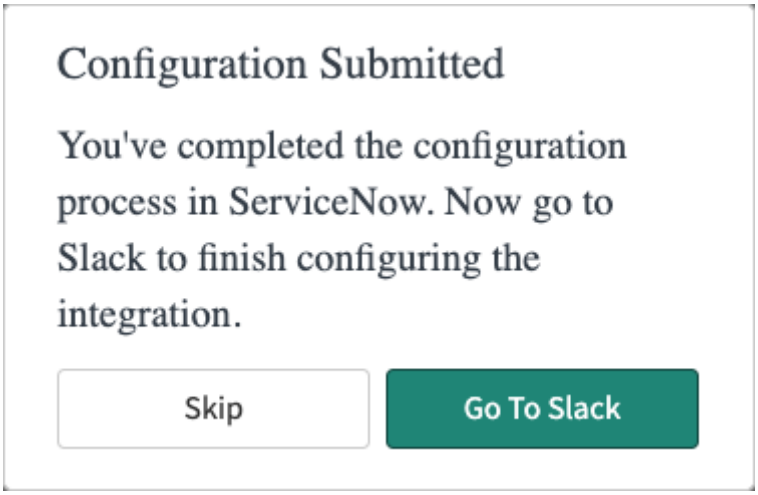


To get the Team ID, view the HTML source code for your Slack workspace page.

The Team Name is the same as your subdomain in your Slack workspace.

To get the User ID, copy the member ID for your own account in the Slack app.

The Bot Username is the name that you assigned to the bot user in Slack.



2. In your ServiceNow instance, navigate to **System Notification** > **Messaging** > **Messaging Integration Configuration**.
3. Next to the Slack listing, click **Install**.
4. On the JSON Configuration window, paste the JSON that you created in Step 1.

5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the confirmation window, click **Skip**.

Result

The system creates a notification channel for your custom Slack app automatically.

What to do next

- Link ServiceNow user accounts to your custom Slack app so that users can take action on notifications that are delivered by your Slack bot.
- For each user account that you link, enable the notification channel using the system settings.
- Create notifications for your custom Slack app by following the steps in Create a messaging notification and Configure message content.

Important terms

Provider

A provider is an implementation that delivers notifications to destinations of a specific channel.

Channel

A channel represents a particular communication mechanism with a recipient.

Destination Type

A destination type represents a logical way of categorizing a destination for the underlying channel and is required to send via a channel, as well as set a preference. As an admin, you can modify the notification **Auto Opt-in** behavior for a destination type.

Destination

A destination is a specific contact information of a recipient for a channel. It includes a destination type and an identifier suitable for use in the channel.

Destination Type sent by default is either set to true or false during the adapter installation. This determines if the destination type is opt-in or opt-out.

- If sent by default is set to true, notifications are delivered to the recipients if they have not explicitly opted-in/out to receive a notification on the destination type.
- If sent by default is set to false, notifications are not delivered to the recipients if they have not explicitly opted in to receive the notification on the destination type.

Destination preference precedence

Notifications are delivered to the destinations that honor the following preference precedence:

1. Notification preference of the recipient
2. Destination preference of the recipient
3. Destination Type send by default. You also have the option to modify **Auto Opt-in** behavior for a destination type.

Note: Groups are not supported as recipients.

Common content for a notification

Provide common notification content so that different notification channels can use the same generic content.

Actionable notification

Enable provider admins to define an actionable notification and send it to users. You can also enable response actions.

Note: A notification should either have Common Content or Provider Content in order to be delivered to the recipients.

All the above-mentioned capabilities are applicable only for Virtual Agent and Workspace providers.

Create provider notification

Create and update provider notifications, add and implement actions, and customize notifications

Create and update a provider notification for all users

Create a notification in the notification provider framework to send to both sys and non-sys users.

Before you begin

Role required: notifications provider admin and admin

Procedure

1. Navigate to **All** > **System Notification** > **Provider** > **Notifications**.
2. Select **New** to create a notification.
3. On the form, fill in the fields.

Notification form

Fields	Description
Name	Name of the notification.
Application	Scope of the notification record.
Category	Select the category to which this notification belongs. A category identifies and groups related notifications. This notification, if active and listed in the selected **Category** in the notification preferences for each user (Notifications tab in the System Settings window).
Active	Option to activate the notification.
Triggered By	Trigger used in the notification record. **Note:** The options in this field depend on the selected table. For example, if you select an incident table, the options are Events or Record Change.
Table	The table name on which the notification is triggered.
Inserted	Condition to trigger the notification.
Updated	Condition to trigger the notification.
Event	Event that triggers the notification. For example, to send a notification after an incident is closed or resolved, you would select the *incident.inactive* event. By default, this event is logged in the system each time an incident is resolved or closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: You can select only an event that shares the same table as the notification. This field appears when you select **Event** in the **Triggered By** field.
Conditions	Additional conditions to trigger the notification.
Users	Names of the available sys users.
Recipients in fields	Field in the currently selected table that contains the users or groups who receive a notification. **Note:** The **Recipients in fields** field under Recipients enables you to choose both sys and non-sys users to whom you can send notifications.
Is the originating user included?	Option to include the originating user to be included in the notification.
Event Parm1 contains recipient(s)?	Option to select if Parm 1 contains a list of comma-separated sys_ids.
Event Parm2 contains recipient(s)?	Option to select if Parm 2 contains a list of comma-separated sys_ids.
Resolve Parm1 recipients from table	Table that is used to resolve the sys_id of a Parm 1 recipient. **Note:** This field appears only when you select Event Parm 1.
Resolve Parm2 recipients from table	Table that is used to resolve the sys_id of a Parm 2 recipient. **Note:** This field appears only when you select Event Parm 2.
Advanced event condition	Option to select when the recipients are from more than 2 tables. These options are dynamic conditions.
Advanced condition	Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties. The advanced condition script must return **true** or set a global answer variable to **true** to send the notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	The advanced condition script uses the following global variables: ○ *current*: Contains the current record from the table to which the notification is linked. ○ *event*: Contains the event that triggered the notification. **Note:** The **Advanced condition** field is evaluated in addition to other conditions that you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

4. Select **Submit**.
5. Open the recently created notification.
6. Update the form using any of the available related lists.
   See Create and add additional recipients and Create and add assignment groups for more information.

Note: All the validation messages given by different providers are retained. Warning messages of one provider isn't overridden by warning messages of another provider.

Create and add additional recipients

Update the notifications form by adding additional recipients from the Additional Recipients related list to send notifications to.

Before you begin

Role required: admin and notifications provider admin

Procedure

1. Click Additional Recipients related list on the notification form to add new recipients.

Note: An error message about adding content to the notification shows up. See create common content and create default content to create content for a notification.

2. Click **New** in the Additional Recipients related list to add additional recipients.
   The Additional Recipients form shows up.
3. Fill up the fields in the Additional Notification Recipients form.

Fields	Description
Notification	Name of the notification **Note:** The Notification name auto-populates and the **Recipient Table** field gets User[sys_user] as the default value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Application	Scope of the recipient record
Recipient Table	Table name of the recipient **Note:** You can also select a non-sys users table.
Active	Option to activate the notification
Static Recipients	Names of static recipients of the notification
Dynamic Conditions	Dynamic filter conditions for the users **Note:** Click the refresh button next to the records matching condition link to update the exact number of records matching the latest filter condition. By default, it shows the total number of records in the current table. Only one active record can be added for a particular recipient table. If you want to add another record for the recipient table, you will have to deactivate the current record.

Note: For one recipient table, we can use either static recipients or dynamic conditions.

4. Click **Submit**.

Create and add assignment groups

Create and add assignment groups where you want users that are part of a group to be the recipients of the provider notification.

Before you begin

Role required: admin or notifications provider admin

Procedure

1. Navigate to **All** > **System Notification** > **Provider** > **Notification**.
2. Select the notification.
3. Select **Groups**.
4. Select **New** or **Edit** to add assignment groups.
   - Select **New** to add assignment groups.

     On the form, fill in the fields.

Field	Description
Name	Name of the group.
Manager	Name of the manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Group email	Group email address.
Parent	Name of the parent group.
Description	Description of the group.

- Select **Edit** and select the groups from the collection to add to the group list.

5. Select **Submit** or **Save**.

Make a notification mandatory for provider framework

Enable admins to mark specific notifications as mandatory that their users cannot turn off.

Before you begin

Role required: admin

When you make a notification mandatory, the toggle button for that notification is read only in the user notification preferences, preventing the user from unsubscribing or disabling that notification.

Procedure

1. Navigate to **All** > **System Notification** > **Provider** > **Notifications**.
2. Select and open the notification.
3. Configure the form and add the **Mandatory** field.

   Note: This field does not display by default.

   a. Select the context menu icon and select **Configure** > **Form Layout.**
   b. Select the **Mandatory** field and the order in which you want the field to appear.
   c. Select **Save**.
4. Select the **Mandatory** check box.

   Note: To honor auto opt-in capability over mandatory notifications, add the property *glide.notification.provider.mandatory.honor_auto_opt_in* and set it to `true`.

Create default content in a provider

Create and use the default content for a notification that doesn't have a content provider or some of the fields in the content provider aren’t present.

Before you begin

Role required: admin

Procedure

1. Enter sys_notification_content.list in the application navigator.
   A list of **Notification Contents** shows up.
2. Select **New Provider Content**.
   a. Select and hold any column header and then select **Configure** > **List Control**.
   b. Clear the **Omit new button** to display the **New Provider Content** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Both shared content and provider content can be default content. Provider content has been considered for this example.

3. Select the type of Notification Content that you would like to create.
4. Fill the **Notification Content** form for the type you have selected in the previous step.

Note: The **is default** field is visible only if the **Notifications** field is not present.

5. Select **Submit**.
   A new default content has been created.

Create custom notifications in Next Experience

Provide better context and information about users' work by creating custom content for in-product notifications in Next Experience.

Before you begin
Role required: admin

About this task
Create notifications with custom title and message content for your applications and use cases. Next Experience notifications appear as toast banners and in the Notifications menu.

Note: Next Experience notifications aren't supported in the legacy Agent Workspace.

Procedure
1. Navigate to **All** > **System Notification** > **Provider** > **Notifications**.
2. Select **New**.
3. On the form, fill in the fields.

Notifications form

Field	Description
Name	Name of the notification.
Application	Application scope of the notification.
Active	Option to activate the notification. The notification is active by default.
When to send	
Trigger	System action that triggers the notification. You can send the notification after a record is changed or after an event is triggered.
Inserted	Option to send the notification after a record is inserted. This field appears when you select **Record Change** in the **Trigger** field.
Updated	Option to send the notification after a record is updated. This field appears when you select **Record Change** in the **Trigger** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Event	Event that triggers the notification. For example, to send a notification after an incident is closed or resolved, you would select the *incident.inactive* event. By default, this event is logged in the system each time a user resolves or closes an incident. **Note:** You can select only an event that shares the same table as the notification. This field appears when you select **Event** in the **Trigger** field.
Table	Table to receive notifications about.
Conditions	Filter to specify the table records that users receive notifications about. For example, to send notifications about top-priority incidents, you would select **Incident [incident]** in the **Table** field and set the conditions to **[Priority] [is] [1 - Critical]**.
Who will receive	
Users	Users who receive the notification. **Note:** Notifications in messaging channels are sent only to users with ServiceNow accounts (sys_user profiles). Consumers and customer contacts are considered as guests and can't receive notifications in messaging channels.
Recipients listed in fields	Record fields that include users who receive the notification. For example, to send the notification to the record assignee, select **Assigned to**. **Note:** This field shows up only if you select a table.
Include the person whose action triggered the notification	Option to include the user who changed the record or triggered the event.
Recipient(s) listed in event parm1	Option to select whether Parm 1 contains a list of comma-separated sys_ids. For more information, see Classic Events.
Recipient(s) listed in event parm2	Option to select if Parm 2 contains a list of comma-separated sys_ids
Table containing recipients from event parm1	Table that is used to resolve the sys_id of the recipient **Note:** This field appears only when you select Event parm 1.
Table containing recipients from event parm1	Table that is used to resolve the sys_id of the recipient **Note:** This field appears only when you select Event parm 2.
Advanced event condition	Option to select when the recipients are from more than two tables. These are dynamic conditions.

4. From the form context menu, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the **Contents** tab and then select **New Provider Content**.
6. Select **Next Experience** as the content provider.
7. On the form, fill in the fields.

Notification Next Experience Content form

Field	Description
Name	An internal name for the notification content.
Notification	The notification trigger that sends the notification content.
Active	Option for whether the notification is sent when triggered.
Table	Table to receive notifications about.
Route	Next Experience Route
Message Heading	Header text at the top of the message. From the Select variables list, you can select variables to include your message heading.
Message	Secondary text of the message that follows the heading. From the Select variables list, you can select variables to include your message body.

Example

The following example shows the values for a notification with custom content that references the number and short description of an incident.

Field	Value
Name	Incident record update content
Notification	Incident records
Active	true
Message Heading	${number} changed
Message	Short description: ${short_description}

8. Select **Submit**.

Result

When triggered, users configured to receive the notifications see notifications with custom content as banners and in the Notifications menu in the Next Experience Unified Navigation.

The UI Notification Inbox [ui_notification_inbox] table lists all sent notifications and their recipients.

Trouble?

If users receive duplicate notifications, verify that the notification trigger has only one content provider. If the notification has both a Next Experience and Workspace content provider, remove the Workspace content provider from the notification trigger to send only the Next Experience notification with custom content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Implementing notification action with a script

Use the **Script** field in the Notification Action form to update and implement a notification action.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Provider** > **Notifications**.
   A list of notifications shows up.
2. Select an existing notification.
3. Scroll down to the Notification Actions related list.
4. Open the Notification Action form and choose between the following options to reach the Notification Action form:
   - If there are no existing notification actions under Notification Actions related list, do the following.
     a. Click **New Provider Action** under Notification Actions related list.
     b. Select the type of notification action you would like to create from the Notification Action wizard.

     Note: Scriptable Action, Flow Action and Virtual Agent are the only types of notification actions available.

   - If there is an existing notification action, select one from the list under Notification Actions related list.

   The Notification Action form shows up.
5. On the form, update the fields as required.

Fields	Description
Name	Name of the actionable notification.
Application	Scope of the actionable notification record.
Notification	Name of the notification containing the actionable notification record.
Active	Option to activate the actionable prompt record.
Script	Script to implement the actionable notification.

6. Click **Update**.

Select provider notification action capabilities

Enable provider notification definitions to accept actions as scriptable action, flow actions, and virtual agent.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Notification** > **Provider** > **Notifications**.
   A list of notifications shows up.
2. Select an existing notification.
3. Scroll down to the related lists.
4. Select the Actions related list.
5. Select **New Provider Action**.
   The Notification Action wizard shows up.
6. Select one of the following types of notification actions you would like to create from the Notification Action wizard.
   - Scriptable Action
   - Flow Action
   - Virtual Agent

Create a scriptable notification action

Select **Scriptable Action** from the Notification Action wizard to create a scriptable notification action.

Before you begin

Role required: admin

`Before performing this task, you must complete` Select provider notification action capabilities .

Procedure

1. Select **Scriptable Action**.
2. On the form, fill in the fields.

Fields	Description
Name	Name of the notification action.
Application	Scope of the notification action record.
Notification	Name of the notification containing the notification action record.
Active	Option to activate the notification action record.
Script	Script to implement the notification action.
Acknowledgement	Acknowledgement message after an action is selected from a notification.

3. Select **Submit**.

Create a flow notification action

Select **Flow Action** from the Notification Action wizard to create a flow notification action.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Select **Flow Action**.
2. On the form, fill in the fields.

Fields	Description
Name	Name of the notification action.
Notification	Name of the notification containing the notification action record.
Async	Option to execute configured flow or action asynchronously.
Active	Option to activate the notification action record.
Choose Flow or Action	Option to select either Flow or Action. See Flow Designer for more information. **Note:** You can select either Flow or Action, but not both.
Inputs	Script used for the creation of flow notification action. **Note:** The script returns Json of key value pairs, which is passed as input in executing configured flow or action.
Acknowledgement	Acknowledgement message after an action is selected from a notification.

3. Select **Submit**.

Add actions to the notification content

Use the Link Actions to Content related list to add actions to the notification content, selection of the provider notification and ordering of actions of an actionable content.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Notification** > **Provider** > **Notifications**.
2. Select **New** to create a notification, or select an existing notification.

   Note: If the notification includes one or more actions, a message appears to remind you to ensure the actions are associated with content.

3. In the related lists section, select the Link Actions to Content related list.

4. Select **New** to create an actionable content.
5. On the form, fill in the fields.

Actionable Content form

Fields	Description
Name	Name of the action set.
Application	Scope of the notification.
Notification	Name of the notification.
Actions	Option to select the actions. **Note:** You can also set the order of actions of an actionable content.
Content	Option to select the content to apply to the selected action.
Active	Option to activate the action set.
Action(s) listed in event parm1	Option to link actions from event parm1. Actions must be sys_ids from the **sys_notification_action** table.
Action(s) listed in event parm2	Option to link actions from event parm2. Actions must be sys_ids from the **sys_notification_action** table.

6. Select **Submit**.

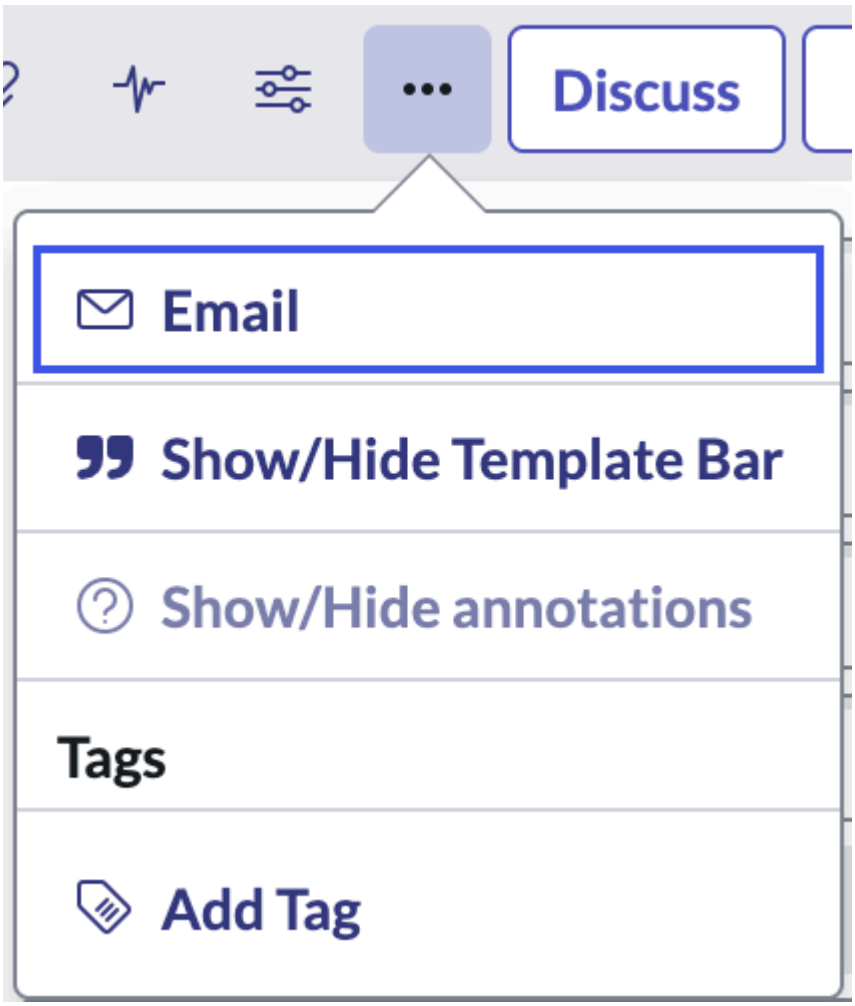
- Reference



Email client

Send email directly from any record, such as an incident, change request, or problem record.

Using the email client

You can use the email client either from a form or the record view in a workspace. To open the email client in a workspace or from a form, open a record and select the More options icon ···. Select **Email**

Email client

.

The email client looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

The email client uses the multipart/mixed content type and supports HTML markup in the message body.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Subject** field on the email client allows a larger character count than the default setting for the **Subject** field on the Email [sys_email] table. If the subject text from the client is being truncated, increase the **Max length** value for the **Subject** field on the Email table.

For more information on using the email client in a workspace, see Communicating via email in workspace.

Activation information

The email client is activated with the Email Client plugin (com.glide.email_client), which is active by default on the ServiceNow AI Platform.

The email client is enabled by default on the incident table. To enable the email client for another table, add the *email_client* dictionary attribute on the table's collection record. For more information, see Enable the email client for a table.

The email client is enabled by default on the change table.

Give users access to the email client by assigning them the email_composer role.

More setup

You can configure the email client by creating an Email Client Configuration [sys_email_client_configuration] record. For more information, see Email client configurations.

You can also create email client templates or quick messages to use predefined content in email client messages. For more information, see the following:

- Create an email client template
- Composing emails with quick messages

Optionally, you can give users the option to send email client messages as SMS text messages. For more information, see Enable SMS delivery with the email client.

Configure email client

Enable and configure email client.

Configuration overview

Enable the email client for a table

Enable the email client for a table so that users can send emails directly from the table record.

Before you begin
Role required: admin

About this task
The email client is enabled by default on the Incident [incident] table. You can enable the email client for another table by adding the *email_client* dictionary attribute to the table.

Note: This capability is not inherited by tables that extend the current table. For example, enabling the email client on the Task table does not enable it for the Incident or Problem tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a record in the table that you want to enable the email client for.
   For example, to enable the email client for the Problem [problem] table, navigate to **Problem** > **Open**, and then open any problem record.
2. On the form, select the menu icon (⋮) and then select **Configure** > **Dictionary**.
3. On the Dictionary Entries list, open the record of type **Collection**.
   The record does not have any entry for **Column name**.
4. On the form, in the Related Links section, select **Advanced view**.
5. In the **Attributes** field, enter `email_client=true`.
   If there are other values in the field, separate the attribute with a comma.
6. Select **Update**.

Email client configurations

Use email client configurations to manage the behavior of your email client. Each configuration consists of different email controls for setting allowable email recipients and email addresses.

The Email Client Configuration module is activated by default through the Email Client plugin (com.glide.email_client).

How email client configurations work

Email client configurations determine how your email client behaves, such as whether the From address or Reply-To address should be displayed. A configuration applies to a specific ServiceNow table, which enables you to define email client behavior for a specific context, purpose, or application. For example, if you have email client users who send email about Customer Service case records, you can create a configuration that applies email client controls specific to customer service. You can also select the email client recipient qualifiers for controlling the auto-complete recipient results from a selected table, such as the Customer Contact table.

An email client configuration consists of the following components:

Email client recipient qualifiers

Recipient qualifiers control the email recipients returned in the auto-complete results for the To, Cc, and Bcc fields of the email client. You can provide additional qualifiers displayed in the auto-complete results to differentiate recipients that have the same names and narrow the results.

> **Note:** Use the **To is Optional** field in the Email Client Configuration form to make the **To:** field optional to send an email.

Email client From addresses

This control enables the display of the From and Reply-To addresses. Use the Email Client Template to create a set of allowable From addresses that can be used when a user sends an email with the email client. You can provide a specific From address to be used in the email client, or you can choose to hide it entirely.

Email client attachment handling

By default, attachments that are sent from the email client are attached to the target record. Instead, you can select to attach files to the Email [sys_email] record, or you can set conditions that define which email client attachments are added to the target record. To see the status of all email attachments, go to the Email Attachments [sys_email_attachment] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also use an Email Client Template to define the content of an email client message and set other message characteristics, such as an email sender (From address) configuration.

Email client configuration process

Users with the admin role define and edit email client configurations. Users with the email_client_admin role can edit configuration information in selected tables.

1. **Build the various email client controls that can be used to create an email client configuration.**
   - Define email client recipient qualifiers
   - Define email client from addresses
2. **Create the email client configuration.**

   Define an email client configuration that determines how your email client behaves when users create an email message.

Define email client recipient qualifiers

Create a configuration that controls the auto-complete list of recipients displayed in the email client.

Before you begin

Role required: email_client_admin

About this task

You can specify recipient qualifiers that display additional fields (from a selected ServiceNow table) in the auto-complete list. These fields differentiate email recipients who have the same first and last names.

Use the following tabs in the Email Client Recipient Qualifier form to define a recipient configuration.

- **Display Configuration** – Set up the email recipient auto-complete behavior and optionally select additional fields to differentiate recipients who have the same name. The additional fields ensure that users select the proper recipient for an email.
- **Query Configuration** – Specify a condition or script that queries the selected table and filters the recipient results returned.

You can define different recipient configurations, which can be used in an email client configuration.

Procedure

1. Navigate to **Email Client** > **Email Client Recipient Qualifier** and select **New**.
2. Fill in the fields at the top of the Recipient Qualifier form.

Field	Description
Name	A unique name for this email client recipient configuration.
Application	The type of scoped application.
Table	The ServiceNow table to be queried for recipients.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	A brief description of this recipient configuration.

3. Fill in the fields in the **Display Configuration** tab to control the auto-complete display in the email client.

Field	Description
Email Address	The field on the table that contains the recipient email address.
Display Name	The field on the table used for the recipient name displayed.
Order	The order of results returned relative to other recipient qualifiers defined.
Additional Display Fields	A content list for choosing additional fields from the table to be displayed in the auto-complete list. Differentiates recipients who share the same name.
Search Additional Fields	A check box for enabling additional fields to be searched. Expands the recipients returned in the auto-complete list by querying (searching) the **Additional Display Fields**.

4. Fill in the fields in the Query Configuration tab.

Field	Description
Prefix Search	Option to find the desired recipient using prefix. **Note:** Selecting the **Prefix Search** option displays the **Last Name Field** drop-down menu with options to filter the recipient's name.
Type	Select the method for filtering the recipients returned in the auto-complete list: ○ Condition ○ Script
Conditions	If you selected Condition for the **Type**, use the condition builder to specify the conditions that must be met to return the appropriate recipients.
Script	If you selected Script for the **Type**, enter a script that uses these variables to return the appropriate recipients:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	○ *recipientQuery*: GlideRecord for the table being queried.
	○ *targetRecord*: GlideRecord for the target record from which the email client was opened.
	
	For example, this recipientQuery is a GlideRecord that represents the Customer Contact table. The targetRecord variable is a Customer Service case from which the email client was opened. This query limits the email client auto-complete results to contacts who belong to the same account as the Customer Service case.
	
	`(function (recipientQuery, targetRecord) {`
	
	`// Limit results to contacts belonging to the account for the case.`
	`var account = targetRecord.getValue('account');`
	
	`recipientQuery.addQuery('account', account);`
	
	`})(recipientQuery, targetRecord);`

5. Select **Submit**.
   The recipient qualifier configuration is added to the Recipient Qualifier [sys_recipient_qualifier] table and is available for use in an email client configuration.

Define email client from addresses

Set an allowable email address that is displayed in the From address of a message sent from the email client.

Before you begin

Role required: admin

Procedure

1. Navigate to **Email Client** > **Email Client From Address** and click **New**.
2. In the **Display name**, enter the name to be displayed in the From field of the email client message.
3. Enter a valid **Email address** for the From address in the email client.
4. Select **Submit**.
   The From address is added to the Email Client From Address [sys_email_client_from_address] table.

© 2026 ServiceNow, Inc. All rights reserved.

Create an email client configuration

Define a configuration that controls the display and behavior of the email client that is based on a selected ServiceNow table.

Before you begin

Role required: email_client_admin

About this task

The configuration determines the recipient auto-complete results that are displayed, email addresses that can be entered, and a set of allowable From addresses to be used when sending a message with the client.

You can create one email client configuration per ServiceNow table.

Procedure

1. Navigate to **Email Client** > **Email Client Configuration** and select **New**.
2. On the form, fill in the fields.

Field	Description
Name	Unique name for this email client configuration.
Application	Type of scoped application.
Active	Option that indicates that the configuration is active. The configuration is active by default.
Table	ServiceNow table that this client configuration applies to. Select a table from the list.

3. In the Recipient Configuration section, select **Recipient Qualifiers** to be used for this client configuration.
   a. Select the lock icon ( ).
   By default, two types of recipients are available: Active Users with email accounts and Active Groups with email accounts.
   b. Select the search icon ( ) and select a recipient configuration from the list of available recipient configurations.
   c. Select the lock icon ( ) to lock it.
4. In the Display Configuration section:
   a. Select the **Display From** option to display the From email address in the email client, or clear the check box to hide the From email address in the email client.
   b. Select the **Display Reply-To** option to display the Reply To address in the email client, or clear the check box to hide the Reply To email address in the email client.
5. In the Attachment Handling section, select from one of three choices for the **Attachment Send Action** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Attach to Email Record	Keep email client attachments on the Email [sys_email] record when you send an email.
Attach to Target Record	Attach email client attachments to the target record when you send an email. This option is the default value.
Conditionally Attach to Target Record	Set conditions that define which email client attachments are moved to the target record when you send an email. Attachments that do not meet the conditions remain on the email record when you send an email.

6. In the Filter Configuration section, select **Email Address Filters** to be applied to the email client.
   a. Unlock the lock icon ().
   b. Select the search icon () and select one or more Email Address Filters.
   c. Select the lock icon () to lock **Email Address Filters**.

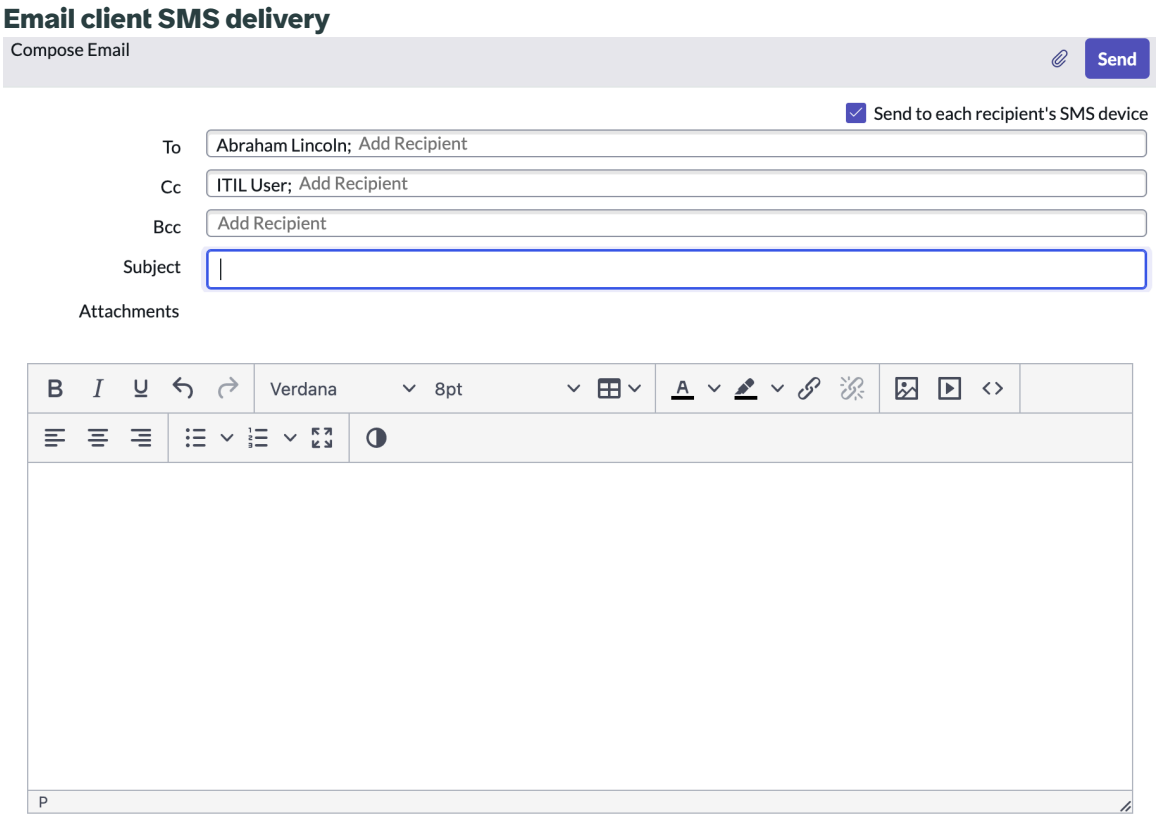
   Each filter that you select evaluates a given email address and determines whether or not the given address is valid to apply to an outbound email.
7. Click **Submit**.
   The configuration is added to the Email Client Configuration [sys_email_client_configuration] table.

Enable SMS delivery with the email client

Give users the option to send an email client message as an SMS text message.

Before you begin

Role required: admin



Procedure

1. In the application navigator, enter `sys_properties.list`.
2. From the list, find and open the record for the *`glide.email_client.show_sms_option`* property.
3. On the form, change **Value** to **true**.
4. Click **Update**.

Result

In the email client, user can select to send the message as an SMS text message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the recipient doesn't have a registered SMS device, the email client sends the message to the primary email device.

Add a system property

Create an email client template

Create a different template for each table that uses the email client to pre-populate data for recipients and email content.

Before you begin

Role required: admin

About this task

The email client uses its own email templates to define default values for fields. Use the following sections in the Email Client Template form to build a client template:

- Content: The message body.
- Recipients: The email addresses of users receiving the email message. The email addresses are displayed in the To, Cc, and Bcc fields of the message.
- Sender Configuration: The method used to generate the email sender (From email address) of the message.

Procedure

1. Navigate to **All** > **Email Client** > **Email Client Templates**.
2. Select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email Client Template form

Field	Description
Name	Unique template name.
Table	The table that the template applies to. Enable the email client for the same table.
Conditions	The conditions that determine when this client template is used. Use the condition builder to identify the target record that must match before this template is applied to the email client. **Note:** Conditions are only used for to apply a default template upon initial load. Conditions are not used when loading a custom email template from a workspace sidebar.
Application	The type of scoped application.
Execution Order	A number that indicates the order in which the template conditions are evaluated. The template with the lowest execution order is considered.
Include attachment from email	Option for including attachments from email to the **replyall-received**, **reply-received**, **forward-sent**, **reply-sent**, **replyall-sent**, and **forward-received** response templates. **Note:** This option is applicable only for response email in a configurable workspace.

4. On the **Content** tab, fill in the fields.

Content tab

Field	Action
Subject	Enter a description of the email. **Note:** The **Subject** field on the email client allows a larger character count than the default setting for the **Subject** field in the Email [sys_email] table. If the subject text from the client is being truncated, increase the **Max length** value for the **Subject** field in the Email table.
Content Type	Select the format of the message body content: **HTML** or **plain text**.
Body HTML	If you've selected **HTML** for the **Content Type** field, enter the content of the message body using the HTML editor toolbar to format the HTML. To reference field values, select variables from the variables list or manually type variable references using the syntax `${table_name.variable_name}`. To reference the user who launches the email client, enter the variable `${current_user}`. **Note:** Line breaks don't appear for multi-line fields such as ${description} and ${comments} in the email client template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Action
	You can call a mail script by using `${mail_script:script name}` in the **Body HTML** field.
Body text	If you selected **plain text** for the **Content Type** field, enter any text or mail script that you want to appear in the message body. You can insert a mail script in the **Body text** field by using the following syntax: `<mail_script> [code] </mail_script>`

5. On the **Recipients** tab, fill in the fields.

Recipients tab

Field	Action
To	Enter a comma-separated list of either field names that contain user email addresses or just email addresses. To reference an email address using a script, create a script include and then call the script include in the **To** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. Use only one JavaScript expression and do not combine it with field names.
Cc	Enter a comma-separated list of either field names that contain user email addresses or just email addresses. To reference an email address using a script, create a script include and then call the script include in the **Cc** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. Use only one JavaScript expression and do not combine it with field names. This field can't have the same addresses as the **To** field.
Bcc	Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the **Bcc** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. Use only one JavaScript expression and do not combine it with field names. This field can't have the same addresses as the **To** or **Cc** fields.

6. On the **Sender Configuration** tab, select the **From Generation Type** method to determine how the sender (From address) in the email client message is generated.

Type	Description
None	The From address isn't generated in the email client message.
SMTP Email Account	Use the From address of the SMTP email account for the instance as the sender.
Select From List	Choose from a list of allowable From addresses de fined in the Email Client From Address [sys_email_client_from_address] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Description

Script	Run a GlideRecord query on the Email Client From Address [sys_email_client_from_address] table.
	
	For example, the following script sets the From address based on the location of the incident caller:
	
	`(function (fromAddressQuery, targetRecord) {`
	`  // targetRecord is incident for this template`
	`  var location = targetRecord.caller_id.country;`
	
	`  if (location == 'us')`
	`  fromAddressQuery.addQuery('email_address', 'servicedesk.us@example.com');`
	`  else if (location == 'japan')`
	`  fromAddressQuery.addQuery('email_address', 'servicedesk.jp@example.com');`
	`  else if (location == 'uk')`
	`  fromAddressQuery.addQuery('email_address', 'servicedesk.uk@example.com');`
	
	`})(fromAddressQuery, targetRecord);`

Text	Enter the email From address to be used in the client.
User Email Addresses	For integrating users or agents personal corporate mail boxes with ServiceNow to send and receive emails. **Note:** This requires User Mailbox Integration (com.glide.email.user_mailbox.integration) plugin to be installed.

Use this method only if you want a different From address than the one defined in your SMTP email account.

Note:

The From email address doesn't appear in the email client unless you configure an email client to display the From address. For more information on managing the behavior of an email client, see Email client configurations.

If the domain for the From address isn't the domain of the SMTP email account server, the owner of the From domain address must configure the SPF record for the domain. The owner changes the domain settings to enable the instance to send an email as if from that domain. For more information on using SPF records, see ServiceNow KB0535456.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Submit**.
   The template is added to the Email Client Templates [sys_email_client_template] table.

Script includes

Apply an email client template

After you create an email client template, you can apply it to an email.

Before you begin
Role required: admin

About this task
The following steps are implemented only after creating an email client template

Procedure

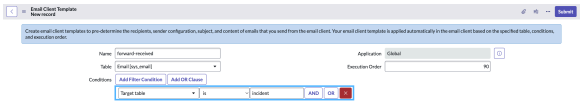
1. Click the ellipsis (...) icon at the top of the template to apply the template to an email.
2. Select **Email**.
3. Fill in the fields to compose an email.
   See Create an email client template for field details.

> **Note:** The body of the email is filled up with the details from the incident record. If you modify one or more fields in the incident record and are not saved, the unsaved changes still reflect in the email body.
>
> **Note:** 2000 characters is the total limit for all the changes in the incident record. If some of your changes are not reflected and get truncated in the email body, this is because the total changes is more than 2000 character limit.

Create an email client response template

You can now create custom email client response templates that support conditions.

Before you begin
Role required: admin



About this task
Email client template is applied automatically in the email client based on the specified table, conditions, and execution order.

Procedure

1. Navigate to **All** > **Email Client** > **Email Client Templates**.
   The following options for **Response Template - Received** and **Response Template - Sent** show up.
2. Click one of the available options to create a template for that selected option.
3. Fill in the fields at the top of the Email Client Template form.

Field	Description
Name	Auto-filled template name based on the selected template option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This is a read-only field.
Table	Auto-filled table name. **Note:** This is a read-only field because for response templates, the table name is always sys_email.
Conditions	The conditions that determine when this client response template is used. Use the condition builder to identify the target record that must match before this template is applied. **Note:** If the conditions are not true, the email client gets the default template. Select the target table name under conditions that the template applies to. Enable the response template for the same table. 
Application	The type of scoped application.
Execution Order	A number that indicates the order in which template conditions are evaluated.

4. Fill in the fields in the **Content** tab.

Field	Description
Subject	Enter a description of the email. **Note:** The **Subject** field on the email client allows a larger character count than the default setting for the **Subject** field on the Email [sys_email] table. If the subject text from the client is being truncated, increase the **Max length** value for the **Subject** field on the Email table.
Content Type	Select the format of the message body content: HTML or plain text.
Body HTML	If you selected HTML for the **Content type**, enter the content of the message body using the HTML editor toolbar to format the HTML. To reference field values, select variables from the variables list or manually type variable references using the syntax `${table_name.variable_name}`. To reference the user who launches the email client, enter the variable `${current_user}`. **Note:** Line breaks don't appear for multi-line fields such as ${description} and ${comments} in the email client template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You can call a mail script by using `${mail_script:script name}` in the **Body HTML** field.
Body text	If you selected plain text for the **Content type**, enter any text or mail script that you want to appear in the message body. You can insert a mail script in the **Body text** field by using the following syntax: `<mail_script> [code] </mail_script>`

5. Fill in the fields in the **Recipients** tab.

Field	Description
To	Enter a comma-separated list of either field names that contain user email addresses or just email addresses. To reference an email address using a script, create a script include and then call the script include in the **To** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. Use only one JavaScript expression and do not combine it with field names.
Cc	Enter a comma-separated list of either field names that contain user email addresses or just email addresses. To reference an email address using a script, create a script include and then call the script include in the **Cc** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. Use only one JavaScript expression and do not combine it with field names. This field can't have the same addresses as the **To** field.
Bcc	Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the **Bcc** field. Your script must start with the `javascript:` prefix. The script must return email addresses in a comma-separated string. Use only one JavaScript expression and do not combine it with field names. This field cannot have the same addresses as the **To** or **Cc** fields.

6. In the **Sender Configuration** tab, select the **From Generation Type** to determine how the sender (From address) in the email client message is generated.
   Use this field only if you want a different From address than the one defined in your SMTP email account.
   - None: The From address is not generated in the email client message.
   - SMTP Email Account: Use the From address of the SMTP email account for the instance as the sender.
   - Select From List: Choose from a list of allowable From addresses defined in the Email Client From Address [sys_email_client_from_address] table.
   - Script: Run a GlideRecord query on the Email Client From Address [sys_email_client_from_address] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, the following script sets the From address based on the location of the incident caller:

```
(function (fromAddressQuery, targetRecord) {
    // targetRecord is incident for this template
    var location = targetRecord.caller_id.country;

    if (location == 'us')
        fromAddressQuery.addQuery('email_address',
 'servicedesk.us@example.com');
    else if (location == 'japan')
        fromAddressQuery.addQuery('email_address',
 'servicedesk.jp@example.com');
    else if (location == 'uk')
        fromAddressQuery.addQuery('email_address',
 'servicedesk.uk@example.com');

})(fromAddressQuery, targetRecord);
```

- Text: Enter the email From address to be used in the client.

Note: The From email address does not appear in the email client unless you configure email client to display the From address. For more information on managing the behavior of email client, see Email client configurations.

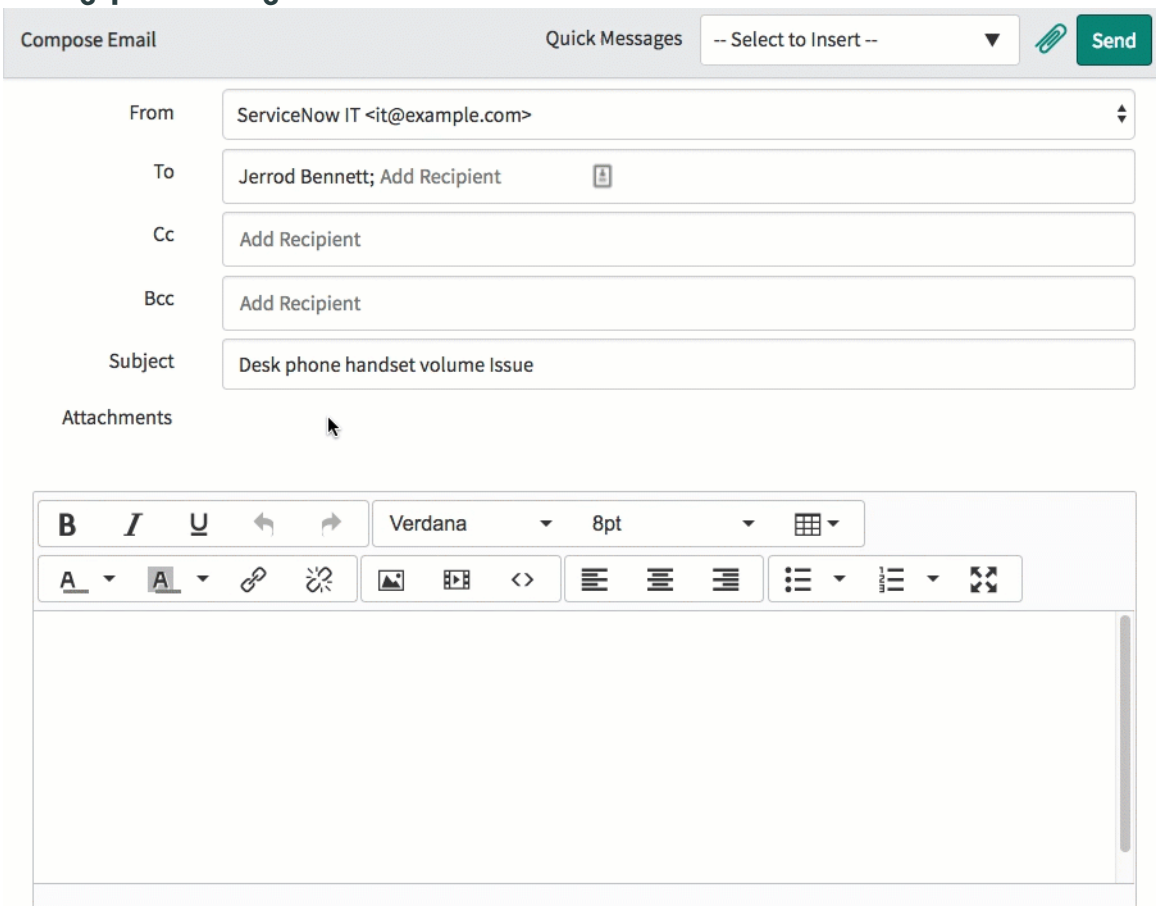
If the domain for the From address is not the domain of the SMTP email account server, the owner of the From domain must configure the SPF record for the domain. The owner changes the domain settings to allow the instance to send email as if from that domain. For details on using SPF records, see ServiceNow KB0535456.

7. Click **Submit**.

Composing emails with quick messages

Insert predefined content into the message body of emails that you send from the email client.

Using quick messages



In the email client, you can select a quick message to fill the email body with the content that is specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client so that you can construct an email with multiple quick messages.

By default, the quick message content is inserted at the place of the cursor. It doesn't replace the content that you created before selecting the quick message. To replace message content with a quick message, highlight the text to replace and then select a quick message.

Note: To instead have quick message content replace all existing content in an email draft, set the *glide.email_client.quick_message.insert* property to **false**.

Adding quick messages to an email

Creating quick message content

Define quick messages by creating records in the Email Client Canned Messages [sys_email_canned_message] table.

When you define a quick message, you can add any of the following types of content into the message body:

- Icons
- Logos
- Pictures
- Rich-text HTML
- Hyperlinks
- Variables
- Any other HTML constructs

Note: If you add attachments to the quick message, the attachments aren't sent as part of the email distribution.

Assign the email_client_quick_message_author role to business managers so that they can create quick messages for users in their group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting quick message conditions

When you define a quick message, you can limit the availability of the quick message according to:

- The user who launches the email client
- The group of the user who launches the email client
- The table of the record from which you launch the email client
- The target record from which you launch the email client

For example, if you designate Beth Anglin as the user for a certain quick message, the quick message is available in the email client only for Beth Anglin.

If you associate a quick message to the Incident [incident] table, the quick message is available in the email client only after you launch from an incident record. If you specify a target record from the Incident table for the quick message, the quick message becomes available in the email client only for matching incident records.

Define a quick message

Create predefined content to add in the email client so that users can write emails consistently and efficiently.

Before you begin

Role required: email_client_quick_message_author or admin

Procedure

1. Navigate to **Email Client** > **Quick Messages**.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
Title	Name that appears in the Quick Message selector.
Active	Option for activating the quick message. When selected, the quick message is available for selection in the Quick Message selector.
Application	Type of scoped application.
User	User who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.
Group	Group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.
Table	Table to which the quick message applies. To make the quick message available for all tables, leave blank.
Conditions	Target record that must match the conditions before the quick message appears for selection in the email client.
Body	Content to insert in the **Message Text** field in the email client. By default, the field supports HTML format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	To reference field values, select variables from the variables list or manually type variable references using the syntax `${table_name.variable_name}`. To reference the user who launches the email client, enter the variable `${current_user}`. To reference the title of the user who launches the email client, enter the variable `${current_user.title}`. **Note:** To view and select the variables, you must select a Table. You can use these values to include a predefined signature in email responses from agents to customers. **Note:** Line breaks don't appear for multi-line fields such as ${description} and ${comments} in the email client template.

4. Select **Submit**.

Email address internationalization

Email address internationalization allows international character support for email addresses for non-English characters when sending and receiving emails. Email addresses can have non American Standard Code for Information Interchange (ASCII) characters.

Enable or disable International characters in an email by running a scheduled job.

The *glide.email_address.rfc6530.enabled* system property can be set to true only if the configured email SMTP server for the instance supports SMTP UTF8 extension. This property by default enables sending and receiving of inbound emails to and from international email addresses including processing of the emails received from encoded international email addresses.

Enable or disable email address internationalization

Enable email address internationalization by setting the *glide.email_address.rfc6530.enabled* system property to `true`.

Disable email address internationalization by setting the *glide.email_address.rfc6530.enabled* system property to `false`.

Customize email address internationalization

Customize email address internationalization to turn off processing of inbound and outbound emails, disable support for inbound emails or to add email address format for decoding international email addresses.

Before you begin
Role required: admin

Procedure

1. **Optional:** Turn off processing of inbound and outbound emails from or to RFC 6530 email addresses.

   a. In the navigation filter, enter `sys_properties.list`.

   b. Select **New** to create the *glide.email_address.inbound.rfc6530* property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the form, fill in the details.

Fields	Input
Name	*glide.email_address.inbound.rfc6530*
Description	This property turns off processing of emails from RFC 6530 email addresses.
Type	true|false
Value	false
Ignore cache	Select the check box. **Note:** When Ignore cache check box is selected, the system flushes the server cache when the parameter is changed.
Read roles	Define the roles that have read access to this property.
Write roles	Defines the roles that have write access to this property.

d. Select **Submit**.

2. **Optional:** Disable support for processing inbound emails received from encoded email addresses.

a. In the navigation filter, enter `sys_properties.list`.

b. Select **New** to create *glide.inbound.rfc6530.support.encoded.from.address* property.

c. On the form, fill in the details.

Fields	Input
Name	*glide.inbound.rfc6530.support.encoded.from*
Description	This property disables support for processing emails received from encoded email addresses.
Type	String
Value	false
Ignore cache	Select the check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Input
	Note: When Ignore the cache check box is selected, the system flushes the server cache when the parameter is changed.
Read roles	Define the roles that have read access to this property.
Write roles	Define the roles that have write access to this property.

d. Select **Submit**.
The encoded email addresses are received-ignored.

3. **Optional:** Add email address format for decoding international email addresses if the format isn't ISO-8859-1, ISO-8859-8, or ISO-8859-15.
   a. In the navigation filter, enter `sys_properties.list`.
   b. Open the *`glide.inbound.rfc6530.supported.encoding.formats`* system property.
   c. Add the required format to the value field, for multiple formats use comma-separated list.
   d. Select **Update**.

Components installed with the email client

Several types of components are installed with activation of the Email Client (com.glide.email_client) and Email Client Template (com.glide.email_client_template) plugins, including tables and user roles and tables.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Tables installed

Table	Description
Email Client Configuration [sys_email_client_configuration]	Controls for the email client. There's only one Email Client Configuration record for each table that uses the email client.
Email Client From Address [sys_email_client_from_address]	Email addresses that users can select as the From address of an email client message.
Recipient Qualifier [sys_recipient_qualifier]	Email addresses that users can send email client messages to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Email Client Template [sys_email_client_template]	Templates that are applied automatically to qualified email client messages.

Email client administrator [email_client_admin]

Configures the email client to fit the needs of your organization and can read or write email client templates.

Contains Roles

List of roles contained within the role.

- email_client_quick_message_author
- email_client_template_write

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note: Avoid granting an admin role when more specialized roles are available.

Email composer [email_composer]

Creates email client messages and can read email client templates.

Contains Roles

List of roles contained within the role: email_client_template_read.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

None.

Read-only role for email client templates [email_client_template_read]

Reads email client templates.

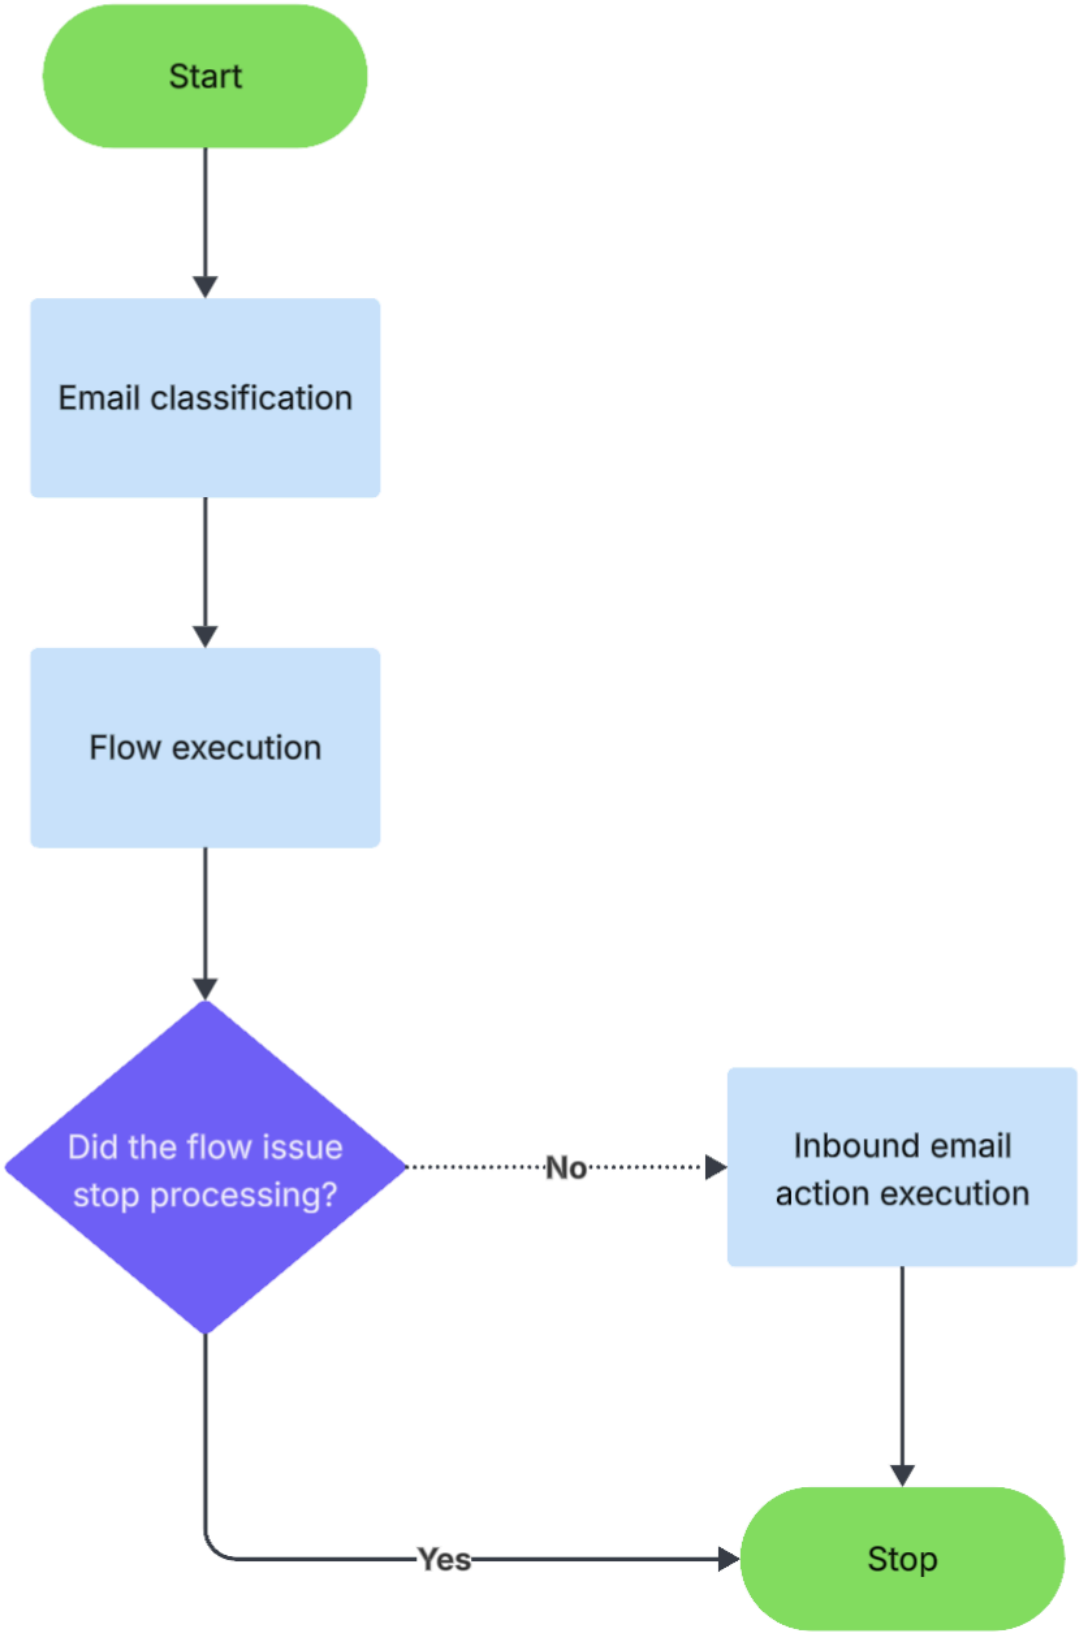
Automating system responses to inbound email

Save time from responding to emails manually when you configure your instance to send replies, create incidents, or update records automatically in response to inbound emails.

You can define system responses to inbound emails in two ways:

- Create an inbound email flow in Workflow Studio
- Script an inbound email action

Inbound email trigger in Workflow Studio



With the inbound email trigger in Workflow Studio, you can create flows that define the automated processes that your instance takes when it receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The following diagram shows the processing order for inbound emails. When an email is sent to your instance, the system first classifies the email as a reply, forward, or new email. Then the system runs the inbound email through an inbound email flow. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop processing, the system tries to match the email to another inbound email flow. If at any point the email does not match with an inbound email flow, the system matches the email to an inbound email action instead.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Provides an easy and accessible interface that uses natural language.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Reduces upgrade costs, with upgrade-safe ServiceNow AI Platform logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.

For more information on creating inbound email flows in Workflow Studio, see Workflow Studio flow trigger types or follow the steps in Create a flow with an inbound email trigger. To view or manage your inbound email flows, navigate to **Flow Designer** > **Inbound Email Flows**.

Column Level Encryption for email attachments

Secure attachments in inbound and outbound emails using Column Level Encryption.

Using Column Level Encryption for email attachments requires you to have Column Level Encryption configured on your instance. For more information, see Column Level Encryption.

For each inbound email action, when an email includes attachments and the target record table is Column Level Encryption-enabled, the attachments added to the target record are encrypted.

If an inbound email with attachments is received from an external user who does not have access to the target table, the attachments are not added to the target record such as an incident or case. Instead, the attachments are added to the sys_email record and the email logs.

When you send an outbound email from a workspace with attachments encrypted on the target table, the attachments are decrypted before sending the email so recipients can access them.

Note: To disable adding encrypted attachments to outbound emails, create a system property named *`glide.attachment.restrict_cle_attachments`*, and set it to **true**. By default, this property is set to **false**.

Inbound email actions

Define an inbound email action and processing to script how the system responds to an inbound email.

Inbound email actions

Define an inbound email action to script how the system responds to an inbound email.

Note: Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the system takes the inbound email action that you configure. The system can take two types of actions:

- Record action: setting a value for a field in the target table.
- Email reply: sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action's script.

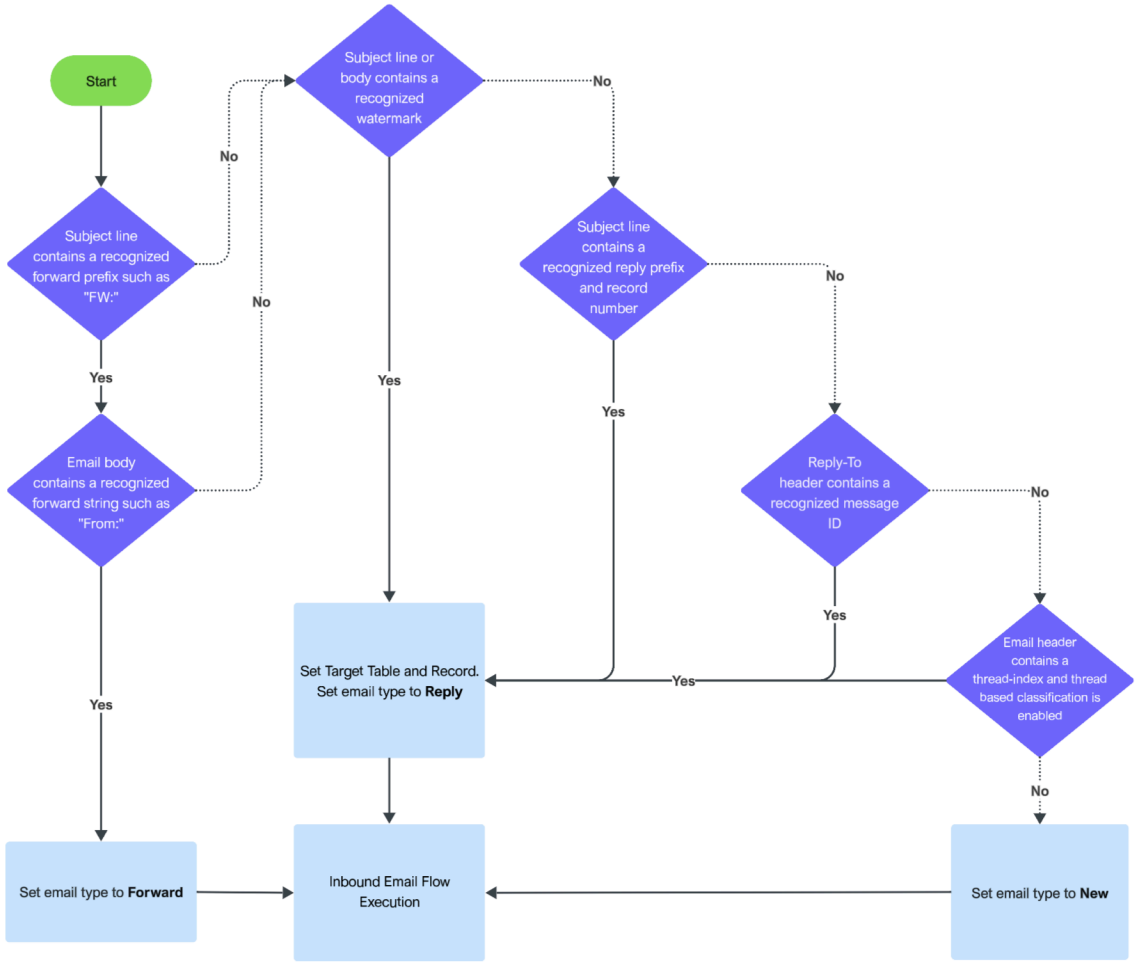
Inbound email receive types

The system classifies all incoming email into one of three types: forward, reply, or new.



Inbound action classifications

Order	Type	Criteria
1	Forward	The system classifies an email as a forward only when it meets all these criteria: • The subject line contains a recognized forward prefix such as **FW:**. • The email body contains a recognized forward string such as **From:**. The system classifies any email that meets these criteria as a forward, even if the message contains a watermark or record number that otherwise classifies it as a reply.
2	Reply	The system classifies an email as a reply when it fails to match it to the forward receive type and it meets any one of these criteria: **1.** The subject line or email body contains a recognized watermark such as **Ref:MSG0000008**. **2.** There is no watermark and the subject line contains a recognized reply prefix such as **RE:** and a recognized record number such as **INC0005574** **3.** There is no watermark and the Reply-To header contains a recognized message ID of an email with watermark. **4.** If an email does not meet any of the previous criteria, the system checks the email header for a thread-index. When a thread-index is present, the system classifies the email as a reply and associates it with the relevant conversation or thread view. This functionality is supported only for emails originating from Microsoft Outlook. **Note:** To enable thread indexing, create the system property *glide.inbound.email.classify.by.thread_index* and set it to **true**.
3	New	The system classifies an email as new when it fails to match it to the forward and reply receive types.

Note: From Paris release and beyond, if an email body has multiple watermarks, the last watermark in the email body is considered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Determining the type of incoming email

Attachments

If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.

Character encoding

- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
- Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.

See the System email log and mailboxes for examples of what you might see if a notification or inbound email action is not processed.

Note: The state of all incoming emails that have been run against inbound email actions, even if there is no matching action, is changed to **Processed**.

Domain separation

The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For

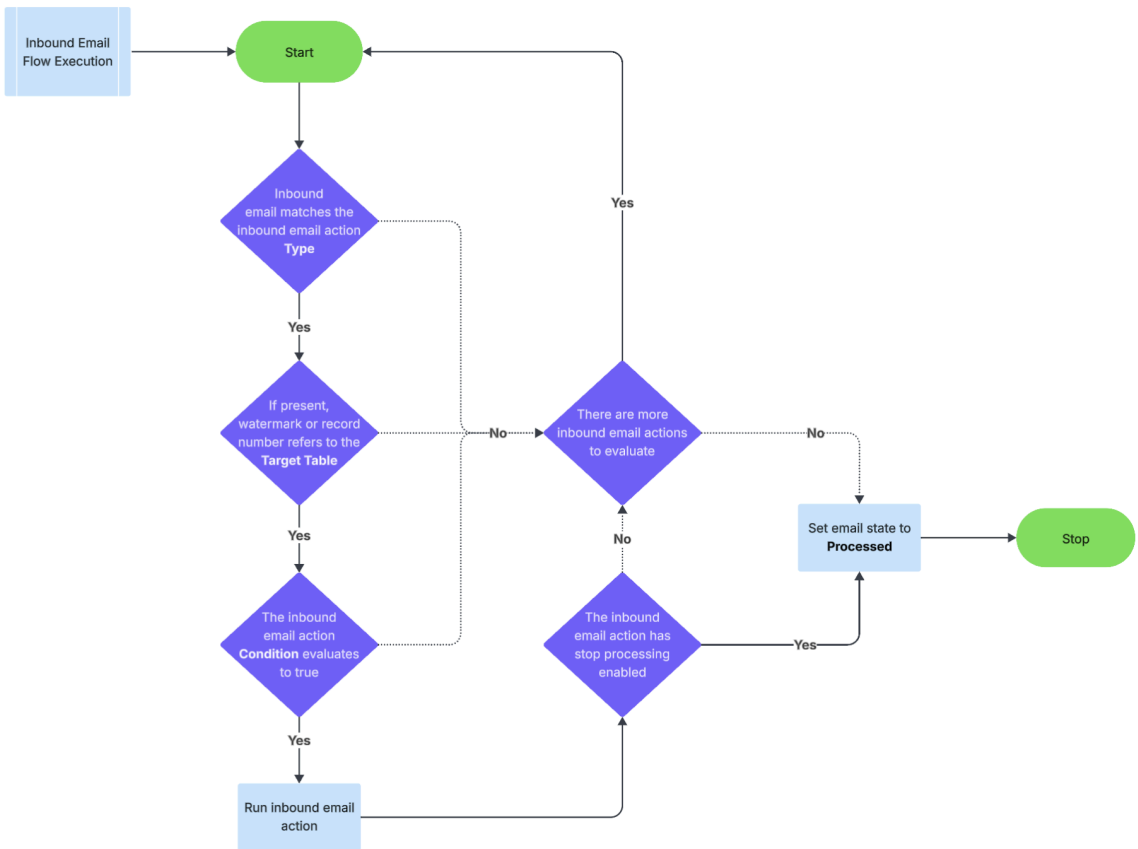
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the **Caller** field. If that user is not in the User [sys_user] table, the incident is in the global domain.

Related topics

Notification variables

Watermarks on notification emails



Inbound email action processing

The system determines which inbound actions to run by comparing the inbound email type and inbound action conditions to the incoming email message. Certain properties are available to set the reply and forwarding prefixes in the email subject lines that your instance recognizes when processing inbound emails.

Note: Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The system follows this processing flow to determine whether to run an inbound action.

Inbound action processing work flow

The system only runs an inbound action when:

- The incoming email type matches the inbound action **Type**.
- If present, the watermark or record number refers to a record in the **Target table**.
- The inbound action **Conditions** evaluates to true.

If any of these criteria are not met, the system skips the current inbound action and evaluates the next active inbound action. The system processes inbound actions from the lowest to highest

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order value. If the inbound action has **Stop processing** enabled, the system updates the **State** of the email record to **Processed** after running the inbound action **Script**.

The following video shows how an inbound action condition prevents an incident from being created.

Prefixes recognized in email subject lines

Email reply prefixes

When no watermark is present or the In-Reply-To email header is present, the instance recognizes email containing a prefix from the *glide.email.reply_subject_prefix* property as reply email. You can use this property to set non-standard reply prefixes in your email system.

Property	Description
glide.email.reply_subject_prefix	Specifies the comma-separated list of prefixes in the subject line that identify an email reply. • Type: string • Default value: re:,aw:,r:,Accepted:,Tentative:,Declined: **Note:** The case of the reply prefix in the email, for example RE:, must exactly match the case of the prefixes defined in this property. If, for example, an email contains the Re: prefix and only RE: is defined in the property, the email will not be recognized as a reply. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as RE:, Re:, and so on.

Email forward prefixes

Emails with certain prefixes trigger the forward type of inbound email action. The instance recognizes any email whose subject line contains a prefix from the *glide.email.forward_subject_prefix* property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. Use this property to set non-standard forward prefixes in your email system or you want email forwards to behave like replies. If the value of the system property is empty, then the system reverts to using the values **fw:** and **fwd:**.

Property	Description
glide.email.forward_subject_prefix	Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• Type: string • Default value: fw:,fwd: • Location: Add to the System Properties [sys_properties] table **Note:** Prefixes are case insensitive.

Email forwards as replies

Properties are available to force inbound actions to process forwarded mail as replied mail. These properties control the subject prefix that the inbound actions use.

Property	Value needed
glide.email.reply_subject_prefix	re:,Re:,RE:,aw:,r:,fw:,fwd:,Fwd:,FWD:
glide.email.forward_subject_prefix	[any text that is not a forward prefix]

These properties cause the Update Incident inbound action to process all forwarded and replied-to mail.

Note: The *glide.email.forward_subject_prefix* property must contain some text so that the forwarded email can be processed as a Reply. It can be any text except a forward prefix (that is, fw:,fwd:,Fwd:,FWD:).

Matching a sender email address to a user

The instance matches a senders email address to an active user in the User [sys_user] table using inbound actions.

When processing an email, the instance sets the current user to the user whose email address matches **email.from**. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the **caller_id** of the incident to the value returned by `gs.getUserID()`.

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

Note: Each user record must have a unique email address so that the instance can reliably match the email to the correct user.

If a unique email address for each user is not possible, assign a shared email address to only one active user so that the instance always matches incoming email from that address to the active user.

Matching watermarks in the Subject line or Body

The following examples illustrate how the instance matches randomized watermarks in an email subject line or body.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: For instances upgraded from a release before Jakarta, the system can recognize both randomized and non-randomized watermarks during a watermark transition period.

Examples of matching watermarks in the Subject line or body

Subject Line or Body Contents	Matching Results
Ref:MSG0000008_ aLJc130zDhCVuh3spXmt	The instance recognizes this string as a watermark and searches the Email Watermarks [sys_watermark] table for a record with the number MSG0000008_ aLJc130zDhCVuh3spXmt. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in .
Ref:MSGWTR0000008_wfLLz42IxCgUvG2JlYnh	The instance recognizes this string as a watermark and searches the Email Watermarks [sys_watermark] table for a record with the number MSGWTR0000008_wfLLz42IxCgUvG2JlYnh. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in .

Matching record numbers in the Subject line or Body

The following examples illustrate how the instance matches record numbers in the subject line of an email to an existing record when no watermark is present.

Examples of matching record numbers in the Subject line

Subject line contents	Matching results
RE: Example INC0005574	The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record `INC0005574`. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.
RE: Example "INC0005574" RE: Example *INC0005574	The instance recognizes this subject line as a reply but does not recognize the `"INC` prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.
RE: "Example INC0005574" RE: Example INC0005574*	The instance recognizes this subject line as a reply and recognizes the `INC` prefix as belonging to the Incident table. The instance searches the Incident table for an existing record `INC0005574"`, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound

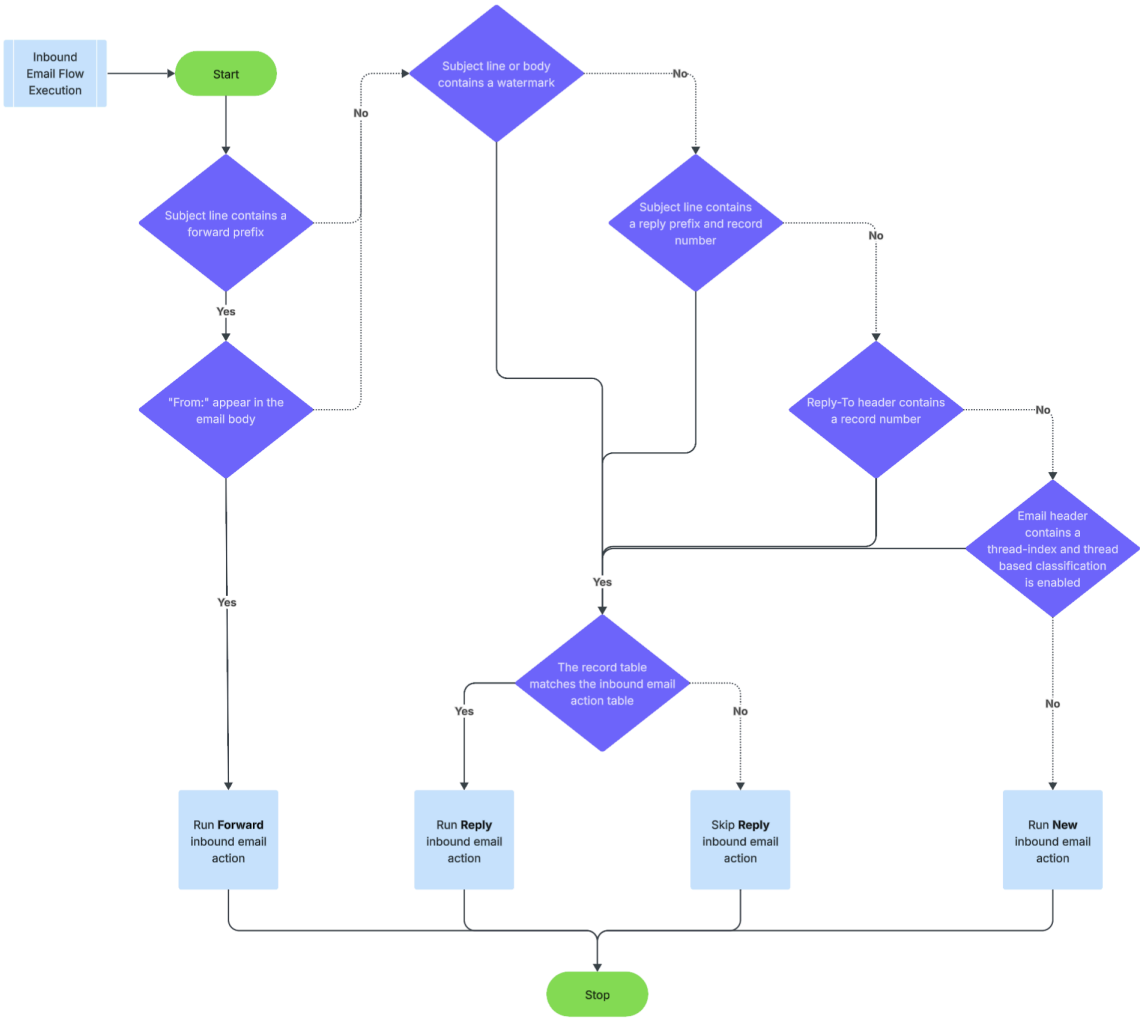
Examples of matching record numbers in the Subject line (continued)

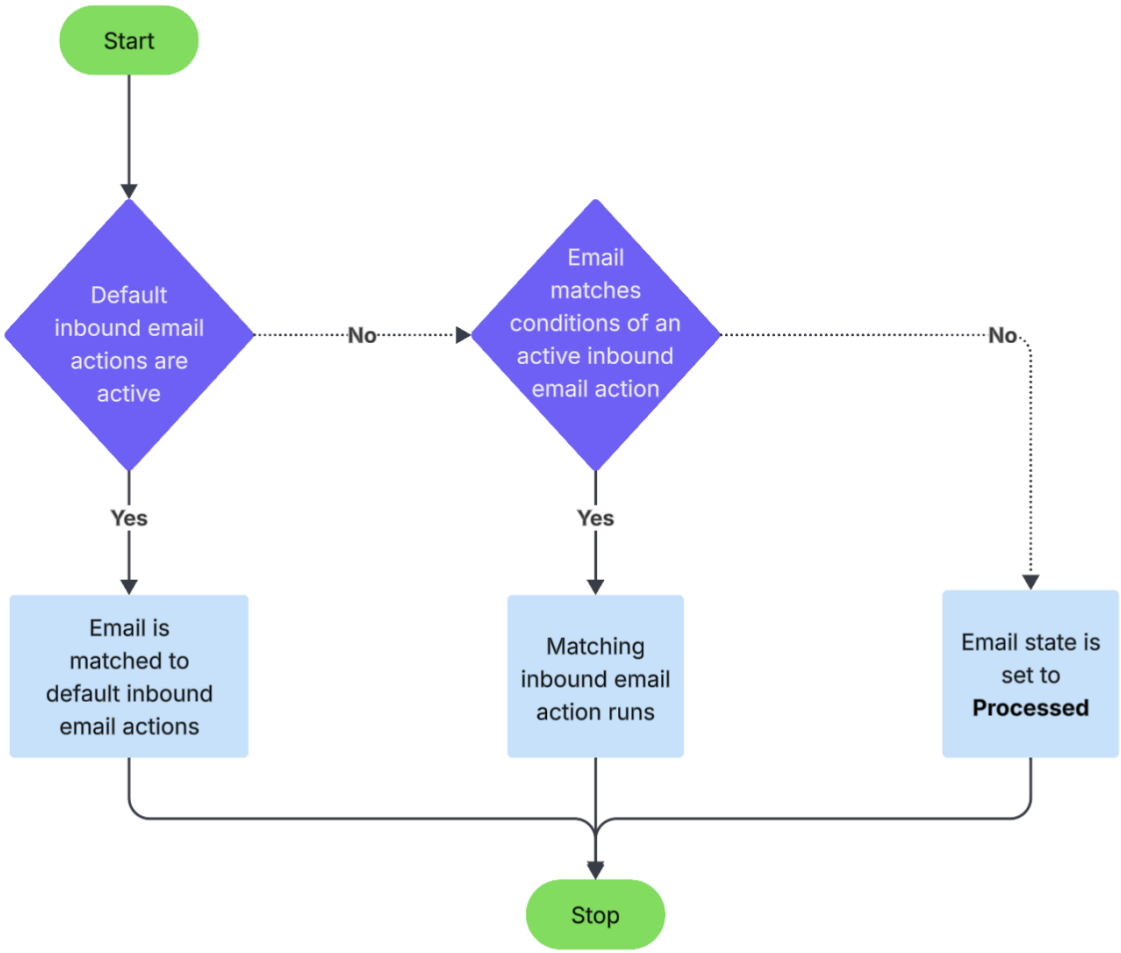


Subject line contents	Matching results
	action for new emails to create an incident and associates the new incident with the email.
RE: CHG0008593 and INC000576	The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance matches first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email. **Note:** The instance does not support processing email with multiple numbers in the subject line because there is no way to predict which record the instance matches first. For this reason, do not include more than one $number variable in your notifications.
FW: Example INC0005574	The instance recognizes this subject line as a forward because of the `FW:` prefix. It uses the inbound action for forwarded emails to create an incident and associates the new incident with the email.
Example INC0005574	The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident and associates the new incident with the email.

Criteria for matching email to inbound actions

Default conditions of active inbound actions are used to manage incoming email. Inbound email actions are classified as forward, reply, or new based on subject line, record matching, and email headers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Default matching criteria

If you customize or deactivate the default inbound actions, the conditions of the active inbound actions are checked. If an inbound action with matching conditions cannot be found, the state is set to Processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom matching criteria

Inbound action type criteria

Inbound email action type	Required matching criteria	Name of default action (Incident table)	Result of default action
Forward	The email contains the following conditions: • A subject starting with a recognized forward prefix even if a watermark or an In-Reply-To header is present • From <user email> appears anywhere in the email body.	Create Incident (Forwarded)	Create new record
Reply	The email contains one of the following conditions and the table specified in the email matches the table of the inbound action: **1.** A valid watermark that matches an existing record. **2.** A subject line starting with a recognized reply prefix when no watermark is present and a valid record number that matches an existing record.	Update Incident (BP)	Update existing record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inbound action type criteria (continued)

Inbound email action type	Required matching criteria	Name of default action (Incident table)	Result of default action
	3. An In-Reply-To email header when neither a watermark nor a valid record number is present that matches an existing record. **4.** A thread-index in an email header when the email does not meet any of the previous conditions that matches an existing record. **Note:** To enable thread indexing, create the system property *glide.inbound.email.classify.by.thread_index* and set it to **true**.		
New	The email does not meet the conditions for either a reply or forward type inbound email action	Create Incident	Create new record

If more than one inbound action is available for a particular type of email, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action's table, the instance uses the **Order** field to determine the order in which the actions run.

Configure inbound email actions

Configure a processing order for inbound email actions and use the order to manage multiple filters in inbound email actions.

Enable automatic user creation

An administrator can set an email property to automatically create users from incoming email. The administrator provides a list of trusted domains to prevent untrusted users from being automatically created.

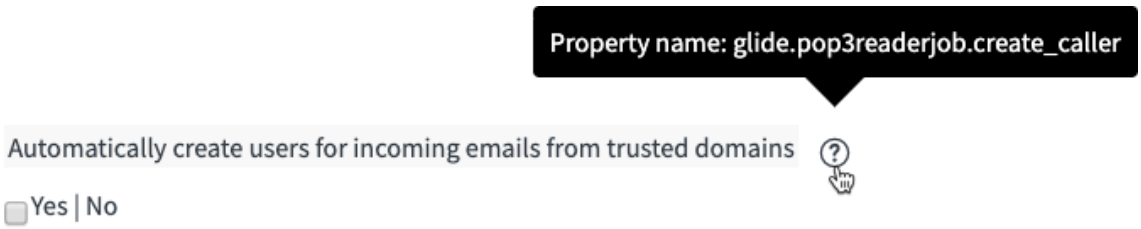
Before you begin

Role required: admin

About this task

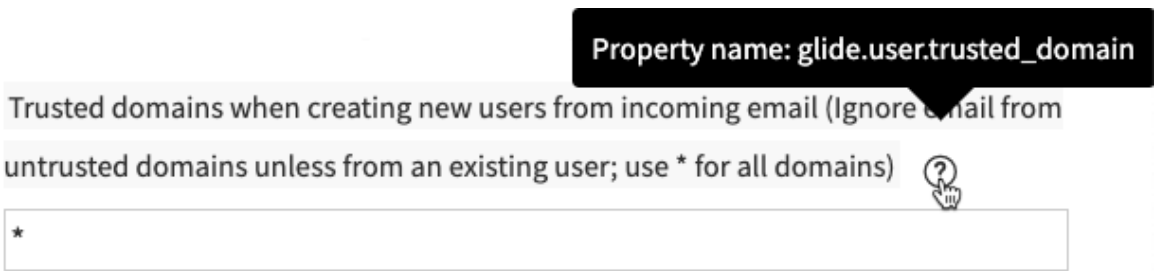
For example, you can prevent email from users outside your company domain from creating incidents. When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID [sys_user.user_name] set to the sender's full email address.
Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

Note: To learn more about the *glide.user.trusted_domain* property, which affects automatic email creation, see Restrict emails by domain for user creation (instance security hardening) in the Instance Security Hardening Settings.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating users from incoming email



Value of email.from Variable	User ID Created	Email Address	Name
new.user@company.com	new.user@company.com	new.user@company.com	New User
"New User" <new.user@company.com>	new.user@company.com	new.user@company.com	New User
"User, New" <new.user@company.com>	new.user@company.com	new.user@company.com	New User
"User" <nuser@company.com>	nuser@company.com	nuser@company.com	User

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. Select the check box for **Automatically create users for incoming email from trusted domains** (*glide.pop3readerjob.create_caller*).

3. Enter the list of trusted domains in **Trusted domains for creating users from incoming emails** (*glide.user.trusted_domain*).

Note:

- The *glide.user.trusted_domain* property prevents user creation if the sender is not from a trusted domain. However, the system may still process inbound actions for emails that are received from the domain. To have the system ignore these emails, set up a system address filter. For more information on setting up system address filters, see System address filters. You can also prevent untrusted users from triggering inbound actions by locking out the guest user.
- The *glide.user.trusted_domain* property does not accept wildcarded domains or values such as:
  - *.edu
  - *.net
  - .edu
  - .net

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Save**.
5. **Optional:** Complete the following steps to lock out the guest user.
   a. Navigate to **User Administration** > **Users** and select the user **guest**.
   b. Select the **Locked out** field to disable the guest account.

What to do next

When the property *glide.pop3readerjob.create_caller* is set to *false*, the instance runs inbound actions from users who do not match an existing user by impersonating the guest user.

If the property *glide.pop3readerjob.create_caller* is set to *true*, but a user has a valid email address associated with a non-primary device, the instance creates a new user record for that email address if there is no matching email address in the Users [sys_user] table. The instance does not validate non-primary email addresses against the Notification Devices [cmn_notif_device] table.

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin sets the property *glide.email.create_userid_from_email* to **true** by default. After activating the plugin, enable automatic user creation from email.

Note: The *glide.email.create_userid_from_email* is not used by the system when the record is created using record producer or created manually.

Warning: Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and randomly selects one of the users with the matching email address.

Setting field values from the email body

Values in an inbound email can set field values in a task record.

Any name:value pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The name:value pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long name:value pairs.

Tip: To prevent unexpected parsing, ensure that all the names in the name:value pairs are unique.

See Redirecting Emails for an example of using *setDisplayValue()* in an inbound email action.

Note: The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.

For example, if an email body contains this line:

```
Foo:bar
```

The inbound email script creates the variable *email.body.foo* with the value of **bar**. You can use these variables to create conditions such as:

```
if(email.body.foo!=undefined){
   current.[field]=email.body.foo;}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, the script sets the value of *[field]* to the value **bar**.

Note: Spaces are rendered as underscores when a name:value pair gets parsed into a variable/value pair. For example, if an email body contains a line with spaces like `my variable:data`, then the inbound email script creates the variable *email.body.my_variable*. The value of the variable is **data**.

Specifying the inbound email processing order

You can configure a processing order for inbound email actions and use the order to manage multiple filters in inbound email actions.

The Ordered Email Processing (com.glide.email_ordered_processing) plugin is enabled by default for new instances. Users with the admin role can activate the plugin for upgraded instances. The plugin adds the **Order** column to the Rules [sysrule] table, which the instance uses to determine when to process emails. Admins can also add a command to an action script that halts processing after the script runs.

Configure the processing order

Configure the processing order for inbound email actions to force them to run in a prescribed order.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Policy** > **Email** > **Inbound Actions**.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the **Order** field to establish when this inbound rule should run in relation to other rules.
   If you upgraded and activated the plugin, the **Order** field might be named **Execution Order**.

   Note: Ensure each inbound action has a unique **Order** value to ensure the system stops processing as expected. If multiple inbound actions have the same **Order** value, the system might evaluate all of the inbound actions, even if one of them contains the `event.state="stop_processing";` script or has the **Stop processing** option selected.

4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:
   - Select the **Stop processing** check box.
   - Add the following line to the bottom of the **Actions** script:

     ```
     event.state="stop_processing";
     ```

Manage multiple filters in an inbound email action

Use process ordering and the *stop_processing* command to manage multiple filters in inbound email actions.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In this example, you can create new problem records when `prb:` appears in the subject line and new change requests when `chg:` appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

Procedure

1. Create an action with a condition of `Subject > starts with > chg:` and the `event.state="stop_processing";` command appended to the script.
2. Assign this action an Order value of `100`.
3. Create an action with a condition of `Subject > starts with > prb:` and the `event.state="stop_processing";` command appended to the script.
4. Assign this action an Order value of `200`.
5. Create an action for incident with no conditions and an Order value of `300`.

   It is not necessary to add the *`stop_processing`* command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

Result

If either a change request or a problem is created, the *`stop_processing`* command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

Use Inbound email actions

Create inbound email actions and reprocess received emails.

Create an inbound email action

Create inbound email actions to define the actions that the system takes when an email is received.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Policy** > **Email** > **Inbound Actions**.
2. Select **New**.
3. Fill in the fields as described in the table.

Note: You might need to configure the form to see all fields.

Inbound Email Actions form fields

Field	Description
When to run	
Name	Enter a descriptive name for this email action.
Target table	Select the table where the action adds or updates records.
Action type	Select the type of action the instance takes. Select **Record Action** to modify a record in the instance, or select **Reply Email** to have the instance send an email back to the source of the inbound email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Select the check box to activate the inbound email action. Clear the check box to disable the action.
Stop processing	Select this check box to help prevent the system from running additional inbound email actions after this action runs.
Redact sensitive data	Select this to mask sensitive data such as personal details, SSN, credit card details. **Note:** Available only when Sensitive Data Redaction for Inbound Emails plugin is activated.
Type	Select the message type required to run the action. The action runs only if the inbound email is of the selected type. Available types are: ○ *New*: An email that is not recognized as a reply or forward. ○ *Reply*: An email with a watermark with an In-Reply-To email header, or whose subject line begins with a recognized reply prefix. ○ *Forward*: An email whose subject line begins with a recognized forward prefix, even if the email also contains a watermark or In-Reply-To header. **Note:** By default, inbound emails of the *Forward* type always generate new incidents regardless of the presence of a watermark. If this behavior doesn't match your business logic, you can change the recognized reply and forward prefixes to treat forwards like replies.
Required roles	Specify required roles that the sender must have to trigger the inbound action.
Order	Enter a number that specifies when this inbound action runs relative to other inbound actions that use the same target table. The instance processes the action with the lowest order number first.
From	Select the user required to run the action. If a user is selected, the action runs only when the email sender matches the user name. Leave this field empty to perform the action for all users. **Note:** If the selected user is later archived or deleted, the restriction is removed and anyone can trigger the inbound email action.
Condition	Specify the condition that must evaluate to true to trigger the inbound action. Build a condition with the choice lists or enter a statement that determines when the inbound email action runs. For example: `email.subject. startsWith ( "chg:" )`
Actions	
Field actions	This field appears if the **Action type** is **Record Action**. Specify how information in the email is inserted into the record. For example, select **[Created by] [From email] [Sender]**, so that when the request is inserted, you can see who it is for.
Reply email	This field appears if the **Action type** is **Reply Email**. compose the email message to send to the source that triggered the inbound email action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

Script	Enter the script that the action runs. Typically, this script uses the validators script include and email variables.
	
	A template is provided:
	
	`(function runAction(/*GlideRecord*/ current, /*GlideRecord*/ event, /*EmailWrapper*/ email, /*ScopedEmailLogger*/ logger) {`
	
	`// Implement email action here`
	
	`})(current, event, email, logger);`
	
	The following objects are available:
	○ **current**: access the record referred to by the inbound email. For example, `current.assigned_to` accesses the person assigned to the task.
	○ **event**: access one of the parameters of the originating event. For example, `event.parm1` accesses the first parameter of the event or `event.parm2` for the second parameter. See Events for more information.
	○ **email**: access the inbound current email record. For example, `email.subject` accesses the content in the subject line of the email. See Accessing email object variables for more information.
	○ **logger**: add a message to the log file with the source set to `email.<Sys ID of incoming email>`. For example: `logger.log ("Some information")`

Description	
Description	Enter a detailed explanation of what this inbound email action does.
Other fields	
Order	Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. The Ordered Email Processing plugin does not activate this field.

Reprocess received emails

When a email has been processed incorrectly, fix the underlying problem, then reprocess the email. You can reprocess emails individually or in a batch.

Before you begin

Role required: admin

About this task

Various scenarios can result in improperly processed emails. After taking corrective action, reprocess the emails to get correct email records. Two of the most common scenarios are:

- The inbound action failed to trigger correctly. After you update or fix the inbound action, reprocess the affected emails to create the correct records.
- Emails have accidentally ended up on a development instance, usually due to the username or password of a production or test instance being reused on the development instance. In this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

case, you first export the emails from the development instance as XML and import them to the correct instance. On the correct instance, reprocess the imported emails to obtain correct email records.

You can reprocess emails with the types `received` or `received-ignored`. Such emails are processed to the system mailboxes **Received** and **Junk**, respectively.

Take the following steps only after fixing the underlying problem. This procedure only reprocesses the emails.

Procedure

1. Navigate to the relevant **System Mailbox** or navigate to **All** > **System Logs** > **Email**.
2. Decide whether to reprocess emails individually or in a batch.
   - To reprocess an individual email, open that email and click **Reprocess email**.
   - To reprocess several emails at once, select them from the mailbox or the email log and apply the **Reprocess received emails** action.

   Remember that you can reprocess only `received` or `received-ignored` emails.

Sensitive data redaction

Redact sensitive data such as Social Security number, credit card details, email address, phone number, and other personal information from inbound emails to help protect data and privacy.

When an inbound email is received, the sensitive data is masked. The sensitive data is redacted from the body, body_text, subject in the [sys_email] table after flows and inbound actions are executed.

Note: Data that has been redacted can't be recovered.

Redact sensitive data option is available in inbound email actions once the following is activated:

- Sensitive Data Redaction for Inbound Emails plugin
- Data Discovery application

Note: Data Discovery application does not require a paid subscription when used along with sensitive data redaction for inbound emails plugin.

To create inbound email actions, see Create an inbound email action.

Redaction time for the record can be viewed by checking the **Email Log**. For more information, see System email log and mailboxes.

Activate sensitive data redaction for inbound emails plugin

You can activate the Sensitive Data Redaction for Inbound Emails plugin (com.glide.email_inbound.redaction) for Notifications if you have the admin role. The application installs related plugins if they are not already installed.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Sensitive Data Redaction for Inbound Emails plugin (com.glide.email_inbound.redaction) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

Activating Data Discovery

Note: Data Discovery application does not require a paid subscription when used along with sensitive data redaction for inbound emails plugin.

Data Discovery **patterns**

Default data patterns are used to filter table entries for further classification. The Data Discovery pattern defines the regular expression used to match data against a target table. For more information, see Configure Data Discovery patterns.

Customize behavior for sensitive data redaction

Customize sensitive data redaction behavior by creating system properties for flows that are triggered by inbound emails, sys_email record, and inbound actions.

Before you begin

Role required: admin

Procedure

1. **Optional:** Create a system property to toggle redaction in flows.

   Note: When this property is enabled, then by default all inbound actions and sys_email record are redacted irrespective of the below property values mentioned in Step 2 and Step 3.

   a. In the navigation filter, enter `sys_properties.list`.

   b. Select **New** to create *glide.email.inbound.email_redaction.trigger_flow.enabled* property.

   c. On the form, fill in the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Input
Name	*glide.email.inbound.email_redaction.trigge*
Description	This is a global property to toggle redaction in Workflow Studio
Type	true|false
Value	false

d. Select **Submit**.

2. Optional: Create a system property to toggle redaction in the sys_email record.

a. In the navigation filter, enter `sys_properties.list`.

b. Select **New** to create *glide.email.inbound.email_redaction.sys_email.enabled* property.

c. On the form, fill in the details.

Fields	Input
Name	*glide.email.inbound.email_redaction.sys_em*
Description	This property toggles redaction in sys_email record
Type	true|false
Value	true

d. Select **Submit**.

3. Optional: Create a system property to toggle redaction in all inbound actions.

a. In the navigation filter, enter `sys_properties.list`.

b. Select **New** to create *glide.email.inbound.email_redaction.email_wrapper.enabled* property.

c. On the form, fill in the details.

Fields	Input
Name	*glide.email.inbound.email_redaction.email_*
Description	This property toggles redaction in all inbound emails
Type	true|false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Input
Value	false

d. Select **Submit**.

References for Inbound email

Email object variables, user impersonations and inbound actions and examples for processing inbound email actions.

Accessing email object variables

An inbound email action script contains the email object to access various pieces of an inbound email through variables. You can use the global variable *sys_email* with inbound email actions.

Accessing email objects with variables

Variable	Contents
email.to	Contains a comma-separated list of email addresses in the To: and Cc: boxes.
email.direct	Contains a comma-separated list of email addresses in the To: box.
email.copied	Contains a comma-separated list of email addresses in the Cc: box.
email.body_text	Contains the body of the email as a plain text string.
email.body_html	Contains the body of the email as an HTML string.
email.from	Contains an email address that depends on the following conditions: • If the address listed in the email **Headers** field matches an existing user's **Email address**, this variable contains the user's email address. • If the address listed in the email **Headers** field does not match an existing user's **Email address**, this variable contains the address listed in the email **Headers** field.
email.from_sys_id	Contains the Sys ID of the user who sent the email to the instance.
email.fromAddress	If system property *glide.email.inbound_action.extract_from_hea* property is set to true, *origemail* is computed from the headers. The default value is false if the property does not exist.
email.origemail	Contains the address of the email sender as listed in the email **Headers** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing email objects with variables (continued)

Variable	Contents
email.subject	Contains the subject of the email as a plain text string.
email.recipients	Contains a comma-separated list of recipient addresses as a plain text string, in the To: box.
email.recipients_array	Contains the recipient addresses as an array.
email.content_type	Contains the MIME content type of the email (for example, *text/plain; charset="us-ascii"* or *text/html; charset="us-ascii"*).
email.headers	Contains details about the sender, route, and receiver as a plain text string in the format of the sending email client.
email.importance	Contains an indication from the sender about how important a message is. The value can be **High**, **Low**, or empty.

Note: The instance follows RFC 2822 (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the *email.to*, *email.direct*, and *email.copied* variables only if emails addressed to groups follow the expected RFC format.

Inbound email.recipient variables

The recipients variables (*email.recipients*, *email.recipients-array*) allow processing of inbound email based on the email recipients. For example, you can create a script to process email based on the array values:

```
var rarray  = email.recipients_array ; for ( var i  = 0 ; i  <
 rarray.length ; i ++ ) { var recipient  = rarray [i ] ; // do
 something with it }
```

The sys_email variable

This variable lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as **uid**, **sys_id**, **content_type**, and so on.

Email user matching

When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

Matching email to existing users

Value of email.from Variable	Matching User ID	Email Address	Name
michael.tossi@company.com	michael.tossi@company.com	michael.tossi@company.com	Michael Tossi
"Michael Tossi" <michael.tossi@company.com>	michael.tossi@company.com	michael.tossi@company.com	Michael Tossi

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Matching email to existing users (continued)

Value of email.from Variable	Matching User ID	Email Address	Name
"Tossi, Michael" <michael.tossi@company.com>	michael.tossi@company.com	michael.tossi@company.com	Michael Tossi
"Tossi" <mtossi@company.com>	mtossi@company.com	mtossi@company.com	Tossi

Note: This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the `gs.createUser()` method. Use either the automatically-generated email variables or the `gs.GetUserID()` method instead.

User impersonations and inbound actions

When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

Note: If inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering inbound actions. For more information on filtering domains, see Designate untrusted and trusted email domains.

Allowing locked out users to process inbound email actions

A property is available to allow locked out users to trigger inbound actions. For example, enabling the property can allow locked out users to reset their password and send email to the instance asking for assistance.

Property allowing locked out users to trigger inbound email actions

Property	Description
glide.pop3.process_locked_out	Enables (true) or disables (false) the ability for locked out users to trigger inbound actions. • Type: true | false • Default value: false • System Properties [sys_properties] table

Warning: Enabling this property (*glide.pop3.process_locked_out*) also enables users from untrusted domains to trigger inbound actions. The user must still be active.

Redirecting email to the instance POP3 account

Configure other mailboxes to forward email to the instance's POP3 account.

By default, the *POP Reader* scheduled job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The *POP Reader*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

downloads any email waiting on the mail server and creates *email.read* events. After the instance processes the events, the inbound email actions run.

The *POP Reader* shows the number of emails processed during the reader's last run. The message shows the number of emails the reader processed or `0 processed` if no emails were available. The reader resets the status each time it runs.

It is not possible to specify more than one POP3 account for an instance, but you can forward other mailboxes to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient, and then set an *assignment_group* value.

There can be multiple active POP3 accounts with different email addresses but only one instance POP3 account.

```
if(email.direct.indexOf('facilities@anycorp.com')>-1)
current.assignment_group.setDisplayValue('Facilities
 Management');
```

Inbound email action examples

Various examples of inbound email actions are available to help you build your own inbound email actions. These examples show how to set up inbound email actions to handle email replies, create (log) a problem record, request a change, and update an incident.

Inbound email action example: handling email replies

This example shows you how to set up inbound email actions to handle replies that users send back to the instance.

Before you begin

Role required: admin

About this task

The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the **Additional Comments** text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

This inbound email action is replicated in Workflow Studio as the sample flow **Inbound Email Flow Example: handling email replies**. To view the sample flow, navigate to **Flow Designer** > **Designer**.

Procedure

1. Navigate to **System Policy** > **Inbound Actions** and click **New**.
2. Populate the form as follows:

Inbound action field values

Field	Value
Name	Update Incident
Type	Reply

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Target table	Incident [incident]

3. In **Script**, enter this code.

```
gs.include('validators');

//Note: current.caller_id and current.opened_by are already set
 to the first UserID that matches the From: email address

if (current.getTableName() == "incident") {
  current.comments = "reply from: " + email.origemail + "\n\n"
 + email.body_text;

  if (email.body.assign != undefined)
    current.assigned_to = email.body.assign;

  if (email.body.priority != undefined &&
 isNumeric(email.body.priority))
    current.priority = email.body.priority;

  if (email.body.category != undefined)
    current.category = email.body.category;

  if (email.body.short_description != undefined)
    current.short_description = email.body.short_description;

  current.update();
}
```

Inbound email action example: logging a problem

This example shows you how to set up inbound email actions to a create a problem record.

Before you begin

Role required: admin

About this task

Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

This inbound email action is replicated in Workflow Studio as the sample flow **Inbound Email Flow Example: logging a problem**. To view the sample flow, navigate to **Flow Designer** > **Designer**.

Procedure

1. Navigate to **System Policy** > **Inbound Actions** and click **New**.
2. Populate the form as follows:

Field	Entry
Name	Log Problem
Type	New

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Entry
Active	True
Target Table	Problem [problem]
Condition	`email.subject.indexOf("Problem: ") == 0`

Script	`current.description = email.body_text;`
	`current.short_description = email.subject.toString().substring(9);`
	
	`current.assignment_group.setDisplayValue("Development");`
	
	`if (email.body.assign != undefined)`
	`current.assigned_to = email.body.assign;`
	
	`current.insert();`

Inbound email action example: requesting a change

This example shows you how to set up inbound email actions to create a change request record.

Before you begin

Role required: admin

About this task

Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

Procedure

1. Navigate to **All** > **System Policy** > **Inbound Actions** and click **New**.
2. Populate the form as follows:

Field	Entry
Name	Request Change
Type	New
Active	True
Target Table	Change Request [change_request]
Condition	`email.subject.indexOf("Change Request: ") == 0`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Entry

Script	`current.comments = email.body_text; current.short_description = email.subject;`
	
	`current.notify = 2;`
	
	`if (email.body_text.assign != undefined) current.assigned_to = email.body_text.assign;`
	
	`if (email.body_text.priority != undefined) current.priority = email.body_text.priority;`
	
	`if (email.body_text.category != undefined) current.category = email.body_text.category;`
	
	`current.insert();`

Values automatically set from incoming email

The default inbound action for the Incident table automatically sets the following field values when it receives an incoming email.

Values automatically set from incoming email

Field value set	Value used from incoming email
`current.caller_id`	User ID of the first user whose email address matches the `email.from` variable.
`current.opened_by`	User ID of the first user whose email address matches the `email.from` variable.

If multiple users have the same email address, the instance first searches for an active user with the email address. Use unique email addresses for each user record whenever possible. If not, having only one active user with the shared email address guarantees that the instance always matches incoming email from this address to the active user.

Integrate inbound events

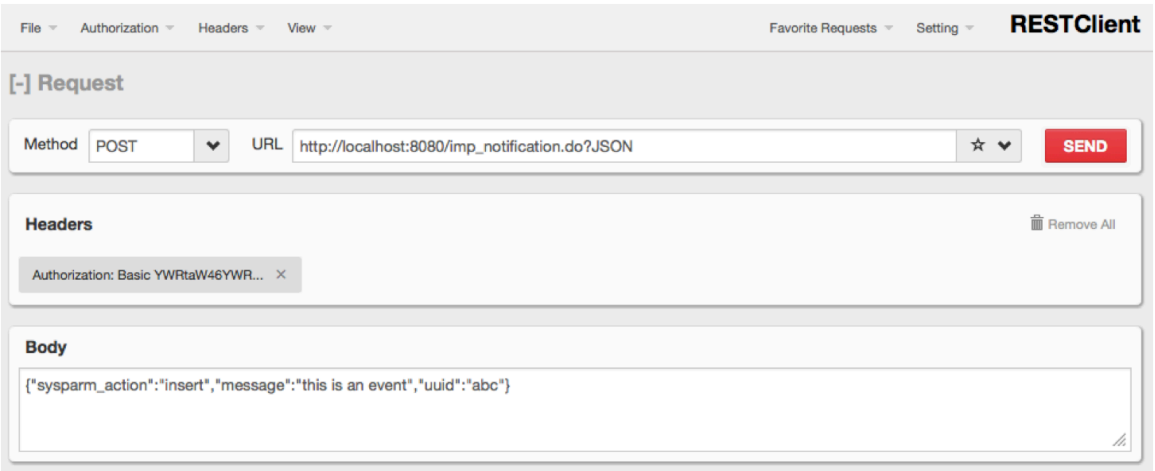
This example illustrates how to create a notification from an inbound JSON request.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When complete, you will be able to:



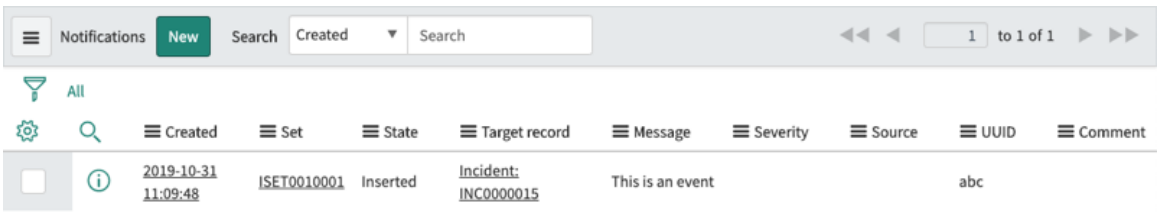
- Send a JSON request to the [imp_notification] web service import set with the JSON processor
- Create a new import set in the [imp_notification] table in the instance using data from the JSON request

The following example steps assume you have your own demonstration instance.

Procedure

1. Activate the JSON Web Service plugin.
2. Install the RESTClient Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.
   - **Method**: *POST*
   - **URL**: `http://<instance name>.service-now.com/imp_notification.do?JSON`
   - **Headers**: Authorization: Basic
   - **Body**:

```
{"sysparm_action":"insert","message":"this is an
 event","uuid":"abc"}
```



5. Click **Send**.
6. Navigate to **Response** > **Response Body (Raw)**.
7. Verify that the instance sends back a response with a `sys_id`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Login to your development instance.
9. In Navigation filter, enter `imp_notification.list`.
10. Verify that the import set table has an event matching your JSON request.

Notification Preferences

With notification preferences you can manage and choose the notifications you want to receive.

Get started

Explore	Notification Preferences in Next Experience	Notification Preferences in Core UI
Learn about preferences and choose the notifications you want to receive	Manage and set notification preferences, including customized notifications and channels	Set notification preferences, including personal subscriptions and channels

Troubleshoot and get help

- Troubleshooting Notification emails
- Ask or answer questions in the Platform community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exploring preferences

With notification preferences you can manage and choose the notifications you want to receive. Notification preferences enable you to set global preferences, search for notifications, enable and disable notifications, and customize the way you receive system notifications.

Notification preferences for Next Experience

You can manage your own notification preferences for Next Experience, including personal notifications and channels for receiving them. With **Advanced Preferences** managing notification preferences in Next Experience is more efficient and also supports provider notifications.

For more information, see System and custom notification and delivery channel preferences in Next Experience.

Notification preferences for Core UI

In the Core UI, you set personal notification preferences, including personal subscriptions and channels for receiving them, through the **Notifications** tab of the System Settings window.

Note: To switch to the Core UI from the Next Experience UI, set the property *glide.ui.polaris.core.notification_preference.enabled* to true.

For more information, see Setting notification preferences in Core UI.

Notification preferences benefits

Notification preferences benefits

Benefit	Feature
Manage and set your own notification inNext Experience preferences, including customized notifications and channels for receiving them	System and custom notification and delivery channel preferences in Next Experience
Set your own notification preferences in Core UI, including personal subscriptions and channels for receiving them. All users can set these preferences through the Notifications tab of the System Settings window.	Setting notification preferences in Core UI

What to explore next

To learn more about configuring and using notification preferences, see:

- System and custom notification and delivery channel preferences in Next Experience
- Setting notification preferences in Core UI

System and custom notification and delivery channel preferences in Next Experience

You can manage and set your own notification preferences, including customized notifications and channels for receiving them.

With notification preferences, you can control the system notifications and custom notifications that you receive and apply conditions to restrict notification delivery and choose how the notifications are delivered to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Standardized forms across custom notification preferences and delivery channels have been enabled from Yokohama onwards. To use standardized forms, set the property *glide.notification.preference.sn_form_enabled* to `true`.

Search notifications

You can also search for notifications under both system and custom notifications. There are 2 types of searches, search on preferences that only searches if it matches the notification name and AI search.

With AI search, the search functionality now goes beyond just looking for notification names. It can also search within fields of notification records, offering a broader and more accurate search experience. To use the AI search, the AI Search for Notifications plugin must be installed and index sources **Platform Notifications V1** and **Platform Notifications V2**, for more information see Activate AI Search for Notifications and Index AI Search for notifications.

System notifications

System notifications alert you of record changes that might concern or interest you. You can be notified via email, SMS text messages, push notifications, or messaging applications.

With system notifications, you can:

- Set your preferences for specific notifications by searching in the list of your notifications or by filtering them by category.
- Set preferences at a global level.
- Easily enable or disable all notifications or individual notifications.
- Use advanced filter options based on categories, delivery channels, active or inactive notifications, email digest, and subscribable notifications.
- Add or modify a notification schedule for individual delivery channels for each system notification.
- Set a schedule for all notifications, individual system notifications, or delivery channels.

  For more information, see Apply notification conditions

Custom notifications

A custom notification is a system notification that you can subscribe to and customize by adding conditions.

With custom notifications, you can:

- Search for a specific notification in the list of your notifications to be able to set your preferences for that notification.
- Use advanced filter options based on categories, delivery channels, active or inactive subscriptions, and email digest.
- Create and modify custom notifications, which are subscriptions to notifications that are important to you.
- Set preferences at a global level.
- Easily enable or disable all notifications or individual notifications.
- Enable or disable notification channels.
- Add or modify a notification schedule for individual delivery channels for each system notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set a schedule for all notifications, individual system notifications, or delivery channels.

  For more information, see Apply notification conditions

Note:

Custom notifications for Next Experience do not support notifications that require a related affected record. For these notifications, you have to set the preference in the Core UI. For more information, see Setting notification preferences in Core UI.

Note: Subscription-based notifications are not domain aware and cannot support domain-specific settings.

Delivery Channels

Delivery channels is a list of your chosen channels such as email, SMS, instant message and voice channels for receiving notifications.

With Delivery Channels, you can:

- Enable or disable a particular channel for receiving notifications.
- Create, edit, or delete notification channels for instant messages, email, SMS, and voice.

  Note: Only admins can delete channels from the cmn_notif_device table.

- Choose how notifications are delivered.
- Set a schedule for the record in the channel and apply to the notifications you want to receive.

Activate AI Search for Notifications

You can activate the AI Search for Notifications plugin (com.glide.notification.ais) for Notifications if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

Role required: admin

About this task

The following items are installed with Notifications:

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the AI Search for Notifications plugin (com.glide.notification.ais) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

Index AI Search for notifications

Index AI Search for notifications

Make content from multiple internal indexed sources searchable by performing a full table index. This procedure indexes existing records from the source tables and any child tables configured for indexing.

Before you begin

Your indexed sources must be active and internal (referring to ServiceNow AI Platform tables). To index content from indexed sources for external documents, see Indexing and searching external content in AI Search.

Role required: ais_admin

About this task

Once you define an indexed source, AI Search begins automatically indexing to reflect changes to records in the selected source table and its specified child tables. The results of all record create, update, and delete operations in these tables are reflected in the search index. AI Search doesn't index content from unmodified records in these tables until you perform a full table index

Follow these steps to index searchable content from existing records in indexed sources. Use the same steps to manually reindex content for indexed sources that have already been indexed.

If an indexed source contains unindexed records, the Indexed Sources list displays an informational message and marks the new source with an alert triangle icon. A similar informational message appears on the Indexed Source form. Make sure to perform a full table index for each indexed source that displays the alert triangle icon.

Procedure

1. Navigate to **All** > *AI Search* > *AI Search* **Index** > **Indexed Sources**.
2. Search for **Platform Notifications V1** and **Platform Notifications V2**.
3. In the **Actions on selected rows...** menu, select **Index All Tables**.
   The Indexed Source History page for the last selected index appears. A message reports that AI Search has queued an indexing task for the indexed source.
4. **Optional:** Refresh the Indexed Source History form page to monitor the progress of the indexing task.
   When the task completes, the **Ingestion State** field shows *indexed*.

Set notification preferences

View, enable, and disable general settings for notification preferences, and delivery channels.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Standardized forms across custom notification preferences and delivery channels have been enabled from Yokohama onwards, to use standardized forms set the property *glide.notification.preference.sn_form_enabled* to `true`.

Procedure

1. From your user profile, navigate to **Preferences** > **Notifications**.
2. Select the **General** tab.
3. Set global notification preferences.

Option	Description
Allow Notifications	Enable or disable all notifications.
Advanced Preferences	Customize notification preferences for sys tem notifications, custom notifications, and delivery channels.
System notifications	Enable or disable system notification cate gories, for example, Approval or Connect noti fications.
Custom notifications	Enable or disable custom notifications.
Delivery Channels	Enable or disable individual delivery chan nels.

Customize system notifications

Create custom notifications, which are subscriptions to notifications of importance to you, and apply conditions that control specific content included in your custom notification. You can also enable or disable the channels for delivery.

Before you begin
Role required: none

About this task

Note: Custom notifications for Next Experience do not support the setting for the affected record the notification is based on. For notifications that require an associated affected record, see Create personal notifications.

Procedure

1. From your user profile, navigate to **Preferences** > **Notifications** and then select **Advanced Preferences**.
2. Select the **Custom Notifications** tab.
3. Select **Create notification**.
4. Select the notification you want to receive.
   a. Enter a name for the notification in the **Personal notification name** field.
   b. Select the system notification you want to receive from the **Notification** drop-down.
   c. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the channels from the delivery channels through which you want to receive the notifications.
6. Select **Next**.
7. Set a schedule or conditions for receiving notifications.

   a. Choose to have notifications delivered only during weekday working hours by selecting **Monday thru Friday (9 to 5)**.

   b. **Optional:** Set a filter with as many conditions as desired to limit the notifications you receive.

   (Optional) For example, you can choose to be notified only when an incident communication plan is created for a specific configuration item.

   Note: All conditions are set to **[Active][is][true]** by default.

8. Select **Save**.

Modify a notification

Modify a notification by establishing a schedule or setting conditions to control the notifications you receive.

Before you begin

Role required: none

Procedure

1. From your user profile, navigate to **Preferences** > **Notifications** and then select **Advanced Preferences**.
2. Determine the type of notification you want to modify by selecting either the **System Notifications** or **Custom Notifications** tab.
3. Access the Add/Edit Schedule dialog box.
   - In the **System Notifications** tab, select and expand the notification and select **Schedule**.
   - In the **Custom Notifications** tab, select **Schedule** in the notification entry.
4. Choose to have notifications delivered 24x7 by selecting **None** or only during weekday working hours by selecting **Monday thru Friday (9 to 5)** in the **Schedule** field.
5. **Optional:** Set a filter with as many conditions as desired to limit the notifications you receive.
   - In the **System Notifications** tab, select the **Advanced Filter** checkbox and set the filter in the **conditions** field.
   - In the **Custom Notifications** tab, set the filter in the **conditions** field.

   (Optional) For example, you can choose to be notified only when an incident communication plan is created for a specific configuration item.

   Note: All conditions are set to **[Active][is][true]** by default.

6. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create notification filter configuration for notification preferences

Control the list of notifications that are displayed to the users under the advanced notification preferences page. This capability can help narrow down and show only relevant notifications based on user criteria.

Before you begin
Role required: admin

Procedure

1. In the **Filter Navigator**, enter `sys_properties.list`.
2. Create a property named `glide.notification.preference.apply_filter_config` and set it to **true**.
3. Navigate to **All** > **System Notification** > **Emails** > **Notification Filter Configuration**.
4. Select **New**.
5. Enter the **Name** and the **Order**, the notification filter configuration with the lowest order will take precedence.
6. Select the User Criteria from the list of target records or create a new user criteria.
7. Select **Notification filters** tab to create and submit filter conditions for the selected user criteria.
8. Specify filters for Classic Notifications and Provider Notifications to control which notifications appear on the preferences page.
9. Select **Submit**.

Delete a custom notification

Delete custom notifications that you don't need any more.

Before you begin
Role required: none

Procedure

1. From your user profile, navigate to **Preferences** > **Notifications** and then select **Advanced Preferences**.
2. Select the **Custom Notifications** tab.
3. In the notification entry, select the more actions icon and select **Delete**.

Add a new notification delivery channel

Add new channels for email, instant message, SMS, and voice to receive notifications and set a schedule for the channel for the notifications you want to receive.

Before you begin
Role required: none

Procedure

1. From your user profile, navigate to **Preferences** > **Notifications** and then select **Advanced Preferences**.
2. Select the **Delivery Channels** tab.
3. In the relevant delivery channel type, select **+Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the dialog box, select the **Channel Info** entry.
5. Enter a channel name and the relevant details.
6. Select **Set Schedule** and select a schedule from the **Schedule**drop-down list to schedule notifications for the channel.
7. Select **Save**.

Edit a delivery channel

Edit an email, instant message, SMS, or voice channel for receiving notifications, and schedule when the channel can receive notifications.

Before you begin

Role required: none

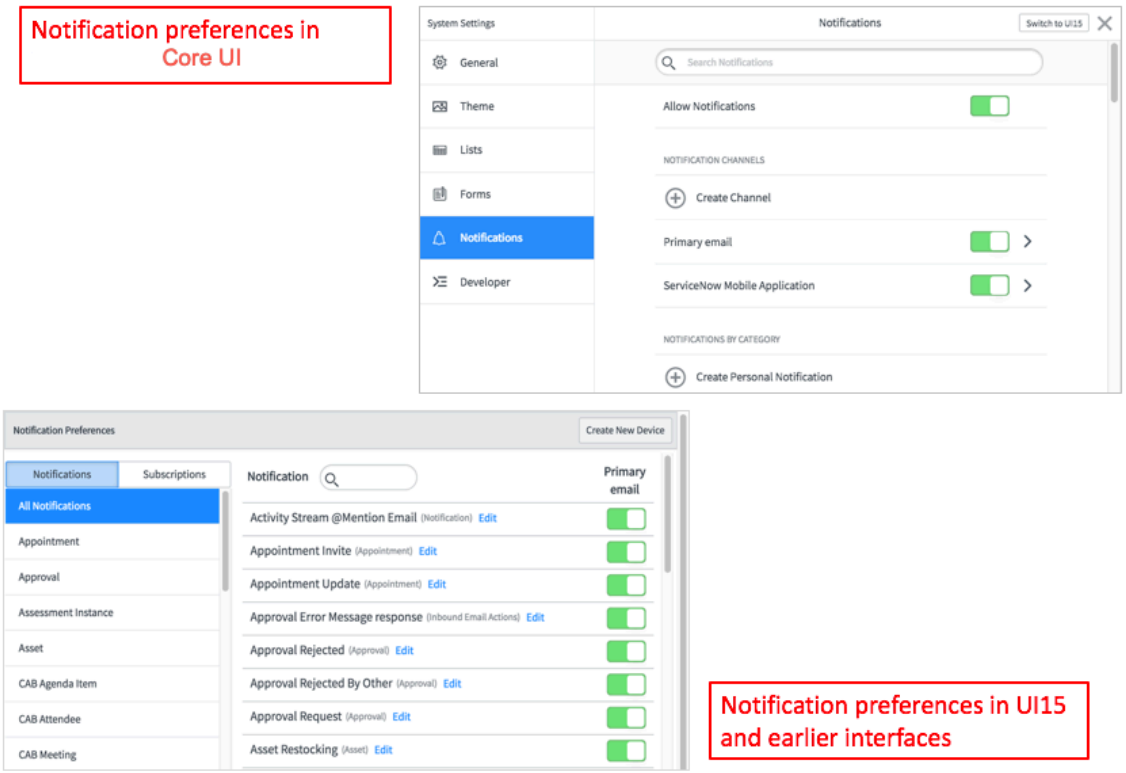
Procedure

1. From the user profile, navigate to **Preferences** > **Notifications** and then select **Advanced Preferences**.
2. Select **Delivery Channels**.
3. Expand the delivery channel that you want to edit.
4. Select the more actions icon for the channel and select **Edit**.
5. Make the changes to the channel name, email address, or schedule.
6. Select **Save**.

Setting notification preferences in Core UI

You can set your own notification preferences, including personal subscriptions and channels for receiving them. All users can set these preferences through the **Notifications** tab of the System Settings window.

With the **Notifications** tab, you can:



- Search for a specific notification in the list of your notifications.
- Use a global switch to enable or disable all your notifications.
- Enable or disable a particular channel for receiving notifications, as well as create, edit, or delete channels.
- Control the notifications that you receive and apply conditions to restrict notification delivery.
- Create personal notifications, which are subscriptions to notifications that are important to you.

Comparison between notification preferences in Core UI and earlier interfaces

In new and upgraded instances that use the Core UI interface, the System Settings window is the central location for managing your notification preferences for Next Experience. The Notification Preference User Interface plugin (com.glide.notification.preference.ui) is activated by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notification preferences in Core UI and UI15

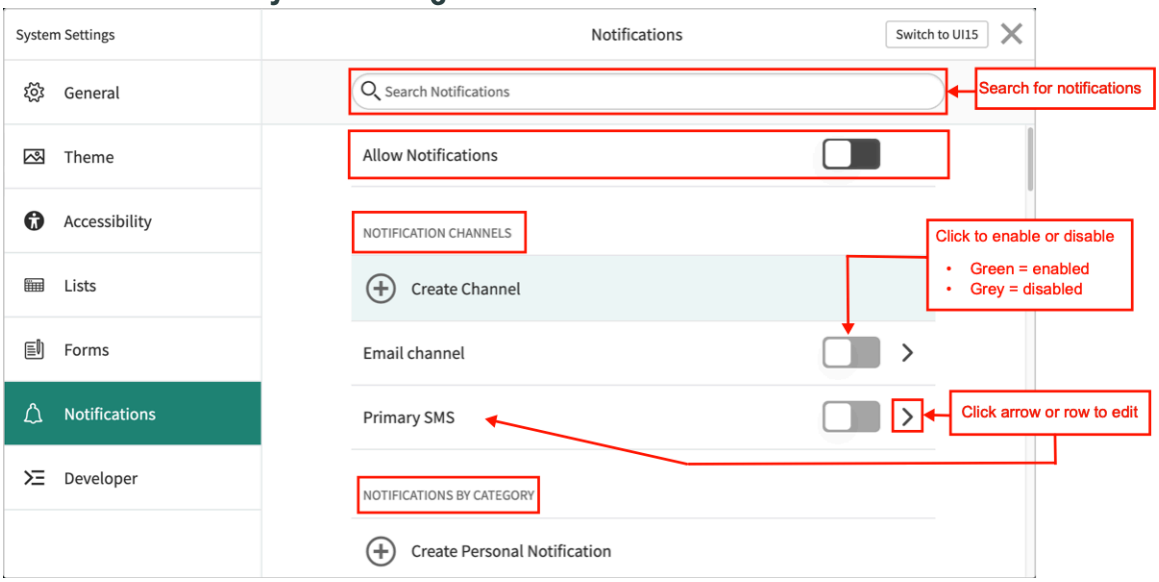
In UI15 and earlier interfaces:

- Users set notification preferences through the **Notification Preferences** link in the User form (**Self service** > **My Notification Preferences**).
- Admins created user devices and set notification preferences for users through the **Notification Preferences** link in the User form, accessed through the User Administration module (**User Administration** > **Users**).

Note:

Admins can revert to the UI15 notification preferences interface by setting the *glide.notification.preference.UI.enabled* property to false.

Manage your notification preferences in Core UI



Note:

To switch to the Core UI from Next Experience, set the property *glide.ui.polaris.core.notification_preference.enabled* to true.

To access your notification preferences, click the gear icon (⚙) in the banner frame, and in the System Settings window, click the **Notifications** tab. You can also access the System Settings by navigating to **Self Service** > **My Notification Preferences**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notifications tab in System Settings window

In the **Notifications** tab, use the settings in the following table to manage your notifications.

Setting	Description
Search	Search bar for finding notifications. To find a notification: • Enter the name of the notification you are searching for. When you type the first three characters, the system automatically returns a list of notifications matching the characters entered. • Enter two asterisks to return a list of all notifications in alphabetic order (the notifications are not organized by category).
Allow notifications	Global switch for enabling or disabling all notifications.
Notification channels	List of your channels for receiving notifications. Use this section to: • Enable or disable a channel by using its toggle switch. If you disable a channel, notifications are not delivered through that channel. • Add channels using the **Create Channel** option. • Modify channel information. Click the channel row or the right arrow (**>**) next to the appropriate channel to edit or delete it.
Notifications by category	List of notification categories that identify and group related notifications. Each category contains the notifications that you can subscribe to. To view the notifications in a given category, click the category row or the right arrow (**>**) next to the appropriate category. You can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting	Description
	• Edit settings for a notification: ○ Enable or disable channels for the selected notification. ○ Apply notification conditions, such as schedules and filters, that affect the delivery of the notification. • Create personal notifications, which are subscriptions to specific notifications that matter to you.

Note: Subscription-based notifications are not domain aware and cannot support domain-specific settings.

Subscription-based notifications

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification channels that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

Notifications that administrators mark as subscribable are automatically available in user notification settings. Users are limited to one subscription per notification.

Administrators should create subscription-based notifications when they do not want to specify users for a notification and want to let users proactively subscribe to the notification.

Note: Subscription-based notifications are not domain aware and cannot support domain-specific settings.

Subscriptions 2.0 plugin

The Subscription Based Notifications 2.0 plugin must be active to use subscribable notifications. This plugin is active by default on all new and upgraded instances.

The plugin installs the Notification Subscription [sys_notif_subscription] table, which holds user subscriptions to all notifications.

Subscriptions and notification preferences

Users can subscribe to notifications available to them through their notification preferences. In the Core UI interface, all users can set and modify their notification preferences through the **Notifications** tab of the System Settings window.

Create personal notifications

Create personal notifications, which are subscriptions to notifications of importance to you. You can apply conditions that control specific content included in your personal notification, and also enable or disable the channels for delivery.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

To switch to the Core UI from Next Experience, set the property *glide.ui.polaris.core.notification_preference.enabled* to true.

About this task

A personal notification is a subscribable notification that you can customize by adding conditions. You can assign the notification a name that is meaningful to you and filter the information received in that notification.

Note: Users are limited to one subscription per notification.

Procedure

1. Navigate to **User menu** > **Preferences** > **Notifications**.
2. Select **Create Personal Notification**.
3. Complete the New Personal Notification form (see table).

Field	Description
Name	A descriptive name for your personal notification. Use a meaningful name to distinguish it from system notifications.
Notification	The notification to subscribe to. You can subscribe only to notifications that are configured to allow subscriptions. Depending on the notification you select, the **Table**, **Affected record**, and **Send when** fields are displayed.
Table	The database table that the notification is linked to.
Affected record	The specific record that the notification is based on. This field appears when you select a notification that has an affected record (for example, a notification for a problem record that has multiple affected CIs). Click the lookup icon, select the table and specific document (record) in that table, and click **OK**.
Send when	Another condition that must be met to send the notification. For example, you might create a filter whose conditions send notifications when an incident with a priority of **1 - Critical** is opened for a network issue.

4. Select **Save**.
   In the following example, notice the category in which the system placed the personal notification.
   The system creates the personal notification and adds it to the appropriate notification category.
5. Enable or disable the channels for your personal notification.
6. Navigate back to the list of notifications for the category by selecting the left back arrow (**<**) at the top of the form.
   Notice that your Personal Notifications are listed above the System Notifications in the given category.
7. Navigate back by selecting the left back arrow (**<**) at the top of the form or by selecting the **Notifications** tab.

Create a service provider

Administrators can configure service providers for devices that use SMS.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Important: Service providers such as AT&T and Verizon may soon be deprecating the **email-to-text** functionality. See Using Notify with SMS for SMS delivery.

Administrators also have the option of configuring how a device's service provider affects the construction of the device's email address.

Procedure

1. Navigate to the Notification Service Provider [cmn_notif_service_provider] table by entering `cmn_notif_service_provider.list` in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Select **Update**.
4. Select **Save** on the Notification Preferences page.

Notification Service Provider form fields

Field	Description
Name	Configured name of the service provider.
Type	Type of device, in this case **SMS**.
Active	Enables or disables this notification device.
Advanced notification	Removes all the previous options and displays the **Advanced script** field.
Advanced script	Used for custom notifications that run a script rather than construct a traditional SMS/email. This is used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that can't receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.
Construct address manually	Removes the prefix and suffix options and displays the **Construction script** field.
Construction script	Enables you to script the email address construction as you would in a business rule. For example, `abc + current.phone_number + def@text.att.net` would construct an email address of `abc2223334444def@text.att.net`. **Note:** `Current` is a reference to the device, not the service provider, therefore the *`current.phone_number`* variable that uses the device's `phone_number` value.
SMS Provider Email Prefix	Places the provided text before the device's specified phone number; for example: `PREFIX2223334444@text.att.net`
SMS Provider Email Suffix	Places the provided text after '@' sign; for example: `2223334444@SUFFIX`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Notification Device Variables	Optional attributes of an SMS device used inside an SMS service provider's **Advanced script**. This is used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and isn't necessary for configuring external SMS providers.

Select a service provider

You can configure how a device's service provider affects the construction of the device's email address.

Before you begin

Role required: admin

Procedure

1. From the user menu, navigate to **Preferences** > **Notifications** and then select the **Advanced Preferences** link.
2. Select the **Delivery Channels** tab.
3. If no devices are configured, follow these steps to add an SMS device and select a service provider.

   a. In the SMS channel section, select **+Add**.

   b. Expand the **Channel Info** section and provide the Channel Name and Phone number in the fields.

   c. From the **Service provider** drop-down list, select the appropriate service provider.
   The service providers are stored in the Notification Service Provider [cmn_notif_service_provider] table. Only active service providers are visible.

   d. Select **Save**.

SMS notification advanced scripting

You can use these objects and their attributes in your advanced notification scripts on the SMS Notification Service Provider form.

Objects and attributes

Object	Example attributes
current	• current.number • current.assigned_to • current.company • current.state
email	• email.notify • email.sourceTable • email.contentType • email.attachments

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Objects and attributes (continued)

Object	Example attributes
	• email.HTML • email.dataVersionHeader • email.UID • email.allowSavingNoRecipientEmail • email.recipients • email.ignore • email.save • email.headers • email.sysID • email.attachmentLimits • email.class • email.sysId • email.textBody • email.hashCode • email.weight • email.equals • email.logEmail • email.reset • email.wait • email.body • email.SMSText • email.watermark • email.textBodyLegacy • email.sourceHeader • email.subject • email.instance • email.importance
device	• device.service_provider • device.group • device.order • device.sys_id • device.sys_updated_by • device.sys_created_by • device.primary_email • device.schedule

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Objects and attributes (continued)

Object	Example attributes
	• device.name • device.sys_created_on • device.email_address • device.active • device.phone_number • device.sys_mod_count • device.sys_updated_on • device.user • device.sys_meta • device.type

Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

Before you begin

Role required: admin

About this task

When you make a notification mandatory, the notification is locked in user notification preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule.

Users receive mandatory notifications even if they disable notifications.

Note: Mandatory notifications apply to only the primary device of the user. You cannot make a notification mandatory for secondary devices.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Open the appropriate notification.
3. Configure the form and add the **Mandatory** field.

   Note: This field does not display by default.

   a. Select the context menu icon ( ) and select **Configure** > **Form Layout.**

   b. Select the **Mandatory** field and the order in which you want the field to appear.

   c. Select **Save**.
   For more information about configuring the form layout, see Configuring the form layout.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the **Mandatory** check box.

   When a user checks their notification preferences, the control button for the mandatory notification is on and is read only.

Force a notification to be sent

To force a notification to be sent to the specified users, enable forced delivery.

Before you begin
Role required: admin

About this task
Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the **Notification** field is set to **Disable**.

Note: Forced delivery applies to only the primary device of the user. You cannot force a notification to be sent to secondary devices.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Open the appropriate notification.
3. Configure the form and add the **Force delivery** field.

   Note: This field does not appear by default.

   a. Select the context menu icon ( ) and select **Configure** > **Form Layout.**

   b. Select the **Form delivery** field and the order in which you want the field to appear.

   c. Select **Save**.
   For more information about configuring the form, see Configuring the form layout.

4. Select the **Force delivery** check box.
5. Select **Update**.

   Unlike using the **Mandatory** option, forcing the delivery does not lock the user's preference or prevent the user from unsubscribing from the notification.

Create a notification filter

Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Before you begin
Role required: admin

About this task
For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. For Core UI, filters for notifications or channels are set through the Notifications tab of the System Settings window. For details, see Apply notification conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The system applies the user's filter conditions after the administrator's conditions have been evaluated. If the administrator's conditions fail, the system ignores notification filters.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notification Filters** and create a record.
2. In the *Notification conditions* related list of the new record, create and submit filter conditions on one or more tables.
3. Repeat the procedure to create additional conditions on other tables for this filter.

Filter device notifications using a schedule

You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

Before you begin
Role required: admin

About this task
Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if an administrator selects the **Weekdays** schedule for an email device, the device receives email notifications triggered between Monday and Friday. If notifications are triggered on Saturday, they are not delivered to the device.

Procedure

1. Define schedules as needed using **System Scheduler** > **Schedules** > **Schedules**.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the **Schedule** field.
4. In the **Schedule** field, select the schedule for the device.
5. Select **Submit**.

Edit the schedule or filter of an existing notification message

You can update a schedule or filter that was previously created for an email notification.

Before you begin
Role required: admin

About this task
To edit the schedule or filter of an existing notification message:

Procedure

1. In the Notification Preferences screen, select the notification message to edit.
   You cannot edit any attributes of a mandatory message.
2. Make the appropriate changes in the form.
3. Select **Update**.

Create notification channels

You can add channels to receive your notifications. A notification channel is an email account or voice message system that you have access to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: none

About this task
Notification channels include email addresses, service providers for SMS messages, and mobile applications. You can create voice notification channels to support applications like Notify.

Note: If you are using the ServiceNow mobile application or a custom push application, you do not need to create a push channel for your mobile device. The system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.

Procedure
1. Navigate to **User menu** > **Preferences** > **Notifications**.
2. Select **Create Channel**.
3. Complete the fields on the New Channel form.

Field	Description
Name	A descriptive name for the channel, such as the device or email account.
Type	The type of channel: ○ **Email**: for email messages. **Note:** All users with an email address have a primary email channel, which is created automatically after a notification is sent to them. ○ **SMS**: for SMS messages. ○ **Voice**: for phone messages. ○ **Instant Message**: for instant messages. If you are using the ServiceNow mobile application or a custom push application, the system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.
Email address	The email address of the channel.
Phone number	The phone number for SMS messages or for voice messages.
Service provider	The service provider for SMS messages.

4. Select **Save**.
   The system creates and enables the channel, and adds it to the list of notification channels.

What to do next
To receive notifications on your new notification channel, you must enable the channel for individual notifications. After you enable the channel for a notification, you can set conditions to further control the notifications that you receive on the channel. For more information, see Apply notification conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Modify notification channels

You can update channel information for your notifications.

Before you begin
Role required: none

Procedure

1. Navigate to **User menu** > **Preferences** > **Notifications**.
2. In the Notification Channels section, select the channel row or the right arrow (**>**) next to the channel name.
3. In the Edit Channel form, update the fields (see Create notification channels for descriptions of the form fields).
4. Select **Save**.

Result
The system updates and saves the channel information that you modified.

Delete a notification channel

Delete a notification channel so that you no longer receive notifications through the channel.

Before you begin
Role required: admin

Procedure

1. Navigate to **User menu** > **Preferences** > **Notifications**.
2. In the Notification Channels section, select the channel row or the right arrow (**>**) next to the channel name.
3. On the Edit Channel form, select **Delete**.

Result
The system deletes the channel from the list of notification channels and no longer delivers notifications to that channel.

Apply notification conditions

Set various conditions and filters to control the notifications you receive. You can also enable or disable an email digest and the delivery of individual notifications by channel.

Before you begin
Role required: none

About this task

- Enable or disable an email digest if a digest is available for the notification. An email digest is a single email that summarizes the activity for the notification during a time interval that you specify. Admins configure the email digest content for a notification.
- Enable or disable a channel on which the notification is received.
- Set preconfigured schedules and filters that determine when you receive your notifications.
- Set more advanced filter conditions to limit the notifications delivered to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **User menu** > **Preferences** > **Notifications**.
2. Select the notification:
   a. In the Notifications By Category section, select the row or right arrow (**>**) of the category that you want to view.
   b. In the list of notifications for the category, select the row or right arrow (**>**) next to the notification that you want to edit.
3. **Optional:** Enable or disable an email digest for the notification, if an email digest is available:
   a. Select the **Email Digest** switch.
   The email digest is enabled when the switch is green and turned off when the switch is grey.
   b. To enable the digest, select the **Interval** (length of time) during which the notifications are accumulated.

   The interval begins with the first occurrence of notification activity during the specified interval. For example, if you selected the Daily interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day. Soon after the interval ends, the system sends the email digest instead of sending the individual notifications that were triggered during the digest interval. If you turned off the digest, the system immediately stops accumulating the notifications and doesn't send the email digest.
4. Toggle the channel switch enable or disable a channel on which the notification is received.
5. To apply conditions for notification delivery, select the row or the right arrow (**>**) next to the channel for the notification.
   a. Fill the Apply Conditions form.

Field	Description
Schedule	Determines when the notification can and can't be received.
Filter	Preconfigured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of **1 - Critical** is opened for a network issue.
Advanced filter	Check box to use the condition builder to create additional criteria. When you select the check box, the **Table** and **Conditions** fields are displayed.
Table	Table for the notification. For example, if you selected an incident-related notification, you might select the Incident [incident] table.
Conditions	Define as many conditions as needed to limit the notifications you receive. For example, you can choose to be notified only when an incident communication plan is created for a specific configuration item.

   b. Select **Save**.

Notification agent and agentic workflows in Notifications

Use the Notification agent and agentic workflows to automate inbound emails processing and to create and modify email notifications, templates, and layouts.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect case information (for chat summarization, resolution notes generation, knowledge generation, call summarization), chat transcripts (for chat recommendation), and email information (for email response). Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Explore AI in Notifications

Automates inbound email processing and enables the creation and modification of email notifications, templates, and layouts.

Overview of the Notification agent and agentic workflows in Notifications

Email Agents help automate the triage of tasks that are created via inbound emails by identifying intent, executing actions, & drafting appropriate email responses. The Email Agentic Workflow is designed to intelligently process and respond to various inbound email requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users

Users

User	Role	Description
Admin	sn_notif_agents.notification_ai_admin	Admins activate, enable, and create intents for email agents.

Benefits

Benefit	Feature	Users
Automate inbound email processing by intelligently understanding requests, extracting information, performing necessary actions, and drafting responses.	Use email agentic workflow	Admin
Create and modify email notifications, templates, and layouts through conversation instead of navigating complex forms and scripts.	Notification agent	Admin

What to explore next

To learn more about configuring and using the Notification agent and agentic workflows with email notifications, see:

- Configure email agentic workflows in Notifications
- General guidelines for creating and mapping an intent

Use email agentic workflow

Use email agentic workflow to intelligently analyze inbound emails, extract information, perform necessary actions, and draft responses.

Email agentic workflows in email notifications

Available email agentic workflows

Agentic workflow name	Description	Available AI agents
Intent to action	Triages tasks that are created via inbound emails by identifying intent, executing actions, and drafting appropriate email responses.	• Intent Identification Agent • Intent Executor Agent • Email Generator Agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role permissions and access

The execution role provides the minimum required permissions to execute intents. Additional intent execution roles can be added as needed to extend permissions for specific actions. Without these, the execution may fail due to insufficient permissions.

Roles for action execution

Role	Description
sn_notif_agents.notification_ai_admin	Has permission to read and create intents, actions and map actions.
sn_notif_agents.notification_ai_reader	Has permission to read intents and actions.
sn_notif_agents.intent_executor	Has permission to execute intents.

Note: When an action runs, it uses the sender's permission, guest users use the **guest_email_agent** role which is limited by default to **sn_notif_agents.intent_executor**. If the execution action needs more access, those permissions must be added under the **sn_notif_agents.intent_executor** role as a child role so it can run properly. The system masks the role based on user permissions, revealing only the roles common to both the user and the **sn_notif_agents.intent_executor** roles.

Email Generation for Reply Email Action

After you connect an AI Search profile to the reply-email action, users can submit queries that can be answered using the profile's content. AI Search check the sender's permissions and returns only the information permitted for their role.

Email Intent to Action Agentic Workflow

Email agentic workflow automates inbound emails by intelligently interpreting requests, extracting information, performing necessary actions, and drafting responses.

Email request types

The Email agentic workflow is designed for intelligently processing and responding to various inbound email requests. It categorizes these requests into two types for appropriate automated handling:

- Workflow executions: These emails contain requests where the system identifies a specific intent that triggers a predefined, automated workflow. This enables for the execution of custom processes based on the email's content.
- Information queries: For these requests, the system acts as an intelligent assistant, answering questions by leveraging default AI search profile that can be mapped to existing information sources.

Intent to action driven email processing

The foundation of an intelligent email automation system lies in its ability to accurately interpret the purpose of an incoming email and execute the appropriate action. This process is driven by Intent to Action mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Intent: The underlying purpose or request expressed in an incoming email. It's what the sender wants to achieve (for example "approve my leave," "answer my question"). Admins define these intents. The system's framework attempts to match incoming emails to these predefined intents.
- Action: The specific task or process that the system executes in response to a successfully identified intent.

An Intent represents the underlying purpose or request conveyed in an inbound email. These intents are predefined and configured by administrators, enabling the system to recognize specific types of requests, such as a "leave approval" or a "query about a specific topic." The system uses a framework to match incoming emails to these configured intents.

Once an intent is identified, a corresponding Action is triggered. An action is the specific task or process that the system performs to fulfill the email's request. Actions can take various forms:

- Subflows: These are predefined workflows that execute a series of steps relevant to the matched intent. For example, a "leave approval" intent might trigger a subflow to initiate an approval process.
- Reply Emails: In some cases, the action involves sending an automated email response back to the sender. For example, an acknowledgment or a direct answer containing extracted information.

Note: A crucial aspect of this system is handling emails that don’t match any preconfigured intents. For such cases, a Default Intent Action (also referred to as a no intent action) is executed. This default action can be configured by administrators. This fallback process is designed so that every email gets a response, whether it's a generic one like making a note for later manual review or sending a standard confirmation or an acknowledgment

Basically, the system's framework continuously analyzes incoming emails, identifies their intent, and performs the associated action, providing a structured and automated approach to managing diverse email requests.

Email Agents

Email agents help automate triaging of tasks that are created via inbound emails by identifying intent, executing actions, and drafting appropriate email responses.

The email agentic workflow is powered by specialized AI agents, each responsible for intelligently processing and responding to inbound emails. These agents work together to understand and manage requests, execute actions, and generate appropriate communications.

1. **Intent Identification Agent**

   This agent acts as the initial brain of the workflow and identifies the intent of inbound email requests using LLM (LLMs). It uses these advanced LLM (LLMs) to analyze the content of an inbound email, deciphering its underlying intent. Once identified, this intent is then mapped to a preconfigured and customized intent within the system.

   The Intent Identification Agent functions include:

   - Intelligent Intent Recognition: Using LLMs to understand natural language and identify the user goal.
   - Custom Intent Mapping: Linking recognized intents to specific, user-defined categories or actions. This enables flexibility and tailors it to the unique business needs.
   - Action Association: Identifying intents with a variety of subsequent actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Intent Executor Agent

Once the Intent Identification Agent has determined the email's purpose, the Intent Executor Agent takes over. Its role is to carry out the instructions associated with the identified intent, this involves extracting any crucial data points from the email (for example order numbers, customer IDs, specific requests) and then executing the corresponding actions or workflows.

The Intent Executor Agent functions include:

- Input Extraction: Identifying and extracting critical information from the email content needed for subsequent actions.
- Action Execution: Triggering and managing the execution of the predefined workflows or actions linked to the identified intent.
- Default Action Handling: Providing a fallback mechanism by executing a default action if an email's intent can't be matched to any specific custom intent, confirming no request goes unaddressed.

Note: Once the intent is finalized, this information will be used to retrieve any relevant actions.

3. Email Generator Agent

The Email Generator Agent is responsible for crafting clear, concise, and relevant email responses. It takes inputs from the inbound email, including the identified intent, and extracted information to formulate a suitable reply. The context, tone and goals for drafting emails can be configured by administrators.

The Email Generator Agent functions include:

- Contextual Response Generation: Using all available information and context to create highly relevant and personalized email responses.
- Draft Creation (Supervised): Generating email drafts that can be reviewed and approved by a human agent before sending, enabling oversight and quality control.
- Automated Sending (Unsupervised): For routine or low-risk requests, the agent can be configured to automatically send emails without human intervention, significantly boosting efficiency.

General guidelines for creating and mapping an intent

By following some general guidelines for creating email intents and mapping actions to intents, you can create clear and effective instructions that help maximize the efficiency and effectiveness.

Overview of creating and mapping an intent

AI agents and agentic workflows rely on LLMs, so the language that you use for their instructions is important. There are many steps that you can take to help improve the quality and consistency of your agentic AI solutions.

Intent Guidelines

The discussion highlights several crucial guidelines for defining and configuring intents to ensure accuracy, help prevent misinterpretation, and optimize the performance of the LLM-driven system:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Be clear, specific, and avoid vagueness
  - Use instructions that are concise, clear, and precise. Simple language can help remove ambiguous situations that could stall or disrupt an agent's progress.
  - Intents should be highly specific and not overlap with other intents.
  - Avoid using just keywords or topic names instead, describe the user's full intention.
  - Vague intents can confuse the LLM and lead to incorrect matches.
  - Clarify boundaries and limitations.

Example of clear intents

Example	Weak intent	Specific and strong intent	Notes
Subscription Cancellation	User requesting to cancel subscription	User requesting to cancel music subscription	If your system handles various types of subscriptions for example, music and video streaming, software licenses, a vague intent like cancel subscription could lead to the LLM incorrectly identifying which service the user wants to cancel. A specific intent like cancel music subscription ensures the LLM understands the exact service, allowing the correct workflow to be triggered.
Leave Approval	Leave approval	User requesting for a leave approval	Leave approval is a topic, not an action or a user's intent. The LLM needs to understand the user's intention. By stating User requesting for a leave approval, you clearly communicate that the user is initiating a request, not just mentioning a topic.
Leave Approval including recipient	User requesting for a leave approval	User requesting for a leave approval for their colleague	While the system might default to assuming the request is from the email sender, explicitly stating for their colleague provides

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example	Weak intent	Specific and strong intent	Notes
			crucial context. This prevents scenarios where a request made on behalf of someone else is incorrectly processed for the sender, highlighting the need for intelligence in understanding the subject of the request.

- Context and coherence:
  - The intent should clearly articulate what the user is asking for or requesting.
  - Distinguish between a user merely mentioning something and explicitly requesting an action.
  - Design instructions that serve the overall objective. All of your tools and AI agents work together to solve problems.

Example of intents for user's explicit request

User email	Incorrect Intent match	Notes
I just bought a car, my father was insisting me on getting a car insurance quotation	Requesting for a car insurance quotation	In this scenario, the user is talking about getting a quotation because their father insisted, but they haven't explicitly requested one from the system. If an intent designed to generate a quotation matches this email, the user would receive an unsolicited quotation, leading to a poor and potentially confusing experience. The system should only act when the user's intent is a direct request for that action.
Marketing email, maybe I should just unsubscribe already	Requesting to unsubscribe from emails	Marketing emails, just unsubscribe. This statement is sarcastic or a casual expression of frustration, not a direct request to unsubscribe. If the intent is configured too broadly like just "unsubscribe email", it might incorrectly trigger an unsubscribe action. The intent should be precise enough to differentiate

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User email	Incorrect Intent match	Notes
		between a casual remark and a clear, actionable request.

- Include critical details:
  - Ensure the intent description contains all critical details that differentiate it from any similar requests.
  - Use consistent formatting. Similar instructions should use similar language patterns.
  - Missing critical details can lead to false positives or false negatives.
  - If a detail can change the meaning or appropriate action, it must be included in the intent.
  - Use consistent terminology throughout.

Examples of intents that include critical details

Weak intent	Strong Intent	Notes
Requesting for an insurance quotation	Requesting for a car insurance quotation	If a company offers multiple insurances, and the associated workflow is specifically designed for car insurance, the intent must include car. Without this critical detail, an email requesting a different kind of insurance might incorrectly match the insurance quotation intent, leading to a failed or inappropriate workflow.
User requesting for money for house	User requesting for a home loan	Requesting for money is extremely broad. An email like "I gave you money last week, give me my money back" (a request for repayment) could incorrectly match this vague intent, even though it's not a home loan request. Including home loan as a critical detail clarifies the specific financial transaction.

- Differentiate between action requests and informational queries:
  - Clearly define whether an intent is for executing an action or for providing information.
  - This helps prevent the system from taking an action when only information is sought, or vice versa.

Example for intent type

User email	Intent type	Note
"My team needs writing software installed on our new	Action request intent	This email clearly asks for an action to be performed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User email	Intent type	Note
machines. Please arrange this.		(software installation). An intent configured as "User requesting installation of Adobe Creative Suite" would correctly match, triggering a workflow to provision and install the software.
I need to install writing software on my personal device for a project. Can you tell me how to do it?	Informational query intent	The user is not asking for the system to perform the installation, but rather for guidance or instructions. If only the action request intent existed, it might incorrectly trigger an installation workflow, or fail to provide the user with the requested information. A separate intent for user asking for instructions on how to install writing software would correctly match and provide a link to a knowledge base article or a step by step guide.

- Help the LLM – Don't Make It Guess:
  - The overarching principle is to make intents as clear and unambiguous as possible to guide the LLM effectively.
  - The system is a framework; its effectiveness depends on how wisely intents are configured.

For more general guidelines, see General guidelines for writing prompts for agentic AI.

Important Considerations

It’s recommended not to configure workflows to produce final artifacts directly. Instead, workflows should create drafts or intermediate artifacts that require human review and confirmation.

- Target Record for drafting and email: If using the email drafting capability, a target record must be attached to the email by the time the agent workflow triggers. Without a target record, generated email drafts can't be access.
- Order of Execution: When enabling the agentic workflow either via Inbound Action or Inbound Email Trigger, consider its order relative to existing inbound actions. The default order 999 places it last to avoid interfering with other processes, but this can be adjusted.
- Human Oversight: The system aims to remove bottlenecks and increase efficiency, but it doesn’t eliminate the need for human involvement. It's designed to augment, not fully replace, human agents.

Configure email agentic workflows in Notifications

Configure email agentic workflow in Notifications for email agentic workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Notifications Email Agents plugin

You can activate the Notifications Email Agents plugin (sn_notif_agents) for Notifications if you have the admin role.

Before you begin

Now Assist for Notifications requires a separate subscription from the rest of the ServiceNow AI Platform.

To purchase a subscription, contact your ServiceNow account manager. When you purchase a subscription, certain plugins are activated automatically. If a paid plugin isn't activated automatically, you can manually activate it from the All Applications list in your instance.

Note:

Before purchasing a subscription, you can evaluate the feature on a non-production instance without charge by requesting it from the Now Support Service Catalog.

Role required: sn_notif_agents.notification_ai_admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Notifications Email Agents plugin (sn_notif_agents) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

Enable intent to action from Inbound email actions or Inbound email triggers in Workflow Studio.

Enable intent to action workflow from inbound actions

Enable and configure intent to action workflow to invoke the agentic workflow from inbound actions.

Before you begin

Role required: sn_notif_agents.notification_ai_admin

Important: If intent to action has been enabled from the Workflow studio flow for Inbound email trigger then do not enable intent to action from inbound actions.

Procedure

1. Navigate to **All** > **System Policy** > **Email** > **Inbound Actions**.
2. Search for **Trigger Intent to Action**.
3. Select the **Active** check box to activate the inbound email action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Order** field, enter the desired order number, the default value mentioned is **999**.

   Note: You can modify the order number to determine the point at which the agentic workflow is invoked.

5. Select **Update**.

What to do next

Create email intents

Enable intent to action workflow from triggers

Enable and configure intent to action workflow to invoke this agentic workflow from triggers.

Before you begin

Role required: sn_notif_agents.notification_ai_admin

Important: If intent to action has been enabled from Inbound email actions then do not enable intent to action from triggers.

Procedure

1. Navigate to **All**, in the search filter, enter `sys_flow_email_trigger`.
2. Select the filter icon to search based on **Sys ID**.
3. Enter `e856ae0bff24f210359bfffffffff07` as the Sys ID and select the **Run** button.
4. Open the record, select the **Active** check box to activate.

   Note: In the Email Triggers table, for **Stop condition evaluation** when the trigger is set to **true**, it prevents the system from evaluating trigger conditions after this one. If you want trigger conditions after this, select **true** and set it to **false**.

5. **Optional:** Run the flow on an incoming email.

   a. Navigate to **All** > **Process Automation** > **Workflow Studio**.

   b. Select the **Flows** data pill filter

   c. Search and open the **Trigger Intent to Action** flow.

   d. Select the **Edit** button to edit the trigger.

   e. Select **Inbound Email** trigger and set the desired email conditions that need to be met to run the flow.

   f. Select **Activate**.
   For more information, see Edit a flow, Test a flow, and Activate a flow.

What to do next

Create email intents

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create email intents

Create and define an email intent for analyzing and identifying the primary purpose for an inbound email. Understanding the email's intent helps guide the tone, context, and call-to-action for effective responses.

Before you begin
Role required: sn_notif_agents.notification_ai_admin

About this task
Follow the General guidelines for creating and mapping an intent

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Email Intents**.
2. Select **New**.
3. On the form, fill in the fields.

Notification Intent form

Name	Name of the intent.
Description	Brief description of the intent along with the goal of the intent.
Active	Option that indicates that the configuration is active. The configuration is active by default.
Conditions	The conditions on the inbound record that will be evaluated to fetch the list of intents available for an inbound email.

Note: The default action is executed if an email's intent cannot be matched to any specific custom intent, ensuring no request goes unaddressed.

4. Select **Submit**.

What to do next
Create and associate actions for intent

Create and associate actions for intent

Create and map actions to an intent for executing appropriate actions once the intent match happens.

Before you begin
Role required: sn_notif_agents.notification_ai_admin

About this task
Subflows must be created to invoke subflows to associate an action to the intent. For more information, see Create a subflow in Workflow Studio.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Email Intents**.
2. From the table, select the intent.
3. From Notification Intent Actions, select **New** to add actions to the intent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter the **Name**.
5. Select the **Type** based on the criteria defined for the intent.

Type	Action
Subflow Invocation	Select the **Subflow** tab and select the sub flow that must be triggered when the intent is matched. To create subflows see, Create a
Reply Email	**Note:** **Reply Email** type will not work if the target record is not attached to the email. **a.** Select the **Reply Email** tab **b.** Enter the **Email Content Guidelines** and **Recipients**. **c.** Enter the **Recipients** if it's a new recipient aside from the original recipient **d.** Select **Email Delivery Mode**, select **Auto** to send the email to the user, select **Draft** to draft a reply. **Note:** If the **Assigned to** field in target record is not populated then the user won't be able to review the draft or draft a reply. **e.** In **Search profile**, select or add a profile that can be used for generating a reply for the email when the intent is matched.

6. Enter the **Order** number for processing once the intent is identified, the system retrieves the associated actions according to the sequence specified in the action record.
7. **Optional:** Select **Stop processing** check box to stop processing after a certain action.
8. **Optional:** Select **Default** check box if there are no matching intents for the email.

   Note: For such cases, a Default Intent Action (also referred to as a no intent action) is executed. This ensures that every email gets a response, whether it's a generic mail or sending a standard confirmation or an acknowledgment.

9. In the **Action Execution Criteria** tab, specify the conditions needed to execute the action.
10. Select **Submit**.

Notification agent

Use the Notification agent to create and modify email notifications, templates, and layouts through conversation, reducing the need of navigating complex forms and scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notification agent capabilities

The Notification agent is an agentic AI feature that simplifies the process of creating and modifying email notifications, template, and layouts using natural language prompts.

Describe your notification requirement, and the agent handles configuration, templates, layouts, and duplicate detection.

Example: End to end notification creation using the Notification agent

The following table shows how a platform administrator creates, applies email templates, tests, and activates a P1 incident notification using the agent chat interface.

Example	Scenario	Action	Agent output
Creating a notification from a natural language prompt.	A platform administrator needs to notify users when a P1 incident is assigned to them without navigating the Notifications module.	Create a notification whenever a P1 incident is assigned to a user from the sys_user [sys_user] table. Set the email template to **incident.ess.resolve**.	The agent checks for duplicates and generates a notification record with the name, table, trigger, template, and recipients populated for review.
Modifying preview content.	After previewing the generated notification, the administrator wants to adjust the email template content.	Add the incident priority to the email body.	The agent updates the email template to include the incident priority field and presents it for review.

Create an email notification using the Notification agent

Create an email notification using the Notification agent by describing your requirements in natural language, without navigating forms or writing scripts.

Before you begin

Confirm the notification details before deployment.

Note: The Notification Agent requires the Implementation Agent (IA) Orchestration framework and is not supported as a standalone feature.

Role required: admin

Procedure

1. Navigate to **Admin** > **Admin Home**.
2. In the **Manage your products** section, select **View product overview** on the relevant product card.
3. In the **Configuration insights** section, select **Configure**.
   The configure page opens in the Configuration Console.
4. Select **Notifications** under the business unit you want to configure (for example, Legal, Workplace Services, or Finance for Core Business Suite).
5. Select **Configure with Now Assist**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The conversational panel opens, detects the current page context, and invokes the Notification Agent.

6. Select **Create a new notification**, or enter a natural language prompt.
   Example prompts:
   - `Notify the approver when an [application] request is pending approval.`
   - `Notify the assignee when an [application] task is due.`
   - `Create a new notification that sends an email when a new incident is created. The notification should be sent to both the caller and the assigned user on the incident. Set the notification category to IT Service Management. Set the email template to 'incident.ess.resolve'.`

   Note:

   The agent supports two intents, creating a new notification or editing an existing notification. If the intent is unclear, the agent prompts you to select one.

7. If the agent asks clarifying questions, provide the requested details to help it generate accurate notifications.
8. Review the notification details that are displayed.
9. Select one of the following options:
   - **No, looks good** to create notification with the current details
   - **Yes, I'd like to make changes** to modify the notification details
10. **Optional:** If you selected **Yes, I'd like to make changes**, enter the updates when prompted.
    Now Assist revises the notification and displays the updated details.
11. Review the updated notification details and select **Confirm**.
    Now Assist creates the notification and displays a success message.

Edit an email notification using the Notification agent

Edit an email notification using the Notification agent by describing your requirements in natural language, instead of navigating forms or writing scripts.

Before you begin

Confirm the notification details before deployment.

Note: The Notification Agent requires the Implementation Agent (IA) Orchestration framework and is not supported as a standalone feature.

Role required: admin

Procedure

1. Navigate to **Admin** > **Admin Home**.
2. In the **Manage your products** section, select **View product overview** on the relevant product card.
3. In the **Configuration insights** section, select **Configure**.
   The configure page opens in the Configuration Console.
4. Select **Notifications** under the business unit you want to configure (for example, Legal, Workplace Services, or Finance for Core Business Suite).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Configure with Now Assist**.
   The conversational panel opens, detects the current page context, and invokes the Notification Agent.
6. Select **Edit an existing notification**.

   Note:

   The agent supports two intents, creating a new notification or editing an existing notification. If the intent is unclear, the agent prompts you to select one.

7. When prompted, enter the name of the email notification.
   Now Assist loads the notification record and displays a link for review.
8. Enter the changes you want to make.
   Example prompts:
   - `Modify the condition to trigger when priority is High.`
   - `Trigger the notification when the record is updated.`

   Now Assist processes your updates and displays the revised notification details.
9. Review the updated notification details and confirm.
   Now Assist saves the changes and displays link to the updated notification.
10. **Optional:** If further modifications are needed, specify any additional changes.

System Events

System Events in ServiceNow are crucial for automating processes and maintaining platform efficiency. They act as triggers for business rules, notifications, work-flows, and other actions, ensuring timely and consistent execution of tasks. By monitoring and responding to these events, organizations can streamline operations, improve response times, and enhance user experiences.

Exploring system events

Events are special records that the system uses to log when certain conditions occur and to take some kind of action in response.

System events overview

Learn about how system events function as triggers for actions and enable process automation.

Realize the benefits of leveraging system events by doing the following tasks in your instance:

- Create events
- Log events
- Implement automated job scheduling
- Move an event
- Register events
- Reprocess events
- Pass event parameters from a work-flow to a notification

System events users

Users

User	Description
Administrator	Administrators leverage system events to trigger automated actions and work-flows based on specific occurrences in the platform, enabling asynchronous processing and responsive automation. They can generate events via scripts or business rules, register them in the Event Registry, and handle them using notifications, script actions, or flows.
Business analysts	Business analysts analyze trends and processes by leveraging events to capture specific system activities, generate logs, or send data to analytic tools for better decision-making and process improvement.
Compliance officers	Compliance officers help to ensure adherence to regulatory requirements by using events to log critical activities, generate

Users (continued)

User	Description
	compliance reports, or initiate corrective actions when deviations from standards are detected.
Customer support	Customer support employees use system events to enhance customer service by triggering automated responses to customer requests, creating follow-up tasks, or escalating unresolved cases to appropriate teams.
Developers	Developers create and manage system events to integrate modules, trigger work-flows, and implement custom logic in response to user actions or record changes, helping to ensure extensibility and dynamic system behavior.
HR administrators	HR professionals use system events to automate HR processes, such as notifying employees of updates, generating on-boarding work-flows when a new hire is recorded, or triggering document reviews during off-boarding.
ITOM/ITSM	IT service managers use system events to monitor and automate ITSM processes, such as sending notifications for SLA breaches, escalating incidents, or triggering task work-flows, helping to ensure efficient IT service delivery and compliance with SLAs.
Marketing teams	Marketing teams automate customer engagement by using events to trigger campaign actions, such as sending promotional emails or updating CRM systems when specific conditions (e.g., customer interaction) are met.
Operations teams	Operations teams monitor and respond to operational alerts or system changes by triggering events that initiate corrective actions, such as restarting services, updating CMDB records, or notifying relevant teams of maintenance schedules.
Project managers	Project managers use system events to trigger notifications for project updates, create task dependencies automatically, or update stakeholders when milestones are achieved, enabling better project tracking and communication.
Security analysts	Security analysts leverage system events to trigger immediate responses to security incidents, such as creating alerts, generating logs, or initiating containment work-flows in response to detected threats or vulnerabilities.

System events benefits

System events benefits

Captures event activity in logs for auditing, debugging, and monitoring system behavior, providing insights into event performance and bottlenecks.	Event logs	Administrators, Compliance Officers, Security Analysts
Schedules jobs to be executed automatically at specific times or intervals, ensuring routine tasks are performed without manual intervention.	Implement automated job scheduling	Operations Teams, IT Service Managers, Administrators
Transfers events between queues or categories, helping optimize processing priority and load balancing in event-driven systems.	Move an event	Administrators, Developers
Registers custom or system-defined events in the platform to make them available for triggering specific actions or work-flows.	Register an event	Developers, Administrators
Provides the ability to reprocess failed or incomplete events, ensuring system reliability and minimizing the impact of errors.	Reprocess an event	IT Operations Teams, Developers, Administrators
Enables seamless transfer of contextual data from work-flows to notifications, ensuring messages contain relevant and actionable information for recipients.	Pass event parameters from a work-flow to a notification	Developers, IT Service Managers, HR Professionals

What to explore next

To learn more about configuring and using System events, see:

- Configuring system events
- Managing system events
- System events reference

System Events

Events are special records that the system uses to log when certain conditions occur and to take some kind of action in response to the conditions.

The system uses business rules to monitor for system conditions and to generate event records in the Event [sysevent] table, which is also known as the event log or event queue.

Event-generating business rules typically use this script logic:

If [some condition is true for the current record], then [add a specific event to the queue].

For example, here are some of the conditions in the **incident event** business rule:

- If a user adds a comment to an incident record, add an *`incident.commented`* event.
- If a user adds an incident record, add an *`incident.inserted`* event.
- If a user updates an incident record, add an *`incident.updated`* event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event-generating business rules use the GlideSystem `eventQueue` method to insert event records, which typically contain this information:

Event fields

Field	Description
Name	Unique name of event. Baseline event names include the record affected and the triggering action, such as `incident.commented`.
Parm1	Event-specific parameter the system uses to pass record information to other parts of the system, such as a record Sys ID or a field value.
Parm2	Event-specific parameter the system uses to pass record information to other parts of the system, such as a record Sys ID or a field value.
Table	Table to which the event applies. This is the same table on which the business rule ran.
Instance	Sys ID of the record to which this event applies.

Scheduled jobs periodically read the event queue and forward them to the appropriate handler for processing. The handler uses information from event records to take some kind of action such as:

- Run a script action
- Send a notification
- Trigger a workflow activity
- Trigger an inactivity monitor

By default, the system provides events covering a broad view of application activity. If existing events do not meet your needs, you can create your own events to watch for specific changes to records.

For developer training, see Scheduled Script Executions and Events Objectives on the ServiceNow® Developer Site.

Use the System Events and Jobs Dashboard to monitor the system event processing system and the scheduled jobs processing system.

Event processing during platform upgrade

Determine which events are to be processed during a platform upgrade by configuring the following properties:

- **glide.event_processor.all_events_upgrade_safe**: Set to **true** to process all events during platform upgrade. Default = **false**.
- **glide.event_processor.upgrade_safe_events**: Configure a comma-separated list of event names to indicate that only specified events are processed. Default = <empty>.

  This property is relevant only when `glide.event_processor.all_events_upgrade_safe = false`.

Event registry

The events registry lists the events the system recognizes. Use registered events to automate other activities, such as script actions or notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After you create a new event and a business rule that uses the event, you must register it.

Registration lets other parts of the system, such as Email and SMS notifications and Script Actions, see the event in their list of available events and react to the event when it occurs.

Related topics

Register an event

Configuring System events

Plan, configure, and implement system events without having to complete any extra configurations first. Follow the task listed in the configuration overview to implement automated job scheduling.

Configuration overview

Implement automated job scheduling

Implement the message processing framework (automated jobs scheduling) by using the Queue Registration link on the Event Registration form.

Implement automated job scheduling

Implement the message processing framework (automated jobs scheduling) by using the Queue Registration link on the Event Registration form.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Policy** > **Events** > **Registry**.
2. Select **New** to register a new event.

   Note: You can also select an existing event to update the configurations.

3. Click the Queue Registration link in the banner message on the Event Registration form.

   Note: You can also disable automated job scheduling by selecting **Disable Automatic Job Scheduling** button on the Queue Registry list page.

   If you have started a new event, the Queue Registry list shows up. If you have selected an existing event, the Queue Registration new record shows up.
4. Select **New** to create a new queue.
   The Queue Registration form shows up.
5. On the form, fill in the fields.

Field	Description
Queue	Name of the queue
Application	Scope of the application
Automatic Job Scheduling	Option to implement automated job scheduling
Event Processing Order	Option to select the way of processing events

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Parallel: Process multiple events simultaneously ○ Sequential: Process only one event at a time. The events are inter-dependent and can process only after the previous event is completed **Note:** Once you have configured the processing order and submitted the queue, it can't be edited. You can delete the queue and create a new queue.
Job configuration type	Type of job configuration **Note:** This field is disabled when you select Sequential as the Event Processing Order. If you select Parallel as the Event Processing Order, you have 2 options. ○ Constant: Creates the required number of jobs ○ Scale with node: Multiplies jobs by the number of nodes. You can use this option if you are unaware of the number of available nodes
Scale factor	Total number of jobs based on the Job configuration type selected
Poll interval	Determines how frequently jobs should poll and process events of this queue
Description	Optional field to describe about this queue related information

6. Click **Submit**.
   The Queue Registry list shows up. It also shows the update made to the recent queue.
7. Select the recently added queue.
   The Queue Registration form shows up.
8. Scroll down to the Related lists section.
9. Select the **Status** entry in the Queue Details related list.

   Note: Since the new queue has been submitted, the Status entry is Active.

   The Queue Details form shows up.
10. **Optional:** Update the number of jobs for this queue as per the requirement.
    You can now manually scale up or down as per the requirements without having to configure everything and can eventually avoid misconfiguration.
11. **Optional:** Click Rollback related link on the Queue Registration form if you want to roll back a queue to its previous configurations without automated job scheduling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The Rollback related link shows up only if you are in an automated jobs scheduling configuration.

12. **Optional:** Select **Retrieve Configurations** if you want to retrieve any existing job configurations for this queue.

    Note: This process is possible only if you are in an automated jobs scheduling configuration.

    If any queue with your suggested queue name already exists in the manual jobs scheduling configuration, the configurations of the existing queue are retrieved. You can then validate and update them as required.

Managing system events

Managing system events involves creating, monitoring, and handling events to drive automation and streamline processes. Administrators and developers can define custom events, register them in the system, and set up actions or work-flows that respond to these events. This functionality helps ensure efficient task execution, helps improve system monitoring, and enables more robust error handling for enhanced operational reliability.

Overview of managing system events

- Create an event

  Create custom system events.

- Move an event

  Accelerate the execution process by moving high priority events from the default queue to an isolated queue.

- Pass event parameters from a work-flow to a notification

  Pass two event parameters that send information about a record or related records from a work-flow to a notification.

- Register an event

  Register an event for a specific table and a business rule that fires the event.

- Reprocess an event

  Re-fire an event for testing or diagnostic purposes.

System events reference

For more information, see System events reference.

Create an event

If you do not find a suitable existing event, you can create your own.

Before you begin
Role required: admin

About this task
The gs.EventQueue function works directly with the backend and therefore business rules that are called by gs.EventQueue() are not invoked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Policy** > **Events** > **Registry**, and then select **New**.
2. On the form fill in the fields.

Event Registration Form Completion

Field	Description
Event name	Name of your new event.
Table	Database table for this event. **Note:** Only tables and database views that are in the same scope as the event appear on the listing.
Queue	Name of the queue that the event is placed into when triggered. Use only lowercase letters, no spaces, and no special characters except underscore (_). For example, `my_queue`. See Using custom queues to process events.
Priority	Order in which messages will be processed. Lower values have higher priority. **Note:** The com.glide.sysevent.priority.enabled system property is enabled by default. If you disable it, events processing is not done by priority.
Caller Access	Restricted caller access settings. ○ Caller Restriction: calls to the resource must be manually approved. ○ Caller Tracking: Calls to the resource are automatically approved.
Fired by	Name of the business rule that runs the event. This field is for reference only and is not used by any process. Make sure that there is enough information to locate your event again.
Description	Short description of the purpose of the event.

3. Click the **Business Rules** related link.
4. If you are creating an event for a base system table, select the existing event business rule for the table.

   Example
   For example, select the *sc request events* business rule to create a custom Request event.
5. If you are updating an existing event business rule, add a new condition to the **Script**.

   Example
   The following sample script adds a *request.commented* event with the user's Sys ID as parm1 and the user's user name for parm2.

```
if (current.operation() != 'insert' &&
 current.comments.changes()) {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.eventQueue('request.commented', current, gs.getUserID(),
 gs.getUserName());
}
```

6. If you are creating an event for a custom table, create a new business rule that runs after database operations.

Example
For example, this business rule defines several events for a custom application called Marketing Events.

Sample event business rule

Field	Value
Name	Attendee Events
Table	Attendee [x_snc_marketing_ev_attendee]
Application	Marketing Events
Advanced	Selected
When	after
Insert	Selected
Update	Selected
Delete	Selected
Script	Add custom script that: ○ Checks for one or more conditions on the current record. ○ Calls the gs.eventQueue() method and specifies an event name. See code sample.

Note: If you add **Filter Conditions**, **Role conditions**, or a **Condition** value, verify it runs the business rule when expected.

```
(function executeRule(current, previous /*null when async*/) {
   //This function will be automatically called when this rule
 is processed.
        //Add event when attendee inserted
        if(current.operation() == 'insert' &&
 current.marketing_event.changes()) {

 gs.eventQueue('x_snc_marketing_ev.attendee.added', current,
current.marketing_event, current.email);
        }
        //Add event when marketing event changes
        if(current.operation() == 'update' &&
 current.marketing_event.changes()) {

 gs.eventQueue('x_snc_marketing_ev.attendee.deleted', previous,
previous.marketing_event, previous.email);

 gs.eventQueue('x_snc_marketing_ev.attendee.added', current,
current.marketing_event, current.email);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        }
        //Add event when attendee deleted
        if(current.operation() == 'delete') {

 gs.eventQueue('x_snc_marketing_ev.attendee.deleted', current,
              current.marketing_event, current.email);
}
})(current, previous);
```

7. Register the event.

What to do next
Create a script action or notification to process the event.

Related topics

Register an event

Script actions

Move an event

Accelerate the execution process by moving high priority events from the default queue to an isolated queue.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Event registry**.
   A list of registered events shows up.
2. Select the event you want to move.
   The Event Registration form of the selected event shows up.
3. Select **Move to Default Queue** to move the event from the current queue and accelerate its execution.

   Note: If you are currently in the default queue, you will have the **Move to Adaptive Event Queue** option to select.

   The processor can execute only one event at a time. So, if you move an event to a queue, it gets executed only when the processor is available.

4. **Optional:** Navigate to **System Diagnostics** > **Stats** > **Adaptive Events** to track the average execution time of the events.
   You can select any slow moving event and change the queue as required. You can also register an event to show up on the event registry list.

Pass event parameters from a work-flow to a notification

Pass two event parameters that send information about a record or related records from a work-flow to a notification.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Policy** > **Events** > **Registry** and define a new event to call.
2. Create the activity step that calls the event from your workflow and assign the two possible parameters.
   These parameters can be references or fields on the record that triggered the workflow, such as *current.number* for the request item number. You can also dot-walk to records in other tables. The event then sends the parameters information to the notification that it triggers.
3. Retrieve the parameters in the notification with email scripts by using *event.parm1* and *event.parm2*.
   For example:

```
var string = event.parm1.toString();
template.print(string);
```

Example:

Another example using Sys IDs gives you access to anything in the record that triggered the workflow. Use a script like this to send information about a change or request to support personnel, for example.

```
var id = event.parm1.toString();
var gr = new GlideRecord('sc_req_item');
gr.get('sys_id', id);
if (gr.next()){
   // Do something.
}
```

Scripting for email notifications

Register an event

You can register an event for a specific table and a business rule that fires the event.

Before you begin

Role required: admin

Procedure

1. To register an event, browse to **System Policy** > **Events** > **Registry**, and then click **New**.
2. On the form fill in the fields.

Event Registration Form Completion

Field	Description
Event name	Name of your new event.
Table	Database table for this event. **Note:** Only tables and database views that are in the same scope as the event appear on the listing.
Queue	Name of the queue that the event is placed into when triggered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Use only lowercase letters, no spaces, and no special characters except underscore (_). For example, `my_queue`. See Using custom queues to process events.
Priority	Order in which messages will be processed. Lower values have higher priority. **Note:** The com.glide.sysevent.priority.enabled system property is enabled by default. If you disable it, events processing is not done by priority.
Caller Access	Restricted caller access settings. ○ Caller Restriction: calls to the resource must be manually approved. ○ Caller Tracking: Calls to the resource are automatically approved.
Fired by	Name of the business rule that runs the event. This field is for reference only and is not used by any process. Make sure that there is enough information to locate your event again.
Description	Short description of the purpose of the event.

Reprocess an event

You can fire the event again for testing or diagnostic purposes.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Logs** > **Events**.
2. Open an event.
3. Under **Related Links**, click **Reprocess Event**.
   The event returns to the event queue.

System events reference

Reference topics provide information about system events.

Event logs

The event log records all system events that occur within the ServiceNow AI Platform.

This log provides the following information for all events that occur:

Event log

Field	Description
Created	Date and time of the event for the locale of the machine running the instance.
Name	Name of the event as listed in the Event Registry.
URI	HTTP query that generated the event.
Parm1	Event-specific value that depends on the event and the recipient.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event log (continued)

Field	Description
Parm2	Event-specific value that depends on the event and the recipient.
Table	Database table acted on for this event.
Processed	Date and time the event started processing. This time reflects the locale of the machine running the instance.
Processing time	Time taken to process this event, in milliseconds.
Queue	Processor queue name.

Event states

The event state describes where in the life cycle the event is.

Event states

State	Description
Ready	The system created the event and it is in the queue waiting to be processed.
Processed	The event successfully ran. An event does not necessarily trigger any further action when processed. Additional functionality must make use of the event.
Error	The event encountered an error during processing. This state is often caused by invalid event parameters. Reprocessing the event may resolve the error.
Transferred	The event was rotated to a different shard of the Event [`sysevent`] table. When an event is rotated, a duplicate record is created in an active shard to be processed. A scheduled job processes the event when it is next in the queue, but it is not possible to predict when this will happen as because several events may need to be processed before it. Therefore, you can reprocess the event. See Reprocess an event.

The incident events business rule

The incident events business rule comes with the system and defines a number of events that can be triggered by different actions in the Incident table.

This business rule defines several events, three of which are triggered after a record in the Incident table is inserted or updated. The first script is:

```
if (current.operation() != 'insert' &&
 current.comments.changes()) {
gs.eventQueue("incident.commented", current, gs.getUserID(),
 gs.getUserName());
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The condition in this script requires that a change be made to the **Comments** field in an existing (not inserted) incident record. If this condition is true, then the platform adds the `incident.commented` event to the event queue.

The second condition requires that a record be inserted before the event is added to the queue.

```
if (current.operation() =='insert') {
```

The third condition is true whenever the incident record is updated (including updates to the **Comments** field, as specified by the first script).

```
if (current.operation() == 'update')
```

The then part of each script, the *`gs.eventQueue`* function, adds the event to the event queue. This statement uses the following syntax, set off with braces:

```
gs.eventQueue("incident.updated", current, gs.getUserID(),
 gs.getUserName());
```

The *`gs.eventQueue`* function takes the following parameters:

gs.eventQueu parameters

Field	Input Value
Name	The name of the event triggered, set in quotation marks.
Record	The record referenced when the condition in the script evaluates to *true*. Usually this is expressed as *current*, meaning the current record the business rule is working on. If the business rule is being triggered as part of a scheduled job, use a GlideRecord argument in its place.
Parm 1	An optional parameter you can use to pass system or record information with the event. For example, the GlideSystem API call *`gs.getUserID()`* passes the Sys ID of the user who acted on the current record as a string value. Other scripts can reference this string value as parm1 using the format `${event.parm1}`.
Parm 2	An optional parameter you can use to pass system or record information with the event. For example, the GlideSystem API call *`gs.getUserName()`* passes the user name of the user who acted on the current record. Other scripts can reference this string values as parm2 using the format `${event.parm2}`.

Note: The gs.EventQueue function works directly with the backend and therefore business rules that are called by gs.EventQueue() are not invoked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global events

Your instance has a global function called `global_events()` that triggers from a business rule when certain conditions occur.

This function triggers when your instance is:

- Inserting new records
- Updating existing records
- Adding comments to an existing record
- Assigning a record to a user
- Exceeding a record's inactive timer

For example, if you add the script global.events(current) to a business rule on the `change_request` table, the instance automatically configures the following events:

- change_request.inserted
- change_request.updated
- change_request.commented
- change_ request.assigned
- change_ request.inactive

Script actions

You can use script actions to create server-side scripts that perform a variety of tasks, such as modifying a configuration item (CI), or managing failed login attempts. Script actions are triggered by events only.

Role required: sysevent_script_action_admin or admin

To create a new script action, navigate to **System Policy** > **Events** > **Script Actions** and click **New**.

Script actions

Field	Description
Name	Unique name for your script action.
Application	Application that contains the script.
Event name	Event to use for this script. If you do not find an event for your script action that suits your purpose, you can create a new one.
Active	Check box that enables or disables the script action. Select **true** to enable the script action.
Execution order	Order in which the script will be executed.
Condition script	Statement for a condition under which this script should execute. The system only parses the **script** field if the condition evaluates to true. If you decide to include the condition statement in the script, leave this field blank.
Script	Script that runs when the condition you define evaluates to true. Two additional objects are available in this script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script actions (continued)

Field	Description
	• *event*: a GlideRecord - the sysevent that caused this to be invoked. If you want this first parameter on the event, use *event.parm1* or *event.parm2* for the second parameter. For the date/time of the event, use *event.sys_created_on*. To get the user ID that created the event (if there was a user associated), use *event.user_id*. • *current*: a *GlideRecord* - the event scheduled on behalf of (incident for example).

Sample scripts from the change events business rule

Several scripts are found in the baseline change events business rule.

This business rule defines events that fire after a change request is inserted or updated.

```
if (current.operation() == 'insert') {
 gs.eventQueue("change.inserted", current, gs.getUserID(),
 gs.getUserName());
}

if (current.operation() == 'update') {
 gs.eventQueue("change.updated", current, gs.getUserID(),
 gs.getUserName());
}

if (!current.assigned_to.nil() && current.assigned_to.changes())
 {
  gs.eventQueue("change.assigned", current,
 current.assigned_to.getDisplayValue() ,
 previous.assigned_to.getDisplayValue());
}

if (current.priority.changes() && current.priority == 1) {
  gs.eventQueue("change.priority.1", current, current.priority,
 previous.priority);
}

if (current.risk.changes() && current.risk== 1) {
  gs.eventQueue("change.risk.1", current, current.risk,
 previous.risk);
}

if (current.start_date.changes() || current.end_date.changes()
 || current.assigned_to.changes()) {
  if (!current.start_date.nil() && !current.end_date.nil()
 && !current.assigned_to.nil()) {
    gs.eventQueue("change.calendar.notify", current,
 current.assigned_to, previous.assigned_to);
  }

  // Remove from previous assigned to, due to assigned_to
 changing
  if (!previous.assigned_to.nil()) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      if (!current.assigned_to.nil() &&
 current.assigned_to.changes() &&
         (!previous.start_date.nil()
 && !previous.end_date.nil())) {
        gs.eventQueue("change.calendar.notify.remove", current,
 current.assigned_to, previous.assigned_to);
      }
   }
  // Remove old calendar from current assigned to, due to date
 changing
  else if (!current.assigned_to.nil()) {
     if ((current.start_date.changes()
 && !previous.start_date.nil()) ||
         (current.end_date.changes()
 && !previous.end_date.nil())) {
       gs.eventQueue("change.calendar.notify.remove", current,
 current.assigned_to, current.assigned_to);
     }
  }
}
```

State Management

State Management enables an administrator to define State Models and State Transitions that control how a record is allowed to transition through a predefined list of states.

An example of a state transition is when the **State** field in a facilities request is moved from the **Assigned** state to the **Work In Progress** state.

State Management is active for all instances.

What is a state model?

A state model is a list of states that describe an expected record workflow through the lifecycle of the record. State models can be defined for any table that extends the task table. State models simplify defining the state transitions allowed for a specific task type.

In the State Model [sys_state_model] table, define the name of the state model and which task table the state model is applied to. Use the condition builder to specify any conditions for applying the state model to records and any required condition for moving between states.

For example, you could define a state model for a new custom application for airline reservations. The custom application has a Reservation Request [reservation_request] table with 4 states: **Held**, **Confirmed**, **Completed**, and **Canceled**. You could define the state model to target the Reservation Request table, and then define the state transitions for each of the 4 states. When you enable the state model, the choice list for the **State** field includes only the choices allowed by the conditions in the state transitions.

Note: State Management includes example state models that are copies of the normal, emergency, and standard change request state models. By default, these examples are not enabled. Use them only as examples to develop a state model and transitions for a task table that does not have a state model. Do not enable these example state models for change requests and then make changes to them. Doing so breaks existing transitions for change requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What is a state transition?

State transitions are a list of conditions for entering or exiting each state defined for a table. In the State Transitions [sys_state_transition] table, use the condition builder to build a list of conditions required for entering or exiting each state.

To prevent users from choosing an invalid state, any attempt to update a record's state is denied if it violates the state transitions, whether the attempt is through user input, a script, a Web API such as REST or SOAP, or any other source.

State transitions control the choice list for the **State** field on the target task table and prevent you from choosing any state value that does not adhere to the underlying process or does not meet the defined conditions for the transition.

For example, if the enter condition for the **Completed** state is **State is Confirmed**, only records in the Confirmed state can transition to the Complete state. When a record is in the Confirmed state, the only choice in the **State** field choice list is **Completed**.

Add a state model and transitions

Add a state model and transitions to specify conditions for moving between states.

Before you begin

Role required: state_model_admin or admin

About this task

Develop and test your state model in a non-production instance before deploying it in the production instance.

Procedure

1. Navigate to **All** > **State Management** > **State Models**.
2. Click **New**.
3. Fill in the fields on the form.

State model fields

Field	Description
Name	Descriptive name for this state model.
Table	Table this state model applies to.
Application	Defaults to **Global**.
Order	Order in which this state model is evaluated for the target table. State models are evaluated in numerical order, from the lowest number to the highest number. Leave space between the numbers so that you can insert a new state model later, if necessary. For example, enter 10 for the first state model to be evaluated, 20 for the next state model to be evaluated, and so on.
Active	Indicates that this state model is enabled. Clear this check box until you define the state transitions for the state model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description of this state model.
Condition	Condition builder that sets the conditions for applying this state model to records. For example, you could add the condition **Category is Networking** versus **Category is Security** if there are different state models for networking requests and security requests.
Common Exit Condition	Condition builder that sets any common condition required for moving from one state to another.

4. Open the form context menu and click **Save**.
   The **State Transitions** related list appears.
5. Click **New** on the **State transitions** related list.
6. Fill in the fields on the form.

State transition fields

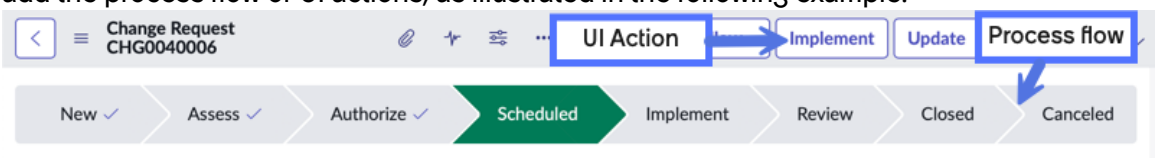
Field	Description
State Model	State model that uses this state transition.
State	State this transition controls, for example **Ready** or **In Progress**.
Application	Defaults to **Global**.
Order	Order in which this state transition is evaluated. State transitions are evaluated in numerical order, from the lowest number to the highest number. For example, if the first predefined state is **New**, give that state the lowest order number so that the conditions for entering and leaving the state are evaluated first. Leave space between the numbers so that you can insert a new state transition later, if necessary. For example, enter 10 for the first state transition to be evaluated, 20 for the next state transition to be evaluated, and so on.
Terminal State	Selected if there are no transitions from this state.
Description	Description of this state transition. For example, the **Description** for the Assess state could be `New state can move only to Assess state`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Enter Condition	Condition builder that sets the conditions for entering this state.
Exit Condition	Condition builder that sets the conditions for exiting this state.

7. Click **Submit**.
   The state model form reopens, and the new transition is added to the related list.
8. Continue adding state transitions for the remaining states.
9. When finished adding state transitions in the state model form, select the **Active** check box and click **Update**.

Implement process flow and UI actions with a state model



You can implement a process flow and UI actions with a state model.

Before you begin

Role required: state_model_admin or admin

About this task

State models provide a way to limit the choices for moving between states in a form. If you set up only a state model, users manually change states in the form. Additional steps are required to add the process flow or UI actions, as illustrated in the following example.

Procedure

1. Verify the choices for the **State** field for the table and ensure that you created transitions for them.
   For more information about how to add **State** field choices, see Best practices for state field choice values.
2. After creating the state model, define the process flow.
   For more information about process flows, see Process flow formatter.
3. Define UI actions as desired to move between states.
   For more information about UI actions, see UI actions.

Result

After the state model is enabled, only the defined state transitions are included in the choice list for the **State** field, and the process flow and UI actions are implemented.

Installed with State Model

Several types of components are installed with the State Model.

Tables installed with State Model

State Model adds the following tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
State Model [sys_state_model]	Defines the name of the state model and which table the state model targets. Also defines the condition for applying the state model to records and any common condition for moving from any state to any other state.
State Transition [sys_state_transition]	Defines how each record in the target table transitions to (the enter condition) and/or from (the exit condition) each state predefined for that table.

Roles installed with State Model

State Model adds the following role.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

State Model Administrator	Description	Contains roles
[state_model_admin]	Allows users to add, modify, and delete state models for task tables.	None

State model Administrator [state_model_admin]

Add, modify, and delete state models for task tables.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note: Avoid granting an admin role when more specialized roles are available.

Script includes installed with State Model

State Model adds the following script include.

Script include	Description
TableChoiceUtils	Utility class to get the choice list of a table field.

Client scripts installed with State Model

State Model adds the following client script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Client script	Table	Description
Populate State Choices	State Transition [sys_state_transition]	Populates the **State** field choices in the targeted record.

Business rules installed with State Model

State Model adds the following business rules.

Business rule	Table	Description
Set the display value for state	State Transition [sys_state_transition]	Sets the **State** field value based on the state model for the table.
Set the table to pick choices	State Transition [sys_state_transition]	Caches the **State** field value from the first table in the hierarchy for further rule processing.

Metrics

A metric measures and evaluates the effectiveness of IT service management processes.

For example, a metric could measure the effectiveness of the incident resolution process by calculating how long it takes to resolve an incident.

A metric can often be easily obtained from the data. To find the number of incidents created today, a report counts the number of incidents in the incident table with a Created date of today. However, metrics must be gathered as data is updated. For example, determining how long an incident was assigned to a certain group requires collecting information about assignment changes and calculating the duration of each assignment.

The Metric plugin provides an easy, declarative way of defining metrics. Once defined, the data for the metric is gathered, and instances of the metric are calculated and stored. For example, the "Assigned to Duration" metric measures the amount of time an incident is assigned to an individual. To define this metric, you create a metric definition of the type "Field value duration" and select the "Assigned to" field from the Incident table. A metric instance is created for each incident assignment showing its duration. Reporting on the duration of incident assignments becomes easy.

You can report on a metric by using a Working with database views for reporting that links the metric to the table on which it is defined.

To install the Metric Definition plugin (com.glide.metrics), navigate to **System Definition** > **Plugins**, search for Metric Definition, and click **Install**.

Define a metric

Create a metric definition for a task table.

Before you begin

Role required: metric_admin

About this task

Metric definitions do not generate values for time periods before they were created. They only apply to events that occur after the metric definition has been established.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Metrics** > **Definitions**.

> **Important:** Don't confuse these metric definitions with the metric definitions for the Assessments feature. The Assessments feature is concerned with questionnaires. It isn't related to the Metrics feature.

2. Select **New**.
3. Complete the Metric definition form then select **Submit**.

> **Note:** In the base system, metrics are configured to work on the task table only. To apply metrics to cmdb_ci tables, duplicate the metric events business rule that currently runs on the task table for the cmdb_ci table. Without the events created, no metric processing can occur.

New metric definitions

Field	Description
Number	The system generates a unique record number for the metric definition.
Name	Enter a unique name to describe what metrics are collected.
Table	Select the table that you want to collect metrics for. A metric can only apply to one table. **Note:** The list shows only tables and database views that are in the same scope as the metric definition
Field	Select the table column that you want to monitor for changes. Metrics only work on audited fields. Creating a metric for a non-audited field produces unreliable metrics. **Note:** Fields starting with 'sys_' don't work for a metric definition, except for 'sys_domain'.
Type	Select what values this metric generates. ○ **Field value duration**: This type of metric measures the duration of time from when the value of the specified field is set until it's changed. A Field value duration metric can optionally specify a script. The script can either return a duration value or set the answer variable to false to stop processing the metric. For example, the baseline incident metrics stop calculating duration when the Active field of an incident is set to false. The script can also carry out any other action such as closing the duration of other metrics defined on the same record. For more information, see Sample field value duration script. ○ **Script calculation**: This type of metric creates a metric instance using a script. The script has access to the current row in the table (for example an incident) and the metric definition. The script must perform metric calculations and insert data into the metric_instance table. The calculation doesn't have to result in a duration. It can calculate any type of value and store it in the metric instance value.
Timeline	Check this box to display the metric on a timeline page. For more information, see Timeline pages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Check this box to monitor changes for this metric.
Description	Specify what data the metric monitors and its conditions. A good description helps other metrics administrators understand the purpose of your metric.
Script	Enter the script that you want the metric to run to either calculate a duration or perform some calculation on the metric_instance table.

Sample field value duration script

Review the existing Incident Open metric definition to see how you can create your own custom metric.

This script either provides a duration value or stops processing durations (sets the answer variable to *fal*se) when an incident is closed.

```
// script can set answer to false to terminate processing of the
 metric
    // mi - MetricInstance
    // answer
    if (!current.active) {
    answer = false;
    mi.endDuration();
    gs.log("Closing field durations");
    closeDurations(mi.current);
    }

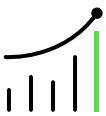
    function closeDurations(current) {
    var now_GR = new GlideRecord('metric_instance');
    gr.addQuery('id', current.sys_id);
    gr.addQuery('calculation_complete', false);
    gr.addQuery('definition.type', 'field_value_duration');
    gr.query();
    while (gr.next()) {
    gs.log("closing: " + gr.definition.name + " for: " +
 current.number);
    var definition = new GlideRecord('metric_definition');
    definition.get(gr.definition);
    var mi = new MetricInstance(definition, current);
    mi.endDuration();
    }
    }
```

Metric instance

A metric instance is a record in the metric_instance table. A record holds one instance of a metric.

Metric instance records get created and updated in one of two ways:

- If the metric is a duration, the system automatically populates the metric instance table with duration values.
- If the metric is calculated from a script, the script itself must populate the metric_instance table.



Some of the notable fields in the metric_instance table are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Metric definition: the metric definition for which this metric instance was gathered.
- Value: For a "Field value duration" metric this is the value of the table field for which duration is calculated. For example, for the "Assigned to Duration" metric, the Value is the name of the person assigned to the incident. For other metrics, the value can be any value calculated by the metric.
- ID: Identifies the specific record for which the metric is gathered. For example, the specific incident.
- Duration: Time duration for a Field value duration metric.

Maintaining and monitoring the ServiceNow AI Platform

Keep your instance running smoothly, improve performance, and find issues before they arise, all with this suite of tools.

Instance Scan	Platform performance	System Diagnostics
		
Find potential health issues and opportunities for best practice improvement in your instance.	Optimize your application with diagnostics and performance monitoring.	Monitor health and performance of your instance.

Instance Scan

Get detailed analysis of your instance configurations, and stop potential system health issues before they arise. Use ServiceNow's Instance Scan any time and ensure system stability, whether you are developing, releasing, or upgrading your application. Schedule, execute, and track scans from single-point to full-suite tests, and review the data they provide with dashboards.

See Instance Scan.

Events

Track every occurrence in your app, from screen loads to user clicks. Usage Insights provides detailed charts and tables for every event, to show you where the most activity goes on in your app. Analyze core processes in your business and improve user efficiency and workflow.

See System Events.

Platform performance

Keep your system optimized and running smoothly. Use diagnostics to track processing and response times, network speeds and behaviors, and browser settings. Monitor platform performance, set quotas and control system bandwidth to ensure stable operations for users, set up test modules, and more.

See Platform performance.

Instance Scan

Use ServiceNow® Instance Scan to interrogate your instance for configurations that indicate health issues and identify opportunities to address best practices. Instance Scan checks your existing configurations and helps you avoid creating future configuration issues. Instance Scan is a tool that can be used as a part of your development operations, release management as well as pre- and post-upgrades.

Get started

Explore  Learn about Instance Scan records and components.	**Configure**  Execute scans to keep a track on the health of your instance.
Use  Use Instance Scan dashboard for a system wide visual representation of the health of your instance.	**References**  Learn additional information about Instance Scan.

Troubleshoot and get help

- Ask or answer questions about Instance Scan in the ServiceNow Community
- Search the Known Error Portal for known error articles

Exploring Instance Scan

If you are new to Instance Scan, read this overview to learn what the tool can do. Follow the tutorial to create checks and execute scans that uses most basics of Instance Scan features.

Note: Instance Scan doesn't fully support domain separation. Findings are visibly domain separated based on the domain of the source record. For more information see Domain separation.

Instance Scan overview

Instance Scan uses the following records, components and scan types.

Checks

Checks are singular focused rules that detect anomalies or opportunities in an instance. These checks can run against tables, records, or metadata. Checks are defined to identify security, upgrade best practices, manageability, user experience and performance vulnerabilities. See Getting started with checks for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results

An Instance Scan result reports the status and type of the scan. See Results for more information.

Findings

A finding is a reference to a record that has violated a rule from a check on the instance. See Findings for more information.

Dashboard

The Instance Scan dashboard is a system-wide visual representation of the health of your instance. The dashboard helps you manage and analyze the full scan results against your instance. See Instance Scan dashboard for more information.

Quota rule

A quota rule determines the execution threshold of a scan. The quota rule prevents the instance from running long scans. For example, any scan running longer than the threshold set by the quota rule will result in a failure. See Quota rules for more information.

Full scan

Execute a scan for the entire instance by selecting **Execute Full Scan**. Implementing a full scan runs all the active checks present in your instance.

Point scan

Execute all applicable checks against a single record, update set, or an application by selecting **Run Point Scan**. For example, if you execute a point scan against a business rule, only the checks that are applicable to the business rule table run, and only that single target record is scanned. If you execute an update set scan or an application scan, all records related to that update set or application are scanned. See Execute an app scan and Execute an update set scan for more information.

Test scan

Execute a test scan to verify if the check works as expected. The test scan enables you to test a single check instead of a full scan by selecting a single check and selecting **Test Check** on the Check form.

Note: Instance Scan can scan tables that are extended by sys_metadata.

Instance Scan users

Instance Scan has the following roles.

Users	Description
scan_user	The scan_user role can run different types of scans, read checks, execute checks, and view the findings and results.
scan_check_writer	This role includes the scan_user role and provides permission to create new checks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Instance Scan benefits

Benefit	Feature	Users
Create checks and check suites to know the health of your instance	• Getting started with checks • Create a check • Create a check suite	scan_user
Execute scans on the created checks to review the instance health	Executing a scan	scan_user
Scheduling of scans and suite scan	• Schedule a full scan • Schedule a suite scan	scan_user
Monitor your scans to ensure no health issues of your instance	Monitoring a scan	scan_user
Manage and analyze the results of full scan against your instance	Instance Scan dashboard	scan_user

What to explore next

To learn more about using Instance Scan, see:

- Configuring Instance Scan
- Using Instance Scan
- Instance Scan references

Getting started with checks

Checks are singular focused rules that detect anomalies or opportunities in an instance. These checks can run against tables, records, or metadata. Checks are defined to identify security, upgrade best practices, manageability, user experience and performance vulnerabilities.

Check types

You can create your check by selecting one of these types.

Table Check

Create a check by selecting **Create a new Table Check** if you know which specific table and conditions you want to test. This check type is applied on only one table at a time. You can also include your own script for more complex capabilities by selecting the **Advanced** option on the form.

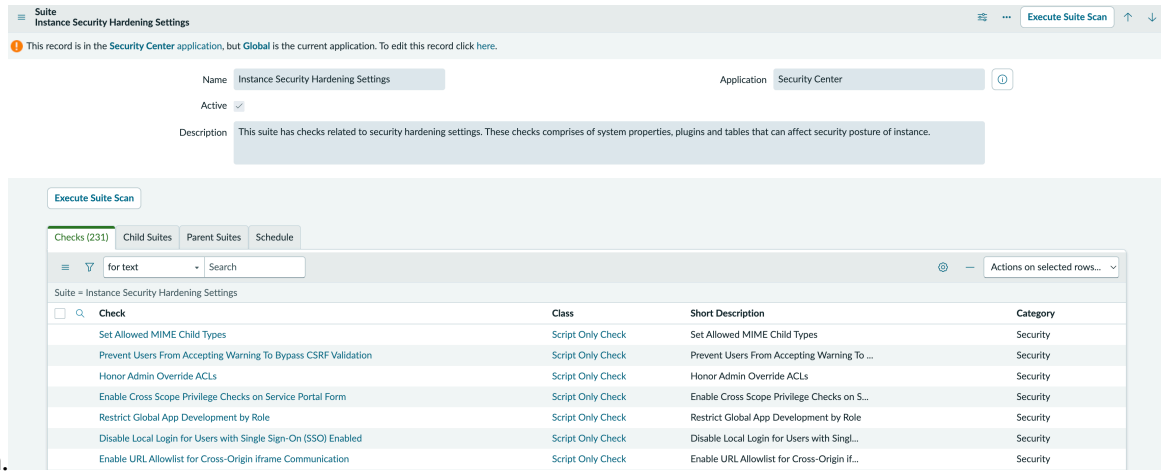
Column Type Check

Retrieve all records containing a specific column field type from all tables in an instance by selecting **Create a new Column Type Check**. The **Column Type Check** type implements the rule you created to iterate all records matching the target column field type.

Script Only Check

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a check without specifying a table or a column type by selecting **Create a new Script Only Check**. You can verify meta data, configurations, and execute complex checks by writing your own script.



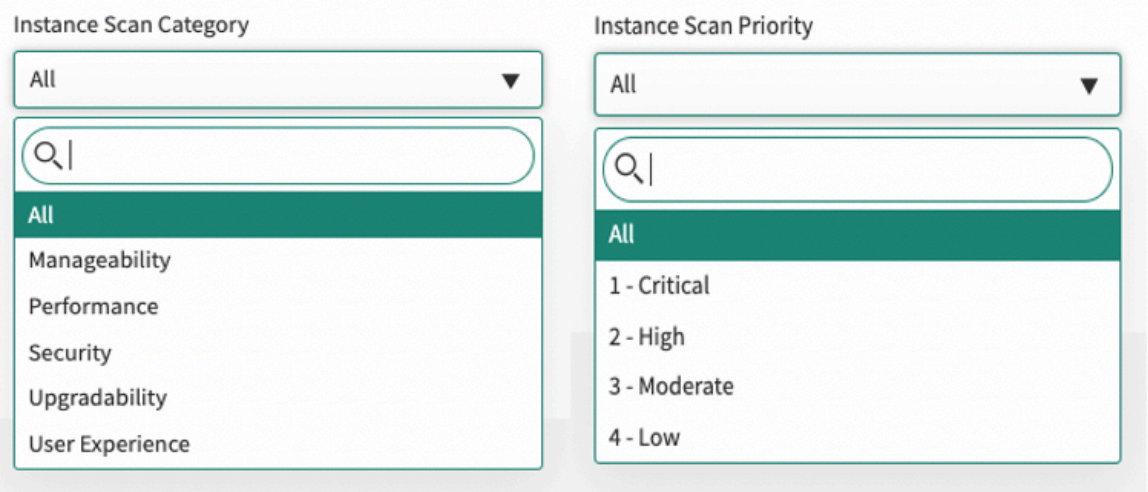
Linter Check

Create a linter check to identify any issues in a script. When a linter check is run on a record, an abstract syntax tree for its code is generated. You can use the abstract syntax tree to analyze issues with the code.

Suites management

A suite is a collection of individual checks and suites that can be used for a scan. Suites can be created for specific business needs. All child suites are executed when a parent suite is used in a scan.

Navigate to **Instance Scan** > **Suites**. Select one of the suites from the list. Select **Execute Suite Scan** to run a suite scan. See Execute a suite scan for more information.



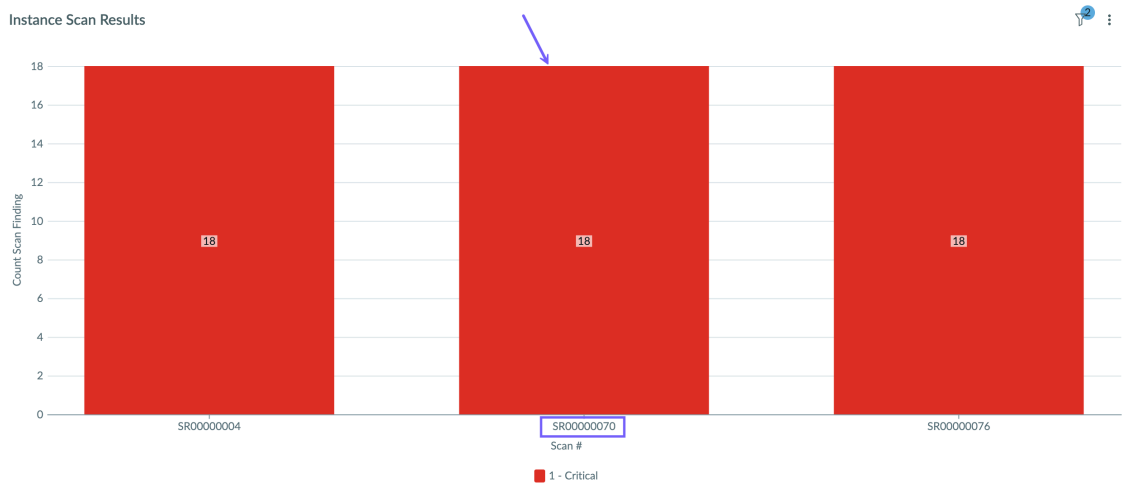
Note: Some ServiceNow provided suites are protected suites and the checks in the suite are not modifiable. For example, if you have a suite from the app store, the suite is unmodifiable. You can't add a child suite to the unmodifiable suite. But you can add a parent suite because it doesn't affect the suite.

Instance Scan dashboard

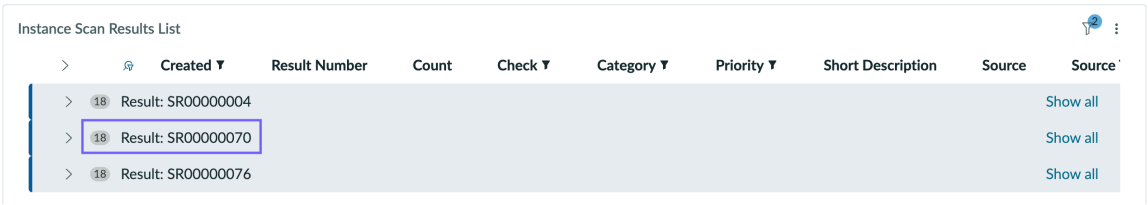
The Instance Scan dashboard is a system wide visual representation of the health of your instance. The dashboard helps you to manage and analyze the results of full scan against your instance.

The dashboard offers several options to filter your search results to find the exact check finding that might be causing some issues. The **Instance Scan Category** is the filter picker that shows all the categories of all the checks that were scanned. You can select the type of scan category that you want the dashboard to display as a part of the scan results. **Instance Scan Priority** helps you to select the priority level of the results to decide which scan results must be addressed first. This priority level is often referred to as the rating level of the scans.

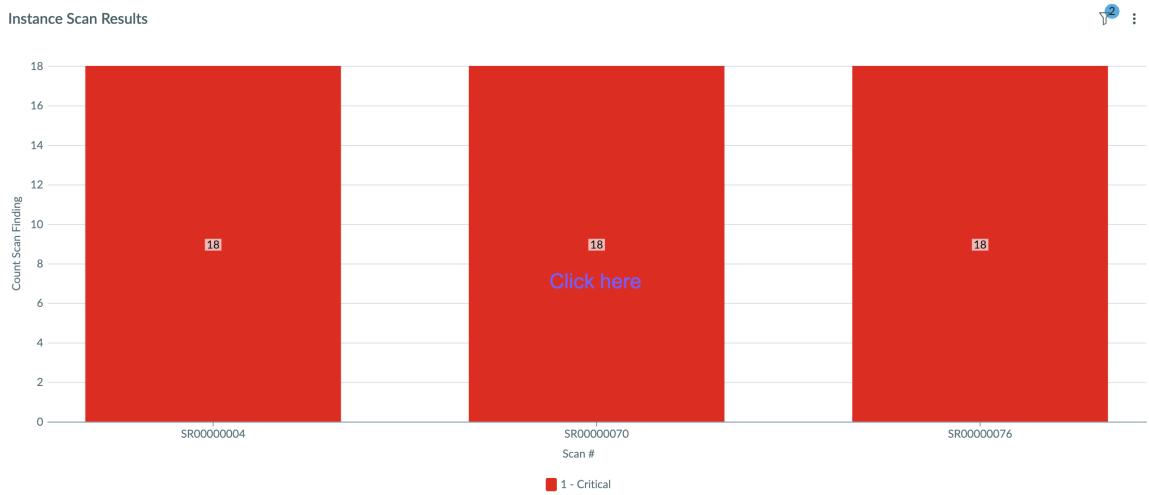
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The dashboard is only applicable for full scans. The **Instance Scan Category** is only available if you have data or a finding in the result set that are applicable to the categories.



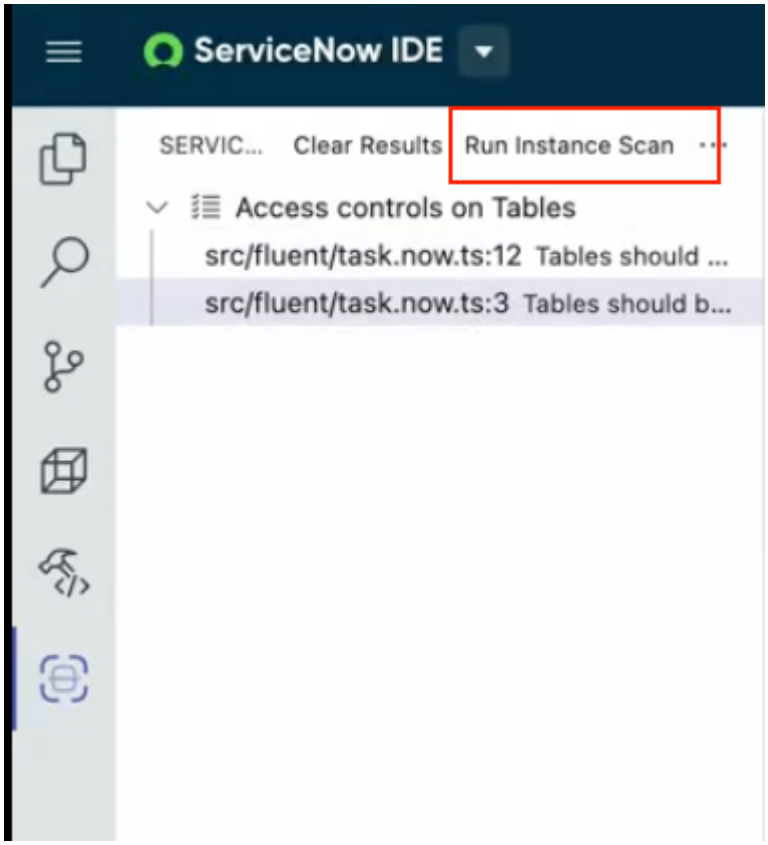
For example, you can use the dashboard to compare the results of the check findings. If you see a sudden change in the number of check findings, select the particular scan result from the Scan Results List.



You can review all the findings for the scan that generated an unexpected number of findings. This list displays all the findings that are related to one or more of all the scans.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also directly select the column with the required findings to display the related list for a particular scan.



The list also indicates the source from which the finding has been retrieved. You can export the list view data to an external source such as a .csv file or an .xlsv file for further performance comparison and analysis.

Instance Scan extension for IDE

Access Instance Scan directly from your integrated development environment (IDE) on the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See ServiceNow IDE for more information.

Configuring Instance Scan

Execute the different kinds of scans that Instance Scan offers to keep a check on the health of your instance. You can also schedule a full scan so you can ensure the health of your instance even without an active session.

Note: Instance Scan scans only customized records, but point scan scans all records including the default records.

1. Execute scans: Execute the different types of scans available as per your requirements.
2. Schedule scans: Create a schedule to regularly trigger either a full or a suite scan even when you don't have an active session.
3. Monitor scans: Track the progress status of the executed and scheduled scans.
4. Review scans: Review your executed scans with the findings and results components.

Instance Scan table cleanup policies

Instance Scan offers table cleanup policies to erase previous scan results.

The cleanup policies are based on the time that the scans are created. The timer starts when you run a scan. **Table Cleanup** is run against the Auto Flushes [sys_auto_flush] table and cleans up the previous scan results.

- If the result records are older than 90 days (**7,776,000** seconds), the first policy clears all scan result records and related records.
- If the following conditions are true, the second policy deletes all scan result records and related records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Scan type** is **Test Scan**.
- The records are older than 14 days, and **Age in seconds** is equal to or greater than **1,209,600** seconds.

You can also modify these policies by entering any customized time period. See Customize table cleanup policies for more information.

Customize table cleanup policies

Clean up previous scan results at a regular interval by customizing the table cleanup time period.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Instance Scan** > **Table Cleanup**.
2. Select one of the cleanup policies from the Auto Flushes list.
3. Customize the **Age in seconds** field as required.
4. To save the customized table cleanup policy, select **Update**.

Timeout threshold

A timeout determines the execution threshold of a scan from running long scans. For example, any scan running longer than the set time period results in a failure.

If the scan or the check takes longer than the set time period set by the quota rule, an error message appears.

Note: By default the scans are limited to three hours and individual checks are limited to 10 minutes.

To learn how to configure these thresholds, see Implement a scan timeout threshold and Implement a check timeout threshold.

Implement a scan timeout threshold

Set the execution time of a single scan by implementing **Transaction Quota Rules**. Setting of a quota rule prevents your instance from running a long scan.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Transaction Quota Rules**.
2. To set a definite execution time, select **Scan timeout**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter the definite execution time in the **Maximum Duration (seconds)** field and select **Update**.

   Note: The minimum allowed timeout threshold is 5 seconds. If you set the timeout to anything less than 5 seconds, the system still considers it to be 5 seconds. By default, it has been set to 10,800 seconds.

   The scan fails if the execution time exceeds the set timeout. For more information on the type of scan you want to run, see Configuring Instance Scan .

Implement a check timeout threshold

Set the execution time of an individual check by implementing timeout system property. Setting of a timeout threshold prevents your instance from running a long check.

Before you begin
Role required: admin

Procedure

1. In the navigation filter, enter *sys_properties.list*.
2. From the System Properties list, select *glide.scan.process_check.time_out*.

   Note: If *glide.scan.process_check.time_out* is not present in the list, see Create a new check timeout system property for more information.

3. In the **Value** field, set the execution time for the check in seconds.

   Note: The minimum allowed timeout threshold is 5 seconds. If you set the timeout to anything less than 5 seconds, the system still considers it to be 5 seconds. By default, it has been set to 600 seconds.

Result
A timeout threshold for a check is set by the user. Individual checks will be cancelled after the set time threshold exceeds.

Create a new check timeout system property

Create a new timeout threshold property for a check if the *glide.scan.process_check.time_out* system property is not present. Setting of a timeout threshold prevents your instance from running a long check.

Before you begin
Role required: admin.

Procedure

1. In the navigation filter, enter *sys_properties.list*.
2. Click **New** to create a new timeout system property.
3. In the **Name** field, enter *glide.scan.process_check.time_out*.
4. In the **Value** field, enter the check execution time in seconds.

   Note: The minimum allowed timeout threshold is 5 seconds. If you set the timeout to anything less than 5 seconds, the system still considers it to be 5 seconds. By default, it has been set to 600 seconds.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Instance Scan

Execute and schedule the following scans within Instance Scan. You can also analyze the results of the scans in your instance on a dashboard.

Create a check

Create your own checks by implementing the following procedure.

Before you begin

Role required: scan_admin

Procedure

1. Navigate to **All** > **Instance Scan** > **Checks**.
2. Select **New** from the Checks context menu.
   The Check Interceptor list appears.
3. Select one of the available types of checks.
   See Check types for more information.

> **Note:** If you want to update an existing check, the **Version** field increments itself. The new version provides you a change history. You can also know which particular version of the check ran with a given scan.

Create a table type check

Create a check by selecting **Create a new Table Check** if you know which specific table and conditions you want to test. This check type is applied on only one table at a time. You can also include your own script for more complex capabilities by selecting the **Advanced** option on the form.

Before you begin

Role required: scan_admin

```
Before performing this task you must complete Create a check.
```

Procedure

1. Select **Create a new Table Check**.
2. On the form, fill in the fields.

Fields	Description
Name	Name of the check record.
Application	Application that has the check record.
Category	Category of the check record.
Priority	Priority at which the findings should be resolved.
Version	Current version of the check record. **Note:** If you want to update an already existing check, the **Version** field increments itself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Active	Option to activate this check record.
Short Description	Mandatory description about the check records.
Description	Additional information about the check records.
Resolution Details	Guideline to avoid check to go off against one or more tables.
Table	Table queried for this check.
Conditions	Conditions that filter records on a table. Only the records that meet the criteria are scanned.
Advanced	Option to execute the defined script against each record that matches the condition and control when a finding is generated if **Advanced** is true. If **Advanced** is false, a finding is generated for every record that matches the condition in the defined table.
Documentation URL	Documentation link for the check details. **Note:** A scan_user can't edit the **Documentation URL** field.
Run Condition	Boolean field that determines if the check should be run.
Table	Table from which records will be scanned
Conditions	Conditions that determine which records will run
Script	The script that executes against each record that matches the condition in the defined table. **Note:** This field shows up only if the **Advanced** check box is selected.

Create a column type check

Retrieve all records containing a specific column field type from all tables in an instance by selecting **Create a new Column Type Check**. The **Column Type Check** type implements the rule you created to iterate all records matching the target column field type.

Before you begin

Role required: scan_admin

```
Before performing this task you must complete Create a check.
```

Procedure

1. Select **Create a new Column Type Check**.
   A New record form appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. On the form, fill in the fields.

Fields	Description
Name	Name of the check record.
Application	Application that has the check record.
Category	Category of the check record.
Priority	Priority at which the findings should be resolved.
Version	Current version of the check record. **Note:** If you want to update an already existing check, the **Version** field increments itself.
Active	Option to activate this check record.
Short Description	Mandatory description about the check records.
Description	Additional information about the check records.
Resolution Details	Guideline to avoid check to go off against one or more tables.
Column Type	Column type queried for this check.
Documentation URL	Documentation link for the check details. **Note:** A scan_user can't edit the **Documentation URL** field.
Run Condition	Boolean field that determines if the check should be run.
Column Type	Type of columns that will run.
Script	Script that executes against each record in a table containing a field of the defined column type.

Create a script only check

Create a check without specifying a table or a column type by selecting **Create a new Script Only Check**. You can verify meta data, configurations, and execute complex checks by writing your own script.

Before you begin

Role required: scan_admin

```
Before performing this task you must complete Create a check.
```

About this task

The script only check runs only during a full scan and executes only once during a scan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select **Create a new Script Only Check** from the **Check Interceptor** list.
2. On this form, fill in the fields.

Fields	Description
Name	Name of the check record.
Application	Application that has the check record.
Category	Category of the check record.
Priority	Priority at which the findings should be resolved.
Version	Current version of the check record. **Note:** If you want to update an already existing check, the **Version** field increments itself.
Active	Option to activate this check record.
Short Description	Mandatory description about the check records.
Description	Additional information about the check records.
Resolution Details	Guideline to avoid check to go off against one or more tables.
Documentation URL	Documentation link for the check details. **Note:** A scan_user can't edit the **Documentation URL** field.
Run Condition	Boolean field that determines if the check should be run.
Script	Option to write a custom script to generate findings.

Create a linter check

Create a linter check to identify any issues in a script. When a linter check is run on a record, an abstract syntax tree for its code is generated. You can use the abstract syntax tree to analyze issues with the code.

Before you begin

Role required: scan_admin.

```
Before performing this task you must complete Create a check.
```

Procedure

1. Select **Create a new Linter Check**.
2. On the form, fill in the fields.

Linter Check form

Fields	Description
Name	Name of the check record.
Application	Application that has the check record.
Category	Category of the check record.
Priority	Priority at which the findings should be resolved.
Version	Current version of the check record. **Note:** If you want to update an already existing check, the **Version** field increments itself.
Active	Option to activate this check record.
Short Description	Mandatory description about the check records.
Description	Additional information about the check records.
Resolution Details	Guideline to avoid check to go off against one or more tables.
Documentation URL	Documentation link for the check details. **Note:** A scan_user can't edit the **Documentation URL** field.
Run Condition	Boolean field that determines if the check should be run.
Script	The script that executes against each record that matches the condition. By default, this field has an engine object to use. This engine object contains other objects like `engine.finding` which you can call `engine.finding.increment()` to manually increment the **Count** field on that specific finding. Another object is `engine.current` which is the current GlideRecord that the check would be viewing when running. **Note:** This is new to Quebec release, where previously you would call `finding` and `current` directly.

Advanced linter check scripts

Linter check scripts helps you in writing checks that look for issues in scripts. When a linter check is run on a record, it provides an abstract syntax tree for its code. You can use this abstract

© 2026 ServiceNow, Inc. All rights reserved.

syntax tree to analyze issues with the code such as too many nested if statements or usages of slow API in a while loop.

Linter check usage

Linter checks have a unique object to use called `rootNode`. This is the root node of the parsed abstract syntax tree (AST) for the script of the current record. This object has many functions, but the `visit` function is the most important. The `visit` function takes a callback function as a parameter which gets called on every node of the tree. The callback function then takes a node as a parameter which represents the current node during its iteration. You can return false from the callback function to stop iterating the tree early, otherwise it keeps visiting every subnode in the tree of the node you called `visit` on.

For example, if you want to scan for a deprecated API called `badFunction()`. You can write a Linter Check with a script in the following example:

```
(function(engine) {
 engine.rootNode.visit(function(node) {
  if (node.getTypeName() === "NAME" &&
    node.getNameIdentifier() === "badFunction" &&
    node.getParent().getTypeName() === "CALL") {
   engine.finding.incrementWithNode(node);
  }
 });
})(engine);
```

When you run a scan with this Linter Check, it checks every record in the scan with a script field. For example, if a record in that scan has a script that looks like the following, the scan picks up a finding for this record.

```
/*
badFunction()
*/
// badFunction()
function badFunction() {
 return;
}
var GoodClass = Class.create();
GoodClass.prototype = Object.extendsObject(Object, {
 badFunction: function() {
  // actually good
 }
});
var badFunction = ["badFunction", "badFunction()"];
badFunctionButSometimesGood();

badFunction();
```

Node functions

The following is a list of available functions to call on the node object.

- `getRootNode()`: Get the root node of the tree for this node
- `getParent()`: Get the parent of this node
- `getLineNo()`: Get the line number location for this node
- `getColumnNo()`: Get the column number location for this node
- `toSource()`: Get the source for this node. The source is based on this node and its children

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `getTypeName()`: Get the node type name of this node. For example, a function call in source is tokenized as a node with the type name of "CALL"

  Note: The values of `node.getTypeName()` are from different types of nodes in an Abstract Syntax Tree (AST). The possible values come from Rhino's AST parser itself.

- `getNameIdentifier()`: If the node type of this node is "NAME", then return the identifier, which is the string value of the name itself. A "NAME" node represents a simple name that is not a keyword, like a function name or a variable name.

  Note: If this node is not a NAME node, then the result is null.

- `getAbsolutePosition()`: Get the absolute position of this node. The absolute position is the number of characters from the start of the script to this node
- `compareTo(other)`: Compare this node with another node. The node with a greater absolute position and length will be the larger in comparison. `other` is a node to compare with this node
- `visit(callbackFunction)`: Visit each node in the subtree starting from this node and execute the given callback function on each node. `callbackFunction` is a function that will be executed on each node in the subtree of this node. This callback function takes a LinterCheckAstNode as a parameter which is will be the node being visited
- `debugPrint()`: Returns a string representation of the abstract syntax tree, starting from this node. Each line contains information about a node, and the indentation represents the hierarchy relationship between the nodes. The information in each line is arranged as follows
  1. Absolute position
  2. Node type name
  3. Position relative to parent
  4. Length
  5. Name identifier (if a NAME node)

For more information, see LinterCheckAstNode API - Scoped, Global.

Create a check suite

Create a check suite to bundle a group of checks into a suite and execute it.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Instance Scan** > **Suites**.
   A list of suites shows up.
2. Select **New** to create a new suite.
3. Fill in the details on the new suite record.

Fields	Description
Name	Name of the suite
Application	Scope of the suite

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Active	Option to activate this suite
Description	Information about the suite

4. Select **Submit** to create a new check suite.

> **Note:** The suites that you create are completely modifiable. You can modify the checks in the suite and can also add child and parent suites.

Executing a scan

Use the following types of scans to execute checks, a scan or a suite scan.

Execute a point scan

Execute all applicable checks against a single record, update set or an application by selecting **Run Point Scan**.

Before you begin

Role required: admin

About this task

For example, if you execute a point scan against a business rule, only the checks that are applicable to the business rule table run, and only that single target record is scanned. If an update set scan or an application scan is executed, all records related to that update set or application are scanned.

Procedure

1. Navigate to **All** > **Instance Scan** > **Checks**.
2. Navigate to the record in a table applicable for point scan.

> **Note:** The **Run Point Scan** related link appears in the UI only for applicable records.

3. Scroll down to the **Related Links** section.
4. Select the **Run Point Scan** related links.

> **Note:** The **Run Point Scan** related link is available only if all the following conditions are true.
>
> - Available checks that are applicable to the record
> - The record is active
> - The user has read access to the record
> - The record is on a table that extends sys_metadata
> - The role of the user must be scan_user
> - The system property *glide.scan.enable_point_scan_ui_action* must not be false

The progress tracker appears showing the status of the scan.

5. Select **Go to Result**.
   The Scan Result record appears.
6. Select **Checks** related list to look at the findings.
   If you want to review the failure reasons, select the **Failures** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
A scan of all applicable checks against only a single record is executed.

Execute an update set scan

Use an update set scan to run applicable checks against the current versions of records that have updates in the update set. If a record has been modified since it was added to the update set, the scan reflects those later changes. Issues that exist only in the update set version of a record aren't detected.

Before you begin
Role required: admin

About this task
The scan runs all active checks that apply to the record types in the update set. Applicable checks are determined by matching the tables of the records in your update set against the check definitions in Instance Scan. The following check types run during an update set scan:

Table Check

Create a check by selecting **Create a new Table Check** if you know which specific table and conditions you want to test. This check type is applied on only one table at a time. You can also include your own script for more complex capabilities by selecting the **Advanced** option on the form.

Column Type Check

Retrieve all records containing a specific column field type from all tables in an instance by selecting **Create a new Column Type Check**. The **Column Type Check** type implements the rule you created to iterate all records matching the target column field type.

Linter Check

Create a linter check to identify any issues in a script. When a linter check is run on a record, an abstract syntax tree for its code is generated. You can use the abstract syntax tree to analyze issues with the code.

Procedure

1. Navigate to **All** > **System Update Sets** > **Local Update Sets**.
2. Select the update set from the list.
3. Select **Scan Update Set** from the **Related Links** list.

Result
The scan runs applicable checks against the current versions of records that have updates in the update set. To review findings, open the result record and select the Checks related list.

Example:
For example, if your update set contains a business rule, checks that target the business rules table run against that record.

Execute an app scan

Scan the installed files of an application as well as the application record itself with applicable checks by executing an application scan.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For example, if the application installs a business rule, checks that are relevant to sys_script table are executed against that business rule. To trigger an application scan, go to the record of the application you desire to scan and select **Scan Application** form link UI action.

Procedure

1. Navigate to **System Application** > **All Available Applications** > **All**.
   A list of all available applications and plugins appears.
2. Select the menu icon of the desired application.
3. Select **Go to application** option from the menu icon.

   Note: The **Go to application** option appears only if the selected application is not a plugin.

4. Select **Scan Application** to run app scan.

Execute a test scan

Execute a test scan to verify if the check works as expected. The test scan enables you to test a single check instead of a full scan by selecting a single check and selecting **Test Check** on the Check form.

Before you begin

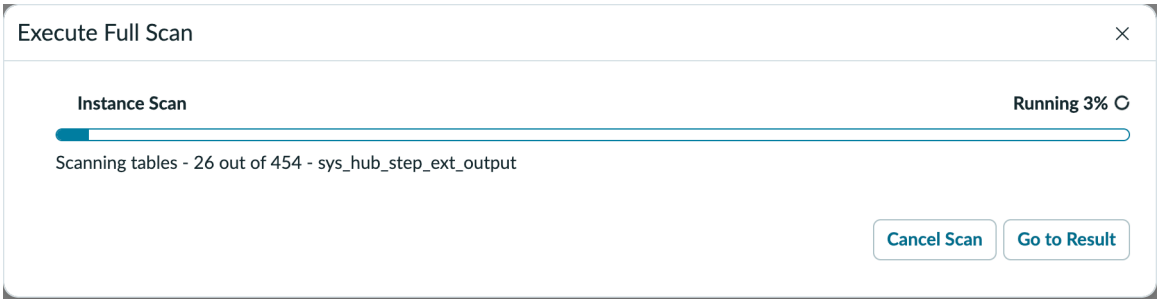
Role required: admin

Procedure

1. Navigate to **All** > **Instance Scan** > **Checks**.
   A list of checks appears.
2. Open the check record you want to test from the list.
3. To start the test, select **Test Check**.
   The status of the scan appears in the progress tracker. The **Findings**module in the application navigator shows the number of records found from running the check test.

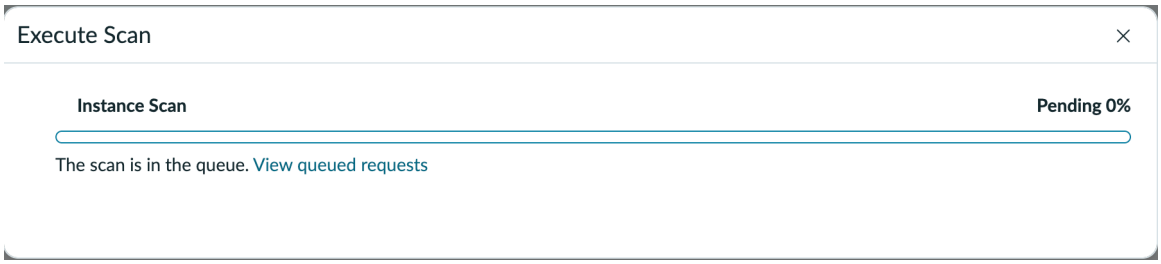
Execute a full scan

Execute a scan for the entire instance by selecting **Execute Full Scan**. Implementing a full scan runs all the active checks present in your instance.



Before you begin

Role required: admin



Procedure

1. Navigate to **All** > **Instance Scan** > **Checks**.
   A list of all the checks on the instance shows up.
2. Select **Execute Full Scan** to execute full scan on all the checks.
   The progress tracker shows the status of the scan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can now execute multiple full scans simultaneously if you have enabled glide.scan.parallel_scan_enabled system property. You can also set the maximum number of scans that can run concurrently by setting the value for glide.scan.max_parallel_scans property. See Instance Scan properties for more information.

Select View queued requests link to see all the queued requests on the Scan Queue Operations page.

Note: This modal shows up only when the number of parallel scans exceeds the set value for concurrent scans.

3. **Optional:** Review the results and other information about the scan execution on the Scan Queue Operations page.

   Note: This step is applicable only when you are executing multiple full scans in parallel.

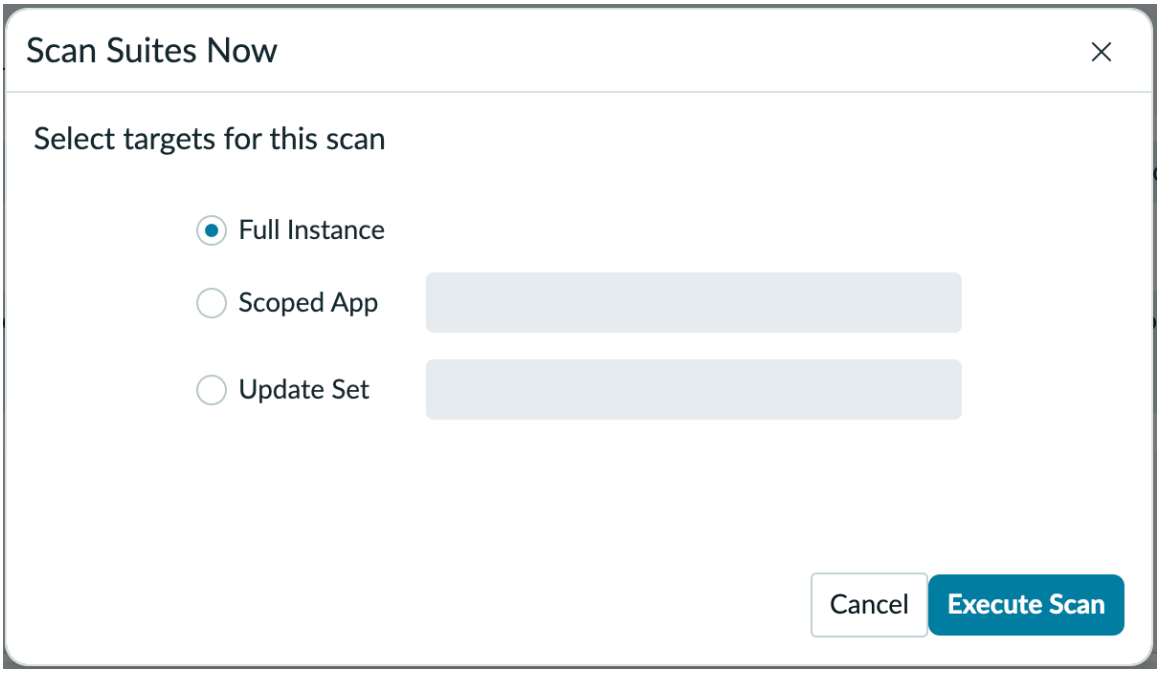
4. To find the **Result Number** and the number of checks that ran as part of the full scan, select **Go to Result**.
5. **Optional:** From the related list, select **Checks** to view the list of all the checks that ran as a part of the full scan.
6. **Optional:** From the related list, select **Errors** to review the errors encountered during the full scan.

Result

A scan of the whole instance is executed.

Execute a suite scan

Execute suites of available checks against a specific target to have targeted scan results by selecting **Execute Suite Scan**.



Before you begin

Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Instance Scan** > **Suites**.
   A list of all suites displays.
2. Select one of the suites from the list.
   The form for the selected suite displays.
3. Select **Execute Suite Scan**.
   The **Scan Suites Now** modal displays.
4. Select a target for the scan.

   - **Full Instance**: Scans all the available records in the instance.
   - **Scoped App**: Scans selected scoped apps. You can select multiple scoped apps.
   - **Update Set**: Scans multiple update sets.
5. Select **Execute Scan**.

Note: If a record is inactive, the checks don't generate any findings for that record.

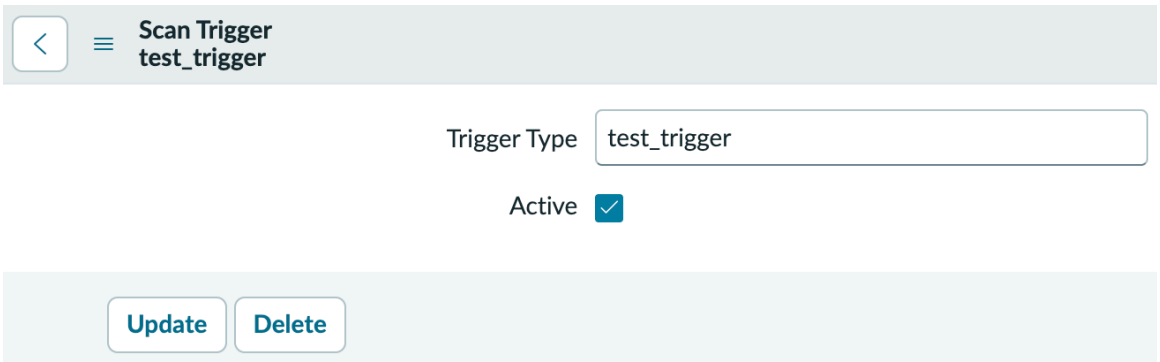
Execute a reactive scan

Execute a reactive scan to set up a scan that runs automatically on an execution tracker failure.

Before you begin

Role required: admin.

About this task



For many failed processes on your instance, you can find a corresponding record on the execution tracker. The progress window shows the status of the test. If a process fails on an execution tracker, Instance Scan can watch for that failure on the progress status and run a scan automatically.
The **Trigger Type** in the Scan Trigger form should match the **Source Table** field on the sys_execution_tracker record of the failed process to enable the connection between the two. For example, if the failed test is in the Update Sets list, you can set up the **Trigger Type** as sys_update_set. This enables Instance Scan to be connected to the execution tracker test failure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter `scan_trigger_list.do` in the navigation filter.
   A list of scan triggers shows up.
2. Select the required trigger from the list to update it.

Note: The **Trigger Type** is based off of table names. You can also create a custom trigger type in your codes.

The reactive scan is now set up to automatically scan the execution tracker of the failed process which appears on the scan results table.

Schedule a full scan

Create a schedule to regularly trigger a full scan even when you don't have an active session. A schedule creates an established baseline for the health of the instance and provides a comparison to configuration and instance health over time.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Instance Scan** > **Checks**.
2. Select **Schedule Full Scan**.
3. On the Trigger full scan form, fill in the fields.

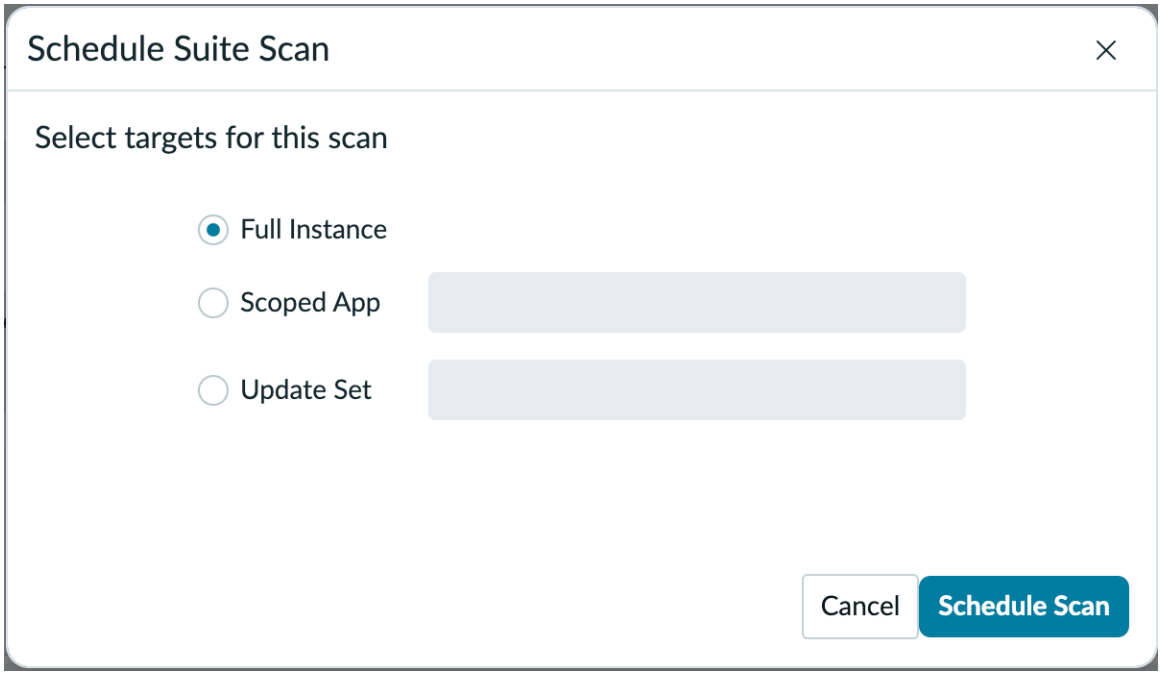
Field	Description
Name	Name of the check record.
Active	Option to execute the scan at a scheduled time.
Application	Application where the job belongs.
Conditional	Option to select conditions under which the scan runs.
Run	List used to select the scheduling of full scan.
Run this script	Selection to run the default script.
Update	The script that is updated for full scan.
Execute Now	The default script that is executed for full scan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Delete	The script is deleted for full scan.

4. To run the full scan, select **Execute Now**.
   A list of findings is displayed.
5. From the application navigator, select **Results**.
   The status of the execution is displayed along with the **Result Number**.
6. To display the list of findings, select the **Result Number**.
7. **Optional:** From the application navigator, select **Dashboard** to display data about the findings.

Result
A schedule to trigger a full scan regularly even without an active session is created.



Schedule a suite scan

Create a schedule to regularly trigger a suite scan even when you don't have an active session.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **Instance Scan** > **Suites**.
   A list of suites displays.
2. Select a suite from the list to schedule a suite scan.
3. Select Schedule related list.
   A list of scheduled scans displays.
4. Select **New** to create a schedule for the suite scan.
   The **Schedule Suite Scan** modal displays.
5. Select a target for the scan.
   - **Full Instance**: Scans all the available records in the instance.
   - **Scoped App**: Scans selected scoped apps. You can select multiple scoped apps.
   - **Update Set**: Scans multiple update sets.
6. Select **Schedule Scan**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If a record is inactive, the checks don't generate any findings for that record.

The **Scheduled Scan** form displays.

7. On the form, fill in the fields.

Linter Check form

Fields	Description
Name	Name of the scheduled scan.
Application	Application that has the record.
Combo	References a record which has a list of sources and a list of targets to run the scan against.
Run	Frequency at which the scan should be scheduled to run. ○ Daily: Scan is scheduled to run daily. Time: The time at which the scan is scheduled to start daily. ○ Weekly: Scan is scheduled to run weekly. ▪ Day: The day in the week on which the scan is scheduled to start weekly. ▪ Time: The time at which the scan is scheduled to start. ○ Monthly: Scan is scheduled to run monthly. ▪ Day: The day in the month on which the scan is scheduled to start monthly. ▪ Time: The time at which the scan is scheduled to start.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ Periodically: Scan is scheduled to run periodically. ▪ Starting: Date and time at which the scan is scheduled to start. ▪ Repeat interval: Date and time at which the scan has been scheduled to repeat. ○ Once: Date and time at which the scan is scheduled to start. ○ On Demand: Scan is not scheduled to run and runs only manually when **On Demand** option is chosen for the **Run** field. ○ Business Calendar: Business calendar time of the user to schedule the scan run either at the beginning of that period or at the end, depending on their selection.
Active	Option to activate the record.
Conditional	Option to write your own script condition, which is always verified before scheduled scan runs.
Run as	User role used to run the scan.
Run as tz	Timezone used to run the scan.

8. Select **Submit**.
   The scan that has been scheduled displays under Schedule related list.

Monitoring a scan

You can check the progress status of a scan by checking the progress tracker.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Instance Scan** > **Checks**.
   A list of checks appears.
2. Run the required scan.
   The progress tracker displays the status of the scan run. You can close the progress tracker and view it later without having to stay in the modal for the execution to complete. To see the status later, go to **Results** in the application navigator. Select the required scan results record to review its status.
3. To see the status of the scan, select **Go to Result**.
   If the scan completes, a list of findings is displayed. You can also find all the checks that ran as a part of the scan by selecting the Checks related list. If any of the checks fails, click Failures related list to review them. If the full scan takes some time to complete, you can check the status by selecting **Results** from the application navigator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parallel scans

Parallel scan is a functionality in Instance Scan that allows multiple scans to run in parallel instead of sequential execution. This improves efficiency and reduces wait times when several scans are executed concurrently.

Use parallel scan to reduce wait times and improve throughput when multiple scans are triggered at the same time. Parallel execution is especially useful in environments with large development teams or frequent scans, where running scans sequentially can delay feedback and slow development and validation workflows. By enabling concurrent execution, parallel scan reduces delays caused by sequential processing and helps teams receive faster feedback when multiple scans are triggered across scripts, tables, update sets, or large code and configuration changes.

Parallel scan uses a queue-based execution model when `glide.scan.queue.enabled` property is enabled. If queuing is enabled, the request is placed in the queue and later picked up for execution. If queuing is not enabled, the scan starts immediately when selected.

Note: Scans can run in parallel only when both queuing and parallel scan properties are enabled.

System properties for parallel scan

- glide.scan.parallel_scan_enabled: This property enables or disables parallel scan execution for Instance Scan. The default value for this property is `true`, allowing multiple scan requests to execute concurrently, subject to the configured maximum parallel scan limit. If set to `false`, scans run sequentially, even if queuing is enabled.

  For example, if the maximum parallel scan value is configured as 5, the first five scans are executed simultaneously. Any subsequent scans are added to a queue and run after the initial scans complete.

- glide.scan.queue.enabled: This property controls whether Instance Scan uses the queue-based execution model. The default value is `true` allowing scan requests to be sent to NowMQ and processed through the queue. This property must be enabled to allow scans to run in parallel, as queued execution is required for concurrent processing. When disabled, scan execution starts immediately when a scan is selected, bypassing the queue.
- glide.scan.max_parallel_scans: This property defines the maximum number of instance scans that can run concurrently. The default value for parallel scan limit is 5, with a supported minimum value of 1 and a maximum value of 15.

Note: Parallel scan is applicable on full scan, test scan, suite scan, and reactive scan. It is not applicable with point scan.

See Instance Scan properties for more information.

Reviewing of scans

After the scans have been executed, you can review them with the findings and results components.

- Results: An Instance Scan result reports the status and type of scan. You can also see all the checks that ran as part of the scan and all other information related to the scan such as errors and scan logs. Use Scan Results dashboard to get detailed information about an executed scan.
- Findings: A finding is a reference to a record that has violated a check which was used in a scan. You can also mute a finding if you don't want a finding to be reported in the next scan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results

An Instance Scan result reports the status and type of scan. You can also see all the checks that ran as part of the scan and all other information related to the scan such as errors and scan logs.

On selecting **Go to Result** from the progress tracker of a scan, the Scan Result is identified by a **Result Number**. Select **Results Dashboard** to view the scan results.

The **Scan Type** field states the type of scan that was executed. The **Status** field shows the status of the scan which can either be **In progress**, **Complete** or **Failed**. The **Execution Time** field shows the duration of the scan in milliseconds.

There are the following related lists in the **Scan Result** form.

Scan Findings

The Scan Findings related list shows up all the findings encountered during the execution of the checks.

Suites

The Suites related list shows up all the suites that ran as part of the scan.

Checks

The Check related list shows all the checks that ran as part of the scan.

Failures

The Failures related list shows up all the checks that failed during the execution of the scan. It also shows up the reason of its failure in the form of an error message.

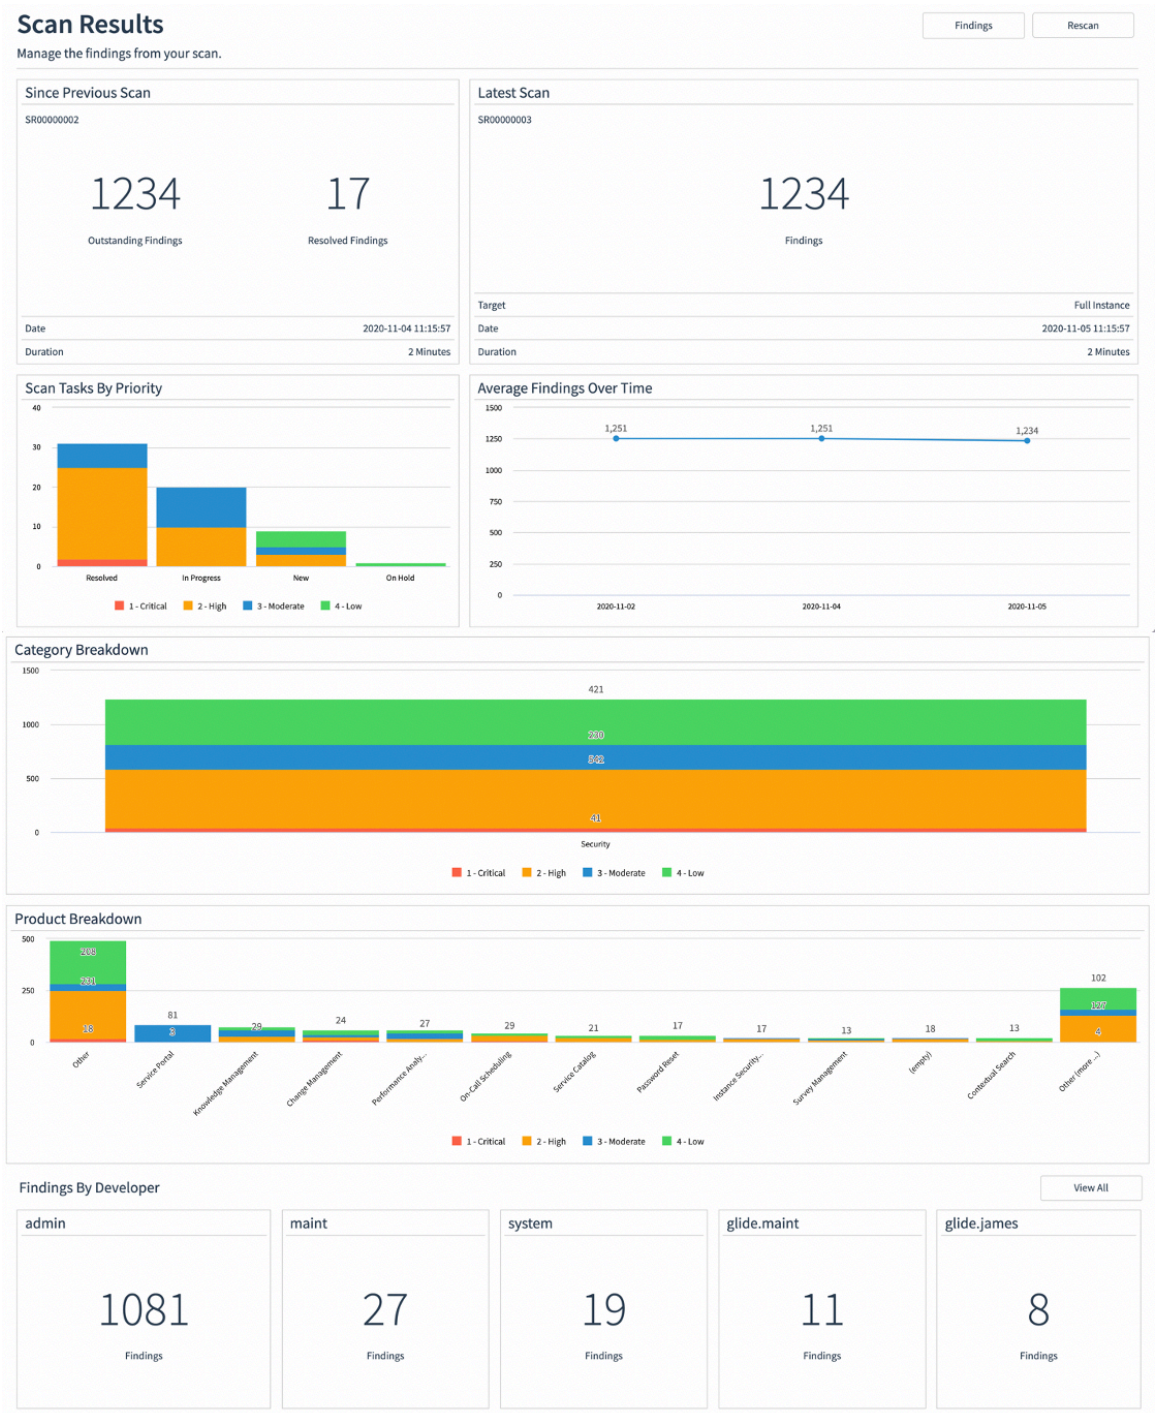
Scan Log

The Scan Log related list shows up messages encountered during the entire scan.

Scan Statistics

The Scan Statistics related list shows up

Target



The Target related list shows all the targets against which the checks have executed.

Scan results

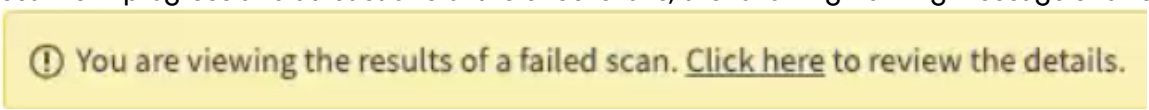
Scan Results dashboard helps you with an overview of all details of an executed scan.

Navigate to **All** > **Instance Scan** > **Results**. Select a scan result from the Scan Results list. Click Results Dashboard link on the Scan Result form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select **Rescan** to execute the same scan again. If you want to see all the findings grouped by checks, select **Findings** at the top right corner.

Fields	Description
Previous Scan	Details about the previous scan. • Result number: Link to the previous scan result record • Outstanding Findings: Total findings whose status has not been marked as Resolved.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	• Resolved Findings: Total findings whose status has been marked as Resolved. **Note:** Not all findings that have been marked Resolved are fixed. If a finding has not been fixed and has been marked Resolved, it still adds to the count of total findings. • Date: Date and time on which the previous scan started • Duration: Total time needed to complete the previous scan
Latest Scan	Details about the recent completed scan. • Result number: Link to the latest scan result record • Findings: Total number of findings found in the latest scan • Target: Target against which the scan is executed ○ Full Instance: Scans all the available records in the instance ○ Scoped App: Scans selected scoped apps. You can select multiple scoped apps. ○ Update Set: Scans multiple update sets. • Date: Date and time on which the scan started • Duration: Total time needed to complete the scan
Scan Tasks By Priority	Scan tasks sorted by priority. The priority comes from the checks to which these tasks belong. **Note:** The states come from the states of the tasks associated with the findings.
Average Findings Over Time	Reporting of the average number of findings in a day.
Category Breakdown	Category breakdown of the checks that have run as part of the scan
Product Breakdown	Product family of each of the scan findings records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	Note: Incident records don't have product family.
Findings By Developer	Name of the user whose changes generated the findings. **Note:** Only the top 5 user names appear on the list. Click **View All** to view all the findings grouped by users.

If a scan is in progress and at least one of the checks fails, the following warning message shows up.

Findings

A finding is a reference to a record that has violated a rule from a check on the instance. You can find the source record and the number of times the record triggered rules of a given check.

Each finding is specific to a result and each result is specific to a scan that has been executed.

Note: When you run a scan, you definitely get a result of the scan but might not get any findings. There might be no findings encountered during the execution of the checks.

Note: If a record is inactive, the checks don't generate any findings for that record.

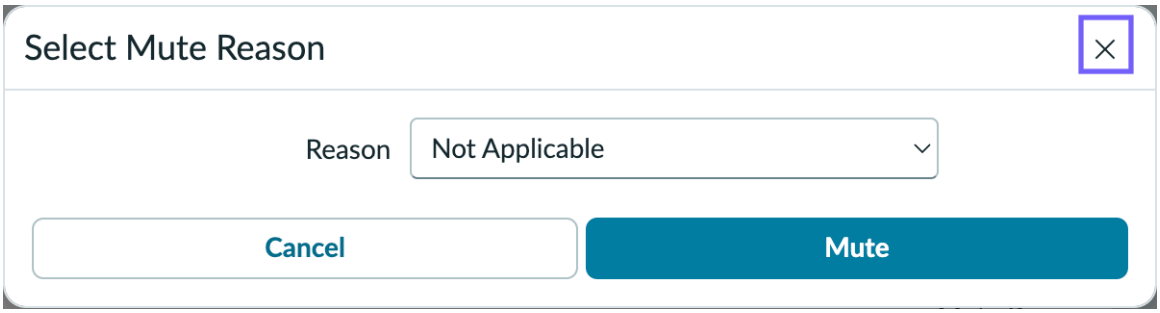
The Scan Finding gives information about the check that has been violated by a record. The **Source Table** and **Source** fields point to the record that has violated a rule from a check during the execution. You can find more information about the record by clicking the information icon. The **Count** field shows the number of times the record has violated the check rules. The finding also shows the version of the check that generated the finding. The **Product Family** field shows you the product family for each check. The **Task** field helps you to assign a task to an individual or a group. See Creating scan tasks for more information. If you want to avoid a finding from being generated from any future scans, use the **Mute Rule**.

Note: If you use the **Mute Rule**, you must also select a reason for muting the finding.

Mute a finding

Mute a finding on the Scan Finding form to avoid the finding from being reported in the later scan results.

Before you begin



Role required: admin.

Procedure

1. Navigate to **All** > **Instance Scan** > **Results**.
   A list of Scan Results shows up.
2. Select the scan result you ran from the list.
   The Scan Result form for the scan shows up.
3. Select the Scan Findings related list.
   A list of findings for the scan shows up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Use the information icon to open the finding you want to mute.
5. Select **Mute** to avoid the finding from being reported in the next scan.

Note: The Select Mute Reason modal shows up only if you select **Mute** on the Scan Finding form.

6. Select the reason for muting the finding and then select **Mute** on the modal.

Note: Select **Unmute** if you want the finding to be reported in the later scans. The **Unmute** button is visible only when you have muted a finding.

Creating scan tasks

Create a scan task to facilitate task assignments from the finding of a record.

Before you begin

Role required: scan_user

Procedure

1. In the navigation filter, enter `scan_task_list.do`.
2. Select **New** to create a new scan task.
   The **Scan Task** form appears.
3. Fill in the following fields in the form.

Scan Task form details

Field	Description
Number	Auto-generated task number
Assigned to	Person responsible to work on the task
Assignment group	Group responsible to work on the task
Active	Option to activate task
State	State of the task. ○ **New** ○ **In Progress** ○ **On Hold** ○ **Resolved**
Short description	Brief description about the task
Description	Additional information about the task

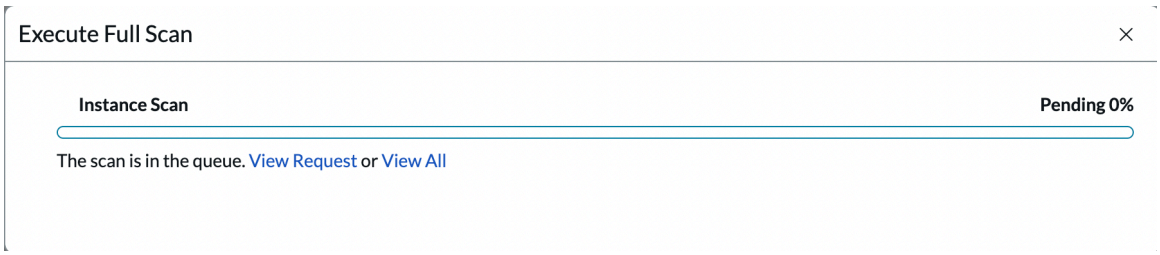
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Work notes	Additional notes

Note: The scan_user can assign the task only to a non-scan_user. The user to which the task has been assigned also gets the same privilege as the scan_user.

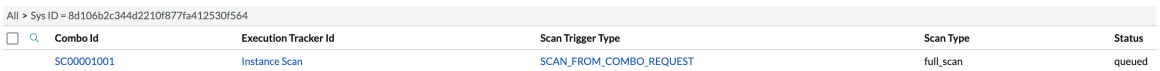
Queue your scan

Leverage the scan queue feature to line up your scans for automatic execution following the current scan.



Before you begin

Role required: admin



Procedure

1. Navigate to **All** > **Instance Scan** > **Checks**.
   The list of checks shows up.
2. Select a scan to run it on the selected check.
   The scan execution modal shows up.

   Note: If another scan is ongoing, the modal gives a message that the current scan is in the queue. You will also see View Request and View All links in the scan modal.

   If you select the View All link, the list of all queued scans shows up. If you select View Request, it only shows the status of the selected scan.

   Note: If a scan is already in progress and you select another scan, it gets queued to be executed. If you select the same scan again, it doesn't create duplicate records in the queue. Once the ongoing scan completes (successful or failed), the next scan in the queue starts executing automatically.

   If there is no ongoing scan, the selected scan starts the execution process. You will see the execution modal with **Cancel Scan** and **Go to Results** options.

3. **Optional:** Implement the following steps to view the status of the ongoing scan or any other scans.
   a. Go to **All** > **Instance Scan** > **Scan Results**. The list of all scan results and their status shows up.
   b. Select a scan record to see more details. The Scan Results form for the selected scan record shows up.

      Note: If the scan is ongoing, the status is In progress. If the scan is queued, the status is Pending.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select Show Progress related link.

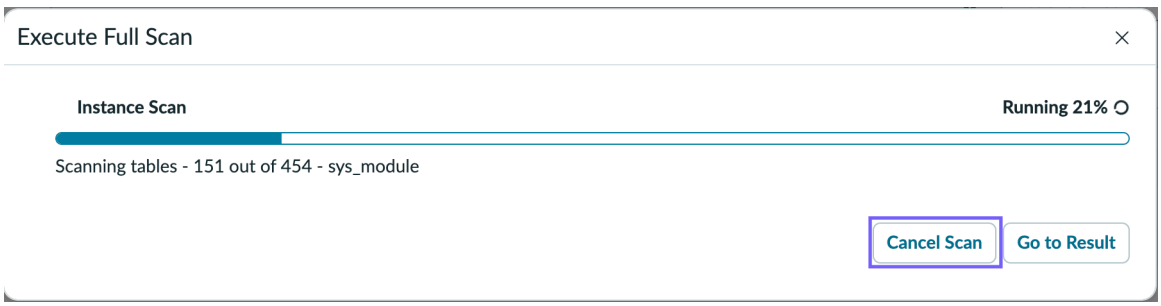
(Optional)

Note: This related link is visible only if the selected scan is currently executing.

d. Select either the Cancel Scan related link or the **Cancel Scan** button on the scan execution modal if you want to cancel the ongoing scan.

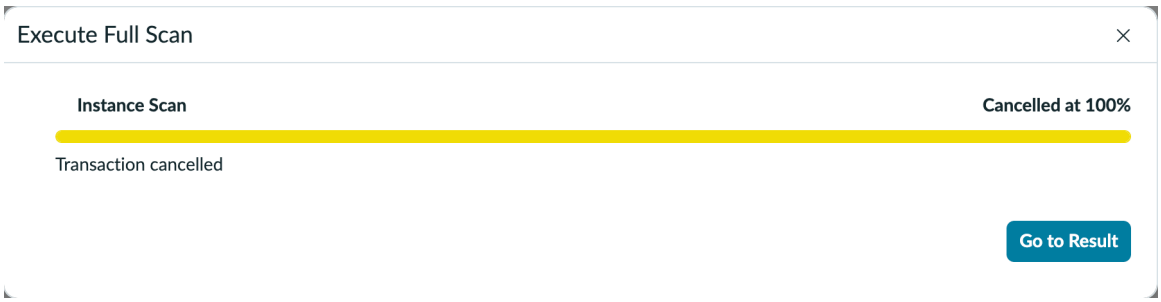
Note: These options are visible only if the scan is currently executing and is not yet completed (successful or failed).

Cancel a scan



Cancel or abort an ongoing scan by either selecting Cancel Scan in the scan execution modal or the Cancel Scan related link in the results record.

Before you begin

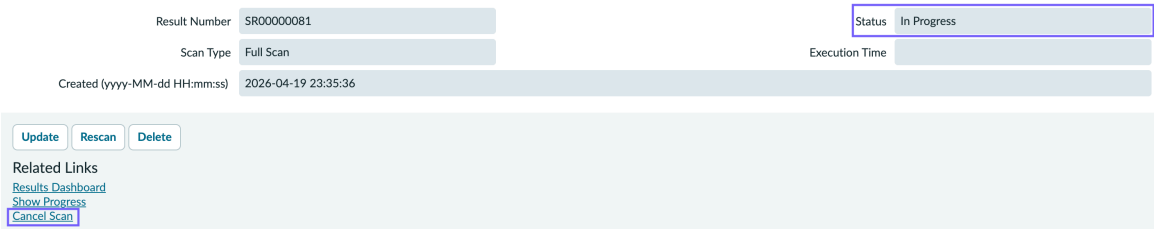


Role required: admin

Procedure

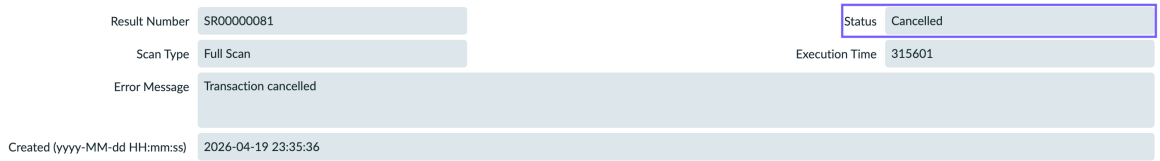
1. Navigate to **All** > **Instance Scan** > **Checks**.
   The list of checks shows up.
2. Select a scan to run it on the selected check.

   The scan execution modal shows up.
3. Select **Cancel Scan** to cancel the ongoing scan.
   The Cancel Scan modal shows up with the status of the cancelled transaction. You can also select **Go to Results** to see the results record of the selected scan.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Cancel Scan** button won't show up if the scan is complete (successful or failed).



4. **Optional:** Select **Cancel Scan** related link to cancel the scan, if you have selected **Go to Results** in the previous step.

(Optional)

Note: The **Cancel Scan** related link is visible only if the scan is still running. The **Status** field in the Scan Results form say In Progress if the scan is still ongoing.

5. Close the Cancel Scan modal or select **Go to Results** in the Cancel Scan modal.

The Scan Result record is updated. The **Status** field now says Cancelled.

6. Scroll down to the **Scan Findings** related list.
It generates the findings of the scan till the point it was cancelled.

Note: Since the scan is already cancelled, the Cancel Scan related link doesn't show up.

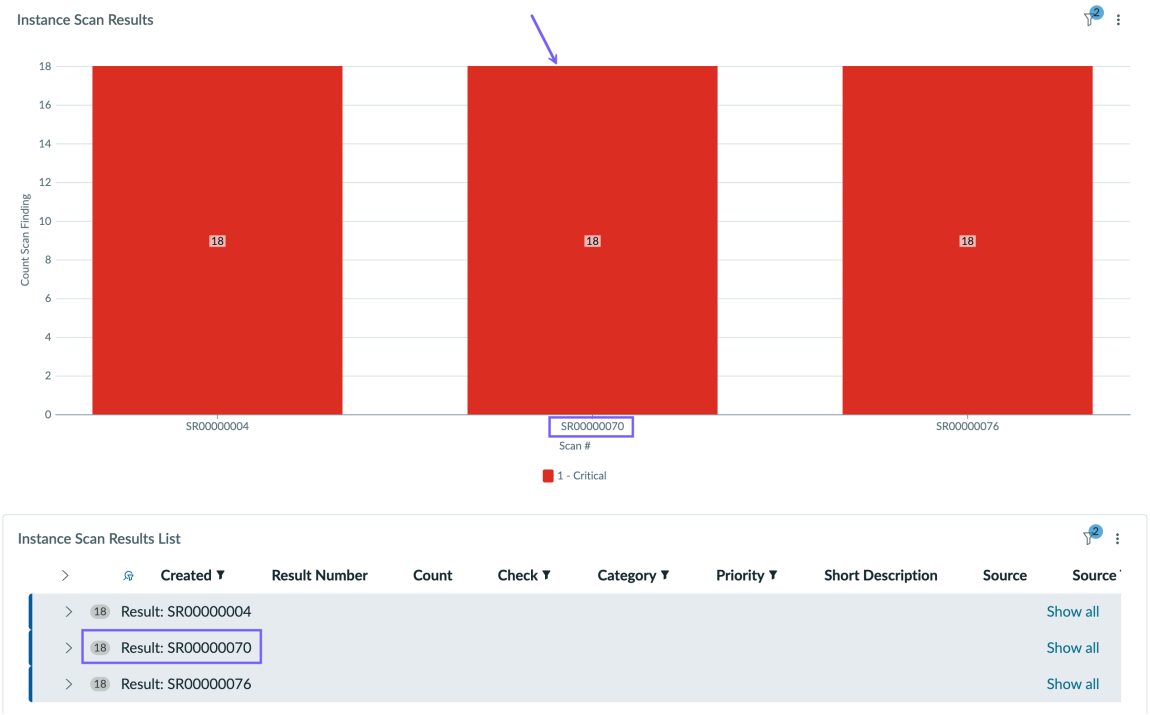
Using the Instance Scan dashboard

Compare and analyze the results of the scans in your instance by representing it on the premium Performance Analytics (PA) dashboard.

Before you begin

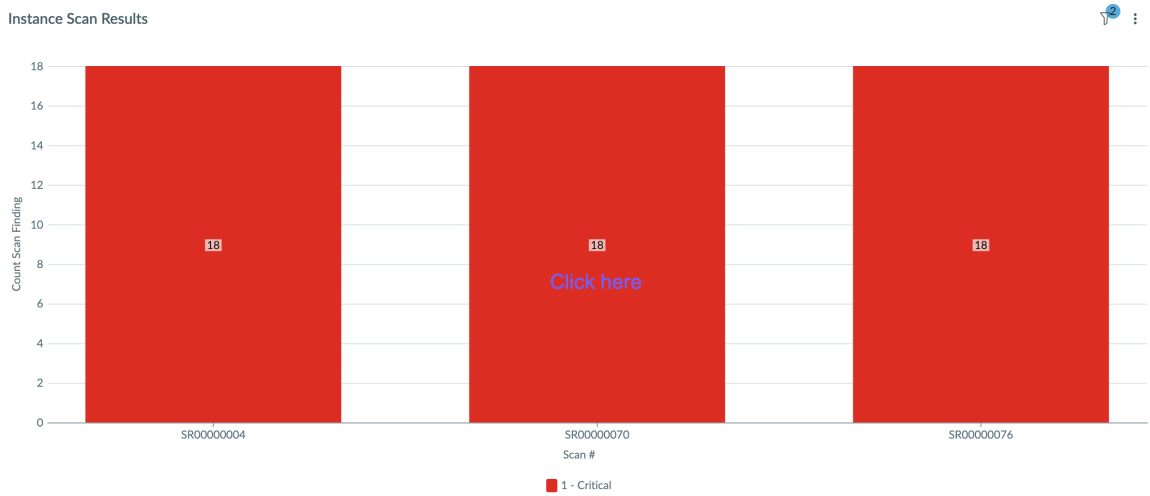
You've created some checks to execute the full scan. See Create a check and Execute a full scan for more information.

Role required: admin.



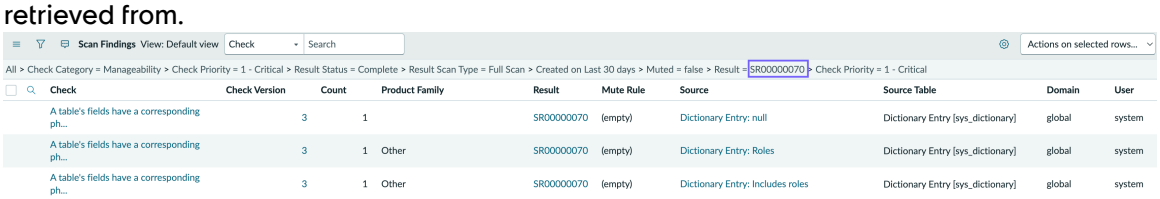
Procedure

1. Navigate to **All** > **Instance Scan** > **Dashboard**.
2. Select an option from the **Instance Scan Category** or **Instance Scan Priority** list.



Note: The dashboard is applicable only for full scans. The **Instance Scan Category** appears only if you have data or a finding in the result set that are applicable to the categories.

3. Select the scan result from the Scan Results list that generates an unexpected number of check findings.
A related list of findings related to only that scan is expanded.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Select the scan column directly from the dashboard to display the related list of checks.

The related list of checks appears. The list also indicates the source that the finding has been retrieved from.

Result

A dashboard showing the results of scans is created.

Instance Scan references

The reference topics provide additional information about Instance Scan.

Instance Scan roles

Instance Scan is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Instance Scan user [scan_user]

The scan_user role can run different types of scans and view the findings and results.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

None.

Instance Scan properties

On the properties form, you can set parameters that control how the instance executes.

Property	Description
glide.scan.inactive_records	• Controls whether instance scan considers inactive records, where active=false • The default value is false. Instance Scan scans only the active records • When enabled, scans will include inactive records in the health check evaluation
glide.scan.max_parallel_scans	• Defines the maximum number of instance scans that can run concurrently • The default value is 5 • Used by the scan queue system to limit parallel scan execution
glide.scan.parallel_scan_enabled	• Enables or disables the parallel scan feature • The default value is true • When enabled, it allows multiple scans to run simultaneously based on the max_parallel_scans limit

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.scan.queue.enabled	• Enables or disables the instance scan queue system • The default value is true • When enabled, scan requests are queued and processed based on available capacity
glide.scan.base_system_records	• Controls whether instance scan checks out-of-box (base system) records • The default value is false. The Base system records are skipped **Note:** The Base system records are determined by checking if they would be replaced during an upgrade using the CollisionAPI. • When enabled, scans will include records that would be replaced on upgrade (non-customized ServiceNow delivered records)
glide.scan.sn_non_standard_scopes_list	• Comma-separated list of ServiceNow scopes that shouldn't be treated as third-party scopes • The default value is "" • Used to exclude specific non-standard ServiceNow scopes from being classified as ISV/ third-party applications during scan classification

Monitor System Events and Scheduled Jobs dashboards

Use the **System Events and Jobs Dashboard** module to monitor the system event processing system and monitor the scheduled jobs processing system in the **Scheduled Jobs** dashboard tab.

You need to install the dashboard application to view information about events and queues. See Understand your System Events Dashboard for more information. There are two ways of representing the information about the events and queues in the event processing system.

- Scores
  - Scores-System Event processing health checks
  - Scores-Current Scores
  - Scores-Trends
- Details: See Details-Configure an alert for more information.

In order to view the completed jobs details, select the **Scheduled Jobs** tab. See Understand your Scheduled Jobs dashboard for more information.

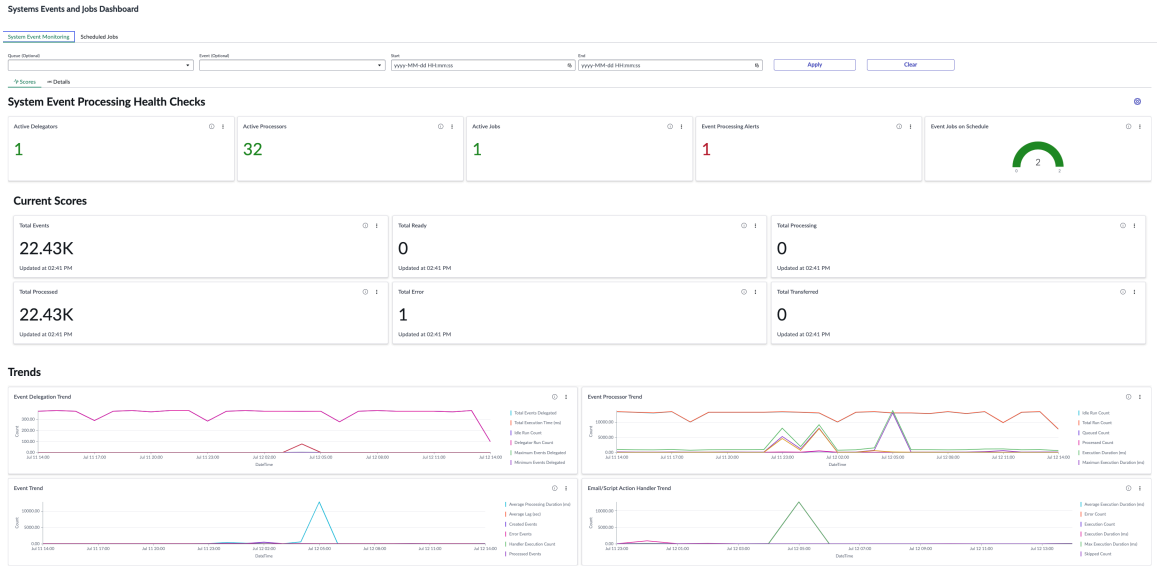
Understand your System Events Dashboard

Use the System Event Processing dashboard to set the filters to display information about events and queues.



Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Go to **All** > **System Diagnostics** > **System Events Dashboard**.

   The System Event Monitoring dashboard shows up.

2. Select the Queue and Event you want to view the information about.

   Note: By default, the default queue is selected. You can also select other queue and event types.

3. Set the Start and the End dates for which you want to view the queues and events information.
4. Select Apply to apply the filter set using the above steps.

   Note: You can also clear the filter using Clear and make new selections.

   The Scores and Details sections show up based on your selections.

Scores-System Event processing health checks

The Scores and tab shows what's going on in the event processing system.

Field	Description
Active Delegators	Indicates whether there is an event delegator enabled. The event delegator is responsible for delegating out events to queues that use the delegated event functionality. Clicking on the card will take you to the list of delegators. Number of delegators in green is positive. **Note:** This card shows up only if the **Queue** uses the delegator model. If this card shows up, the **Active Jobs** card doesn't show up. If no queue is selected, **Active Delegators**, **Active Processors**, and **Active Jobs** cards show up simultaneously.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active Processors	The number of active event processors in the event system. Click on the card to take you to the list of active processors (if any). Number in red indicates that the processor needs to be configured. **Note:** This card shows up only if the **Queue** uses the delegator model. If this card shows up, the **Active Jobs** card doesn't show up. If no queue is selected, **Active Delegators**, **Active Processors**, and **Active Jobs** cards show up simultaneously.
Active Jobs	Number of jobs associated for a queue in processing framework. These jobs are different than the earlier jobs used in the delegator model. In processing framework based on the configuration and checks, the processing jobs are created automatically. **Note:** This card shows up only if the **Queue** doesn't use the delegator/ dedicated model and is backed by processing framework. If this card shows up, the **Active Delegators** and **Active Processors** cards don't show up. If no queue is selected, **Active Delegators**, **Active Processors**, and **Active Jobs** cards show up simultaneously.
Event Processing Alerts	The number of event processing alerts in the last 5 hour. Clicking on the card takes you to the Events Alerts table that has all the corresponding alerts.
Event Jobs on Schedule	Number of scheduled jobs events that are on schedule.

Scores-Current Scores

Use the Current Scores section to have a direct check on the sysevent table and shows the current states of the events.

Field	Description
Total Events	Total events in the system within the set time period
Total Ready	Total events that are ready to be processed
Total Processing	Total events that are processing
Total Processed	Total events that are already processed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Total Error	Total errors in the events
Total Transferred	Total events transferred from previous shard to the current shard

Scores-Trends

Use the Trends section to have a metric-based graphical understanding of the activities in the event processing system.

Note: By default, the trends are set to 24 hours. You can set it up to 15 days.

Field	Description
Event Delegation Trend	Metric collected related to the delegation of events
Event Processor Trend	Metric collected for the various events processor
Event Trend	Metric for specific events
Email/Script action Handler Trend	Metric collected for event handlers

Details-Configure an alert

Review the details of an alert set every 15 minutes mostly on an instance level. By default, five alerts are provided along with the application. The alerts are setup based on a set of conditions, including what queue it applies to.

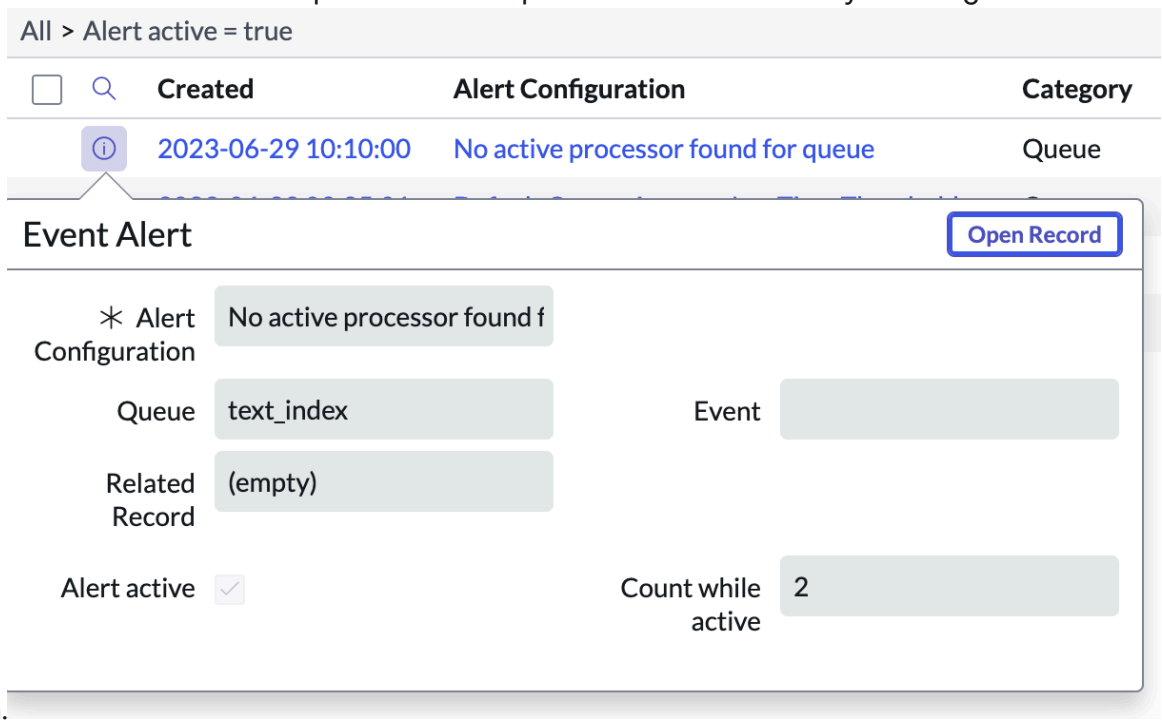
Before you begin

Role required: admin

Procedure

1. Go to **All** > **System Policy** > **Events** > **Configure Alerts**.
   The Events Alert Configurations list shows up.
2. Select one of the available alerts to make changes to the conditions that will trigger an alert.

   Note: You receive a notification in the notification icon when the alert is created.



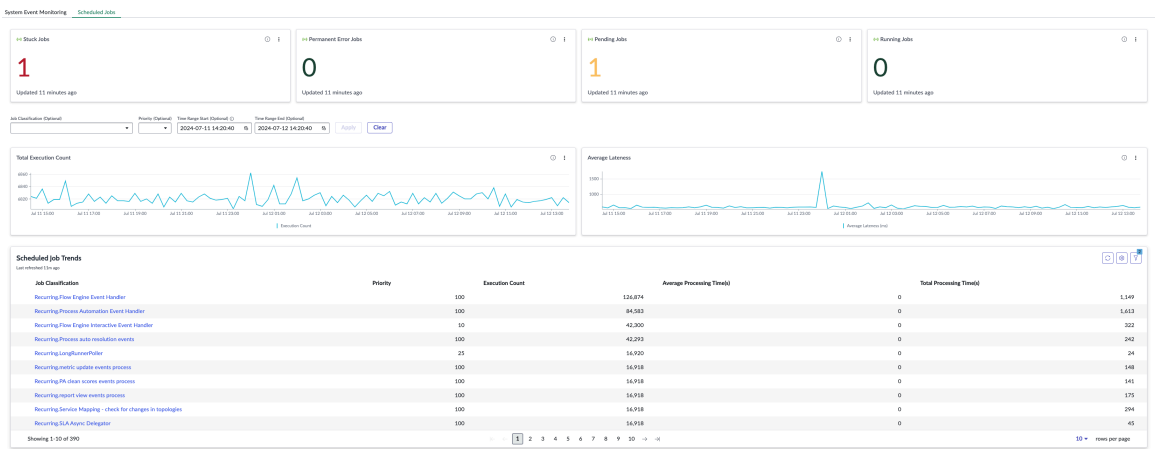
3. Go to **All** > **System Policy** > **Events** > **Alerts**.
   The Event Alerts list shows up.

   Note: The alert conditions are validated every 15 mins approximately.

4. Select the alert you just updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can open the Event Alert form for the selected alert by selecting the Created column. If you select the Alert Configuration column, the Event Alert Configuration form for the selected alert shows up. You can also open the Event Alert form by selecting the 'i'



icon.

5. **Optional:** Select **Reset alert** if the alert notification is no longer required.

Understand your Scheduled Jobs dashboard

Visit scheduler dashboard to learn about key health metrics and insights of scheduled jobs.

Navigate to **All** > **System Diagnostics** > **System Events and Job Monitoring** > **Scheduled Jobs Dashboard**.

The following cards show up on the dashboard

Field	Description
Stuck Jobs	The scheduled jobs that are pinned to a non-existent node show up here. If a scheduled job

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	is assigned to run on a non-existent node and is a parent job that doesn't have Startup as the **Trigger Type**, it is classified under **Stuck Jobs**. The System ID column states the node that the job was assigned to run. One of the reasons of a job being classified as **Stuck Jobs** is if an instance was cloned from another instance and now there are jobs pinned to run on the old instance's nodes. You can take the following actions on the stuck jobs: • You can delete it to remove the job from sys_trigger permanently. • You can recover these jobs which clears the**System ID** column data and allows it to run again based on its **Next Action** time.
Permanent Error Jobs	The scheduled jobs which have a **State** of **Permanent Error** show up here. If you have upgraded from a pre-Utah version to a more recent version, a fix script is executed and it sets the scheduled jobs to **Permanent Error** state if the job was a parent job or a standalone job and picked up to run on a specific node that no longer exists. You can also set the job state to **Permanent Error** manually. You can take the following actions on the permanent error jobs: • You can delete it to remove the job from sys_trigger permanently. • You can recover these jobs which set the state back to **Ready**. It can again run based on its **Next Action** time.
Pending Jobs	Jobs that are to be executed soon.
Running Jobs	Jobs that are actively running.
Jobs Classification (optional)	Optional way to group certain jobs based on filter conditions to collect job completion history by the defined group/classification. You can set up these classifications in the Job Classification Rules table. The default classification is TriggerType.JobName.
Total Execution Count	Graphical representation of the total number of scheduled job executions on your instance over a period of time. The default time period is last 24 hours. You can view the data only from last 7 days. The data originate from the sys_scheduler_job_history table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When you click on an execution count in the graph, the Scheduled Job History list shows up. The list of jobs have been grouped using Jobs Classification concept with Trigger Type as either Run Once or Recurring.
Average job wait time	Graphical representation of the average wait time in milliseconds of all scheduled jobs on your instance over a period of time. The default time period is last 24 hours. You can view the data only from last 7 days. The data originates from the sys_scheduler_job_history table. **Note:** When you click on a wait time average data in the graph, the Scheduled Job History list shows up. The list of jobs have been grouped using Jobs Classification concept with Trigger Type as either Run Once or Recurring.
Scheduled Job Trends	List of completed jobs grouped by Job Classification concept. The default time period is last 24 hours. You can view the data only from last 7 days. The data originate from the sys_scheduler_job_history table.

Note: For both **Stuck Jobs** and **Permanent Error Jobs** tiles, the data and columns originate from the sys_trigger table. Both the tiles are used to cleanup jobs and keep the scheduled jobs in a positive state. Select the required tile to see the list view of the jobs. The **Wait time** column on both the lists refers to how late the job is based on the time it was supposed to run. If **Next Action** is in the past, the wait time is calculated as the current time minus the next action time. For example, if the job was scheduled to run two minutes ago, then the wait time is two minutes. If the job is scheduled to run in the future, then the wait time is 0.

Scheduled Job Trends

This table provides details on the history of completed jobs by classifications. Default view provides the data for last 24 hours.

Field	Description
Job Classification	Provides a way of grouping similar type of jobs based on job name, trigger type (recurring, run once, etc.).
Priority	Priority at which the jobs are processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The lower the number, the higher is the priority. For example, priority of 10 is higher than 100.
Execution Count	Number of times the job has been executed within a timeframe.
Average Processing Time(s)	Average time in seconds needed to process the jobs.
Total Processing Time(s)	Total time in seconds needed to process the jobs.

Platform performance

Monitoring and optimizing ServiceNow AI Platform performance is an important part of maintaining your instance. Optimizing platform performance supports a smooth and consistent user experience, and enhances the platform's scalability and reliability.

Get started with ServiceNow AI Platform performance

Explore

Learn the fundamentals of optimizing platform performance.

Configure

Learn how to configure the ServiceNow AI Platform to optimize performance.

Monitor

Monitor key metrics and transactions in the ServiceNow AI Platform to track performance trends and identify potential issues.

Resolve issues

Take necessary steps to address performance issues when they arise.

Reference

Get details about form, methods, and properties related to platform performance.

Exploring platform performance

The ServiceNow AI Platform provides configurations, monitoring, and diagnostics that administrators can use to support optimized system performance.

ServiceNow AI Platform performance overview

Managing platform performance is important for enabling a smooth and reliable user experience, and for enhancing your instance's scalability. Instance administrators can use various tools to improve, monitor, and troubleshoot ServiceNow AI Platform performance. These proactive measures help maintain optimal functionality and avoid potential disruptions.

Users that manage ServiceNow AI Platform performance

Users

User	Description
Instance administrator	Configure the instance to optimize performance, monitor the instance for performance issues and degradation, and troubleshoot performance issues.

Platform performance optimization workflow

Instance administrators can optimize ServiceNow AI Platform performance by taking the following steps:

1. Configure key ServiceNow AI Platform components to support optimized performance.
2. Monitor platform performance to identify performance degradation.
3. Resolve platform performance issues when the arise.

What to explore next

To learn more about improving ServiceNow AI Platform performance, see:

- Configuring the ServiceNow AI Platform to optimize performance
- Resolving platform performance issues
- Monitoring platform performance

Import set performance

The algorithm transforms import sets from their staging table into their final destination.

Importing data via an import set requires two phases:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The data is loaded from a data source into a staging table
2. The data is transformed from the staging table into a target table

The transform algorithm operates in "blocks" of 100 records at a time as opposed to the previous algorithm which transformed a single record at a time. The newer approach allows the application server to pre-fetch a variety of information relevant to each block of records, reducing the number of unique interactions with the database and improving throughput.

Who should expect to see a performance improvement?

Any customer using import sets should expect to see a performance improvement in large transformations.

What kinds of transformations benefit the most from these changes?

Transformations with a large number of reference or choice type columns see the largest improvement.

What kind of transformations benefit the least?

Transformations that with complex or unkeyed coalesce conditions see a proportionately smaller benefit.

Configuring the ServiceNow AI Platform to optimize performance

Configure browser settings, transaction and application quotas, and operational toggles options to optimize performance. Optimizing ServiceNow AI Platform performance supports a smooth a responsive user experience.

Configuration overview

Most configuration for platform performance optimization is completed by instance administrators in each instance of the ServiceNow AI Platform. Any user can verify browser configuration to optimize performance.

- Set transaction quotas

  Instance administrators set transaction quotas to help prevent poorly performing queries and scripts from consuming system resources. After determining normal parameters for transactions, you can create a transaction quota rule that defines when a long-running transaction should be canceled.

- Set application quotas

  Instance administrators can set application quotas in addition to global transaction quotas. Application quota rules limit the number of events or jobs that can run within an application's scope during a specified amount of time, helping optimize bandwidth use.

- Set operational toggles

  Instance administrators can control how much bandwidth an application uses in the instance by mapping system run levels to operational toggles.

- Verify browser settings for performance optimization

  Verify that your browser supports data compression to support optimal performance. Any user can verify that their browser's settings.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transaction quotas

Transaction quotas allow you to define a quota policy for different types of transactions. A transaction quota cancels any transaction in violation of the policy and notifies the user of the cancellation.

Administrators can set transaction quotas to prevent poorly performing queries and scripts from consuming system resources. This ensures that no transaction consumes enough resources to prevent other transactions from running. Administrators can also view cancellation log messages to identify transactions that might consume excessive resources.

The Transaction Quotas plugin is active by default on all new and upgraded instances.

How transaction quotas work

Transactions use the Quota Manager, which is a background thread that cancels transactions according to transaction quota rules. The Quota Manager performs the following actions.

1. Obtains a list of active transactions, similar to the list under **User Administration** > **Active Transactions**.
2. Cycles through each transaction and checks all quota rules with conditions matching the transaction. The first occurrence that exceeds any of the quota limitations triggers a transaction cancellation. If a transaction changes or there is a new quota rule, the Quota Manager re-evaluates the transaction.

   Note: The **Order** field on a quota rule affects the order in which the quota rules are checked. The Quota Manager checks lower-order rules first (for example, order 80 before order 90), but ultimately checks all rules. This might have marginal performance implications, depending on the conditions of the rules involved.

3. Cancels the transaction if it has been running longer than the specified quota maximum.
4. Logs the running transactions.
5. Sleeps until the next heartbeat, which is controlled by the *glide.quota.manager.heartbeat* system property.

Transaction cancellation from exceeded quotas

When a transaction runs longer than the maximum duration specified by a quota rule, the user is notified of the cancellation and the reason.

Additionally, a warning is logged in the Transaction Cancellation Log whenever a transaction is cancelled due to exceeded quotas. To view the Transaction Cancellation Log, navigate to **All** > **System Logs** > **System Log** > **Transaction Cancellation Log**.

Transaction cancellation examples

Transactions can be canceled for more than one reason. Look for the following indicators.

- **maximum execution time exceeded**: This message appears when the glide.quota.manager threads cancels the transaction.
- **canceled by other transaction**: This message appears when the transaction was canceled by the session thread that initially issued it, and not by the glide.quota.manager thread.
- **canceled by user request**: This message appears when the user selected the red X button to cancel the running transaction.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you are looking for transactions that were canceled by glide.quota.manager, search for the **[Message] [Contains] [maximum execution time exceeded]** combination. For example:

```
Cancelling transaction /home.do - Default-thread-11.0
 (maximum execution time exceeded): Thread Default-thread-11.0
 (Default-thread-11.0, F530DD111B11111111FC031767DA158E), after
 30000ms
```

.

Configure a transaction quota rule

Transaction quota rules allow you to define a quota policy for different types of transactions.

Before you begin

Role required: admin

About this task

Transaction quota rules allow you to specify the following conditions.

- The conditions under which the policy applies.
- The order in which transaction quotas apply.
- The maximum duration of a transaction before the quota manager cancels it.

Before setting transaction quotas, navigate to **All** > **User Administration** > **Active Transactions** to review the normal transaction activities for your instance. You can view and terminate long-running transactions if necessary. Over time, you can determine the normal transaction load for your instance and set your quotas to match these norms.

⚠ **Warning:** Setting transaction quotas too low can severely impact your users and prevent normal instance operations. Test your transaction quotas rigorously before implementing them in production.

Procedure

1. If necessary, activate the Transaction Quotas plugin.
   To verify whether the Transaction Quotas plugin is already active, navigate to **Admin** > **Application Manager** and search for Transaction Quotas in Application Manager. If the plugin is included in the **Installed** tab, it is already activated.
2. Navigate to **All** > **System Definition** > **Quota Rules**.
3. Click **New**.
4. On the Transaction Quota Rule form, fill in the fields.
   For a description of the field values, see Transaction quota rule form.
5. Set a condition to specify when the transaction quota should take effect.
   The transaction quota rule condition builder displays conditions that are only applicable to transactions. For a description of the condition builder options, see Transaction quota rule condition builder.
6. Select **Submit**.

Before you begin
Role required: admin

About this task
Knowledge of Apache Jelly is highly recommended when modifying the UI page. See Extensions to Jelly syntax for more information.

Procedure
1. Navigate to **All** > **System UI** > **UI Pages**.
2. Open the UI page with the name **transaction_canceled_quota**.
3. In the **HTML** field, add or modify the new cancellation message.
   To add variable information to the cancellation message, see Methods to add variable information to the cancellation message.
4. Click **Update**.

View a transaction cancelled because of a quota rule

The Quota Manager logs each canceled transaction as a warning message in the system log.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System Logs** > **System Log** > **Warnings**.
2. Edit the filter to add the condition **[Message] [starts with] [Cancel]**.
3. Select **Run**.

Enable transaction quota debugging

You can enable the logging of transaction quota debugging information by enabling the system property.

Before you begin
Role required: admin

Procedure
1. Add the `glide.quota.manager.debug` system property, and set the value to true.
2. Navigate to **System Diagnostics** > **Session Debug** > **Debug Quotas**.
   The Debug Quota script runs to enable debugging.

What to do next
After setting the above system property to **true**, go to your system log to see messages from the Quota Manager.

Related topics
Add a system property

Application quotas

You can set a limit on the number of events or jobs that can run in an application's scope within a specified time. Limiting the number of events or jobs running at the same time can help optimize bandwidth usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application quota rules limit the number of events or jobs that can run within an application's scope during a specified amount of time. Each scoped application can have one application quota rule. When an application exceeds the quota limit, all transactions running in the application scope are canceled. Until the next update period, new transactions within the application scope are cancelled as soon as they're initiated. These actions effectively block transactions from an application scope from running for the update period.

An application quota rule applies to transactions created by all instances of an application and all transactions created by methods of the application called by other applications. If two users are running the same application, the application quota rule does not distinguish between transactions for each instance of the application. If, together, they violate the quota, all transactions in the application's scope are canceled.

If you check the **Log Only** option, transactions are not canceled by a quota violation. Instead, entries are added to the local host log that indicate the transactions are running under violation.

Transaction and application quota rules are evaluated separately. By defining an application quota rule, you simply introduce another restriction. A transaction is canceled if it violates a transaction quota rule, or if collectively with other application transactions, it violates its application quota rule.

You cannot define an application quota rule for the global application.

Configure an application quota rule

Configure an application quota rule to limit the number of events or jobs that can run in an application's scope within a specified time.

Before you begin
Role required: admin

About this task
You must be in the application scope of the application for which you want to create a rule.

Procedure

1. Navigate to **All** > **System Definition** > **Application Quota Rules**.
2. Select **New**.
3. On the Application Quota Rule form, fill in the fields.
   For a description of the field values, see Application quota rule form.
4. Set a condition to specify when the application quota rule should take effect.
   The application quota rule condition builder displays conditions that are only applicable to transactions. For a description of the condition builder options, see Application quota condition builder.
5. Select **Submit**.

Operational toggles

You can control how much bandwidth an application uses on your system by mapping system run levels to operational toggles. An excessive bandwidth could impact your system performance and your users' experience.

Operational toggles overview

You can use system run levels to map descriptive names to operational toggle levels. System run levels define the operational state of your system based on the toggles and toggle levels

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

you have configured. These levels help you manage the system's performance and resource allocation.

Operational toggles can be used to throttle application performance during high-use periods. By adjusting operational toggles, you can limit the number of events or jobs running within an application's scope to help prevent system overload.

You can also create operational toggles to enhance user experience. For example, a type-ahead search polling toggle might help users complete searches more quickly. You could add this toggle to enable users to perform type-ahead searches based on keystroke values, providing real-time search suggestions as they type.

Operational toggle levels

You can create different levels of your desired toggle. For example, you might want to perform a type-ahead search every keystroke or every fifth keystroke. For more information about toggle levels, see Create an operational toggle level.

Run level toggle mapping

You can associate the system run level to the toggle level with toggle mapping. Depending on your instance health, the API returns the appropriate toggle level value and exception roles. For information about how to create run level toggle mapping, see. Create run level toggle mapping.

Create an operational toggle

Create an operational toggle to maintain system run levels that throttle the application operation. Operational toggles enhance your users' experience by tailoring resource consumption to system run levels.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Run Level** > **Operational Toggles**.
2. Select **New**.
3. On the Operational Toggles form, fill in the fields.
   For a description of the field values, see Operational toggles form
4. Select **Submit**.

Create run level toggle mapping

Create run level toggle mapping so that you can associate the system run level to the toggle level.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Run Level** > **Run Level Toggle Mapping**.
2. Select **New**.
3. On the Run Level Mapping form, fill in the fields.
   For a description of the field values, see Run level toggle mapping form.
4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an operational toggle level to define thresholds

Create operation toggle levels so that you can define the threshold limits that your application can function within.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Run Level** > **Operational Toggle Levels**.
2. Select **New**.
3. On the Operational Toggle Level form, fill in the fields.
   For a description of the field values, see Operational toggle level form.
4. Select **Submit**.

Browser settings and performance

Enable data compression through your web browser to avoid slow performance on pages with large data sets.

Web pages in your instance might include large data sets, especially in tables with many rows and columns. To improve speed on pages that require large amounts of data, most browsers can accept compressed data. Data compression reduces the size of data transmitted between the server and the client to improve transfer speed and bandwidth use.

Compression is enabled by default on all ServiceNow application servers and in many web browsers. Review your specific browser settings to verify that data compression is supported and enabled.

Monitoring platform performance

The ServiceNow AI Platform includes tools that administrators can use to monitor platform performance. Monitoring platform performance enables administrators to proactively identify and solve issues.

Overview of monitoring platform performance

Administrators have access to various logs and dashboards that can be used to monitor how a ServiceNow AI Platform instance is performing. These logs and dashboards can be accessed and reviewed at any time to identify indicators of performance degradation. If you notice abnormally slow response times or an unusually high volume of cancelled transactions, you might have performance issues that need to be resolved.

Reviewing transaction logs

The instance automatically logs the vital statistics of every transaction that it processes, and that information is available to you as an administrator. Reviewing transaction logs can help identify latency and performance issues.

To view the transaction log, log in to your instance and navigate to **All** > **System Logs** > **Transactions**.

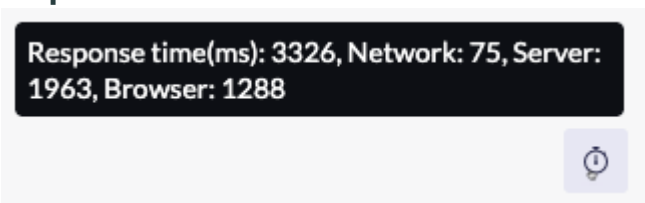
To see the average response time of all listed transactions, select and hold (or right-click) the column **Response time**. Select **Configure** > **List Calculations**, and then select the **Average value** check box.

You can limit the list to those transactions that took place during the time period of interest. The default filter returns transactions from today.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For each completed transaction, available information includes the following (times are in milliseconds):

- Date/time, User ID, IP address, and URL of the transaction.
- Total response time, which doesn't include the browser time because the server doesn't have that information.
- **Output length**: how many bytes the transaction returned, after any compression.
- **SQL time**: time spent executing SQL commands.
- **SQL count**: number of SQL commands executed.
- **Business rule time**: time spent processing business rules.
- **Business rule count**: number of business rules executed.
- **Network time**: network transmission time, both from and to the user.



Note: You can change which columns are shown and their order by selecting the Update Personalized List icon ( )

Reviewing response time on forms

A response time indicator (clock) appears at the end of many forms and lists.

This indicator provides the processing time for a completed transaction, including the total time and the time for each step. Select the icon to show and hide the response time details. Hover over the icon to see a tooltip with the details. The following example shows the response time for retrieving a filtered list in a demo instance.

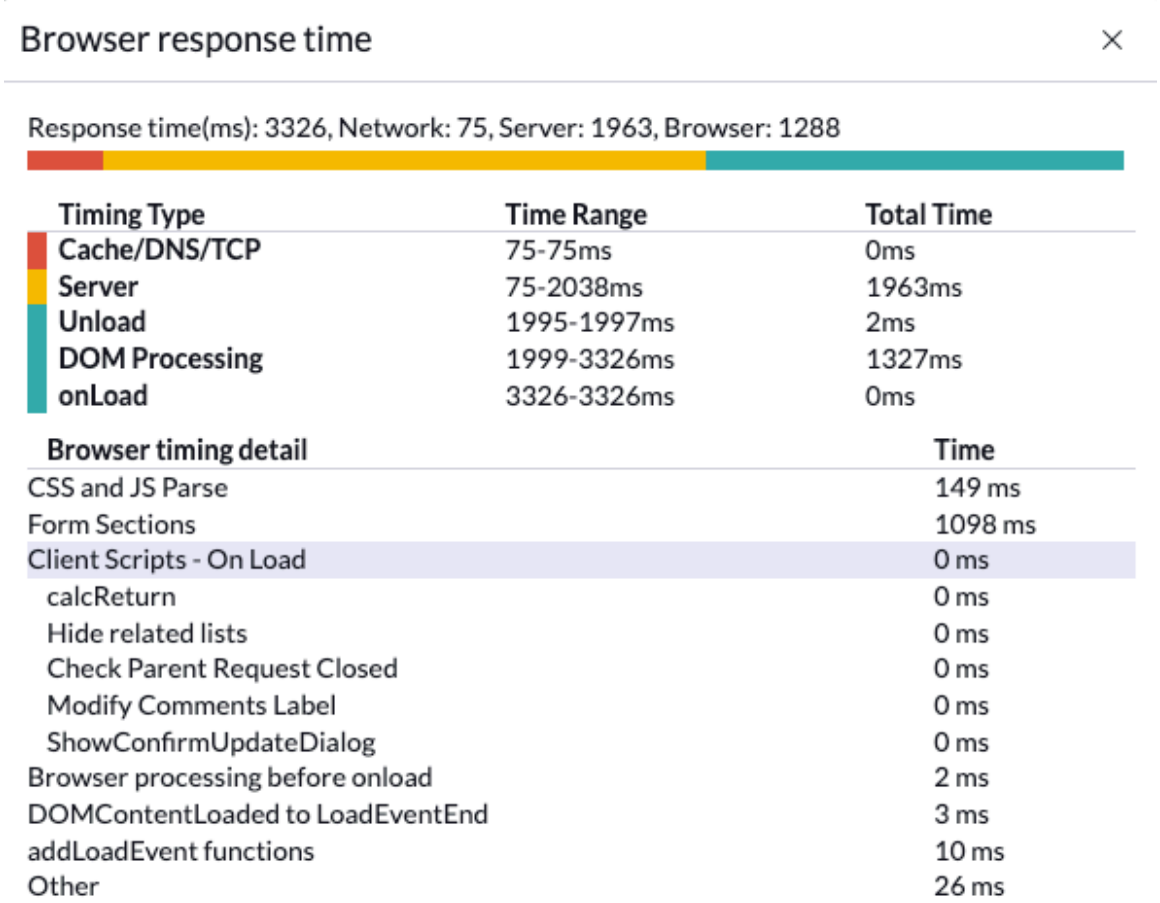
Response time

In this example, the transaction took the following amount of processing time:

- 3326 milliseconds total time
- 75 milliseconds moving data across the network
- 1963 milliseconds on the server

Note: Server time is calculated using the following formula:

```
server time = (client response time - browser time - client
 network time)
```



- 1288 milliseconds in the browser, rendering the HTML and parsing and executing JavaScript

A response time indicator doesn't appear for simple operations, such as paging or changing a list sort order. The response time indicator also doesn't appear for the first transaction in a session.

To view a detailed breakdown of the processing time on forms, select the response time indicator icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response time details

Administrators can disable the response time by setting the *glide.ui.response_time* property to **false** in the System Properties [sys_properties] table. In the navigation filter, enter `sys_properties.list` and search for *glide.ui.response_time*.

Reviewing response times from system logs

You can use the system logs to review a list of response times for different transactions. To view the log, navigating to **All** > **System Logs** and select the relevant log type. When you review response times, look for the following issues.

1. A period where all transactions took an unusually long time. For example, transactions that normally took 1 second took 15 seconds between 11:00 AM and 11:20 AM. This issue can indicate that an unusual load, such as a large report, ran on that app server during that time.
2. A specific transaction which repeatedly took an unusually long time. For example, the list of closed incidents sorted by short description took 30 seconds each time it was displayed. This issue can indicate that a particular transaction put an unusual database load on the system, such as sorting 500,000 records on an unindexed field.

If you notice issues with form response times, see Improving response times on forms.

Client transaction timings

The Client Transaction Timings plugin provides extra information about the time spent on both the client and server sides, by the browser and the network. This feature not only helps find long-running processes, but also provides information about where in the process the performance issue is caused.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Client transaction timings.

Transaction call chains

Identify and debug the root causes for a problematic transaction by recording, and then reviewing, its call chain. A call chain consists shows the ordered series of scripts executed during the life cycle of a transaction.

With Transaction Call Chain tracking, an administrator can register the URL of a problematic transaction. The call chain is then recorded during the next occurrence of the registered URL. Transaction call chains can help diagnose transaction performance issues.

The following shows the workflow for enabling and using transaction call chain tracking.

1. When you find a problematic transaction on the Transaction Log or Slow Transaction list that requires debugging, select it to view its detail record. To aid in debugging, filter and group these lists by application scope, limiting transactions that appear to only those transactions originating in specific scopes.

   Note: To learn more about these lists, see Transaction logs and Slow transactions log record detail.

2. In the record detail form, select **Record call chain of next occurrence**. Doing this designates that the next occurrence of the transaction URL should be persisted with all of its call chain information.

   Optionally, you can designate a user ID so call chain recording only takes place during the next transaction occurrence for a specific user.

3. The next time a user accesses the URL, the Transaction Call Chain Register record is updated to contain a list of the script resources executed to service the request. This list of resources is available for administrators to view by navigating to the Transaction Call Chain Record and selecting the Transaction Call Chain related list.
4. In Transaction Call Chains, review the recorded call chain for the transaction, and then take the needed actions required to debug it.

Create a transaction call chain register

Create a call chain register to record call chain information for a problematic (or slow) transaction during the next occurrence of that URL. You specify that the next occurrence of the transaction URL should be persisted with all of its call chain information.

Before you begin

Role required: admin

Procedure

1. Navigate to the Transaction Log or Slow Transactions list, select the problematic transaction, and enable recording of the call chain.

Type of Log	Steps
Transaction Log	**a.** Navigate to **System Logs** > **Transactions** **b.** To aid in debugging, filter and group the Transaction Log by application scope, limit ing transactions that appear to only those transactions originating in specific scopes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type of Log	Steps
	c. Select the problematic transaction. **d.** In the Transaction Log Entry form, select **Open Record**, then select **Record call chain of next occurrence**.
Slow Transactions	**a.** Navigate to **System Diagnostics** > **Stats** > **Slow Transactions** **b.** To aid in debugging, filter and group the Slow Transactions list by application scope, limiting transactions that appear to only those transactions originating in specific scopes. **c.** Select the problematic transaction. **d.** In the Slow Transactions form, click **Open Record**, then select **Record call chain of next occurrence**.

2. On the Transaction Call Chain Register form, fill in the fields.
   For a description of the field values, see Transaction call chain register form.
3. Select **Submit**.

Result

A call chain register is created to designate that the next occurrence of the transaction URL should be persisted with all of its call chain information.

Note: Once the call chain is recorded (**true** appears in the **Recorded** field), you can view it in the Transaction Call Chain Register form itself.

What to do next

Review a transaction call chain

Review a transaction call chain

Use Transaction Call Chains to review the resulting call chain for a selected transaction. You can use the information in Transaction Call Chains can help debug performance issues.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Diagnostics** > **Transaction Call Chain** > **Transaction Call Chains**.
2. To view call chain detail, select the **Created** field for the desired call chain component or script.
   For a description of the field values in the Transaction Call Chain form, see Transaction call chain form.

Note: You can view transaction log detail by selecting the **Transaction Log** field for the selected call chain component or script. To learn more, see Transaction logs.

Thread performance monitoring

The instance tracks the performance of individual threads, which administrators can view in the transaction log.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The amount of time a thread waits for an available semaphore or session synchronization is included in the **Response Time** field in the transaction log. To view the transaction log, navigate to **All** > **System Logs** > **Transactions**.

Monitoring instance usage

You can track application usage on your instance through the Application Usage Overview and the ServiceNow Store Usage overview dashboards.

The usage analytics process collects data on all your instances and regularly updates the reports in the Usage Overview and ServiceNow Store Usage Overview dashboards. Application usage data is collected whenever an application is opened, and counts on tables are collected once a day. Data is collected on:

- The number of active users in the system
- The hardware CIs discovered (for instances that use Discovery)
- The number of cloud management service catalog items available to users in instances that use Cloud Management

Users with the admin or usage_admin role can view the Application Usage Overview and ServiceNow Store Usage Overview dashboards.

Application Usage Overview

The Application Usage Overview dashboard contains information about ServiceNow applications.

To view the Application Usage Overview, navigate to **Self-Service** > **Dashboards**. From the available dashboards, select **Usage Overview**.

ServiceNow Store Usage Overview

The ServiceNow Store Usage Overview dashboard contains information about applications procured from the ServiceNow Store.

To view the ServiceNow Store Usage Overview, navigate to **Self-Service** > **Dashboards**. From the available dashboards, select **ServiceNow Store Usage Overview**.

Application usage overview dashboard

The Application Usage Overview dashboard displays reports on the use of ServiceNow applications on your instance.

Application Usage Overview reports

Chart or report	Description
Usage of ServiceNow Applications	Shows the number of views or operations performed for each of the listed applications, grouped by month.
Users of ServiceNow Applications	Shows the number of active users who have used the instance, grouped by month. An active user is any user who could have accessed the applications, not only users who actually did access the applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Usage Overview reports (continued)

Chart or report	Description
Usage of Custom Applications	Shows the number of views or operations performed for each of the listed custom applications, grouped by month.
Users of Custom Applications	Shows the number of active users who have used custom applications, grouped by month. An active user is any user who could have accessed the custom applications, not only users who actually did access the applications.
Google **Maps Usage By Month**	Shows the number of views or operations performed for the Google maps application.
Additional Metrics	Shows any of the following items, depending on your licensing agreement: • Primary database size of this instance in megabytes • ServiceNow® Performance Analytics of all indices • NotifyNow conference calls • ServiceNow® Cloud Provisioning plugins active • ServiceNow® Discovery plugin active • ServiceNow® Password Reset plugin active • ServiceNow® Cloud Management — VMware instance • Vendor custom applications • Custom applications • ServiceNow® Event Management plugin active • Active benchmark indicators • Customer updated PA indicator • Active users • ServiceNow® Cloud Management — EC2 instances • ServiceNow® Orchestration core plugins active • Custom tables extending base system tables other than Task • Virtual node count • Active users for subscriptions • NotifyNow Messages • ServiceNow® Edge Encryption plugin active • Number of Google map page hits during the current month - as of yesterday • Physical node count

ServiceNow Store usage overview dashboard

The ServiceNow Store Usage Overview dashboard displays reports on the use of ServiceNow Store applications on your instance.

© 2026 ServiceNow, Inc. All rights reserved.

ServiceNow Store Usage Overview reports

Chart or report	Description
Usage of ServiceNow Store Applications	Shows the number of views or operations performed for each of the listed applications, grouped by month.
Users of ServiceNow Store Applications	Shows the number of active users who have used the instance, grouped by month. An active user is any user who could have accessed the applications, not only users who actually did access the applications.

Resolving platform performance issues

If platform performance issues are identified, administrators can resolve problems and improve performance.

Overview of resolving platform performance issues

Even if you have configured your ServiceNow AI Platform instance to optimize performance, performance issues might still be identified through continued monitoring. The following topics can help you address common kinds of platform performance issues as they arise.

Instance cache effects on performance

Minimize actions that purge and rebuild the instance cache during core business hours to avoid performance degradation during peak hours.

Performance degrades whenever you purge and rebuild the instance cache. During core business hours, avoid or minimize any of the following actions that purge and rebuild the instance cache.

- Adding or updating system properties
- Adding or updating dictionary entries
- Committing update sets
- Adding or updating translations

Improving response times on forms

Learn the techniques that can be used to improve form response times. If you notice latency or slow response times on forms, using these techniques can help improve performance.

1. If you notice one or more transactions that span the entire form response time window, try adding additional indexing to the database to make the transaction faster. Even with indexing, some queries might still take longer than others.

   For more information about indexing, see Resolving slow queries.

2. Verify that a cache flush isn't being run during business hours.

   Cache flushes are intended to help prevent older data from interfering with changes and updates, and are performed automatically when using update sets. Scheduled cache flushes, using cache.do, can affect overall performance and degrade system response times. Don't run cache flushes or trigger automatic cache flushes during business hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about actions that trigger automatic cache flushes, see Instance cache effects on performance.

3. If you can't find any specific issues leading to slow response times on forms, contact Customer Service and Support to see if there are global issues with the application server hardware.

Resolving slow queries

Identifying and resolving slow queries is an important aspect of improving platform performance. The ServiceNow AI Platform generates index suggestions to help resolve slow queries.

Database queries that take an unusually long time to execute might be caused by inefficient query design, high data volume, and lack of proper indexing. The best way to resolve slow queries depends on the combination of factors that contribute to the issue.

Causes and possible solutions for slow queries

Cause	Possible solution
Inefficient query design	Review and modify query structures to enhance performance. Query modifications might include verifying that you're fetching only the necessary data, or implementing pagination at the query level. You can use a slow query log to determine which queries might need to be enhanced. For more information about how to use a slow query log, see Use a slow query log.
High data volume	Verify that necessary transaction quotas, application quotas, and operational toggles are set to optimize bandwidth use. For more information, see Configuring the ServiceNow AI Platform to optimize performance.
Lack of proper indexing	Use the Index Suggestion Engine (ISE) to generate index suggestions for selected slow queries.

Overview of using the Index Suggestion Engine

The Index Suggestion Engine (ISE) can help generate index suggestions for slow queries. If you modify query design and manage data volume but still notice slow queries, you can use the ISE to generate indexes for slow queries.

Use the following steps to resolve slow queries with the ISE:

1. Use the slow query log to identify slow queries that might benefit from improved indexing.
2. Generate an index suggestion for a slow query using the ISE.
3. Review the index suggestion and decide whether to move forward.
4. Export a query suggestion from a production instance to a non-production instance for evaluation before adding the index in your production instance.
5. Create an index from the suggestion or schedule index creation once you're satisfied with the effects of the index suggestion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Test index performance to evaluate query speed improvement.
7. If an index isn't needed anymore, drop the index or schedule it to be dropped. If an index isn't being used or isn't performing well, the ISE might display a suggestion to drop an index.

Additional info

For more information about how the ISE generates index suggestions, see Index suggestions for slow queries.

Index suggestions for slow queries

The Index Suggestion Engine (ISE) can generate an index suggestion for a selected slow query. When you request an index suggestion for a slow query, the ISE analyzes the query and recommends an index that can improve the query execution time.

In new and upgraded instances, the Index Suggestion Engine plugin (com.glide.index_suggestion) is activated by default.

Note: The ISE supports MySQL databases only.

Administrators use the ISE to:

- Generate an index suggestion for a slow query.
- Review index suggestions for slow queries in your instance.
- Export an index suggestion to a non-production instance for evaluation and testing.
- Schedule an index for creation.
- Monitor the effectiveness of an index during the index evaluation period.
- Test index performance (this test is an immediate performance assessment of the index).
- Drop an index that does not optimize query performance, as recommended by the ISE.

If you choose to use the index suggestion and create the index, the ISE continues to review the effectiveness of that index during a 14-day evaluation period. The ISE provides details on the index during the evaluation, including recommendations for managing the index.

How index suggestions work

You start the index suggestion process by requesting an index suggestion for a selected slow query. The ISE runs a daily job that collects column statistics from tables in the slow query, gathering data such as cardinality (unique columns in a table) and null/not null count.

Next, the ISE aggregates and analyzes the information collected, applies a weighted column ranking algorithm to the slow query, and generates an index suggestion for the query.

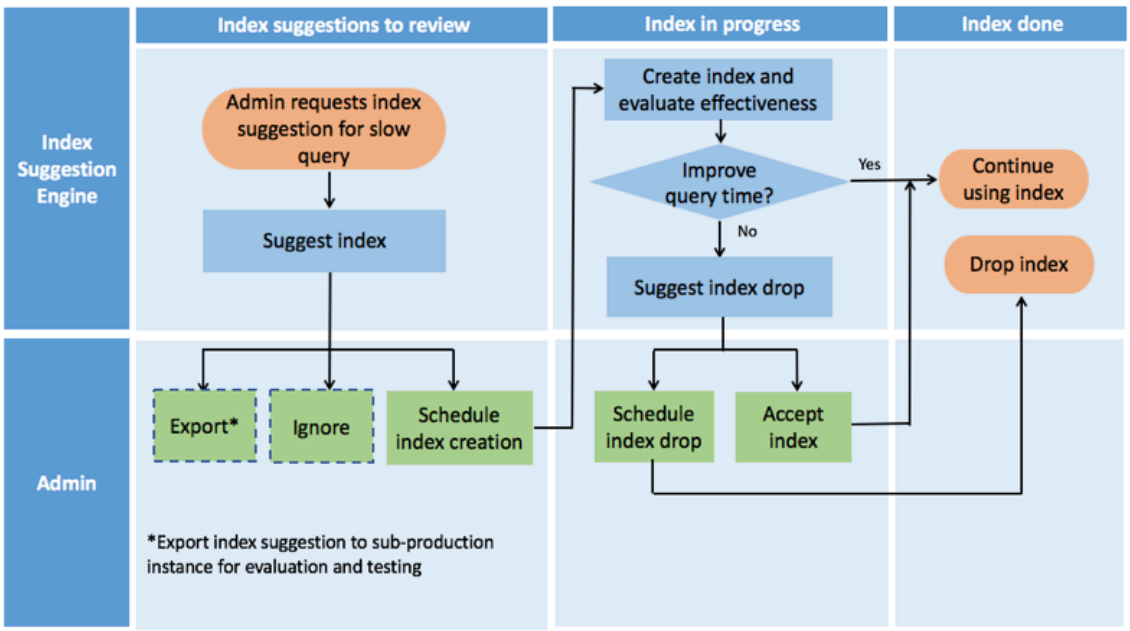
After an index suggestion is generated, you review the suggestion and determine whether to create the index for the slow query. When you create the index, the ISE provides information on the index as it moves through its life cycle. You can track the index suggestion through three main processing stages:

Index suggestions to review

During this initial stage, you can review index suggestions that the ISE generated for your slow queries. You can choose to ignore a suggestion, export the index suggestion to a non-production instance for further testing, or schedule the index for creation. If the ISE successfully generates an index suggestion and you choose to schedule the index for creation, the index suggestion moves to the next processing stage. However, if the database cannot use the suggestion or the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

suggestion degrades query performance, the ISE recommends that you drop the index suggestion.



Index in progress

In this stage, the ISE creates the index and the 14-day evaluation period begins. The ISE does an hourly evaluation to determine whether the index improves or degrades the query execution time. The ISE updates the index state, including recommended actions that you can take. For example, if the index does not improve the performance of the slow query, the ISE advises that you drop the index. You can then schedule the index to be dropped from the database. During this stage, you can also choose to test index performance or accept an index, even if the ISE recommends dropping it.

Index done

In the last processing stage, the ISE describes the final state of the index and related processing activity. If the index improved the slow query time, the ISE changes the index state to Created and the database continues to use the index. If the index did not improve the query time and you chose to drop the index, the ISE drops the index from the database and changes the index state to Dropped.

Index suggestion life cycle

Processing states for index suggestions

The Index Suggestions [sys_index_suggestion] table provides state information on your indexes as they move through the three main processing stages:

- **Index Suggestions > To review**
- **Index Suggestions > In Progress**
- **Index Suggestions > Done**

The ISE uses the following states to describe the processing activity for an index.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Index suggestion states

State	Description
Index suggestions to review	
Suggested	ISE generated an index suggestion for the slow query.
Drop Suggested—Unused	ISE recommends that you drop the index, since the database is not using the index for the slow query.
Drop Suggested—Performance Degradation	ISE recommends that you drop the index because the index did not improve the query time or made the performance worse.
Index in progress	
Creation Scheduled	You scheduled the index for creation.
Creation in Progress	ISE is creating the index.
Creation Failed	ISE could not create the index.
Evaluating Effectiveness	ISE created the index and is assessing index performance during the 14-day index evaluation period.
Drop Suggested—Unused	ISE recommends that you drop the index from the table for which the index was created, since the database is not using the index for the slow query.
Drop Suggested—Performance Degradation	ISE recommends that you drop the index because the index did not improve the query time.
Drop Scheduled	You scheduled the index to be dropped from the database.
Drop in Progress	ISE is dropping the index from the database.
Drop Failed	ISE could not drop the index. Contact Customer Service and Support for assistance.
Index done	
Created	After the 14-day evaluation period, the ISE determined that the index improved query performance. Indicates that the database continues to use the index.
Ignored	You chose to ignore the index suggestion.
Dropped	ISE successfully dropped the index.
Accepted	You chose to keep the index even though the ISE recommended dropping it.
Superseded	A recent index suggestion replaced the index for the same table and slow query.

Use a slow query log

Administrators can use slow query logs to gain insight into how queries are affecting platform performance. The Slow Queries log aggregates data for similar queries. Use slow query data to evaluate the need for new indexes, changes to existing indexes, or changes to frequent queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Queries are similar when they select from the same table and query the same field in the where clause, but search for different values in the field. For example, these queries are aggregated as similar queries.

```
SELECT * FROM sys_user WHERE name="ITIL User"
SELECT * FROM sys_user WHERE name="System Administrator"
```

Aggregating similar query data allows administrators to monitor the performance impact of slow queries and of queries that occur frequently. The log reports data for similar queries where the total execution time exceeds 5 seconds.

Procedure
1. Navigate to **All** > **System Diagnostics** > **Stats** > **Slow Queries**
2. Open a query record for more details.

   For a description of the field values in the query record, see Query record form fields.
3. To see what the database is doing to retrieve the data, click **Explain Plan**.
   The query plan is reported in the **MySQL Explain Plan** related list. Use the query plan to evaluate the need for new indexes or changes to existing indexes. For more information, see MySQL explain plan documentation.

   This feature works on other supported databases, including MongoDB and Oracle.
4. To generate an index suggestion for a slow query, click **Index Suggestion**.
   For details, see Generate an index suggestion for a slow query.

Generate an index suggestion for a slow query

Use the Index Suggestion Engine (ISE) to generate an index suggestion for a slow query. The ISE analyzes slow queries and provides index recommendations to improve execution time when possible.

Before you begin
Role required: admin

About this task
When the ISE generates an index suggestion for a slow query, it reviews query metrics and information from tables in the query. If the ISE doesn't have the information required to generate an index suggestion, the system displays messages informing you about the data needed. These messages typically provide links for obtaining more information, such as updated query metrics or gathering column statistics from tables in the query. Sometimes the ISE might be unable to provide a recommended index for the query and lets you know why the suggestion can't be generated.

Procedure
1. Navigate to **All** > **System Diagnostics** > **Stats** > **Slow Queries**.
2. In the Slow Queries table, select the query record for which you want to generate an index suggestion.
3. In the Slow Queries record, select **Suggest Index**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If more information is needed to generate a suggestion, the system might display one or more messages with details for obtaining that information. After you respond to each message, select **Suggest Index**. Repeat this process until the ISE has the information required to generate the index suggestion.

For example, the following information might be needed to generate a suggestion:

- Recent metrics—If the system displays a message indicating that query metrics are outdated, the message provides a link for obtaining the most recent metrics.
  - Select the link to get the updated query metrics.
  - Select **Suggest Index**.
- Column statistics—If the column statistics don't exist for the query, the system displays a message asking you to schedule the Collect Column Stats job. You can choose to run the job at the default time when the system is less busy, or you can have the system collect the statistics immediately.
  - If you schedule the Column Stats job to run later, the ISE generates the index suggestion after it collects the column statistics. After the column stats job runs, return to the Slow Queries record and select **Suggest Index**.
  - If you choose to collect column stats immediately, the system displays the Collect Column Statistics progress indicator while it gathers column statistics. In the Slow Queries record, select **Suggest Index**.

When the ISE successfully generates an index suggestion, the Index Suggestion record for the query shows the index **State** as **Suggested**.

4. If you want to continue working with the index suggestion, select the next processing step.

Option	Description
Export	Downloads the index suggestion as an .xml file so that you can export it to a non-production instance for testing and evaluation.
Ignore	Sets the index suggestion state to Ignore, which indicates that the index suggestion isn't to be used. Index suggestions with an Ignore state are listed in the **Index Suggestions > Done** view of the Index Suggestion table.
Schedule creation	Opens the Schedule Index Creation window for scheduling index creation.

Review index suggestions for slow queries

You can review index suggestions and indexes created by the Index Suggestion Engine (ISE). The ISE provides three main views of index suggestions as they move through their life cycle: index suggestions in review, index in progress, and index done.

Before you begin

Role required: admin

About this task

Access index suggestions from the Application Navigator or the Performance homepage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Access the index suggestions for your instance by navigating to **System Diagnostics** > **Index Suggestions** > **Index Suggestions > To review**.
2. In the Index Suggestions table, select the table associated with the index suggestion you want to view from the **Table Name** column.
3. Review the index suggestion for the selected table.
   For a description of the field values in the index suggestion, see Index suggestion form fields.
4. Choose the next processing step for the index suggestion.

Option	Description
Export	Downloads the index suggestion as an .xml file, which can be exported to a non-production instance for testing and evaluation.
Ignore	Changes the index suggestion state to ignore, which indicates the index suggestion is no longer active and available for index creation. Index suggestions with an Ignore state are listed in the **Index Suggestions > Done** view of the Index Suggestion table.
Schedule creation	Opens the Schedule Index Creation window to schedule an index suggestion for creation.

Export a slow-query index suggestion to a non-production instance

You can export an index suggestion from a production instance to a non-production instance for creation, evaluation, and testing before implementing the index on your production instance.

Before you begin
Role required: admin

About this task
This task involves exporting an index suggestion as an .xml file from your production instance and importing it to a non-production instance. You can then create the index and evaluate its performance on the non-production instance.

Procedure

1. In your production instance, navigate to the index suggestion to be exported:
   a. Navigate to **System Diagnostics** > **Index Suggestions** > **Index Suggestions > To review**.
   b. In the Index Suggestions table, select the table associated with the index suggestion you want to open from the **Table Name** column.
2. In the Index Suggestions form, click **Export**.
   The index suggestion is downloaded as an .xml file with the file name `sys_index_suggestion_<alphanumeric identifier>.xml`. The file name has a unique alphanumeric string to differentiate it from other index suggestions.
3. In your non-production instance, navigate to **System Diagnostics** > **Index Suggestions** > **Index Suggestions > To review**.
4. In the Index Suggestions table under Related Links, click **Import Suggestions**.
5. In the Import XML form, choose the index suggestion file that you exported and click **Upload**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the import, the imported index suggestion appears in the Index Suggestions table on your non-production instance.

6. To continue the index evaluation process on your non-production instance, you can schedule the index suggestion for creation and test index performance.

Schedule a slow-query index suggestion for creation

Use the Index Suggestion Engine (ISE) to schedule an index suggestion for creation.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Diagnostics** > **Index Suggestions** > **Index Suggestions > To review**.
2. In the Index Suggestion table, select the table associated with the index suggestion you want to create from the **Table Name** column.
3. In the Index Suggestion form, select **Schedule Creation**.
4. In the Schedule Index Creation window, select the time that you want the index to be created and select **Create**.

   Note: If the index you want to create involves large tables, such as the Incident or CMDB table, index creation may take up to one hour or longer.

   - **Create now** —The Schedule Index Creation progress indicator window shows the progress of the index creation. When index creation is complete, click **Close**.
   - **Create later** —If you select this option, the state changes to Create Scheduled, and the index is created at the scheduled time. After the index is created, the index state changes to Evaluating Effectiveness.

   When the ISE creates the index at the selected time, it assigns an index name based on the tables used in the slow query.

5. Verify that the index was created by reviewing the index **State** in the Index Suggestion record or in the Index Suggestion table (**System Diagnostics** > **Index Suggestions** > **Index Suggestions > In Progress**).
   The Index Suggestion record shows the state, Evaluating Effectiveness. The ISE begins the 14-day index evaluation period.
6. During the evaluation period, you can monitor the index **State** in the Index Suggestion record or in the Index Suggestion table (**System Diagnostics** > **Index Suggestions** > **Index Suggestions > In Progress**).

Test index performance for slow queries

After the Index Suggestion Engine (ISE) generates an index suggestion for a slow query, you can test the index to see if it improves execution time. If you're evaluating an index suggestion on a non-production instance, you can run this test after creating the index to get immediate results on index performance.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

This test is an optional assessment of the index. The test isn't part of the 14-day index evaluation process that automatically occurs after you create an index.

Note: Index test results from your non-production instance might not necessarily predict similar performance results on your production instance.

Procedure

1. Open the Index Suggestion record for the index that you want to test:
   a. Navigate to **System Diagnostics** > **Index Suggestion** > **Index Suggestions > In progress**.
   b. In the Index Suggestions table, select the table associated with the index suggestion you want to view in the **Table Name** column.
2. In the Index Suggestion record, select **Test Performance** to start the performance test.
3. When the Test Index Suggestion progress indicator shows that testing is complete, select **Go to Result**.
4. In the Query Performance Test Results form, compare the **Average with index** and **Average without index** fields to see if the index improved the query time.

Query Performance Test Results

Field	Description
Index Suggestion	Name of the index suggestion.
Created	Date and time this performance test was run.
Average with Index (ms)	Query time using the index suggestion.
Average without Index (ms)	Query time before using the index suggestion.
Forced	Check box indicating whether the database is using the index. If this box is selected, the database is forced to use the index suggestion, but only for this test. If the box is cleared, the database is using the index.

5. Select the back arrow to navigate back to the Index Suggestion record for the table.
   The result of this index performance test doesn't change the index state recorded in the Index Suggestion record.

Drop a slow query index

You can drop an index for a slow query when the index isn't used by the database or doesn't improve query performance. You can drop the index immediately or schedule the drop for a later time.

Before you begin

Role required: admin

About this task

During the index evaluation period, the Index Suggestion Engine (ISE) might generate a recommendation to drop the index. A recommendation to drop an index is generated in the following cases:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The database doesn't use the index
- The index doesn't improve query execution time

Note: If you want to retain an index even though the ISE generates a recommendation to drop it, you can use the **Accept** option in the Index Suggestion record to continue using the index. Before using this option, contact Customer Service and Support for guidance.

Procedure

1. Navigate to **All** > **System Diagnostics** > **Index Suggestions** > **Index Suggestions > In Progress**.
2. In the Index Suggestions table, select the table associated with the index suggestion you want to drop in the **Table Name** column.
3. In the Index Suggestion record, select **Schedule Drop**.
4. In the Schedule Index Drop window, select the time when you want the index dropped and select **Drop**.

   Note: If the index you want dropped involves large tables, such as the Incident or CMDB table, dropping the index may take up to one hour or longer.

   - **Drop now** —The Schedule Index Drop progress indicator window shows the progress of the index drop. When the index drop completes, select **Close**. If the drop is successful, the Index Suggestion record shows the index state as Dropped.
   - **Drop later** —When you schedule the drop, the index state changes to Drop Scheduled. When the system drops the index at the scheduled time, the index state changes to Dropped.
5. Verify that the index was dropped by reviewing the index state in the Index Suggestion record or in the Index Suggestion table (**System Diagnostics** > **Index Suggestions** > **Index Suggestions > Done**).

Transaction cancellation

You can cancel transactions that take longer than expected to load. Canceling long-running transactions can help prevent excessive resource consumption.

Causes of slow-loading transactions include the following scenarios.

- Sorting a large number of records by an unindexed string field.
- Grouping a large table on a field that has predominantly distinct values.
- Exporting all rows from a large table.
- Testing a poorly scripted business rule that has an infinite JavaScript loop.

Transaction cancel timer

Note: You can’t cancel an import with these controls.

During a long-running transaction, a timer and a cancellation option appear in an alert banner.

To cancel the transaction, select the **Cancel** button. The alert message displays when a transaction cancellation is in progress and when the cancellation is completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Selecting **Cancel** stops only the transaction associated with the window or tab where the alert appears. It doesn't cancel transactions running in your other open windows or tabs.

If a slow transaction completes successfully, the timer indicates how long it took for the transaction to complete.

Canceled transaction logs

Canceled transactions appear in the transaction log with **CANCELLED** appended to the URL. Transactions canceled by a user are logged differently from transactions canceled by transaction quotas. For more information about canceled transaction logging, see Canceled-transaction logging to a table. For more information about transaction quotas, see Transaction quotas.

Properties for transaction cancellation

Administrators can configure the behavior of the transaction cancellation capability using the following properties.

Property	Definition	Location
com.glide.request_manager.active	Let users cancel long-running transactions (enabled by default).	Open the sys_properties table by navigating to **All** and entering `sys_properties.list`.
glide.ui.transaction.long_response.time	Delay in seconds before the cancel transaction button appears for a long-running transaction.	Navigate to **All** > **System Properties** > **UI Properties** and locate the field labeled **Delay in seconds before the Transaction Cancel button is displayed for a long-running transaction**.

View and kill active transaction

Administrators can view active transactions and kill long-running transactions.

Before you begin

Role required: admin

About this task

This action is intended to stop background processes, such as scheduled jobs, and not user-initiated transactions.

Procedure

1. If High Security Settings are enabled, elevate privileges to security_admin.
2. Navigate to the appropriate **Active Transactions** module.
   - To view and kill transactions on the current node for your instance, navigate to **User Administration** > **Active Transactions**.
   - To view and kill transactions on all nodes for your instance, navigate to **System Diagnostics** > **Active Transactions (All Nodes)**.
3. Find the transaction that you want to stop.
   The process to display the transactions is included in the list. Don't kill that process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Kill the transaction in one of the following ways:
   - Select and hold (or right-click) the record and select **Kill** from the available options.
   - Select the check box next to one or more records and select **Kill** from the **Actions on selected rows** drop-down menu.

Canceled-transaction logging to a table

The system logs canceled transactions to a table in addition to the transaction log.

Transactions canceled manually or by a quota rule are logged to the Transaction Cancellation Log [syslog_cancellation] table. The Transaction Cancellation Log is an extra debugging feature, and doesn't contain information on all cancellations.

Note: There are safeguards in place to help prevent infinite loops and issues related to synchronicity. Because of this, it's not always possible to log a cancellation to a database table.

You can find the Transaction Cancellation Log by selecting **System Logs** > **System Log** > **Transaction Cancellations**.

You can turn off canceled-transaction logging to a table by changing a property.

Canceled-transaction log property

Property	Description
glide.quota.manager.log.cancellation	Indicates whether canceled transactions are to be logged to the Transaction Cancellation Log table. Type: Boolean Default value: true Location: Add to the System Properties [sys_properties] table

Add a module to test connection speed

A connection test can indicate the connection speed between your computer and your instance. A connection speed test (/connection_test.do) is available as a UI page.

Before you begin

Role required: admin

Procedure

1. Perform the appropriate action for your version of the UI.

UI version	Steps
Core UI	**a.** Navigate to **System Definition** > **Application Menus**. **b.** Open the application menu to which you want to add the module, for example, **System Diagnostics**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI version	Steps
UI15	Select and hold (or right-click) an application menu, such as **System Diagnostics**, and se lect **Edit Application Menu** or the pencil icon.

2. Select **New** in the list of modules.
3. Complete the Module form using the following values:
   - **Title**: Unique name such as `Connection Test`
   - **Link type**: **URL (from Arguments)**
   - **Arguments**: `connection_test.do`
4. Select **Submit**.

Platform performance reference

Reference topics provide additional information about the forms that you use to manage performance for the ServiceNow AI Platform.

Default quota rules

Various transaction quota rules are available in the base system.

Fix Script Processor

Allows the fix script processor to run for four hours.

Presence

Cancels presence requests quickly when the system is busy.

REST Import Set API request timeout

Prevents inbound REST Import Set API transactions from running for longer than 60 seconds.

REST Table API request timeout

Prevents inbound REST Table API transactions from running for longer than 60 seconds.

AMB Transactions

Cancels AMB transactions lasting longer than the specified maximum duration. Applies to all AMB transaction types: message send and message receive.

Reference Completer

Stops the reference completer transaction after five seconds.

REST Aggregate API request timeout

Prevents inbound REST Aggregate API transactions from running for longer than 60 seconds.

Homepage Widgets

Prevents all homepage widgets from running longer than 30 seconds.

REST Attachment API request timeout

Prevents inbound REST Import Set API transactions from running for longer than 60 seconds.

UA Count Persistor Quota

Prevents UA count persistor scheduled jobs from running for more than one hour.

UI Transactions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cancels UI transactions that are two seconds away from the 5-minute server disconnect. ServiceNow datacenter load balancers display an internal server error (HTTP Error 500) to users after five minutes. This quota rule returns a transaction canceled page instead of an error. This rule includes an exception to prevent the cancellation of background scripts.

PA Diagnostics All

Prevents any Diagnostics transaction that originates outside the scope of the Diagnostics application from running longer than 30 minutes. Diagnostics transactions refer to executing a diagnostic, opening a Diagnostics form, or opening a Diagnostics list.

Normal transaction activities

Before setting transaction quotas, navigate to **User Administration** > **Active Transactions** to review the normal transaction activities for your instance. You can view and terminate long-running transactions if necessary. Over time, you can determine the normal transaction load for your instance and set your quotas to match these norms.

Transaction quota properties

An administrator can add the following system properties to manage transaction quotas.

Configuring Transaction Quota Properties

Property	Description
glide.quota.manager.heartbeat	The number of seconds between the start of each Quota Manager heartbeat. This value determines how often the Quota Manager checks for transactions that exceed a quota and how often it writes status in the log file. Type: Integer Default value: 1 Location: Add to the [sys_properties] table
glide.quota.manager.minimum_transaction_time	The minimum number of seconds a transaction must run before the Quota Manager matches it to a transaction quota. ServiceNow recommends setting this value to at least 1 second to avoid performance issues. For optimal performance, set this value to the value of your most restrictive quota. For example, if your most restrictive quota cancels transactions longer than 1 minute, set the minimum transaction time to 60 seconds. Type: Integer Default value: 1 Location: Add to the [sys_properties] table
glide.quota.manager.debug	Controls whether to display (true) or hide (false) additional debugging information

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring Transaction Quota Properties (continued)

Property	Description
	related to the Quota Manager. Debugging information includes running transactions, canceled transactions, and what quotas are matched to transactions. Type: True | False Default value: True Location: Add to the [sys_properties] table

Related topics

Add a system property

Transaction quota rule form

A description of the fields on the Transaction Quota Rule form.

Transaction quota rule fields

Field	Description
Name	A unique name to identify the rule.
Active	A check box that determines if this rule is active (selected).
Maximum Duration	The number of seconds a transaction has to complete before the quota cancels the transaction.
Maximum Business Rules	The number of business rules executions allowed.
Maximum Database Time	The total number of seconds for all SQL requests.
Maximum SQL Statement Time	The number of seconds a SQL statement can run.
Maximum Outbound Requests	The number of outbound HTTPs requests allowed.
Order	A number that represents the priority of the quota transaction in relation to other quotas. The transaction quota with the lowest timeout, the lowest order value, and matching conditions determines the applied quota policy.
Maximum Events	The number of sysevent inserts allowed.
Maximum Jobs	The number of sys_trigger inserts allowed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transaction quota rule fields (continued)

Field	Description
Maximum SQL Queries	The number of SQL queries allowed.
Maximum Outbound Request Duration	The number of seconds for an outbound HTTP request.
Description	A description of the transaction quota rule.

Transaction quota rule condition builder

A description of the options available in the condition builder for the Transaction Quota Rule form.

Field	Description
URL	The URL of the page.
Thread Name	The name of the execution thread that is running the transaction. Foreground threads have names like http-bio-8080-exec-1. Background threads can have various names, and are useful where the URL is not sufficiently descriptive.
Foreground	Whether the transaction was completed in the foreground or background: • **True**: a foreground transaction. • **False**: a background transaction.
Type	The type of transaction: • **List**: Any list transaction, such as incident_list.do. • **Form**: All forms, UI pages, CMS pages, and so on. • **XMLHttp**: Transactions that run through GlideAjax, where the URL is xmlhttp.do. • **Report**: The page `sys_report_template.do`. • **SOAP**: SOAP transactions. • **Export**: When a list is exported in a format such as XML or Excel. • **Scheduler**: When a scheduled job is performed. • **Text Search**: The text search transaction or any of its related operations. • **Other**: Any type that does not meet the qualities of another type. **Note:** Match the transaction quota **Type** to the transaction type listed in the Quota Manager log entry for the transaction.
User	The user performing the transaction.
Homepage	The homepage that is running. This condition is populated only if the URL is `home.do`.
Homepage Widget	The widget that is rendered in the transaction. When a homepage or non-responsive dashboard renders, each widget renders in parallel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	When a responsive dashboard renders, each widget renders in sequence. When the quota is exceeded, users see the message: `Widget cancelled - maximum execution time exceeded`. Increase the quota value if you don't want to show this message.
Attributes	Miscellaneous attributes that are related to the transaction.

Example system log messages

An example of system log messages for transactions.

- At every heartbeat interval, which is one second by default, the Quota Manager prints the running transactions:

```
2012-02-13 12:34:08 (096) glide.quota.manager SYSTEM
 URL= /incident_list.do?
sysparm_userpref_module=b55fbec4c0a800090088e83d7ff500de&active
=true&sysparm_query=active=true^EQ,
THREAD= http-bio-8080-exec-3, FG= true, TYPE= 1, STATE= 2,
 USER= null, TIME= 8,807, MEM= 0, ATTRIBUTES= {}
```

- Every time the Quota Manager matches a quota to a transaction, it prints a message similar to the following example:

```
2012-02-13 13:25:31 (900) glide.quota.manager SYSTEM
 QuotaFinder: Assigning quota
"TEST PROBLEM FORM" with filter:
 type=form^urlLIKEsys_id=46fb9e31a9fe198101492060c2a4f8cb^EQ to
transaction:
 URL= /problem.do?sys_id=46fb9e31a9fe198101492060c2a4f8cb,
 THREAD= http-bio-8080-exec-1,
FG= true, TYPE= 1, STATE= 4, USER= null, TIME= 1,121, MEM= 0,
 ATTRIBUTES= {}
```

- Every time the Quota Manager cancels a transaction, it prints a message similar to the following example:

```
2012-02-13 13:25:33 (930) glide.quota.manager SYSTEM WARNING
 *** WARNING ***
Transaction: Cancelling transaction /problem.do (maximum
 execution time exceeded):
Thread http-bio-8080-exec-1
```

Methods to add variable information to the cancellation message

You can use the following methods of the *jvar_transaction* variable to add information to the cancellation message.

Adding Variable Information to the Cancellation Message

Method	Description
getURL()	Returns the URL for the transaction.
getReason()	Returns the reason for page cancellation, localized to the user's language.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adding Variable Information to the Cancellation Message (continued)

Method	Description
getQuotaId()	Returns the sys_id of the quota rule.
getQuotaName()	Returns the name of the quota rule.
getRunTime()	Returns the total run time for the page up to this point.
getType()	Returns the type of transaction, such as form, list, report, other.
getUser()	Returns the sys_id of the user.
getHomepage()	Returns the sys_id of the homepage.
getHomepageWidget()	Returns the name of the homepage widget.

Application quota rule form

A description of the fields on the Application Quota Rule form.

Application quota rule fields

Field	Description
Name	A unique name to identify the rule.
Application	The scoped application's name. To change this field, use the application picker to change the application. This field cannot be Global.
Order	A number that represents the priority of the quota transaction in relation to other quotas.
Active	A check box that determines if this rule is active (selected).
Log only	When checked, transactions are not canceled by a quota violation, but entries are added to the local host log that indicate the transactions are violating the quota rule. An entry is added to the Transaction Cancellation Log where the log only field is set.
Maximum Events	The maximum number of events allowed during the update period.
Maximum Jobs	The maximum number of jobs allowed during the update period.
Condition	The conditions that determine when the transaction quota applies. The condition builder displays conditions that are only applicable to transactions. For example, Foreground is true.
Description	A description of the transaction quota.

Application quota condition builder

A description of the options available in the condition builder for the Application Quota Rule form.

Field	Description
Attributes	Miscellaneous attributes that are related to the transaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Created	When the transaction was created.
Created by	Who created the transaction.
Foreground	Whether the transaction was completed in the foreground or background: • True: a foreground transaction. • False: a background transaction.
Homepage	The homepage that is running. This value is populated only if the URL is `home.do`.
Homepage Widget	The homepage widget that is rendered in the transaction. When a homepage is rendered initially, each homepage widget is rendered in parallel.
Initial Scope Name	Scope where the method that created the transaction is defined. Setting this name to anything other than the selected application means that the rule is never used. The rule only looks at transactions of the selected application, and this value has the rule look for a different application, so the condition is never satisfied.
Scope Name	Scope of the application that called the method that created the transaction.
Sys ID	A sys_id of the transaction.
Thread Name	The name of the execution thread that is running the transaction. Foreground threads have names like `http-bio-8080-exec-1`. Background threads may have various names, and may be useful where the URL is not sufficiently descriptive.
Type	The type of transaction: • **List**: Any list transaction, such as incident_list.do. • **Form**: All forms, UI pages, CMS pages, and so on. • **XMLHttp**: Transactions that run through GlideAjax, where the URL is xmlhttp.do. • **Report**: The page `sys_report_template.do`. • **SOAP**: SOAP transactions. • **Export**: When a list is exported in a format such as XML, Excel. • **Scheduler**: When a scheduled job is performed. • **Text Search**: The text search transaction or any of its related operations. • **Other**: Any type that does not meet the qualities of another type. **Note:** Match the transaction quota **Type** to the transaction type listed in the Quota Manager log entry for the transaction.
URL	The URL of the page.
Updated	When the transaction was updated.
Updated by	Who updated the transaction.
Updates	What was updated.
User	The user performing the transaction.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application quota property

An administrator can add a system property to specify how often application quota rules are evaluated.

Application quota property

Property	Description
glide.quota.manager.cluster.update.seconds	Indicates the application quota update period in seconds. If this value is less than the glide.quota.manager.heartbeat property, the glide.quota.manager.heartbeat value is used. Type: Number Default value: 300 (5 minutes) Location: Add to the System Properties [sys_properties] table

Operational toggles form

A description of the fields in the Operational Toggles form.

Field	Description
Toggle Name	Unique name for the operational toggle.
Toggle ID	Toggle ID field that is inactive.
Short Description	Description of what function the toggle performs. **Note:** An example of this is a type-ahead search polling toggle that performs a type-ahead search every 10th keystroke.
Application	Scope that is to a specific application or is a global scope.

Run level toggle mapping form

A description of the fields in the Run Level Toggle Mapping form.

Run level toggle mapping form

Field	Description
System Run Level	Toggle level to associate the system run level with.
Toggle	Behavior of the toggle.
Toggle Level	Degree that the toggle operates.
Application	Scope of the toggle level to specific application or global.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Run level toggle mapping form (continued)

Field	Description
Value	Behavior of the run level. **Note:** An example of a value is as follows: 1 or every keystroke that the system performs a type-ahead search.
Exception Roles	Exception roles that the restrictions don't apply to. **Note:** An example of these exception roles is as follows: • activity_admin • activity_creator • admin

Operational toggle level form

A description of the fields in the Operational Toggle Level form.

Operational toggle level form

Field	Description
Toggle	The preexisting toggle that you want to create levels for.
Short Description	A brief description of the desired level's function.
Application	The scope that the toggle level will apply to. This could be either a specific application or the global scope.
Value	Behavior of the toggle level.

Transaction call chain register form

A description of the fields in the Transaction Call Chain Register form.

Transaction Call Chain Register form

Field	Description
URL	URL for the selected transaction.
Transaction Log	Transaction log ID created during the next occurrence of the URL. This field is empty when you first create the call chain register for a transaction.
Recorded	Check box that indicates if call chain recording has already taken place for this transaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transaction Call Chain Register form (continued)

Field	Description
	• This field is clear (**false**) when you first create the call chain register for a transaction. • **true** appears when the call chain is recorded during the next occurrence of the URL.
User	(Optional) If call chain recording should only take place when a specific user executes the next transaction occurrence, select the user ID. Leave it empty if you want call chain recording to occur regardless of user.

Transaction call chain form

A description of the fields in the Transaction Call Chain form.

Transaction Call Chain form

Field	Description
Source Table	Source table for the script resource executed in the call chain.
Source	Script resource executed in the call chain.
Persisted Sequence	Order in which the script executed in the call chain.
Call Depth	Depth of the executed call chain. For example, a script calling a script include, which in turn calls another script include would have at least three rows. One row has a depth of 1, the second row has a depth of 2, and the third row has a depth of 3.
Trigger Table	Name of trigger table, if any, for the executed call chain component.
Duration(ms)	Observed duration of the script execution, in milliseconds.
Transaction Log	Transaction log ID created for the recorded call chain.

Query record form fields

A description of the fields in the query record form.

Query record fields

Field	Description
Example	An SQL statement for an individual query, before being canonicalized to aggregate it with similar queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query record fields (continued)

Field	Description
Hash	The hash value for this record.

Example stack trace	A stack trace for an individual query. Lines referencing script code (includes both custom and base system code) appear in the following format:
	`table name.sys_id:line number`
	For example, this stack trace indicates a function call from line 119 of a script include.
	`sys_script_include.105f70abc0a8010300d4d79ed1b93eb0:119`
	For more information, see stack traces.

Example URL	The URL for an individual query, depending on how the query was called. • User transactions: lists the transaction parameters. For example, if a user navigates to the incident list, the URL is `/incident_list.do sysparm_query=active=true` • Scheduled jobs: lists the name of the scheduled job. • Any other method: lists an empty field.
First sighting	The first occurrence of a similar query.
Last sighting	The last occurrence of a similar query.
Total execution time	Total execution time.
Execution Count	The number of similar query occurrences that are aggregated.
Average execution time (ms)	The average duration to execute one of these similar queries.

Index suggestion form fields

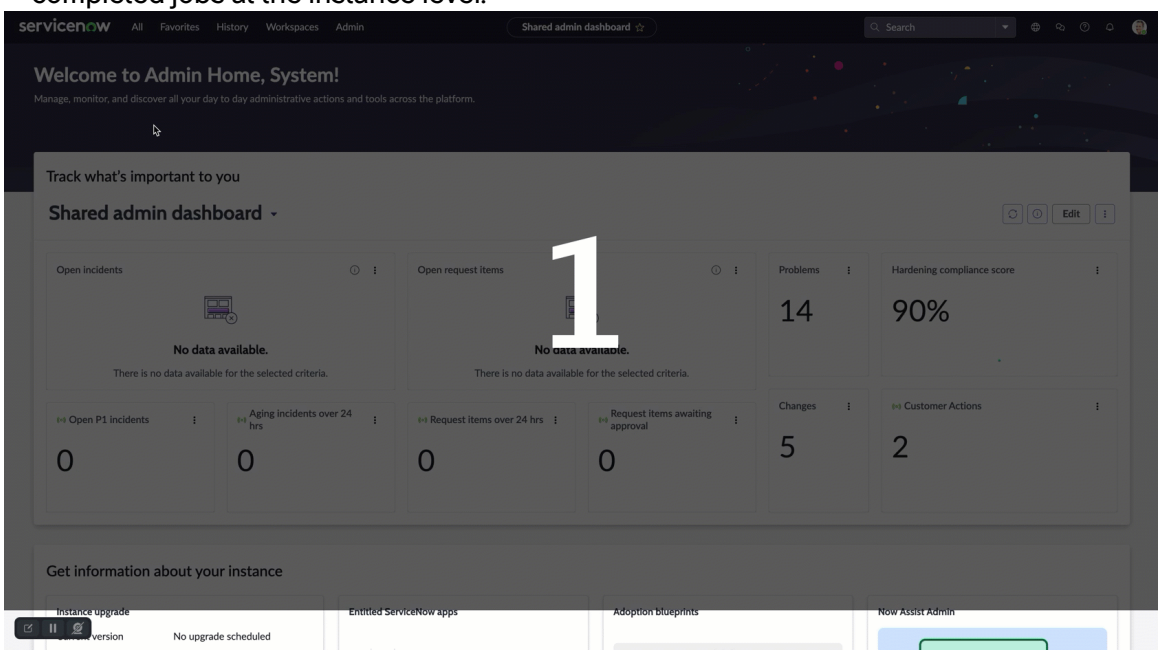
A description of the fields in the index suggestion form.

Index Suggestion fields

Field	Description
Slow query	The slow query for which the index suggestion was generated.
Example	An actual SQL statement for an individual query, before being canonicalized to aggregate it with similar queries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Index Suggestion fields (continued)



Field	Description
Table name	Name of the table used in the query.
Column names	Names of the columns used in the query.
Index name	Name of the index, assigned by the ISE after the index is created.
State	Processing state of the index. For details, refer to Index suggestions for slow queries to see index suggestion states and table.
Imported	This box, if checked, indicates that the index suggestion was imported from a different instance for evaluation and testing.

System Diagnostics

Review System Diagnostics to monitor the health and performance of your instance.

Use the following tools and modules to diagnose the health of your instance:

- System Events and Jobs Dashboard
  - System Events dashboard: Use the System Events dashboard to set the filters to display information about events on your instance.
  - Scheduled Jobs dashboard: Use the Scheduled Jobs dashboard to view the details of the completed jobs at the instance level.

- Stats Tools: Use Stats tools for performance evaluation by accessing the system activities statistics.

Stats Tools

To aid in performance evaluation, the Stats Tools records statistics for system activities that affect performance such as the execution of queries, scripts, and transactions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The Stats Tools plugin is activated by default. It requires the admin role to activate or upgrade, and it requires the com.snc.jrobin.

Stats Tools adds modules under **System Diagnostics** > **Stats**, including **Slow Queries**, **Slow Scripts**, and **Slow Transactions**. Each module accesses a table of activity patterns [sys_query_pattern], [sys_script_pattern], [sys_transaction_pattern]. Each pattern table represents a collection of unique activities. Each collection is an aggregation of executions of that unique activity over all time. Each record provides basic timing analysis with example identifiable details of the activity.

Note: To aid in debugging, you can filter most of these logs by application scope, limiting the transactions (for example, slow scripts or events) to only those transactions originating in specific scopes.

Activity patterns are immediately recorded to a cache and are later persisted to their pattern table. If you flush server caches, then recorded activities that have not been persisted are cleared. The following are examples of pattern records.

- Each time a query is executed that meets the recording and persistence threshold it is aggregated and stored as a query pattern record.
- Each time a particular business rule is executed it aggregates to a script pattern record.
- Each time a particular background job runs it aggregates into a unique transaction pattern record.
- Each click of the **New** button on the Incidents list counts as a list type transaction pattern with specific form action.

Metrics

Metrics include total and average times of interest per unique execution pattern over the total execution count. Metrics are aggregated with each new instance of the unique activity and persisted to the pattern record.

Metadata

Example data from specific executions are included on each pattern to identify execution details.

Characterizations of each activity type

Transactions	Any transaction type includes server-side and related client-side transactions. Metrics include **Total server load time**, which aggregates the total server-side time excluding semaphore and session wait times. It also aggregates relevant server transaction times that are found on the syslog_transaction table. Transaction types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(continued)

	• An HTTP Request transaction is identified by a URL, transaction type, processor, form/list action, URL query (filters), and related table name. • Any other transaction is identified by its transaction URL/page/name, transaction type, and processor or thread name.
Scripts	Any script activity type includes scripts evaluated by GlideScopedEvaluator. Script Types: • A Jelly Script is identified by the sys_jelly_file table, jelly file path, line number, and script that was executed. • Any other script is identified by the table and sys_id.
Queries	Any query activity includes prepared statements executed by GlideDBI. Query Types: All queries are identified by MongoDB query or insert, update, or select statements, as well as other components of the statement like selected columns, where clause, unions, column sets, and limits.

Slow mutex locks record detail

Administrators can use slow mutex logs to gain insight into how mutex locks are affecting platform performance.

Field	Description
Mutex name	The name of the mutex lock for this record.
Is Fast Lock	If **false**, the lock was placed on a record in the ServiceNow platform. If **true**, the lock was placed on a record in the underlying database.
Average execution time	The average time for which the mutex lock was held.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(continued)

Field	Description
2-hour moving average (ms)	The average of the moving average values of execution time, calculated over periods of two hours.
Day moving average (ms)	The average of the moving average values of execution time, calculated over periods of one day.
Month moving average (ms)	The average of the moving average values of execution time, calculated over periods of one month.
Execution count	The number of similar occurrences that are aggregated.
Last sighting	The time and date the last occurrence was noted.
First sighting	The time and date the first occurrence was noted.
Example stack trace	A stack trace for an individual mutex lock.
Total execution time	The sum of execution time for the aggregated occurrences.
Has	The hash value for this record.
Label	The mutex lock label.
Example URL	The URL for an individual mutex lock.
Event Execution Time / Event Count Trend graphs	The Mutex Execution Time Trend graphs show the total execution time of these mutex locks over the most recent period of two hours, one day, or one month. The Mutex Count Trend graphs show the mutex lock counts over the most recent period of two hours, one day, or one month.

Slow events log record detail

As an administrator, you can use Slow Events logs to gain insight into how events are affecting platform performance. To aid in debugging, you can filter slow event log detail by application scope, limiting events to only those events originating in specific scopes.

Field	Description
Event name	Name of the event for this record.
Queue	Event queue containing this event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(continued)

Field	Description
Event application	Application scope the slow event originated in. Global appears if the slow event originated in the global scope.
Execution count	Number of similar occurrences that are aggregated.
Average execution time (ms)	Average duration to execute the event in a single occurrence, in milliseconds.
Day moving average (ms)	Average of the moving average values of execution time, calculated over periods of one day.
Last sighting	Time and date the last occurrence was noted.
First sighting	Time and date the first occurrence was noted.
Hash	Hash value for this record.
Month moving average (ms)	Average of the moving average values of execution time, calculated over periods of one month.
Label	Label for the event.
Example URL	URL for an individual event.
Example stack trace	Example stack trace for an individual event.
Total execution time	Total sum of the event execution times for the aggregated occurrences.
Event Execution Time / Event Count Trend graphs	Event Execution Time Trend graphs show the total execution time of these events over the most recent period of two hours, one day, or one month. Event Count Trend graphs show the event counts over the most recent period of two hours, one day, or one month.

Slow scripts log record detail

As an administrator, you can use Slow Scripts logs to gain insight into how events are affecting platform performance. To aid in debugging, you can filter a slow script log by application scope, limiting scripts to only those scripts originating in specific scopes.

Field	Description
Label	Label assigned to the script.
Script source	Source of the script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(continued)

Field	Description
Script application	Application scope the slow script originated in. Global appears if the script originated in the global scope.
Average execution time (ms)	Average duration to execute the script in a single occurrence, in milliseconds.
Execution count	Number of similar occurrences that are aggregated.
Day moving average (ms)	Average of the moving average values of execution time, calculated over periods of one day.
Original application	Total sum of the script execution times for the aggregated occurrences.
Last sighting	Time and date at which the script was last executed.

Slow interactions log record detail

Administrators can use Slow Interactions logs to gain insight into how interactions are affecting platform performance.

Field	Description
Label	Label assigned to the interaction.
Average execution time (ms)	Average duration to execute the interaction, in a single occurrence, in milliseconds.
Execution count	Number of similar occurrences that are aggregated.
Total execution time	Total sum of the execution times for the aggregated executions of the interaction.
First sighting	Time and date the first occurrence was noted.
Hash	Hash value for this record.
Last sighting	Time and date the last occurrence was noted.
Example Java stack trace	Example stack trace for an individual event.
Window start	Start time
Window end	End time

Slow transactions log record detail

As an administrator, you can use Slow Transactions logs to gain insight into how transactions are affecting platform performance. To aid in debugging, you can filter transaction log detail by application scope, limiting transactions to only those transactions originating in specific scopes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Average execution time (ms)	Average duration to execute the transaction, in a single occurrence, in milliseconds.
Execution count	Number of similar occurrences that are aggregated.
Total execution time	Total sum of the execution times for the aggregated executions of the transaction.
Average client time (ms)	Average duration to execute the transaction on the client, in a single occurrence, in milliseconds.
Total client time (ms)	Total sum of the transaction execution times for the aggregated occurrences on the client, in milliseconds.
Origin application	Application scope the transaction originated in. Global appears if the transaction originated in the global scope.
Example type	Example transaction type executed.
Example processor	Example processor for an individual transaction.

Daily Slow Patterns

Daily Slow Patterns takes a daily rollup of platform performance-pattern data and computes day-over-day trend and anomaly signals for each pattern. You can then determine whether a query, script, or transaction pattern is increasing in frequency or duration over time.

Requirements

Accessing Daily Slow Patterns requires the admin role.

Daily Slow Patterns requires the Daily Stats Snapshot (com.glide.stats.daily_snapshot) plugin, which is not active by default. To activate it, navigate to **All** > **System Diagnostics** > **Plugins**, search for the plugin by its ID, and install it.

Access Daily Slow Patterns

To access Daily Slow Patterns, navigate to **All** > **System Diagnostics** > **Stats** > **Daily Slow Patterns**.

Note: There is no dedicated dashboard for daily slow patterns data. To analyze patterns across types, query the individual snapshot tables directly or build a custom report. For a list of the available tables, see Daily Slow Patterns tables and fields.

Processing overview

The platform tracks performance patterns in memory, including slow queries, scripts, transactions, mutex contention, events, and table I/O. The live pattern aggregates reflect only the totals accumulated since each pattern last reset, which can be minutes or months earlier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Daily Slow Patterns runs once per day. Rather than capturing a single live total, it computes what changed since the previous day and stores the result as a daily record. This lets you compare a pattern against its own history and identify whether its frequency or duration is shifting over time.

The feature also provides an on-demand comparison that computes a difference between any two points in time. For example, you can capture pattern state before a Discovery run starts and compare it against the state when the run completes.

Note: An on-demand comparison reflects all activity on the instance during the selected window, not the activity of a single process. Use it in controlled conditions where other instance activity is limited.

What data is stored

The daily snapshot tables store performance telemetry only. This telemetry describes how the platform performs, not the data that your users work with. Stored values include execution counts, durations, timing breakdowns, table and script identifiers, mutex and event names, query hashes, and the running-statistics values used to compute trends.

Important: The daily snapshot tables contain performance telemetry only. They don't contain business data or customer record data. This distinction supports audit and compliance responses, including FedRAMP and SOC responses, that classify these tables as operational telemetry rather than customer data.

Two fields are an exception to the telemetry-only classification, because both capture diagnostic samples verbatim from live traffic. The following table describes these fields.

Fields that can contain literal values from live traffic

Field	What it can contain
`daily_query_pattern.executable_sql`	A reconstructed, runnable copy of a sampled slow query. Placeholder values are replaced with the values passed at run time. If a query filtered on a literal value, such as a caller name or a case number, that value appears in this field.
`daily_pattern.url`	The request URL and the full dumped request parameters for the sampled transaction. Submitted form or record field values can appear here.

Access to all daily snapshot tables requires the admin role, which limits who can read these values. The values in these two fields are still real customer data after an admin can read them. If your compliance posture prohibits retaining literal record or parameter values, treat `executable_sql` and `url` as sensitive. Scope retention for them separately, even in admin-only tables.

Trend and anomaly signals

For each pattern, the daily snapshot computes a z-score, a significance value, and a deviation value, along with a percentile rank for each. These values help you find and confirm patterns whose behavior changed. The following list describes what each value tells you:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Z-score: how statistically unusual today's value is for a pattern, measured as the number of standard deviations from that pattern's running mean. A value near 0 is typical, and values further from 0 are more unusual.
- Significance: an operational impact score that combines the z-score with how much of the metric happened that day. Sort or filter on significance to find what changed today.
- Deviation: how far today's value falls from the pattern's running mean, expressed in the metric's own units.

Each of these values comes in three variants that track different questions about the same pattern: a per-call average, a daily total, and a daily count. The variants can move independently. For example, a pattern that runs far more often than usual changes the count variant. If each run takes its typical time, the average variant stays near 0.

Data accumulation and reliability

The reliability of z-scores, deviation, and significance rankings increases as more daily snapshots accumulate for a pattern.

Note: Z-scores, deviation, and significance rankings aren't meaningful until enough daily snapshots have accumulated after installation. On a newly installed instance, no history exists yet, so these values can't describe a pattern's real variability.

The following points describe how the values behave over time:

- On the first day a pattern is seen, no variance can be measured yet, so deviation is 0 and the z-score is 0 by definition.
- For the first several days, the running standard deviation is based on very few samples and is statistically noisy. A single unusual day can move the mean and deviation disproportionately.
- The platform doesn't enforce a fixed warm-up period. As a practical guideline, treat z-scores and significance rankings as informational rather than actionable until a pattern has accumulated at least several weeks of daily snapshots.

Daily Slow Patterns tables and fields

Tables and fields that Daily Slow Patterns populates with per-day performance telemetry, including trend, anomaly, and I/O tracking data.

Daily slow patterns tables

Daily Slow Patterns populates a set of tables that store performance telemetry. For an overview of how the snapshot works, see Daily Slow Patterns. The following table describes each table.

Daily slow patterns tables

Table	Description
Daily Pattern [daily_pattern]	Base table for daily pattern snapshots. Includes the running-statistics values used to compute trends.
Daily Query Pattern [daily_query_pattern]	Daily snapshot of slow query patterns.
Daily Script Pattern [daily_script_pattern]	Daily snapshot of slow script patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Daily slow patterns tables (continued)

Table	Description
Daily Transaction Pattern [daily_transaction_pattern]	Daily snapshot of slow transaction patterns.
Daily Mutex Pattern [daily_mutex_pattern]	Daily snapshot of mutex contention patterns.
Daily Event Pattern [dailyevent_pattern]	Daily snapshot of event patterns.
Daily IOStats [daily_iostats]	Per-table daily changes for gets, inserts, updates, deletes, and selects, and their timings. This table is turned off by default.

Table I/O tracking property

The Daily IOStats [daily_iostats] table is turned off by default. It's controlled by the *`com.glide.stats.daily_snapshot.diff_iostats`* system property, which defaults to `false`.

Table I/O tracking property

Property	Description	Default
`com.glide.stats.daily_snapshot.diff_iostats`	Turns daily table I/O trend and anomaly tracking on or off. Set this property to `true` to populate and analyze `daily_iostats`.	`false`

While the property is `false`, daily snapshot runs skip `daily_iostats` entirely. No rows are created or compared, and any rows left over from a period when it was turned on are cleaned up automatically. The z-score, significance, and running-counter fields apply to `daily_iostats` only after you turn the property on.

Average, total, and count variants

Each trend value comes in three variants, distinguished by a field-name suffix. The following table describes each variant and the question it answers.

Trend value variants

Field suffix	Column label	Tracks	Question it answers
None	(avg)	Per-call average duration	Did each run get slower or faster than usual?
`_total`	(no modifier)	Total duration for the day	Did this pattern consume more or less total time today?
`_count`	(count)	Execution count for the day	Did this pattern run more or less often today?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The field-name suffix and the column label are inverted by design. The field with no suffix carries the **(avg)** label, and the field with the `_total` suffix carries the unqualified label. When you build a report or filter on these columns, check both the field name and the column label rather than assuming one from the other.

The Daily Transaction Pattern [daily_transaction_pattern] and Daily IOStats [daily_iostats] tables repeat this three-way split once for each tracked dimension, such as `business_rule_time`, `sql_time`, and `cpu_time` for transactions, or `gets`, `inserts`, and `selects` for I/O. Each column is a combination of a dimension and a variant, not a separate metric to understand on its own.

Internal running counters

To compute deviation and z-score across days, the platform carries forward internal running counters from the previous snapshot. These fields include `welford_weight_sum`, `welford_day_count`, `welford_m2_accumulator`, and `overall_average`, along with their total, count, and per-dimension variants.

Note: The running-counter fields are intermediate values that the platform uses to compute the next day's snapshot. Their raw values aren't meaningful on their own, so don't surface them on dashboards or reports. The values meant for use are deviation, z-score, significance, and their percentile ranks.

Using ServiceNow AI Platform upgrade tools

Get the latest in ServiceNow® products and services on the ServiceNow AI Platform®. The system helps you plan for updates, and monitor and work with your applications before, during, and after upgrading.

Upgrade Center	Upgrade Console
	
Plan and manage all your upgrades in one place, past and present, with data visualizations, upgrade histories, and more.	Streamline upgrades with a single destination for tools, insights, and progress tracking.

Upgrade Center

Plan for all your upgrades on the ServiceNow AI Platform, and get clear oversight of the process at every step. The Upgrade Center includes multiple options for each aspect of your upgrading plan. Explore various updates available to your infrastructure with Upgrade Preview, including detailed insights before actually upgrading. Visual task boards (VTB) in the Upgrade Center give you all the necessary info to manage your workflow post-upgrade, and past updates are detailed with the Upgrade History module. Tie it all together with the Upgrade Monitor to plan, schedule, observe, and debug upgrades.

See Upgrade Center.

Upgrade Preview module

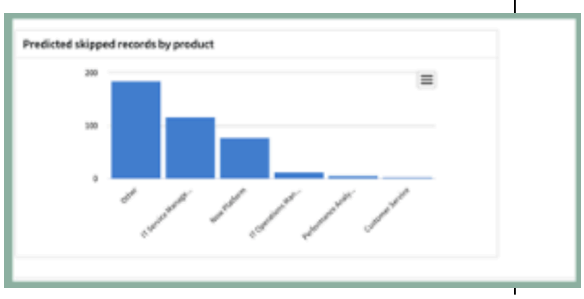
The Upgrade Preview module enables you to have an unprecedented insight to an instance prior to an actual upgrade. You can explore and preview upgrades to different ServiceNow release versions and see how your instance might be impacted with your current configurations. The Upgrade Preview utility helps you to plan, schedule, and prepare for an upgrade.

The preview status info and link in the message displayed on top of the Upgrade Preview page states the current status of the ongoing preview process. Because you can get an accurate prediction on the new and existing applications and their skipped records, the preview execution time has increased considerably. Select the link in the message to see the status of the preview process.

The Execution Tracker record displays when you select the progress link in the message. Select Show status related list to show the current status of the executed preview process.

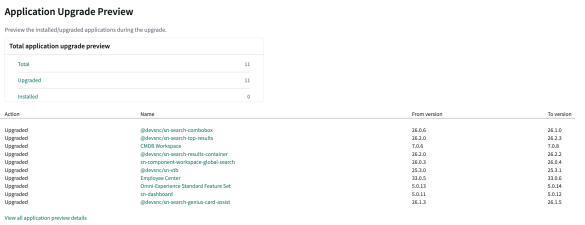
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Depending on the eligibility of your instance, the list of available target versions for preview varies. Only versions that are allowed for a particular instance to be upgraded to, show up on the list. If your instance is not eligible to be upgraded to any version, the drop-down menu is empty.



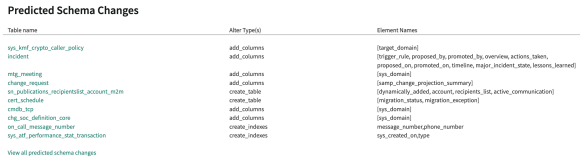
The following cards display with more information.

Card names	Description
Current version	Name of the current version. • Upgraded on: Date on which the instance got upgraded to the current version • End of life: Link to KB0610454 for more information about end of life
Previewing version	Information about the previewing version displays. If you haven't previewed any version, you are expected to select a version for preview and select **Go**. If you have already previewed a version, the following information displays. • Preview created: Date on which the preview was created • View preview details: Link to the Upgrade Preview form **Note:** Select **Refresh preview** if you want to regenerate a new preview of the same target version. Although selecting **Refresh preview** regenerates the skipped list, the reverted records won't get skipped. If you have reviewed and retained some records, they get replaced as soon as you select **Refresh preview**.
Scheduled upgrade	Name of the next upgrade that has been scheduled to start. If there is no currently scheduled upgrade, the card shows No upgrade scheduled. **Note:** This card can have different messages depending on the schedule of the upgrade. If there is an upgrade scheduled, the following information displays.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	• Estimated upgrade duration: Estimated duration needed to complete the scheduled upgrade. **Note:** If this is your first upgrade, there will be no information about estimated upgrade duration. • Next scheduled upgrade: Date and time on which the next upgrade has been scheduled to start.
Find out what's new and changed	Links to view the new and changed features in the current upgrade version. The following three links show up when you select **Go** to preview the upgrade version. • Problem fixes: Fixes that have been made since the last upgrade version • Personalized release notes: Release notes summary for the previewed version • Known error articles: Errors that have been identified but not yet resolved **Note:** These links don't show up if you haven't previewed any upgrades.
Skipped list prediction **Note:** If you are using Upgrade Plan, the card name changes to Skipped list prediction with plans.	Information about the predicted skipped records. See Preview predicted changes for more details. • Total record changes: Total number of records that are predicted to change when the upgrade occurs. Total record changes also include possible predicted skipped files known as Predicted skipped records. Review changes: Link to the list of records that have changed and can be reviewed. • Predicted skipped records: Total number of records that have been predicted to be skipped. ○ Total: Total predicted skipped records ○ To review: Predicted skipped records to be reviewed ○ Reviewed: Predicted skipped records that have been reviewed



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	○ Resolved: Predicted skipped records that have been resolved by implementing the rules **Note:** This entry shows up on the card only when rules are executed on the skipped records. You will also see a link to create a skipped record rule if either there are no existing rules or the existing rules aren't executed. **Note:** Skipped record rules and upgrade plans can't be implemented together. See Execute a skipped record rule automatically for more information. • Predicted skipped records by priority: Pie chart to represent the predicted skipped records by priority. **Note:** Select the pie chart to see the list of predicted skipped records. ServiceNow prioritizes the skipped records based on the importance of the file types. The prioritization is done as follows: ○ Priority 1 (highest priority): UI pages, UI macros, and more ○ Priority 2: Business Rules, Security ACLs, and more ○ Priority 3: Reports and more ○ Priority 4: Form Sections, Choice Sets, and more ○ Priority 5 (lowest priority): everything else
Predicted skipped records by product	Records that have been predicted to be skipped and are sorted as per their product families. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	Note: The products sorted under the Other category don't have any specific product family.
Application Upgrade Preview	Accurate prediction on the installs and upgrades for new and existing applications and for their specific skipped records. It states the total number of applications that have been either upgraded or installed. **Note:** The skipped records prediction is reflected on the Predicted skipped records by product card.  By default, 10 applications preview details show up. Select View all applications preview details link to view the entire list. It states the name of the application and the following information: • Action: The action taken on the specific application. It can either be upgraded for the existing applications or installed for the new applications. • From version: States the previous version of the upgraded application (existing application). **Note:** This field is empty if the application is a newly installed application. • To version: States the current version to which the existing application has been upgraded. **Note:** This field shows the current version of the newly installed application.
Predicted Schema Changes	Prediction about the kind of changes in the database based on the upgrade on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	 By default, 10 predicted schema changes show up. Select View all predicted schema changes link to view the entire list. Changes like new columns, new tables, and new indexes are captured in this section.
Automated Test Framework (ATF) results	Percentage of passing ATF tests that ran in the last 30 days. • Most recent ATF run: Date and time on which the recent ATF tests ran • View ATF results: Link to show more information about the recent ATF results **Note:** Only the tests which are finished and have passed are considered for the ATF results. If one test runs more than once, only the recent execution is considered in the results.

Upgrade Monitor module

Schedule an upgrade and monitor the status of an ongoing upgrade using the Upgrade Monitor module. You can also view the upgrade summary and the list of records causing conflicts in your instance once the upgrade is complete.

Access Upgrade Monitor

If you log in with the admin role while an upgrade is underway, the system automatically displays the Upgrade Progress screen. If no upgrade is in progress, you can navigate to **All** > **Upgrade Center** > **Upgrade Monitor**.

How the Upgrade Monitor fits into the upgrade process

Note: For detailed information about the upgrade process, see Upgrade your instance.

The Upgrade Monitor concerns only part of the larger upgrade process:

1. Clone the production instance to a test instance and a non-production instance.
2. Apply the upgrade to the non-production instance.
3. On the upgraded non-production instance, process the skipped list.
4. Test the non-production instance to confirm that the instance still works and performs adequately. Compare to benchmark data from pre-upgrade production instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Apply the upgrade to the test instance. Import the update sets created on the non-production instance when you processed the skipped list. Repeat the testing to make sure that the process is working.
6. Apply the upgrade to the production instance. Import the update sets created on the non-production instance when you processed the skipped list. Test to confirm that the instance works and performs adequately.

Within this larger process, the Upgrade Monitor helps you upgrade individual instances:

- During the upgrade, it shows where in the process the system is
- After the upgrade, it reports what the upgrade did and for how long
- As you upgrade the first non-production instance, it helps you resolve conflicts between customizations and changes that are part of the upgrade
- On non-production instances, it provides information that can help you estimate how long the upgrade might take on the production instance

Monitoring an individual instance as it upgrades

While the upgrade is in progress the Upgrade Progress shows what the upgrade process has done, what it is doing, and what remains to be done.

When the upgrade completes, the system displays the Upgrade Summary Report. The Upgrade Summary Report provides information about conflicts between customizations versus changes in the upgrade and provides a link to reconcile these conflicts. For information about understanding and resolving these conflicts, see Process the skipped records list.

When you upgrade a non-production instance, the Upgrade Summary Report can help you estimate how long the same upgrade might take on a production instance. For details about the elements on this report and how to use this information, see Upgrade Details form.

Resolving conflicts

To prevent losing customizations, the system skips upgrading records you have customized and provides you with a list of these skipped records.

As you upgrade your first non-production instance, go through the Skipped Changes to Review related list and resolve these conflicts. The system records the changes you make during this process in update sets. See Review skipped records using related lists, for more information.

You do not need to reconcile the skipped list on any instances you later upgrade. Instead, you can apply the upgrade then import the update sets containing your changes.

For details on reconciling conflicts, see Process the skipped records list.

Factors affecting upgrade duration

Various factors affect how long the system takes to perform an upgrade. The Upgrade Monitor on non-production instance can help you understand those factors and estimate how long the upgrade to your production instance takes.

Many factors can affect the duration of the upgrade process:

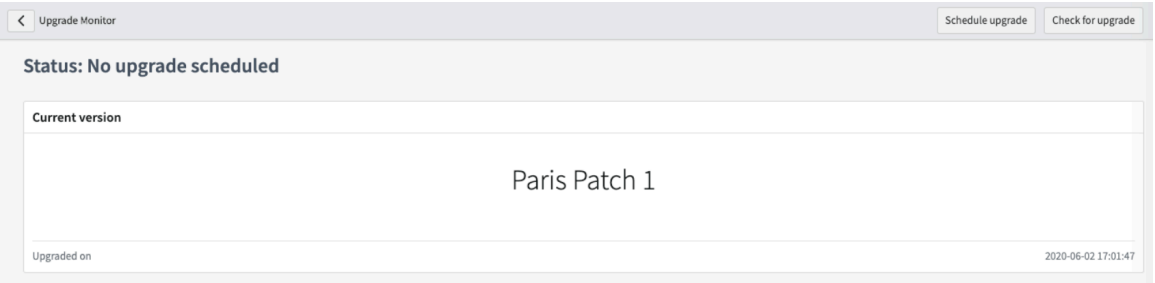
- The number of records in the database
- The number of customizations in the database
- The number of nodes in the instance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The size of tables in the instance that require a schema-change in the instance
- The number of fix scripts required and the size of the tables those fix scripts manipulate

Upgrading a non-production instance can help you estimate how long the upgrade takes on production, but differences between the instances can significantly affect the duration:

- When you cloned the production instance to the non-production instance, you may have clone-excluded some tables. This reduces the size of the database and makes the non-production instance upgrade faster than the production instance.
- The production instance may have more memory and processing power.
- The production instance may have more nodes than the non-production instance.



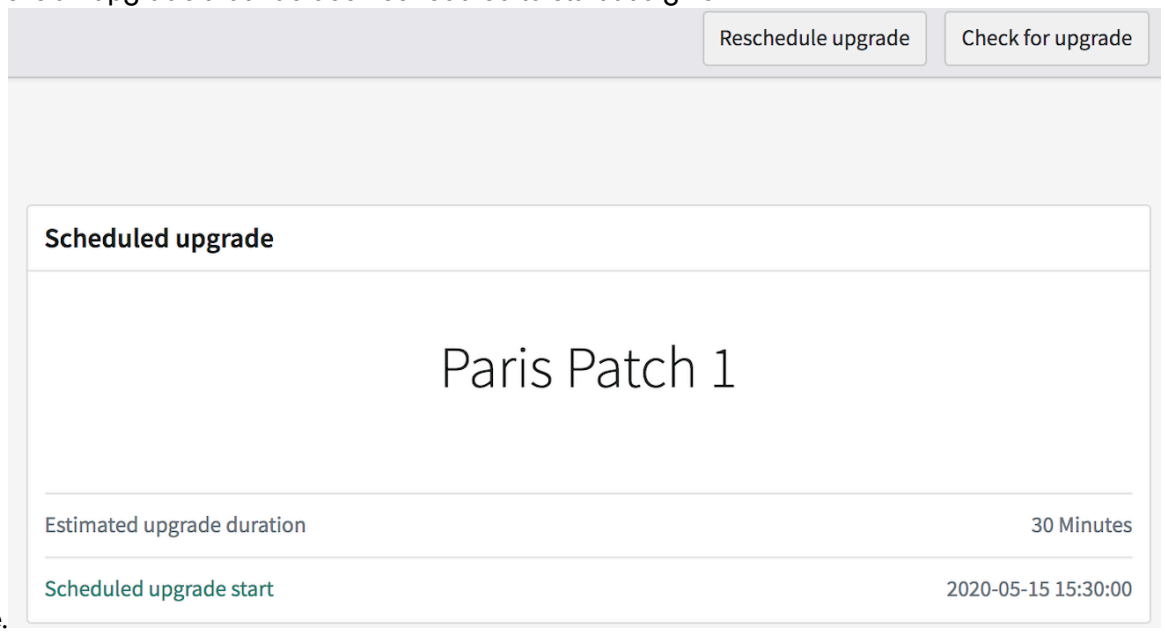
After upgrading the first non-production instance, examine the Upgrade Summary Report for data to help estimate the impact of these factors.

Upgrade Monitor schedule states

When an upgrade is scheduled, the Upgrade Monitor displays information about the next scheduled upgrade. It displays the date and time when the next scheduled upgrade will start. If there is no upgrade scheduled, the Upgrade Monitor displays **Status: No upgrade detected**.

No upgrade scheduled

There is no upgrade that has been scheduled currently.

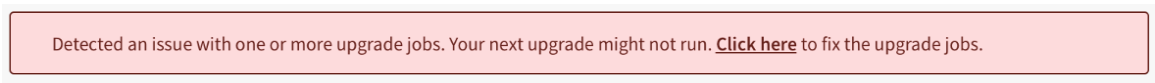


You can also schedule an upgrade by selecting **Schedule upgrade**. To check for an immediately available upgrade, select **Check for upgrade**. It also shows the current version of your upgrade and the date it was upgraded on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade scheduled

There is an upgrade that has been scheduled to start at a given time.



You can also reschedule the upgrade by selecting **Reschedule upgrade**. To check for an immediately available upgrade, select **Check for upgrade**. By selecting either **Reschedule upgrade** or **Schedule upgrade**, you will be directed to HI Upgrade Wizard.

Upgrade monitor with issue detected

If one or both of the triggers for upgrading the system ('Check distribution for possible upgrade' and 'Check database for possible upgrade') have been customized or are missing, the Upgrade Monitor displays a warning and provides a button for resolving the issues.

Note: If your instance is self-hosted (not hosted by ServiceNow) this message may not necessarily indicate a problem. If you have customized or disabled the upgrade job and want to keep that customization or disabled state, do not select the button to fix the upgrade issue.

To resolve the issues with the upgrade jobs, select the link in the message. This action reverts both upgrade triggers ('Check distribution for possible upgrade' and 'Check database for possible upgrade') to their base versions.

Note: 'Upgrade' job has been renamed to 'Check distribution for possible upgrade' starting Paris. 'Check Upgrade Script' job has been renamed to 'Check database for possible upgrade' starting Paris.

Upgrade Plan overview

Accelerate your upgrades using the Upgrade Plan that automates the installation of applications during upgrades, giving you a seamless upgrade experience. It helps you define applications and target versions to be installed in your instance.

Navigate to **All** > **Upgrade Center** > **Upgrade Plan**.

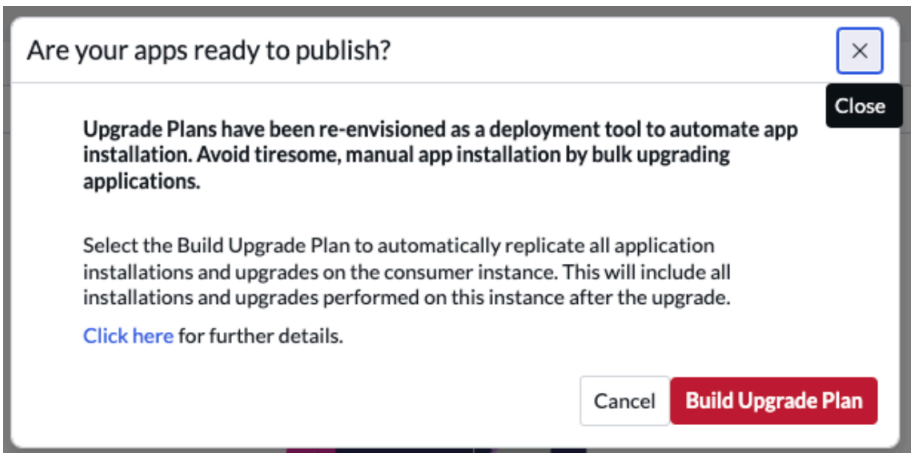
You will need the following instances to use Upgrade Plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Builder instance: Build your upgrade plan
- Consumer instance: Implement your created upgrade plan

Note: Ensure that you have upgraded your instance to the latest available version to build the upgrade plan. It is recommended to configure your dev instance as your builder instance. You are required to install the upgrade plan before upgrading your consumer instance. See Upgrade Plan Properties for more details.

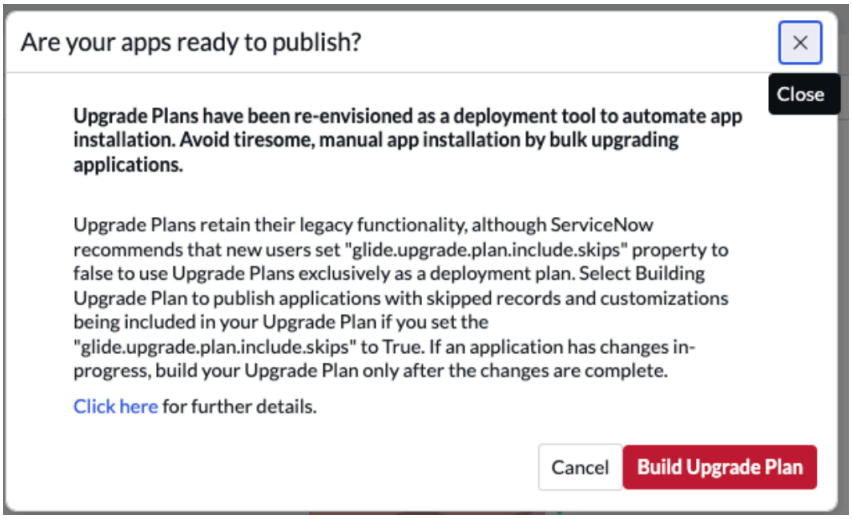
When you upgrade an instance, resolutions are skipped, and customizations are often loaded post upgrade. This causes temporary breakdown of features until fully loaded. Tasks like committing update sets, installing new plugins and applications, and multiple update are also time consuming. Use the Upgrade Plan feature to automate these post-upgrade tasks by tracking your actions and replay the steps on all the required instances. You don't have to manually apply post-upgrade tasks which helps in reducing downtime.



Note: After upgrading to the latest version, you will see some skipped records. Some of those records will already be marked as reviewed and some of them will need to be reviewed.

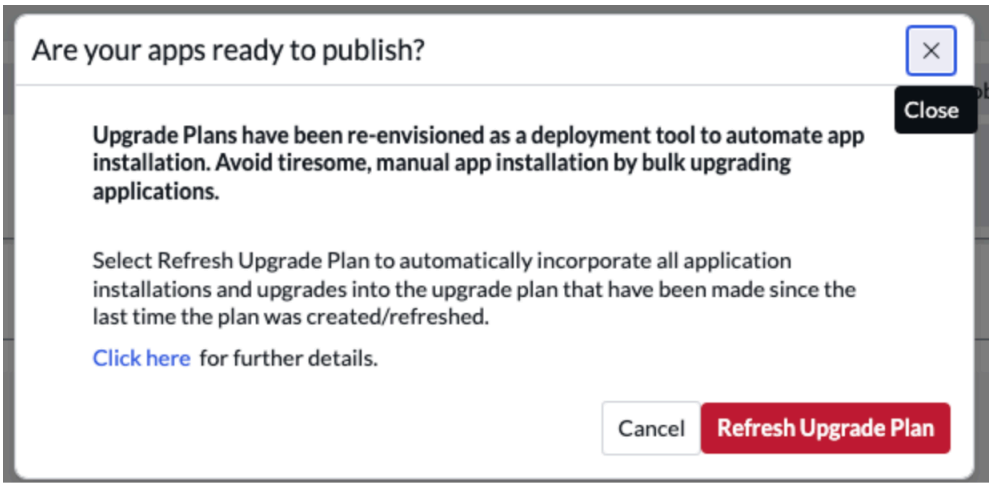
Starting Yokohama release, customizations and skipped records are not a part of the Upgrade Plan, by default. You can choose to include the customizations and skipped records along with the app installations within the Upgrade Plan by enabling the glide.upgrade.plan.include.skips property. This property controls about when skips and customizations are included when you build or refresh an Upgrade Plan.

- When glide.upgrade.plan.include.skips property is **TRUE**, skips and customizations are included when an Upgrade Plan is built or refreshed
- When glide.upgrade.plan.include.skips property is **FALSE**, skips and customizations aren't included when an Upgrade Plan is built or refreshed. This property has been set to False by default.

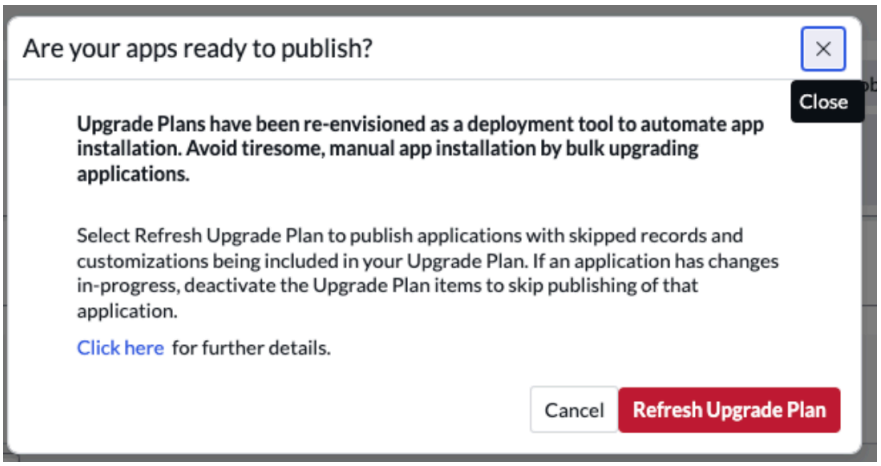


You will see one of the following modal messages depending on the scenario:

- First time user: When you are building your Upgrade Plan for the first time (the property is disabled by default)



- Building the upgrade plan with the property enabled



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Refreshing the Upgrade Plan with the property disabled (default)

- Refreshing the Upgrade Plan with the property enabled

Advantages of Upgrade Plan over Update Sets

You can achieve the following using Upgrade Plans:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Along with the skipped record resolution, you can also track app and plugin installation

  Note: You won't be allowed to choose the skipped records that are captured by the upgrade plan. Upgrade plan captures all the skipped records regardless of whether they are reviewed or not and modified or not. If the customizations are coming from different instances, then the skipped records are required to be reviewed.

- Optimizing the table alters using batch bootstrapping
- Manage your customizations using the App Repository

Note: It is recommended to build an Upgrade Plan for each instance upgrade. When you build an upgrade plan on a builder instance, it gets created to the exactly same as the builder instance version (including patches and hot fixes). You can't use the previously created Upgrade Plan for the new instance upgrade. In case of consumer instances, when you install the upgrade plan, its version should match exactly the consumer instance version.

Persona

If you are using the app repository for active application development, use Upgrade Plan to accelerate your upgrades.

Note: If you are currently using the Update Sets and want to catapult your upgrade process, use the Upgrade Plan feature.

Design considerations

The following are the important considerations while working with Upgrade Plan:

- Each new instance upgrade requires its own upgrade plan. It can't be shared across upgrades.
- Only one builder instance is supported to build the Upgrade Plan
- Upgrade Plan can't be uninstalled on a consumer instance. You can rollback the entire upgrade but not partially.
- The scope of the files moved to **Global Customizations - Upgrade Plan** application by upgrade plan is still global
- During an upgrade, only the upgrade plan items with **State=Ready** and **Active=true** are installed on the consumer instances. The rest of the items are skipped.
- Upgrade sets can't be included in the Upgrade Plan
- Maint only plugins are not allowed in Upgrade Plan
- Configure your instance as a builder instance before installing new applications and plugins or during skip resolutions. Otherwise, the actions are not captured by the Upgrade Plan.
- You can't view the list of customizations in the Upgrade Plan items view. You can navigate to the respective tables to ensure if the customization has been captured.

See KB1271313 for more information.

Upgrade Plan background operations

During the building of the upgrade plan, the following operations are done at the background:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Skipped records are packaged and uploaded to the App Repository in the form of Global Application and App customization. The following are the 3 types of apps created by Upgrade Plan on your instance and App Repo.

  Note: After the packaging is done, you can choose the items from the Upgrade Plan. An Upgrade Plan works at the scope level, so it captures everything and publishes it to the repository.

  - The global records are packaged into the global customization upgrade plan app and published to the app repo
  - The scoped skipped records are packaged into the respective app customization packages
  - When the upgrade plan is published, a global application is created, for example, **Upgrade Plan - release name**
- Existing ServiceNow features like Global Application and App customization are used as application containers that can be installed in all the required instances. See and Application scope for more information.
- If you install any applications or plugins, they are also captured in the Upgrade plan. But, since they are application life cycle items, they are never pushed to the App Repository.

During the consumption of the upgrade plan, the following operations are done at the background:

- At first the upgrade plan is validated and then the source from the app repo is downloaded
- Once the source is downloaded, the app is moved to the ready state

  Note: Only the upgrade plan items with **State=Ready** and **Active=true** are installed on the consumer instances. The rest of the items are skipped.

- Auto-generation of the preview for the upgrade plan

Upgrade History module

The Upgrade History module tracks every upgrade made to an instance. You can also view the complete report of an old upgrade or a recently completed upgrade version using this module.

To view an upgrade history record, navigate to **All** > **Upgrade Center** > **Upgrade History** and select an upgrade from the list. On selecting an upgrade from the list, the System Upgrades form appears.

System Upgrades form details

Field	Description
From	Name of the previous .war file (version).
To	Name of the applied .war file (version).
Upgrade started	Time stamp when the upgrade process began.
Upgrade finished	Time stamp when the upgrade process was completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade History Details form section

Field	Description
Changes skipped	Total number of records that are different from the previous upgrade and the upgrade component was not applied, mostly due to customization.
Changes applied	Total number of changes that are applied as a part of this upgrade **Changes applied** is sum of updated and different records, added to the number of deleted records (where the value of changed is true) added to the number of inserted records (where the value of changed is true).
Changes processed	Total number of records that were processed as a part of this upgrade. Changes processed is the sum of **Changes skipped** and **Changes applied**.
Copies to review	Total number of copied records to review whose base records have been upgraded

Select Skipped Record VTB related link to view and manage skipped records over VTB. See Skipped Records visual task board (VTB) for more information.

Select View Upgrade Plan History related link to view the details of the upgrade plan configuration. See Upgrade Plan overview for more information.

Select View Upgrade Summary Report related link to view the summary of an older upgrade over Upgrade Monitor module.

See Review skipped records using related lists for more information about related lists.

Using Upgrade Center

Use different features in Upgrade Center for previewing, scheduling, and monitoring your upgrade experience. You can also review and track every upgrade made in your instance using the Upgrade History module.

- Previewing your upgrade: Get an insight into your upgrade experience for different ServiceNow release versions and see its impact on your current configurations.
- Scheduling and monitoring your upgrade: Monitor the status of an ongoing upgrade using the Upgrade Monitor module. You can also schedule an upgrade using this module.
- Reviewing your upgrade history: Track an upgrade and review its reports using the Upgrade History module.

Previewing an upgrade

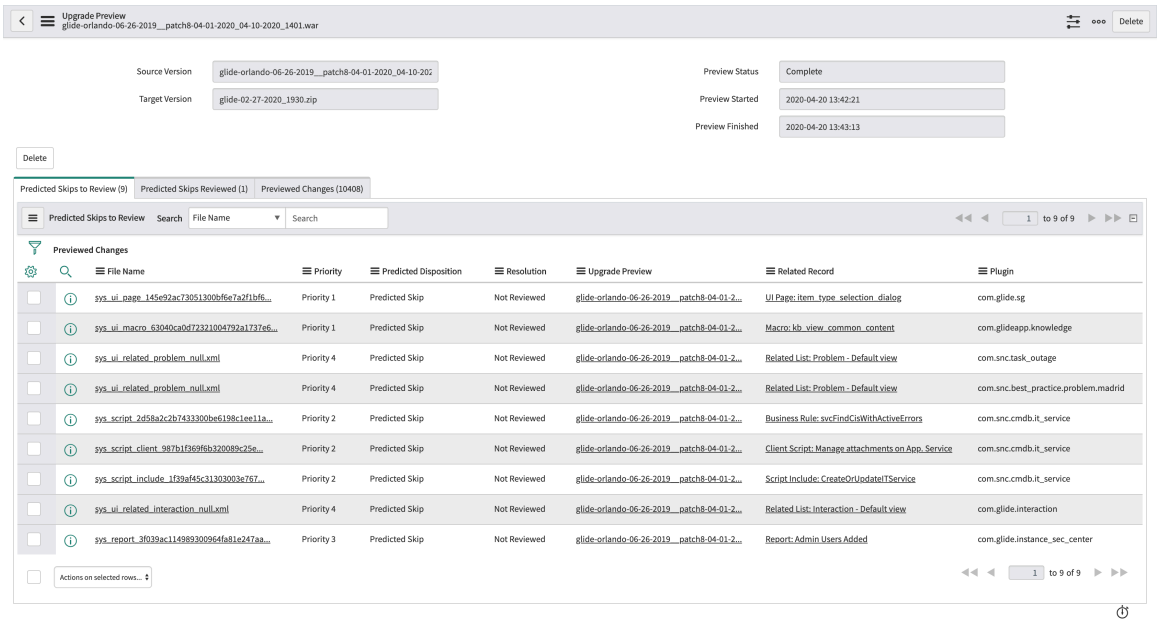
Use the Upgrade Preview module to have an insight about the experience of an upgrade prior to the actual upgrade. You can explore and preview upgrades to different ServiceNow release versions and see how your instance might be impacted with your current configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Preview predicted changes: Preview the changes that have been predicted to occur after an upgrade.
- Upgrade Preview form: Alternate view of a previewed upgrade.

View previewed upgrade

Use the Upgrade Preview form to have an alternate view of a previewed upgrade.



Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Preview module**.
2. Select the target version to be previewed.
3. Click **Go** or **Refresh Preview** to run the selected preview.
4. Click **View preview details** on the **Previewing version** card to view the following related lists.
   - **Predicted Skips to Review related list**: The Upgrade Preview process informs you about the customizations that are predicted to be skipped during an upgrade. The upgrade preview process the skip files that have been customized. Predicted Skips to Review lists all the skipped files that haven't been reviewed yet.
   - **Predicted Skips Reviewed related list**: Predicted Skips Reviewed related list displays the records which have previously appeared on the Predicted Skips to Review related list and have been reviewed. When you select a skipped record to review and the **Resolution Status** has been set to a value other than **Not Reviewed**, the updated record moves to the Predicted Skips Reviewed related list.
   - **Previewed Changes related list**: Previewed Changes related list gives the total number of records that are predicted to change when the upgrade occurs. Total record changes also includes possible predicted skip files known as Predicted skipped records.

   See Previewed changes for more details about the related lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input Value
Source version	Current version of the instance
Target version	Target version to which the instance is upgraded to be previewed
Preview status	Status of the preview. ○ Pending ○ In Progress ○ Complete ○ Cancelled ○ Failed
Preview Started	Date and time on which the preview started
Preview Finished	Date and time on which the preview completed

Preview predicted changes

Use the previewed changes table to view the list of total records that are predicted to change when the upgrade occurs.

Preview skipped list prediction

The **Total record changes** also includes records that are predicted to be skipped due to various reasons. The most common reason is due to customization. The reason an upgrade skips customizations is to avoid overwriting your customizations. Upgrade Preview attempts to predict which records will be skipped when the actual upgrade occurs. It predicts skips due to customizations, and some of the other more complex scenarios as well. It is possible to use Upgrade Preview to address these predicted customization skips before the upgrade occurs, which can prevent that skip from happening.

Click **View preview details** link on the **Previewing version** card. The Upgrade Preview form appears along with the following related lists details.

Related lists details

Field	Description
File name	Record that has been flagged for reconciliation.
Predicted Disposition	Action predicted to be performed on this file during the selected upgrade: • Predicted Insert: The system is predicted to insert a new record. • Predicted Update: The system is predicted to update this record. • Reverted: This record was reverted to the base version, and won't be skipped on the next upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related lists details (continued)

Field	Description
	• Predicted Skip: The system won't change this record in order to preserve customizations. • Predicted Skip (Manual Merge): The system won't change this record because updating it requires manual intervention. • Predicted Skip (Apply Once): The system is predicted to skip this record because it had already applied an update from an xml file in the apply once folder.
Priority	Priority that has been assigned to resolve the conflict. Values range from one to five, with one representing the highest priority. **Note:** ServiceNow prioritizes the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more • Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Resolution	Ways to resolve a conflict. • **Not reviewed**: Conflicted files that have not been reviewed yet • **Reviewed**: Reviewed but no action has been taken yet • **Review not needed**: Review of the skipped files are not required • **Reviewed and Retained**: Left customizations in place without update from upgrade • **Reviewed and Reverted**: Customizations discarded, record updated according to the upgrade version
Plugin	Plugin containing the record
Related record	Record that the changelist entry applies to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduling and monitoring an upgrade

Use the Upgrade Monitor module to schedule and monitor the status of an ongoing upgrade in your instance. You can also view the upgrade summary and the list of records causing conflicts in your instance once the upgrade is complete.

- Monitoring an upgrade: Monitor the progress of an ongoing upgrade in your instance
- Process the skipped records list: Resolve the differences between the upgraded and customized versions of a record by processing the skipped records list
- Resolve conflicts of a record: Resolve conflicts between your customized record and the changes associated with the upgrade

Monitor an upgrade to an instance

Monitor the progress of an ongoing upgrade in an instance with the Upgrade Monitor. When the upgrade is done, you can view a summary of the results on the Upgrade Summary Report.

Before you begin

Role required: admin

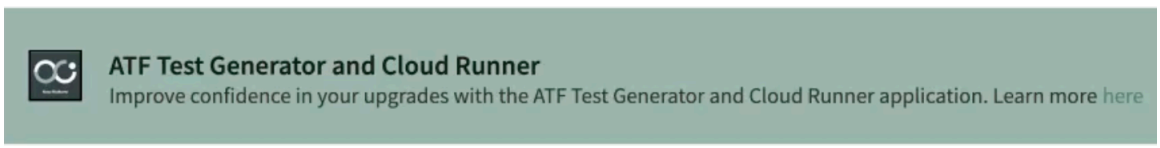
Procedure

1. Navigate to **Upgrade Center** > **Upgrade Monitor**.

   Note: If an upgrade is in progress, the user is automatically directed to **Upgrade Center** > **Upgrade Monitor** page.

2. Monitor the progress of the upgrade.
   When the system finishes the upgrade, it displays the Complete upgrade summary report.

   Note: You can now view the status of every stage in the upgrade process. See Upgrade Progress for more information.



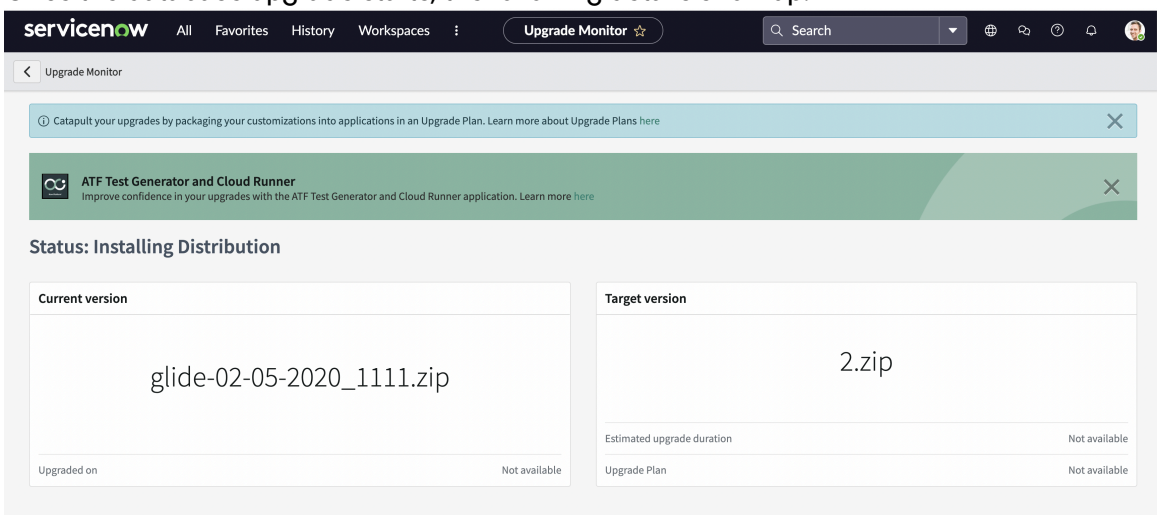
What to do next

From the Upgrade Summary Report, resolve any conflicts that prevented the system from upgrading records.

Upgrade Progress

When an upgrade is underway, Upgrade Progress displays progress bars and other information to help you monitor the process.

You can view the status of each of the stages during an upgrade process. It helps you to know exactly which stage you are in at any point of the upgrade process.



If you have the ATF Test Generator and Cloud Runner store application installed, you can schedule test generation runs from the Upgrade Monitor page. The above message shows up during an upgrade process when the following conditions are met.

- The SN_ATF_TG plugin is not active.
- The instance is not a fed instance.
- The instance is not a self-hosted instance.

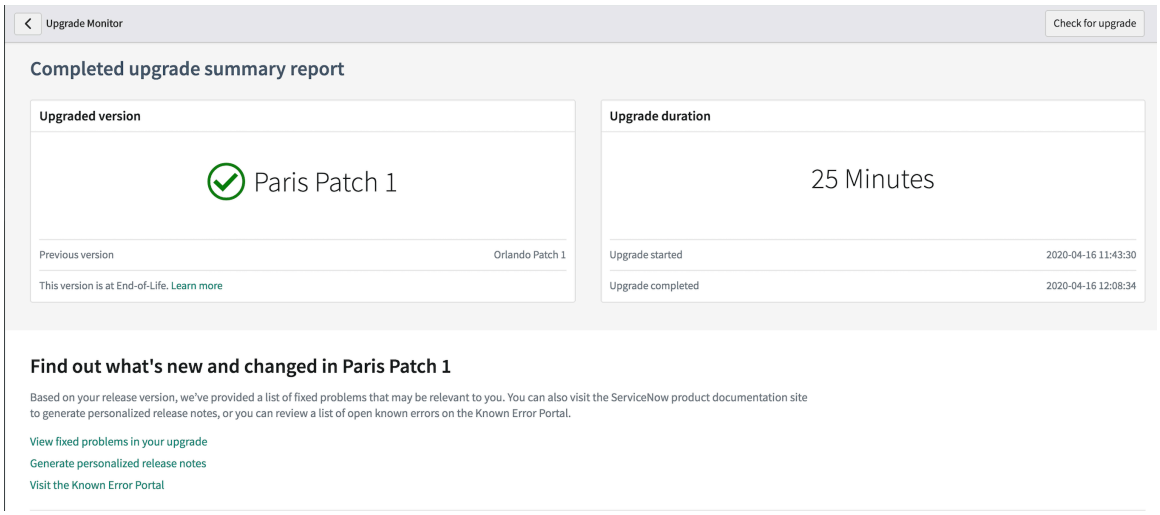
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can now confidently upgrade your instance by using the ATF Test Generator and Cloud Runner store app. See Exploring ATF Test Generator and Cloud Runner for more information.

Once the database upgrade starts, the following details show up.

Upgrade Progress details

Field	Input Value
Current version	Current version of the instance
Target version	Target upgrade version of the instance
Upgrade Progress	A progress bar depicting where the upgrade is in the overall process. The length of a section in the bar does not indicate the relative duration of that process.
Upgrade Progress: Upgrading Platform	The system is applying upgrades to elements that form the foundation of the platform.
Upgrade Progress: Updating Schema	The system is scanning the plugins to create a list of tables that require upgrading. This prevents the system from upgrading the same table multiple times.
Upgrade Progress: Loading Plugins	The system is loading both core and optional plugins. Some features require more than one plugin, so the number of plugins listed may not match the number of optional features installed.
Upgrade Progress: Completing	The system is upgrading components that need to be completed after the previous three stages are done.
Details	Shows the current activity, a progress bar for the current activity, and the file currently being updated.
Node Upgrades	The color of the icons represents the status of each node during this upgrade: Pending, Running, Successful, Failed, or Down.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

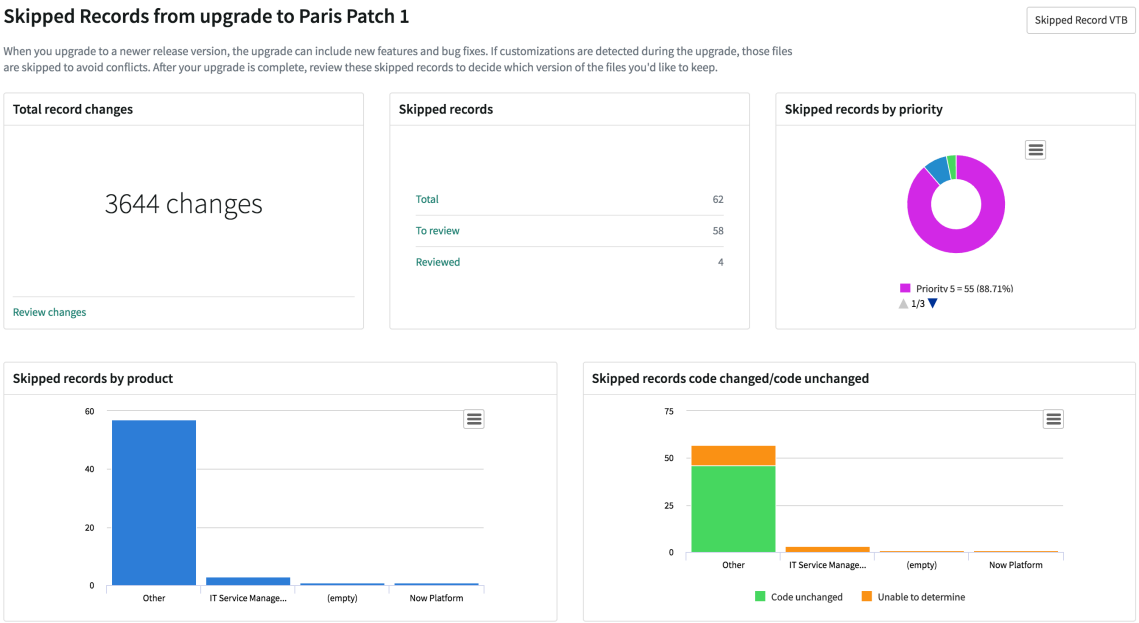
Upgrade Progress details (continued)

Field	Input Value
Node	The selected node indicated by the arrow. To change the selection, position the mouse cursor over the icon for the node to select.
Running time	How long the selected node (indicated by the arrow) has been running. If the selected node is offline, this value stops updating and shows how long a node was online before going offline.
Version	The current build for the selected node (indicated by the arrow).
Successful upgrade	When the selected node is online, shows how long the node has been online. If the selected node is offline, shows how long the node has been offline.

Upgrade Summary Report

The Upgrade Summary report summarizes the actions taken, provides tools to resolve conflicts between customizations and changes that are part of the upgrade, and provides information to help estimate time for upgrades to other instances.

Upgrade Summary details



Field	Input Value
Upgraded version	Version to which the instance has been upgraded
Upgrade duration	Total time taken to make the upgrade
Find out what's new and changed	Links to view the new and changed features in the current upgrade version. The following three links show up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

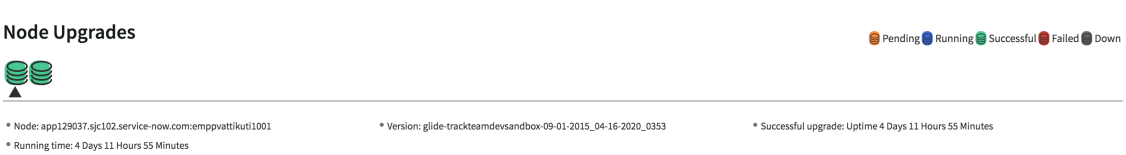
Upgrade Summary details (continued)

Field	Input Value
	• Problem fixes: Fixes that have been made since the last upgrade version • Personalized release notes: Release notes summary for the previewed version • Known error articles: Errors that have been identified but not yet resolved

Skipped Records

Skipped Records details

Field	Input Value
Total record changes	Total number of records that have changed since the previous upgrade version. **Review changes**: List of records that have changed can be reviewed. See System Upgrade form for more details.
Skipped records	Skipped records to prevent your customizations from being overwritten. If customizations are found in some records during the upgrade, those records are skipped. As an admin, you can resolve each update that was skipped due to a customization. To resolve a skipped update, you can review the reason for each skipped record and then



© 2026 ServiceNow, Inc. All rights reserved.

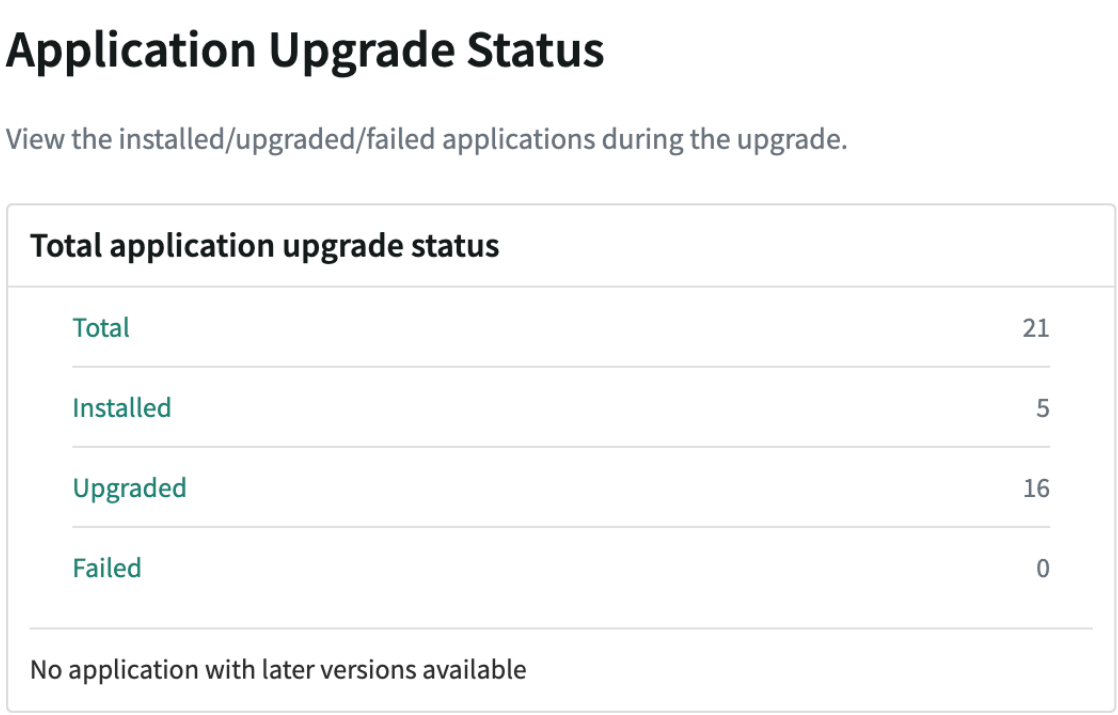
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Skipped Records details (continued)

Field	Input Value
	either retain the customization or revert the customization to the base system. If you choose to revert some of the customizations to the base version, those records are sent through the upgrade without getting skipped. • **Total**: Total skipped records • **To review**: Total skipped records that are yet to be reviewed • **Reviewed**: Total skipped records that have been reviewed
Skipped records by priority	ServiceNow prioritizes the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more • Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Skipped records by product	Skipped records are sorted by product names
Skipped records code changed/code unchanged	Skipped records are sorted depending on if there are changes in the code or not.

Note: You can click **Skipped Record VTB** to view the resolution status of the current upgrade with skipped records using the visual task board (VTB) view. See Skipped Records visual task board (VTB) for more information.



Node Upgrades

The Node Upgrades section shows the status of the upgrade for each node in the instance. The color of the icon denotes the status, as illustrated by the legend (key) and to the right of the node icons. To see details about a node, position the cursor above the icon for that node. An arrow points to the node selected, and the information below the icons pertains to that node.

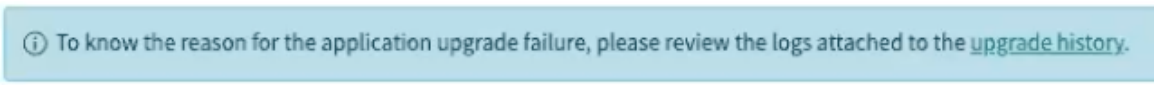
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Upgrade Status

You can view the list of installed and upgraded applications during an upgrade. It also lists the applications that failed to install during the process.

Note: The **All applications are on the latest versions** message shows up only when all the applications are on their latest versions.



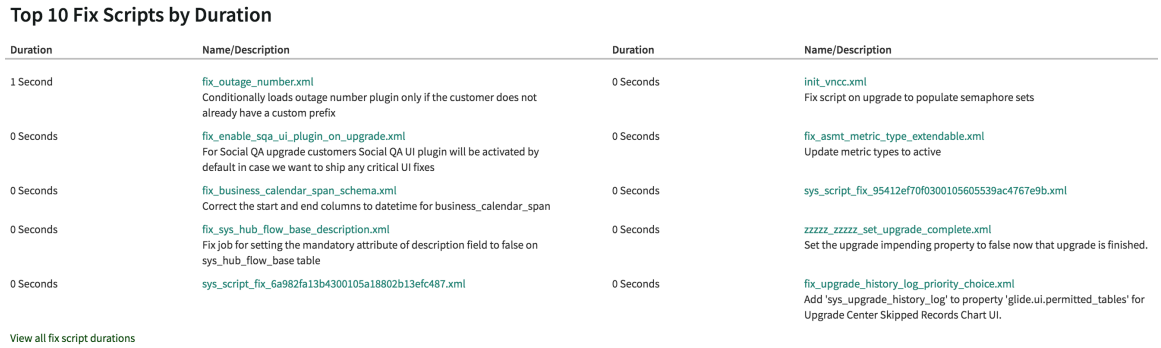
Action	Name	From version	To version	Latest version
Upgraded	@devsnc/sn-tab-filter	23.0.2	24.0.6	24.0.6
Installed	Process Automation Content	n/a	23.0.3	23.0.3
Upgraded	Common UIB Wrapper Components	1.2.4	1.2.6	1.2.6
Upgraded	@devsnc/sn-search-results-container	23.2.7	24.0.9	24.0.9
Upgraded	sn-component-workspace-global-search	23.2.9	24.0.7	24.0.7
Upgraded	Webviews for mobile	27.0.5	29.0.0	29.0.0
Upgraded	FDIH Dashboard	23.0.8	23.0.10	23.0.10
Installed	Playbook Experience Components	n/a	24.0.0	24.0.0
Installed	Security Center	n/a	1.1.7	1.1.7
Upgraded	@devsnc/sn-search-genius-card-assist	23.0.0	24.0.6	24.0.6

View all application details

You can view the first 10 applications that were installed during the upgrade. Select **View all application details** to view the information about all the installed, upgraded, and failed applications on the Upgrade App Version Histories table.

Note: You can select any of the application links to go to its form view. Select **Go to application** on the form view to go to the application sys record.

The following message shows up if you have selected any of the failed applications link.

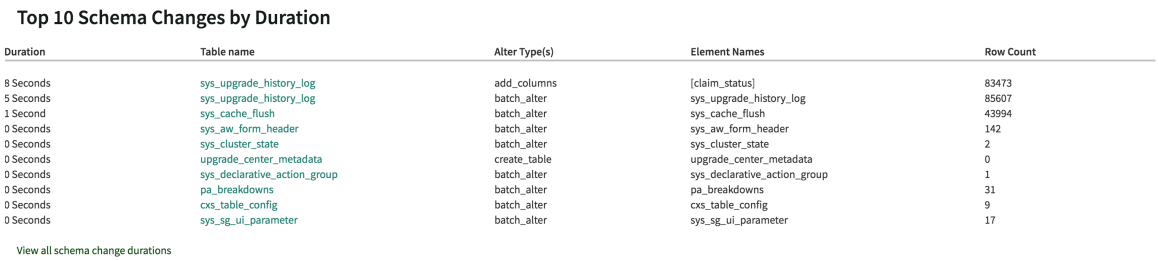


Schema Changes to Clone-excluded Tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Schema Changes to Clone-excluded Tables section shows a list of tables affected by the upgrade that were clone-excluded when you cloned the production instance to this instance. Because clone-excluded tables are empty, upgrading them takes less time than upgrading those same tables on the production instance. To estimate how much longer the production upgrade takes, note the size of the clone-excluded tables on the production instance.

Top 10 Fix Scripts by Duration



Top 10 Fix Scripts by Duration

Duration	Name/Description	Duration	Name/Description
1 Second	fix_outage_number.xml Conditionally loads outage number plugin only if the customer does not already have a custom prefix	0 Seconds	init_vncc.xml Fix script on upgrade to populate semaphore sets
0 Seconds	fix_enable_sqa_ui_plugin_on_upgrade.xml For Social QA upgrade customers Social QA UI plugin will be activated by default in case we want to ship any critical UI fixes	0 Seconds	fix_asmt_metric_type_extendable.xml Update metric types to active
0 Seconds	fix_business_calendar_span_schema.xml Correct the start and end columns to datetime for business_calendar_span	0 Seconds	sys_script_fix_95412ef70f0300105605539ac4767e9b.xml
0 Seconds	fix_sys_hub_flow_base_description.xml Fix job for setting the mandatory attribute of description field to false on sys_hub_flow_base table	0 Seconds	zzzzz_zzzzz_set_upgrade_complete.xml Set the upgrade impending property to false now that upgrade is finished.
0 Seconds	sys_script_fix_6a982fa13b4300105a18802b13efc487.xml	0 Seconds	fix_upgrade_history_log_priority_choice.xml Add 'sys_upgrade_history_log' to property 'glide.ui.permitted_tables' for Upgrade Center Skipped Records Chart UI.

View all fix script durations

View all schema change durations

The Top 10 Schema Changes by Duration helps you understand which schema changes required the most time.

Top 10 Plugins by Duration

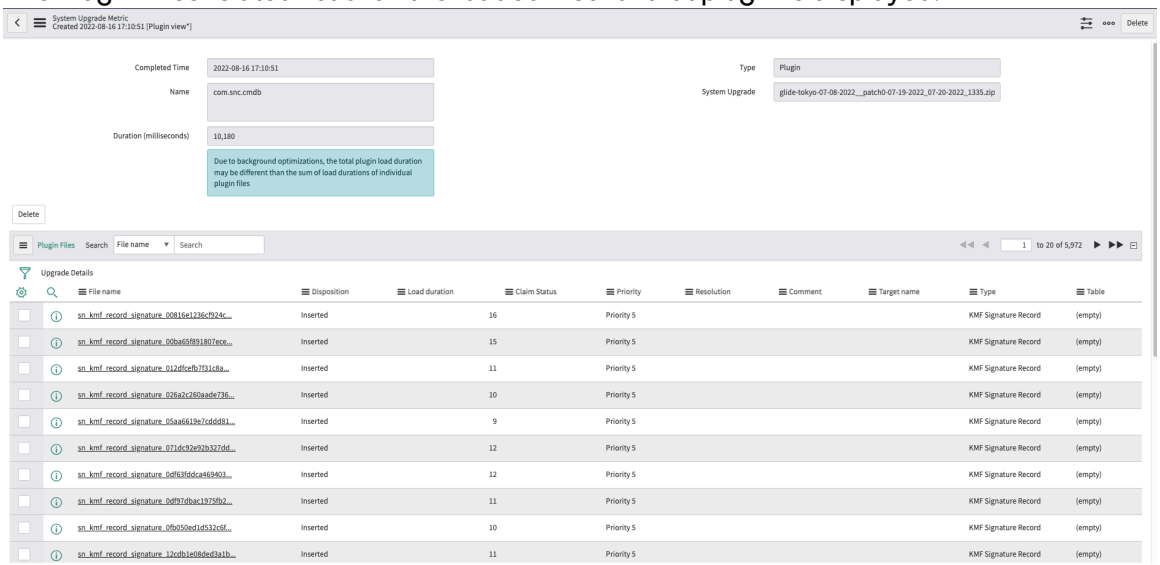
The Top 10 Plugins by Duration helps you see the plugins that required the most time. Click **View all plugin duration** to see the **System Upgrade Metrics** list filtered by current sys upgrade history log and sorted by duration. See View loaded files for a plugin for more information.

View loaded files for a plugin

Get a related list view of all the files loaded for a plugin by clicking **View all plugin duration**.

Before you begin

Role required: admin.



Procedure

1. Navigate to **All** > **Upgrade Center** > **Upgrade Monitor**.
   When the system finishes the upgrade, it displays the Upgrade Summary Report.
2. Scroll down to **Top 10 Plugins by Duration**.
3. Click **View all plugin duration**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **System Upgrade Metrics** list of all the plugins and their durations shows up.

4. Click one of the plugins from the list to open the **System Upgrade Metrics** form view of that plugin.
   The Plugin Files related list of all the loaded files for that plugin is displayed.

Note: The total plugin load duration is not the sum of the load duration of all the loaded files for that plugin.

Process the skipped records list

Process the skipped records list to resolve the differences between the upgraded and customized versions of a record. If you have customized or altered a record affected by this upgrade, such as a business rule or script, the upgrade generates a skip log record.

Before you begin

Role required: admin

About this task

Review the changes you made to baseline records, such as business rules and scripts, that appear on the skipped records list and revert to the baseline version if appropriate. Post-upgrade, thoroughly test all changes you made to these records.

Procedure

1. Navigate to **All** > **Upgrade Center** > **Upgrade Monitor**.

   If the upgrade is still in progress, the system displays the Upgrade Progress screen. When the upgrade finishes, the system displays the Upgrade Summary Report.

2. After the system displays the Upgrade Summary Report, click the Review changes link in the Skipped box.

   The system displays the System Upgrades form.

3. Navigate to Review Skipped Records section and – if necessary – scroll to the Skipped Changes to Review related list.
   See Review skipped records using related lists for more information.

4. Click the row for the first record you want to reconcile.

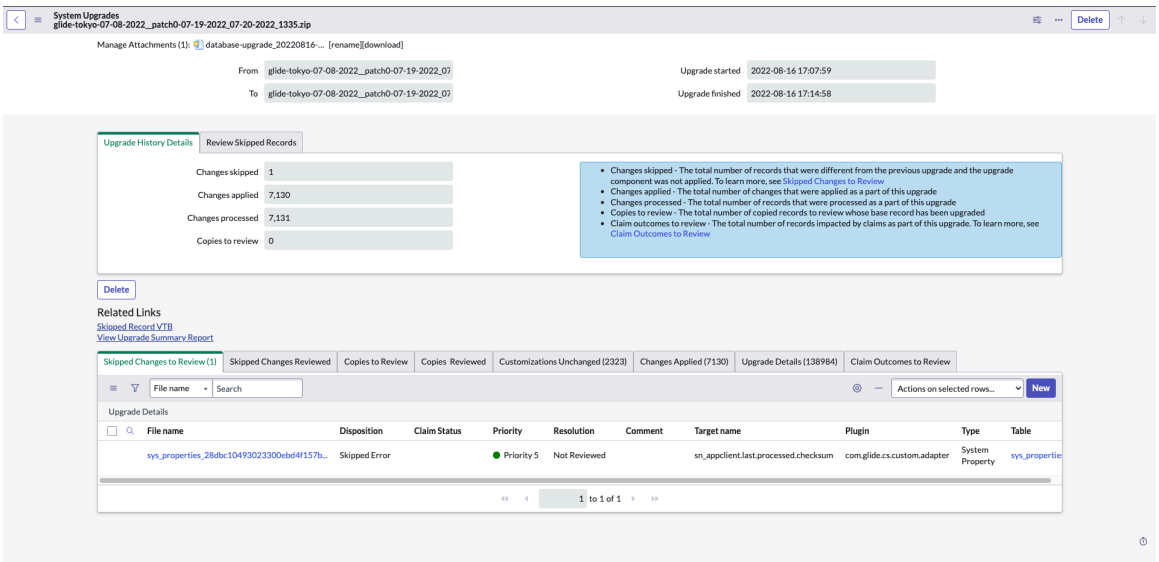
   The system displays the Upgrade details form for that record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Evaluate how you want to resolve the conflict for this record and take the appropriate action:

Action	Description
Retain the customized record as is and do not update it	After reviewing the changes, set **Resolution Status** to **Reviewed and Retained**. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list. See Review skipped records using related lists.
Retain the customization by merging changes from the updated object	**a.** Click **Resolve Conflicts** to navigate to the Resolve Conflicts form. **b.** Review the differences. **c.** To merge a field: ▪ Click the right-arrow button for the field. ▪ Click a text box to view and edit the detailed differences. ▪ When you have merged all appropriate fields, click **Merge**. After merging the customization changes: ○ The **Resolution Status** changes to **Reviewed and Merged**. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.
Discard the customization and update the record to match the base system for this upgrade	After reviewing the changes, click **Revert to Base System**. ○ The **Disposition** changes from **Skipped** to **Reverted**. ○ The **Resolution Status** changes to **Reviewed and Reverted**. ○ The system creates a Customer Update record. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. **Note:** At any time after you revert a customization, you can click **Reapply Changes** to reapply the customization (undo the revert).
Review the skip and perform no action on the object	After reviewing the changes, set **Resolution Status** to **Reviewed**. The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Action	Description
Leave on the skipped list for a later decision, and note that you have not reviewed the record	From the **Resolution** list, choose **Not Reviewed** to defer the decision on how to handle this conflict. The record stays on the Skipped Changes to Review related list.

Note: The system tracks changes to records in an update set so you can apply these changes to another instance later. However, the system does not migrate the upgrade details records from one instance to the next. These records apply to a specific upgrade of a specific instance. If you want to preserve the Comments, Resolutions, or other information from the skipped list, export it from this instance.

6. In the **Comment** field, write the reasons for making your decision and other information you want to document.
7. Click **Update**.
   Post-upgrade, thoroughly test all changes you made to the records on the skipped record list.

System Upgrade form

When an upgrade is complete, the System Upgrades form displays key statistics about the upgrade and a related list of skipped records (the skipped list).

System Upgrade details

Field	Input Value
From	Version of the instance before upgrading.
To	Version of the instance after upgrading.
Upgrade started	Time of the start of the upgrade.
Upgrade finished	Time at which the upgrade completed.
Changes skipped	Total number of records that are different from the previous upgrade and the upgrade component was not applied, mostly due to customization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Upgrade details (continued)

Field	Input Value
Changes applied	Total number of changes that are applied as a part of this upgrade **Changes applied** is sum of updated, different records, deleted records (where the value of changed is true) and inserted records (where the value of changed is true).
Changes processed	Total number of records that were processed as a part of this upgrade. Changes processed is the sum of **Changes skipped** and **Changes applied**.
Copies to review	Total number of copied records to review whose base records have been upgraded

Resolve conflicts for an individual record

Reconcile differences between your customized record and the changes associated with the upgrade.

Before you begin

Role required: admin

Procedure

1. From the Upgrade Details form for the record you are reconciling, click **Resolve Conflicts**.

   The system displays the Resolve Conflicts form, which highlights differences between the two versions of the record. The form displays information about the base system record on the left and the customized record on the right.

   Note: The system creates a new customer update record when you click **Resolve Conflicts**.

2. Compare the base system with the customized record for each field on this form.
   For non-script fields, edit the customized record on the right-hand side to include what you want from the base system and the customization.
3. If this record contains a script, check it for conflicts and resolve.
   a. Click inside the Script field.

      The system displays the Resolve Conflicts - Script form highlighting areas where the two versions of the script differ.

   b. Edit the right-hand side so that the script contains whichever content you want. To move a block of code from the left to right side, click the small arrows corresponding to that block in the middle column.

   c. Click **OK**.

      The system returns to the Resolve Conflicts form.

4. To save your changes to the record, click **Save Merge**.
   The system sets the **Resolution** for this record to **Reviewed and Merged**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

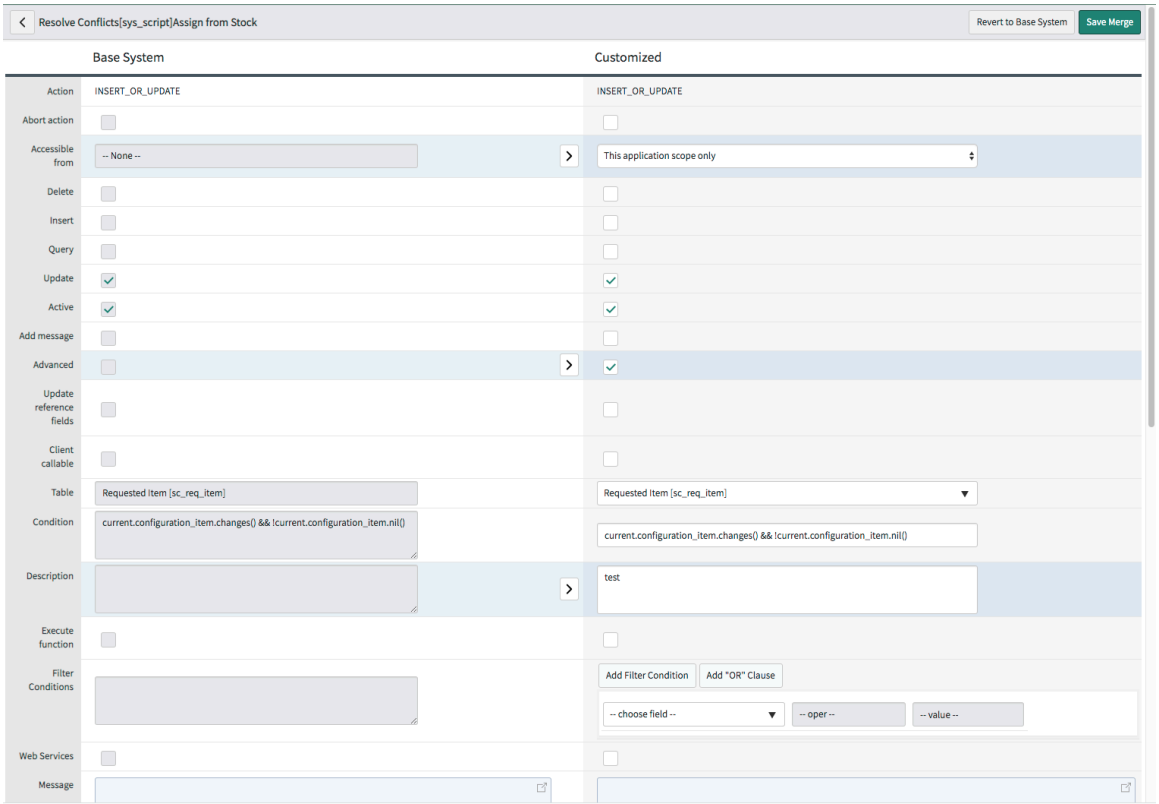
Upgrade details form

From the Upgrade Details form, you can review an individual record affected by the upgrade and reconcile conflicts between the upgrade and customizations.

Upgrade Details form details

Field	Input value
File name	The record the system has flagged as needing to be reconciled.
Priority	The priority the system has assigned to resolving this conflict. Values range from one to five, with one representing the highest priority.
Comment	Comments to document your decisions about reconciling this record.
Resolution	How you elected to resolve this conflict: • **Not reviewed**: Not yet reviewed • **Reviewed**: Reviewed but no action yet taken • **Reviewed and Merged**: Made changes to the record to reconcile the customized and upgraded versions • **Reviewed and Retained**: Left customizations in place without update from upgrade • **Reviewed and Reverted**: Customizations discarded, record updated according to upgrade For more information, see Process the skipped records list.
Disposition	Action performed on this file during the selected upgrade:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Upgrade Details form details (continued)

Field	Input value
	• Inserted: The system inserted a new record • Updated: The system updated the record • Deleted: The system deleted the record • Skipped: The system did not change this record in order to preserve customizations • Reverted: This record was reverted to the base version • Table not found: The system could not find the table that contains this record • Unchanged: The system did not change this record because the baseline component has not changed since the last release • Skipped Manual Merge: The system did not change this record because updating it requires manual intervention • Skipped Apply Once: The system skipped this record because it had already applied an update from an xml file in the apply once folder • Not Latest: The system applied a change, but this change was overwritten later during the same upgrade.
Type	Type of the record, for example, Script include.
Target name	Name of the skipped record, if applicable.
Update set	Unused.
Plugin	The plugin containing this record.
Table	The table containing this record.

Resolve Conflicts form

The Resolve Conflicts form you compare to the base system version with the customized version of a record and reconcile the differences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields

The fields this form displays depend on the type of record you are reconciling. The left column shows the records fields in the base system, including the proposed changes that are part of the upgrade. The right column shows the fields for your customized record.

Preparing your upgrade plan

Prepare an upgrade plan to be used in your upgrade by executing the following tasks.

Building your Upgrade Plan

Build your upgrade plan to experience a seamless and an accelerated upgrade by packaging the applications in an upgrade plan.

Before you begin

Note: Ensure that you have upgraded your instance to the latest available version to build the upgrade plan. It is recommended to build an Upgrade Plan for each instance upgrade. The target version of the Upgrade Plan must be exactly the same as the instance version (including patches and hot fixes). You can't use the previously created Upgrade Plan for the new instance upgrade.

Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Administration** > **Properties** > **Upgrade Plan Properties**.

   Note: It is recommended to set up your dev instance as a builder instance.

2. Navigate to **All** > **Upgrade Center** > **Upgrade Plan**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you are on the Upgrade Monitor page, click **Manage Upgrade Plan**.

The Upgrade Plan list view shows up.

3. Click **Build** to start the upgrade plan build.
   Upgrade Plan takes up only the app installations by default and publish it on to the app repository. See Upgrade Plan background operations section in Upgrade Plan overview for more information.

   Note: Ensure all the applications in the instance are in ready state to be published on to the app repository.

   You are allowed to have only one Upgrade Plan at any point of time.
   A final confirmation message shows up to start building the upgrade plan. If any application has changes in-progress, the Upgrade Plan must be built only after the changes are done. Warning message shows up to complete the review of the remaining skipped records, provided you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.
4. Click **Build Upgrade Plan**.
   The upgrade plan starts to build.
5. Click **Go to Upgrade Plan** once the build is done.

   Note: Click **View Details** if you want to view the execution details of the Upgrade Plan. If you see a warning, it is recommended to review the execution details to know the errors.

   The upgrade plan opens and a list of upgrade plan items shows up.
6. **Optional:** Click **New** if you want to manually add any upgrade plan items.

   Note: The applications or plugins that you want to add manually to the upgrade plan must be already installed and active on the instance.

   If you want to skip any of the upgrade plan items from being a part of the Upgrade Plan, set the selected upgrade plan item to false.
7. **Optional:** Click **Refresh** to capture all the recent changes to the Upgrade Plan.

   Note: This step is applicable only if you have any update on the existing application or plugin in the Upgrade Plan. If the upgrade plan has already been published, you are required to republish it after every refresh.

8. Click **Publish** to publish the Upgrade Plan.
   See Upgrade Plan background operations section in Upgrade Plan overview for more information.

   Note: Install all the required applications and plugins before publishing the upgrade plan. If you have set the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property to true, you will have to resolve all the skipped records before publishing the upgrade plan. If you want to delete the Upgrade Plan, click **Delete**. The **Delete** option is available only for the Upgrade Plans that are not yet published.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

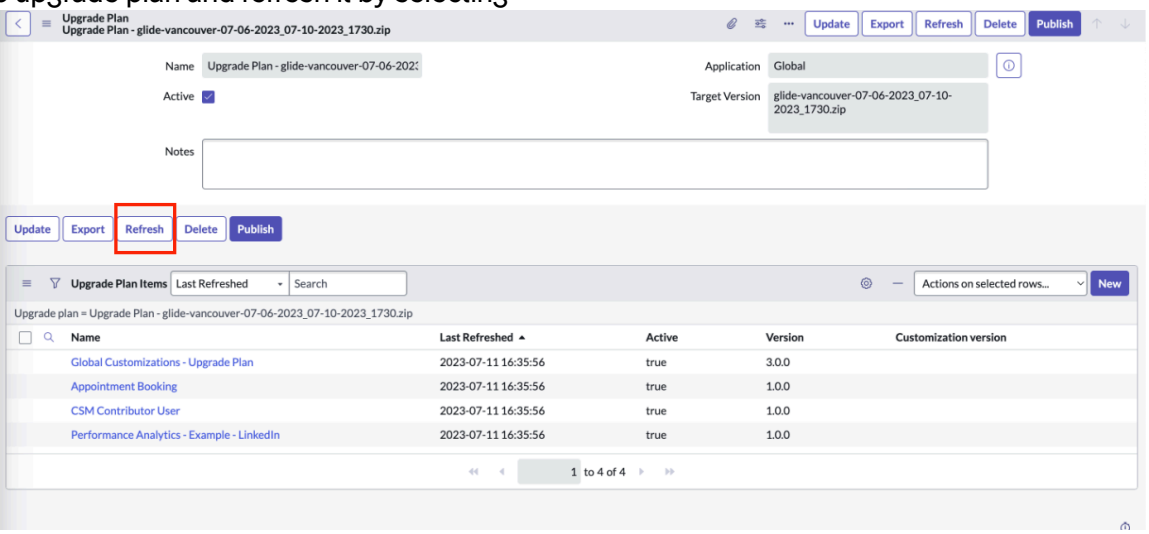
The upgrade plan is now ready to be installed in the consumer instance.

Refreshing your Upgrade Plan

Refresh your upgrade plan to package all the recently installed plugins and applications into your upgrade plan.

Before you begin

Role required: admin



Procedure

1. Go to the applications and plugins you need and select **Activate** to install them.

   Note: This can be done even after the Upgrade Plan is published.

   The plugin activation starts and installs successfully.

2. Go to the upgrade plan and refresh it by selecting

Refresh.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

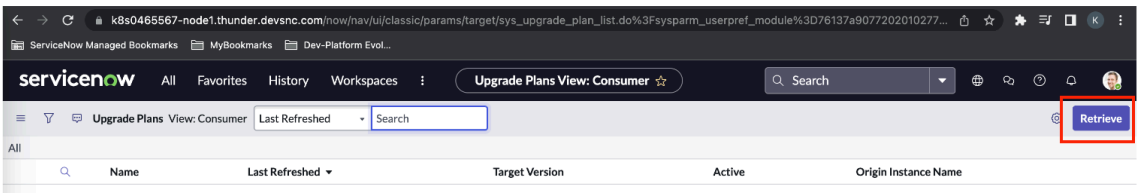
The Refresh Upgrade Plan confirmation message shows up.

3. After the upgrade plan refreshes, select **Go to Upgrade Plan**.

> **Note:** The **Publish** button is still visible because the updated Upgrade Plan needs to be published.

The recently installed plugins and applications show up under Upgrade Plan Items related list.

Installing your Upgrade Plan

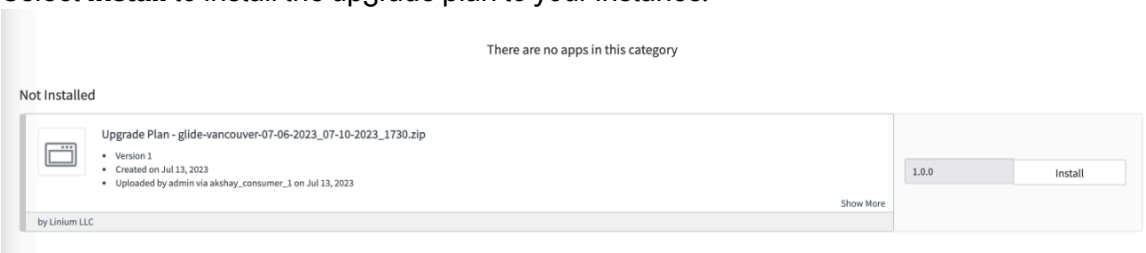


Install your upgrade plan in the consumer instance to implement it in your upgrades.

Before you begin

Role required: admin

Procedure



1. Navigate to **All** > **Upgrade Plan**.
   The list view of the upgrade plans shows up.
2. Select Retrieve to find your upgrade plan.

3. Search your upgrade plan by name.
4. **Optional:** Navigate to **All** > **My company applications** and refresh it.

> **Note:** This step is applicable only if you can't find the required version of your upgrade plan.

5. Repeat the previous steps to see the latest version of the upgrade plan.
6. Select **Install** to install the upgrade plan to your instance.

> **Note:** If you made any changes to the upgrade plan on the builder instance after installing it on the consumer instance, then update the upgrade plan to the latest version.

Prepare to upgrade with Upgrade Plan

Prepare your instance upgrade with Upgrade Plan by determining all the applications and plugins are ready to be implemented in the upgrade.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Upgrade Plan**.
   The upgrade plan that is installed shows up on the list.
2. Select the upgrade plan.
   The upgrade plan form view shows up with all its configurations.
3. To ensure that all the applications and plugins are ready to be implemented in the upgrade, select **Refresh** in the context menu of the Upgrade Plan.
   If there are errors for any of the items, then fix them and follow the Reprocess step.

   Note: All the applications and plugins under the Upgrade Plan Items related list must be in the **Ready** state to proceed with the upgrade. The application or plugin in the **Already Installed** state, error or its latest version won't be considered during the upgrade process.

   The upgrade plan is now ready to be implemented.
4. Apply an existing upgrade plan to an instance anytime, without being limited to during upgrades only.

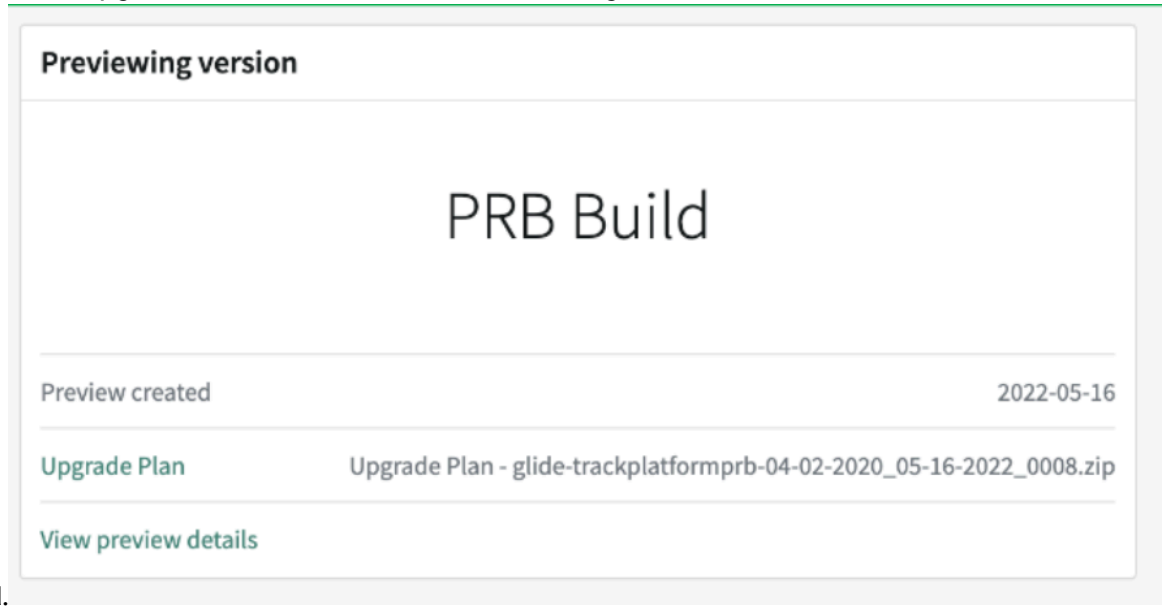
   You can now also export the upgrade plan in a batch install format by using the **Export** button. See CI/CD - POST /sn_cicd/app/batch/install for more information.
5. **Optional:** Select **Reinstall** to reinstall the failed items in an upgrade plan, after the upgrade completes.
   You can also review the upgrade plan history to know the reasons of failure.

   Note: You are required to use this option only if you have failed items in an upgrade plan.
6. **Optional:** Click **Reprocess** to reprocess the upgrade plan after the upgrade plan item errors have been resolved.

   Note: This step is applicable only if you have any error items in the upgrade plan.

Preview Upgrade Plan

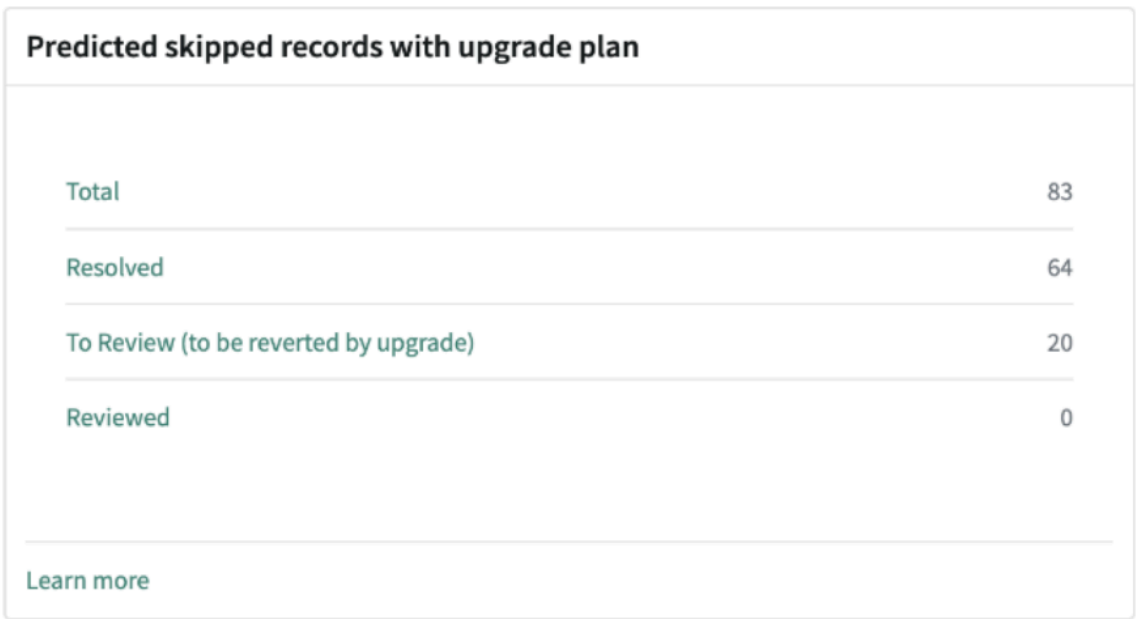
Preview your upgrade plan before being implemented in the upgrades. Once the upgrade plan is installed, it auto generates the preview of the upgrade plan.



Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Go to the Upgrade Preview page to preview the Upgrade Plan.
2. Check the Upgrade Plan mentioned on the Previewing version

card.

3. **Optional:** Check the Predicted skipped records with upgrade plan card to preview the skipped

records.

- Total: total number of skipped records
- Resolved: skipped records included in the upgrade plan
- Reviewed: skipped records that have been reviewed

Note: This step is applicable only if you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.

Apply Upgrade Plan on your upgrade

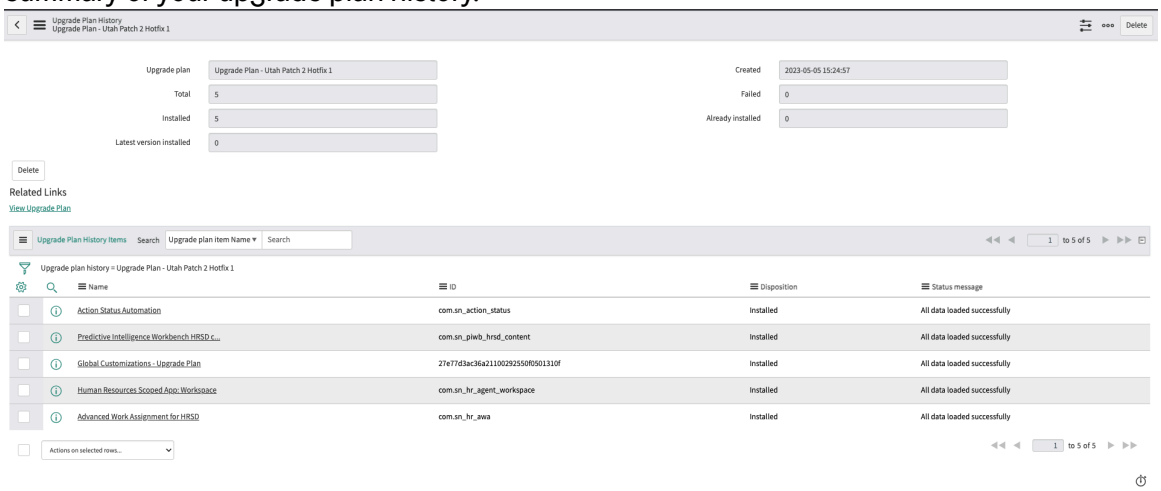
Apply the selected upgrade plan to your instance upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure



1. Go to the Upgrade Monitor page to ensure that the selected upgrade plan is being implemented in your upgrade.
   If the upgrade plan has been implemented on the ongoing upgrade, the Review upgrade plan link shows up on the Target version card.

   See Upgrade Plan background operations section in Upgrade Plan overview for more information.

2. Check on the date and time of the implemented upgrade plan in the Upgrade duration card once the upgrade completes.
   You can select the Review upgrade plan link on the Upgrade duration card to know the history of the upgrade plan. It shows all the installed applications and plugins and the failed items.
3. **Optional:** Scroll down to see the skipped records with upgrade plan.
   - Total: Total number of skipped records
   - Resolved: Total records from the upgrade plan that have been auto-resolved
   - To review: Total records left to be reviewed manually

   Note: This step is applicable only if you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.

4. **Optional:** Click **Review upgrade plan** on the Upgrade duration card if you want to check the summary of your upgrade plan history.

Review skipped records with upgrade plan

Review the skipped records after the completion of the upgrade.

Before you begin

Note: This process is applicable only if you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Once the upgrade completes, scroll down to see the skipped records with upgrade plan.
   - Total: Total number of skipped records
   - Resolved: Total records from the upgrade plan that have been auto-resolved
   - To review: Total records left to be reviewed manually

   Note: After using the upgrade plan, the Global Application is created and all the records move to the Global Application. As soon as you create the Global Application, the new update sets show up.

   You won't be allowed to choose the skipped records that are captured by the upgrade plan, regardless of whether they are being reviewed. If the customizations are coming from different instances, then the skipped records are required to be reviewed.

2. Select the To review link to look at the records that need to be reviewed manually.

Reviewing upgrade history

The Upgrade History module tracks every upgrade made to an instance. You can also view the complete report of an old upgrade or a recently completed upgrade version using this module.

- Upgrade history related lists: Use the related lists to resolve, track and review the skipped records in an upgrade
- Visual task board (VTB) view of skipped records: Use the VTB view to see the resolution status of any previous upgrade with skipped records

Review skipped records using related lists

Use different related lists to resolve, track and review the skipped records in an upgrade.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Upgrade History**.
   A list of upgrades is displayed.
2. Select an upgrade from the list.
   System Upgrades form is displayed.
3. Select any of the following related lists to review the skipped records.

   Skipped Changes to Review related list

   Resolve the skipped update records by tracking and reviewing them in the Skipped Changes to Review related list. To prevent your customizations from being overwritten during system upgrades, the upgrade process skips (does not apply the update to) objects that have been customized. See Resolve a skipped update and set a resolution status for more information.

   Skipped Changes Reviewed related list

   View the list of the reviewed skipped records in the Skipped Changes Reviewed related list. When you select a skipped record to review and set a **Resolution Status** to a value other than Not Reviewed, the update record moves from Skipped Changes to Review related list to the Skipped Changes Reviewed related list.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copies to Review related list

Copies to Review lists all the records that need to be reviewed.

Copies Reviewed related list

Copies Reviewed lists all the records that have been reviewed.

Customization Unchanged related list

Customizations Unchanged lists all records that were skipped (due to a customization), but there have been no changes from the last upgrade. See Revert a customization for more information.

Changes Applied related list

Changes Applied lists all changes that were applied in this upgrade.

Claim Outcomes to Review related list

During system upgrades, the Claim Status tab displays outcomes to review and resolve.

Upgrade Details related list

Upgrade Details lists all Upgrade Details records for this upgrade.

Note: The Copies to Review and Copies Reviewed related lists are Platform specific related lists.

Upgrade history related lists details

The following table gives the description of each field in all the related lists within the upgrade history module.

Related lists details

Field	Input Value
File name	File name has different description for different related lists • Skipped Changes to Review related list: Name of skipped Upgrade Detail record • Skipped Changes Reviewed related list: Name of the reviewed Upgrade Detail record • Copies to Review related list: Name of the record that needs to be reviewed • Copies Reviewed related list: Name of the record that has been reviewed • Customization Unchanged related list: Name of unchanged sys_upgrade_history_log record. Select it if you want to access Upgrade Details and add comment text, or set a resolution status for it • Changes Applied related list: Current upgrade file name

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related lists details (continued)

Field	Input Value
	Note: ServiceNow prioritizes the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more • Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Claim Status	Outcomes: • N/A: There are no claims on the record (no need to review) • Won conflict: The loading application loaded the file but is in conflict with the previously loaded file. Recommendation: Review the two versions of the file to confirm your intended outcome. • No conflict: There may be one or more applications loading but there is no conflict. However, it is still good to review the outcome to see if it's what you intended. • Lost conflict: The file was not loaded because another application has a better claim on the file. Recommendation: Review the two versions of the file to see which should be loaded (or if they should be merged).
Reason	States the reason why a particular record has been moved to the Skipped Error disposition.
Resolution	• Reviewed • Retained • Reverted
Comment	During the process of resolving a skipped update, you have the option to add a **Comment** to any record. For example, the comment might explain the action that you took to future reviewers.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related lists details (continued)

Field	Input Value
Target name	Name of the record corresponding to the current file.
Plugin	Plugin that contains the record.
Type	Current file type (such as Business Rule or UI Policy).
Table	Table that contains the record.
Changed by vendor	Indicates whether the file has been changed by the vendor since the last upgrade.

Revert a customization

To prevent customizations from being overwritten by system upgrades, the upgrade process automatically skips changes to objects that have been customized. You may want to overwrite your customizations when a software upgrade contains a feature that you would like to implement.

Before you begin

Role required: admin

About this task

To identify customized objects, the system adds a corresponding record in the Customer Updates [sys_update_xml] table. The table maintains the current version information for all objects that have been customized. The upgrade process skips changes to objects that have entries in the table. The upgrade process does not skip objects if only excluded fields have changed.

Procedure

1. Navigate to **All** > **Upgrade Center** > **Upgrade History**.
2. Select the desired software version.
3. Filter the Upgrade Details related list by **Disposition is Skipped**.
4. **Optional:** Add another filter condition for **Changed is True** to return only the objects that have changed since the last upgrade.
5. Select the update record to implement.
   The **File differences** field displays a side-by-side comparison of the customization and the default version. Deletions are highlighted in red, additions in green, and modifications in yellow.
6. Click **Revert to base system** to overwrite your customized object with the system default version.
   - The **Disposition** changes from **Skipped** to **Reverted**.
   - After you revert a customization, you have the option to click **Reapply Changes** to reapply your customizations (undo the revert).

Resolve a skipped update and set a resolution status

Review the reason for each skipped record to resolve each skipped update after an upgrade.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You resolve an update by either retaining the customization or by merging or overwriting the customization with the base system update.

Note: Objects that are customized and that did not change in the base system since the last upgrade require no action on your part.

When an object is customized, the system adds a corresponding record to the Customer Updates [sys_update_xml] table and then maintains current version information for all customized objects. The upgrade process skips changes to objects that have a current version in the Customer Updates table. When you follow the procedure, you perform one of the following actions:

- Retain a customization with no changes
- Retain a customization by merging changes from the updated object
- Revert a customized object to the updated version (that is, overwrite the customization)
- Review the skip and perform no action on the object

Note: If you want to capture your changes in update sets other than the default, ensure that you are in the Application Scope context of the item that you change while reviewing it as part of skipped items. If you are in a different scope, you may end up with items for different scopes in your update set.

Procedure

1. Navigate to **All** > **Upgrade Center** > **Upgrade History**.
2. Select the desired software version.
3. In the Skipped Changes to Review related list, select the update record to resolve.
   See Review skipped records using related lists.
4. Review the list of changes.
   For text fields, you can click in the field to open the Diff/Merge tool.

   To review the differences, Click a text box to view and edit the detailed differences.
5. Perform one of the following actions.

   You have the option to add a **Comment** to any record, for example, to explain the action to future reviewers.

Skipped Changes to Review related list

Field	Input Value
Retain the customized record as is and do not update it.	After reviewing the changes, set **Resolution Status** to **Reviewed and Retained**. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list.
Retain the customization by merging changes from the updated object.	**a.** Click**Resolve Conflicts** to navigate to the Resolve Conflicts form. **b.** Review the differences. **c.** To merge a field:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input Value
	▪ Click the right-arrow button for the field. ▪ Click a text box to view and edit the detailed differences. ▪ When you have merged all appropriate fields, click **Merge**. After merging the customization changes: ○ The Resolution Status changes to Reviewed and Merged. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.
Discard the customization and update the record to match the base system for this upgrade.	After reviewing the changes, click **Revert to Base System**. ○ **Disposition** changes from **Skipped** to **Reverted**. ○ **Resolution Status** changes to **Reviewed and Reverted**. ○ The system creates a Customer Update record. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. **Note:** At any time after you revert a customization, you can click **Reapply Changes** to reapply the customization.
Review the skip and perform no action on the object.	After reviewing the changes, set **Resolution Status** to **Reviewed**. The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.
Leave on the skipped list for a later decision, and note that you have not reviewed the record.	From the **Resolution** list, choose **Not Reviewed** to defer the decision on how to handle this conflict. The record stays on the Skipped Changes to Review related list.

6. Click **Update**.
7. Repeat the process to resolve each update record in the list.

Result

Only skipped updates with a **Resolution Status** of **Not Reviewed** or without a resolution set appear in the Skipped Changes to Review related list. Any action you take that changes the **Resolution Status** to a value other than **Not Reviewed** or **--None--** removes the skipped update from list and moves it to the Skipped Changes Reviewed related list.

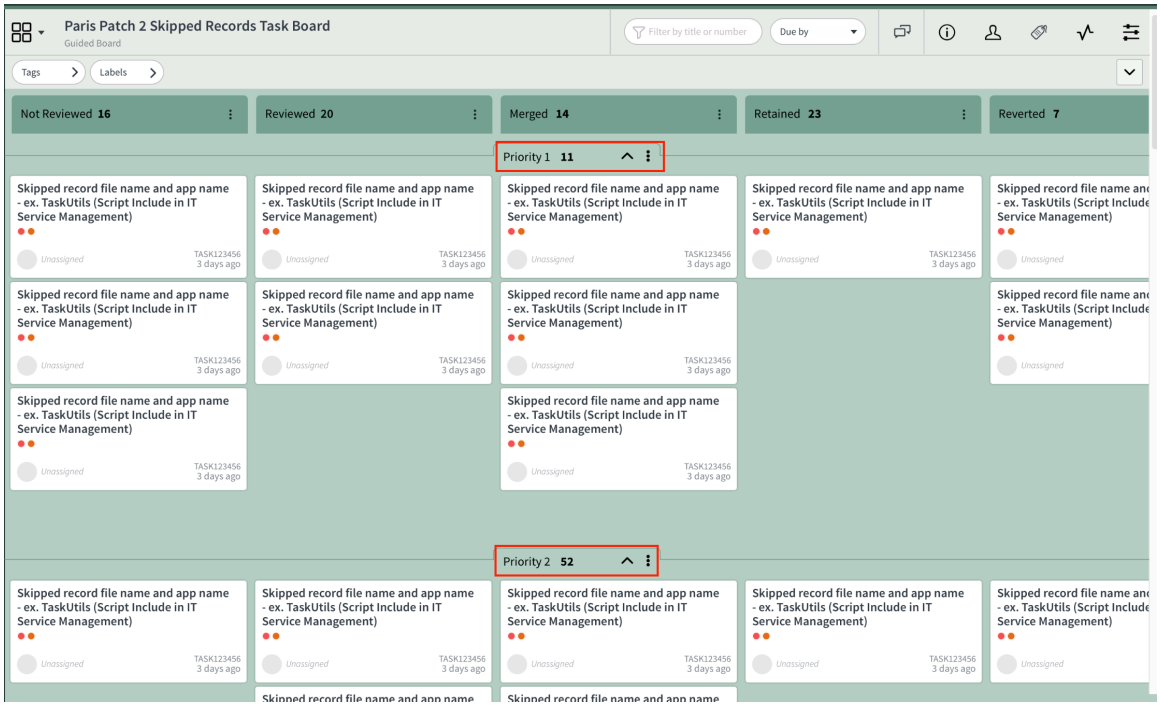
Skipped Records visual task board (VTB)

View the resolution status of any previous upgrade with skipped records using the visual task board (VTB) view. An upgrade history record is created for each upgrade that is run.

To view the history report navigate to **Upgrade Center** > **Upgrade History**. You can then select an upgrade from the list to view the upgrade history details. Click the **Skipped Record VTB** related link to view and manage the skipped records over VTB.

Note: The **Skipped Record VTB** related link shows up only when there are skipped records for the version upgrade.



Upgrade History VTB details

Field	Description
Not Reviewed	Tasks which have not been reviewed
Reviewed	Tasks which have been reviewed
Merged	Tasks which have both the old and new changes
Retained	Tasks which have retained the updates from the latest upgrade
Reverted	Tasks which have reverted its changes to the base system

The skipped records are prioritized based on the importance of the file types. The prioritization is done as follows:

- Priority 1 (highest priority): UI pages, UI macros, and more
- Priority 2: Business Rules, Security ACLs, and more
- Priority 3: Reports and more
- Priority 4: Form Sections, Choice Sets, and more
- Priority 5 (lowest priority): other

Upgrade History task form details (continued)

Field	Description
	• Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Resolution	The resolution made in the previous upgrades
Target name	Name of the record that you see on UI, as opposed to the sys_update_name which is the underlying name that has the table and sys_id
Type	Type of file which determines the priority level.
Table	The table where the skipped record belongs.

Update default labels in VTB view

Filter skipped records in the task board of the VTB with the implementation of color-coded labels. You can filter the skipped records by assigning a color to each of the products.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Upgrade History**.
2. Select an upgrade from the list.
   The System Upgrades form appears.
3. Click the **Skipped Record VTB** related link to view the resolution status of the skipped records over VTB.

   Note: The **Skipped Record VTB** related link shows up only when there are skipped records for the version upgrade.

   The VTB view of the resolution status of the skipped records shows up.
4. Click **Labels** to show the default labels.
   The default labels consist of Include codes, Does not include code and Others categories.

   Note: The Include and Does not include codes categories indicate if there is any change in the code of the skipped records. All products fall under Other category of labels. The product labels are assigned with different colors. The tasks get assigned based on the label colors of the products.

5. **Optional:** If you want to add a label, click **Add Label**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enter the name of the label you want to create. You can also change the color of a label by clicking the color circle.

Note: The new labels and colors are saved only for the current visual task board and don't get rolled over to the next updated board. If you want the new label updates to show up in the next updated board, navigate to **Upgrade Center** > **Administration** > **Properties** > **Upgrade Center VTB Labels**. Set the colors as required and the updated colors start showing up from the next generated board.

What to do next

Click on a skipped record in the VTB to update the task. See Upgrade History Task form for more information.

View import history

View your import history by accessing the **My Application Import History** module.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **My Application Import History**.
   The list of import history records in your instance shows up.
2. Select one of the imports from the list for more information about that import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The form view of sys_upgrade_history record shows up.

Note: To learn more about importing from Source Control, see ServiceNow Studio. Once the importing is done, use the **My Application Import History** module to view the import history.

Quick access to plugins and history records

Reduce the navigating time by directly accessing plugins, application installation history records, and update set commits history records. The filters for the plugins and history records are automatically implemented in the plugins and history records views.

Before you begin
Role required: admin

About this task

Plugins and application installation history records

1. Navigate to **System Definition** > **Plugin Installation History**.
2. Select any of the plugins or history records to access them directly.

Update set commit history records

1. Navigate to **System Update Sets** > **Update Sets to Commit**.
2. Select any of the update sets to directly view the commit history of that update set.

Explore upgrade history log

Reduce processing time by extracting all upgrade related logs into a separate file named database-upgrade_<timestamp>.log. You can also zip the file and attach it to upgrade history.

Before you begin
Role required: admin.

About this task
When the upgrade starts, the upgrade log messages are written to both the localhost_log file and the database-upgrade_<timestamp>.log file. When the upgrade is done, the database-upgrade_<timestamp>.log file is uploaded to the upgrade history table.

Procedure

1. Navigate to **All** > **System Logs** > **Utilities**.

   Note: You can implement this step to view the extracted database-upgrade_<timestamp>.log file only after the upgrade is done.

2. Click **Node Log File Download**.
   The database-upgrade_<timestamp>.log file appears in the list of log files.

   Note: The localhost_log file consists of all the logs. The database-upgrade_<timestamp>.log file consists of logs only related to the upgrade.

   The database-upgrade_<timestamp>.log file appears only if the `glide.db.upgrade.log.save_to_db.enabled` property is set to True. By default, the `glide.db.upgrade.log.save_to_db.enabled` is set to True.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Go to **Upgrade Center** > **Upgrade History**.
   A list of upgrades shows up.
4. Click the required upgrade from the list.
   You can see database-upgrade_<timestamp>.log file is automatically attached to the upgrade.

   Note: The database-upgrade_<timestamp>.log file gets attached only if the `glide.db.upgrade.log.save_to_db.enabled` property is set to True. By default, the `glide.db.upgrade.log.save_to_db.enabled` is set to True.

5. Download the zipped database-upgrade_<timestamp>.log file.

   Note: The database-upgrade_<timestamp>.log file has been zipped to reduce the download time.

Administering Upgrade Center

The Administration module contains information about upgrade risk and execution of skipped record rules.

Managing upgrade risk

You will be notified of the possible conflicts that might result due to several customizations in a skipped metadata file, with a new UI message on the form pages of the metadata files.

One of the major conflict areas during an upgrade is resolving conflicts for skipped metadata files that are released by ServiceNow® but have been customized. These conflicts result from multiple users updating the same files. ServiceNow might update the code in the files which you have customized over time. Whenever you install an application or a plugin, you often customize them as per your requirements. During the next upgrade, you might have several skipped records depending on the previous customizations.

Important: Avoid modifying the high risk and medium risk (if possible) skipped metadata files that can potentially cause conflicted skipped metadata files in your next upgrade. You can edit the files if the modifications are absolutely required.

The purpose of the UI message is to inform you about potential complications that might arise during the upgrade process, especially if any high-priority files have been modified. The notification is of the form of UI messages on the form pages of the metadata files.

The UI message varies based on the severity of the files.

- Medium risk and non-customized: The medium risk files that are not customized might be updated in future releases. It is recommended not to modify these files unless necessary.

  ⓘ Warning: This is a Medium Risk file that might get updated again in later releases. **Do not** alter this file unless necessary.

- High risk and non-customized: The high risk files that are non-customized might be updated in future releases. It is recommended not to modify these files unless necessary.

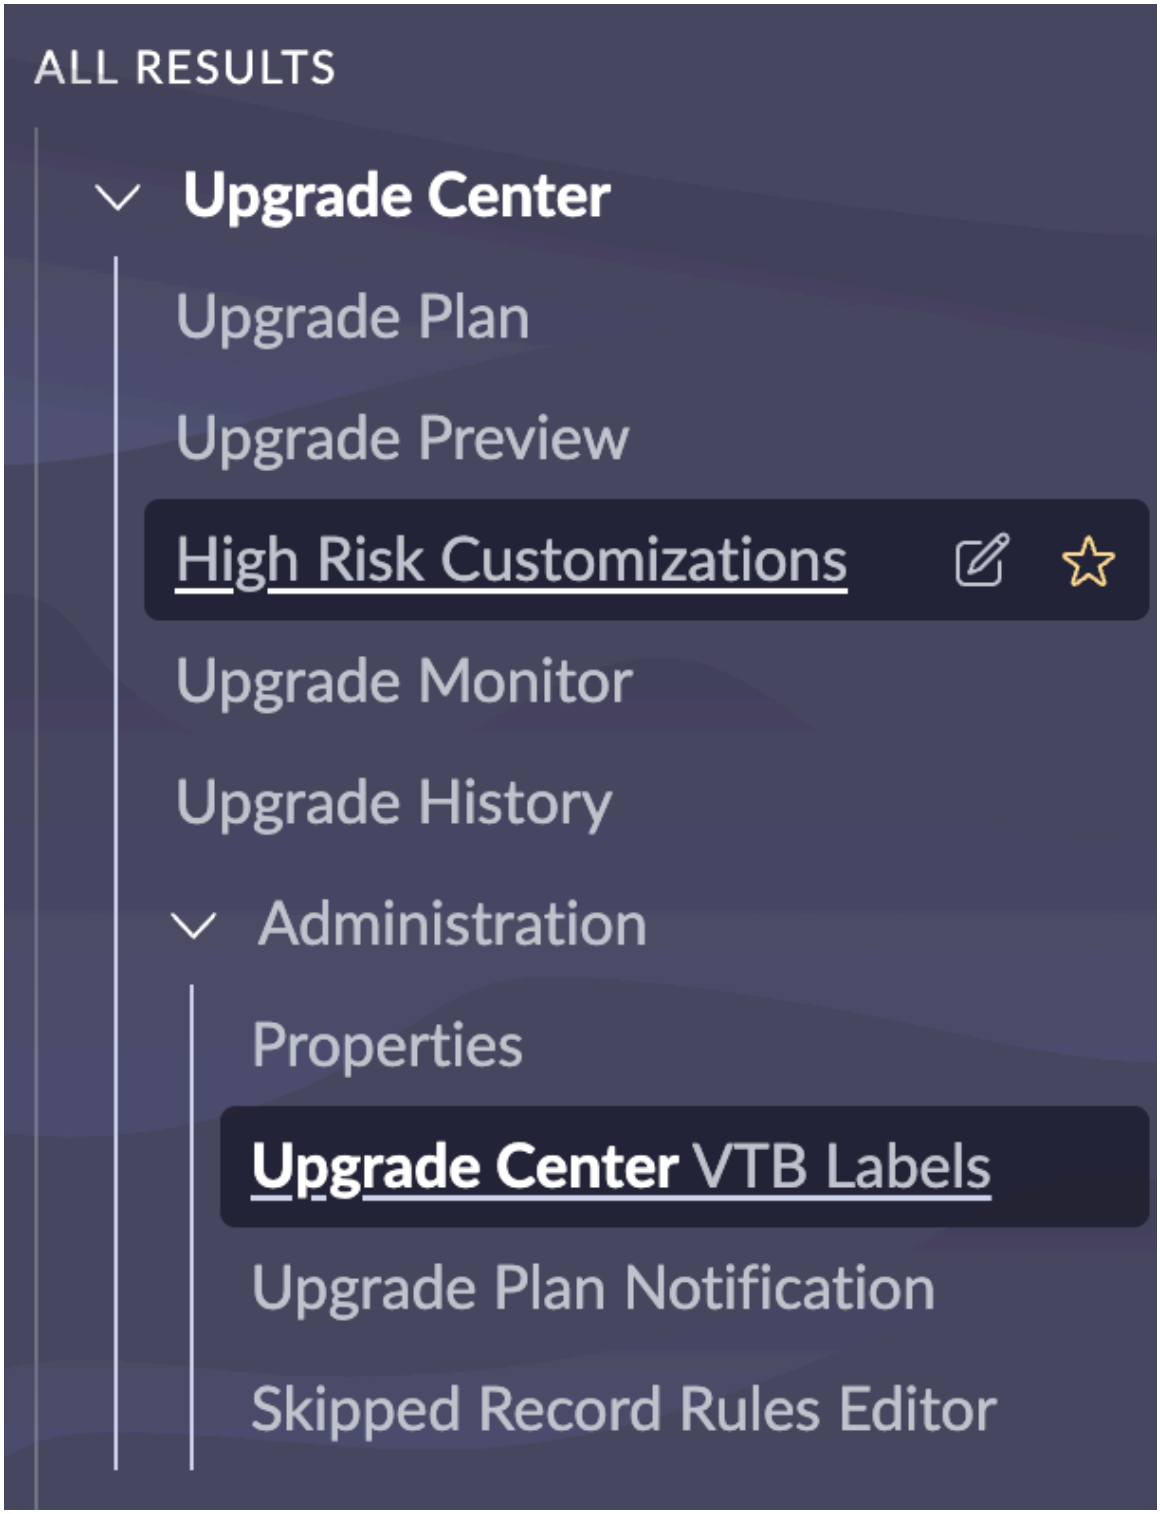
  ⊗ Warning: This is a High Risk file that might get updated again in later releases. **Do not** alter this file unless necessary.

  Note: You can proceed to modify these files if the changes are absolutely required. The following modal shows up.

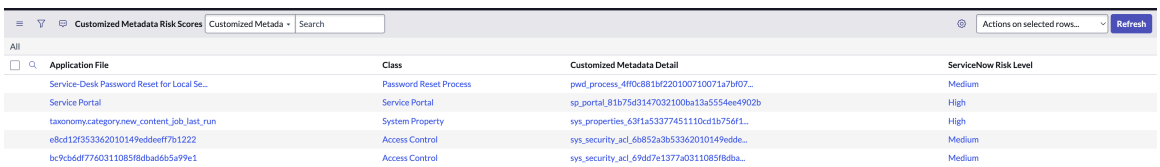
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- High risk and customized: The high risk files that are customized might be updated in future releases. It is recommended to revert them to the Base System to avoid conflicts.

- Medium risk and customized: The medium risk files that are customized might be updated in future releases. It is recommended to revert it to the Base System to avoid conflicts.



- Non-risky and non-customized: You don’t see any warning for this condition.
- Non-risky and customized: You don’t see any warning for this condition.

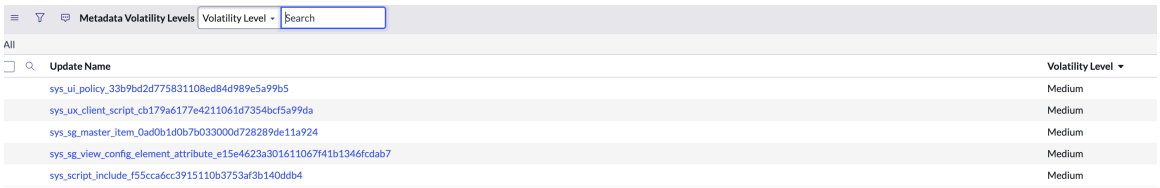


High Risk Customizations menu

The **High Risk Customizations** menu item presents the overlap between ServiceNow's high and medium risk files and your customizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

They are stored in a virtual table called v_metadata_customization_risk, and is refreshed after a set period of time or when you select the **Refresh** on the list view.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk files storage

The high risk and medium risk files are stored in the new sys_metadata_volatility table.

Note: It is recommended not to modify the sys_metadata_volatility table and is automatically updated for every family upgrade. The sys_metadata_volatility table is not a part of the menu item in the navbar.

Note: Risk is determined by the likelihood of a given metadata file being modified, which is predicted based on trends in updates from recent releases. Some files that may not currently exist in the system will be present in the table to account for future installation of apps/plugins.

Create a skipped record rule

Create skipped record rules based on your set conditions to define your customizations after an upgrade.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Administration** > **Skipped Record Rules Editor**.
   A list of available rules shows up.

   Note: By default, a few inactive sample rules have been provided. You can set it to active if you want to use the sample rules.

2. Select **New** to create a new skipped record rule.
   The Upgrade Skipped Record Rules form shows up.

   Note: The new rules are active by default. You can make them inactive if you don't want to use them.

3. Fill in the fields on the form.

Field	Description
Name	Name of the rule.
Order	Order in which the rule runs. **Note:** The order number automatically increments from the last rule order created.
Active	Option to activate the rule.
Conditions	Conditions as to when the rules are implemented on the skipped records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: These conditions are only for skipped records that are not being reviewed. If you set the disposition condition to anything other than the skipped records, that condition doesn't work.
Action	Option to choose one of the four following actions: ○ Keep My Modifications (Always Retain) ○ Revert and Keep Inactive ○ Assign Skipped Records to User ○ Assign Tags to Skipped Records **Note:** Based on the selected action, a message shows up with more information.
Comment	Add a comment on the conditions being set.

4. Select **Submit**.
   The new rule appears on the list of available rules.

What to do next
You can now run the skipped record rules either automatically during an upgrade or can run on demand on the skipped records. See Execute a skipped record rule for more information.

Execute a skipped record rule

Run skipped record rules based on your set conditions to resolve skipped records in an upgrade. The rules either execute automatically during an upgrade or can run on demand after an upgrade.

Before you begin
Role required: admin

Execute a skipped record rule on demand

Execute the skipped record rules on demand on the skipped records whenever it's required.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Administration** > **Skipped Record Rules Editor**.
   A list of available rules shows up.

   Note: By default, a few inactive sample rules have been provided. You can set it to active if you want to use the sample rules.

2. Execute the rules on demand using either of the following ways.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Using Run Now	**a.** Select the rule that you want to execute from the list. **b.** Select **Run Now** from the configuration list action items. **Note:** When you select **Run Now**, a progress bar shows up to display the progress of the rule execution.
Using View Latest Upgrade History tab	**a.** Select the **View Latest Upgrade History** tab. The System Upgrades form shows up. **Note:** The skipped record rules are executed only on the latest upgrade. **b.** Select **Run skipped Record Rules** on the form. **Note:** All the active rules get exe cuted. You can't choose the specif ic active rules to run while using this process.

Execute a skipped record rule automatically

Execute the skipped record rules automatically during the upgrade on the skipped records.

These rules are executed on the skipped records automatically during the upgrade process. The prediction of the rules execution on the skipped records can be previewed on the Skipped list prediction card in the Upgrade Preview module.

Once the execution of the rules are done, the summary can be reviewed in the Upgrade Summary of Upgrade Monitor.

Note: Skipped record rules and upgrade plans can't be implemented together in an upgrade.

Upgrade Center references

These reference topics provide additional information about your upgrade properties, roles and skipped rules.

Upgrade Center properties

On the properties form, you can set parameters that control how the system executes.

Upgrade Duration Estimation Properties

Field / Element	Description

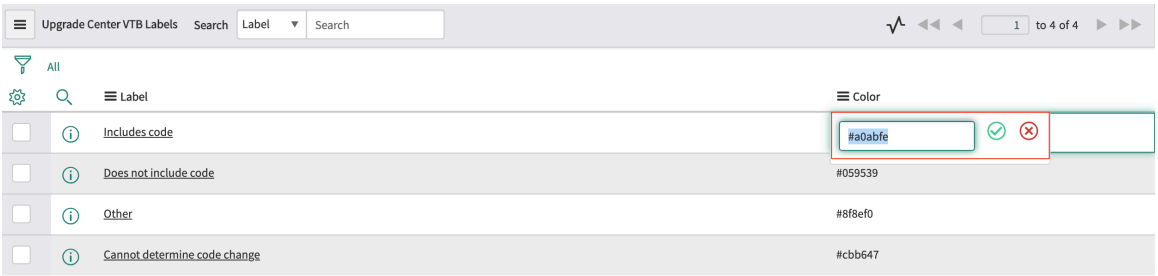
Upgrade Visual Task Board Properties

Field / Element	Description
Enable an admin or user with admin role to own Upgrade VTB *glide.upgrade_center.task_board.owner*	Upgrade VTB owner must be an admin. If this property is absent, the system uses the first admin user from active admin users list. The active admin users list is sorted by username.
Enable admins or users with admin role to be members of Upgrade VTB *glide.upgrade_center.task_board.members*	Upgrade VTB members must be an admin. If this property is absent, the system adds all active admin users as members.

Upgrade Plan Properties

Field / Element	Description
Queries about the type of instance the user is configured. *glide.upgrade.plan.instance_type*	You must configure the instance either as a builder or a consumer. You must build the upgrade plan on a builder instance and implement it on a consumer instance.



Upgrade Center VTB Labels list

The Upgrade Center VTB Labels list under Administration module shows all the labels in the Upgrade Visual Task Board (VTB). You can also change the color of the existing labels.

If you want to change the color of an existing label, navigate to **Upgrade Center** > **Administration** > **Properties** > **Upgrade Center VTB Labels**

Note: If you update the color of an existing label, the change will not be reflected in the current version upgrade related board. The change will be seen only from the next version upgrade.

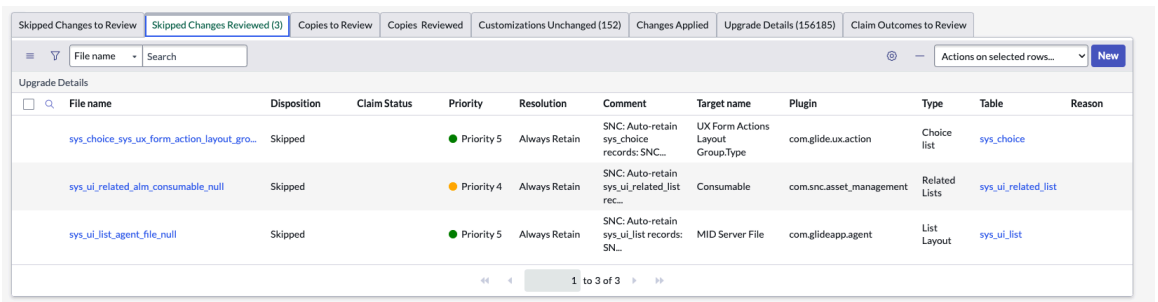
Default skipped rules

Reduce considerable processing time with the default skipped rules to auto-retain high friction causing configuration metadata types.



Starting with Xanadu, new skipped rules have been introduced by default to help you auto-retain certain customizations during the upgrade process. This eliminates the need for manual review of the skipped records generated during the upgrade process.

The following is the list of tables from which if any skipped record is being generated as a metadata file, the customizations are retained by default with the new skipped rules:

- sys_ui_section
- sys_ui_form
- sys_ui_form_section
- sysevent_email_action
- sys_ui_related_list
- sys_ui_list
- sys_choice
- sys_choice_set
- sys_report
- pa_dashboards
- wf_workflow

Note: For wf_workflow_version table, the new skipped rules automatically sets the generated skipped records to **Keep My Modifications (Always Retain)**. This table is generally used for configuration changes and doesn't need to be reviewed.

The skipped records that are retained automatically by the default skipped rules are found in the Skipped Changes Reviewed related list.

Note: You can also find a comment for each retained skipped records to show the related table it was generated from during the upgrade process.

Exploring Upgrade Console

Utilize Upgrade Console to gain a comprehensive understanding of your upgrade process and make informed decisions.

Upgrade Console overview

Upgrade Console is an application that provides the option to upgrade from the instance itself. When you request an upgrade, the instance automatically begins the process at the scheduled time. This upgrade includes both pre-upgrade and post-upgrade steps.

Note: You can install the Upgrade Console store application from the ServiceNow store for the latest version.

Upgrade Console summary	Guided Upgrade
 Access all the relevant information and tools required for your upgrade	 Simplify your upgrade process with the guided setup

Note: The **Guided Upgrade** tab shows up only when the upgrade process has started.

You can access Upgrade Console in one of the following ways.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Steps
Using the application navigator	1. Navigate to **All** > **Admin Center** > **Upgrade Console**. 2. Select one of the sections or tool tiles for more information.
Using Admin tab option	1. Navigate to **Admin** > **Upgrade Console**. 2. Select one of the sections or tool tiles for more information.
Using Admin tab and Admin Home option	1. Navigate to **All** > **Admin Center** > **Admin Home**. 2. Scroll down to the Get information about your instance section. 3. Select the Upgrade Console link in the Instance Upgrade tile.

Upgrade Console users

Users

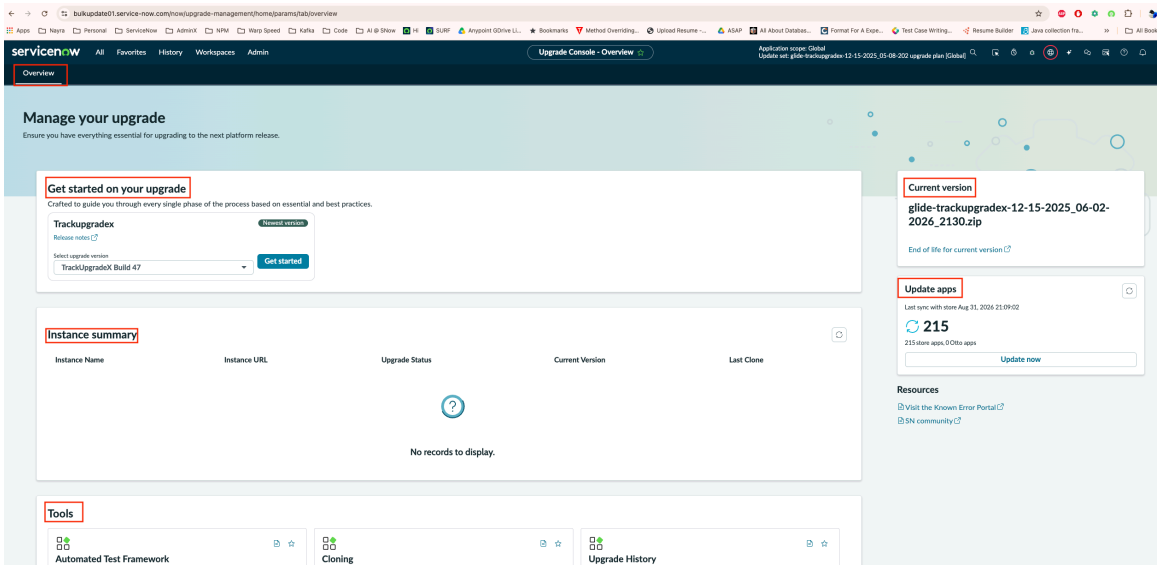
User	Description
upgrade_admin	The system administrator user accesses all tables, tools and information within Upgrade Console on your instance.

Upgrade Console benefits

Benefit	Feature	Users
One-stop shop experience for all relevant information for an upgrade	Upgrade Console summary	System administrator
Unfettered access to all tools required for your instance upgrade	Upgrade Console tools	System administrator
Guided setup process for your instance upgrade	Access guided upgrade on a non-production instance	System administrator

What to explore next

To learn more about using Upgrade Console, see:



- Using Upgrade Console
- Administering Upgrade Console
- Upgrade Console references

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Upgrade Console summary

Utilize the Upgrade Console store application to access all pertinent information and tools for your upgrade.

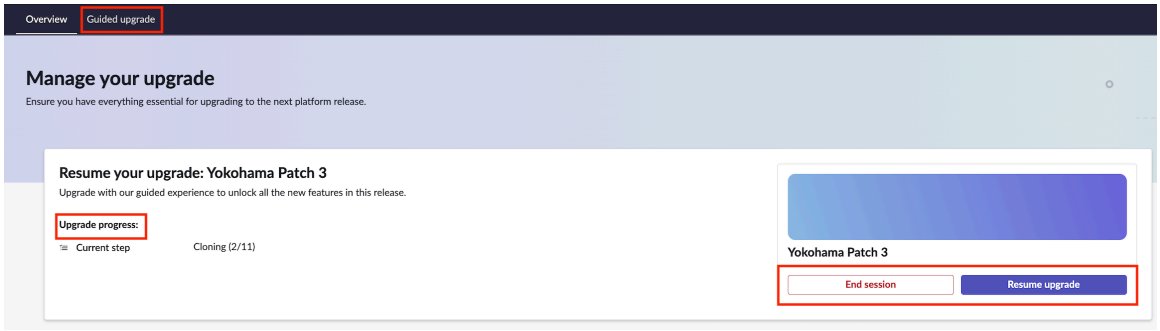
Note: The Overview details for Upgrade Console are same for both sub-production and production instances.

You can achieve the following using Upgrade Console.

- Get a comprehensive, single-page view of all relevant information for an upgrade
- Access to all required tools for an upgrade
- Option to use the guided setup process for an upgrade on your instance
- One-stop experience for a seamless upgrade process

Note: By default, you are on the Overview tab when you first land in Upgrade Console. The Guided Upgrade tab shows up only when the upgrade process has started.

The following are the major sections on the Overview tab.



Get started on your upgrade

In this section, you can view the latest version. You can also select the required patch version and select **Get started** to start the selected upgrade. Select Read release notes link to view the delta changes in the latest version of the release.

Note: This section has the above UI only when an upgrade has not started.

If an upgrade is already in progress or have been paused in between, you will see the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This section shows the current upgrade version name and the progress of the upgrade process. Select **Resume upgrade** if you want to resume the upgrade process. You can also end the upgrade process by selecting **End session**.

Note: It is to be noted that if you end an upgrade, it rolls back all progress and data created for your upgrade.

Upgrade scheduled

In this section, you can view the scheduled upgrade name and the start date information. You can select **Go to monitor** to go to the Monitor module to see more details on the scheduled upgrade. Select **Go to guided upgrade** to work on the pre and post upgrade activities.

Note: This section is visible only when an upgrade is scheduled.

Instance summary

This section states the name of the instance and the URL link to the instance. It also shows the status which can be either Scheduled or Not Scheduled. Apart from that, it also shows the current version of the instance and information about the latest clone.

Current version

You can view the current version name in this section.

Note: You can also select the End of life for current version link to learn when the current version expires. See KB0610454 for more information.

Tools

This section displays all the required tools needed for a seamless upgrade experience. It has the following tools:

- Automated Test Framework: The Automated Test Framework (ATF) is a robust tool designed to automate the testing of your instance. By automating test creation and execution, the ATF significantly reduces the time and effort required to verify instance functionality after various changes, such as upgrades, application development, or configuration updates implemented through update sets. When a test fails, the ATF provides detailed information about the specific changes that might have caused the issue, enabling you to quickly identify and address the root cause. See Explore ATF in Upgrade Console for more details.
- Cloning: The System Clone application facilitates the duplication of entire databases. This cloning technique, frequently employed to mirror a production instance for testing purposes, utilizes data extracted from the latest nightly backup. See Explore Cloning in Upgrade Console for more details.
- Upgrade History: The Upgrade History module maintains a comprehensive record of all upgrades performed on your instance. This module allows you to access detailed reports of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

both historical and recent upgrades, providing valuable insights into the upgrade process and its outcomes. See Explore Upgrade History in Upgrade Console for more details.

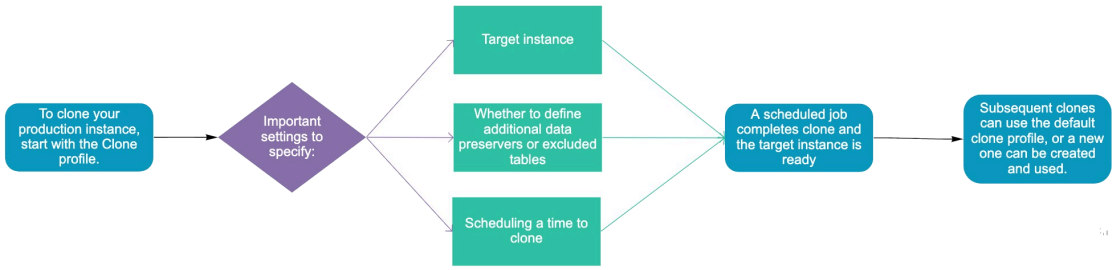
- Upgrade Monitor: The Upgrade Monitor module empowers you to efficiently manage the upgrade process. You can schedule upcoming upgrades and monitor the progress of ongoing upgrades in real-time. Once an upgrade is complete, the module provides a detailed summary of the upgrade process and a list of any records that encountered conflicts during the upgrade. See Explore Upgrade Monitor in Upgrade Console for more details.
- Now Support: See Now Support in Upgrade Console for more details.
- Upgrade Preview: The Upgrade Preview module offers a comprehensive solution for gaining a deep understanding of your instance's readiness for an upgrade. By providing a detailed preview of how your instance might be affected by different ServiceNow release versions, this module enables you to make informed decisions about your upgrade strategy. With the ability to explore and assess potential impacts, you can confidently plan, schedule, and prepare for your upgrade, ensuring a successful transition to the latest ServiceNow release. Explore Upgrade Preview in Upgrade Console for more details.
- Upgrade Skipped Record Rules Editor: To effectively manage customization requirements during and after upgrades, leverage skipped record rules. By creating these rules based on your specific conditions, you can either automate the resolution of skipped records during the upgrade process or manually execute them post-upgrade. This flexible approach empowers you to maintain control over your customizations and ensure a seamless upgrade experience. See Explore Upgrade Skipped Record Rules Editor in Upgrade Console for more details.
- Upgrade Plans: Experience a more efficient and streamlined upgrade process with the Upgrade Plan. This feature automates the installation of applications, significantly reducing the time and effort required to complete upgrades. Upgrade Plan empowers you to take control of your upgrade process and achieve a seamless transition to the latest ServiceNow release by allowing you to define the applications and target versions to be installed in your instance. See Explore Upgrade Plan in Upgrade Console for more details.

Helpful Resources

This section contains links to the product documentations, knowledge error portals, and community forums.

Explore ATF in Upgrade Console

The ATF Test Generator and Cloud Runner is a powerful tool that leverages ServiceNow's advanced capabilities to intelligently generate comprehensive regression tests specifically designed for your instance.



By analyzing your instance's specific behavior and workflows, the test generator intelligently creates precise test cases. This tool seamlessly integrates with the existing ATF framework, providing a smooth user experience. Additionally, you have the flexibility to execute these tests using ServiceNow's Cloud Runner, which leverages headless browsers hosted by ServiceNow.

See ATF Test Generator and Cloud Runner tool in Upgrade Console for more information.

Explore Cloning in Upgrade Console

The System Clone application facilitates the creation of exact copies of instance databases. This process is frequently employed to replicate production instances into pre-production environments for thorough testing of proposed changes. The cloned data is derived from the most recent nightly backup, ensuring data accuracy and consistency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: A new, unified admin experience for cloning data between instances is now available in the Clone Admin Console. This enhanced console builds upon our existing clone engine and provides improved visibility into one of our most frequently used automations. In addition to streamlining the cloning process, the console offers a range of other enhancements.

See Cloning tool in Upgrade Console for more information.

Explore Upgrade History in Upgrade Console

The Upgrade History module maintains a comprehensive record of all upgrades performed on an instance. This module allows you to access detailed reports for both historical and recent upgrade versions.

To view an upgrade history record, navigate to Upgrade Console in one of the ways.

Option	Steps
Using left navigation	1. Navigate to **All** > **Admin Center** > **Upgrade Console** > **Upgrade History**. 2. Select an upgrade from the list. On selecting an upgrade from the list, the System Upgrades form appears.
Using Admin tab option	1. Navigate to **Admin** > **Upgrade Console** > **Upgrade History**. 2. Select an upgrade from the list. On selecting an upgrade from the list, the System Upgrades form appears.

System Upgrades form details

Field	Description
From	Name of the previous .war file (version).
To	Name of the applied .war file (version).
Upgrade started	Time stamp when the upgrade process began.
Upgrade finished	Time stamp when the upgrade process was completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade History Details form section

Field	Description
Changes skipped	Total number of records that are different from the previous upgrade and the upgrade component was not applied, mostly due to customization.
Changes applied	Total number of changes that are applied as a part of this upgrade **Changes applied** is sum of updated and different records, added to the number of deleted records (where the value of changed is true) added to the number of inserted records (where the value of changed is true).
Changes processed	Total number of records that were processed as a part of this upgrade. Changes processed is the sum of **Changes skipped** and **Changes applied**.
Copies to review	Total number of copied records to review whose base records have been upgraded.

See Upgrade History tool in Upgrade Console for more information.

Explore Upgrade Monitor in Upgrade Console

The Upgrade Monitor module is a powerful tool for scheduling upgrades, monitoring their progress, and analyzing post-upgrade results, including conflict resolution.

Access Upgrade Monitor

If you log in with the admin role while an upgrade is underway, the system automatically displays the Upgrade Progress screen. If no upgrade is in progress, you can follow one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Console** > **Upgrade Monitor**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Console** > **Upgrade Monitor**.

How the Upgrade Monitor fits into the upgrade process

Note: For detailed information about the upgrade process, see Upgrade your instance.

The Upgrade Monitor concerns only part of the larger upgrade process:

1. Clone the production instance to a test instance and a non-production instance.
2. Apply the upgrade to the non-production instance.
3. On the upgraded non-production instance, Process the skipped records list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Test the non-production instance to confirm that the instance still works and performs adequately. Compare to benchmark data from pre-upgrade production instance.
5. Apply the upgrade to the test instance. Import the update sets created on the non-production instance when you processed the skipped list. Repeat the testing to make sure that the process is working.
6. Apply the upgrade to the production instance. Import the update sets created on the non-production instance when you processed the skipped list. Test to confirm that the instance works and performs adequately.

Within this larger process, the Upgrade Monitor helps you upgrade individual instances:

- During the upgrade, it shows where in the process the system is
- After the upgrade, it reports what the upgrade did and for how long
- As you upgrade the first non-production instance, it helps you resolve conflicts between customizations and changes that are part of the upgrade
- On non-production instances, it provides information that can help you estimate how long the upgrade might take on the production instance

Monitoring an individual instance as it upgrades

While the upgrade is in progress the Upgrade Progress shows what the upgrade process has done, what it is doing, and what remains to be done.

When the upgrade completes, the system displays the Upgrade Summary Report. The Upgrade Summary Report provides information about conflicts between customizations versus changes in the upgrade and provides a link to reconcile these conflicts. For information about understanding and resolving these conflicts, see Process the skipped records list list.

When you upgrade a non-production instance, the Upgrade Summary Report can help you estimate how long the same upgrade might take on a production instance. For details about the elements on this report and how to use this information, see Upgrade details form.

Resolving conflicts

To prevent losing customizations, the system skips upgrading records you have customized and provides you with a list of these skipped records.

As you upgrade your first non-production instance, go through the Skipped Changes to Review related list and resolve these conflicts. The system records the changes you make during this process in update sets. See Review skipped records using related lists, for more information.

You do not need to reconcile the skipped list on any instances you later upgrade. Instead, you can apply the upgrade then import the update sets containing your changes.

For details on reconciling conflicts, see Process the skipped records list.

See Upgrade Monitor tool in Upgrade Console for more information.

Factors affecting upgrade duration

Various factors affect how long the system takes to perform an upgrade. The Upgrade Monitor on non-production instance can help you understand those factors and estimate how long the upgrade to your production instance takes.

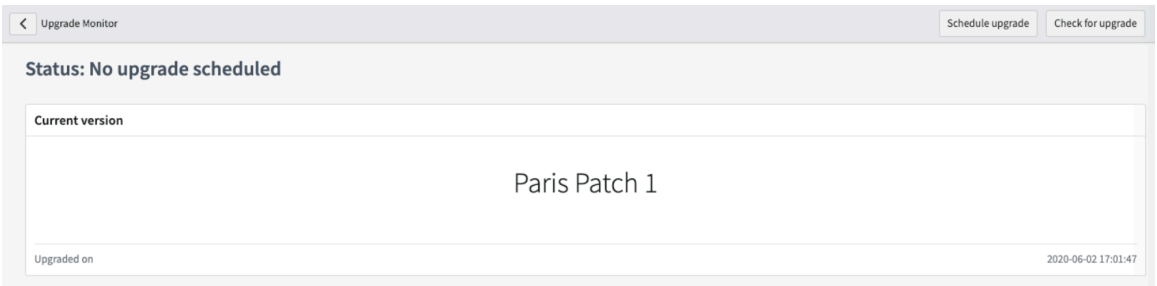
Many factors can affect the duration of the upgrade process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The number of records in the database
- The number of customizations in the database
- The number of nodes in the instance
- The size of tables in the instance that require a schema-change in the instance
- The number of fix scripts required and the size of the tables those fix scripts manipulate

Upgrading a non-production instance can help you estimate how long the upgrade takes on production, but differences between the instances can significantly affect the duration:

- When you cloned the production instance to the non-production instance, you may have clone-excluded some tables. This reduces the size of the database and makes the non-production instance upgrade faster than the production instance.
- The production instance may have more memory and processing power.
- The production instance may have more nodes than the non-production instance.



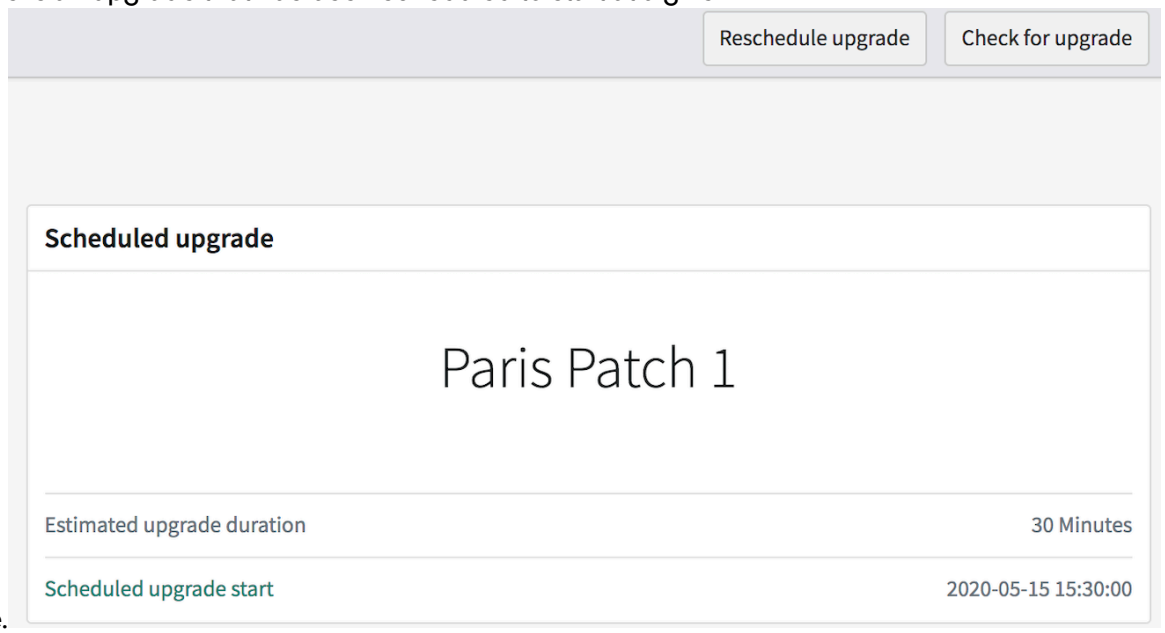
After upgrading the first non-production instance, examine the Upgrade Summary Report for data to help estimate the impact of these factors.

Upgrade Monitor schedule states

When an upgrade is scheduled, the Upgrade Monitor displays information about the next scheduled upgrade. It displays the date and time when the next scheduled upgrade will start. If there is no upgrade scheduled, the Upgrade Monitor displays **Status: No upgrade detected**.

No upgrade scheduled

There is no upgrade that has been scheduled currently.

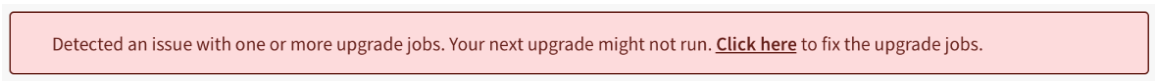


You can also schedule an upgrade by selecting **Schedule upgrade**. To check for an immediately available upgrade, select **Check for upgrade**. It also shows the current version of your upgrade and the date it was upgraded on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade scheduled

There is an upgrade that has been scheduled to start at a given time.



You can also reschedule the upgrade by selecting **Reschedule upgrade**. To check for an immediately available upgrade, select **Check for upgrade**. By selecting either **Reschedule upgrade** or **Schedule upgrade**, you will be directed to HI Upgrade Wizard.

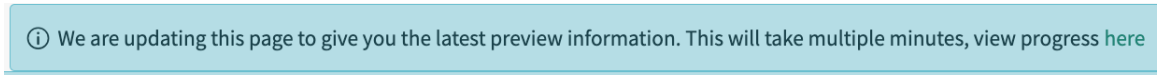
Upgrade monitor with issue detected

If one or both of the triggers for upgrading the system ('Check distribution for possible upgrade' and 'Check database for possible upgrade') have been customized or are missing, the Upgrade Monitor displays a warning and provides a button for resolving the issues.

Note: If your instance is self-hosted (not hosted by ServiceNow) this message may not necessarily indicate a problem. If you have customized or disabled the upgrade job and want to keep that customization or disabled state, do not select the button to fix the upgrade issue.

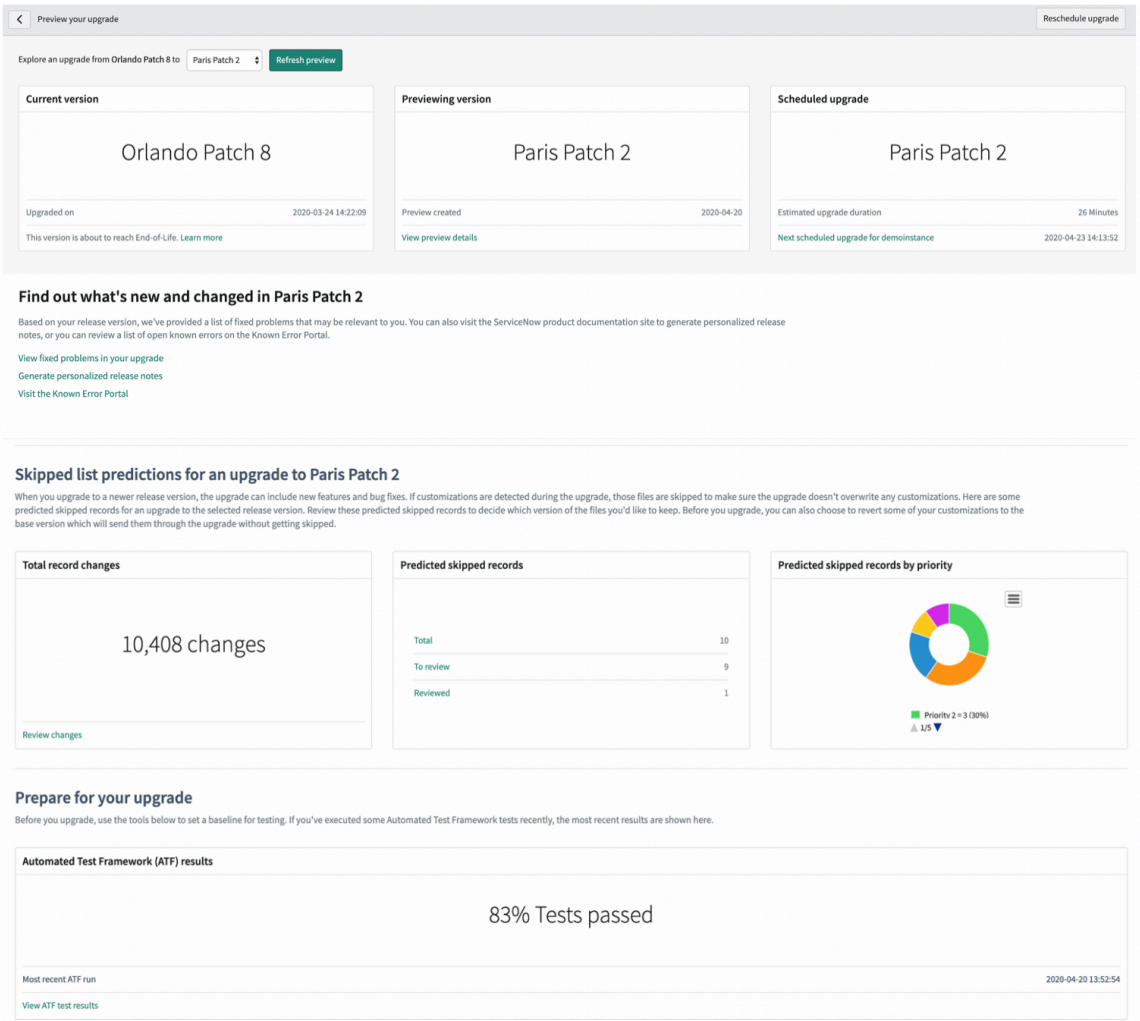
To resolve the issues with the upgrade jobs, select the link in the message. This action reverts both upgrade triggers ('Check distribution for possible upgrade' and 'Check database for possible upgrade') to their base versions.

Note: 'Upgrade' job has been renamed to 'Check distribution for possible upgrade' starting Paris. 'Check Upgrade Script' job has been renamed to 'Check database for possible upgrade' starting Paris.



Explore Upgrade Preview in Upgrade Console

Leverage the Upgrade Preview module to conduct in-depth assessments of your ServiceNow instance prior to an upgrade. Explore how different release versions may affect your current configurations and fine-tune your upgrade plan accordingly.



The preview status info and link in the message displayed on top of the Upgrade Preview page states the current status of the ongoing preview process. Since you can get an accurate prediction on the new and existing applications and their skipped records, the preview execution

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

time has increased considerably. Click on the link in the message to see the status of the preview process.

The Execution Tracker record shows up on clicking the progress link in the message. Click Show status related list to show the current status of the executed preview process.

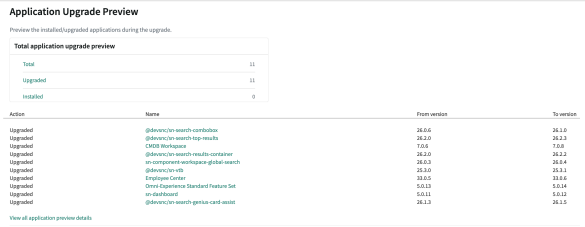
Note: Depending on the eligibility of your instance, the list of available target versions for preview varies. Only versions that are allowed for a particular instance to be upgraded to, show up on the list. If your instance is not eligible to be upgraded to any version, the drop-down menu is empty.

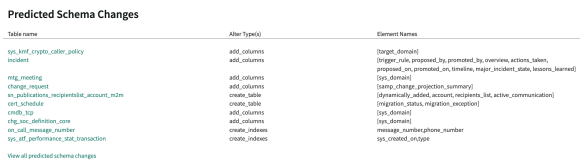
The following cards show up with more information.

Card names	Description
Current version	Name of the current version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	• Upgraded on: Date on which the instance got upgraded to the current version • End of life: Link to KB0610454 for more information about end of life
Previewing version	Information about the previewing version shows up. If you haven't previewed any version, you are expected to select a version for preview and click **Go**. If you have already previewed a version, the following information shows up. • Preview created: Date on which the preview was created • View preview details: Link to the Upgrade Preview form **Note:** Click **Refresh preview** if you want to regenerate a new preview of the same target version. Although clicking **Refresh preview** regenerates the skipped list, the reverted records won't get skipped. If you have reviewed and retained some records, they get replaced as soon as you click **Refresh preview**.
Scheduled upgrade	Name of the next upgrade that has been scheduled to start. If there is no currently scheduled upgrade, the card shows No upgrade scheduled. **Note:** This card can have different messages depending on the schedule of the upgrade. If there is an upgrade scheduled, the following information shows up. • Estimated upgrade duration: Estimated duration needed to complete the scheduled upgrade **Note:** If this is your first upgrade, there will be no information about estimated upgrade duration. • Next scheduled upgrade: Date and time on which the next upgrade has been scheduled to start.
Find out what's new and changed	Links to view the new and changed features in the current upgrade version. The following





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	three links show up when you click **Go** to preview the upgrade version. • Problem fixes: Fixes that have been made since the last upgrade version • Personalized release notes: Release notes summary for the previewed version • Known error articles: Errors that have been identified but not yet resolved **Note:** These links don't show up if you haven't previewed any upgrades.
Skipped list prediction **Note:** If you are using Upgrade Plan, the card name changes to Skipped list prediction with plans.	Information about the predicted skipped records. See Preview predicted changes for more details. • Total record changes: Total number of records that are predicted to change when the upgrade occurs. Total record changes also include possible predicted skipped files known as Predicted skipped records. Review changes: Link to the list of records that have changed and can be reviewed • Predicted skipped records: Total number of records that have been predicted to be skipped. ○ Total: Total predicted skipped records ○ To review: Predicted skipped records to be reviewed ○ Reviewed: Predicted skipped records that have been reviewed ○ Resolved: Predicted skipped records that have been resolved by implementing the rules **Note:** This entry shows up on the card only when rules are executed on the skipped records. You will also see a link to create a skipped record rule if either there are no existing rules or the existing rules aren't executed. **Note:** Skipped record rules and upgrade plans can't be implemented together. See Execute a skipped record rule automatically for more information.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	 By default, 10 applications preview details show up. Click View all applications preview details link to view the entire list. It states the name of the application and the following information: • Action: The action taken on the specific application. It can either be upgraded for the existing applications or installed for the new applications. • From version: States the previous version of the upgraded application (existing application). **Note:** This field is empty if the application is a newly installed application. • To version: States the current version to which the existing application has been upgraded. **Note:** This field shows the current version of the newly installed application.
Predicted Schema Changes	Prediction about the kind of changes in the database based on the upgrade on your instance.  By default, 10 predicted schema changes show up. Click View all predicted schema changes link to view the entire list. Changes like new columns, new tables, and new indexes are captured in this section.
Automated Test Framework (ATF) results	Percentage of passing ATF tests that ran in the last 30 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Card names	Description
	• Most recent ATF run: Date and time on which the recent ATF tests ran • View ATF results: Link to show more information about the recent ATF results **Note:** Only the tests which are finished and have passed are considered for the ATF results. If one test runs more than once, only the recent execution is considered in the results.

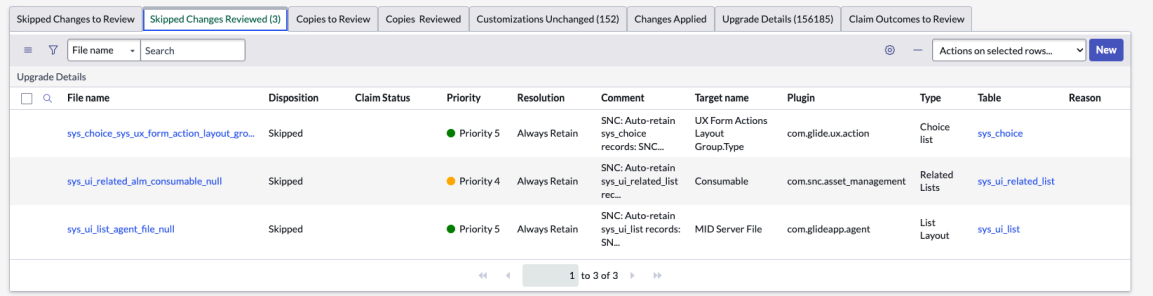
See Upgrade Preview tool in Upgrade Console for more information.

Explore Upgrade Skipped Record Rules Editor in Upgrade Console

Configure skipped record rules with the use of Upgrade Skipped Record Rules Editor to automate or facilitate the resolution of data inconsistencies arising from the upgrade process.

Formulate automated resolution rules to mitigate potential customization conflicts following an upgrade. These rules can be configured to execute autonomously during the upgrade process or manually initiated post-upgrade.

Starting Xanadu release, new skipped rules have been introduced by default to help you auto-retain certain customizations during the upgrade process. This eliminates the need for manual review of the skipped records generated during the upgrade process.



The following is the list of tables from which if any skipped record is being generated as a metadata file, the customizations are retained by default with the new skipped rules:

- sys_ui_section
- sys_ui_form
- sys_ui_form_section
- sysevent_email_action
- sys_ui_related_list
- sys_ui_list
- sys_choice
- sys_choice_set
- sys_report
- pa_dashboards
- wf_workflow

Note: For wf_workflow_version table, the new skipped rules automatically sets the generated skipped records to **Keep My Modifications (Always Retain)**. This table is generally used for configuration changes and doesn't need to be reviewed.

The skipped records that are retained automatically by the default skipped rules are found in the Skipped Changes Reviewed related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can also find a comment for each retained skipped record to show the related table it was generated from during the upgrade process.

See Upgrade Skipped Record Rules Editor tool in Upgrade Console for more information.

Explore Upgrade Plan in Upgrade Console

The Upgrade Plan automates the installation of applications during upgrades, providing a seamless upgrade experience. Define applications and target versions to be installed in your instance and accelerate your upgrade process.

Navigate to Upgrade Plan using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Console** > **Upgrade Plan**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Console** > **Upgrade Plan**.

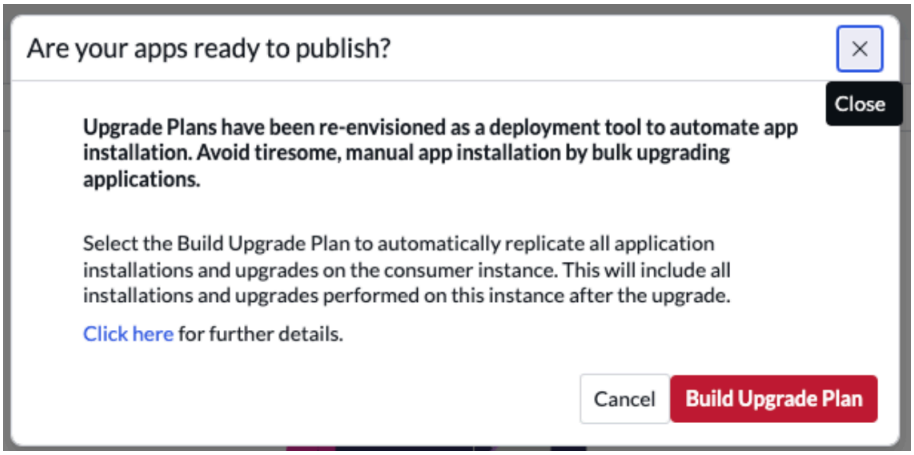
You will need the following instances to use Upgrade Plan.

- Builder instance: Build your upgrade plan
- Consumer instance: Implement your created upgrade plan

Note: Ensure that you have upgraded your instance to the latest available version to build the upgrade plan. It is recommended to configure your dev instance as your builder instance. You are required to install the upgrade plan before upgrading your consumer instance. See Upgrade Plan Properties for more details.

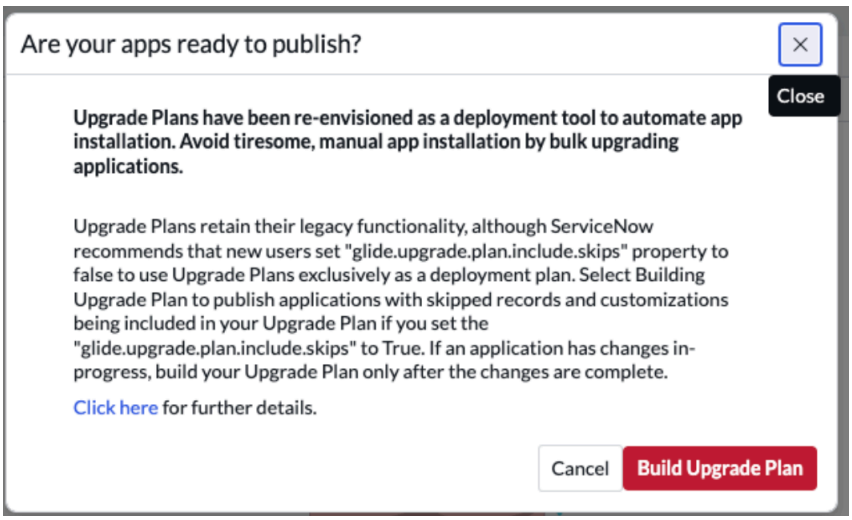
When you upgrade an instance, resolutions are skipped, and customizations are often loaded post upgrade. This causes temporary breakdown of features until fully loaded. Tasks like committing update sets, installing new plugins and applications, and multiple updates are also time consuming. Use the Upgrade Plan feature to automate these post-upgrade tasks by tracking your actions and replaying the steps on all the required instances. You don't have to manually apply post-upgrade tasks which helps in reducing downtime.

Note: After upgrading to the latest version, you will see some skipped records. Some of those records will already be marked as reviewed and some of them will need to be reviewed.



Starting in the Yokohama release, customizations and skipped records are not a part of the Upgrade Plan, by default. You can choose to include the customizations and skipped records along with the app installations within the Upgrade Plan by enabling theglide.upgrade.plan.include.skips property. This property controls about when skips and customizations are included when you build or refresh an Upgrade Plan.

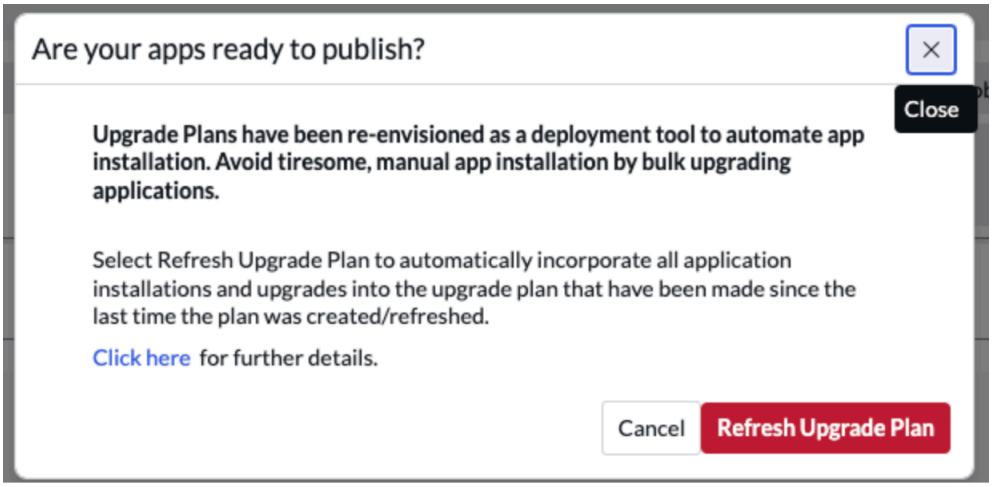
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



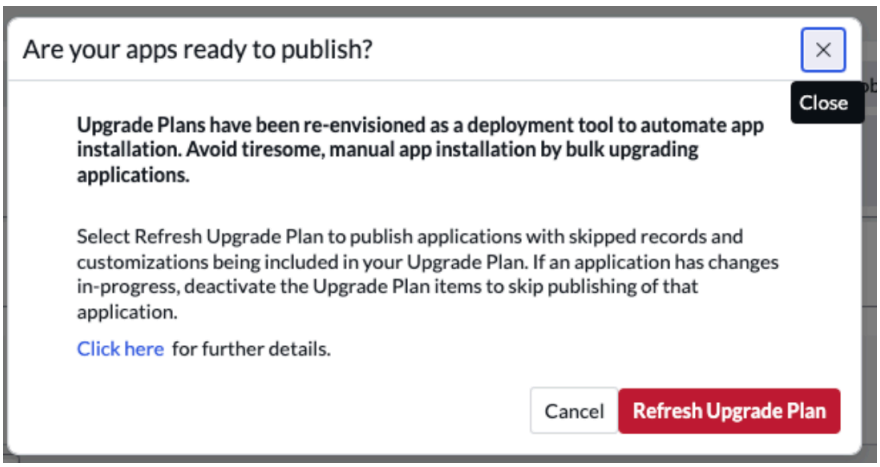
- When glide.upgrade.plan.include.skips property is **TRUE**, skips and customizations are included when an Upgrade Plan is built or refreshed
- When glide.upgrade.plan.include.skips property is **FALSE**, skips and customizations aren't included when an Upgrade Plan is built or refreshed. This property has been set to False by default.

You will see one of the following modal messages depending on the scenario:

- First time user: When you are building your Upgrade Plan for the first time (the property is disabled by default)



- Building the upgrade plan with the property enabled



- Refreshing the Upgrade Plan with the property disabled (default)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Refreshing the Upgrade Plan with the property enabled

Advantages of Upgrade Plan over Update Sets

You can achieve the following using Upgrade Plans:

- Along with the skipped record resolution, you can also track app and plugin installation.

  Note: You won't be allowed to choose the skipped records that are captured by the upgrade plan. Upgrade plan captures all the skipped records regardless of whether they are reviewed or not and modified or not. If the customizations are coming from different instances, then the skipped records are required to be reviewed.

- Optimizing the table alters using batch bootstrapping.
- Manage your customizations using the App Repository.

Note: It is recommended to build an Upgrade Plan for each instance upgrade. When you build an upgrade plan on a builder instance, it gets created to the exact same version as the builder instance version (including patches and hot fixes). You can't use the previously created Upgrade Plan for the new instance upgrade. In case of consumer instances, when you install the upgrade plan, its version should match exactly the consumer instance version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Persona

If you are using the app repository for active application development, use Upgrade Plan to accelerate your upgrades.

Note: If you are currently using the Update Sets and want to catapult your upgrade process, use the Upgrade Plan feature.

Design considerations

The following are the important considerations while working with Upgrade Plan:

- Each new instance upgrade requires its own upgrade plan. It can't be shared across upgrades.
- Only one builder instance is supported to build the Upgrade Plan.
- Upgrade Plan can’t be uninstalled on a consumer instance. You can roll back the entire upgrade but not partially.
- The scope of the files moved to **Global Customizations - Upgrade Plan** application by upgrade plan is still global.
- During an upgrade, only the upgrade plan items with **State=Ready** and **Active=true** are installed on the consumer instances. The rest of the items are skipped.
- Upgrade sets can’t be included in the Upgrade Plan.
- Maint only plugins are not allowed in Upgrade Plan.
- Configure your instance as a builder instance before installing new applications and plugins or during skip resolutions. Otherwise, the actions are not captured by the Upgrade Plan.
- You can’t view the list of customizations in the Upgrade Plan items view. You can navigate to the respective tables to ensure if the customization has been captured.

See KB1271313 for more information.

Upgrade Plan background operations

During the building of the upgrade plan, the following operations are done in the background:

- Skipped records are packaged and uploaded to the App Repository in the form of Global Application and App customization. The following are the 3 types of apps created by Upgrade Plan on your instance and App Repo.

  Note: After the packaging is done, you can choose the items from the Upgrade Plan. An Upgrade Plan works at the scope level, so it captures everything and publishes it to the repository.

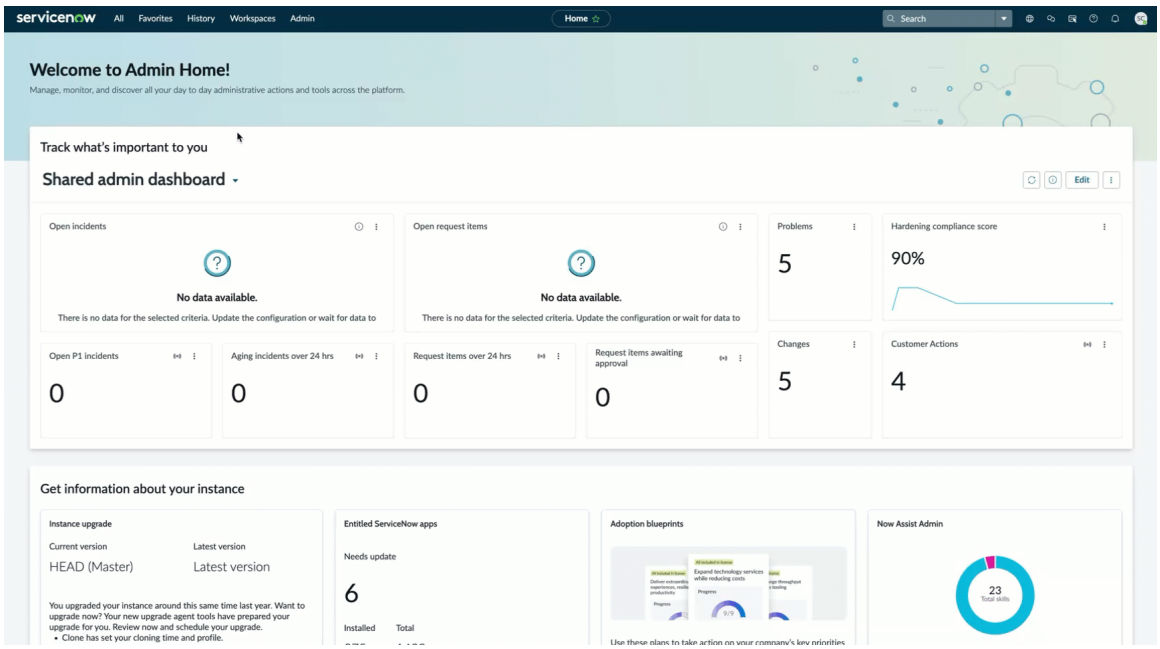
  - The global records are packaged into the global customization upgrade plan app and published to the app repo.
  - The scoped skipped records are packaged into the respective app customization packages.
  - When the upgrade plan is published, a global application is created, for example, **Upgrade Plan - release name**.
- Existing ServiceNow features like Global Application and App customization are used as application containers that can be installed in all the required instances. See and Application scope for more information.
- If you install any applications or plugins, they are also captured in the Upgrade plan. But, since they are application life cycle items, they are never pushed to the App Repository.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

During the consumption of the upgrade plan, the following operations are done in the background:

- At first the upgrade plan is validated and then the source from the app repo is downloaded.
- Once the source is downloaded, the app is moved to the ready state.

> **Note:** Only the upgrade plan items with **State=Ready** and **Active=true** are installed on the consumer instances. The rest of the items are skipped.



- Auto-generation of the preview for the upgrade plan.

See Upgrade Plans tool in Upgrade Console for more information.

Guided upgrade

Upgrade your instance effortlessly with the guided process.

To streamline your upgrade process, follow the guided setup steps outlined in Access guided upgrade on a non-production instance and Access guided upgrade on a production instance. Before you begin, ensure you're logged in as an administrator. This intuitive tool walks you through the necessary pre- and post-upgrade activities and the instance upgrade tasks, ensuring a seamless transition to the latest release.

> **Note:** The GIF illustrates accessing the guided upgrade feature on a non-production instance. The process is the same for both production and non-production instances.

Using Upgrade Console

Use the Upgrade Console experience to access all the tools, information, and guided setup for a smooth upgrade on your instance.

Review the following for a seamless upgrade experience.

Upgrade Console tools

Access all the necessary tools you might require for a seamless upgrade experience on your instance.

You can access the following tools from the Upgrade Console experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The tools available in Upgrade Console are same for both sub-production and production instances.

ATF Test Generator and Cloud Runner tool in Upgrade Console

Leverage the power of ServiceNow's ATF Test Generator and Cloud Runner to create intelligent, comprehensive regression tests.

You can achieve the following using the ATF Test Generator and Cloud Runner store application.

- Leverages ServiceNow's AI to automatically create regression tests tailored to specific instances.
- Integrates seamlessly with the existing ATF framework, ensuring a smooth user experience.
- ServiceNow's Cloud Runner allows you to execute ATF tests on a headless browser, eliminating the need for local setup.
- Intelligent test generation helps ensure comprehensive test coverage for your applications.
- Automated test creation and cloud-based execution significantly reduce testing time and effort.
- AI-powered test generation minimizes human error and improves the reliability of test results.
- Streamlined workflows and efficient test execution optimize your testing process.

See ATF Test Generator and Cloud Runner for more information.

Cloning tool in Upgrade Console

Utilize the System Clone application to duplicate an entire database from one instance to another. This cloning process, commonly employed to replicate a production instance for pre-production testing, leverages the latest nightly backup as the data source.

You can achieve the following using the System Clone tool:

- Clone a ServiceNow instance to a target instance.
- Clone a ServiceNow instance to a target instance running a different version.
- Clone a ServiceNow instance from a backup.
- Clone a ServiceNow instance over a production instance.

See Exploring Instance Clone for more information.

Upgrade History tool in Upgrade Console

Utilize the Upgrade History module to maintain a comprehensive record of all upgrades performed on an instance. Access detailed reports for both historical and recent upgrade versions to facilitate analysis and troubleshooting.

See Reviewing upgrade history for more information.

Reviewing upgrade history

The Upgrade History module tracks every upgrade made to an instance. You can also view the complete report of an old upgrade or a recently completed upgrade version using this module.

- Upgrade History related lists: Use the related lists to resolve, track and review the skipped records in an upgrade
- Visual task board (VTB) view of skipped records: Use the VTB view to see the resolution status of any previous upgrade with skipped records

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review skipped records using related lists

Use different related lists to resolve, track and review the skipped records in an upgrade.

Before you begin

Role required: admin

Procedure

1. Navigate to Upgrade History using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade History**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade History**.

   A list of upgrades is displayed.

2. Select an upgrade from the list.
   System Upgrades form is displayed.
3. Select any of the following related lists to review the skipped records.

   Skipped Changes to Review related list

   Resolve the skipped update records by tracking and reviewing them in the Skipped Changes to Review related list. To prevent your customizations from being overwritten during system upgrades, the upgrade process skips (does not apply the update to) objects that have been customized. See Resolve a skipped update and set a resolution status for more information.

   Skipped Changes Reviewed related list

   View the list of the reviewed skipped records in the Skipped Changes Reviewed related list. When you select a skipped record to review and set a **Resolution Status** to a value other than Not Reviewed, the update record moves from Skipped Changes to Review related list to the Skipped Changes Reviewed related list.

   Copies to Review related list

   Copies to Review lists all the records that need to be reviewed.

   Copies Reviewed related list

   Copies Reviewed lists all the records that have been reviewed.

   Customization Unchanged related list

   Customizations Unchanged lists all records that were skipped (due to a customization), but there have been no changes from the last upgrade. See Revert a customization for more information.

   Changes Applied related list

   Changes Applied lists all changes that were applied in this upgrade.

   Claim Outcomes to Review related list

   During system upgrades, the Claim Status tab displays outcomes to review and resolve.

   Upgrade Details related list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade Details lists all Upgrade Details records for this upgrade.

Note: The Copies to Review and Copies Reviewed related lists are Platform specific related lists.

Upgrade history related lists details

The following table gives the description of each field in all the related lists within the upgrade history module.

Related lists details

Field	Input Value
File name	File name has different description for different related lists • Skipped Changes to Review related list: Name of skipped Upgrade Detail record • Skipped Changes Reviewed related list: Name of the reviewed Upgrade Detail record • Copies to Review related list: Name of the record that needs to be reviewed • Copies Reviewed related list: Name of the record that has been reviewed • Customization Unchanged related list: Name of unchanged sys_upgrade_history_log record. Select it if you want to access Upgrade Details and add comment text, or set a resolution status for it • Changes Applied related list: Current upgrade file name • Claim Outcomes to Review related list: Name of skipped Upgrade Detail record • Upgrade Details related list: Current upgrade file name
Disposition	Action performed on this file during the selected upgrade: • Inserted: The system inserted a new record. • Updated: The system updated this record. • Deleted: The system deleted this record. • Skipped: The system did not change this record in order to preserve customizations. • Skipped Error: The system didn't have the upgrade on this file but skipped due to reasons like the record already exist in the system in a different scope or a system property exists. **Note:** This is editable only by a maint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related lists details (continued)

Field	Input Value
	• Reverted: This record was reverted to the base version. • Table not found: The system could not find the table that contains this record. • Unchanged: The system did not change this record because the baseline component has not changed since the last release. • Skipped Manual Merge: The system did not change this record because updating it requires manual intervention. • Skipped Apply Once: The system skipped this record because it had already applied an update from an xml file in the apply once folder. • Not Latest: The system applied a change, but this change was overwritten later during the same upgrade.
Priority	Relative importance of the conflict that caused the skip. **Note:** ServiceNow prioritizes the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more • Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Reason	States the reason why a particular record has been moved to the Skipped Error disposition.
Resolution	• Reviewed • Retained • Reverted
Comment	During the process of resolving a skipped update, you have the option to add a **Comment** to any record. For example, the comment might explain the action that you took to future reviewers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related lists details (continued)

Field	Input Value
Target name	Name of the record corresponding to the current file.
Plugin	Plugin that contains the record.
Type	Current file type (such as Business Rule or UI Policy).
Table	Table that contains the record.

Revert a customization

To prevent customizations from being overwritten by system upgrades, the upgrade process automatically skips changes to objects that have been customized. You may want to overwrite your customizations when a software upgrade contains a feature that you would like to implement.

Before you begin

Role required: admin

About this task

To identify customized objects, the system adds a corresponding record in the Customer Updates [sys_update_xml] table. The table maintains the current version information for all objects that have been customized. The upgrade process skips changes to objects that have entries in the table. The upgrade process does not skip objects if only excluded fields have changed.

Procedure

1. Navigate to Upgrade History using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade History**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade History**.

   A list of upgrades is displayed.
2. Select the desired software version.
3. Filter the Upgrade Details related list by **Disposition is Skipped**.
4. **Optional:** Add another filter condition for **Changed is True** to return only the objects that have changed since the last upgrade.
5. Select the update record to implement.
   The **File differences** field displays a side-by-side comparison of the customization and the default version. Deletions are highlighted in red, additions in green, and modifications in yellow.
6. Click **Revert to base system** to overwrite your customized object with the system default version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Disposition** changes from **Skipped** to **Reverted**.
- After you revert a customization, you have the option to click **Reapply Changes** to reapply your customizations (undo the revert).

Resolve a skipped update and set a resolution status

Review the reason for each skipped record to resolve each skipped update after an upgrade.

Before you begin

Role required: admin

About this task

You resolve an update by either retaining the customization or by merging or overwriting the customization with the base system update.

Note: Objects that are customized and that did not change in the base system since the last upgrade require no action on your part.

When an object is customized, the system adds a corresponding record to the Customer Updates [sys_update_xml] table and then maintains current version information for all customized objects. The upgrade process skips changes to objects that have a current version in the Customer Updates table. When you follow the procedure, you perform one of the following actions:

- Retain a customization with no changes
- Retain a customization by merging changes from the updated object
- Revert a customized object to the updated version (that is, overwrite the customization)
- Review the skip and perform no action on the object

Procedure

1. Navigate to Upgrade History using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade History**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade History**.

   A list of upgrades is displayed.

2. Select the desired software version.
3. In the Skipped Changes to Review related list, select the update record to resolve.
   See Review skipped records using related lists.
4. Review the list of changes.
   For text fields, you can click in the field to open the Diff/Merge tool.

   To review the differences, Click a text box to view and edit the detailed differences.

5. Perform one of the following actions.

   You have the option to add a **Comment** to any record, for example, to explain the action to future reviewers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Skipped Changes to Review related list

Field	Input Value
Retain the customized record as is and do not update it.	After reviewing the changes, set **Resolution Status** to **Reviewed and Retained**. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list.
Retain the customization by merging changes from the updated object.	**a.** Click**Resolve Conflicts** to navigate to the Resolve Conflicts form. **b.** Review the differences. **c.** To merge a field: ▪ Click the right-arrow button for the field. ▪ Click a text box to view and edit the detailed differences. ▪ When you have merged all appropriate fields, click **Merge**. After merging the customization changes: ○ The Resolution Status changes to Reviewed and Merged. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.
Discard the customization and update the record to match the base system for this upgrade.	After reviewing the changes, click **Revert to Base System**. ○ **Disposition** changes from **Skipped** to **Reverted**. ○ **Resolution Status** changes to **Reviewed and Reverted**. ○ The system creates a Customer Update record. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. **Note:** At any time after you revert a customization, you can click **Reapply Changes** to reapply the customization.
Review the skip and perform no action on the object.	After reviewing the changes, set **Resolution Status** to **Reviewed**. The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.
Leave on the skipped list for a later decision, and note that you have not reviewed the record.	From the **Resolution** list, choose **Not Reviewed** to defer the decision on how to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input Value
	handle this conflict. The record stays on the Skipped Changes to Review related list.

6. Click **Update**.
7. Repeat the process to resolve each update record in the list.

Result

Only skipped updates with a **Resolution Status** of **Not Reviewed** or without a resolution set appear in the Skipped Changes to Review related list. Any action you take that changes the **Resolution Status** to a value other than **Not Reviewed** or **--None--** removes the skipped update from list and moves it to the Skipped Changes Reviewed related list.

Skipped Records visual task board (VTB)

View the resolution status of any previous upgrade with skipped records using the visual task board (VTB) view. An upgrade history record is created for each upgrade that is run.

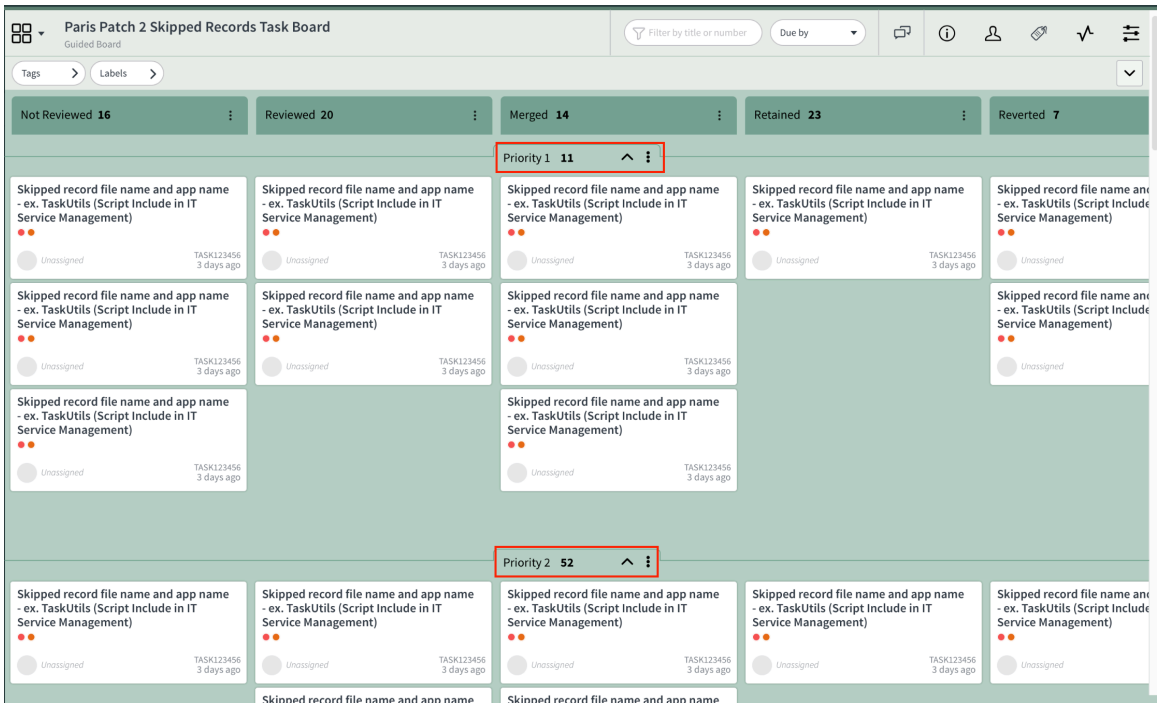
To view the history report navigate to Upgrade History using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade History**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade History**.

You can then select an upgrade from the list to view the upgrade history details. Click the **Skipped Record VTB** related link to view and manage the skipped records over VTB.

Note: The **Skipped Record VTB** related link shows up only when there are skipped records for the version upgrade.

Upgrade History VTB details



Field	Description
Not Reviewed	Tasks which have not been reviewed
Reviewed	Tasks which have been reviewed
Merged	Tasks which have both the old and new changes
Retained	Tasks which have retained the updates from the latest upgrade
Reverted	Tasks which have reverted its changes to the base system

The skipped records are prioritized based on the importance of the file types. The prioritization is done as follows:

- Priority 1 (highest priority): UI pages, UI macros, and more
- Priority 2: Business Rules, Security ACLs, and more
- Priority 3: Reports and more

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

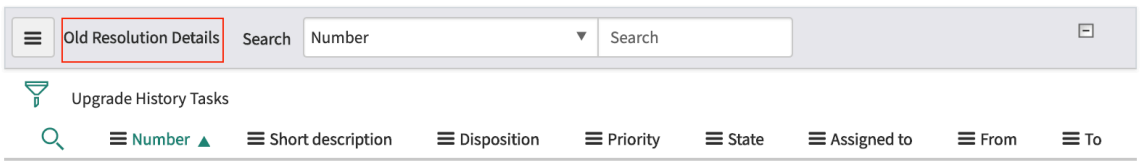
- Priority 4: Form Sections, Choice Sets, and more
- Priority 5 (lowest priority): other

Upgrade History Task form

You can update information about a skipped record task using the Upgrade History Task form.

To make changes on a skipped record task, click a task number link on a task over VTB.

Upgrade History task form details



Field	Description
Short description	Description about the task
Priority	Prioritization of the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more • Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Disposition	Disposition is Skipped since the task board is only for skipped records. The system did not change this record in order to preserve customizations.

To	Past current version

Previous Resolutions related list

The Previous Resolutions related list shows the history of the selected skipped record. You can see what resolutions have been done with the selected skipped record in the previous upgrades.

Upgrade History task form details

Field	Description
File name	Name of the skipped record.
Disposition	Disposition is skipped since the related list is only for skipped records.
Priority	Prioritization of the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade History task form details (continued)

Field	Description
	• Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Resolution	The resolution made in the previous upgrades
Target name	Name of the record that you see on UI, as opposed to the sys_update_name which is the underlying name that has the table and sys_id
Type	Type of file which determines the priority level.
Table	The table where the skipped record belongs.

Update default labels in VTB view

Filter skipped records in the task board of the VTB with the implementation of color-coded labels. You can filter the skipped records by assigning a color to each of the products.

Before you begin

Role required: admin

Procedure

1. Navigate to Upgrade History using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade History**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade History**.

   A list of upgrades is displayed.

2. Select an upgrade from the list.
   The System Upgrades form appears.
3. Click the **Skipped Record VTB** related link to view the resolution status of the skipped records over VTB.

   Note: The **Skipped Record VTB** related link shows up only when there are skipped records for the version upgrade.

   The VTB view of the resolution status of the skipped records shows up.
4. Click **Labels** to show the default labels.
   The default labels consist of Include codes, Does not include code and Others categories.

   Note: The Include and Does not include codes categories indicate if there is any change in the code of the skipped records. All products fall under Other category of labels. The product labels are assigned with different colors. The tasks get assigned based on the label colors of the products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** If you want to add a label, click **Add Label**.
   Enter the name of the label you want to create. You can also change the color of a label by clicking the color circle.

(Optional)

> **Note:** The new labels and colors are saved only for the current visual task board and don't get rolled over to the next updated board. If you want the new label updates to show up in the next updated board, navigate to **Upgrade Center** > **Administration** > **Properties** > **Upgrade Center VTB Labels**. Set the colors as required and the updated colors start showing up from the next generated board.

What to do next

Click on a skipped record in the VTB to update the task. See Upgrade History Task form for more information.

View import history

View your import history by accessing the **My Application Import History** module.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **My Application Import History**.
   The list of import history records in your instance shows up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select one of the imports from the list for more information about that import.
   The form view of sys_upgrade_history record shows up.

   Note: To learn more about importing from Source Control, see ServiceNow Studio. Once the importing is done, use the **My Application Import History** module to view the import history.

Quick access to plugins and history records

Reduce the navigating time by directly accessing plugins, application installation history records, and update set commits history records. The filters for the plugins and history records are automatically implemented in the plugins and history records views.

Before you begin
Role required: admin

About this task

Plugins and application installation history records

1. Navigate to **System Definition** > **Plugin Installation History**.
2. Select any of the plugins or history records to access them directly.

Update set commit history records

1. Navigate to **System Update Sets** > **Update Sets to Commit**.
2. Select any of the update sets to directly view the commit history of that update set.

Explore upgrade history log

Reduce processing time by extracting all upgrade related logs into a separate file named database-upgrade_<timestamp>.log. You can also zip the file and attach it to upgrade history.

Before you begin
Role required: admin.

About this task
When the upgrade starts, the upgrade log messages are written to both the localhost_log file and the database-upgrade_<timestamp>.log file. When the upgrade is done, the database-upgrade_<timestamp>.log file is uploaded to the upgrade history table.

Procedure

1. Navigate to **All** > **System Logs** > **Utilities**.

   Note: You can implement this step to view the extracted database-upgrade_<timestamp>.log file only after the upgrade is done.

2. Click **Node Log File Download**.
   The database-upgrade_<timestamp>.log file appears in the list of log files.

   Note: The localhost_log file consists of all the logs. The database-upgrade_<timestamp>.log file consists of logs only related to the upgrade.

   The database-upgrade_<timestamp>.log file appears only if the `glide.db.upgrade.log.save_to_db.enabled` property is set to True. By default, the `glide.db.upgrade.log.save_to_db.enabled` is set to True.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Go to **Admin** > **Upgrade Management Console** > **Upgrade History**.
   A list of upgrades shows up.
4. Click the required upgrade from the list.
   You can see database-upgrade_<timestamp>.log file is automatically attached to the upgrade.

   Note: The database-upgrade_<timestamp>.log file gets attached only if the `glide.db.upgrade.log.save_to_db.enabled` property is set to True. By default, the `glide.db.upgrade.log.save_to_db.enabled` is set to True.

5. Download the zipped database-upgrade_<timestamp>.log file.

   Note: The database-upgrade_<timestamp>.log file has been zipped to reduce the download time.

Upgrade Monitor tool in Upgrade Console

Leverage Upgrade Monitor to schedule upgrades, monitor their progress, and analyze post-upgrade results, including conflict resolution.

Scheduling and monitoring an upgrade

Use the Upgrade Monitor module to schedule and monitor the status of an ongoing upgrade in your instance. You can also view the upgrade summary and the list of records causing conflicts in your instance once the upgrade is complete.

- Monitoring an upgrade: Monitor the progress of an ongoing upgrade in your instance
- Process the skipped records list: Resolve the differences between the upgraded and customized versions of a record by processing the skipped records list
- Resolve conflicts of a record: Resolve conflicts between your customized record and the changes associated with the upgrade

Monitor an upgrade to an instance

Monitor the progress of an ongoing upgrade in an instance with the Upgrade Monitor. When the upgrade is done, you can view a summary of the results on the Upgrade Summary Report.

Before you begin

Role required: admin

Procedure

1. Navigate to Upgrade Monitor using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade Monitor**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade Monitor**.

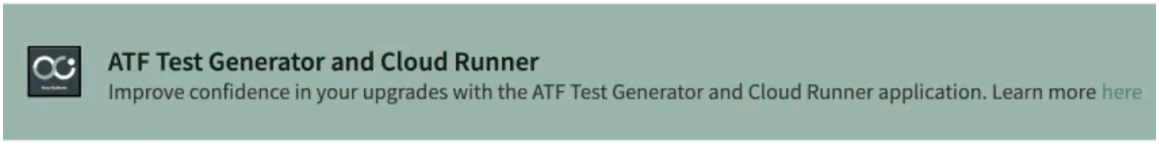
   Note: If an upgrade is in progress, the user is automatically directed to the Upgrade Monitor page.

   A list of upgrades is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Monitor the progress of the upgrade.
   When the system finishes the upgrade, it displays the Complete upgrade summary report.

Note: You can now view the status of every stage in the upgrade process. See Upgrade Progress for more information.



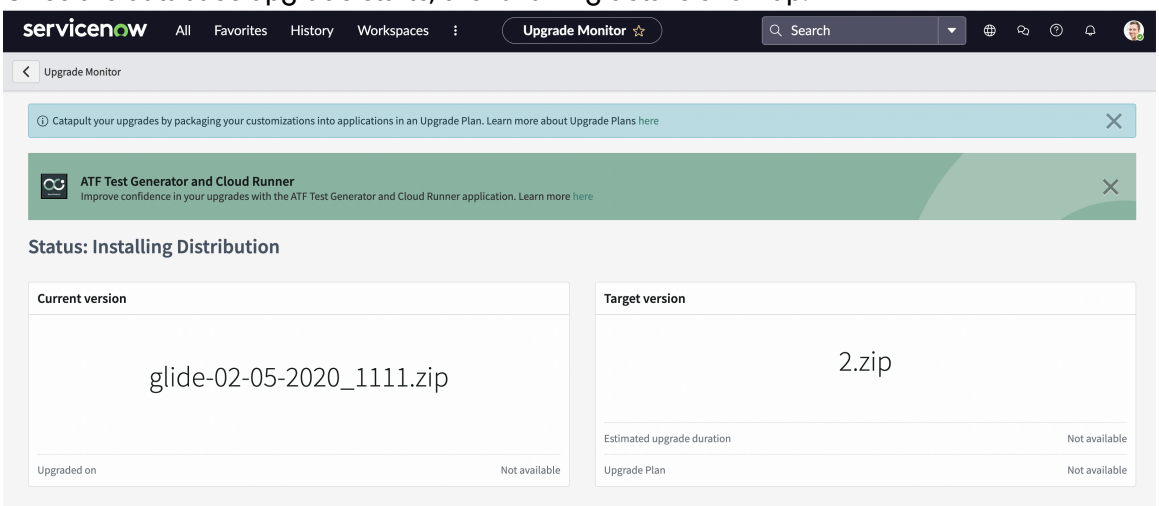
What to do next

From the Upgrade Summary Report, resolve any conflicts that prevented the system from upgrading records.

Upgrade Progress

When an upgrade is underway, Upgrade Progress displays progress bars and other information to help you monitor the process.

You can view the status of each of the stages during an upgrade process. It helps you to know exactly which stage you are in at any point of the upgrade process.



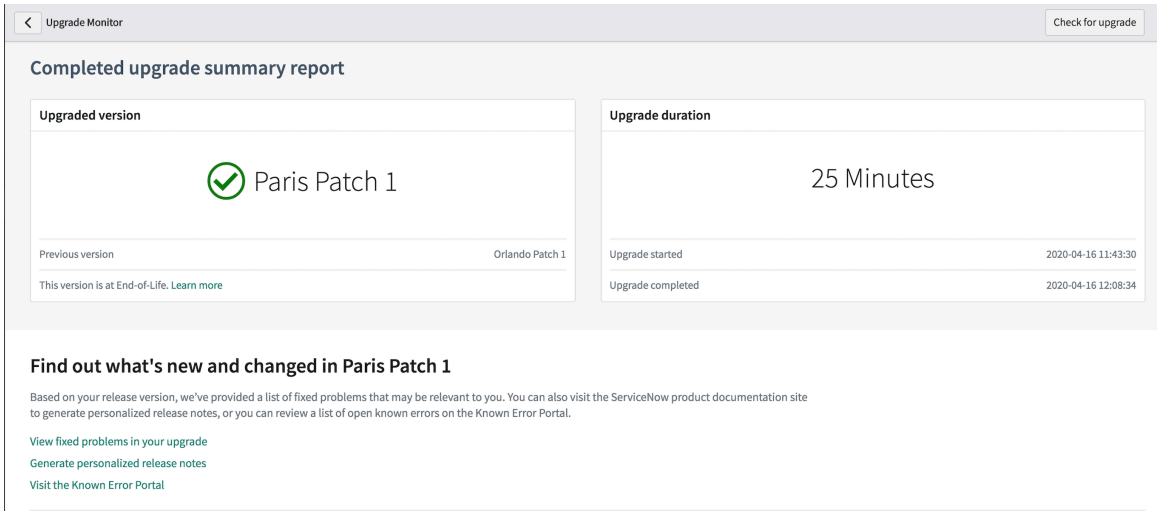
If you have the ATF Test Generator and Cloud Runner store application installed, you can schedule test generation runs from the Upgrade Monitor page. The above message shows up during an upgrade process when the following conditions are met.

- The SN_ATF_TG plugin is not active.
- The instance is not a fed instance.
- The instance is not a self-hosted instance.

Note: You can now confidently upgrade your instance by using the ATF Test Generator and Cloud Runner store app. See Exploring ATF Test Generator and Cloud Runner for more information.

Once the database upgrade starts, the following details show up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



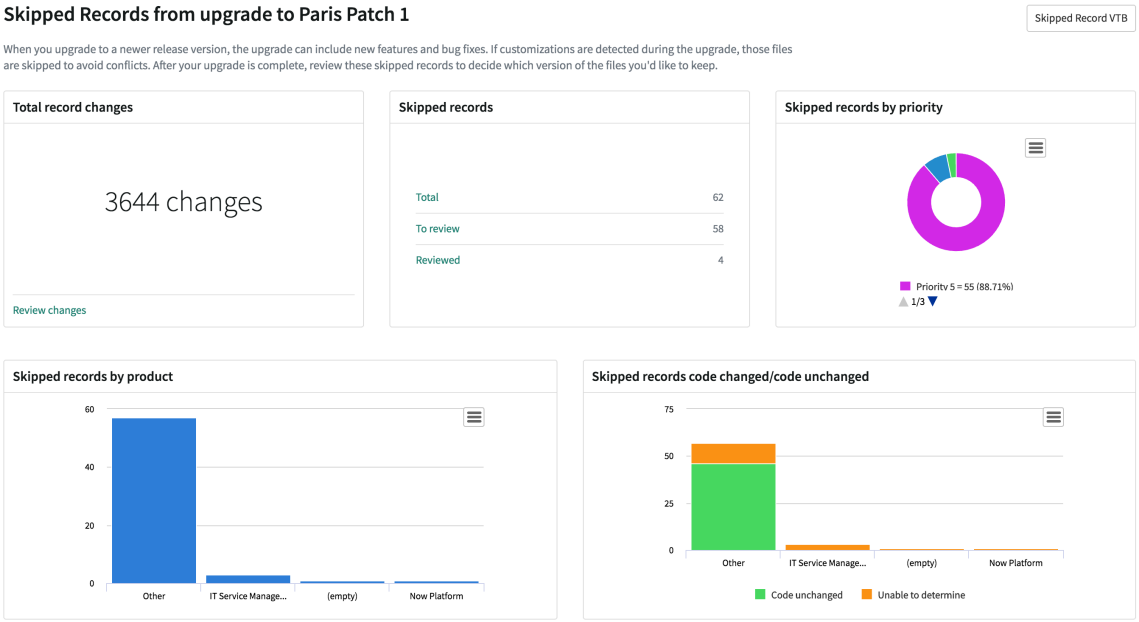
Upgrade Progress details

Field	Input Value
Current version	Current version of the instance
Target version	Target upgrade version of the instance
Upgrade Progress	A progress bar depicting where the upgrade is in the overall process. The length of a section in the bar does not indicate the relative duration of that process.
Upgrade Progress: Upgrading Platform	The system is applying upgrades to elements that form the foundation of the platform.
Upgrade Progress: Updating Schema	The system is scanning the plugins to create a list of tables that require upgrading. This prevents the system from upgrading the same table multiple times.
Upgrade Progress: Loading Plugins	The system is loading both core and optional plugins. Some features require more than one plugin, so the number of plugins listed may not match the number of optional features installed.
Upgrade Progress: Completing	The system is upgrading components that need to be completed after the previous three stages are done.
Details	Shows the current activity, a progress bar for the current activity, and the file currently being updated.
Node Upgrades	The color of the icons represents the status of each node during this upgrade: Pending, Running, Successful, Failed, or Down.
Node	The selected node indicated by the arrow. To change the selection, position the mouse cursor over the icon for the node to select.
Running time	How long the selected node (indicated by the arrow) has been running. If the selected node is offline, this value stops updating and shows how long a node was online before going offline.
Version	The current build for the selected node (indicated by the arrow).
Successful upgrade	When the selected node is online, shows how long the node has been online. If the selected node is offline, shows how long the node has been offline.

Upgrade Summary Report

The Upgrade Summary report summarizes the actions taken, provides tools to resolve conflicts between customizations and changes that are part of the upgrade, and provides information to help estimate time for upgrades to other instances.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Upgrade Summary details

Field	Input Value
Upgraded version	Version to which the instance has been upgraded
Upgrade duration	Total time taken to make the upgrade
Find out what's new and changed	Links to view the new and changed features in the current upgrade version. The following three links show up. • Problem fixes: Fixes that have been made since the last upgrade version • Personalized release notes: Release notes summary for the previewed version • Known error articles: Errors that have been identified but not yet resolved

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Skipped Records

Skipped Records details

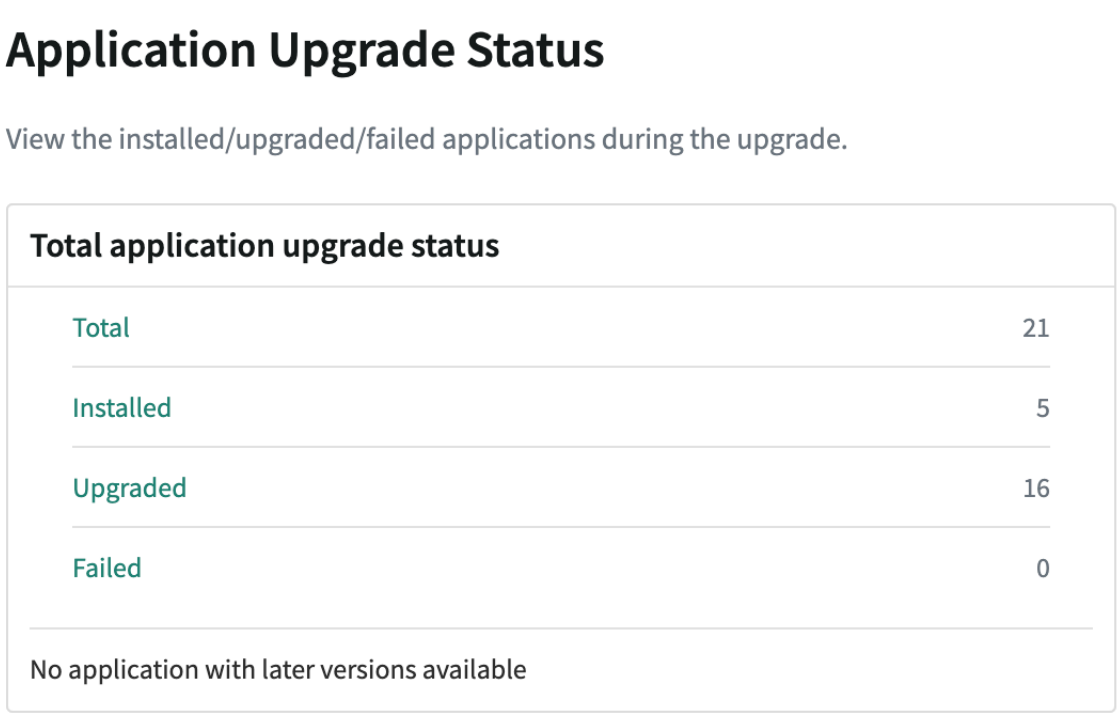
Field	Input Value
Total record changes	Total number of records that have changed since the previous upgrade version. **Review changes**: List of records that have changed can be reviewed. See System Upgrade form for more details.
Skipped records	Skipped records to prevent your customizations from being overwritten. If customizations are found in some records during the upgrade, those records are skipped. As an admin, you can resolve each update that was skipped due to a customization. To resolve a skipped update, you can review the reason for each skipped record and then either retain the customization or revert the customization to the base system. If you choose to revert some of the customizations to the base version, those records are sent through the upgrade without getting skipped. • **Total**: Total skipped records • **To review**: Total skipped records that are yet to be reviewed • **Reviewed**: Total skipped records that have been reviewed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Skipped Records details (continued)

Field	Input Value
Skipped records by priority	ServiceNow prioritizes the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more • Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Skipped records by product	Skipped records are sorted by product names
Skipped records code changed/code unchanged	Skipped records are sorted depending on if there are changes in the code or not.

Note: You can click **Skipped Record VTB** to view the resolution status of the current upgrade with skipped records using the visual task board (VTB) view. See Skipped Records visual task board (VTB) for more information.



Node Upgrades

The Node Upgrades section shows the status of the upgrade for each node in the instance. The color of the icon denotes the status, as illustrated by the legend (key) and to the right of the node icons. To see details about a node, position the cursor above the icon for that node. An arrow points to the node selected, and the information below the icons pertains to that node.

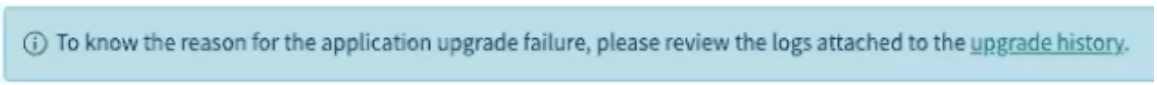
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application Upgrade Status

You can view the list of installed and upgraded applications during an upgrade. It also lists the applications that failed to install during the process.

Note: The **All applications are on the latest versions** message shows up only when all the applications are on their latest versions.



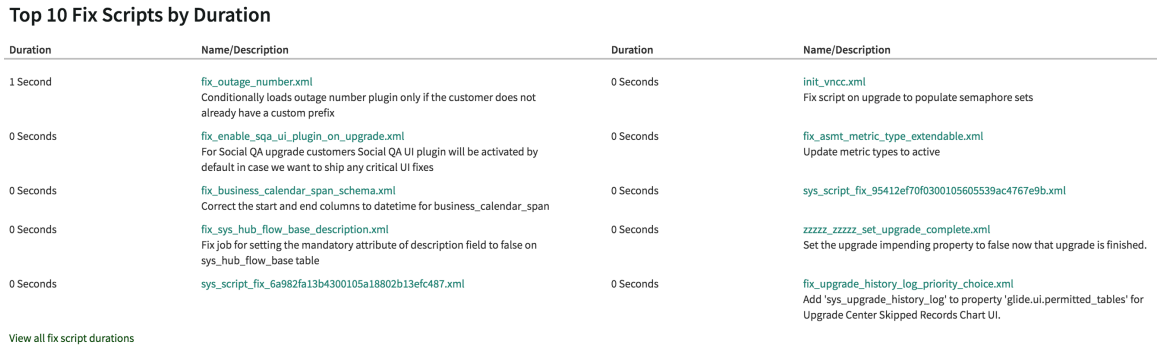
Action	Name	From version	To version	Latest version
Upgraded	@devsnc/sn-tab-filter	23.0.2	24.0.6	24.0.6
Installed	Process Automation Content	n/a	23.0.3	23.0.3
Upgraded	Common UIB Wrapper Components	1.2.4	1.2.6	1.2.6
Upgraded	@devsnc/sn-search-results-container	23.2.7	24.0.9	24.0.9
Upgraded	sn-component-workspace-global-search	23.2.9	24.0.7	24.0.7
Upgraded	Webviews for mobile	27.0.5	29.0.0	29.0.0
Upgraded	FDIH Dashboard	23.0.8	23.0.10	23.0.10
Installed	Playbook Experience Components	n/a	24.0.0	24.0.0
Installed	Security Center	n/a	1.1.7	1.1.7
Upgraded	@devsnc/sn-search-genius-card-assist	23.0.0	24.0.6	24.0.6

View all application details

You can view the first 10 applications that were installed during the upgrade. Select **View all application details** to view the information about all the installed, upgraded, and failed applications on the Upgrade App Version Histories table.

Note: You can select any of the application links to go to its form view. Select **Go to application** on the form view to go to the application sys record.

The following message shows up if you have selected any of the failed applications link.

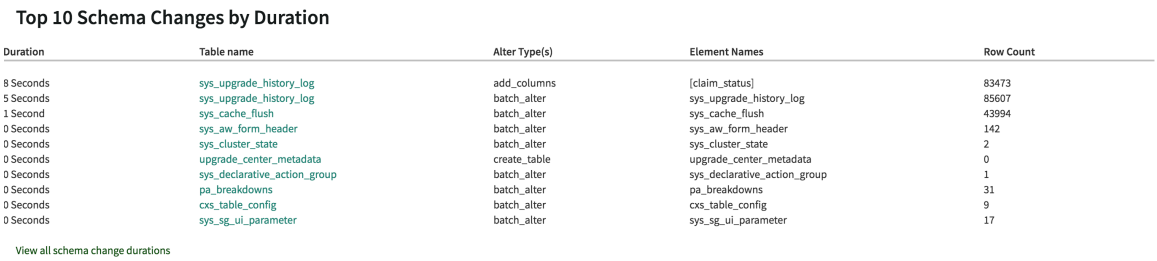


Schema Changes to Clone-excluded Tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Schema Changes to Clone-excluded Tables section shows a list of tables affected by the upgrade that were clone-excluded when you cloned the production instance to this instance. Because clone-excluded tables are empty, upgrading them takes less time than upgrading those same tables on the production instance. To estimate how much longer the production upgrade takes, note the size of the clone-excluded tables on the production instance.

Top 10 Fix Scripts by Duration



Top 10 Fix Scripts by Duration

Duration	Name/Description	Duration	Name/Description
1 Second	fix_outage_number.xml Conditionally loads outage number plugin only if the customer does not already have a custom prefix	0 Seconds	init_vncc.xml Fix script on upgrade to populate semaphore sets
0 Seconds	fix_enable_sqa_ui_plugin_on_upgrade.xml For Social QA upgrade customers Social QA UI plugin will be activated by default in case we want to ship any critical UI fixes	0 Seconds	fix_asmt_metric_type_extendable.xml Update metric types to active
0 Seconds	fix_business_calendar_span_schema.xml Correct the start and end columns to datetime for business_calendar_span	0 Seconds	sys_script_fix_95412ef70f0300105605539ac4767e9b.xml
0 Seconds	fix_sys_hub_flow_base_description.xml Fix job for setting the mandatory attribute of description field to false on sys_hub_flow_base table	0 Seconds	zzzzz_zzzzz_set_upgrade_complete.xml Set the upgrade impending property to false now that upgrade is finished.
0 Seconds	sys_script_fix_6a982fa13b4300105a18802b13efc487.xml	0 Seconds	fix_upgrade_history_log_priority_choice.xml Add 'sys_upgrade_history_log' to property 'glide.ui.permitted_tables' for Upgrade Center Skipped Records Chart UI.

View all fix script durations

View all schema change durations

The Top 10 Schema Changes by Duration helps you understand which schema changes required the most time.

Top 10 Plugins by Duration

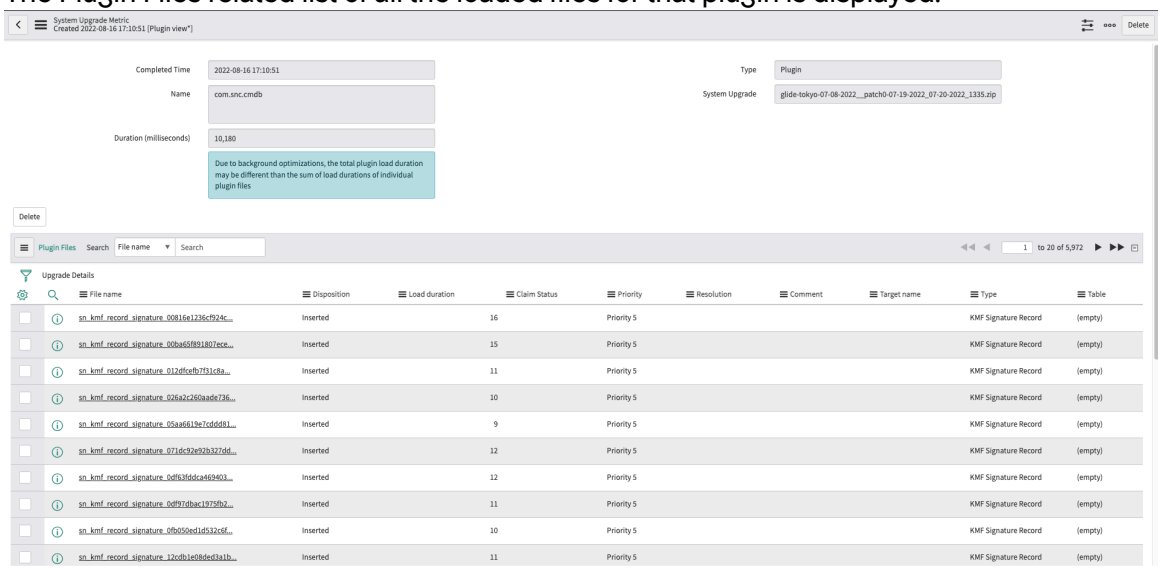
The Top 10 Plugins by Duration helps you see the plugins that required the most time. Click **View all plugin duration** to see the **System Upgrade Metrics** list filtered by current sys upgrade history log and sorted by duration. See View loaded files for a plugin for more information.

View loaded files for a plugin

Get a related list view of all the files loaded for a plugin by clicking **View all plugin duration**.

Before you begin
Role required: admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to Upgrade Monitor using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade Monitor**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade Monitor**.

Note: When the system finishes the upgrade, it displays the Upgrade Summary Report.

2. Scroll down to **Top 10 Plugins by Duration**.
3. Click **View all plugin duration**.
   The **System Upgrade Metrics** list of all the plugins and their durations shows up.
4. Click one of the plugins from the list to open the **System Upgrade Metrics** form view of that plugin.
   The Plugin Files related list of all the loaded files for that plugin is displayed.

Note: The total plugin load duration is not the sum of the load duration of all the loaded files for that plugin.

Process the skipped records list

Process the skipped records list to resolve the differences between the upgraded and customized versions of a record. If you have customized or altered a record affected by this upgrade, such as a business rule or script, the upgrade generates a skip log record.

Before you begin

Role required: admin

About this task

Review the changes you made to baseline records, such as business rules and scripts, that appear on the skipped records list and revert to the baseline version if appropriate. Post-upgrade, thoroughly test all changes you made to these records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to Upgrade Monitor using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade Monitor**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade Monitor**.

Note: If the upgrade is still in progress, the system displays the Upgrade Progress screen. When the upgrade finishes, the system displays the Upgrade Summary Report.

A list of upgrades is displayed.

2. After the system displays the Upgrade Summary Report, click the Review changes link in the Skipped box.

   The system displays the System Upgrades form.

3. Navigate to Review Skipped Records section and – if necessary – scroll to the Skipped Changes to Review related list.
   See Review skipped records using related lists for more information.
4. Click the row for the first record you want to reconcile.

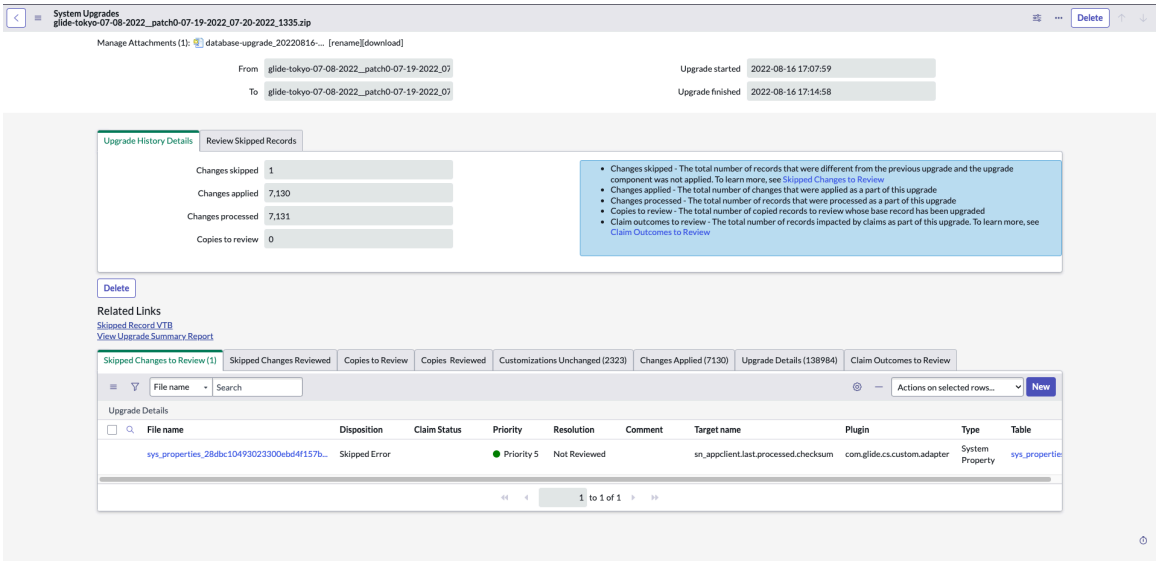
   The system displays the Upgrade details form for that record.

5. Evaluate how you want to resolve the conflict for this record and take the appropriate action:

Action	Description
Retain the customized record as is and do not update it	After reviewing the changes, set **Resolution Status** to **Reviewed and Retained**. The record moves from the Skipped Changes to Review to Skipped Changes Reviewed related list. See Review skipped records using related lists.
Retain the customization by merging changes from the updated object	**a.** Click **Resolve Conflicts** to navigate to the Resolve Conflicts form. **b.** Review the differences. **c.** To merge a field: ▪ Click the right-arrow button for the field. ▪ Click a text box to view and edit the detailed differences. ▪ When you have merged all appropriate fields, click **Merge**. After merging the customization changes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	○ The **Disposition** changes from **Skipped** to **Merged**. ○ The **Resolution Status** changes to **Reviewed and Merged**. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.
Discard the customization and update the record to match the base system for this upgrade	After reviewing the changes, click **Revert to Base System**. ○ The **Disposition** changes from **Skipped** to **Reverted**. ○ The **Resolution Status** changes to **Reviewed and Reverted**. ○ The system creates a Customer Update record. ○ The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list. **Note:** At any time after you revert a customization, you can click **Reapply Changes** to reapply the customization (undo the revert).
Review the skip and perform no action on the object	After reviewing the changes, set **Resolution Status** to **Reviewed**. The record moves from the Skipped Changes to Review to the Skipped Changes Reviewed related list.
Leave on the skipped list for a later decision, and note that you have not reviewed the record	From the **Resolution** list, choose **Not Reviewed** to defer the decision on how to handle this conflict. The record stays on the Skipped Changes to Review related list.



Note: The system tracks changes to records in an update set so you can apply these changes to another instance later. However, the system does not migrate the upgrade details records from one instance to the next. These records apply to a specific upgrade of a specific instance. If you want to preserve the Comments, Resolutions, or other information from the skipped list, export it from this instance.

6. In the **Comment** field, write the reasons for making your decision and other information you want to document.
7. Click **Update**.
   Post-upgrade, thoroughly test all changes you made to the records on the skipped record list.

System Upgrade form

When an upgrade is complete, the System Upgrades form displays key statistics about the upgrade and a related list of skipped records (the skipped list).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Upgrade details

Field	Input Value
From	Version of the instance before upgrading.
To	Version of the instance after upgrading.
Upgrade started	Time of the start of the upgrade.
Upgrade finished	Time at which the upgrade completed.
Changes skipped	Total number of records that are different from the previous upgrade and the upgrade component was not applied, mostly due to customization.
Changes applied	Total number of changes that are applied as a part of this upgrade **Changes applied** is sum of updated, different records, deleted records (where the value of changed is true) and inserted records (where the value of changed is true).
Changes processed	Total number of records that were processed as a part of this upgrade. Changes processed is the sum of **Changes skipped** and **Changes applied**.
Copies to review	Total number of copied records to review whose base records have been upgraded

Resolve conflicts for an individual record

Reconcile differences between your customized record and the changes associated with the upgrade.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From the Upgrade Details form for the record you are reconciling, click **Resolve Conflicts**.

   The system displays the Resolve Conflicts form, which highlights differences between the two versions of the record. The form displays information about the base system record on the left and the customized record on the right.

   Note: The system creates a new customer update record when you click **Resolve Conflicts**.

2. Compare the base system with the customized record for each field on this form.
   For non-script fields, edit the customized record on the right-hand side to include what you want from the base system and the customization.
3. If this record contains a script, check it for conflicts and resolve.
   a. Click inside the Script field.

      The system displays the Resolve Conflicts - Script form highlighting areas where the two versions of the script differ.

   b. Edit the right-hand side so that the script contains whichever content you want. To move a block of code from the left to right side, click the small arrows corresponding to that block in the middle column.
   c. Click **OK**.

      The system returns to the Resolve Conflicts form.
4. To save your changes to the record, click **Save Merge**.
   The system sets the **Resolution** for this record to **Reviewed and Merged**.

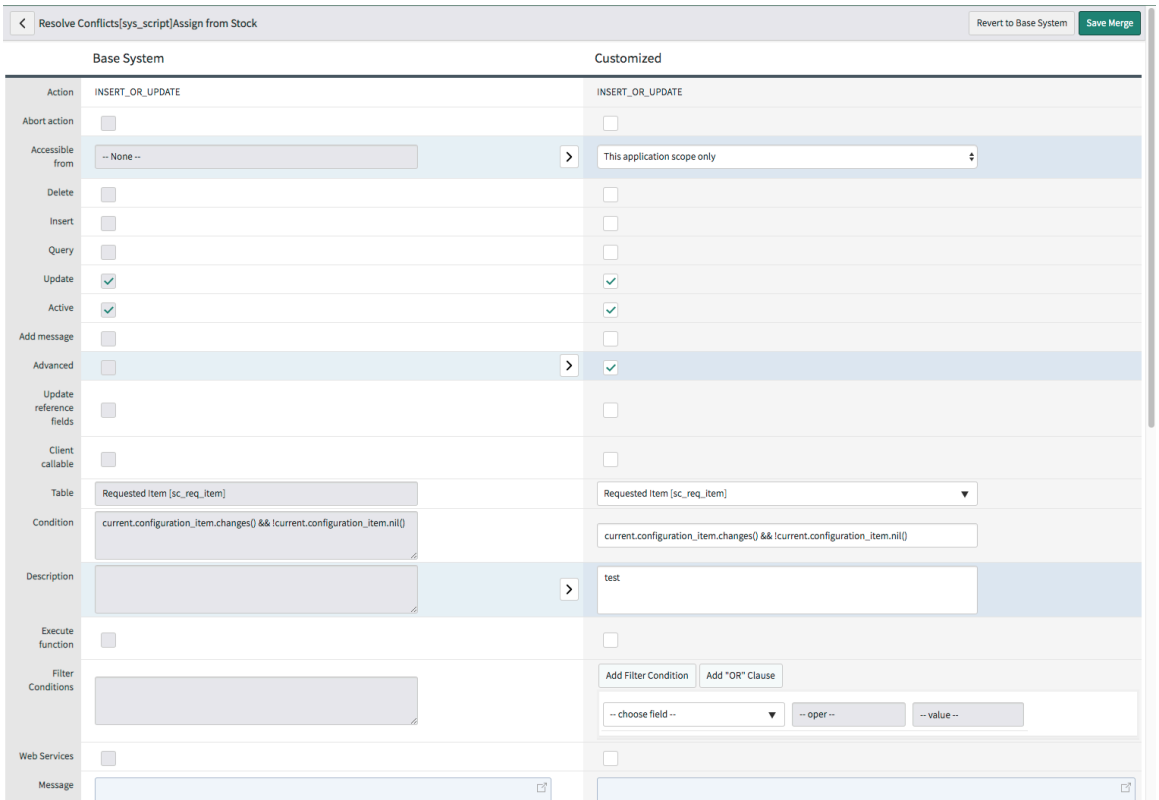
Upgrade details form

From the Upgrade Details form, you can review an individual record affected by the upgrade and reconcile conflicts between the upgrade and customizations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade Details form details

Field	Input value
File name	The record the system has flagged as needing to be reconciled.
Priority	The priority the system has assigned to resolving this conflict. Values range from one to five, with one representing the highest priority.
Comment	Comments to document your decisions about reconciling this record.
Resolution	How you elected to resolve this conflict: • **Not reviewed**: Not yet reviewed • **Reviewed**: Reviewed but no action yet taken • **Reviewed and Merged**: Made changes to the record to reconcile the customized and upgraded versions • **Reviewed and Retained**: Left customizations in place without update from upgrade • **Reviewed and Reverted**: Customizations discarded, record updated according to upgrade For more information, see Process the skipped records list.
Disposition	Action performed on this file during the selected upgrade: • Inserted: The system inserted a new record • Updated: The system updated the record • Deleted: The system deleted the record • Skipped: The system did not change this record in order to preserve customizations • Reverted: This record was reverted to the base version • Table not found: The system could not find the table that contains this record • Unchanged: The system did not change this record because the baseline component has not changed since the last release • Skipped Manual Merge: The system did not change this record because updating it requires manual intervention • Skipped Apply Once: The system skipped this record because it had already applied



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade Details form details (continued)

Field	Input value
	an update from an xml file in the apply once folder • Not Latest: The system applied a change, but this change was overwritten later during the same upgrade.
Type	Type of the record, for example, Script include.
Target name	Name of the skipped record, if applicable.
Update set	Unused.
Plugin	The plugin containing this record.
Table	The table containing this record.

Resolve Conflicts form

The Resolve Conflicts form you compare to the base system version with the customized version of a record and reconcile the differences.

Fields

The fields this form displays depend on the type of record you are reconciling. The left column shows the records fields in the base system, including the proposed changes that are part of the upgrade. The right column shows the fields for your customized record.

Now Support in Upgrade Console

Try contacting Now Support if you need any assistance regarding Upgrade Console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Click Contact Customer Service and Support for more information.

Upgrade Preview tool in Upgrade Console

Use the Upgrade Preview module to have an insight about the experience of an upgrade prior to the actual upgrade. You can explore and preview upgrades to different ServiceNow release versions and see how your instance might be impacted with your current configurations.

- Preview predicted changes: Preview the changes that have been predicted to occur after an upgrade.
- Upgrade Preview form: Alternate view of a previewed upgrade.

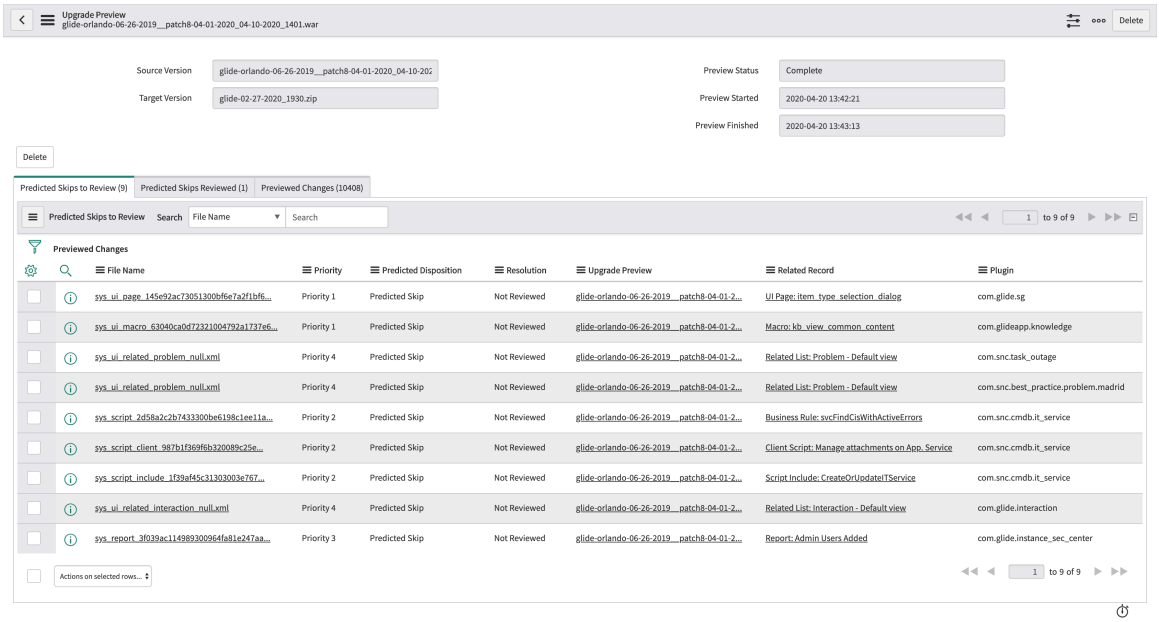
View previewed upgrade

Use the Upgrade Preview form to have an alternate view of a previewed upgrade.

Before you begin

Role required: admin

Procedure



1. Navigate to Upgrade Preview using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade Preview**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade Preview**.

2. Select the target version to be previewed.
3. Click **Go** or **Refresh Preview** to run the selected preview.
4. Click **View preview details** on the **Previewing version** card to view the following related lists.
   - **Predicted Skips to Review related list**: The Upgrade Preview process informs you about the customizations that are predicted to be skipped during an upgrade. The upgrade preview process the skip files that have been customized. Predicted Skips to Review lists all the skipped files that haven't been reviewed yet.
   - **Predicted Skips Reviewed related list**: Predicted Skips Reviewed related list displays the records which have previously appeared on the Predicted Skips to Review related list and have been reviewed. When you select a skipped record to review and the **Resolution Status** has been set to a value other than **Not Reviewed**, the updated record moves to the Predicted Skips Reviewed related list.
   - **Previewed Changes related list**: Previewed Changes related list gives the total number of records that are predicted to change when the upgrade occurs. Total record changes also includes possible predicted skip files known as Predicted skipped records.

   See Previewed changes for more details about the related lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input Value
Source version	Current version of the instance
Target version	Target version to which the instance is upgraded to be previewed
Preview status	Status of the preview. ○ Pending ○ In Progress ○ Complete ○ Cancelled ○ Failed
Preview Started	Date and time on which the preview started
Preview Finished	Date and time on which the preview completed

Preview predicted changes

Use the previewed changes table to view the list of total records that are predicted to change when the upgrade occurs.

Preview skipped list prediction

The **Total record changes** also includes records that are predicted to be skipped due to various reasons. The most common reason is due to customization. The reason an upgrade skips customizations is to avoid overwriting your customizations. Upgrade Preview attempts to predict which records will be skipped when the actual upgrade occurs. It predicts skips due to customizations, and some of the other more complex scenarios as well. It is possible to use Upgrade Preview to address these predicted customization skips before the upgrade occurs, which can prevent that skip from happening.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Click **View preview details** link on the **Previewing version** card. The Upgrade Preview form appears along with the following related lists details.

Related lists details

Field	Description
File name	Record that has been flagged for reconciliation.
Predicted Disposition	Action predicted to be performed on this file during the selected upgrade: • Predicted Insert: The system is predicted to insert a new record. • Predicted Update: The system is predicted to update this record. • Reverted: This record was reverted to the base version, and won't be skipped on the next upgrade. • Predicted Skip: The system won't change this record in order to preserve customizations. • Predicted Skip (Manual Merge): The system won't change this record because updating it requires manual intervention. • Predicted Skip (Apply Once): The system is predicted to skip this record because it had already applied an update from an xml file in the apply once folder.
Priority	Priority that has been assigned to resolve the conflict. Values range from one to five, with one representing the highest priority. **Note:** ServiceNow prioritizes the skipped records based on the importance of the file types. The prioritization is done as follows: • Priority 1 (highest priority): UI pages, UI macros, and more • Priority 2: Business Rules, Security ACLs, and more • Priority 3: Reports and more • Priority 4: Form Sections, Choice Sets, and more • Priority 5 (lowest priority): other
Resolution	Ways to resolve a conflict.

Related lists details (continued)

Field	Description
	• **Not reviewed**: Conflicted files that have not been reviewed yet • **Reviewed**: Reviewed but no action has been taken yet • **Review not needed**: Review of the skipped files are not required • **Reviewed and Retained**: Left customizations in place without update from upgrade • **Reviewed and Reverted**: Customizations discarded, record updated according to the upgrade version
Plugin	Plugin containing the record
Related record	Record that the changelist entry applies to

Upgrade Skipped Record Rules Editor tool in Upgrade Console

Create skipped record rules, based on your specified conditions, to define customizations post-upgrade. Subsequently, execute these rules to resolve skipped records during or after the upgrade process, either automatically or on demand.

Create a skipped record rule

Create skipped record rules based on your set conditions to define your customizations after an upgrade.

Before you begin

Role required: admin

Procedure

1. Navigate to Skipped Rules using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Skipped Rules**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Skipped Rules**.

A list of available rules shows up.

Note: By default, a few inactive sample rules have been provided. You can set it to active if you want to use the sample rules.

2. Select **New** to create a new skipped record rule.
The Upgrade Skipped Record Rules form shows up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The new rules are active by default. You can make them inactive if you don't want to use them.

3. Fill in the fields on the form.

Field	Description
Name	Name of the rule.
Order	Order in which the rule runs. **Note:** The order number automatically increments from the last rule order created.
Active	Option to activate the rule.
Conditions	Conditions as to when the rules are implemented on the skipped records. **Note:** These conditions are only for skipped records that are not being reviewed. If you set the disposition condition to anything other than the skipped records, that condition doesn't work.
Action	Option to choose one of the four following actions: ○ Keep My Modifications (Always Retain) ○ Revert and Keep Inactive ○ Assign Skipped Records to User ○ Assign Tags to Skipped Records **Note:** Based on the selected action, a message shows up with more information.
Comment	Add a comment on the conditions being set.

4. Select **Submit**.
   The new rule appears on the list of available rules.

What to do next

You can now run the skipped record rules either automatically during an upgrade or can run on demand on the skipped records. See Execute a skipped record rule for more information.

Execute a skipped record rule

Run skipped record rules based on your set conditions to resolve skipped records in an upgrade. The rules either execute automatically during an upgrade or can run on demand after an upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Execute a skipped record rule on demand

Execute the skipped record rules on demand on the skipped records whenever it's required.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Administration** > **Skipped Record Rules Editor**.
   A list of available rules shows up.

   Note: By default, a few inactive sample rules have been provided. You can set it to active if you want to use the sample rules.

2. Execute the rules on demand using either of the following ways.

Option	Steps
Using Run Now	**a.** Select the rule that you want to execute from the list. **b.** Select **Run Now** from the configuration list action items. **Note:** When you select **Run Now**, a progress bar shows up to display the progress of the rule execution.
Using View Latest Upgrade History tab	**a.** Select the **View Latest Upgrade History** tab. The System Upgrades form shows up. **Note:** The skipped record rules are executed only on the latest upgrade. **b.** Select **Run skipped Record Rules** on the form. **Note:** All the active rules get exe cuted. You can't choose the specif ic active rules to run while using this process.

Execute a skipped record rule automatically

Execute the skipped record rules automatically during the upgrade on the skipped records.

These rules are executed on the skipped records automatically during the upgrade process. The prediction of the rules execution on the skipped records can be previewed on the Skipped list prediction card in the Upgrade Preview module.

Once the execution of the rules are done, the summary can be reviewed in the Upgrade Summary of Upgrade Monitor.

Note: Skipped record rules and upgrade plans can't be implemented together in an upgrade.

Upgrade Plans tool in Upgrade Console

Accelerate your upgrades using the Upgrade Plan that automates the installation of applications during upgrades, giving you a seamless upgrade experience. It helps you define applications and target versions to be installed in your instance.

Follow the following task to build and apply an upgrade plan to your upgrade.

Building your Upgrade Plan

Build your upgrade plan to experience a seamless and an accelerated upgrade by packaging the applications in an upgrade plan.

Before you begin

Note: Ensure that you have upgraded your instance to the latest available version to build the upgrade plan. It is recommended to build an Upgrade Plan for each instance upgrade. The target version of the Upgrade Plan must be exactly the same as the instance version (including patches and hot fixes). You can't use the previously created Upgrade Plan for the new instance upgrade.

Role required: admin

Procedure

1. Navigate to **All** > **Upgrade Center** > **Administration** > **Properties** > **Upgrade Plan Properties**.

   Note: It is recommended to set up your dev instance as a builder instance.

2. Navigate to Upgrade Plan using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade Plan**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade Plan**.

   Note: If you are on the Upgrade Monitor page, click **Manage Upgrade Plan**.

   The Upgrade Plan list view shows up.

3. Click **Build** to start the upgrade plan build.
   Upgrade Plan takes up only the app installations by default and publish it on to the app repository. See Upgrade Plan background operations section in Upgrade Plans tool in Upgrade Console for more information.

   Note: Ensure all the applications in the instance are in ready state to be published on to the app repository.

   You are allowed to have only one Upgrade Plan at any point of time.
   A final confirmation message shows up to start building the upgrade plan. If any application has changes in-progress, the Upgrade Plan must be built only after the changes are done.
   Warning message shows up to complete the review of the remaining skipped records, provided you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.

4. Click **Build Upgrade Plan**.
   The upgrade plan starts to build.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Go to Upgrade Plan** once the build is done.

   Note: Click **View Details** if you want to view the execution details of the Upgrade Plan. If you see a warning, it is recommended to review the execution details to know the errors.

   The upgrade plan opens and a list of upgrade plan items shows up.

6. **Optional:** Click **New** if you want to manually add any upgrade plan items.

   Note: The applications or plugins that you want to add manually to the upgrade plan must be already installed and active on the instance.

   If you want to skip any of the upgrade plan items from being a part of the Upgrade Plan, set the selected upgrade plan item to false.

7. **Optional:** Click **Refresh** to capture all the recent changes to the Upgrade Plan.

   Note: This step is applicable only if you have any update on the existing application or plugin in the Upgrade Plan. If the upgrade plan has already been published, you are required to republish it after every refresh.

8. Click **Publish** to publish the Upgrade Plan.
   See Upgrade Plan background operations section in Upgrade Plans tool in Upgrade Console for more information.

   Note: Install all the required applications and plugins before publishing the upgrade plan. If you have set the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property to true, you will have to resolve all the skipped records before publishing the upgrade plan. If you want to delete the Upgrade Plan, click **Delete**. The **Delete** option is available only for the Upgrade Plans that are not yet published.

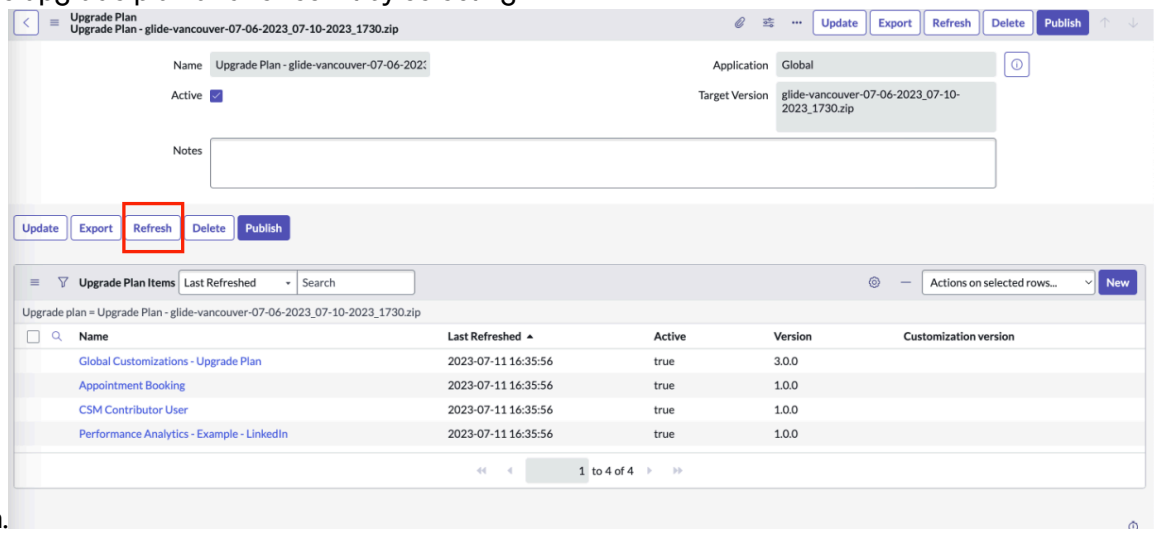
The upgrade plan is now ready to be installed in the consumer instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refreshing your Upgrade Plan

Refresh your upgrade plan to package all the recently installed plugins and applications into your upgrade plan.

Before you begin
Role required: admin



Procedure

1. Go to the applications and plugins you need and select **Activate** to install them.

   Note: This can be done even after the Upgrade Plan is published.

   The plugin activation starts and installs successfully.

2. Go to the upgrade plan and refresh it by selecting

   Refresh.
   The Refresh Upgrade Plan confirmation message shows up.

3. After the upgrade plan refreshes, select **Go to Upgrade Plan**.

   Note: The **Publish** button is still visible because the updated Upgrade Plan needs to be published.

   The recently installed plugins and applications show up under Upgrade Plan Items related list.

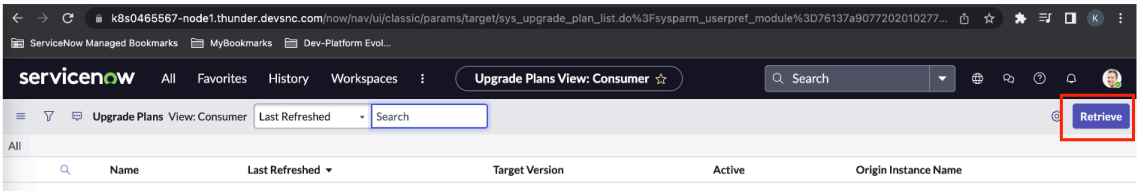
Installing your Upgrade Plan

Install your upgrade plan in the consumer instance to implement it in your upgrades.

Before you begin
Role required: admin

Procedure

1. Navigate to Upgrade Plan using one of the following ways.

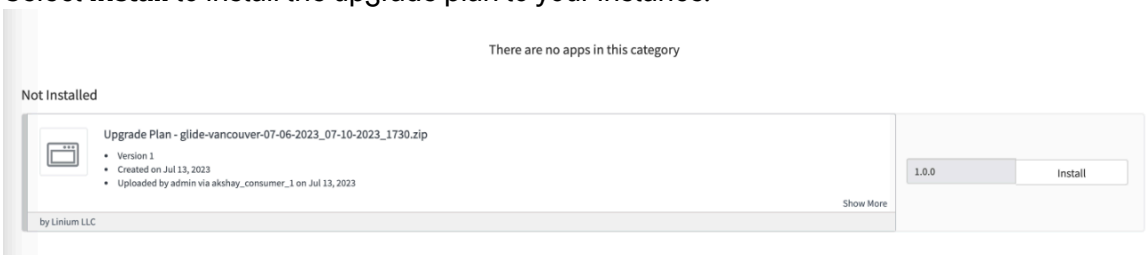


Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade Plan**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade Plan**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If you are on the Upgrade Monitor page, click **Manage Upgrade Plan**.

The list view of the upgrade plans shows up.



2. Select Retrieve to find your upgrade plan.

3. Search your upgrade plan by name.
4. **Optional:** Navigate to **All** > **My company applications** and refresh it.

Note: This step is applicable only if you can't find the required version of your upgrade plan.

5. Repeat the previous steps to see the latest version of the upgrade plan.
6. Select **Install** to install the upgrade plan to your instance.

Note: If you made any changes to the upgrade plan on the builder instance after installing it on the consumer instance, then update the upgrade plan to the latest version.

Prepare to upgrade with Upgrade Plan

Prepare your instance upgrade with Upgrade Plan by determining all the applications and plugins are ready to be implemented in the upgrade.

Before you begin

Role required: admin

Procedure

1. Navigate to Upgrade Plan using one of the following ways.

Option	Navigation
Using left navigation	Navigate to **All** > **Admin Center** > **Upgrade Management** > **Upgrade Plan**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Management** > **Upgrade Plan**.

The upgrade plan that is installed shows up on the list.

2. Select the upgrade plan.
The upgrade plan form view shows up with all its configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To ensure that all the applications and plugins are ready to be implemented in the upgrade, select **Refresh** in the context menu of the Upgrade Plan.
   If there are errors for any of the items, then fix them and follow the Reprocess step.

   Note: All the applications and plugins under the Upgrade Plan Items related list must be in the **Ready** state to proceed with the upgrade. The application or plugin in the **Already Installed** state, error or its latest version won't be considered during the upgrade process.

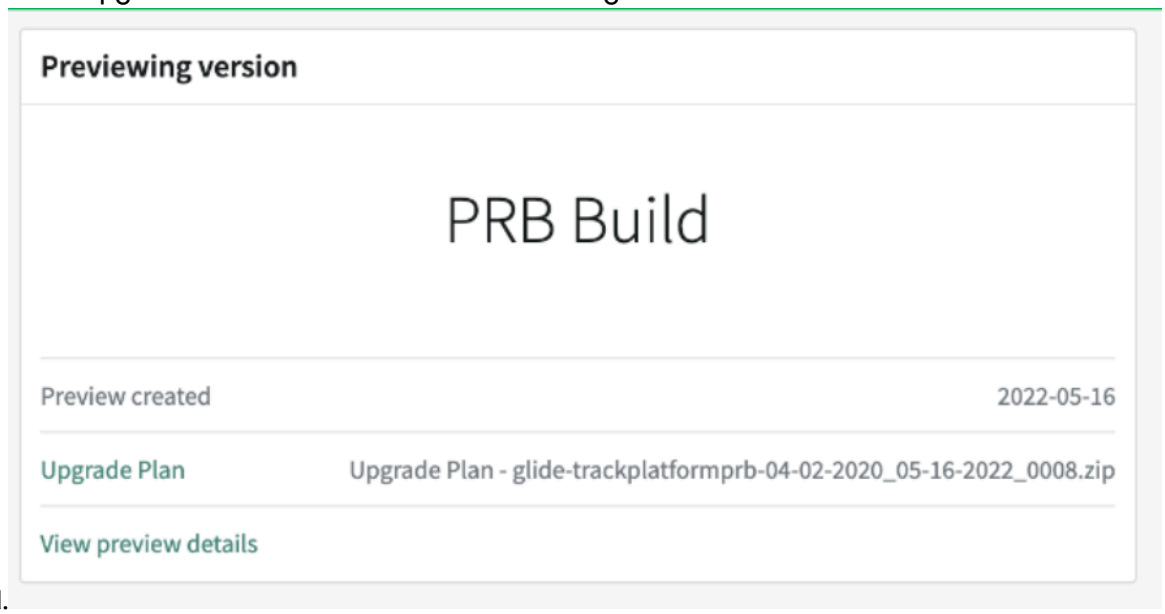
   The upgrade plan is now ready to be implemented.
4. Apply an existing upgrade plan to an instance anytime, without being limited to during upgrades only.

   You can now also export the upgrade plan in a batch install format by using the **Export** button. See CI/CD - POST /sn_cicd/app/batch/install for more information.
5. **Optional:** Select **Reinstall** to reinstall the failed items in an upgrade plan, after the upgrade completes.
   You can also review the upgrade plan history to know the reasons of failure.

   Note: You are required to use this option only if you have failed items in an upgrade plan.
6. **Optional:** Click **Reprocess** to reprocess the upgrade plan after the upgrade plan item errors have been resolved.

   Note: This step is applicable only if you have any error items in the upgrade plan.

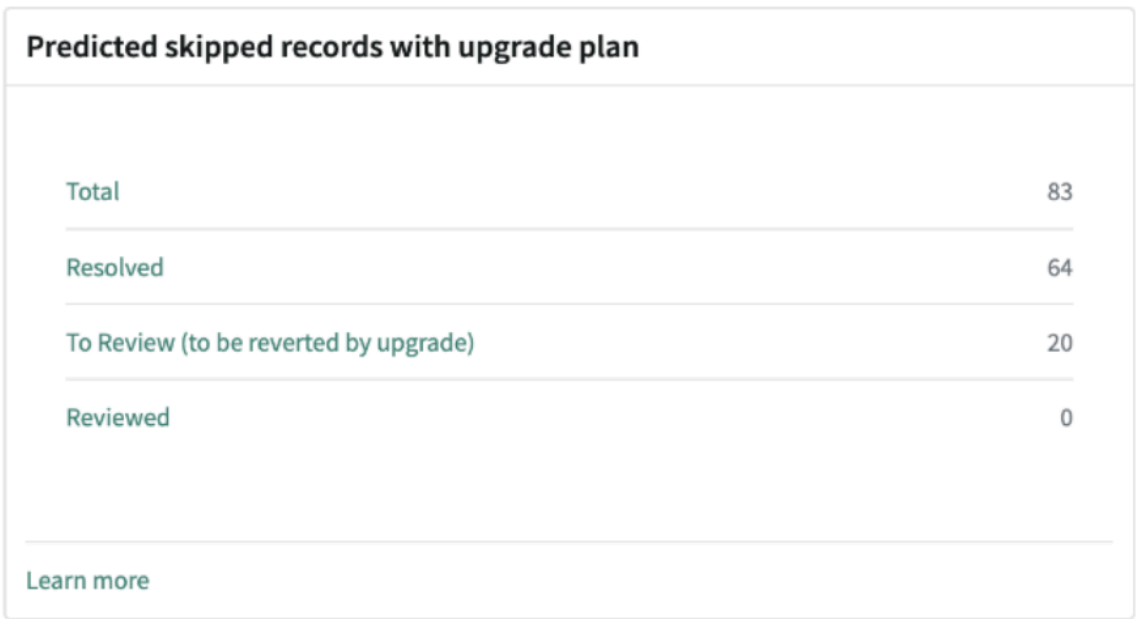
Preview Upgrade Plan



Preview your upgrade plan before being implemented in the upgrades. Once the upgrade plan is installed, it auto generates the preview of the upgrade plan.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Go to the Upgrade Preview page to preview the Upgrade Plan.
2. Check the Upgrade Plan mentioned on the Previewing version

card.

3. **Optional:** Check the Predicted skipped records with upgrade plan card to preview the skipped

records.

- Total: total number of skipped records
- Resolved: skipped records included in the upgrade plan
- Reviewed: skipped records that have been reviewed

Note: This step is applicable only if you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.

Apply Upgrade Plan on your upgrade

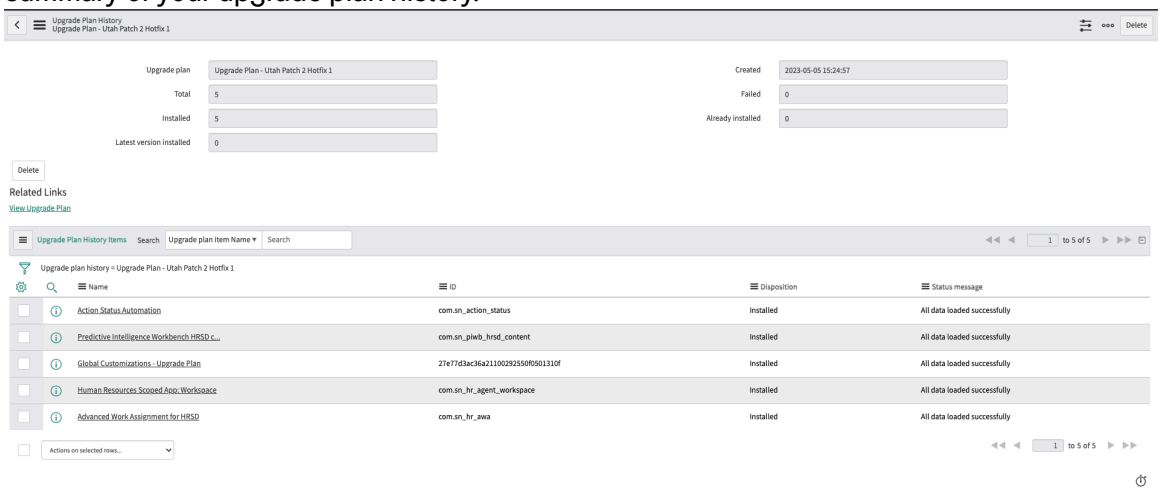
Apply the selected upgrade plan to your instance upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure



1. Go to the Upgrade Monitor page to ensure that the selected upgrade plan is being implemented in your upgrade.
   If the upgrade plan has been implemented on the ongoing upgrade, the Review upgrade plan link shows up on the Target version card.

   See Upgrade Plan background operations section in Upgrade Plans tool in Upgrade Console for more information.

2. Check on the date and time of the implemented upgrade plan in the Upgrade duration card once the upgrade completes.
   You can select the Review upgrade plan link on the Upgrade duration card to know the history of the upgrade plan. It shows all the installed applications and plugins and the failed items.
3. **Optional:** Scroll down to see the skipped records with upgrade plan.
   - Total: Total number of skipped records
   - Resolved: Total records from the upgrade plan that have been auto-resolved
   - To review: Total records left to be reviewed manually

   Note: This step is applicable only if you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.

4. **Optional:** Click **Review upgrade plan** on the Upgrade duration card if you want to check the summary of your upgrade plan history.

Review skipped records with upgrade plan

Review the skipped records after the completion of the upgrade.

Before you begin

Note: This process is applicable only if you have enabled the GLIDE_UPGRADE_PLAN_INCLUDE_SKIPS property.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Once the upgrade completes, scroll down to see the skipped records with upgrade plan.
   - Total: Total number of skipped records
   - Resolved: Total records from the upgrade plan that have been auto-resolved
   - To review: Total records left to be reviewed manually

   Note: After using the upgrade plan, the Global Application is created and all the records move to the Global Application. As soon as you create the Global Application, the new update sets show up.

   You won't be allowed to choose the skipped records that are captured by the upgrade plan, regardless of whether they are being reviewed. If the customizations are coming from different instances, then the skipped records are required to be reviewed.

2. Select the To review link to look at the records that need to be reviewed manually.

Configuring Upgrade Console

Upgrade your production or sub-production instance effortlessly by following our guided steps.

Note: It is recommended to clone the production instance to sub-production instance.

The following steps are in a nutshell to explain the overall configuration experience of Upgrade Console in a sub-production or a production instance.

Configuring Upgrade Console

Implement the following steps to configure Upgrade Console.

1. Navigate to **Admin** > **Upgrade Console** > **Guided upgrade**.

   Note: The **Guided upgrade** tab shows up only when the upgrade is in progress. If there is no ongoing upgrade, you can select the required upgrade version and select **Get started** in the Get started with your upgrade section.

2. Complete the **Pre-upgrade** tasks to move to the Instance upgrade tasks.

   Note: Select either **Mark as complete** or **Skip** to move to the next task in the Pre-upgrade section.

3. Complete the **Instance upgrade** tasks.
4. Complete the **Post-upgrade** tasks to complete the guided upgrade.

   Note: You need to first complete the pre-upgrade tasks to move to the instance upgrade and post-upgrade tasks.

Using guided upgrade to implement Upgrade Console

Implement the following to experience the guided upgrade for a seamless upgrade on your instance.

Access guided upgrade on a non-production instance

Follow the guided upgrade steps to experience the seamless upgrade on your non-production instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: upgrade_admin

Procedure

1. Access Upgrade Console in one of the following ways.

Option	Navigation
Using the application navigator	Navigate to **All** > **Admin Center** > **Upgrade Console**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Console**.
Using Admin tab and Admin Home option.	**a.** Navigate to **All** > **Admin Center** > **Admin Home**. **b.** Select the Upgrade Console link in the In stance Upgrade tile.

Note: By default, you are in the Overview tab at the end of this step.

The Upgrade Console landing page shows up.

2. Access the guided upgrade in one of the following ways.

Option	Steps
Using Get started button **Note: This option is available only when you haven't started the upgrade yet.**	**a.** Select **Get started** in the Newest version tile under Get started on your upgrade sec tion. **b.** Select the Guided upgrade version that you want to implement on your instance.
Using Guided upgrade tab option **Note: This tab is visible only if there's an ongoing upgrade in the instance.**	**a.** Select the **Guided upgrade** tab on the top of the Upgrade Console landing page. **b.** Select **Resume upgrade** to continue with the upgrade process. You can also select **End session** if you want to cancel the ongo ing upgrade process.

3. Complete the Pre-upgrade, Instance upgrade, and Post-upgrade tasks to complete the upgrade process on your non-production instance.

Implement pre-upgrade activities on a non-prod instance

Complete the pre-upgrade tasks for a successful upgrade experience on your instance.

Before you begin

Note: For each step, you will have the option to either skip the step or mark complete and only then move to the next guided upgrade step.

Role required: upgrade_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select **View release notes** if you want to review the release notes of the selected Guided upgrade version.

   Note: This step is visible only if you are in a non-production instance.

2. Request a clone.

   Note: This step is visible only if you are in a non-production instance. It is recommended to clone the production instance to non-production instance. Select **Request clone** to configure the source and target instances.

   Note: For data integrity and recovery purposes, it is recommended that the update sets should be either closed out or backed up. It is crucial for preserving all system modifications and enabling restoration when required.

   You can also see the cloning summary information that tells you the instance you have cloned and other relevant information. You can see the start and end time of the cloning process. By default, you are in the America/Los Angeles timezone. You can modify the timezone preference by navigating to **User Menu** > **Preferences** > **Language & Region**. You can then select the required timezone from the drop down menu.

   There are four different scenario for the cloning process.

   - No clone has been scheduled for this instance

   - Scheduled
   - Running

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Complete

Note: If the cloning process is in progress, the **Skip** and **Mark as complete** options are disabled.

A list of production instances shows up and you can select the instance you want to clone.

Note: If you are in a production instance, the list of instances for cloning doesn't show up.

You can expect the following in this pre-upgrade activity once you select the instance to be cloned.

- You will be redirected to the Cloning tool to initiate the cloning process.
- The Cloning tool guides you through the cloning process of your production instance.
- You will be reminded to ensure to back up the update sets before starting the cloning process to save any changes and configurations.

3. Choose an upgrade plan.
   There are two options to choose your upgrade plan.
   - Select an existing one: You can import update sets to apply or merge upgrade plans for your upgrades. This option is selected by default.

     In order to apply an existing upgrade plan, you have the following options:

     - Import update sets: You must first import update sets before selecting an existing upgrade plan.

       a. Select **Import update sets** to import an update set. The Retrieve Update Sets list shows up.

       b. Select the Import Update Set from XML related link to select the update set to be imported. The Import XML page shows up.

       c. Select an already existing update set using **Choose file** and then select **Upload**.

       The selected update set gets uploaded in the current upgrade plan. The current upgrade plan shows up on the Retrieve Update Sets list.

       d. Select the plan from the Retrieve Update Sets list. The Retrieve Update Set form shows up with all its associated customer updates.

       e. Select **Preview Update Set**. The Update Set Preview modal shows up.

       f. Once the previewing of the update set is completed successfully, select **Commit Update Set**. The Update Set Commit modal shows up.

       Note: This option is visible only after the successful completion of update set preview.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select an existing upgrade plan: You can view the imported plans to choose or can select multiple plans or merge them into one plan.

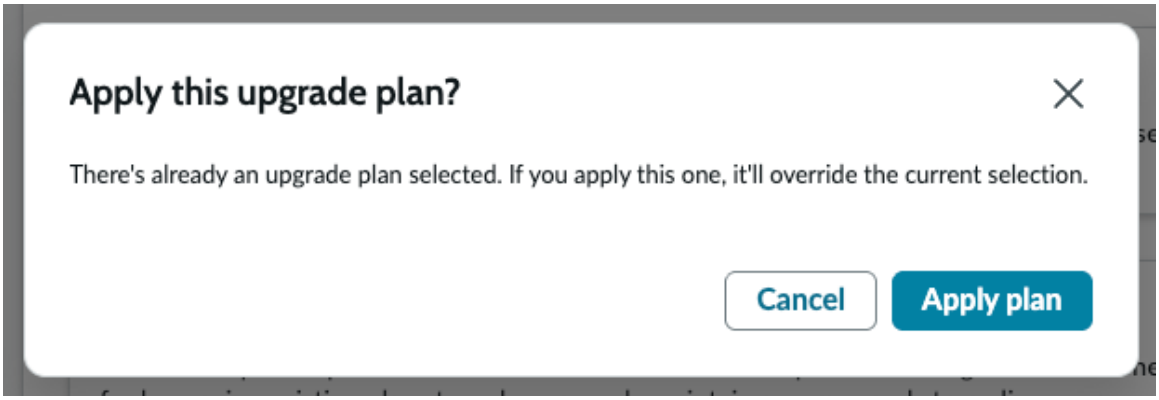
  Note: This option considerably reduces rework with an upgrade plan, maintains accuracy and makes your upgrade process seamless.

  You will see the following modal when you select Select upgrade plan. You can then select either one upgrade plan or multiple plans to be merged and applied to the current upgrade.

  Note: The **Apply** option is visible only when you select one upgrade plan to be applied to the current upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Merge and apply** option is visible only if you have selected multiple upgrade plans. The upgrade plan name changes as per the selection of upgrade plans.



When merging multiple upgrade plans, upgrade plan items that appear in more than one plan are used in the merged plan by their highest version. This ensures consistency and avoids version conflicts in the resulting merged plan.

- Create a new one: You can get started with creating a new plan for your instance upgrade.
  - Create an upgrade plan: Select **Create a plan** to start creating the new upgrade plan. Select the Upgrade Plan link from the success message banner to view the created upgrade plan.

    Note: The success message banner is generated immediately after the upgrade plan is created by selecting **Create a plan** and stays visible until the page is reloaded.

    If you select the **Create a plan** option again after creating a plan, you will see the following message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Only the most recent upgrade plan without any upgrade plan items is retained. For example, if the most recent upgrade plan is created without upgrade plan items, it automatically overrides any earlier upgrade plan that also doesn't have upgrade plan items. There can be more than one upgrade plan with upgrade plan items.

In the Upgrade Plans list, there can be several upgrade plans with upgrade plan items and only the recent upgrade plan with no upgrade plan items.

Note: An instance can have only one active upgrade plan at a time, regardless of whether the plan includes upgrade plan items. Only the most recent upgrade plan is in active state as it automatically gets applied to the current upgrade.

- View generated upgrade plan: This is an alternate way to view the recently created upgrade plan. This option is helpful when you reload the page and the success message banner disappears.

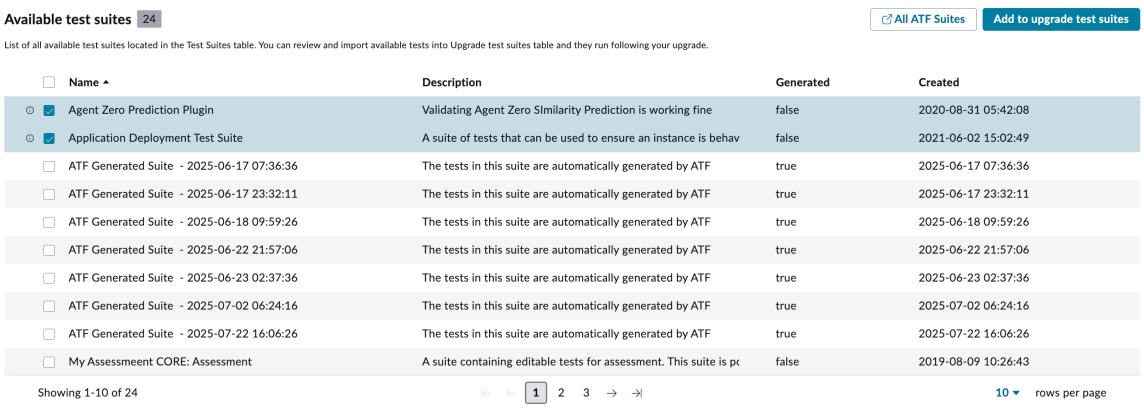
  Note: This option is visible only after the upgrade plan is created.

Once the upgrade plan is finally selected, the **Select upgrade plan** and **Create a new one** options are disabled.

4. Automate upgrade tasks.
   There are two different kinds of upgrade tasks in this step.
   - Default automated tasks: These tasks are completed automatically.
     - Generate upgrade preview: It helps you understand how your instance will be impacted after the upgrade even without having it really upgraded.
     - Create upgrade update sets: The automatic creation of the upgrade update sets capture changes and helps during review of the skipped records.
   - Optional automated tasks: You have the option of completing these tasks automatically.
     - Generate the ATF tests: Automatic generation of the ATF tests using the ATF test generator and cloud runner store application.

       Note: These ATF tests run automatically post-upgrade.

     - Upgrade store applications to the latest version: By default, all the applications are being upgraded to the latest version. If you don’t want them to be upgraded to the latest version, you can disable the toggle and manually select a compatible version during the store application upgrade step.
5. Conduct pre-testing.
   This step captures all the tests required to be executed after the upgrade.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Generate tests: Auto-generates regression tests with the use of ATF Test generator tool. You can review the start time and the total time to complete the test generation.

  Note: The auto-generated ATF test suites are added to the Upgrade Test Suites table and are executed automatically post-upgrade.

  Select **Status** to check the status of the generated tests. You can also cancel the test generation process by selecting **Cancel**.

- Create additional tests: Review the existing tests or create additional tests to complete upgrade faster.
- Upgrade test suites: The auto-generated regression tests in the Generate tests section are added here automatically when they are generated. You can also add more tests by selecting it from the Available test suites table section.
- Available test suites: Review the list of available test suites. You can also select the tests you want to add to the Upgrade test suites section. Only the selected tests are executed automatically after the upgrade.

Note: The available test suites are already successfully passed test suites.

6. Preview application upgrades.

   You can preview all the store applications with their updates for your instance. If the upgrade preview generation is in progress, you can track it using the Execution tracker link.

   - Selected Apps: You can review the following information:
     - Customized apps: Number of apps that have been customized
     - New apps to be installed: Total number of new apps to be installed for the upgrade
     - Apps to be upgraded: Total number of existing apps whose version need to be upgraded

     Note: If you have disabled Upgrade store applications to the latest version previously, the value for Apps to be upgraded depends on the manual selection of the Upgrade store applications section.

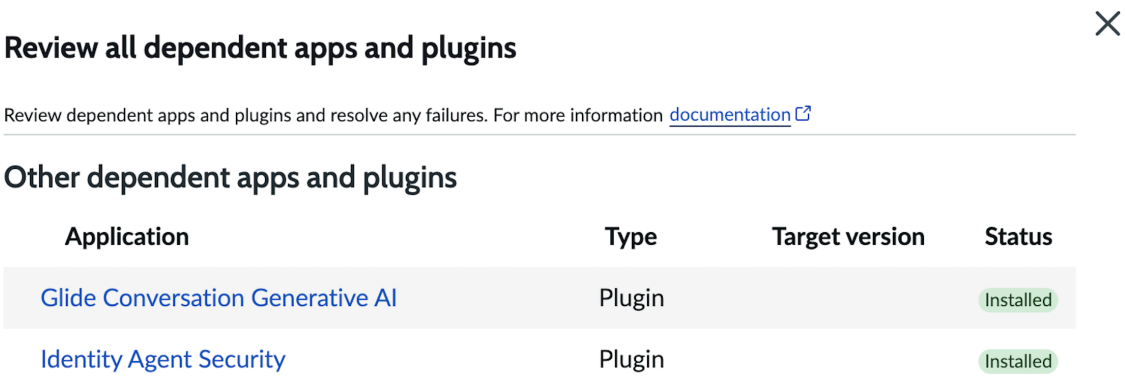
   - Update Otto App Suite: Use the Update Otto App Suite section to manage application version compatibility. When you upgrade an application in the compatibility matrix, the system automatically updates all related applications to compatible versions.

     Select **Suite Version** to select a suite version from the dropdown menu. The dropdown menu shows the suite versions available in the selected version. For example, if you want to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

upgrade your instance to Australia, only the suite versions available in Australia are shown in the dropdown menu options.

Note: Select None as the Suite Version option if you don't want to update Otto App Suite.

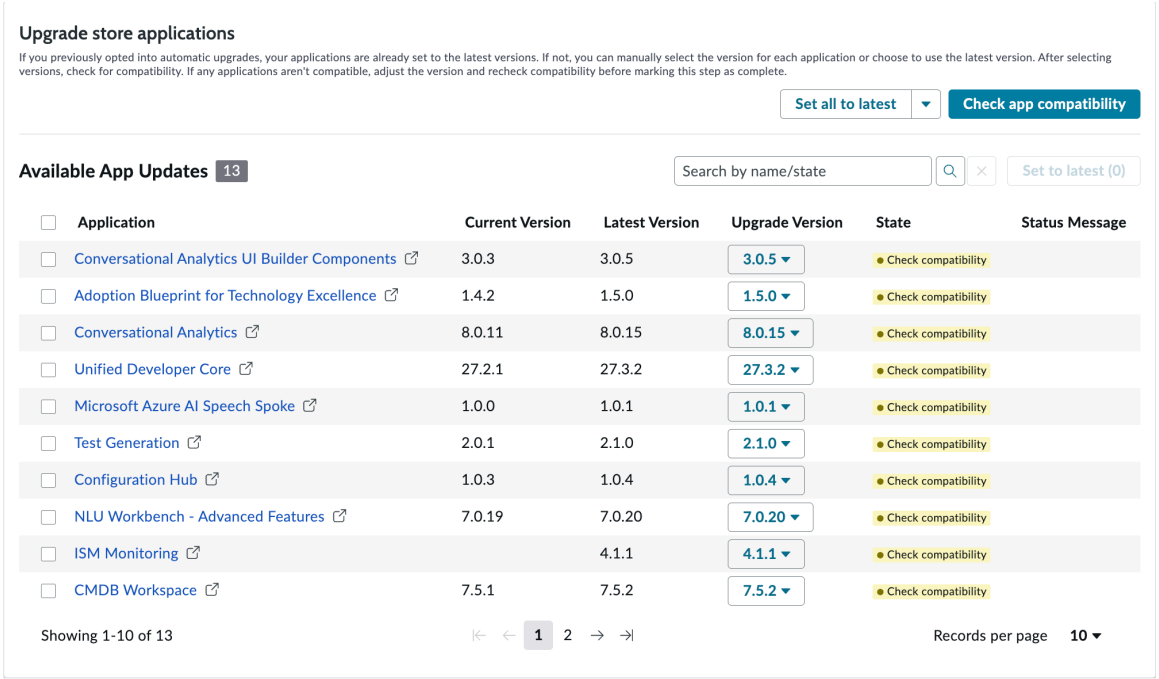


Select Execution tracker link to track the progress of the list. The Execution tracker form shows up. Select Show status related link to see the current status.

Note: Only the applications whose upgraded versions are available to be upgraded in the selected suite version are shown in the list. No new applications can be installed here.

- Application: Name of the application within the selected suite version
- Status: Status of the application
- Current Version: Current version of the application
- Latest Version: Latest available version of the application
- Selected Version: Configured version of the application in the selected suite version

Note: Downgrading of application versions is not allowed.



Select **Dependent apps and plugins** to see the calculated list of all dependent applications and plugins for the Otto App Suite applications list.

For example, if you have 5 applications in the selected version of Otto App Suite, the Otto App suite dependencies modal lists only the dependencies of these 5 applications.

- Upgrade store applications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application: Name of the application
- Current version: Current version of the application on the instance
- Latest version: Latest available version of the application
- Upgrade Version: Selected version of the application to which you want to upgrade
- State: State of the application based on the selected version for the upgrade. It displays either **Compatible** or **Check compatibility** based on the selected version if its compatible or not.
- Status message: Provides you more information about app compatibility if there are any failures after running **Check app compatibility**.

> **Note:** If you have previously selected the automatic upgrade option, the applications are upgraded to the latest version by default.
>
> If you haven't selected the automatic upgrade option previously, you get an option to select the version of the application to which you want to upgrade.

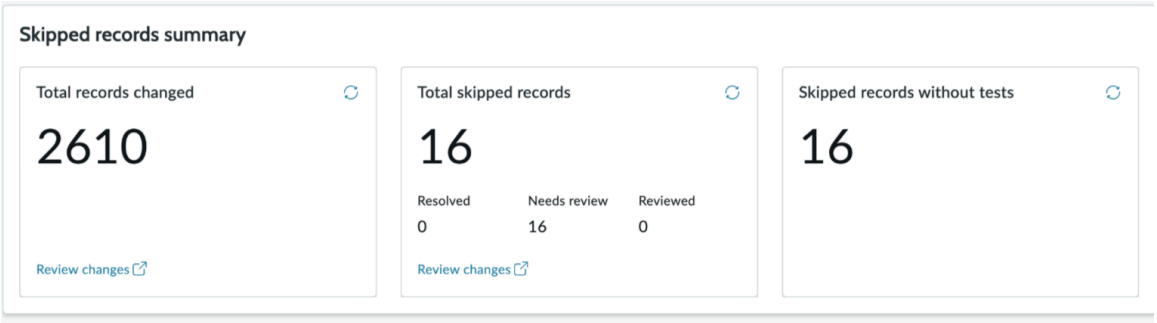
The number of Apps to be upgraded gets updated depending on the manual selection of the apps for the selected versions. For example, if you select **Set all to minimum version** for all the applications, the number of Apps to be upgraded remains unchanged. Select **Set all to latest** if you want to update all the applications to the latest version available. Ensure to check the compatibility of the apps after selecting its versions by selecting **Check app compatibility**. If an application is not compatible, modify the version to make it compatible before moving on to the next step.

> **Note:** You can proceed to the next step of the upgrade process only after checking the compatibility of the applications.

Select **View upgrade plan** in the Selected Apps section to see all the items along with their selected versions being added to the upgrade plan at the end of this step.

You can now edit this step by selecting **Edit step** even after marking it complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note: The **Edit step** option is available only when you mark this step as complete and before scheduling or starting any upgrade. Once you select **Edit step**, the next step in the Pre-upgrade process resets. You can again proceed to the next step of the upgrade process only after checking the compatibility of the applications.

7. Review predicted skipped records.
   Skipped records occur when customizations on your instance prevent certain files from being automatically updated during an upgrade.

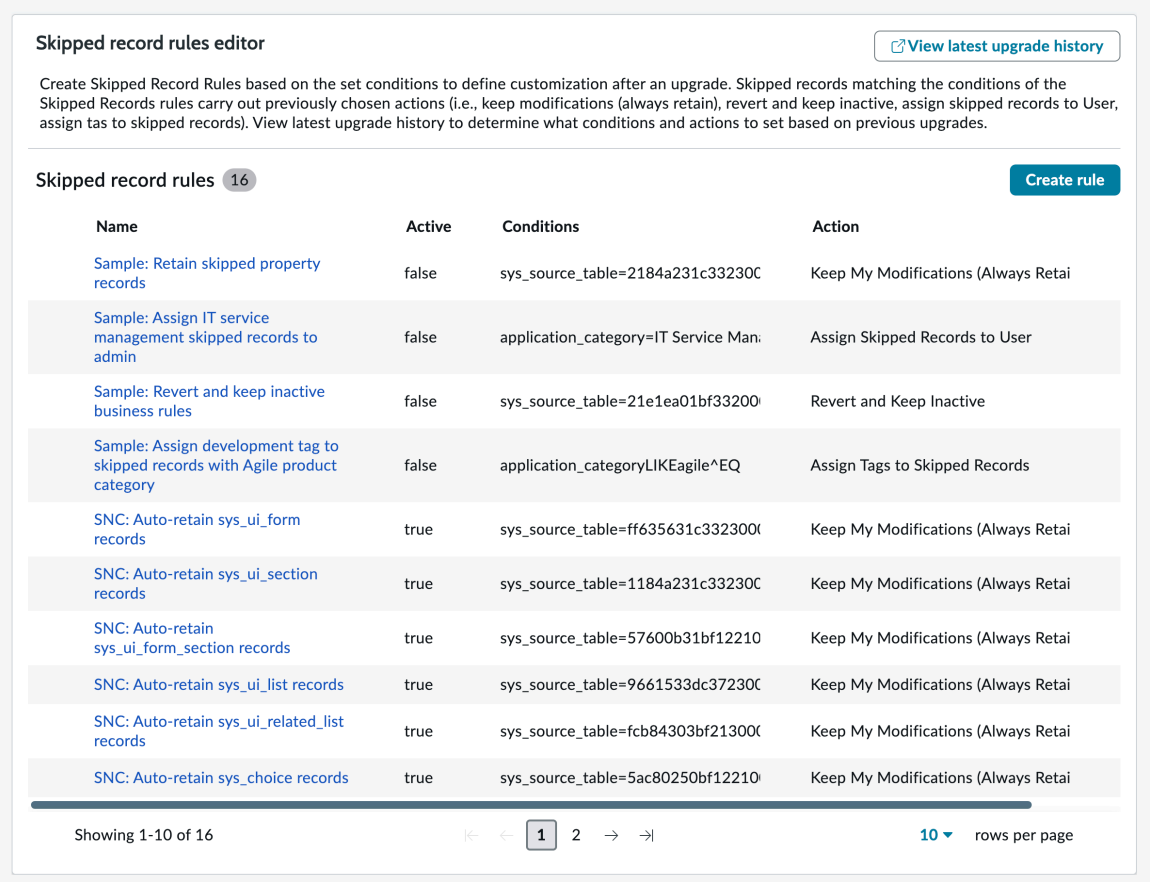
   Select **Regenerate Preview** to regenerate a preview either for all the applications or for only the modified applications in the previous step.

   Note: Set the glide.upgrade_center.regenerate_upgrade_preview property to `true` to regenerate the preview for all the apps.

   - Upgrade preview: You can view the current version and the previewing version of the upgrade in this section. You can also see if there is any upgrade been scheduled.
   - Skipped record summary: You can view the following information.

     - Total records changed: Gives the total number of records that have changed since last upgrade. Select the Review changes link to see the list of records that have changed.
     - Total skipped records: Shows the numbers of skipped records that have been resolved, total skipped records that need to be reviewed and the number of skipped records that have already been reviewed.
     - Skipped records without tests: States the total number of skipped records that have tests. The Test linked link in the Skipped records section points to the list of tests of the skipped records that have associated tests.
   - Predicted skipped records: Shows the total number of predicted skipped records

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Name: Name of the skipped record
- Product: Name of the record that the skipped record belongs to
- Status: Status of the skipped record if it has been resolved, reviewed or needs to be reviewed
- Test linked: Links to the list of test associated with the skipped record. It helps you know the reason why a certain record has been skipped by viewing all the tests associated with the skipped record.
- Prediction disposition: Action predicted to be performed on the skipped record during the selected upgrade.
  - Predicted Insert: The system is predicted to insert a new record.
  - Predicted Update: The system is predicted to update this record.
  - Reverted: This record was reverted to the base version, and won't be skipped on the next upgrade.
  - Predicted Skip: The system won't change this record in order to preserve customizations.
  - Predicted Skip (Manual Merge): The system won't change this record because updating it requires manual intervention.
  - Predicted Skip (Apply Once): The system is predicted to skip this record because it had already applied an update from an xml file in the apply once folder.

- Skipped record rules editor: Use the skipped record rules editor to create skipped record rules based on the set conditions to define customizations after an upgrade.

Note: This step is completed within the Review predicted skipped records step.

The skipped records matching the set conditions in the skipped record rules editor, perform the previously selected actions. Select **View latest upgrade history** to determine the actions and conditions to be set depending on the previous upgrades.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The skipped record rules shows the list of skipped record rules on the instance.

- Name: Name of the rule
- Active: States if the rule is active or not
- Conditions: Conditions set by the rule to filter the skipped records
- Action: Previously chosen action for the specific rule
- Order: The order in which the rules are sorted

Select **Create rule** if you want to create any additional skipped record rules.

You can do the following in this pre-upgrade activity.

- Review the list of predicted skipped records in the Preview module and decide which versions of the files to be retained.
- You can choose some customizations to be reverted to the base version, allowing them to go through the entire upgrade process without being skipped.
- Ensure to review and update the list of skipped records after the upgrade.
- Once done with the reviewing of the skipped records, complete the next activities required in the pre-upgrade process.

Implement instance upgrade activities on a sub-prod instance

Implement the instance upgrade tasks for a successful upgrade on your instance.

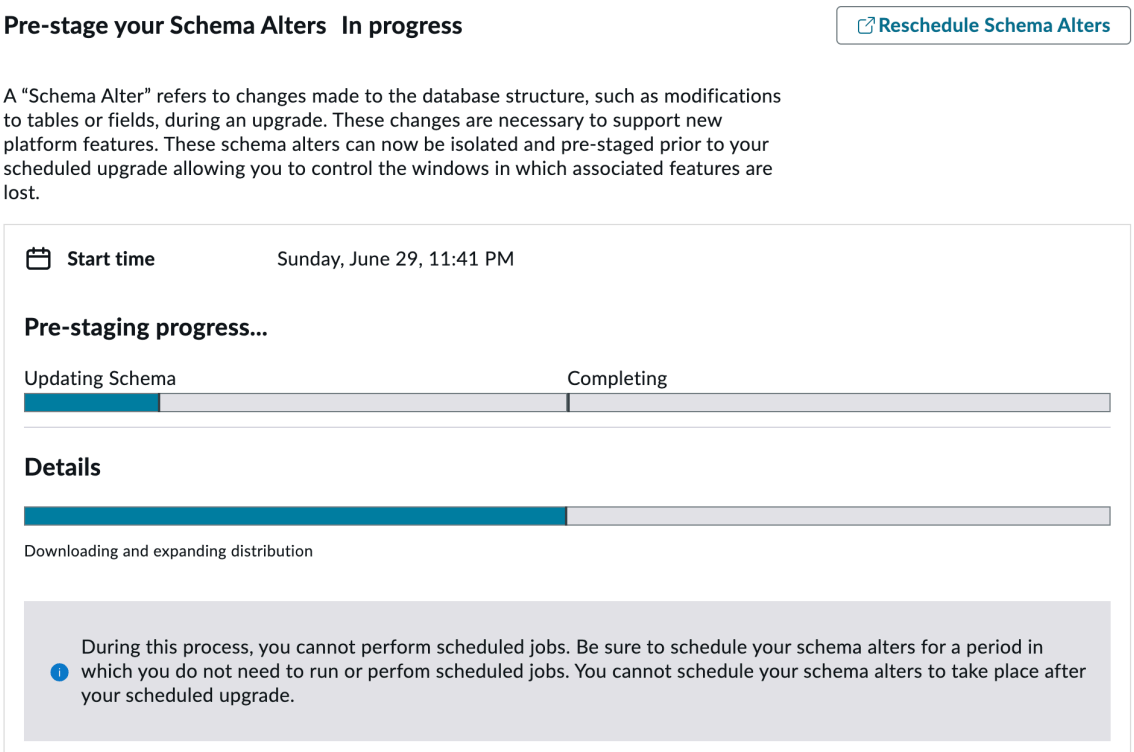
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Note: You will be able to perform the Instance upgrade tasks only after completing the pre-upgrade tasks.

Role required: upgrade_admin

Procedure



1. Upgrade your instance.
   In this section you will see the following information:
   - Scheduled Upgrade: It shows the current status of the upgrade on the instance. You can see one of the following stages in this section.
     - Not scheduled
     - Scheduled
     - Running or in progress
     - Complete

     Select **Reschedule upgrade** if you want to reschedule the upgrade. If there is no upgrade scheduled, select **Schedule upgrade** to schedule an upgrade. You are now redirected to ServiceNow Support to schedule an upgrade for your instance. You can then select one of the available versions and **Submit**. This automatically creates the upgrade request for your instance.

     When the status is Complete, you can view when the upgrade started and completed, as well as the total duration. By default, you are in the America/Los Angeles timezone. You can modify the timezone preference by navigating to **User Menu** > **Preferences** > **Language & Region**. You can then select the required timezone from the drop down menu.
   - Pre-stage your Schema Alters: This section notes the changes in the database during the upgrade process on your instance. It is to be noted that these database modifications are necessary for new platform features. You can now pre-stage the schema alters so that the actual upgrade process is expedited.

     Note: It is recommended to pre-stage your schema changes which accelerates the actual upgrade process. By default, it is scheduled one week prior to the upgrade. During this time, no scheduled upgrade can process. The schema alter process can't start after the scheduled upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can see the start time of the scheduled schema alters. Select **Reschedule Schema Alters** to update the scheduled time for schema alters.

> **Note:** The option of seeing the schema alters and updating the starting time is applicable only if the glide.staged_upgrade.enabled property is enabled or set to true. By default, the glide.staged_upgrade.enabled property is set to false.

2. Select **Mark as complete** when the upgrade process completes.

Implement post-upgrade activities on a non-prod instance

Implement the post-upgrade tasks for a successful upgrade completion on your instance.

Before you begin

> **Note:** You will be able to perform the post-upgrade tasks only after completing the pre-upgrade and instance upgrade tasks.

Role required: upgrade_admin

Procedure

1. Review skipped records.
   You can review the skipped records that were identified during the pre-upgrade steps and during the upgrade. You can see the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Skipped records summary: This section shows the summary of all the skipped records
  - Total records changed: States the total number of records that have been changed since last upgrade. Select Review changes link if you want to see the changes in the records.
  - Total skipped records: States the total number of records that have been skipped during the upgrade. It also shows the number of records that have already been reviewed and need to be reviewed.
  - Skipped records without tests: States the total number of skipped records that have tests. The Test linked link in the Skipped records section points to the list of tests of the skipped records that have associated tests.
- Skipped records: This section shows the list of records that have been skipped during the upgrade.
  - Name: Name of the skipped file
  - Product: Name of the product where the skipped file belongs to
  - Priority: Priority of the skipped record to get it resolved
  - Status: States if the skipped file has been reviewed or not
  - Test linked: Links to the list of test associated with the skipped record. It helps you know the reason why a certain record has been skipped by viewing all the tests associated with the skipped record
  - Predicted Disposition: Action performed on the skipped record during the upgrade
  - Assigned to: Owner of the skipped record

    Note: Select **Assign** to assign a skipped record to get it resolved.

  - Plugin: The app id where the skipped record is found

2. Store application upgrades.
   You can now view the list of applications that have been upgraded depending on the selections made in the Preview application upgrades step in the Pre-upgrade stage.

   Note: It is to be noted that the applications that were not selected during the preview or dont have a newer version available are not listed.

   You can see the following information in this task.

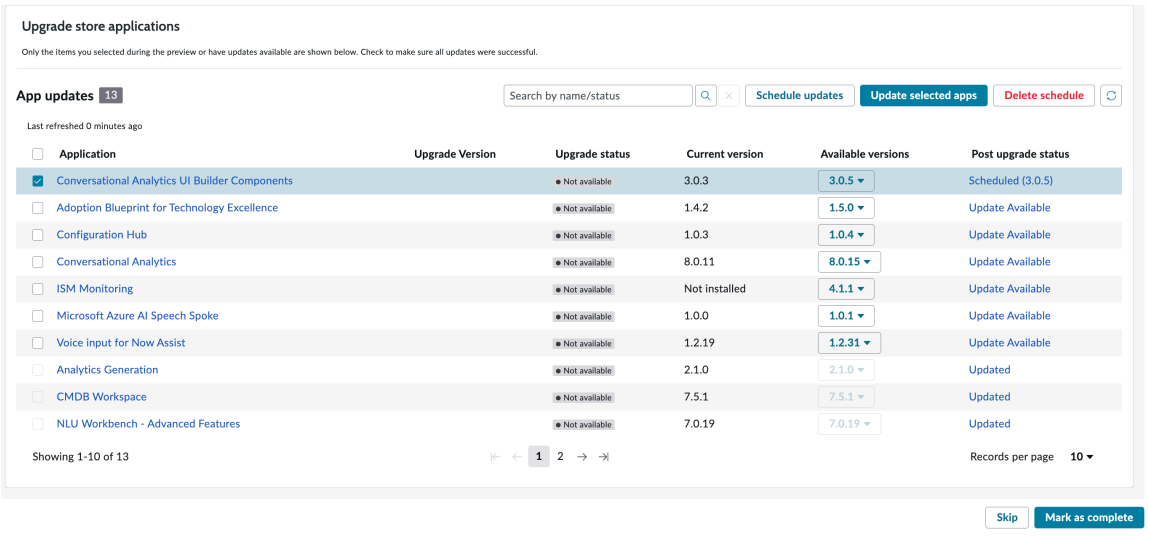
   - App updates: Summary of the applications.
     - Total apps: Total apps the current instance has
     - Apps updated: Total apps that got upgraded during the upgrade or post upgrade
     - Apps to be updated: Total apps that have updates but are yet to be upgraded
     - Scheduled Apps: Total selected apps for scheduled upgrade at later point of time
   - Otto update suite: Select **Suite Version** to select a suite version from the dropdown menu. The dropdown menu shows the suite versions available for the Otto App suite.

     Note: Only the applications whose upgraded versions are available to be upgraded in the selected suite version are shown in the list. No new applications can be installed here. The applications that are already updated in the Preview application upgrade step are not listed in the list.

     Select **Updated suite** if you want to upgrade all the applications mentioned in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application: Name of the application within the selected suite version
- Current Version: Current version of the application
- Latest Version: Latest available version of the application
- Selected Version: Configured version of the application in the selected suite version
- Status: Status of the application



Note: Downgrading of application versions is not allowed.

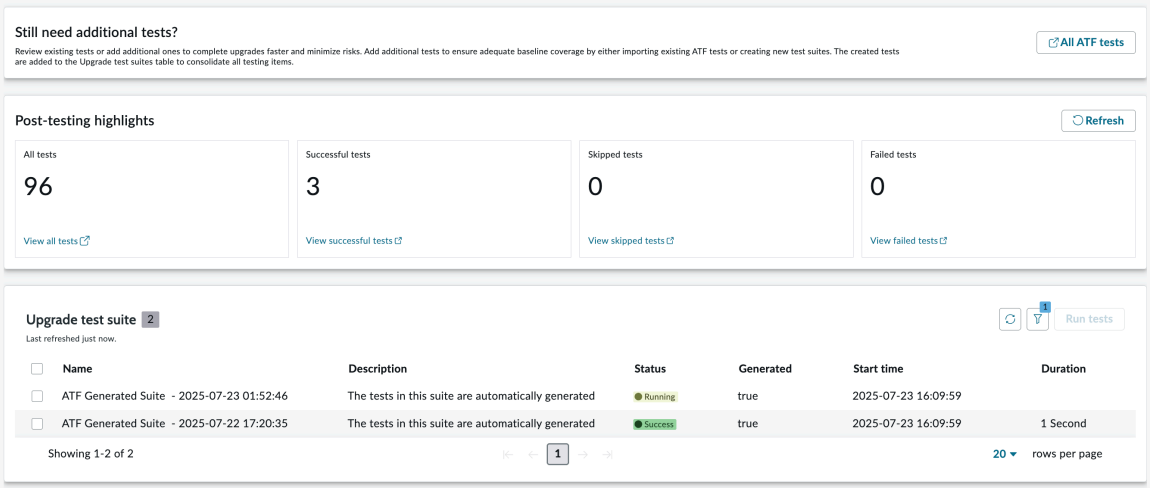
Select **All dependent apps and plugins** to see the calculated list of all dependent applications and plugins for the Otto update suite applications list.

For example, if you have 5 applications in the selected version of Otto update suite, the Otto update suite dependencies modal lists only the dependencies of these 5 applications.

- Upgrade store applications: List of applications that have been selected in the pre-upgrade stage and have updated versions available.

- Application: Name of the application
- Upgrade version: Selected version of the application to which you want to upgrade. This was selected before upgrade starts in preview apps page
- Upgrade status: States if the application is in the Store

Note: The applications that are installed on the instance show up at the end of the applications list.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Current version: States the current version of the application
- Available versions: States the most updated version available for upgrade
- Post upgrade status: States the status of the application. For example, the status indicates whether an application update is Scheduled, Update Available, or already Updated. You can also see the version for the scheduled applications.

Select **Update selected apps** to upgrade the selected apps to the available version immediately. You can also schedule the upgrades by selecting **Schedule updates**. You can also search for an application based on its name or status.

Use **Sync Now** to update the list of installed applications that were added or upgraded outside the upgrade process. For example, if you install or update an app through the App Manager, select **Sync Now** to reflect the latest application status.

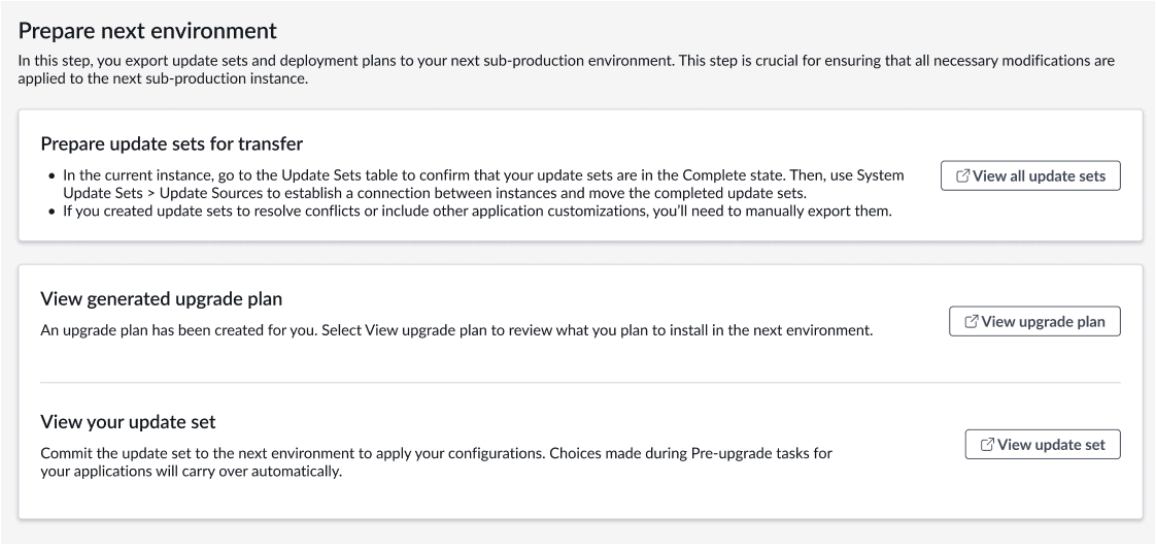
3. Conduct post-testing.
   In order to conduct post-testing, the selected ATF tests are executed to ensure system functionality and integrity of the existing features.

You can review the following information in this step:

- Still need additional tests: You can review the existing tests and add more tests if required for a seamless and faster upgrade. You can either import existing ATF tests or create new test suites.

  Note: The created tests or test suites are added to the Upgrade test suite table for consolidated testing.

- Post-testing highlights: This section states the number of total tests, passed and failed tests, and the skipped records during the upgrade process. You can also select View successful tests and View failed tests links to see the list of tests that passed or failed. Select View skipped tests to view the list of all the skipped tests in the upgrade.
- Upgrade test suite: This section lists the recently created test suites that were additional tests for faster upgrade.
  - Name: Name of the test suite
  - Description: Description of the test suite
  - Status: Status of the test suite if it has been tested or not
  - Generated: States if it has been generated or recently created



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Start time: States the start time of testing of the test suite
- Duration: States the total duration for the testing of the test suite

- ATF troubleshooting agent: Select ATF troubleshooting agent to identify the root cause of test failures on specific metadata. See ATF troubleshooting agent for more information.

4. Prepare next environment.

   In this step, you can see the currently selected upgrade plan. You then prepare the update set and export it to the next production or non-production instance. This task is used to ensure that all necessary modifications are applied to the next production or non-production instance.

   You can see the following information in this task:

   - Prepare update sets for transfer: Check the Update Sets Table and ensure that your update sets are in Complete state. Once they are completed, you can move the update sets to the next production or non-production instance. If you have created new update sets and included other apps customizations, you can manually export them to the next instance. Select **View all update sets** to review your update sets in the Update Sets Table table.
   - View generated upgrade plan: View the upgrade plan created automatically for you to install in the next environment. Select **View update plan** to review the update plan that has been created for you.
   - View your update set: Commit the selected update set to the next environment to apply your configurations. Select **View update set** to download the update set.

     Note: The selection made during the Pre-upgrade tasks for your applications are automatically included.

5. Select **Mark as complete** to complete the sub-production tasks in a non-production instance.

Access guided upgrade on a production instance

Follow the guided upgrade steps to experience the seamless upgrade on your production instance.

Before you begin
Role required: upgrade_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Access Upgrade Console in one of the following ways.

Option	Navigation
Using the application navigator	Navigate to **All** > **Admin Center** > **Upgrade Console**.
Using Admin tab option	Navigate to **Admin** > **Upgrade Console**.
Using Admin tab and Admin Home option	**a.** Navigate to **All** > **Admin Center** > **Admin Home**. **b.** Select the Upgrade Console link in the In stance Upgrade tile.

Note: By default, you are in the Overview tab at the end of this step.

The Upgrade Console landing page shows up.

2. Access the guided upgrade in one of the following ways.

Option	Steps
Using Get started button **Note: This option is available only when you haven't started the upgrade yet.**	**a.** Select **Get started** in the Newest version tile under Get started on your upgrade sec tion. **b.** Select the Guided upgrade version that you want to implement on your instance.
Using Guided upgrade tab option **Note: This tab is visible only if there's an ongoing upgrade in the instance.**	**a.** Select the **Guided upgrade** tab on the top of the Upgrade Console landing page. **b.** Select **Resume upgrade** to continue with the upgrade process. You can also select **End session** if you want to cancel the ongo ing upgrade process.

3. Complete the Select upgrade, Pre-upgrade, Instance upgrade, and Post-upgrade tasks to complete the upgrade process on your production instance.

Implement pre-upgrade activities on a prod instance

Complete the pre-upgrade tasks for a successful upgrade experience on your production instance.

Before you begin

Note: For each step, you will have the option to either skip the step or mark complete and only then move to the next guided upgrade step.

Role required: upgrade_admin

Procedure

1. Choose an upgrade plan.
   There are two options to choose your upgrade plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select an existing one: You can import update sets to apply or merge upgrade plans for your upgrades. This option is selected by default.

  In order to apply an existing upgrade plan, you have the following options:

  - Import update sets: You must first import update sets before selecting an existing upgrade plan.

    a. Select **Import update sets** to import an update set. The Retrieve Update Sets list shows up.

    b. Select the Import Update Set from XML related link to select the update set to be imported. The Import XML page shows up.

    c. Select an already existing update set using **Choose file** and then select **Upload**.

    The selected update set gets uploaded in the current upgrade plan. The current upgrade plan shows up on the Retrieve Update Sets list.

    d. Select the plan from the Retrieve Update Sets list. The Retrieve Update Set form shows up with all its associated customer updates.

    e. Select **Preview Update Set**. The Update Set Preview modal shows up.

    f. Once the previewing of the update set is completed successfully, select **Commit Update Set**. The Update Set Commit modal shows up.

    Note: This option is visible only after the successful completion of update set preview.

  - Select an existing upgrade plan: You can view the imported plans to choose or can select multiple plans or merge them into one plan.

    Note: This option considerably reduces rework with an upgrade plan, maintains accuracy and makes your upgrade process seamless.

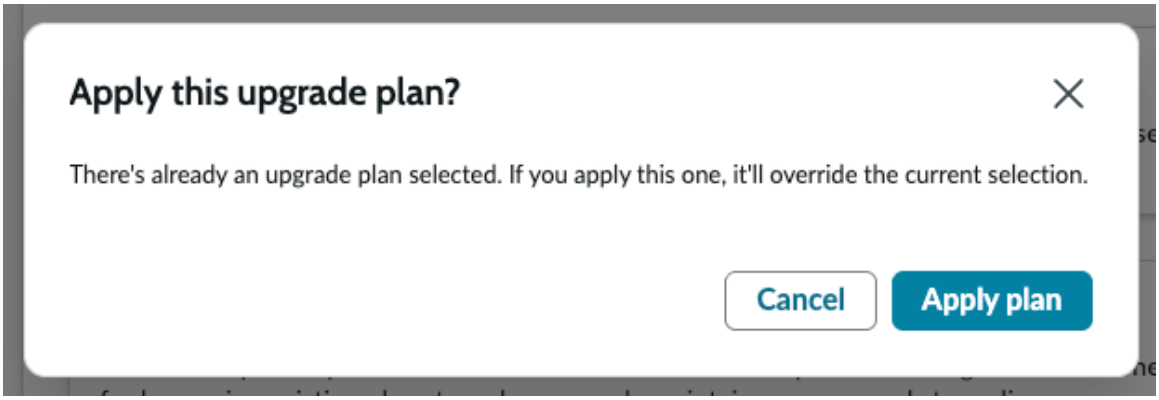
    You will see the following modal when you select Select upgrade plan. You can then select either one upgrade plan or multiple plans to be merged and applied to the current upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Apply** option is visible only when you select one upgrade plan to be applied to the current upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Merge and apply** option is visible only if you have selected multiple upgrade plans. The upgrade plan name changes as per the selection of upgrade plans.



When merging multiple upgrade plans, upgrade plan items that appear in more than one plan are used in the merged plan by their highest version. This ensures consistency and avoids version conflicts in the resulting merged plan.

- Create a new one: You can get started with creating a new plan for your instance upgrade.
  - Create an upgrade plan: Select **Create a plan** to start creating the new upgrade plan. Select the Upgrade Plan link from the success message banner to view the created upgrade plan.

    Note: The success message banner is generated immediately after the upgrade plan is created by selecting **Create a plan** and stays visible until the page is reloaded.

    If you select the **Create a plan** option again after creating a plan, you will see the following message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Only the most recent upgrade plan without any upgrade plan items is retained. For example, if the most recent upgrade plan is created without upgrade plan items, it automatically overrides any earlier upgrade plan that also doesn't have upgrade plan items. There can be more than one upgrade plan with upgrade plan items.

In the Upgrade Plans list, there can be several upgrade plans with upgrade plan items and only the recent upgrade plan with no upgrade plan items.

Note: An instance can have only one active upgrade plan at a time, regardless of whether the plan includes upgrade plan items. Only the most recent upgrade plan is in active state as it automatically gets applied to the current upgrade.

- View generated upgrade plan: This is an alternate way to view the recently created upgrade plan. This option is helpful when you reload the page and the success message banner disappears.

  Note: This option is visible only after the upgrade plan is created.

Once the upgrade plan is finally selected, the **Select upgrade plan** and **Create a new one** options are disabled.

2. Preview application upgrades.

   You can preview all the store applications with their updates for your instance. If the upgrade preview generation is in progress, you can track it using the Execution tracker link.

   - Selected Apps: You can review the following info
     - Customized apps: Number of apps that have been customized
     - New apps to be installed: Total number of new apps to be installed for the upgrade
     - Apps to be upgraded: Total number of existing apps whose version need to be upgraded

     Note: If you have disabled Upgrade store applications to the latest version previously, the value for Apps to be upgraded depends on the manual selection of the Upgrade store applications section.

   - Upgrade store applications

     - Application: Name of the application
     - Current version: Current version of the application on the instance
     - Latest version: Latest available version of the application

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

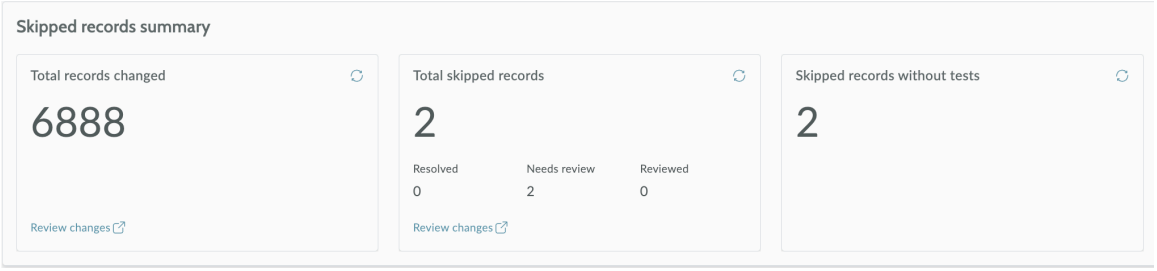
- Upgrade Version: Selected version of the application to which you want to upgrade
- State: State of the application based on the selected version for the upgrade. It displays either **Compatible** or **Check compatibility** based on the selected version if its compatible or not.
- Status message: Provides you more information about app compatibility if there are any failures after running **Check app compatibility**.

Note: If you have previously selected the automatic upgrade option, the applications are upgraded to the latest version by default.

If you haven't selected the automatic upgrade option previously, you get an option to select the version of the application to which you want to upgrade.

The number of Apps to be upgraded gets updated depending on the manual selection of the apps for the selected versions. For example, if you select **Set all to minimum version** for all the applications, the number of Apps to be upgraded remains unchanged. Select **Set all to latest** if you want to update all the applications to the latest version available. Ensure to check the compatibility of the apps after selecting its versions by selecting **Check app compatibility**. If an application is not compatible, modify the version to make it compatible before moving on to the next step.

Note: You can proceed to the next step of the upgrade process only after checking the compatibility of the applications.



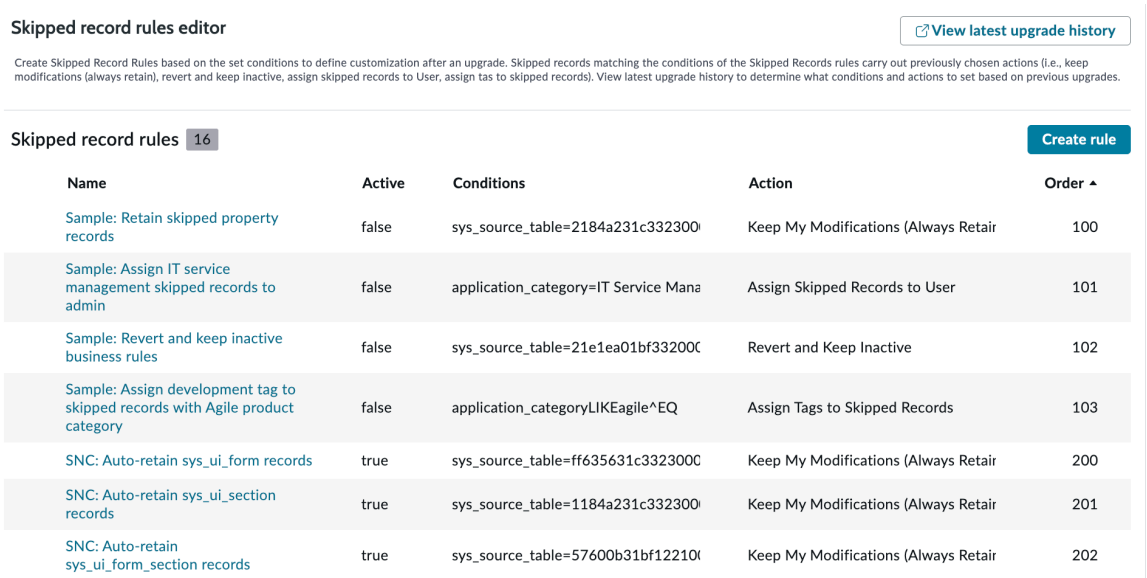
Select **View upgrade plan** in the Selected Apps section to see all the items along with their selected versions being added to the upgrade plan at the end of this step.

You can now edit this step by selecting **Edit step** even after marking it complete.

Note: The **Edit step** option is available only when you mark this step as complete and before scheduling or starting any upgrade. Once you select **Edit step**, the next step in the Pre-upgrade process resets. You can again proceed to the next step of the upgrade process only after checking the compatibility of the applications.

If automatic upgrade has not been opted in, you can manually select the versions of the applications to be upgraded. Select **Set all to latest** if you want to update all the applications to the latest version available. Ensure to check the compatibility of the apps after selecting its versions by selecting **Check app compatibility**. If an application is not compatible, modify the version to make it compatible before moving on to the next step.

3. Review predicted skipped records.
   Skipped records occur when customizations on your instance prevent certain files from being automatically updated during an upgrade.
   - Upgrade preview: You can view the current version and the previewing version of the upgrade in this section. You can also see if there is any upgrade been scheduled.
   - Skipped record summary: You can view the following information.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Total records changed: Gives the total number of records that have changed since last upgrade. Select the Review changes link to see the list of records that have changed.
- Total skipped records: Shows the numbers of skipped records that have been resolved, total skipped records that need to be reviewed and the number of skipped records that have already been reviewed.
- Skipped records without tests: States the total number of skipped records that have tests. The Test linked link in the Skipped records section points to the list of tests of the skipped records that have associated tests.

- Predicted skipped records: Shows the total number of predicted skipped records
  - Name: Name of the skipped record
  - Product: Name of the record that the skipped record belongs to
  - Priority:
  - Status: Status of the skipped record if it has been resolved, reviewed or needs to be reviewed
  - Prediction disposition: Action predicted to be performed on the skipped record during the selected upgrade.
    - Predicted Insert: The system is predicted to insert a new record.
    - Predicted Update: The system is predicted to update this record.
    - Reverted: This record was reverted to the base version, and won't be skipped on the next upgrade.
    - Predicted Skip: The system won't change this record in order to preserve customizations.
    - Predicted Skip (Manual Merge): The system won't change this record because updating it requires manual intervention.
    - Predicted Skip (Apply Once): The system is predicted to skip this record because it had already applied an update from an xml file in the apply once folder.
  - Plugin: The app id where the skipped record is found
- Skipped record rules editor: Use the skipped record rules editor to create skipped record rules based on the set conditions to define customizations after an upgrade.

Note: This step is completed within the Review predicted skipped records step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The skipped records matching the set conditions in the skipped record rules editor, perform the previously selected actions. Select **View latest upgrade history** to determine the actions and conditions to be set depending on the previous upgrades.

The skipped record rules shows the list of skipped record rules on the instance.

- Name: Name of the rule
- Active: States if the rule is active or not
- Conditions: Conditions set by the rule to filter the skipped records
- Action: Previously chosen action for the specific rule
- Order: The order in which the rules are sorted

Select **Create rule** if you want to create any additional skipped record rules.

You can do the following in this pre-upgrade activity.

- Review the list of predicted skipped records in the Preview module and decide which versions of the files to be retained.
- You can choose some customizations to be reverted to the base version, allowing them to go through the entire upgrade process without being skipped.
- Ensure to review and update the list of skipped records after the upgrade.
- Once done with the reviewing of the skipped records, complete the next activities required in the pre-upgrade process.

Implement instance upgrade activities on a prod instance

Implement the instance upgrade tasks for a successful upgrade on your prod instance.

Before you begin

Note: You will be able to perform the Instance upgrade tasks only after completing the pre-upgrade tasks.

Role required: upgrade_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Upgrade your instance.
   In this section you will see the following information:
   - Scheduled Upgrade: It shows the current status of the upgrade on the instance. You can see the following stages in this section.
     - Not scheduled
     - Scheduled
     - Running or in progress
     - Complete

     Select **Reschedule upgrade** if you want to reschedule the upgrade. If there is no upgrade scheduled, select **Schedule upgrade** to schedule an upgrade. You are now redirected to ServiceNow Support to schedule an upgrade for your instance. You can then select one of the available versions and **Submit**. This automatically creates the upgrade request for your instance.

     When the status is Complete, you can view when the upgrade started and completed, as well as the total duration. By default, you are in the America/Los Angeles timezone. You can modify the timezone preference by navigating to **User Menu** > **Preferences** > **Language & Region**. You can then select the required timezone from the drop down menu.
   - Pre-stage your Schema Alters: This section notes the changes in the database during the upgrade process on your instance. It is to be noted that these database modifications are necessary for new platform features. You can now pre-stage the schema alters so that the actual upgrade process is expedited.

     Note: It is recommended to pre-stage your schema changes which accelerates the actual upgrade process. By default, it is scheduled one week prior to the upgrade. During this time, no scheduled upgrade can process. The schema alter process can't start after the scheduled upgrade.

     You can see the start time of the scheduled schema alters. Select **Reschedule Schema Alters** to update the scheduled time for schema alters.

     Note: The option of seeing the schema alters and updating the starting time is applicable only if the glide.staged_upgrade.enabled property is enabled or set to true. By default, the glide.staged_upgrade.enabled property is set to false.
2. Select **Mark as complete** when the upgrade process completes.

Implement post-upgrade activities on a prod instance

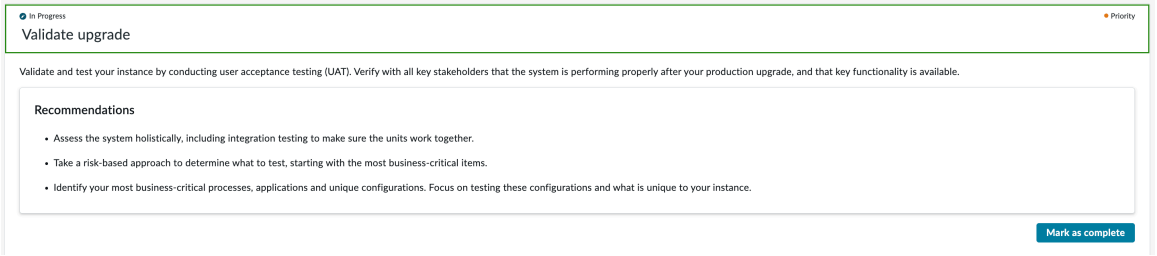
Implement the post-upgrade tasks for a successful upgrade completion on your production instance.

Before you begin

Note: You will be able to perform the post-upgrade tasks only after completing the pre-upgrade and instance upgrade tasks.

Role required: upgrade_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Review skipped records.
   You can review the skipped records that were identified during the pre-upgrade steps and during the upgrade. You can see the following information:
   - Skipped records summary: This section shows the summary of all the skipped records
     - Total records changed: States the total number of records that have been changed since last upgrade. Select Review changes link if you want to see the changes in the records.
     - Total skipped records: States the total number of records that have been skipped during the upgrade. It also shows the number of records that have already been reviewed and need to be reviewed.
     - Skipped records without tests: States the total number of skipped records that have tests. The Test linked link in the Skipped records section points to the list of tests of the skipped records that have associated tests.
   - Skipped records: This section shows the list of records that have been skipped during the upgrade.
     - Name: Name of the skipped file
     - Product: Name of the product where the skipped file belongs to
     - Priority: Priority of the skipped records in which they are reviewed
     - Status: States if the skipped file has been reviewed or not
     - Predicted Disposition: Action performed on the skipped record during the upgrade
2. Store application upgrades.
   You can now view the list of applications that have been upgraded depending on the selections made in the Preview application upgrades step in the Pre-upgrade stage.

   Note: It is to be noted that the applications that were not selected during the preview or don't have a newer version available are not listed.

   You can see the following information in this task.
   - Upgrade store applications: List of applications that have been selected in the pre-upgrade stage and have updated versions available.
   - App updates: List of applications that have failed the upgrade.
     - Application: Name of the application
     - Upgrade version: The version that has been selected for the application before the upgrade starts in preview apps page
     - Upgrade status: States if the application is in the Store
     - Current version: States the current version of the application
     - Available versions: States the most updated version available for upgrade
     - Post upgrade status: States that if the application version is up to date after post upgrade
3. Validate your upgrade.
   Conduct User Accepting Testing (UAT) to ensure that the production instance is performing as expected after the upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Mark as complete** to complete the production tasks in a production instance.

Bulk application updates

The bulk application update console enables you to review, select, and update multiple applications in a single workflow, improving efficiency compared to updating applications individually through the Application Manager.

Benefits

As the number of applications and plugins in your ServiceNow instance increases, updating them individually through the Application Manager becomes increasingly time-consuming. The traditional method requires you to navigate to the Application Manager, search for each application, check the available version, and perform the installation one by one. This repetitive process is cumbersome and inefficient.

The bulk application update provides you a one-stop experience where you can:

- View all available application updates at once
- Select multiple applications to update in a single operation
- Preview changes and validate compatibility before applying updates
- Schedule updates for a future time to minimize system disruption

Performance considerations

Update duration depends on the number of applications selected for update:

- 4–5 applications: Approximately 5 minutes
- 200+ applications: Significantly longer (allow additional time)

Compatibility checks and test execution also extend update time, as the system downloads application packages and processes test results. Plan update operations during maintenance windows or off-peak hours when possible to minimize user impact.

When to use bulk updates vs. Application Manager

Use the bulk application update console when:

- You need to update multiple applications at once
- You want to preview and validate all changes before committing to any updates
- You need to schedule updates for a specific time
- You want to run automated tests on updates before they are applied

Use Application Manager when:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You need to update a single application
- You want to install new applications or plugins
- You need detailed information about an application's features or dependencies

Update multiple applications at once

Use the bulk application update console to review, select, and update multiple applications in a single workflow instead of updating them individually through the app manager.

Before you begin

Role required: upgrade_admin

About this task

The traditional method of updating applications requires you to navigate to the app manager, search for each application, and install updates one by one. This process becomes cumbersome as the number of applications and plugins in your system increases.

You can achieve the following:

- View all available application updates at once
- Select specific applications or all applications for update
- Preview changes before applying updates
- Run automated tests on selected updates
- Schedule updates for a future time or apply immediately
- Review results and troubleshoot any issues

Note: The update process can be time-consuming depending on the number of selected applications.

Procedure

1. Navigate to **Admin** > **Upgrade Console**.

   The Update apps card displays the number of available updates.

2. Review the update summary.
   - Total number of application updates available
   - Last sync date and time
   - Number of store application updates
   - Number of Now Assist application updates (if available)

   Note: Verify that the available updates match your expectations. The system syncs data with the ServiceNow store to display current version information.

3. Select **Update now** to begin the update wizard.
   The system initializes and displays the first step of the workflow.
4. Choose an upgrade plan.
   There are two options to choose your upgrade plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select an existing one: You can import update sets to apply or merge upgrade plans for your upgrades. This option is selected by default.

  In order to apply an existing upgrade plan, you have the following options:

  - Import update sets: You must first import update sets before selecting an existing upgrade plan.

    a. Select **Import update sets** to import an update set. The Retrieve Update Sets list shows up.

    b. Select the Import Update Set from XML related link to select the update set to be imported. The Import XML page shows up.

    c. Select an already existing update set using **Choose file** and then select **Upload**.

    The selected update set gets uploaded in the current upgrade plan. The current upgrade plan shows up on the Retrieve Update Sets list.

    d. Select the plan from the Retrieve Update Sets list. The Retrieve Update Set form shows up with all its associated customer updates.

    e. Select **Preview Update Set**. The Update Set Preview modal shows up.

    f. Once the previewing of the update set is completed successfully, select **Commit Update Set**. The Update Set Commit modal shows up.

    Note: This option is visible only after the successful completion of update set preview.

  - Select an existing upgrade plan: You can view the imported plans to choose or can select multiple plans or merge them into one plan.

    Note: This option considerably reduces rework with an upgrade plan, maintains accuracy and makes your upgrade process seamless.

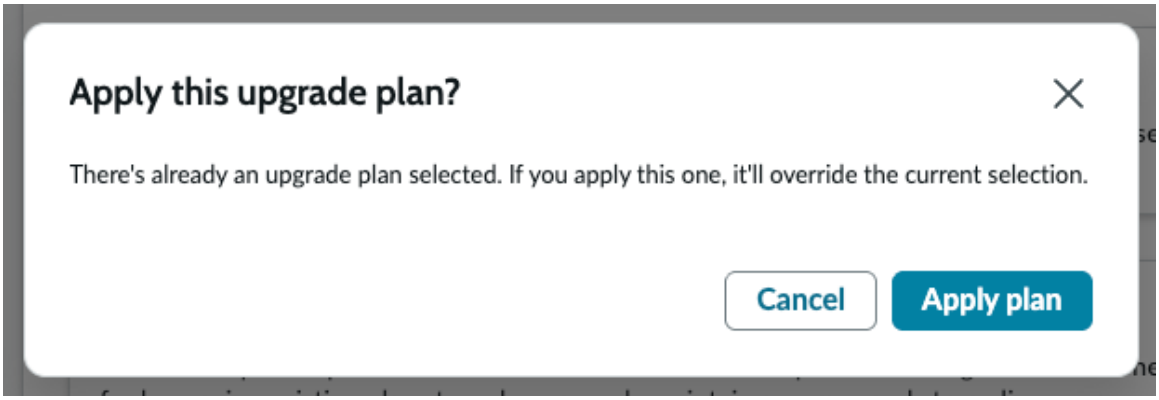
    You will see the following modal when you select Select upgrade plan. You can then select either one upgrade plan or multiple plans to be merged and applied to the current upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Apply** option is visible only when you select one upgrade plan to be applied to the current upgrade.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The **Merge and apply** option is visible only if you have selected multiple upgrade plans. The upgrade plan name changes as per the selection of upgrade plans.



When merging multiple upgrade plans, upgrade plan items that appear in more than one plan are used in the merged plan by their highest version. This ensures consistency and avoids version conflicts in the resulting merged plan.

- Create a new one: You can get started with creating a new plan for your instance upgrade.
  - Create an upgrade plan: Select **Create a plan** to start creating the new upgrade plan. Select the Upgrade Plan link from the success message banner to view the created upgrade plan.

    Note: The success message banner is generated immediately after the upgrade plan is created by selecting **Create a plan** and stays visible until the page is reloaded.

    If you select the **Create a plan** option again after creating a plan, you will see the following message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Only the most recent upgrade plan without any upgrade plan items is retained. For example, if the most recent upgrade plan is created without upgrade plan items, it automatically overrides any earlier upgrade plan that also doesn't have upgrade plan items. There can be more than one upgrade plan with upgrade plan items.

In the Upgrade Plans list, there can be several upgrade plans with upgrade plan items and only the recent upgrade plan with no upgrade plan items.

Note: An instance can have only one active upgrade plan at a time, regardless of whether the plan includes upgrade plan items. Only the most recent upgrade plan is in active state as it automatically gets applied to the current upgrade.

- View generated upgrade plan: This is an alternate way to view the recently created upgrade plan. This option is helpful when you reload the page and the success message banner disappears.

  Note: This option is visible only after the upgrade plan is created.

Once the upgrade plan is finally selected, the **Select upgrade plan** and **Create a new one** options are disabled.

5. Preview and select applications for update.

   The **Preview Application Updates** step displays all available application updates. For each application, you can:

   - **Check the checkbox** to select an application for update
   - **Select a version** from the dropdown menu (the system displays available versions for each application)
   - **Mark to latest** to update selected applications to the newest available version
   - **Select all** to include all 214 (or the total count in your system) applications in this update

   Unselected items show a status of Not selected and won't be included in the update. You can unselect an application at any time without removing it from the upgrade plan—it simply marks the item as inactive.

   After selecting applications, select **Check Compatibility** to validate that selected updates are compatible with your current system configuration. This process downloads application packages from the store and performs compatibility checks.

6. Review compatibility results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the compatibility check completes, each selected application shows a compatibility status:

- **Compatible**: The update can be safely applied
- **Incompatible**: The update can't be applied due to dependency issues or platform version conflicts

If an application is marked incompatible, you can unselect it or choose a different version. Applications not selected for update don't require compatibility checks.

7. **Optional:** Conduct pre-testing with ATF (Automated Test Framework).

   (Optional) If ATF is installed on your instance, you can run tests on the selected updates:

   a. In the **Conduct Pre-Testing** step, select existing test suites from the available list
   b. Select **Add to Upgrade Test Suites** to include them in your update
   c. If ATF requires configuration (such as a test user profile), follow the on-screen alerts to complete setup
   d. Mark as complete when ready to proceed

   If ATF is not installed or if you prefer to skip testing, you can proceed directly to the update step.

8. Review the update summary before proceeding.

   The **Review Updates** page displays:

   - Total number of selected applications
   - Number of compatible and incompatible applications
   - Predicted script changes and records affected
   - Skip rules (if configured)

   Review this information carefully. If you need to make changes, navigate back to previous steps using the **Previous Step** button.

9. Choose to schedule or apply the update immediately.

   In the final step before execution, select one of the following:

   - **Update Now**: Apply all selected updates immediately
   - **Schedule Update**: Choose a future date and time for the update to begin

   If scheduling, select the desired date and time. The system prevents you from selecting a time within the next 5 minutes. If you schedule an update and needs to be updated later, you can:

   - Select **Schedule Update** again to reschedule for a different time
   - Select **Cancel Update** to remove the schedule and then select **Update Now** to apply immediately

10. Monitor update progress.

    Once the update begins, the system displays:

    - A progress bar showing the percentage complete
    - The start time of the update

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Current step information (for example, "Step 10 of 10")
- Pending test counts (if ATF testing is in progress)

You can remain on this page to monitor progress, or navigate away if needed. The system continues processing updates in the background.

11. Review update results.

    When the update completes, the **Results** page displays a summary:

    - Number of applications successfully updated
    - Number of applications with scheduled updates (not yet applied)
    - Number of applications with available updates (not selected in this run)
    - Number of applications that failed during update

    For each application, you can:

    - View the current and updated version numbers
    - Check the post-update status (up-to-date, scheduled, available for update, or failed)
    - Select the application name or status to navigate to the app manager for details

12. **Optional:** Conduct post-testing and troubleshooting.

    (Optional) If ATF testing is enabled, the system automatically runs selected test suites after updates complete. You can:

    - Monitor test progress in real-time
    - View test results, including passed and failed tests
    - If troubleshooting is enabled, investigate failed tests using the troubleshooting agent to identify root causes

    Note: Post-testing and troubleshooting steps may require additional plugins to be installed. Contact your system administrator if these options are unavailable.

13. Review update sets and upgrade plan details (optional).

    In the final step, you can:

    - View all update sets that were created during the update process
    - Access the upgrade plan used for this update
    - Select **View Update Set** to see the combined update set that captured all application updates

    These details are available for reference and troubleshooting if needed in future updates.

What to do next

After completing the update:

- Verify that critical applications are functioning correctly
- If failures occurred, review the post-update status and app manager details to determine remediation steps

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If tests were skipped or failed, schedule a separate testing run or contact your development team
- Return to the bulk application update console periodically to check for new available updates

Administering Upgrade Console

The Administration module contains information about managing upgrade risks.

Managing upgrade risk

You will be notified of the possible conflicts that might result due to several customizations in a skipped metadata file, with a new UI message on the form pages of the metadata files.

One of the major conflict areas during an upgrade is resolving conflicts for skipped metadata files that are released by ServiceNow® but have been customized. These conflicts result from multiple users updating the same files. ServiceNow might update the code in the files which you have customized over time. Whenever you install an application or a plugin, you often customize them as per your requirements. During the next upgrade, you might have several skipped records depending on the previous customizations.

Important: Avoid modifying the high risk and medium risk (if possible) skipped metadata files that can potentially cause conflicted skipped metadata files in your next upgrade. You can edit the files if the modifications are absolutely required.

The purpose of the UI message is to inform you about potential complications that might arise during the upgrade process, especially if any high-priority files have been modified. The notification is of the form of UI messages on the form pages of the metadata files.

The UI message varies based on the severity of the files.

- Medium risk and non-customized: The medium risk files that are not customized might be updated in future releases. It is recommended not to modify these files unless necessary.

  ⓘ Warning: This is a Medium Risk file that might get updated again in later releases. **Do not** alter this file unless necessary.

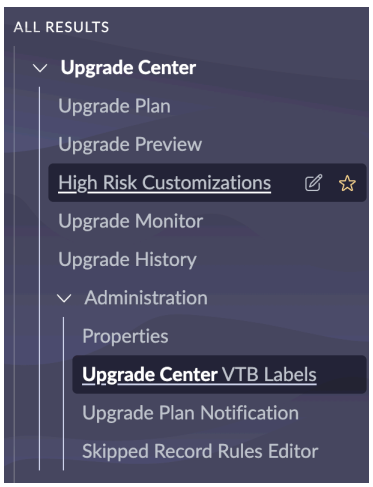
- High risk and non-customized: The high risk files that are non-customized might be updated in future releases. It is recommended not to modify these files unless necessary.

  ⊗ Warning: This is a High Risk file that might get updated again in later releases. **Do not** alter this file unless necessary.

Note: You can proceed to modify these files if the changes are absolutely required. The following modal shows up.

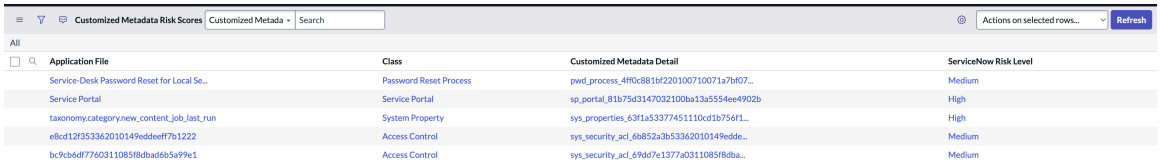
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- High risk and customized: The high risk files that are customized might be updated in future releases. It is recommended to revert them to the Base System to avoid conflicts.



- Medium risk and customized: The medium risk files that are customized might be updated in future releases. It is recommended to revert it to the Base System to avoid conflicts.

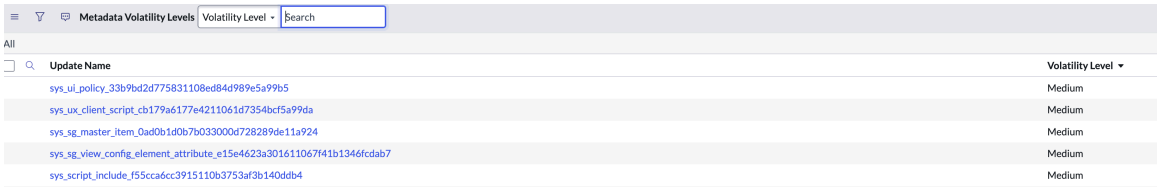
- Non-risky and non-customized: You don’t see any warning for this condition.
- Non-risky and customized: You don’t see any warning for this condition.



High Risk Customizations menu

The **High Risk Customizations** menu item presents the overlap between ServiceNow's high and medium risk files and your customizations.

They are stored in a virtual table called v_metadata_customization_risk, and is refreshed after a set period of time or when you select the **Refresh** on the list view.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk files storage

The high risk and medium risk files are stored in the new sys_metadata_volatility table.

Note: It is recommended not to modify the sys_metadata_volatility table and is automatically updated for every family upgrade. The sys_metadata_volatility table is not a part of the menu item in the navbar.

Note: Risk is determined by the likelihood of a given metadata file being modified, which is predicted based on trends in updates from recent releases. Some files that may not currently exist in the system will be present in the table to account for future installation of apps/plugins.

Upgrade Console references
