notes	Additional information about the company. Data type: String Maximum length: 4,000
num_employees	Number of people employed by the company. Data type: Number (Integer) Maximum length: 40
number	Number that identifies this account. Data type: String Maximum length: 40
parent	Sys_id of the parent account of this account. Located in the Company [core_company] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: String
partner	Flag that indicates whether the account is a partner account or a customer account. Possible values: • true: Partner account • false: Customer account Data type: Boolean Default: false
phone	Primary phone number for the company. Data type: String
primary	Flag that indicates whether this is a primary account. Possible values: • true: Primary account • false: Secondary account Data type: Boolean Default: false
primary_contact	Sys_id of the primary contact for the account. Located in the Contact [customer_contact] table. Data type: String
profits	Profit information entered for this account. Data type: Number (Currency) Maximum length: 40
publicly_traded	Flag that indicates whether the company associated with this account is publicly traded on the stock exchange. Possible values: • true: Publicly traded • false: Private company Data type: Boolean
rank_tier	Type of account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Possible values: • blacklist • strategic • tactical • valued • other Data type: String Maximum length: 40
registration_code	Unique code that customers use when requesting a login on the customer portal. This code provides a method for validating the customer on the company before granting access. Data type: String Maximum length: 40
revenue_per_year	Revenue produced by the company associated with this account. Data type: Number (Currency) Maximum length: 20
state	State in which the company resides. Data type: String Maximum length: 40
stock_price	Price of the company stock. Data type: String Maximum length: 40
stock_symbol	Stock symbol of the company. Data type: String Maximum length: 40
street	Street address of the company. Data type: String Maximum length: 255
sys_class_name	Table that contains the associated account record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	Data type: String
sys_created_by	User that originally created the account. Data type: String Maximum length: 40
sys_created_on	Date and time that the account was originally created. Data type: String
sys_id	Sys_id for the account record. Data type: String
sys_mod_count	Number of times the account information has been updated. Data type: Number (Integer)
sys_updated_by	User that last modified the account information. Data type: String Maximum length: 40
sys_updated_on	Date and time the account information was last updated. Data type: String
theme	Sys_id of the customer portal theme used by this account. Located in the Theme [sys_ui_theme] table. Data type: String
vendor	Flag that indicates whether the company associated with this account is a vendor. Possible values: • true: Vendor • false: Not a vendor Data type: Boolean Default: false
vendor_manager	List of sys_ids of the vendor managers for the account. Located in the User [sys_user] table. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
vendor_type	List of sys_ids of the type of vendor such as, applications, hardware, services, or software. Located in the Vendor Type [vendor_type] table. Data type: String
website	URL of the website for the company. Data type: String Maximum length: 1,024
zip	Zip code of the company. Data type: String Maximum length: 40

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/account/bf60bef46f0331
003b3c498f5d3ee41a" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"

ActivitySubscriptions API

The *ActivitySubscriptions* API provides endpoints to retrieve Activity entities from the Subscriptions and Activity Feed Framework.

This API requires activation of the Subscriptions and Activity Feed Framework (com.snc.activity_subscriptions) plugin. Activate the Customer Central (com.sn_csm_customer_central) plugin to seed configuration in all required tables. For more information on customer central configuration settings, see Configure customer central.

Aggregate API

The *Aggregate* API provides endpoints that allow you to compute aggregate statistics about existing table and column data.

For *Aggregate* API requests, you must have read access for all records in the table you query. If an ACL prevents the requesting user from accessing any record in the table, the request returns a 403 Forbidden error.

Aggregate - GET /now/stats/{tableName}

Retrieves records for the specified table and performs aggregate functions on the returned values.

You can specify which aggregate functions to perform by using either the *sysparm_<aggregate>_fields* parameter or *sysparm_having=<aggregate>^field^operator^value* parameter, substituting *<aggregate>* for one of these aggregate functions:

- avg
- max
- min
- sum

URL format

Versioned URL: `/api/now/{api_version}/stats/{tableName}`

Default URL: `/api/now/stats/{tableName}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
tableName	Name of the table for which to retrieve records. Data type: String

Query parameters

Name	Description
name-value pairs	An alternative to using the *sysparm_query* parameter. You can filter a query us value pairs where the key is the name of a field. For example, instead of using the parameter `&sysparm_query=active=tru` you can use `&active=true`. You can use the display value when the field is a choice or reference type field, such as `&state=closed` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, such as `&active=true&assigned_to=john.smith`. Data type: String
sysparm_<aggregate>_fields	List of fields on which to perform each aggregate operation. You can specify multi by separating each with a comma. For example, to get the average values from the and priority fields, use `sysparm_avg_fields=duration,priority`. **Note:** Specify this parameter, the *sysparm_count* parameter, or both for query to return meaningful results. If neither parameter is passed, no aggrega operation is performed. Data type: String
sysparm_count	Flag that determines whether to return the number of records returned by the que

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: Specify this parameter, the *sysparm_<aggregate>_fields* par or both for your query to return meaningful results. If neither parameter is pas aggregate operation is performed. Data type: String
sysparm_display_value	Data retrieval operation when grouping by reference or choice fields. Based on th the query returns either the display value, the actual value in the database, or bot • true: Returns display values for all fields. • false: Returns actual values from the database. If a value is not specified, this pa defaults to false. • all: Returns both actual and display values. There is no preferred method for setting this parameter. However, specifying the d value may cause performance issues as they are not read from the database and reference other fields and records. For more information on display values and ac see Table API FAQs (KB0534905). Data type: String
sysparm_group_by	Fields by which to group the returned data. You can specify multiple fields by sepa each field with a comma, such as `sysparm_group_by=priority,state`. Data type: String
sysparm_having	Additional query that enables you to filter the data based on an aggregate operati value for this parameter must follow the syntax `aggregate^field^operato` such as `count^priority^>^3` to obtain the number of records within the que with a priority greater than 3. You can specify multiple queries by separating each comma, such `ascount^state^=^1,avg^priority^>^3`. Data type: String
sysparm_order_by	List of values by which to order grouped results. You can specify an order using a an aggregate. For example, if you specify `sysparm_order_by=AVG^state`, g results with lower average state values are returned first. You can also order by CO arrange groups of records by the number of records in each group. When you specify an order, groups are ordered in ascending order by default. Use sort in descending order, such as `sysparm_order_by=state^DESC`. Data type: String
sysparm_query	An encoded query. For example: `(sysparm_query=active=true)` `(sysparm_query=caller_id=javascript:gs.getUserID()^acti` Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
Depends on specified table and specified request parameters.	

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/stats/incident?sysparm
_avg_fields=reassignment_count%2Cbusiness_stc&sysparm_group_by=a
ssignment_group" \
```

ActivitySubscriptions - GET /now/actsub/activities

Retrieves activity records from the Subscriptions and Activity Feed Framework.

No role is required to access this endpoint, but data returned is limited by user access settings.

URL format

Versioned URL: `/api/now/{api_version}/actsub/activities`

Default URL: `/api/now/actsub/activities`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
before	Date/time value. The request returns only records created prior to this date and time. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD
context	Required. Sys_id of an activity context. Located in the Activity Context [sn_actsub_activity_context] table. Predefined activity contexts include Consumer and Contact. Data type: String
context_instance	Required. Sys_id of an instance of the specified activity context, representing the initiator of the activities you want to retrieve. Located in the appropriate table for the activity context. As an example, if you set *context* to the sys_id of the Consumer activity context, set this parameter to the sys_id of the Consumer [csm_consumer] table record for the consumer whose activities you want to retrieve. Data type: String
end_date	Date/time value. The request returns only records created during the time period defined by *start_date* and this parameter. Must be set along with *start_date*. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD
facets	Comma-separated list of sys_ids of activity facet types to retrieve for the specified activity context. These sys_ids are located in the Activity Facet [sn_actsub_facet] table. For more details on activity facets, see Create facets for activity contexts. Data type: String Default: Return all activity facet types configured for the activity context.
last	Index value of the first result row omitted from the response body. The result row index starts at 0, so the last row included in the response body is the one with the index *last*-1. For example, setting `last=5` omits rows with index 5 and above and returns at most only the first five result rows (with index values 0 through 4).

Query parameters (continued)

Name	Description
	Setting `stFrom=1` and `last=5` skips the first result row and returns the second through fifth result rows (with index values 1 through 4). Data type: Number (integer) Default: The value of the **com.snc.actsub.activities.api.fetch.limit** system property (10 by default).
record_id	Sys_id of a record to use when rendering dynamic facets. Located in the appropriate table for the activity type you want to retrieve. For example, if you want to fetch activities for a Case record, set this parameter to the sys_id of the Case record in question. For more details on dynamic facets, see Create facets for activity contexts. Data type: String
start_date	Date/time value. The request returns only records created during the time period defined by this parameter and *`end_date`*. Must be set along with *`end_date`*. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD
stFrom	Index value of the first result row to include in the response body. The result row index starts at 0. For example, `stFrom=2` skips the first two result rows and returns results from the third row onward. Data type: Number (integer) Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. The response body *result.message* parameter describes the nature of the error. Example error messages: • `Make sure a valid context and context_instance are passed` or `Make sure a valid stream and user are passed` indicates that the request lacks one or both of the *context* and *context_instance* query parameters. These parameters are required. • `stFrom can not be greater than last` indicates that the *stFrom* query parameter value exceeds the *last* query parameter value. • `Please provide start_date and end_date` indicates that the request includes only one of the *start_date* and *end_date* query parameters, which cannot be used separately. • `start_date can not be ahead of end_date` indicates that the specified *start_date* query parameter value occurs after the specified *end_date* query parameter value. • `Provided context is not configured in the system` indicates that the *context* query parameter value does not represent a valid activity context. • `Make sure a valid context_instance is passed` indicates that the *context_instance* query parameter value does not represent a valid instance of the specified activity context.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Name	Description
	"display_as_timeago": "String", "label": "String", "show_label": "String", "type": "String", "value": "String" }]
result.activities.subheader_fields.deeplink_to_subobject	Flag indicating whether or not the subheader field displays as a hyperlink to the record for the object on which this activity was performed. Valid values: • true: The subheader field displays as a hyperlink to the record for the object on which this activity was performed. • false: The subheader field doesn't display as a hyperlink to the record for the object on which this activity was performed. Data type: String
result.activities.subheader_fields.display_as_timeago	Flag indicating whether or not the subheader field displays in time ago format. Valid values: • true: The subheader field displays in time ago format. • false: The subheader field doesn't display in time ago format. Data type: String
result.activities.subheader_fields.label	Label for the subheader field. Data type: String
result.activities.subheader_fields.show_label	Flag indicating whether or not the subheader field label displays for subheader field values in the tile for this activity record. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: The subheader field label displays for subheader field values in the tile for this activity record. • false: The subheader field label doesn't display for subheader field values in the tile for this activity record. Data type: String
result.activities.subheader_fields.type	Type of the subheader field. Data type: String
result.activities.subheader_fields.value	Value of the subheader field. Data type: String
result.activities.subobject_sys_id	Sys_id of the record for the object on which this activity was performed. Located in the table specified in the *subobject_table_name* parameter value. Data type: String
result.activities.subobject_table_name	Name of the table containing the record for the object on which this activity was performed. Determined by the Table Name defined in the Activity Group [sn_actsub_subscribable_object] table for the group containing the activity type associated with this activity record. Data type: String
result.activities.sys_id	Sys_id of this activity record. Located in the table specified as the *source_table_name* response body parameter value. Data type: String
result.activities.title	Title that displays on the tile for this activity record. Data type: String
result.hasMoreRecords	Flag indicating whether or not the list of activities in the response body is truncated by the *last* query parameter value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Valid values: • true: The list of activities in the response body is truncated by the *last* query parameter value. Repeating the request with a higher *last* query parameter value will return additional activities for this context and context instance. • false: The list of activities in the response body isn't truncated by the *last* query parameter value. No further activities are available for this context and context instance. Data type: String
result.message	Error message describing the problem encountered during request processing. Data type: String
result.status	HTTP status code returned for request. Valid values: Refer to Status Codes. Data type: Number
result.stream	Sys_id specified in request *context* query parameter. Located in the Activity Context [sn_actsub_activity_context] table. Data type: String
result.user	Sys_id specified in request *context_instance* query parameter. Located in the appropriate table for the activity context. Data type: String

Example: cURL request

Request the second and third activity records for a specific Contact, limiting to data from 2020:

```
curl "https://instance.servicenow.com/api/now/actsub/activities\
?context=4a6a035a73d30010e37d71ef64f6a714\
&context_instance=ddce70866f9331003b3c498f5d3ee417\
&stFrom=1&last=3\
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
&start_date=2020-01-01%2000:00:00&end_date=2020-12-31%2023:59:
59" \
--request GET \
--header "Accept: application/json" \
--user "username:password"
```

The response body includes the two requested activity records for the specified Contact:

```
{
  "result": {
    "hasMoreRecords": true,
    "activities": [
      {
        "subobject_table_name": "sn_customerservice_case",

ActivitySubscriptions - GET /now/actsub/facets/{activity_context}/{context_instance}

Retrieves facets configured for an activity context from the Subscriptions and Activity Feed Framework. Displays activity counts and data for each facet as determined by activity type, group, and context settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users must have the actsub_user or admin role to access this endpoint. Data returned is limited by user access settings.

For more details on activity context facets, see Create facets for activity contexts.

URL format

Versioned URL: `/api/now/{api_version}/actsub/facets/{activity_context}/{context_instance}`

Default URL: `/api/now/actsub/facets/{activity_context}/{context_instance}`

Supported request parameters

Path parameters

Name	Description
activity_context	Sys_id of an activity context. Located in the Activity Contexts [sn_actsub_activity_context] table. Predefined activity contexts include Consumer and Contact. Navigate to **Customer Central** > **Customer Activity** > **Activity Contexts** to view the full list of activity contexts defined for your instance. Data type: String
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
context_instance	Sys_id of an instance of the specified activity context, representing the initiator of the activities you want to retrieve facets for. Located in the context table specified for the activity context record in the Activity Contexts [sn_actsub_activity_context] table. As an example, if you set *`activity_context`* to the sys_id of the Contact activity context, you should set this parameter to the sys_id of the Contact [customer_contact] record for the contact whose activity facets you want to retrieve. Data type: String

Query parameters

Name	Description
end_date	Date/time value. The request returns only records created during the time period defined by *`start_date`* and this parameter. Must be set along with *`start_date`*. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
facets	Comma-separated list of sys_ids of activity facets to retrieve for the specified activity context. To see the activity facet types defined for an activity context, navigate to **Customer Central** > **Customer Activity** > **Activity Contexts** and examine the **Facets** related list. Data type: String Default: Return all activity facets configured for the activity context.
get_activity_count	Flag indicating whether or not to include activity counts for each facet in the response body. Valid values: • true: Include facet activity counts. • false: Omit facet activity counts. Data type: Boolean Default: false
lazy_load	Flag indicating whether or not to improve performance by omitting facet activity data and activity counts from the response body. This parameter takes precedence over *get_activity_count*. Valid values: • true: Omit facet activity data and activity counts. • false: Retrieve facet activity data and activity counts. Data type: Boolean Default: false
start_date	Date/time value. The request returns only records created during the time period defined by this parameter and *end_date*. Must be set along with *end_date*. Data type: String Format: YYYY-MM-DD hh:mm:ss or YYYY-MM-DD

Request body parameters (XML or JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. The response body *result.message* parameter describes the nature of the error. Example error messages: • `Make sure a valid activity context details are passed` indicates that the *activity_context* path parameter value does not represent a valid activity context, the *context_instance* path parameter value does not represent a valid instance of the specified activity context, or both. • `Please provide start_date and end_date` indicates that the request includes only one of the *start_date* and *end_date* query parameters, which cannot be used separately. • `start_date can not be ahead of end_date` indicates that the specified *start_date* query parameter value occurs after the specified *end_date* query parameter value.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	List of activity facets. Data type: Array of Objects `"result": [ { "activity_count": Number, "children": [Array], "facets": [Array], "icon": "String", "is_dynamic": "String", "message": "String", "name": "String", "status": Number } ]`
result.activity_count	Number of activity records included in this facet (and its children, if any. Only displayed when *lazy_load* query parameter is false and *get_activity_count* query parameter is true. Data type: Number
result.children	Array of objects in which each object represents an activity record (if this is a dynamic facet) or a child facet (if this is a static facet). Data type: Array of Objects `"children": [ { "activity_count": Number "facet": "String", "icon": "String", "title": "String" } ]`
result.children.activity_count	Number of activity records included in this child facet (and its children, if any). Only displayed when the *lazy_load* query parameter is false and the *get_activity_count* query parameter is true. Data type: Number
result.children.created	Creation date/time for this activity record. Data type: String Format: YYYY-MM-DD hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.children.facet	Sys_id of this child facet record. Located in the Activity Facet [sn_actsub_facet] table. Data type: String
result.children.icon	Name of the icon associated with this child facet. Data type: String
result.children.sys_id	Sys_id of this activity record. Located in the appropriate table for the parent facet type. As an example, an activity record included in the Cases facet has a sys_id located in the Case [sn_customerservice_case] table. Data type: String
result.children.metadata	Array of objects in which each object includes activity record data for a facet field configured in the Activity Facet [sn_actsub_facet] table record for this facet type. Data type: Array of Objects `"metadata": [ { "key": "String", "label": "String", "type": "String", "value": "String" } ]`
result.children.metadata.key	Name of this facet field. Data type: String
result.children.metadata.label	Label of this facet field. Data type: String
result.children.metadata.type	Type of this facet field. Data type: String
result.children.metadata.value	Value of this facet field. Data type: String
result.children.title	Name of this activity record or child facet. Data type: String
result.facets	Array of sys_ids associated with this facet record. Located in the Activity Facet [sn_actsub_facet] table. For a dynamic facet, this array contains the sys_id of the facet itself. For a static

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	facet, it instead contains the sys_ids of all facets which are children of the facet. Data type: Array `"facets": [ "510d7e2e73570010e37d71ef64f6a70d", "bc9bfaaa73570010e37d71ef64f6a771" ]`
result.icon	Name of the icon associated with this facet. Data type: String
result.is_dynamic	Flag indicating whether or not this facet is a dynamic facet. This value determines the type of information included in the *children* response body parameter. Possible values: • true: This is a dynamic facet. The *children* response body parameter value contains activity record details, and the *facets* parameter contains the dynamic facet sys_id. • false: This is a static facet (a facet group). The *children* response body parameter value contains child facets, and the *facets* parameter contains the sys_ids of these child facets. Data type: Boolean
result.message	Error message describing problem encountered during request processing. Data type: String
result.name	Name of the facet or facet group. Data type: String
result.status	HTTP status code returned for request. Possible values: See the Status Code table. Data type: Number

Example: cURL request

Retrieve Chat, Phone, and Knowledge articles facets and activity counts for a Contact:

```
curl
 "https://instance.servicenow.com/api/now/actsub/facets/4a6a035a
73d30010e37d71ef64f6a714/ddce70866f9331003b3c498f5d3ee417\
?get_activity_count=true\
&facets=510d7e2e73570010e37d71ef64f6a70d,bc9bfaaa73570010e37d71e
f64f6a771,c72d7e2e73570010e37d71ef64f6a7b8" \
--request GET \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept: application/json" \
--user "username:password"
```

The response body includes the three requested facets as children of their facet groups, with activity counts displayed:

```
{
  "result": [
    {
      "is_dynamic": false,
      "name": "Interactions",
      "activity_count": 4.0,
      "facets": [
        "510d7e2e73570010e37d71ef64f6a70d",
        "bc9bfaaa73570010e37d71ef64f6a771"
      ],
      "children": [
        {
          "facet": "510d7e2e73570010e37d71ef64f6a70d",
          "icon": "chat_outline",
          "activity_count": 2.0,
          "title": "Chat"
        },
        {
          "facet": "bc9bfaaa73570010e37d71ef64f6a771",
          "icon": "phone_outline",

        }
      ]
    }
  ]
}
```

Agent Client Collector API

The *Agent Client Collector* API provides endpoints to manage actions on available agents and managing policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API requires the Agent Client Collector Framework (sn_agent) store application and is provided within the `sn_agent` namespace. The endpoints in this API require the agent_client_collector_admin role. For more information, refer to Agent Client Collector.

Agent management endpoints

- Get extensive information of one or more agents. These endpoints are also accessible to users with the agent_client_collector_user role.
  - GET /agents/{agent_id}
  - GET /agents/list
- Submit a request to grab an agent log and retrieving information about the request progress.
  - GET /agents/{agent_id}/log
  - GET /agents/log/{request_id}/
- Disable or enable agent data collection.
  - GET /agents/{agent_id}/data/off
  - GET /agents/{agent_id}/data/on
- Restart an agent with GET /agents/{agent_id}/restart.
- Run discovery on an agent with GET /agents/{agent_id}/discovery.

For information on performing similar tasks in a script include, see AccAgentsAPI.

Policy management and workflow

Use policy management APIs to view details, activate/deactivate a policy, update a policy, and publish a policy.

To update a policy:

1. Get a list of policies and details with GET /agents/policies/list. This endpoint requires the agent_client_collector_user role.
   - To update a policy in the Draft state, use the sys_ids retrieved from the policies list in the update endpoints.
   - To update a policy in Published or Published* state, get an editable sandbox copy with GET /agents/policy/sandbox_from_published/{policy_id}. Use the sys_ids from this response to modify properties using an update endpoint.
2. Modify policy details using an update endpoint.
   - POST /agents/update/policy/{policy_id}
   - POST /agents/update/check/{check_id}
   - POST /agents/update/check_param/{param_id}
   - POST /agents/update/check_secure_param/{param_id}
3. Publish the policy using GET /agents/policy/publish/{policy_id}.

Once published, the policy becomes Active. This API also includes endpoints for activating or deactivating a published policy:

- GET /agents/policy/activate/{policy_id}
- GET /agents/policy/deactivate/{policy_id}

Agent Client Collector - GET /agents/{agent_id}

Gets the information of a specified agent.

URL format

`/api/sn_agent/agents/{agent_id}`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *GET /agents/list* endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_user role.
404	Agent with provided ID not found.

Response body parameters (JSON)

Name	Description
<Array>	Array of JSON objects containing extended agent information. `{ "agent_id": "String", "data_collection": Number, "ip_address": "String", "is_duplicate": Boolean, "is_restart_enabled": Boolean, "name": "String", "number_of_running_checks": Number, "status": Number, "up_since": "String", "version": "String" }`
agent_id	ID of the agent as submitted. Data type: String
data_collection	Data collection indicates whether scheduled checks are to be run. These checks are a part of the policies scheduled for this agent to run. Possible values: • 0: On – Checks run as scheduled. • 1: Off (manual) – Checks have been disabled manually. • 2: Off (auto) – Checks have been disabled automatically due to high CPU consumption by the Data type: Number
ip_address	Agent IP address. Data type: String
is_duplicate	Flag that indicates whether this agent is a duplicate of another. There should be only a single agent on a given host. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: The agent has the same host as an Alive/Up agent with a different agent ID. Turn off or uninstall the duplicate • false: This agent has no duplicates in the Alive/Up state. Data type: Boolean
is_restart_enabled	Flag that indicates whether restart is enabled. Agent restart is not configurable. It depends on the OS and the version of the OS the agent is running on. Possible values: • true: Restart is enabled for this agent. • false: Restart is disabled for this agent. Data type: Boolean
name	Name of the agent. Data type: String
number_of_running_checks	The number of checks the agent is scheduled to run. These checks are a part of the policies scheduled for this agent to run. Data type: Number
status	Status of the agent. Possible values: • 0: Alive/Up – The agent is active. • 1: Warning – The agent has not received a keep-alive message in the past few minutes. • 2: Down – The agent has not received a keep-alive message in a long time. • 3: Restarting – The agent is restarting. Data type: Number
up_since	UTC time since the agent's status became alive/up. The value is in GlideDateTime format. Data type: String
version	Version of Agent Client Collector the agent is running. Data type: String

Example: cURL request

The following example shows how to get agent details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_i
d>" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "name": "WIN-V26KAP7PI2G",
  "status": 2,
  "agent_id": "074b14e2eb3ce9d4",
  "ip_address": "10.196.55.14",
  "number_of_running_checks": 11,
  "data_collection": 0,
  "is_restart_enabled": true,
  "is_duplicate": false,
  "up_since": "2021-03-31 12:02:17",
  "version": "2.3.0"
}
```

Agent Client Collector - GET /agents/{agent_id}/data/off

Disables data collection for a specified agent in the up/alive state.

To determine if an agent's data collection is on or off, run the *GET /agents/{agent_id}* endpoint.

URL format

`/api/sn_agent/agents/{agent_id}/data/off`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *GET /agents/list* endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	Agent not found or isn't in the up/alive state.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to turn off agent data collection.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_i
d>/data/off" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
"message": "Data Collection Disabled For Agent With ID:
 <agent_id>"
}
```

Agent Client Collector - GET /agents/{agent_id}/data/on

Enables data collection for a specified agent in the up/alive state.

To determine if an agent's data collection is on or off, run the *GET /agents/{agent_id}* endpoint.

URL format

`/api/sn_agent/agents/{agent_id}/data/on`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *GET /agents/list* endpoint. Data type: String

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	Agent not found or isn't in the up/alive state.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to turn on agent data collection.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_i
d>/data/on" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "message": "Data Collection Enabled For Agent With ID:
 <agent_id>"
}
```

Agent Client Collector - GET /agents/{agent_id}/discovery

Runs a discovery check to locate CIs related to an agent. The specified agent must be in alive/up status.

URL format

```
/api/sn_agent/agents/{agent_id}/discovery
```

Status codes (continued)

Status code	Description
404	Agent not found or isn't in the up/alive state.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to run discovery on an agent with alive/up status.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_id>/discovery" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "message": "Running Discovery For Agent With ID: <agent_id>"
}
```

Agent Client Collector - GET /agents/check_defs/{check_def_id}

Gets a specified check definition with details.

URL format

`/api/sn_agent/agents/check_defs/{check_def_id}`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table. Data type: String

Query parameters

Name	Description
None

Request body parameters (JSON)

Name	Description
X-Include-Check-Params	Flag that indicates whether existing check parameter details are returned. Information for each standard and secure check parameter is included in a JSON object. Valid values: • true: Return check parameter details. • false: Do not return check parameter details. Data type: Boolean Default: False

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Check definition was not found with the sys_id provided.

Response body parameters (JSON)

Properties	Description
check	Details of the specified check definition. `{ "background": Boolean,`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties	Description

	<pre>"check_group": "String",
	"check_type": "String",
	"command": "String",
	"error": "String",
	"name": "String",
	"params": [Array],
	"plugins": [Array],
	"proxy_valid": Boolean,
	"secure_params": [Array],
	"sys_id": "String",
	"timeout": Number
	}</pre>

background	Flag that indicates whether this check definition is a background check. A background check is a check which the agent starts execution of and doesn't wait for it to finish running. Valid values: • true: This check definition is a background check. • false: This check definition is not a background check. Data type: Boolean
check_group	Group specified for this check definition. Data type: String
check_type	Type of check. Possible values: • Events – Check results are transformed into an Event Management event. • Metrics – Values from the check result are transformed to metrics. Data type: String
command	Command that the Agent Client Collector executes. Data type: String
error	Message if there is an error. Null otherwise. Data type: String
name	Name of the check. Data type: String

params	List of parameter definitions associated with the check definition. These results are only included if the *withParams* parameter is set to true.
	<pre>"params": [
	{
	"active": Boolean,</pre>

© 2026 ServiceNow, Inc. All rights reserved.

Properties	Description

	<pre>"default_value": "String",
	"mandatory": Boolean,
	"name": "String",
	"sys_id": "String"
	}
	]</pre>
	Data type: Array

params.active	Flag that indicates whether the check parameter is active. Valid values: • true: The check parameter is active. • false: The check parameter is inactive. Data type: Boolean
params.default_value	Specifies the default value for this check parameter. Data type: String
params.mandatory	Flag that indicates whether the check parameter is required. Valid values: • true: The check parameter is required. • false: The check parameter is optional. Data type: Boolean
params.name	Name of the check parameter. Data type: String
params.sys_id	Sys_id of the check parameter listed in the Check Secure Parameter Definitions [sn_agent_check_param_def] table. Data type: String
plugins	List of Agent Client Collector plugins associated with this check. Data type: Array
proxy_valid	Flag that indicates whether the check definition policy is set to work as a proxy. Valid values: • true: This check definition policy is set to work as a proxy. • false: This check definition policy is not set to work as a proxy. Data type: Boolean
secure_params	List of assigned to this check. These results are only included if the *withParams* parameter is set to true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties	Description

	<pre>"secure_params": [
	  {
	  "active": Boolean,
	  "name": "String",
	  "order": Number,
	  "sys_id": "String"
	  }
	]</pre>
	Data type: Array

secure_params.active	Flag that indicates whether the secure parameter is active. Valid values: • true: The secure parameter is active. • false: The secure parameter is inactive. Data type: Boolean
secure_params.name	Name of the secure parameter. Data type: String
secure_params.order	Order in which the parameter is sent to the check command/script. Data type: Number
secure_params.sys_id	Sys_id of the secure parameter listed in the Check Secure Parameter Definitions [sn_agent_check_secure_param_def] table. Data type: String
sys_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table. Data type: String
timeout	Timeout in seconds. Data type: Number

Example: cURL request

The following example shows how to get information for a specified check definition.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/check_de
fs/94436b237f705300f128134f8dfa91a4" \

Agent Client Collector - GET /agents/check_defs/list

Gets a list of check definitions with details.

URL format

`/api/sn_agent/agents/check_defs/list`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
X-Enc-Query	An encoded query string to filter the check definition result list. Use null for an unfiltered list of check definitions in the system. Data type: String
X-Include-Check-Params	Flag that indicates whether existing check parameter details are returned. Information for each standard and secure check parameter is included in a JSON object. Valid values: • true: Return check parameter details. • false: Do not return check parameter details. Data type: Boolean Default: False
X-Limit	Limits the number of returned records. Set to null to use the default value. Data type: Number Default: 20,000

Name	Description
secure_params.name	Name of the secure parameter. Data type: String
secure_params.order	Order in which the parameter is sent to the check command/script. Data type: Number
secure_params.sys_id	Sys_id of the secure parameter listed in the Check Secure Parameter Definitions [sn_agent_check_secure_param_def] table. Data type: String
sys_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table. Data type: String
timeout	Timeout in seconds. Data type: Number

Example: cURL request

The following example shows how to retrieve a list of two check definitions with parameter values.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/check_de
fs/list" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "check_definitions": [
    {
      "name": "checks_api_test",
      "command": "echo hello",
      "plugins": [],
      "timeout": 9,
      "proxy_valid": true,
      "background": false,
      "check_type": "TestCheck",
      "check_group": "computer",
      "sys_id": "7f1f9026dba530106f4810284b96194f",
      "params": [],
      "secure_params": [
        {
          "name": "check_api_test_check_secure_param2",
          "active": true,
          "order": 2,
          "sys_id": "2d30a066dba530106f4810284b9619c1"
        },
```

  ]
}
```

Agent Client Collector - GET /agents/exec/background/stop/{request_id}

Stops a background check.

To start a background check, use the *POST /agents/check_defs/{check_def_id}/run* API.

URL format

`/api/sn_agent/agents/exec/background/stop/{request_id}`

Supported request parameters

Path parameters

Name	Description
request_id	The ID of a background check request generated by running the *POST /agents/check_defs/{check_def_id}/run* API.

Query parameters

Name	Description
None

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	The request with the ID provided is not found.

Response body parameters (JSON)

Name	Description
None	

Example: cURL request

The following example shows how to stop a background check.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/exec/background/stop/02359174db2a30108a0751f4f3961997" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Agent Client Collector - GET /agents/exec/run/{request_id}

Gets status of the request with the given ID.

URL format

`/api/sn_agent/agents/exec/run/{request_id}`

Supported request parameters

Path parameters

Name	Description
request_id	The ID of a background check request generated by running the *POST /agents/check_defs/{check_def_id}/run* API.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
202	Message with provided ID indicating that the request is in progress.
400	Error in the arguments provided in the request body.
404	The request with the ID provided is not found.
408	Execution timeout for the request with the ID provided.
500	Error checking the status or the request with the ID provided.

Response body parameters (JSON)

Name	Description
status	Request status. Possible values: • done – Check is successful. • failure – Check has failed. See error message for details. • mid_flow – Request output is being handled by the MID server. • processing – Check is in progress. • timeout – Check processing exceeded time limit set in the *runCheckForCis()* method. Data type: String
err_msg	Error message if any. Possible values: • No agents found for relevant CIs. • No background check request with given ID. • No request with given ID. • No test result with given ID. • Request timeout. Data type: String

Example: cURL request

The following example shows how to get the status of a request.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/exec/run/
12fed13cdb2a30108a0751f4f3961981" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector - GET /agents/exec/test/{test_result_id}

Gets the test check status of the given test result.

URL format

`/api/sn_agent/agents/exec/test/{test_result_id}`

Supported request parameters

Path parameters

Name	Description
test_result_id	A test result ID generated by creating a test check request.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

Status codes (continued)

Status code	Description
202	Message with provided ID indicating that the request is in progress.
404	The request with the ID provided is not found.
408	Execution timeout for the request with the ID provided.
500	Error checking the status of the request with the ID provided.

Response body parameters (JSON)

Properties	Description
status	Status of the test results. Possible values: • 0: Pending • 1: In progress • 2: Complete • 3: No test result with given ID Data type: String
output	Output describing the status. Data type: String

Example: cURL request

The following example shows how get result status of a completed test check request.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/check_ins
tances/99e12466dba530106f4810284b961976/test" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Agent Client Collector - GET /agents/list

Gets a list of agents with related information.

URL format

```
/api/sn_agent/agents/list
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
X-Enc-Query	Encoded query on the Agent Client Collectors [sn_agent_cmdb_ci_agent] table in standard Glide format. See Encoded query strings.
X-Limit	Restricts results to a maximum number of agents. Use null or undefined for both if they are not required.Default/Max: 20,000 Data type: Number

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_user role.

Response body parameters (JSON)

Property	Description
<Array>	Array of JSON objects containing extended agent information. `[ { "agent_id": "String", "data_collection": Number, "ip_address": "String", "is_duplicate": Boolean, "is_restart_enabled": Boolean, "name": "String", "number_of_running_checks": Number, "status": Number, "up_since": "String", "version": "String" } ]`
agent_id	ID of the agent as submitted. Data type: String
data_collection	Data collection indicates whether scheduled checks are to be run. These checks are a part of the policies scheduled for this agent to run. Possible values: • 0: On – Checks run as scheduled. • 1: Off (manual) – Checks have been disabled manually. • 2: Off (auto) – Checks have been disabled automatically due to high CPU consumption by the Data type: Number
ip_address	Agent IP address. Data type: String
is_duplicate	Flag that indicates whether this agent is a duplicate of another. There should be only a single agent on a given host. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• true: The agent has the same host as an Alive/Up agent with a different agent ID. Turn off or uninstall the duplicate • false: This agent has no duplicates in the Alive/Up state. Data type: Boolean
is_restart_enabled	Flag that indicates whether restart is enabled. Agent restart is not configurable. It depends on the OS and the version of the OS the agent is running on. Possible values: • true: Restart is enabled for this agent. • false: Restart is disabled for this agent. Data type: Boolean
name	Name of the agent. Data type: String
number_of_running_checks	The number of checks the agent is scheduled to run. These checks are a part of the policies scheduled for this agent to run. Data type: Number
status	Status of the agent. Possible values: • 0: Alive/Up – The agent is active. • 1: Warning – The agent has not received a keep-alive message in the past few minutes. • 2: Down – The agent has not received a keep-alive message in a long time. • 3: Restarting – The agent is restarting. Data type: Number
up_since	UTC time since the agent's status became alive/up. The value is in GlideDateTime format. Data type: String
version	Version of Agent Client Collector the agent is running. Data type: String

Example: cURL request

The following example shows how to restrict results by query and number. The query returns all agents that are not in the down state with a maximum of two results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl "https://instance.service-now.com/api/sn_agent/agents/list"
 \
--request GET \
--header "Accept:application/json" \
--header "X-Enc-Query: agent_extended_info.status!=2" \
--header "X-Limit: 2" \
--user 'username':'password'
```

Output:

```
{
   "agents": [
     {
       "name": "007-175",
       "status": 0,
        "agent_id": "007-175",
       "ip_address": "11.222.63.66",
        "number_of_running_checks": 0,
       "data_collection": 0,
       "is_restart_enabled": false,
       "is_duplicate": false,
       "up_since": "2021-03-24 14:36:45",
       "version": "2.4.0"
     },
     {
       "name": "win2016-dc-64bit",
       "status": 0,
       "agent_id": "007-64",
       "ip_address": "10.222.333.42",
       "number_of_running_checks": 1,
       "data_collection": 0,
       "is_restart_enabled": true,
       "is_duplicate": false,
       "up_since": "2021-03-24 11:04:38",
       "version": "2.4.0"
     }
   ]
}
```

Example: cURL request

The following example shows how to list every agent in the system. This example uses no query and no maximum number of results.

```
curl "https://instance.service-now.com/api/sn_agent/agents/list"
 \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Agent Client Collector - GET /agents/{agent_id}/log

Requests the log of a specified agent with alive/up status.

Note: To retrieve the log and check its progress, pass the request ID returned to the *GET /agents/log/{request_id}/* endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

`/api/sn_agent/agents/{agent_id}/log`

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the *GET /agents/list* endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	Agent not found or isn't in the up/alive state.

Response body parameters (JSON)

Name	Description
request_id	Sys_id of a request in the Agent Client Collector Requests [sn_agent_request] table. You can use this ID to retrieve the log and check its progress with the *GET /agents/log/{request_id}/* endpoint. Data type: String

Example: cURL request

The following example shows how to get a log request ID.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<sys_id>/log" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
"request_id": "<sys_id>"
```

Agent Client Collector - GET /agents/log/{request_id}/

Checks the status of a grab log request.

Detects changes in the log retrieving request sent with *GET /api/sn_agent/agents/{agent_id}/log*.

URL format

`/api/sn_agent/agents/log/{request_id}/`

Supported request parameters

Path parameters

Name	Description
request_id	Sys_id of a request in the Agent Client Collector Requests [sn_agent_request] table. For the request id, run *GET /api/sn_agent/agents/{agent_id}/log*.

Response body parameters (JSON)

Properties	Description
output	Information describing the status.

Example: cURL request

The following example shows how to use a request ID to get the status of a grab log request.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/log/<requ
est_ID>" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "output": "SensuSnReadFile OK:
 {\"component\":\"agent\",\"level\":\"info\",\"msg\":\"Agent
 Protection: cpu of all checks:
 0%\",\"time\":\"2021-04-05T00:21:41-07:00\"},...
}
```

Agent Client Collector - GET /agents/policies/list

Gets a list of policies that are in published or unpublished draft state.

URL format

`/api/sn_agent/agents/policies/list`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Object (continued)

Property	Description
	Data type: Array
policies.active	Flag that indicates whether the policy is active. Valid values: • true: Policy is active. • false: Policy isn't active. Data type: Boolean
policies.agent_ids	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. These results only display if the *X-Include-Checks-And-Agents* header parameter is set to true. For extended information of an agent, run the ID in the GET /agents/{agent_id} endpoint.
policies.checks	List of objects defining checks listed in the Check Instances [sn_agent_check] table. These results only display if the *X-Include-Checks-And-Agents* or *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects `"checks": [ { "active": Boolean, "auto_generate": Boolean, "check_type": "String" "command_prefix": "String", "command": "String", "event_status_change_threshold": Number, "event_status_repair_threshold": Number, "interval": Number, "name": "String", "sys_id": "String", "timeout": "String" } ]`
policies.checks.active	Flag that indicates whether the policy check is active. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object (continued)

Property	Description
	• true: Policy check is active. • false: Policy check is inactive. Data type: Boolean
policies.checks.auto_generate	Flag that indicates whether to automatically generate the command with the *command_prefix* value. Valid values: • true: Automatically populate the *command* property with active parameter values. • false: Command isn't automatically generated. Data type: Boolean
policies.checks.check_type	Check type specifying the monitoring option. Possible values: • Discovery: Check that locates CIs related to the agent. • Events: The check's result is transformed into an Event Management event. • Metrics: The values from the check result are transformed to metrics. Data type: String
policies.checks.command	Command that the Agent Client Collector executes. Parameter taken from a template or monitored CI. **Note:** If *auto_generate* is true, this property is automatically populated with the prefix and flags of the active parameters listed in the *parameters* object. Data type: String
policies.checks.command_prefix	If the *auto_generate* property is true, this command is used for automatic generation. The prefix consists of any portion of the command which is static (does not change), such as the script name. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object (continued)

Property	Description
policies.checks.event_status_change_threshold	Number of consecutive times that a check's response status must happen before a new event is sent. Returns null if not set. For example, if this value is 3, a check whose response status changes from OK to Error generates a new event with an Error status after the third consecutive occurrence of the status change. Data type: Number
policies.checks.event_status_repair_threshold	Number of consecutive times that a check's response status must improve to close the previous event. Returns null if not set. For example, if this value is 3, a check whose response status changes from Error to OK closes the previous event and generates a new event with an OK status after the third consecutive occurrence of the status change. Data type: Number
policies.checks.interval	Amount of time in seconds to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds. Data type: Number
policies.checks.name	Name of the check. Data type: String
policies.checks.sys_id	Sys_id of the check listed in the Check Instances [sn_agent_check] table. Data type: String
policies.checks.timeout	Amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops. Data type: String
policies.cred_alias	Name listed in the Credentials [discovery_credentials] table. Data type: String
policies.credential_alias	Sys_id of the credential alias in the Connection & Credential Aliases [sys_alias] table.

Object (continued)

Property	Description
	Data type: String
policies.filter	Filter restricting the policy's checks to monitor only the specified criteria. Data type: String
policies.interval	Amount of time in seconds to wait between policy checks. For example, a value of 60 means that the check runs every 60 seconds. **Note:** The value of the *checks.interval* property overrides the value configured in this field. Data type: Number
policies.monitored_ci_group	Name of the CMDB groups associated with the policy. This CMDB is listed in the CMDB Groups [cmdb_group] table. This field is only applied if the value of the *monitored_ci_type_group* property is true. Data type: String
policies.monitored_ci_script	Script for monitoring CIs. This field is only applied if the value of the *policies.monitored_ci_type_script* property is true. Data type: String
policies.monitored_ci_type_filter	Flag that indicates whether filtering by CI type is enabled. The CI type is listed in the *table* property. Valid values: • true: Filtering by checks group is enabled. • false: Filtering by checks group is disabled. Data type: Boolean
policies.monitored_ci_type_group	Flag that indicates whether monitoring by CMDB group type is enabled. Valid values: • true: CMDB group type is enabled. • false: CMDB group type is disabled.

Object (continued)

Property	Description
	Data type: Boolean
policies.monitored_ci_type_script	Flag that indicates whether the script for monitoring CIs is enabled. Valid values: • true: Script for monitoring CIs is enabled. • false: Script for monitoring CIs is disabled. Data type: Boolean
policies.name	Name of the policy. Data type: String
policies.publish_status	Indicates whether the policy is published. Possible values: • Draft: Policy has not been published and is editable using the update endpoints. • Published: Policy is published. The draft (sandbox copy) and published copy are identical. • Published*: Policy is published, but the draft copy (sandbox view) has changes not found in the published copy. Data type: String
policies.sys_id	Sys_id of the policy listed in the Policies [sn_agent_policy] table. Data type: String
policies.sys_updated_on	Date and time that the policy was last updated. Data type: String
policies.table	Monitored CI-type field on the policy. This field is only applied if *monitored_ci_type_filter* is true. Data type: String
policies.params	List of objects containing information of check parameters listed in the Check Parameters [sn_agent_check_param] table. These results only display if the *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects

Object (continued)

Property	Description

	<pre>"params": [
	  {
	  "active": Boolean,
	  "flag": "String",
	  "mandatory: Boolean,
	  "name": "String",
	  "sys_id": "String",
	  "value": "String",
	  "value_required": Boolean
	  }
	]</pre>

policies.params.active	Flag that indicates whether the check parameter is active. Valid values: • true: Check parameter is active. • false: Check parameter is inactive. Data type: Boolean
policies.params.flag	Parameter flag to use during check invocation. Data type: String
policies.params.mandatory	Flag that indicates whether this check is mandatory. Valid values: • true: This check is mandatory. • false: This check is optional. Data type: Boolean
policies.params.name	Name of the parameter. Data type: String
policies.params.sys_id	Sys_id of the parameter listed in the Check Parameters [sn_agent_check_param] table. Data type: String
policies.params.value	Value of the parameter. Data type: String
policies.params.value_required	Flag that indicates whether the information provided by the value property is required. Valid values:

Object (continued)

Property	Description
	• true: The value property is required. • false: The value property is null or not required. Data type: Boolean
policies.secure_params	List of objects containing information of check secure parameters listed in the Check Secure Parameters [sn_agent_check_secure_param] table. For more information, see Create a secure parameter for a check. These results only display if the *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects `"secure_params": [ { "active": Boolean, "name": "String", "order": Number, "sys_id": "String" } ]`
policies.secure_params.active	Flag that indicates whether the check secure parameter is active. Valid values: • true: The check secure parameter is active. • false: The check secure parameter is inactive. Data type: Boolean
policies.secure_params.name	Name of the secure parameter. Data type: String
policies.secure_params.order	Order in which the parameter is sent to the check command/script. Data type: Number
policies.secure_params.sys_id	Sys_id of the record in the Check Secure Parameter [sn_agent_check_secure_param] table. Data type: String

Example: cURL request

The following example shows how to restrict results by query and number. The query returns all active policies and the ID of the associated agent.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/polici
es/list" \
--request GET \
--header "Accept:application/json" \
--header 'X-Enc-Query: active=true ' \
--header 'X-Include-Checks-And-Agents: true' \
--user 'username' : 'password'
```

Output:

```
{
  "policies": [
    {
      "name": "Basic Discovery",
      "sys_id": "68bfd27c536113006dfeddeeff7b12be",
      "active": "true",
      "interval": "43200",
      "sys_updated_on": "2020-07-21 10:14:12",
      "monitored_ci_type_filter": "true",
      "filter":
 "discovery_source=AgentClientCollector^ORlast_discoveredRELATIV
ELT@dayofweek@ago@14",
      "table": "cmdb_ci_server",
      "monitored_ci_type_script": "false",
      "monitored_ci_script": "/*\n      Provide a script to get
 monitored CI type. ...",
      "monitored_ci_type_group": "false",
      "monitored_ci_group": "null// group name as seen in
 cmdb_group table",
      "cred_alias": "null// credential name as seen in
 discovery_credentials table",
      "credential_alias": "null// credential alias sys id as
 seen in sys_alias table",
      "publish_status": "Published",
      "checks": [
        {

    ]
}
```

Agent Client Collector - GET /agents/policy/activate/{policy_id}

Activates a published policy.

For a list of published policies, use GET /agents/policies/list. This endpoint only supports sys_ids in which the value of the policy's *publish_status* property is `Published` or `Published*`.

URL format

`/api/sn_agent/agents/policy/activate/{policy_id}`

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of the published policy listed in the Policies [sn_agent_policy] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Header	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to activate a policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/ac
tivate/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username' : 'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - GET /agents/policy/deactivate/{policy_id}

Deactivates a published policy.

For a list of published policies, use GET /agents/policies/list. This endpoint only supports sys_ids in which the value of the policy's *publish_status* property is `Published` or `Published*`.

URL format

`/api/sn_agent/agents/policy/activate/{policy_id}`

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Header	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to deactivate a policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/de
activate/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username' : 'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - GET /agents/policy/publish/{policy_id}

Publishes a draft policy.

Use any of the following endpoints to modify a draft or sandbox copy prior to publishing:

- POST /agents/update/policy/{policy_id}
- POST /agents/update/check/{check_id}
- POST /agents/update/check_param/{param_id}
- POST /agents/update/check_secure_param/{param_id}

URL format

`/api/sn_agent/agents/policy/publish/{policy_id}`

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of a policy in the Policies [sn_agent_policy] table that is in Draft state or a sandbox copy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	• For a list of policies and details including publish state, use GET /agents/policies/list. • To retrieve sandbox copy of a policy, use GET /agents/policy/sandbox_from_published/{policy_id}. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.

© 2026 ServiceNow, Inc. All rights reserved.

Status codes (continued)

Status code	Description
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Header	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to publish a policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/publish/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username' : 'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - GET /agents/policy/sandbox_from_published/{policy_id}

Gets the sandbox copy of a published policy and provides policy details.

Use the sandbox copy to make updates to a policy and publish. You can use the sys_ids in the response body to work with the following endpoints:

- POST /agents/update/policy/{policy_id}
- POST /agents/update/check/{check_id}
- POST /agents/update/check_param/{param_id}
- POST /agents/update/check_secure_param/{param_id}

For a list of published policies, use GET /agents/policies/list. This endpoint only supports sys_ids in which the value of the policy's *publish_status* property is `Published` or `Published*`.

URL format

`/api/sn_agent/agents/policy/sandbox_from_published/{policy_id}`

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Property	Description

<Object>	Extended details of the sandbox copy associated with the policy. For information on policies, see default checks and policies.
	<pre>{
	  "active": Boolean"
	  "agent_ids": "String",
	  "checks": [Array],
	  "cred_alias": "String",
	  "credential_alias": "String",
	  "filter": "String",
	  "interval": "Number",
	  "monitored_ci_group": "String",
	  "monitored_ci_script": "String",
	  "monitored_ci_type_filter":
	Boolean,
	  "monitored_ci_type_group":
	Boolean,
	  "monitored_ci_type_script":
	"String",
	  "name": "String",
	  "params": [Array],
	  "publish_status": "String",
	  "secure_params": [Array],
	  "sys_id": "String",
	  "sys_updated_on": "String",
	  "table": "String"
	}</pre>

active	Flag that indicates whether the policy is active. Valid values: • true: Policy is active. • false: Policy isn't active. Data type: Boolean
agent_ids	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. These results only display if the *X-Include-Checks-And-Agents* header parameter is set to true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	For extended information of an agent, run the ID in the GET /agents/{agent_id} endpoint.
checks	List of objects defining checks listed in the Check Instances [sn_agent_check] table. `"checks": [ { "active": Boolean, "auto_generate": Boolean, "check_type": "String" "command_prefix": "String", "command": "String", "event_status_change_threshold": Number, "event_status_repair_threshold": Number, "interval": Number, "name": "String", "sys_id": "String", "timeout": "String" } ]` Data type: Array
checks.active	Flag that indicates whether the policy check is active. Valid values: • true: Policy check is active. • false: Policy check is inactive. Data type: Boolean
checks.auto_generate	Flag that indicates whether to automatically generate the command with the *command_prefix* value. Valid values: • true: Automatically populate the *command* property with active parameter values. • false: Command isn't automatically generated. Data type: Boolean
checks.check_type	Check type specifying the monitoring option. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• Discovery: Check that locates CIs related to the agent. • Events: The check's result is transformed into an Event Management event. • Metrics: The values from the check result are transformed to metrics. Data type: String
checks.command	Command that the Agent Client Collector executes. Parameter taken from a template or monitored CI. **Note:** If *auto_generate* is true, this property is automatically populated with the prefix and flags of the active parameters listed in the *parameters* object. Data type: String
checks.command_prefix	If the *auto_generate* property is true, this command is used for automatic generation. The prefix consists of any portion of the command which is static (does not change), such as the script name. Data type: String
checks.event_status_change_threshold	Number of consecutive times that a check's response status must happen before a new event is sent. Returns null if not set. For example, if this value is 3, a check whose response status changes from OK to Error generates a new event with an Error status after the third consecutive occurrence of the status change. Data type: Number
checks.event_status_repair_threshold	Number of consecutive times that a check's response status must improve to close the previous event. Returns null if not set. For example, if this value is 3, a check whose response status changes from Error to OK closes the previous event and generates a new event with an OK status after the third consecutive occurrence of the status change. Data type: Number
checks.interval	Amount of time in seconds to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
checks.name	Name of the check. Data type: String
checks.sys_id	Sys_id of the check listed in the Check Instances [sn_agent_check] table. The POST /agents/update/check/{check_id} endpoint takes this value to update the sandbox copy. Data type: String
checks.timeout	Amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops. Data type: String
cred_alias	Name listed in the Credentials [discovery_credentials] table. Data type: String
credential_alias	Sys_id of the credential alias in the Connection & Credential Aliases [sys_alias] table. Data type: String
filter	Filter restricting the policy's checks to monitor only the specified criteria. Data type: String
interval	Amount of time in seconds to wait between policy checks. For example, a value of 60 means that the check runs every 60 seconds. **Note:** The value of the *checks.interval* property overrides the value configured in this field. Data type: Number
monitored_ci_group	Name of the CMDB groups associated with the policy. This CMDB is listed in the CMDB Groups [cmdb_group] table. This field is only applied if the value of the *monitored_ci_type_group* property is true. Data type: String
monitored_ci_script	Script for monitoring CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	This field is only applied if the value of the *policies.monitored_ci_type_script* property is true. Data type: String
monitored_ci_type_filter	Flag that indicates whether filtering by CI type is enabled. The CI type is listed in the *table* property. Valid values: • true: Filtering by checks group is enabled. • false: Filtering by checks group is disabled. Data type: Boolean
monitored_ci_type_group	Flag that indicates whether monitoring by CMDB group type is enabled. Valid values: • true: CMDB group type is enabled. • false: CMDB group type is disabled. Data type: Boolean
monitored_ci_type_script	Flag that indicates whether the script for monitoring CIs is enabled. Valid values: • true: Script for monitoring CIs is enabled. • false: Script for monitoring CIs is disabled. Data type: Boolean
name	Name of the policy. Data type: String
publish_status	Indicates whether the policy is published. Possible values: • Draft: Policy has not been published and is editable using the update endpoints. • Published: Policy is published. The draft (sandbox copy) and published copy are identical. • Published*: Policy is published, but the draft copy (sandbox view) has changes not found in the published copy. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
params	List of objects containing information of check parameters listed in the Check Parameters [sn_agent_check_param] table. These results only display if the *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects `"params": [ { "active": Boolean, "flag": "String", "mandatory: Boolean, "name": "String", "sys_id": "String", "value": "String", "value_required": Boolean } ]`
params.active	Flag that indicates whether the check parameter is active. Valid values: • true: Check parameter is active. • false: Check parameter is inactive. Data type: Boolean
params.flag	Parameter flag to use during check invocation. Data type: String
params.mandatory	Flag that indicates whether this check is mandatory. Valid values: • true: This check is mandatory. • false: This check is optional. Data type: Boolean
params.name	Name of the parameter. Data type: String
params.sys_id	Sys_id of the parameter listed in the Check Parameters [sn_agent_check_param] table. The POST /agents/update/check_param/{param_id} endpoint takes this value to update the sandbox copy. Data type: String
params.value	Value of the parameter.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	Data type: String
params.value_required	Flag that indicates whether the information provided by the value property is required. Valid values: • true: The value property is required. • false: The value property is null or not required. Data type: Boolean
secure_params	List of objects containing information of check secure parameters listed in the Check Secure Parameters [sn_agent_check_secure_param] table. For more information, see Create a secure parameter for a check. These results only display if the *X-Include-Check-Params* header parameter is set to true. Data type: Array of Objects `"secure_params": [ { "active": Boolean, "name": "String", "order": Number, "sys_id": "String" } ]`
secure_params.active	Flag that indicates whether the check secure parameter is active. Valid values: • true: The check secure parameter is active. • false: The check secure parameter is inactive. Data type: Boolean
secure_params.name	Name of the secure parameter. Data type: String
secure_params.order	Order in which the parameter is sent to the check command/script. Data type: Number
secure_params.sys_id	Sys_id of the record located in the Check Secure Parameter [sn_agent_check_secure_param] table. The POST /agents/update/check_secure_param/{param_id} endpoint takes this value to update the sandbox copy.

Property	Description
	Data type: String
sys_id	Sys_id of the policy listed in the Policies [sn_agent_policy] table. The POST /agents/update/policy/{policy_id} endpoint takes this value to update the sandbox copy. Data type: String
sys_updated_on	Date and time that the policy was last updated. Data type: String
table	Monitored CI-type field on the policy. This field is only applied if *monitored_ci_type_filter* is true. Data type: String

Example: cURL request

The following shows how to get information of the Docker Container Metrics policy.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/policy/sandbox_from_published/<sys_id>" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "name": "Docker Container Metrics",
  "sys_id": "b01e609a1b9fe4943e7f0b05464bcb91",
  "active": "false",

}
```

Agent Client Collector - GET /agents/{agent_id}/restart

Restarts a specified agent with alive/up status.

If Agent Client Collector performance issues occur, you can restart the agent. Manual restart is supported in the following environments:

- Linux-based agents using `systemd`
- Windows agents

URL format

`/api/sn_agent/agents/{agent_id}/restart`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
agent_id	Unique ID of an agent listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table. For a list of agent IDs and other details, run the `GET /agents/list` endpoint. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports `application/json`.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
404	No record found with the provided sys_id or this agent does not support restart.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to restart an agent.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/<agent_id>/restart" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Output:

```
{
  "message": "Restarting Agent With ID: <agent_id>"
}
```

Agent Client Collector - POST /agents/check_defs/{check_def_id}/run

Runs a check against the given configuration item.

To stop a background check, use the request ID provided in the *GET /agents/exec/background/stop/{request_id}* API.

URL format

`/api/sn_agent/agents/check_defs/{check_def_id}/run`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of a check definition in the Check Definitions [sn_agent_check_def] table.

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
params	Map of parameter names and values. These settings can be used to override the parameter records of the check definition and its specified values. `"params": { "<parameter name>": "String" }` Data type: Object
priority	Priority of the request to be set on the ECC queue. Possible values: • 0: interactive • 1: expedited • 2: standard Data type: Number
query	Encoded query for retrieving the GlideRecord from the table specified in the *table* property. Data type: String
table	Name of the cmdb_ci table for this background check. Data type: String
timeout	Value of the timeout for the request in seconds. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	The is an error in the arguments provided in the request body.
404	The check definition with the ID provided is not found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
requestId	Sys_id of the generated background check request.

Example: cURL request

The following example shows how to run a background check and get its request ID.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/check_de
fs/a90d3c361be1301060d2773ad54bcb6f/run" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"table\":\"sn_agent_check_def\"}" \
--user 'username':'password'
```

Output:

```
{
  "request_id": "278c0170db2a30108a0751f4f3961926"
}
```

Agent Client Collector - POST /agents/check_defs/{check_def_id}/test

Enables building test check requests on check definitions.

Use this API for the following tasks:

- Set the check definition to test
- Set the configuration item to run the test against

You can also specify one of the following identifiers to use during the test:

- Credential sys_id
- Credential alias id
- Credential name

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

`/api/sn_agent/agents/check_defs/{check_def_id}/test`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
ci_id	Sys_id of a CMDB Configuration Item.
credentials_id	Sys_id of a credentials record.
credentials_name	Name of the credentials record.
credentials_alias_id	Sys_id of a credentials alias record.
credentials_alias_name	Name of a credentials alias.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Error building the test request.

Response body parameters (JSON)

Name	Description
result_id	Sys_id of the test result record.

Agent Client Collector - POST /agents/check_instances/{check_instance_id}/test

Enables building test check requests on check instances.

Use this API for the following tasks:

- Set the check instance to test
- Set the configuration item to run the test against

You can also specify one of the following identifiers to use during the test:

- Credential sys_id
- Credential alias id
- Credential name

URL format

```
/api/sn_agent/agents/check_instances/{check_instance_id}/test
```

Supported request parameters

Path parameters

Name	Description
check_instance_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
ci_id	Sys_id of a CMDB Configuration Item.
credentials_id	Sys_id of a credentials record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request body parameters (JSON) (continued)

Name	Description
credentials_name	Name of the credentials record.
credentials_alias_id	Sys_id of a credentials alias record.
credentials_alias_name	Name of a credentials alias.
proxy_agent_id	Unique ID of an agent proxy to run this check. This value is listed in the Agent ID column of the Agent Client Collectors [sn_agent_cmdb_ci_agent] table.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Error building the test request.

Response body parameters (JSON)

Name	Description
result_id	Sys_id of the test result record.

Agent Client Collector - POST /agents/update/check/{check_id}

Updates a selected policy check.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

`/api/sn_agent/agents/update/check/{check_id}`

Supported request parameters

Path parameters

Name	Description
check_id	Sys_id of a policy check sandbox copy in the Check Instances [sn_agent_check] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the policy check is active. Valid values: • true: Policy check is active. • false: Policy check is inactive. Data type: Boolean
auto_generate	Flag that indicates whether to automatically generate the command with the *command_prefix* value. Valid values: • true: Automatically populate the *command* property with active parameter values. • false: Command isn't automatically generated. Data type: Boolean
check_type	Check type specifying the monitoring option. Possible values: • Discovery: Check that locates CIs related to the agent. • Events: The check's result is transformed into an Event Management event. • Metrics: The values from the check result are transformed to metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
command	Command that the Agent Client Collector executes. Parameter taken from a template or monitored CI. **Note:** If *auto_generate* is true, this property is automatically populated with the prefix and flags of the active parameters listed in the *parameters* object. Data type: String
command_prefix	If the *auto_generate* property is true, this command is used for automatic generation. The prefix consists of any portion of the command which is static (does not change), such as the script name. Data type: String
event_status_change_threshold	Number of consecutive times that a check's response status must happen before a new event is sent. Returns null if not set. For example, if this value is 3, a check whose response status changes from OK to Error generates a new event with an Error status after the third consecutive occurrence of the status change. Data type: Number
event_status_repair_threshold	Number of consecutive times that a check's response status must improve to close the previous event. Returns null if not set. For example, if this value is 3, a check whose response status changes from Error to OK closes the previous event and generates a new event with an OK status after the third consecutive occurrence of the status change. Data type: Number
interval	Amount of time in seconds to wait between check executions. For example, a value of 60 means that the check runs every 60 seconds. Data type: Number
name	Name of the check. Data type: String
timeout	Amount of time, in seconds, after which the check execution stops when no output is returned. For example, a value of 60 means that when the check execution doesn't return a value for 60 seconds, the execution stops.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to update the event change and repair properties of a policy check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck/<check_sys_id>" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"event_status_change_threshold\" : \"2\",
    \"event_status_repair_threshold\" : \"1\"
}" \
--user 'username':'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - POST /agents/update/check_def_params/{check_def_param_id}

Enables changing one or more field values of a specified check parameter.

URL format

`/api/sn_agent/agents/update/check_def_params/{check_def_param_id}`

Supported request parameters

Path parameters

Name	Description
check_def_param_id	Sys_id of the check parameter listed in the Check Parameter Definitions [sn_agent_check_param_def] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the check parameter is active. Valid values: • true: The check parameter is active. • false: The check parameter is inactive. Data type: Boolean

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
default_value	Specifies the default value for this check parameter. Data type: String
mandatory	Flag that indicates whether the check parameter is required. Valid values: • true: The check parameter is required. • false: The check parameter is optional. Data type: Boolean
name	Name of the check parameter. Data type: String

Note: Refer to the data dictionary for a comprehensive list of Check Definition fields and types.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	The check parameter was not found with sys_id provided.
500	Error updating the check parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
None	Success or error message.

Example: cURL request

The following example shows how to activate a check parameter.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_def_params/02d89bb01b307490f271ea42b24bcb63" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"active\":\"true\"}" \
--user 'username':'password'
```

Output:

```
"message": "Check Definition Parameter Updated Successfully"
```

Agent Client Collector - POST /agents/update/check_def_secure_params/{check_def_secure_param_id}

Enables changing one or more field values of a specified check secure parameter.

URL format

```
/api/sn_agent/agents/update/check_def_secure_params/
{check_def_secure_param_id}
```

Supported request parameters

Path parameters

Name	Description
check_def_secure_param_id	Sys_id of the secure parameter listed in the Check Secure Parameter Definitions [sn_agent_check_secure_param_def] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the secure parameter is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Valid values: • true: The secure parameter is active. • false: The secure parameter is inactive. Data type: Boolean
name	Name of the secure parameter. Data type: String
order	Order in which the parameter is sent to the check command/script. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	The check secure parameter was not found with sys_id provided.
500	Error updating the check secure parameter.

Response body parameters (JSON)

Name	Description
None	Success or error message.

Example: cURL request

The following example shows how to activate a check secure parameter.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_def_secure_params/2d30a066dba530106f4810284b9619c1" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"active\":\"true\"}" \
--user 'username':'password'
```

Output:

```
"message": "Check Definition Secure Parameter Updated
 Successfully"
```

Agent Client Collector - POST /agents/update/check_defs/{check_def_id}

Enables changing one or more field values of a specified check definition.

URL format

`/api/sn_agent/agents/update/check_defs/{check_def_id}`

Supported request parameters

Path parameters

Name	Description
check_def_id	Sys_id of the check definition listed in the Check Definitions [sn_agent_check_def] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Indicates whether this check definition is active. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• 0: This check definition is inactive. • 1: This check definition is active. Data type: Number
background	Flag that indicates whether this check definition is a background check. A background check is a check which the agent starts execution of and doesn't wait for it to finish running. Valid values: • true: This check definition is a background check. • false: This check definition is not a background check. Data type: Boolean
check_group	Group specified for this check definition.
check_type	Type of check. Possible values: • Events – Check results are transformed into an Event Management event. • Metrics – Values from the check result are transformed to metrics. Data type: String
command	Command that the Agent Client Collector executes. Data type: String
name	Name of the check. Data type: String
params	Map of parameter names and values. These settings can be used to override the parameter records of the check definition and its specified values. `"params": { "<parameter name>": "String" }` Data type: Object
plugins	List of Agent Client Collector plugins associated with this check. Data type: Array
proxy_valid	Flag that indicates whether the check definition policy is set to work as a proxy. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	• true: This check definition policy is set to work as a proxy. • false: This check definition policy is not set to work as a proxy. Data type: Boolean
query	Encoded query for retrieving the GlideRecord from the table specified in the *table* property. Data type: String
table	Name of the cmdb_ci table for this check. Data type: String
timeout	Timeout in seconds. Data type: Number

Note: Refer to the data dictionary for a comprehensive list of Check Definition fields and types.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	The check definition was not found with sys_id provided.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Error updating the check definition.

Response body parameters (JSON)

Name	Description
None	Success or error message.

Example: cURL request

The following example shows how to deactivate a check definition.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/check_defs/99e12466dba530106f4810284b961976" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"active\":\"false\"}" \
--user 'username':'password'
```

Output:

```
"message": "Check Definition Updated Successfully"
```

Agent Client Collector - POST /agents/update/check_param/{param_id}

Updates a selected policy check parameter.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

URL format

`/api/sn_agent/agents/update/check_param/{param_id}`

Supported request parameters

Path parameters

Name	Description
param_id	Sys_id of policy check parameter sandbox copy in the Check Parameters [sn_agent_check_param] table. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the check parameter is active. Valid values: • true: Check parameter is active. • false: Check parameter is inactive. Data type: Boolean
flag	
mandatory	Flag that indicates whether this check is mandatory. Valid values: • true: This check is mandatory. • false: This check is optional. Data type: Boolean
name	Name of the parameter. Data type: String
value	Value of the parameter. Data type: String
value_required	Flag that indicates whether the information provided by the value property is required. Valid values: • true: The value property is required. • false: The value property is null or not required. Data type: Boolean

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to update several properties of a policy check parameter.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_param/<param_sys_id>" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"flag\" : \"-d\",
   \"mandatory\" : \"true\",
   \"name\" : \"scheme2\",
   \"value\" : \"120\",
   \"value_required\" : \"false\"
}" \
--user 'username':'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector - POST /agents/update/check_secure_param/{param_id}

Updates a selected policy check secure parameter.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

URL format

`/api/sn_agent/agents/update/check_secure_param/{param_id}`

Supported request parameters

Path parameters

Name	Description
param_id	Sys_id of the policy check secure parameter sandbox copy in the Check Secure Parameter [sn_agent_check_secure_param] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
active	Flag that indicates whether the check secure parameter is active. Valid values: • true: The check secure parameter is active. • false: The check secure parameter is inactive. Data type: Boolean
name	Name of the secure parameter. Data type: String
order	Order in which the parameter is sent to the check command/script. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
403	The user does not have the agent_client_collector_admin role.
404	No record found with the provided sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
message	Message containing operation success or failure results. Data type: String

Example: cURL request

The following example shows how to update the properties of a policy check secure parameter.

```
curl
 "https://instance.service-now.com/api/sn_agent/agents/update/ch
eck_secure_param/<param_sys_id>" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
   \"name\" : \"new name\",
   \"order\" : \"2\"
}" \
--user 'username':'password'
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "message": "Operation was successful"
}
```

Agent Client Collector - POST /agents/update/policy/{policy_id}

Updates a sandbox copy of a policy.

To retrieve the properties of a policy sandbox copy, use GET /agents/policy/sandbox_from_published/{policy_id}.

URL format

`/api/sn_agent/agents/update/policy/{policy_id}`

Supported request parameters

Path parameters

Name	Description
policy_id	Sys_id of a policy sandbox copy in the Policies [sn_agent_policy] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
cred_alias	Name listed in the Credentials [discovery_credentials] table. Data type: String
credential_alias	Sys_id of the credential alias in the Connection & Credential Aliases [sys_alias] table. Data type: String
filter	Filter restricting the policy's checks to monitor only the specified criteria. Data type: String
interval	Amount of time in seconds to wait between policy checks. For example, a value of 60 means that the check runs every 60 seconds. **Note:** The value of the *checks.interval* property overrides the value configured in this field. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
monitored_ci_group	Name of the CMDB groups associated with the policy. This CMDB is listed in the CMDB Groups [cmdb_group] table. This field is only applied if the value of the *monitored_ci_type_group* property is true. Data type: String
monitored_ci_script	Script for monitoring CIs. This field is only applied if the value of the *policies.monitored_ci_type_script* property is true. Data type: String
monitored_ci_type_filter	Flag that indicates whether filtering by CI type is enabled. The CI type is listed in the *table* property. Valid values: • true: Filtering by checks group is enabled. • false: Filtering by checks group is disabled. Data type: Boolean
monitored_ci_type_group	Flag that indicates whether monitoring by CMDB group type is enabled. Valid values: • true: CMDB group type is enabled. • false: CMDB group type is disabled. Data type: Boolean
monitored_ci_type_script	Flag that indicates whether the script for monitoring CIs is enabled. Valid values: • true: Script for monitoring CIs is enabled. • false: Script for monitoring CIs is disabled. Data type: Boolean
name	Name of the policy. Data type: String
table	Monitored CI-type field on the policy. This field is only applied if *monitored_ci_type_filter* is true. Data type: String

```
}" \
--user 'username':'password'
```

Output:

```
{
  "message": "Operation was successful"
}
```

AI Search External User Mapping API

The *AI Search External User Mapping* API provides endpoints that enable ingestion of user mapping information from external sources into the ServiceNow® AI Search application's index.

AI Search External User Mapping - POST /ais/external_content/user_mapping/import_multiple/{target_table}

Imports a list of external user mappings into an AI Search user mapping table. Each mapping specifies externally defined user and group aliases for a ServiceNow AI Platform user. AI Search uses these aliases to determine which external document search results the user can view.

To learn how AI Search external content security utilizes external user mappings, see External content security for AI Search.

User and group names in external user mappings should match those specified in security access permissions for external documents ingested via the *External Content Ingestion* API's *POST /ais/external_content/ingestDocument/{schema_table_name}* endpoint. For more information on ingesting external documents with security access permissions for externally defined users and groups, see External Content Ingestion API.

To view import histories for external user mapping records imported through this endpoint, navigate to *AI Search* > **External Content** > **User mapping import history**. From a history record, you can view the Import Set [sys_import_set] and Multi Import Set [sys_multi_import_set] records for an import task. Use information from these records to verify that your external user mappings were imported correctly.

URL format

Versioned URL: `/api/now/{api_version}/ais/external_content/user_mapping/import_multiple/{target_table}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
target_table	The name of the AI Search user mapping table that you want the imported mappings to appear in. For example, `x_snc_sharepoint_user_table`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Note: You must create the target AI Search user mapping table via the *AI Search* > **External Content** > **Create User Mapping** module before using this endpoint. If you specify a user mapping table that does not exist, the request fails. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
{object}	Required. Unnamed object. Data type: Object `{ "records": [Array] }`
{object}.records	Required. Array of objects in which each object represents a user mapping to import into the specified target table. Data type: Array `"records": [ { "external_group": [Array], "external_user": [Array], "mapping_value": "String" } ]`
{object}.records.external_group	Array of strings where each string is the name of an externally defined group to set as an alias for the ServiceNow AI Platform user specified by the **{object}.records.mapping_value** parameter. Data type: Array Values can be in any format, depending on the names of the externally defined groups selected for the user mapping. Examples include: `"external_group": [ "itil",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	<pre> "hr-admin", "report-dev"]</pre>

{object}.records.external_user	Array of strings where each string is the name of an externally defined user to set as an alias for the ServiceNow AI Platform user specified by the **{object}.records.mapping_value** parameter.
	
	Data type: Array
	
	Values can be in any format, depending on the names of the externally defined user accounts selected for the user mapping. Examples include:
	<pre>"external_user": [
	  "beth-anglin",
	  "ad\beth.anglin",
	  "beth-anglin@sharepoint"
	]</pre>

{object}.records.mapping_value	**Email** field value that uniquely identifies an existing record in the User [sys_user] table. All externally defined user and group aliases in the request are mapped to the ServiceNow AI Platform user with this email address. **Note:** The API treats this parameter as the unique identifier for the user mapping record. If you import another user mapping with the same **mapping_value** as an existing user mapping record, the new record overwrites the existing record. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Object describing the error encountered during processing of the request. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during processing of the request. Data type: String
error.message	Message for the error encountered during processing of the request. Data type: String
import_set_id	Sys_id for the new record created in the Import Set [sys_import_set] table by a successful request. Data type: String
multi_import_set_id	Sys_id for the new record created in the Multi Import Set [sys_multi_import_set] table by a successful request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result	Result for an unsuccessful request. Includes a message describing the reason for the request failure. Data type: String
status	Status of an unsuccessful request. Valid values: • *failure* Data type: String

Example: cURL request

Import externally defined user and group aliases for ServiceNow AI Platform users Beth Anglin and Abel Tuter into an AI Search user mapping table named x_snc_sharepoint_user_table.

```
curl -X POST
 'https://instance.servicenow.com/api/now/v1/ais/external_conte
nt/user_mapping/import_multiple/x_snc_sharepoint_user_table' \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
    "records": [
      {
        "mapping_value": "beth.anglin@example.com",
        "external_user": [
          "ad\beth-anglin",
          "beth.anglin@sharepoint"
        ],
        "external_group": [
          "itil",
          "itil-admin",
          "itil-dev"
        ]
      },
      {
        "mapping_value": "abel.tuter@example.com",
        "external_user": [
          "ad\abel-tuter",
          "abel.tuter@sharepoint"
        ],
        "external_group": [
          "hr",
          "hr-admin",
          "hr-dev"
        ]
      }
    ]
  }'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The response shows the sys_ids for the generated Import Set and Multi Import Set records.

```
{
  "import_set_id": "6e9ddb629d987010f877878bd9f0e9dd",
  "multi_import_set_id": "269ddb629d987010f877878bd9f0e9de"
}
```

Example: cURL request

Import invalid request containing an empty mapping record.

```
curl
 'https://instance.servicenow.com/api/now/v1/ais/external_conte
nt/user_mapping/import_multiple/u_ext_content_user_mapping' \
  --request POST \
  --user 'username':'password' \
  --header 'Accept: application/json' \
  --header 'Content-Type: application/json' \
  --data '{
    "records": [
      {
        "mapping_value": "beth.anglin@example.com",
        "external_user": [
          "ad\beth-anglin",
          "beth.anglin@sharepoint"
        ],
        "external_group": [
          "reports",
          "reports-admin",
          "reports-dev"
        ]
      },
      {}
    ]
  }'
```

The request fails with status 400 and the response indicates the nature of the failure.

```
{
  "result": "Error in processing the message"
}
```

Alarm Management Open API

The *`Alarm Management Open`* API provides endpoints to create, update, and retrieve data from the Events [em_event] and Alert [em_alert] tables.

The telecommunications *`Alarm Management Open`* API (sn_ind_tmf642) is a ServiceNow® implementation of the TM Forum Open API specification. This API is based on TMF642 Alarm Management API REST Specification Release 20, April 2020.

The calling user must have to access the `sn_ind_tmf642.alarm_mgmt_integration` endpoint.

This API is provided within the `sn_ind_tmf642` namespace.

The TM Forum Open API specification requires a synchronous response for every inbound request it receives. Apply correlation and de-duplication in the source operational support system (OSS) before forwarding payloads to the system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API can be extended to make customizations around required parameters, request body validation, additional REST operations, and field mappings. For more information, see the Alarm Management Open API Developer Guide.

The *Alarm Management Open* API is conformance certified by TM Forum.

Alarm Management Open API – GET /sn_ind_tmf642/alarm_mgmt/alarm

Retrieves a list of all alarm records from the Events [em_event] and Alert [em_alert] tables.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
alarmRaisedTime	Date the alarm was raised. Only alarms with a date matching the value of this parameter are returned in the response. Data type: String
fields	List of fields to return in the response. Invalid fields are ignored. Valid fields: • alarmedObject • alarmRaisedTime • alarmType • crossedThresholdInformation • externalAlarmId • id • perceivedSeverity • probableCause • source • sourceSystemId

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• state • type Default: All fields Data type: String
id	Alarm ID. Only alarms with an ID matching the value of this parameter are returned in the response. Located in the **Message key** field in the Events [em_event] table. Data type: String
limit	Maximum number of records to return. For requests that exceed this number of records, use the *`offset`* parameter to paginate record retrieval. Default: 1000 Maximum: 2000 Data type: Number
offset	Starting index at which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. Default: 0 Data type: Number
probableCause	Probable cause of the alarm. Only alarms with a probable cause matching the value of this parameter are returned in the response. Data type: String
state	Alarm state. Only alarms with a state matching the value of this parameter are returned in the response. Data type: String
sourceSystemId	Source system ID of the alarm. Only alarms with a source system ID matching the value of this parameter are returned in the response. Data type: String

Request body parameters (JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
Content-Range	Specifies the range of content returned in a paginated call. For example, if `offset=2` and `limit=3`, the value of the *`Content-Range`* header is `items 3-5`.
Content-Type	Data format of the response body. Only supports *`application/json`*.
Link	Contains the following links to navigate through query results. • first • last • next • previous
X-Total-Count	For paginated queries, this header specifies the total number of records available on the server.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request successfully processed. Full resource returned in response (no pagination).
206	Partial resource returned in response (with pagination).
400	Bad request. Possible reasons: • Invalid path parameter • Invalid URI
404	Record not found. No records matching the query parameters are found in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
affectedService	List of objects identifying one or more services affected by the alarm. Data type: Array `"affectedService":[ { "href": "String", "id": "String" }, ]`
affectedService.href	URL reference providing details of the affected service. Data type: String
affectedService.id	Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
alarmDetails	Additional details about the alarm. Data type: String
alarmedObject	Details of the alarm object. `"alarmedObject": { "href": "String", "id": "String" }` Data type: Object
alarmedObject.id	Unique identifier of the alarm object. This value maps to a CI in the system. Data type: String
alarmedObject.href	URL reference to get the details of the alarm object. Data type: String
alarmedObjectType	Type or class of object associated with the event.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
alarmRaisedTime	Date and time at which the alarm occurs at its source. Data type: String
alarmReportingTime	Date and time at which the OSS reports its alarm. This value might differ from the *alarmRaisedTime* value. For example, if an element management system (EMS) maintains the alarm list: • The *alarmRaisedTime* is the time of alarm detection by the network element (NE). • The *alarmReportingTime* is the alarm report time of storage in the EMS alarm list. Data type: String
alarmType	Alarm category. Data type: String
crossedThresholdInformation	Details about the crossed threshold. `"crossedThresholdInformation": { "direction": "String", "granularity": "String", "indicatorName": "String", "indicatorUnit": "String", "observedValue": "String", "thresholdCrossingDescription": "String", "thresholdId": "String", "thresholdRef": "String" }` Data type: Object

Name	Description
crossedThresholdInformation.direction	Threshold crossing direction. Possible values: • UP • DOWN Data type: String
crossedThresholdInformation.granularity	Granularity at which the indicator is evaluated for threshold crossing. For example, `5MINUTES`. Data type: String
crossedThresholdInformation.indicatorName	Name of the indicator that crosses the alarm threshold. Data type: String
crossedThresholdInformation.indicatorUnit	Measurement unit of the indicator corresponding to the crossed threshold. Data type: String
crossedThresholdInformation.observedValue	Number identifying the indicator crossing the threshold. Data type: String
crossedThresholdInformation.thresholdCrossingDescription	More threshold details of the threshold crossing alarm. Data type: String
crossedThresholdInformation.thresholdId	Unique identifier of the threshold that caused the alarm. Data type: String
crossedThresholdInformation.thresholdRef	URL of the threshold object. Data type: String
externalAlarmId	Unique identifier for the alarm from the source system posting the alarm. Data type: String
href	URL of the resource. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
id	Unique identifier for the system to identify and process the alarm payload as an event. Data type: String
perceivedSeverity	Alarm severity. Possible values: • CLEAR • CRITICAL • MAJOR • MINOR • WARNING Data type: String
plannedOutageIndication	Indicates that the managed object for this alarm is in a planned outage state. For example, planned maintenance or out-of-service. Data type: String
probableCause	Most likely situation to trigger the alarm. Use with *alarmType* to qualify the alarm. Data type: String
proposedRepairActions	If available to the system, provides a repair action to resolve the issue that triggers the alarm. Data type: String
serviceAffecting	Flag that indicates whether the alarm affects service. Valid values: • true: Alarm affects service performance or availability. • false: Alarm does not affect service. Default: false Data type: Boolean
sourceSystemId	Instance ID of the source alarm.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
specificProblem	Specific problem that triggers the alarm. Use with *probableCause* to qualify the alarm. Data type: String
state	Alarm state. Valid values: • Ready • Processed • Ignored • Error If an invalid value is provided, the state is set to `Ready`. If the state is `Ready`, an alert is created in the Alert [em_alert] table and the state then becomes `Processed`. If the state is `Processed`, `Ignored`, or `Error` no alert is created. Default value: Ready Data type: String

Example: cURL request

This example retrieves all alarms.

```
curl
 "https://instance.servicenow.com/api/sn_ind_tmf642/alarm_mgmt/a
larm" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body.

```
[
   {
      "externalAlarmId": "2212331",
      "alarmType": "QualityOfServiceAlarm23",
      "perceivedSeverity": "MAJOR",

Alarm Management Open API – GET /sn_ind_tmf642/alarm_mgmt/alarm/{id}

Retrieves a specified alarm record from the Events [em_event] or Alert [em_alert] table.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm/{id}`

Supported request parameters

Path parameters

Name	Description
id	Unique identifier of the record to retrieve. Located in the **Message key** field in the Events [em_event] table. Data type: String

Query parameters

Name	Description
fields	List of fields to return in the response. Invalid fields are ignored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid fields: • alarmedObject • alarmRaisedTime • alarmType • crossedThresholdInformation • externalAlarmId • id • perceivedSeverity • probableCause • source • sourceSystemId • state • type Default value: All fields Data type: String

Request body parameters (JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected for one or more of the following reasons. • Invalid path parameter. • Invalid URI.
404	Record not found. A record associated with the specified ID is not found in the Event [em_event] or Alert [em_alert] table.

Response body parameters (JSON)

Name	Description
affectedService	List of objects identifying one or more services affected by the alarm. Data type: Array `"affectedService":[ { "href": "String", "id": "String" },]`
affectedService.href	URL reference providing details of the affected service. Data type: String
affectedService.id	Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
alarmDetails	Additional details about the alarm. Data type: String
alarmedObject	Details of the alarm object.

Status codes (continued)

Status code	Description
	• Unable to update event. • The event doesn't exist.

Response body parameters (JSON)

Name	Description
alarmChangedTime	Date and time the alarm changed in GMT on the alarm-owning system. This value is in GlideDateTime format and is in the *Time of event* field of a record in the Events [em_events] table. This value updates when changes to the alarm from the alarmed resource occur or a change from a client update triggers the alarm. This value is required in the response. Data type: String
href	URL reference to the alarm. Data type: String
id	Unique identifier of the alarm. Value determined by the system owning the alarm. Data type: String

Example: cURL request

In this example, the severity is reduced to MINOR.

```
curl
 "https://<instance>.service-now.com/api/sn_ind_tmf642/alarm_mg
mt/alarm/6e116bb8db09201087b9a8394b961950_<external-alarm-id>" \

```

Alarm Management Open API – POST /sn_ind_tmf642/alarm_mgmt/alarm

Creates an alarm record in the Events [em_event] table.

When the alarm record is created, an ID for the alarm is added in the *Message key* field.

An alert record might also be created based on Alert management rules.

This endpoint writes the response body to the **Additional Info** field of the event record in the Events [em_event] table.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm`

Supported request parameters

Path parameters

Name	Description
None

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
affectedService	List of objects identifying one or more services affected by the alarm. Data type: Array `"affectedService":[ { "href": "String", "id": "String" }, ]`
affectedService.href	URL reference providing details of the affected service. Data type: String
affectedService.id	Required. Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
alarmDetails	Additional details about the alarm. Data type: String
alarmedObject	Required. Details of the alarm object. `"alarmedObject": { "href": "String", "id": "String" }` Data type: Object
alarmedObject.id	Required. Unique identifier of the alarm object. This value maps to a CI in the system. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
alarmedObject.href	URL reference to get the details of the alarm object. Data type: String
alarmedObjectType	Type or class of object associated with the event. Data type: String
alarmRaisedTime	Date and time at which the alarm occurs at its source. Data type: String
alarmReportingTime	Date and time at which the OSS reports its alarm. This value might differ from the *alarmRaisedTime* value. For example, if an element management system (EMS) maintains the alarm list: • The *alarmRaisedTime* is the time of alarm detection by the network element (NE). • The *alarmReportingTime* is the alarm report time of storage in the EMS alarm list. Data type: String
alarmType	Required. Alarm category. Data type: String
crossedThresholdInformation	Details about the crossed threshold. `"crossedThresholdInformation": { "direction": "String", "granularity": "String", "indicatorName": "String", "indicatorUnit": "String", "observedValue": "String",`

© 2026 ServiceNow, Inc. All rights reserved.

Request body parameters (JSON) (continued)

Name	Description

	<pre>"thresholdCrossingDescription": "String",
	"thresholdId": "String",
	"thresholdRef": "String"
	}</pre>
	Data type: Object

crossedThresholdInformation.direction	Threshold crossing direction. Possible values: • UP • DOWN Data type: String
crossedThresholdInformation.granularity	Granularity at which the indicator is evaluated for threshold crossing. For example, `5MINUTES`. Data type: String
crossedThresholdInformation.indicatorName	Name of the indicator that crosses the alarm threshold. Data type: String
crossedThresholdInformation.indicatorUnit	Measurement unit of the indicator corresponding to the crossed threshold. Data type: String
crossedThresholdInformation.observedValue	Number identifying the indicator crossing the threshold. Data type: String
crossedThresholdInformation.thresholdCrossingDescription	More threshold details of the threshold crossing alarm. Data type: String
crossedThresholdInformation.thresholdId	Required. Unique identifier of the threshold that caused the alarm. Data type: String
crossedThresholdInformation.thresholdRef	URL of the threshold object.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
externalAlarmId	Required. Unique identifier for the alarm from the source system posting the alarm. Data type: String
id	Unique identifier for the system to identify and process the alarm payload as an event. This value must be empty if used in the payload. The system generates this unique ID for the event and sends it as part of the response payload. Data type: String
perceivedSeverity	Required. Alarm severity. Possible values: • CLEAR • CRITICAL • MAJOR • MINOR • WARNING Data type: String
plannedOutageIndication	Indicates that the managed object for this alarm is in a planned outage state. For example, planned maintenance or out-of-service. Data type: String
probableCause	Required. Most likely situation to trigger the alarm. Use with *`alarmType`* to qualify the alarm. Data type: String
proposedRepairActions	If available to the system, provides a repair action to resolve the issue that triggers the alarm.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String
serviceAffecting	Flag that indicates whether the alarm affects service. Valid values: • true: Alarm affects service performance or availability. • false: Alarm does not affect service. Default: false Data type: Boolean
sourceSystemId	Required. Instance ID of the source alarm. Data type: String
specificProblem	Specific problem that triggers the alarm. Use with *`probableCause`* to qualify the alarm. Data type: String
state	Alarm state. Valid values: • Ready • Processed • Ignored • Error If an invalid value is provided, the state is set to `Ready`. If the state is `Ready`, an alert is created in the Alert [em_alert] table and the state then becomes `Processed`. If the state is `Processed`, `Ignored`, or `Error` no alert is created. Default value: Ready Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid payload. Missing required alarm ID. • Invalid payload. Required field missing:<field name>. • Invalid payload. Missing required object. • Event not created, failed. • Unable to clear event. • Unable to update event. • The event doesn't exist.

Response body parameters (JSON)

Name	Description
affectedService	List of objects identifying one or more services affected by the alarm. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"affectedService":[
	  {
	  "href": "String",
	  "id": "String"
	  },
	]</pre>

affectedService.href	URL reference providing details of the affected service. Data type: String
affectedService.id	Identifier of the service affected by the alarm. This value maps to the affected configuration item (CI) on the alert. Data type: String
alarmDetails	Additional details about the alarm. Data type: String

alarmedObject	Details of the alarm object.
	<pre>"alarmedObject":
	{
	  "href": "String",
	  "id": "String"
	}</pre>
	Data type: Object

alarmedObject.id	Unique identifier of the alarm object. This value maps to a CI in the system. Data type: String
alarmedObject.href	URL reference to get the details of the alarm object. Data type: String
alarmedObjectType	Type or class of object associated with the event. Data type: String
alarmRaisedTime	Date and time at which the alarm occurs at its source. Data type: String
alarmReportingTime	Date and time at which the OSS reports its alarm.

Alarm Management Open API – POST /sn_ind_tmf642/alarm_mgmt/alarm/{id}/clear

Clears a specified alarm and closes any associated alert.

URL format

Default URL: `/api/sn_ind_tmf642/alarm_mgmt/alarm/{id}/clear`

Supported request parameters

Path parameters

Name	Description
id	Unique identifier of the alarm to clear. Located in the **Message key** field in the Events [em_events] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
alarmClearedTime	Date and time at which the alarm clears at the source. This value is in the *`Time of event`* field of the record in the Events [em_events] table. Data type: String
clearSystemId	Required. Name of the instance from which the *`alarmCleared`* operation was invoked. Data type: String
clearUserId	Required. Unique ID of the user who invoked the *`alarmCleared`* operation. This value is in the *`Source`* field of the record in the Events [em_events] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Name	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad request. Possible reasons: • Invalid payload. Missing required alarm ID. • Invalid payload. Required field missing:<field name>. • Invalid payload. Missing required object. • Event not created, failed. • Unable to clear event. • Unable to update event. • The event doesn't exist.

Response body parameters (JSON)

Name	Description
alarmClearedTime	Date and time at which the alarm clears at the source. This value is in the *Time of event* field of the record in the Events [em_events] table. Data type: String
clearSystemId	Name of the instance from which the *alarmCleared* operation was invoked. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
clearUserId	Unique ID of the user who invoked the *alarmCleared* operation. This value is in the *Source* field of the record in the Events [em_events] table. Data type: String
href	URL of the alarm. Data type: String
id	Unique ID in the *Message key* field of a record in the Events [em_events] table. Data type: String

Example: cURL request

This example clears an alarm.

```
curl
 "https://<instance>.service-now.com/api/sn_ind_tmf642/alarm_mg
mt/alarm/6e116bb8db09201087b9a8394b961950_<external-alarm-id>/cl
ear" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"alarmClearedTime\": \"2017-08-15 06:04:15\",
  \"clearSystemId\": \"<source_instance_name>\",
  \"clearUserId\": \"SOURCE_SYSTEM_vManage_00000_000_00\"
}" \
--user 'user':'password'
```

Response body.

```
{
  "result": {
    "alarmClearedTime": "2017-08-15 06:04:15",
    "clearSystemId": "<source_instance_name>",
    "clearUserId": "SOURCE_SYSTEM_vManage_00000_000_00",
    "id": "6e116bb8db09201087b9a8394b961950_<external-alarm-id>"
  }
}
```

AP Invoice API

Allows external systems, such as those used by vendors, to securely submit invoices directly into an accounts payable system in a structured and automated manner.

This API requires the Accounts Payable Invoice Processing (com.sn_ap_apm) store application, which is provided within the `sn_spend_intg` namespace. For information, see Accounts Payable Invoice Processing.

Refer to AP Invoice API Developer Guide for help with the following tasks:

- Define a custom field for invoices, invoice lines, and invoice tax lines.
- Map the custom field between source and target tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Map the custom field to a payload entry in a specific format, such as JSON or cXML.
- Setting credentials for authentication when using cXML as the payload.

Note: The maximum default payload size is 100 records. This value is configurable in the *sn_spend_intg.ap.invoice.create.api.record_limit* system property.

AP Invoice – POST sn_spend_intg/ap_invoice/cxml

Processes an automated invoice in commerce XML (cXML) format.

Use the Invoice integration field mappings [sn_spend_intg_invoice_intg_field_mapping] table to determine how the fields are mapped to cXML tags.

For additional cXML resources, refer to the cXML Reference Guide at https://xml.cxml.org.

Credentials for this API are included in the payload. You can set up credentials in the Source system credential [sn_spend_intg_source_system_credential] table. For instructions, see Setting credentials for authentication in the cXML payload.

You can define custom invoice fields for the request body. Use the following flow to add custom fields, map them to target tables, and format them for availability in the payload:

1. Add custom fields for invoice import
2. Map custom fields between source and target tables
3. Map custom fields to a payload source format

URL format

Versioned URL: `/api/sn_spend_intg/v1/ap_invoice/cxml`

Default URL: `/api/sn_spend_intg/ap_invoice/cxml`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body elements (cXML)

Path	Description
/cXML/Header/From / Credential[@domain='VendorID']/Identity	Identifier for the reseller or supplier that the customer can place orders with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body elements (cXML) (continued)

Path	Description
	Target field: u_supplier Related table: Invoice Import [sn_spend_intg_imp_invoice]
/cXML/Request/InvoiceDetailRequest / InvoiceDetailRequestHeader[@invoiceDate]	Date on which the customer was invoiced. Target field: u_invoice_date Related table: Invoice Import [sn_spend_intg_imp_invoice]
/cXML/Request/InvoiceDetailRequest / InvoiceDetailRequestHeader[@invoiceID]	Invoice number generated from a third-party application. Target field: u_external_invoice_number Related table: Invoice Import [sn_spend_intg_imp_invoice]
/cXML/Request/InvoiceDetailRequest / InvoiceDetailRequestHeader[@invoiceOrigin]	External source system from where the invoice is received. For example, supplier. Target field: u_inbound_source Related table: Invoice Import [sn_spend_intg_imp_invoice]
Contact[@role="remitTo"]/PostalAddress / Street	The street address to which the payment is made. Target field: u_remit_address
Contact[@role="remitTo"]/PostalAddress / City	The city to which the payment is made. Target field: u_remit_to_city
Contact[@role="remitTo"]/PostalAddress / State	The state or province to which the payment is made. Target field: u_remit_to_state_or_province
Contact[@role="remitTo"]/PostalAddress / PostalCode	The zip or postal code to which the payment is made. Target field: u_remit_to_zip_or_postal_code
Contact[@role="remitTo"]/PostalAddress / Country	The country to which the payment is made in ISO 3166 format. For example, US. Target field: u_remit_to_country
/cXML/Request/InvoiceDetailRequest/ InvoiceDetailRequestHeader / InvoiceDetailShipping/	Street from which the items on the purchase order are shipped. Target field: u_ship_from_street

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *`application/xml`*.
Source-System	Specifies the source system from which the request is coming from. Available systems are listed in the Source systems credentials [sn_spend_intg_source_system_credential] table. This setting helps to determine if the request provided follows the structure in the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table. This setting is also used to fetch credentials from the Source system credentials [sn_spend_intg_source_system_credential] table.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	Request Accepted. The request is successful and invoice processing is in progress.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
429	Too Many Requests. The request rate has exceeded the maximum of 10 requests per hour.

Response body parameters

Name	Description
batch_id	Unique identifier for the batch request. This ID can be used to track the status of the request. This record is stored in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Data type: String
error	Contains error details when the request fails. Possible errors: • 400 status code. Invalid payload - Invalid content type. • 400 status code. Invalid payload - Error: Invalid payload structure. • 400 status code when the number of records in the batch is more than the batch size set. Invalid payload - Error: Payload exceeds allowed invoices limit in a batch. • 400 status code if the number of records in the batch is zero. Invalid payload - Error: Empty invoices. No data to process. • 429 status code. Rate limit of 500 requests per hour for APO Invoice Ingestion exceeded. Data type: String
message	A message providing additional context about the request's processing status. Possible details: • 202 status code. Your request has been successfully received and is being processed. • 429 status code. Rate limit exceeded. Data type: String
status	Indicates the result of the request. Possible values: • Success • Fail Data type: String

The following results display if the request is successful and the invoice data is processing. You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Use the batch ID to find the invoice.

```
{
    "batchId": "APIINV1729711710733280",
    "status": "Success",
    "message": "Your request has been successfully received and
 is being processed."
}
```

AP Invoice – POST sn_spend_intg/ap_invoice/json

Processes an automated invoice in JSON format.

Role required: sn_spend_intg.procurement_integrator

You can define custom invoice fields for the request body. Use the following flow to add custom fields, map them to target tables, and format them for availability in the payload:

1. Add custom fields for invoice import
2. Map custom fields between source and target tables
3. Map custom fields to a payload source format

URL format

Versioned URL: `/api/sn_spend_intg/v1/ap_invoice/json`

Default URL: `/api/sn_spend_intg/ap_invoice/json`

Request body parameters (continued)

Name	Description
	Data type: String Maximum length: 40
invoices.supplier	Required. Identifier for the reseller or supplier that the customer can place orders with. Target field: u_supplier Related table: Invoice Import [sn_spend_intg_imp_invoice] Data type: String Maximum length: 100
invoices. supplier_invoice_number	Required. Identification number that is generated by a supplier for this invoice. Target field: u_supplier_invoice_number Related table: Invoice Import [sn_spend_intg_imp_invoice] Data type: String Maximum length: 100
invoices.supplier_tax_id	Tax identifier that is associated with the third party reseller. This is an editable field. Target field: u_supplier_tax_id Related table: Invoice Import [sn_spend_intg_imp_invoice] Data type: String Maximum length: 100
invoices.target_erp	ERP record in which the invoice is posted. Located in the ERP Source [sn_fin_erp_source] table. See ERP source. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Source-System	Specifies the source system from which the request is coming from. This setting helps to determine if the request provided follows the structure in the Invoice integration field mapping [sn_spend_intg_invoice_intg_field_mapping] table.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	Request Accepted. The request is successful and invoice processing is in progress.
400	Bad Request. A bad request type or malformed request was detected.
429	Too Many Requests. The request rate has exceeded the maximum of 10 requests per hour.

Response body parameters

Name	Description
batch_id	Unique identifier for the batch request. This ID can be used to track the status of the request. This record is stored in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Data type: String
error	Contains error details when the request fails. Possible errors: • 400 status code. Invalid payload - Invalid content type. • 400 status code. Invalid payload - Error: Invalid payload structure. • 400 status code when the number of records in the batch is more than the batch size set. Invalid payload - Error: Payload exceeds allowed invoices limit in a batch. • 400 status code if the number of records in the batch is zero. Invalid payload - Error: Empty invoices. No data to process. • 429 status code. Rate limit of 500 requests per hour for APO Invoice Ingestion exceeded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
message	A message providing additional context about the request's processing status. Possible details: • 202 status code. Your request has been successfully received and is being processed. • 429 status code. Rate limit exceeded. Data type: String
status	Indicates the result of the request. Possible values: • Success • Fail Data type: String

Example: cURL request

The following example shows how to process an invoice provided as a request in JSON format.

```
curl
 "https://instance.servicenow.com/api/sn_spend_intg/v1/ap_invoi
ce/json" \
--request \
 POST \
--header \
 "Source-System: Coupa" \
--header \
 "Content-Type: application/json" \
--user 'username' \
:'password' \
--data \

```

The following results display if the request is successful and the invoice data is processing. You can view the status of the request in the Invoice integration log [sn_spend_intg_invoice_integration_log] table. Use the batch ID to find the invoice.

```
{
    "batchId": "APIINV1729711710733280",
    "status": "Success",
    "message": "Your request has been successfully received and
 is being processed."
}
```

Application Service API

The *Application Service* API provides endpoints that enable you to create, modify, and update application services.

This API requires that the user have the Application Service administrator [app_service_admin] role.

Important: Starting with the Rome release, the *Application Service* API is no longer enhanced or supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Application Service - GET /now/cmdb/app_service/{sys_id}/getContent

Retrieves a list of configuration items (CI) in a mapped application service and the relationships between them. Only retrieves content for services that were manually created.

URL format

Default URL: `/api/now/cmdb/app_service/{sys_id}/getContent`

Supported request parameters

Path parameters

Name	Description
sys_id	Sys_id of the mapped application service. Located in the Mapped Application Service [cmdb_ci_service_discovered] table. Data type: String

Query parameters

Name	Description
Mode	Amount of relationship data to return. Valid values: • Shallow: Return parent and child relationships between CIs within a service. • Full: Return CI attributes and lookup information in addition to the data returned in shallow mode.

Query parameters (continued)

Name	Description
	The values are not case-sensitive. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or they do not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
cmdb	List of objects that describe the CIs associated with the specified application service. Data type: Object `"cmdb": [ { "items": {Object}, "relations": [Array] } ]`
cmdb.items	CIs within the application service. If the full query parameter was passed in the request, this section includes attributes and lookup information for each CI. Data type: Array `"items": [ { "className": "String", "values": {Object} } ]`
cmdb.items.className	Name of the class that contains the CI. Data type: String
cmdb.items.values	Information to use to locate an associated CI. Data type: Object `"values": { "name": "String", "sys_id": "String" }`
cmdb.items.values.name	Name of the CI. Data type: String
cmdb.items.values.sys_id	Sys_id of the CI. Data type: String
cmdb.relations	Relationship data for associated CIs, such as hosts and their children. Data type: Array
service	List of services related to the identified service. Data type: Array

Name	Description

	"service": [
	  {
	  "name": "String",
	  "service_relations": [Array],
	  "url": "String"
	  }
	]

service.name	Name of the application service. Data type: String

service.service_relations	Hierarchy data for the CIs within the application service. All CIs form pairs with a parent and child CI. The top-level CI, referred to as the entry point of an application service, does not have a parent CI.
	
	Data type: Array
	"service_relations": [
	  {
	  "child": "String",
	  "parent": "String"
	  }
	]

service.service_relations.child	Name of a child CI related to the CI. Data type: String
service.service_relations.parent	Name of a parent CI related to the CI. Data type: String
service.url	Relative path to the application service. Data type: String

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/cmdb/app_service/2fce4
2d80a0a0bb4004af34d7e3984c8/getContent?mode=shallow" \

Application Service - GET /now/cmdb/csdm/app_service/find_service

Returns basic information about a specified application service and its associated business context.

Note: This endpoint has been deprecated, use SG Services – POST – /sg_services/app_service/find instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/find_service`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
name	Required, if *number* is not passed in. Name of the service for which to return information. Located in the Application Service [cmdb_ci_service_auto] table. Data type: String
number	Required, if *name* is not passed in. Unique number that identifies the application service for which to return information. Located in the Application Service [cmdb_ci_service_auto] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or they do not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Describes an encountered error. Data type: Object `"error": { "details": "String", "message": "String" }`
error.details	Additional information about the error. Data type: String
error.message	Message describing the error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
services	Array of objects, each object containing details of services associated with the specified application service. Data type: Array `"services": [ { "environment": "String", "name": "String", "number": "String", "relationships": {Object}, "sys_id": "String", "version": "String" } ]`
services.environment	Environment in which the application service is deployed, such as "Production" or "Test Lab 2." This can be any value that makes sense to the implementer. Data type: String Maximum length: 40 Default: null
services.name	Required. Name of the application service. Must be a unique name from all other application services. Data type: String Maximum length: 255
services.number	Unique number that identifies the application service. This value is initially generated by the endpoint. Data type: String
services.relationships	Service types associated with the application service. Data type: Object `"relationships": { "business_app": [Array], "business_service_offering": [Array],`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"technical_service_offering": [Array]
	}</pre>

services.relationships.business_app	List of sys_ids of the business applications related to the application service. Data type: Array
services.relationships.technical_service_offering	List of sys_ids of the business service offerings related to the application service. Data type: Array
services.relationships.business_service_offering	List of sys_ids of the technical service offerings related to the application service. Data type: Array
services.sys_id	Sys_id of the application service. Data type: String
services.version	Application service version number. Data type: String Maximum length: 40 Format: User definable Default: null

Example: Sample cURL request

```
curl -X GET \

 https://instance.servicenow.com/api/now/cmdb/csdm/app_service/find_service?name=Email_East&number=SNSVC0001018 \
  -H 'Accept: application/json' \
  -u 'username':'password'
```

```
{

      }
    }
  ]
 }
}
```

Application Service - POST /now/cmdb/app_service/create

Creates an application service or update an existing application service.

URL format

Default URL: `/api/now/cmdb/app_service/create`

Supported request parameters

Parameters

Parameter	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Request body

The API accepts these JSON elements in the request body. In addition, you can add any field from the Mapped Application Service [cmdb_ci_service_discovered] table to pass data to the application service record. For example, to add content to the Comments field, add `"comments": "Passing data to the Comments field"` to the JSON request.

Elements accepted in the request body

Element	Description
name	Name of the application service you wish to create or update.
service_relations	Information about CIs and the hierarchy they form. All CIs form pairs with a parent CI and a child CI. The top-level CI, referred to as the entry point of an application service, does not have a parent CI.
parent	Sys_ id of the CI whose outgoing connection joins this CI with the CI at the lower level in the map hierarchy.
child	Sys_ id of the CI whose incoming connection joins this CI with the CI located of the higher level in the map hierarchy.

Response body

The API returns these JSON elements in the response body.

Elements returned in the response body

Element	Description
URL	URL of the standard table REST API for showing the sys_id of an application service record. This element appears only if the endpoint is successful. Data type: String
getContentUrl	REST API path for getting the application service content. This element appears only if the endpoint is successful. Data type: String
info	Number of CIs added to the application service. This element appears only if the endpoint is successful. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements returned in the response body (continued)

Element	Description
error	Error message details. This element appears only if the endpoint fails. Data type: Object
message	Error message describing the nature of the failure. This element appears only if the endpoint fails. Data type: String
status	States "failure" if the REST API fails. This element appears only if the endpoint fails. Data type: String

Example: Sample cURL request

```
curl
 "http://<instance.servicenow.com>/api/now/cmdb/app_service/crea
te" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"name\": \"myTestAppService\",
\"comments\": \"Passing data to the Comments field\",
\"service_relations\": [
{ \"parent\": \"\",
\"child\": \"3a70f789c0a8ce010091b0ea635b982a\"
},{ \"parent\": \"3a70f789c0a8ce010091b0ea635b982a\",
\"child\": \"b4fd7c8437201000deeabfc8bcbe5dc1\"
},{ \"parent\": \"b4fd7c8437201000deeabfc8bcbe5dc1\",
\"child\": \"53fdbc8437201000deeabfc8bcbe5d10\"
}
]
}" \
--user 'admin':'admin'
```

```
{
  "result": {
    "url":
 "/api/now/table/cmdb_ci_service_discovered/b1cff89fc9e19300964f
cbb1ac3059a5",
    "getContentUrl":
 "/api/now/cmdb/app_service/b1cff89fc9e19300964fcbb1ac3059a5/get
Content",
    "info": "3 CIs added to service"
  }
}
```

Application Service - POST /now/cmdb/csdm/app_service/register_service

Creates an application service record stub in the Application Service [cmdb_ci_service_auto] table and populates it with the passed in information.

Before storing the record, it validates the passed parameters and the uniqueness of the application service name. It also creates upstream relationships which provide business context to the service by associating the specified business applications, business service offerings, and technical service offerings to the service application. It does not create downstream relationships to infrastructure. To define downstream relationships you must call the *Application Service - PUT /now/cmdb/csdm/app_service/{service_sys_id}/populate_service* endpoint.

Note: This endpoint has been deprecated, use SG Services – POST – /sg_services/app_service/register instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/register_service`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters

Name	Description

basic_details	Required. Details of the service associated with the specified application service.
	
	Data type: Object
	
	`"basic_details": {`
	`  "environment": "String",`
	`  "name": "String",`
	`  "version": "String"`
	`}`

basic_details.environment	Environment in which the application service is deployed, such as "Production" or "Test Lab 2." This can be any value that makes sense to the implementer. Data type: String Maximum length: 40

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Default: null
basic_details.name	Required. Name of the application service. Must be a unique name from all other application services. Data type: String Maximum length: 255
basic_details.version	Application service version number. Data type: String Maximum length: 40 Format: User definable Default: null
relationships	Upstream (parent) service types to associate with the application service. These relationships are stored in the CI Relationships [cmdb_rel_ci] table. Data type: Object `"relationships": { "business_app": [Array], "business_service_offering": [Array], "technical_service_offering": [Array] }`
relationships.business_app	List of sys_ids of the business applications to relate to the application service. Data type: Array
relationships.business_service_offering	List of sys_ids of the business service offerings to relate to the application service. Data type: Array
relationships.technical_service_offering	List of sys_ids of the technical service offerings to relate to the application service. Data type: Array

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The application service was successfully registered.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or they do not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	Describes an encountered error. Data type: Object `"error": { "details": "String", "message": "String" }`
error.details	Additional information about the error. Data type: String
error.message	Message describing the error. Data type: String
number	Unique number that identifies the application service. This number is generated by the endpoint.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
service_sys_id	Sys_id of the registered application service.

Example: Sample cURL request

```
curl -X POST \

 https://instance.servicenow.com/api/now/cmdb/csdm/app_service/r
egister_service \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password'
  -d '{
  "basic_details": {
    "environment": "Test Lab 2",
    "name": "Test Lab 2",
    "version": "1.1.1"
  },
  "relationships": {
    "business_app":["f07c7620db54101037740f95ca96199a"],

 "business_service_offering":["069c7e20db54101037740f95ca9619b
f"]
  }
}'
```

```
{
  "result": {
    "service_sys_id": "80f21bbadbd410103d3a93c3e296199a",
    "number": "SNSVC0001018
    }
}
```

Application Service - PUT /now/cmdb/csdm/app_service/{service_sys_id}/populate_service

Populates the specified application service with a specified set of downstream configuration items (CI).

Before calling this endpoint, you must call the POST /now/cmdb/csdm/app_service/register_service endpoint to create the application service.

Note: This endpoint has been deprecated, use SG Services – POST – /sg_services/app_service/populate instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/{service_sys_id}/populate_service`

Supported request parameters

Path parameters

Name	Description
service_sys_id	Sys_id of the application service to populate with the specified CIs. Located in the Application Service [cmdb_ci_service_auto] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description

population_method	CIs to associate with the specified application service. The elements in the *populate_method* object depend on the type of information being populated; defined by the *type* parameter.
	
	Data type: Object
	
	For *type* = cmdb_group_based
	
	`{ "population_method": { "group_id": "String", "type": "String" } }`
	
	For *type* = discovery
	
	Note: To use this type you must activate the Service Mapping (com.snc.service-mapping) plugin.
	
	`{ "population_method": { "attributes": [Array], "entry_point_id": "String", "type":"String" } }`
	
	For *type* = tag_list
	
	Note: To use this type you must activate the Service Mapping (com.snc.service-mapping) plugin.
	
	`{ "population_method": { "tags":[Array], "type":"String" } }`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
population_method.attributes	List of attributes to associate with the CI, such as host, port, name, and URL. For additional information on entry points, see Entry point attributes. **Note:** You must pass all required attributes. Data type: Array `{ "attributes": { "name":"String", "value":"String" } }`
population_method.attributes.name	Name of the attribute, such as host, port, name, and URL. Data type: String
population_method.attributes.value	Attribute value. Data type: String
population_method.entry_point	Required if *population_method.type* = discovery. Entry point into the application service. For additional information on entry points, see Entry point attributes and Create entry point types for Service Mapping. Data type: String
population_method.group_id	Required if *population_method.type* = cmdb_group_based. Sys_id of the group to associate with the CI. Located in the CMDB Group [cmdb_group] table. Data type: String
population_method.tags	List of tags to associate with the CI. This information is located in the Key Values [cmdb_key_value} table. Data type: Array `{ "tags": { "tag": "String", "value": "String" } }`
population_method.tags.tag	Name of the tag. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
population_method.tags.value	Tag value. Data type: String
population_method.type	Required. Type of CI to populate. Valid values: • cmdb_group_based • discovery • tag_list Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or they do not have the app_service_admin role.
500	Internal server error. An unexpected error occurred while processing the request.

Response body parameters (JSON or XML)

Name	Description
error	Describes an encountered error. Data type: Object `"error": { "details": "String", "message": "String" }`
error.details	Additional information about the error. Data type: String
error.message	Message describing the error. Data type: String

Example: Sample cURL request

The following code example shows how to populate an application service when the CI type is cmdb_group_based.

```
curl -X PUT \

 https://instance.servicenow.com/api/now/cmdb/csdm/app_service/f
809cb60db94101037740f95ca96190f/populate_service \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
  "population_method": {
    "type":"cmdb_group_based",
    "group_id": "e809cf60db94101037640f95ca961932"
  }
}'
```

```
{
    "result": {}
}
```

The following code example shows how to populate a discovery application service.

```
curl -X PUT \

 https://instance.servicenow.com/api/now/cmdb/csdm/app_service/f
809cb60db94101037740f95ca96190f/populate_service \
  -H 'Accept: application/json' \
  -H 'Content-Type: application/json' \
  -u 'username':'password' \
  -d '{
  "population_method": {
    "type":"discovery",
    "entry_point_id":"cmdb_ci_endpoint_ad_forest",
```

```
    "attributes": [
      {
        "name":"host",
        "value":"test1.com"
      },
      {
        "name":"port",
        "value":"500"
      },
      {
        "name":"protocol",
        "value":"ssh"
      }
    ]
  }
}'
```

```
{
    "result": {}
}
```

Application Service - PUT /now/cmdb/csdm/app_service/{service_sys_id}/service_details

Updates the specified application service with the passed in basic information.

It also validates the uniqueness of the application service by checking the passed in information against the Identification and Reconciliation engine (IRE) rules defined on the application service class.

Note: This endpoint has been deprecated, use SG Services – POST – /sg_services/app_service/update instead.

URL format

Default URL: `/api/now/cmdb/csdm/app_service/{service_sys_id}/service_details`

Supported request parameters

Path parameters

Name	Description
service_sys_id	Sys_id of the application service to updated. Located in the Application Service [cmdb_ci_service_auto] table. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
basic_details	Details of the service associated with the specified application service. Data type: Object `"basic_details": { "environment": "String", "name": "String" }`
basic_details.environment	Environment in which the application service is deployed, such as "Production" or "Test Lab 2." This can be any value that makes sense to the implementer. Data type: String Maximum length: 40 Default: null
basic_details.name	Required. Name of the application service. Must be a unique name from all other application services. Data type: String Maximum length: 255
relationships	Service types to associate with the application service. Located in the CI Relationships [cmdb_rel_ci] table. Data type: Object `"relationships": { "business_app": [Array], "business_service_offering": [Array], "technical_service_offering": [Array] }`
relationships.business_app	List of sys_ids of the business applications to relate to the application service. Data type: Array
relationships.business_service_offering	List of sys_ids of the business service offerings to relate to the application service. Data type: Array
relationships.technical_service_offering	List of sys_ids of the technical service offerings to relate to the application service.

```

```
{
    "result": {}
}
```

Appointment API

The *Appointment* API provides endpoints for interacting with the appointment booking application. Use this API to book and reschedule appointments, check available appointment slots, and fetch appointment booking configuration details.

Before using this API, the Appointment Booking Configuration and Service Configuration must be setup. In addition, a task for which the appointment is being booked must already exist. For additional information, see Configuring Appointment Booking.

The *Appointment* API requires the Appointment Booking plugin (com.snc.appointment_booking) and is provided within the `sn_apptmnt_booking` namespace. To access this API you must have the snc_internal role.

Appointment - GET /sn_apptmnt_booking/appointment/calendar

Returns the time range for which you can book appointments. The return results honor the lead time and maximum future bookable dates configured in the appointment booking service configuration.

For additional information on lead time and maximum future bookable dates configuration, see Create or modify an appointment booking application configuration.

You must have either the snc_internal or snc_external role to access this endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/calendar`

Default URL: `/api/sn_apptmnt_booking/appointment/calendar`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
catalog_id	Required. Sys_id of the record producer configured with an appointment booking service configuration. Located in the Record Producer [sc_cat_item_producer] table. Data type: String
location	Required. Sys_id of the location (cmn_location) of the appointment. Located in the Location [cmn_location] table. Data type: String
opened_for	Required. Sys_id of the user for whom the appointment is being booked. Located in the User [sys_user] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Information about the results of the endpoint request. Data type: Object `"result": { "range_end": "String", "range_start": "String" }`
result.range_end	End of the range in which the appointments can be booked. `Range End = Today + Maximum future bookable days` Data type: String Format: Appointment's time zone in internal date time format.
result.range_start	Start of the range in which the appointments can be booked. `Range Start = Today + Lead time` Data type: String Format: Appointment's time zone in internal date time format.

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_apptmnt_booking/v1/appoi
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ntment/calendar?catalog_id=e4c1116b3b810300ce8a4d72f3efc40f&loca
tion=32e8499cdb2d2200d75270f5bf9619d6&opened_for=6816f79cc0a8016
401c5a33be04be441" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Result:

```
{
  "result": {
    "range_start": "2023-02-08 03:52:27",
    "range_end": "2023-02-21 23:52:27"
  }
}
```

Appointment - GET /sn_apptmnt_booking/appointment/configuration

Returns the configuration defined in a specified Appointment Booking Service Configuration.

In addition, it returns the translations and user date and time preferences required to render the slots on the appointment booking widgets.

You must have either the snc_internal or snc_external role to access this endpoint.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/configuration`

Default URL: `/api/sn_apptmnt_booking/appointment/configuration`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
catalog_id	Required. Sys_id of the record producer configured with the appointment booking service configuration. Located in the Record Producer [sc_cat_item_producer] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Results of the endpoint request. Data type: Object `"result": { "active": Boolean, "active_string": "String", "advanced_calendar_view_portal": Boolean, "auto_acceptance": Boolean, "locale_language": "String", "service_config": {Object},`

© 2026 ServiceNow, Inc. All rights reserved.

Name	Description
	"task_table": "String", "translations": {Object}, "userDateFormatOptions": {Object}, "useRR": Boolean, "userTimeFormat": {Object}, "userTimeFormatOptions": {Object}, "view_scale": "String" }
result.active	Flag that indicates whether the service configuration setup for the associated catalog ID is active. Possible values: • true: Service configuration setup for the catalog ID is active. • false: Service configuration setup for the catalog ID isn't active. Data type: Boolean
result.active_string	Text representation of the status of the service configuration setup for the associated catalog ID. Data type: String
result.advanced_calendar_view_portal	Flag that indicates whether the advanced calendar view displays on the portal or displays the base view. For additional information on the advanced calendar view, see Create or modify an appointment booking application configuration. Possible values: • true: Advanced calendar view displays on the portal. • false: Basic view displays on the portal. Data type: Boolean
result.auto_acceptance	Flag that indicates whether the appointment automatically transitions to the accepted state. Possible values: • true: Appointment automatically transitions to the accepted state. • false: Agent must manually accept the appointment. Data type: Boolean
result.locale_language	User's language setting.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Format: ISO 639.1 language code
result.service_config	Details about the service configuration. Data type: Object `"service_config": { "active": Boolean, "active_string": "String", "appointment_booking_config": "String", "appointment_duration": "String", "appointments_per_bookable_slot": "String", "bookable_days": "String", "cancel_by_time": "String", "default_timezone": "String", "enable_advanced_config": Boolean, "field_mapping": {Object}, "future_bookable_max_days": "String", "lead_time": "String", "mandatory": "String", "use_slot_end_time_as": "String", "work_duration": "String" }`
result.service_config.active	Flag that indicates the active status of the appointment booking service configuration. Possible values: • true: Active • false: Inactive Data type: Boolean
result.service_config.active_string	Text representation of the status of the appointment booking service configuration. Data type: String
result.service_config. appointment_booking_config	Sys_id of the appointment booking service configuration setup for the associated catalog ID. Located in the Appointment Booking Service Configuration [sn_apptmnt_booking_service_config] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.service_config. appointment_duration	Length of the appointment. Data type: String Unit: Minutes
result.service_config. appointments_per_bookable_slot	Number of appointments that can be booked for the associated slot. Data type: String
result.service_config.bookable_days	Comma-separated values representing the days on which appointments can be booked. Days are represented as integers where, Monday = 1 and Sunday = 7. Data type: String
result.service_config.cancel_by_time	Minimum amount of time prior to the start of an appointment that a user can cancel the appointment. For example, if you have an appointment booked for 1:00pm and there's a 2 hour cancel by time, you must cancel the appointment no later than 10:59 am. Format: This value is the date and time difference from “1970-01-01 00:00:00”. So if the returned value is "1970-01-01 04:00:00, it means that the room must be canceled four hours before the meeting starts. Data type: String
result.service_config.default_timezone	Time zone configuration that appointments are booked in. Possible values: • location: Use the time zone of the location of the appointment. • user: Use the time zone of the person for whom the appointment is being booked. Data type: String
result.service_config. enable_advanced_config	Flag that indicates whether appointment booking configurations and appointment booking rules are considered when booking appointments. For additional information, see Create appointment booking advanced configuration. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Appointment booking configurations and appointment booking rules are considered when booking appointments. • false: Appointment booking configurations and appointment booking rules aren't considered when booking appointments. Data type: Boolean
result.service_config.field_mapping	Details about the catalog variables mapped to the location and contact values used to book the appointment. Data type: Object `"field_mapping": { "contact": "String", "contactRPVariable": {Object}, "location": "String", "locationRPVariable": {Object} }`
result.service_config.field_mapping.contact	Name of the catalog variable that contains the contact value. Data type: String
result.service_config.field_mapping.contactRPVariable	Details about the location catalog variables data. Data type: Object `"contactRPVariable": { "displayName": "String", "label": "String", "name": "String" }`
result.service_config.field_mapping.contactRPVariable.displayName	Display name of the contact catalog variable. Data type: String
result.service_config.field_mapping.contactRPVariable.label	Label of the contact catalog variable. Data type: String
result.service_config.field_mapping.contactRPVariable.name	Name of the contact catalog variable. Data type: String
result.service_config.field_mapping.location	Name of the catalog variable that contains the location value. Data type: String
result.service_config.field_mapping.locationRPVariable	Details about the location catalog variables data. Data type: Object

Name	Description

	"locationRPVariable": {
	"displayName": "String",
	"label": "String",
	"name": "String"
	}

result.service_config.field_mapping. locationRPVariable.displayName	Display name of the location catalog variable. Data type: String
result.service_config.field_mapping. locationRPVariable.label	Label of the location catalog variable. Data type: String
result.service_config.field_mapping. locationRPVariable.name	Name of the location catalog variable. Data type: String
result.service_config. future_bookable_max_days	Maximum number of days in the future that an appointment can be booked. Data type: String
result.service_config.lead_time	Minimum amount of time prior to the start of an appointment that a user can book the appointment. For example, if you want to book an appointment at 1:00pm and there's a 2-hour lead time, you must book the appointment no later than 10:59 am. Format: This value is the date and time difference from "1970-01-01 00:00:00". So if the returned value is "1970-01-01 04:00:00, it means that the room must be booked four hours before the meeting starts. Data type: String
result.service_config.mandatory	Indicator for whether the appointment is mandatory. Possible values: • 0: Appointment isn't mandatory. • 1: Appointment is mandatory. Data type: String
result.service_config. use_slot_end_time_as	Indicator as to when an agent will arrive or complete the work scheduled for the associated appointment. Possible values: • arrive_by: Agent will arrive at the location for the appointment within the specified time slot. • complete_by: Agent will complete the work for the appointment within the specified time slot. • empty: Same as completed_by.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.service_config.work_duration	Amount of time it takes to work on the appointment. Work duration is configured in the appointment booking service configuration. For additional information, see Create or modify an appointment booking service configuration. Data type: String Unit: Minutes
result.task_table	Name of the table for which the appointment can be booked. Configured in the appointment booking service configuration. Data type: String
result.translations	Name-value pairs of text translations used by the appointment booking widget. Contains translated values for actions, messages, days, and months. Data type: Object
result.userDateFormatOptions	Describes the date format options that are needed to render JS date objects. These values are set in appointment booking constants which are not modifiable. Data type: Object `"userDateFormatOptions": { "day": "String", "month": "String", "week": "String", "weekday": "String" }`
result.userDateFormatOptions.day	Day date format. Data type: String Format: Numeric (Values or 1-31)
result.userDateFormatOptions.month	Month date format. Data type: String Format: Short (Values on Jan, Feb, Mar, and so on)
result.userDateFormatOptions.week	Week date format. Data type: String Format: Numeric (Values of 1-5)
result.userDateFormatOptions.weekday	Weekday date format.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Format: Short (Values of Mon, Tue, Wed, and so on)
result.useRR	Value of the sn_apptmnt_booking.use_read_replica_from_ui property. This value defines whether to use the read replica database to fetch appointment slots when the query is performed from the UI. Possible values: • true: Use the read replica database to fetch the slots. • false: Don't use the read replica database to fetch the slots. Data type: Boolean
result.userTimeFormat	Describes the user's time format. The user is the person making the endpoint request. If made through the platform, it is an agent. If made through the portal, it is a customer. Data type: Object `"userTimeFormat": { "type": "String", "value": "String" }`
result.userTimeFormat.type	Type of time format. Possible values: • 12hr • 24hr Data type: String
result.userTimeFormat.value	Preferred time format, such as "HH:mm:ss". Data type: String
result.userTimeFormatOptions	Describes the time format options that are needed to render JS time objects. These values are set in the appointment booking constants which can't be modified. Data type: Object `"userTimeFormatOptions": { "hour": "String", "hourCycle": "String", "minute": "String" }`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.userTimeFormatOptions.hour	Format for hours. Format: numeric (Values 1-12)
result.userTimeFormatOptions.hourCycle	Format for hour cycle. Only possible value is h23.
result.userTimeFormatOptions.minute	Format for minutes. Format: numeric (Values of 1-60)
result.view_scale	View configured in the service configuration. Possible values: • day • week Data type: String

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_apptmnt_booking/v1/appoi
ntment/configuration?catalog_id=e4c1116b3b810300ce8a4d72f3efc4
0f" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```

Appointment - GET /sn_apptmnt_booking/appointment/execute_rule_conditions

Returns the sys_id of the appointment booking service configuration rule that matches a specified task sys_id or a set of specified catalog item data.

The passed task ID or catalog item data is evaluated against the rules defined for a service configuration. The sys_id for the first rule for which these conditions match is returned. You must then pass this rule sys_id to subsequent availability requests to fetch the correct slots, which are defined in the rule.

You must have either the snc_internal or snc_external role to access this endpoint.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/execute_rule_conditions`

Default URL: `/api/sn_apptmnt_booking/appointment/execute_rule_conditions`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
catalogId	Required. Sys_id of the record producer configured with the appointment booking service configuration. Located in the Record Producer [sc_cat_item_producer] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String
otherInputs	Required if the *taskId* parameter isn't specified. Name-value pairs of catalog item variables to compare against the rules defined for a service configuration. For example: `"otherInputs": { "u_sn_point_of_sale_variable_set": "true", "short_description": "Point-of-Sale Installation", "contact": "6816f79cc0a8016401c5a33be04be441", "description": "Install new point-of-sale system with cash tray", "location": "32e8499cdb2d2200d75270f5bf9619d6" }` Data type: Object
taskId	Required if the *otherInputs* parameter isn't specified. Sys_id of the task record for which the appointment is being booked. Located in the task table for which the appointment is being booked. The *catalogId* corresponds to a particular appointment booking configuration and every config has a task table on which the appointment is booked. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Description of the information returned by the endpoint. Data type: Object `"result": { "dedicatedCapacity": Boolean, "futureMaxBookableDays": "String", "ruleId": "String", "ruleName": "String" }`
result.dedicatedCapacity	Flag that indicates whether the associated rule has dedicated capacity. For additional information on dedicated capacity, see Create appointment booking service configuration rules. Possible values: • true: Rule has dedicated capacity. • false: Capacity is shared between the associated rule and the base configuration. It's also shared with other rules that don't have dedicated capacity. Data type: Boolean
result.futureMaxBookableDays	Maximum number of days in the future for which an appointment with the matching rule can be booked. Data type: String
result.ruleId	Sys_id of the appointment booking service configuration rule that matches the *taskId* or *otherInputs* parameters passed in the request. Located in the Service Configuration Rule [sn_apptmnt_booking_config_rule] table. Data type: String
result.ruleName	Name of the rule that matched the passed parameters.

Name	Description
	Data type: String

Example: cURL request

The following code example shows how to use the *taskId* parameter to make the rule comparison request.

```
curl
 "http://instance.servicenow.com/api/sn_apptmnt_booking/v1/appoi
ntment/execute_rule_conditions" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"catalogId\": \"e4c1116b3b810300ce8a4d72f3efc40f\",
  \"taskId\": \"ce1f397c43b861105e0dbcba6ab8f298\"}" \
--user 'username':'password'
```

Response:

```
{
  "result": {
    "ruleId": "f7d5d98f437c21105e0dbcba6ab8f2fc",
    "ruleName": "Priority 1 rule",
    "dedicatedCapacity": true,
    "futureMaxBookableDays": "14"
  }
}
```

Example: cURL request

The following code example shows how to use the *otherInputs* parameter to make the rule comparison request.

```
curl
 "http://instance.servicenow.com/api/sn_apptmnt_booking/v1/appoi
ntment/execute_rule_conditions" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  \"catalogId\": \"e4c1116b3b810300ce8a4d72f3efc40f\",
  \"otherInputs\": {
    \"u_sn_point_of_sale_variable_set\": \"true\",
    \"short_description\": \"Point-of-Sale Installation\",
    \"contact\": \"6816f79cc0a8016401c5a33be04be441\",
    \"description\": \"Install new point-of-sale system with
 cash tray\",
    \"location\": \"32e8499cdb2d2200d75270f5bf9619d6\"
  }
}" \
--user 'username':'password'
```

Response:

```

Appointment - POST /sn_apptmnt_booking/appointment/appointment

Enables you to book and reschedule appointments for a Field Service Management task.

Note: This endpoint only enables you to book and schedule appointments that have start and end times defined in the associated appointment booking service configuration and have available slots.

For additional information on Field Service Management tasks, see Configuring Appointment Booking.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Date type: String Format: YYYY-MM-dd HH:mm:ss
catalogId	Required. Sys_id of the record producer configured for the appointment booking service configuration. The record producer is defined in the **Catalog Item** field in the related appointment booking service configuration record - Appointment Booking Service Configuration [sn_apptmnt_booking_service_config] table. Date type: String
endDateUTC	Required. End date and time for the appointment slot in UTC time zone. Date type: String Format: YYYY-MM-dd HH:mm:ss
location	Required. Sys_id of the location record related to the appointment. Located in the Location [cmn_location] table. Date type: String
openedFor	Required. Sys_id of the user for which the appointment is being booked. Located in the User [sys_user] table. Date type: String
reschedule	Required. Flag that indicates whether the appointment is being rescheduled. Valid values: • true: Appointment currently exists and is being rescheduled. • false: New appointment. Data type: Boolean
service_cofig_rule	If the appointment is being booked under a rule, the sys_id of the service configuration rule. Located in the Service Configuration Rule [sn_apptmnt_booking_config_rule] table. Date type: String
startDateUTC	Required. Start date and time for the appointment slot in UTC time zone. Date type: String Format: YYYY-MM-dd HH:mm:ss in UTC time zone
taskId	Required. Sys_id of the task record for which the appointment is being booked. The table containing this sys_id is defined in the *taskTable* parameter.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Date type: String
taskTable	Required. Name of the table containing the task record for which the appointment is being booked. Date type: String
timezone	Required. Time zone to use when booking or updating the specified appointment slot. Format: Country/City or Area format, such as US/Eastern Date type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
result	Information about the results of the endpoint request. Data type: Object `"result": { "data": "String", "message": "String", "reason": "String", "success": Boolean }`
result.data	Sys_id of the appointment record that has been created or rescheduled. Data type: String
result.message	Message that explains whether the appointment request was scheduled or failed. For example, error responses might include: • Your appointment cannot be scheduled. • Your appointment cannot be rescheduled. If the operation is successful, a message similar to the following is returned: Your appointment has been scheduled successfully. Data type: String
result.reason	Additional information about the results of the appointment request. Data type: String
result.success	Flag that indicates whether the request was successful. Possible values: • true: Request succeeded • false: Request failed Data type: Boolean

Example: cURL request

The following example shows how to create a new appointment booking for a task in the Work Order [wm_order] table.

```
curl
 "https://instance.servicenow.com/api/sn_apptmnt_booking/appoint
ment/appointment" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
\"startDateUTC\": \"2023-02-01 20:00:00\",
\"endDateUTC\": \"2023-02-01 22:00:00\",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
\"actualStartDate\": \"2023-02-01 15:00:00\",
\"actualEndDate\": \"2023-02-01 17:00:00\",
\"taskTable\": \"wm_order\",
\"location\": \"32e8499cdb2d2200d75270f5bf9619d6\",
\"catalogId\": \"e4c1116b3b810300ce8a4d72f3efc40f\",
\"openedFor\": \"ddce70866f9331003b3c498f5d3ee417\"
\"taskId\": \"ce1f397c43b861105e0dbcba6ab8f298\",
\"reschedule\": false,
\"service_configuration_rule\": \"\",
\"timezone\": \"US/Eastern\"
}" \

--user 'username':'password'
```

Response:

```
{
"result": {
  "success": true,
  "message": "Your appointment has been scheduled
 successfully.",
  "reason": "Appointment created!",
  "data": "7a5f393c43b861105e0dbcba6ab8f29f"
  }
}
```

Appointment - POST /sn_apptmnt_booking/appointment/availability

Returns the slots that have been configured in the appointment booking service configuration along with their availability.

If advanced configurations are enabled for the service configuration, the endpoint honors these configurations, and returns the data according to the rules and advanced configuration. You can also use this endpoint to find the first available slot by passing the *get_next_available_slot* parameter or *get_next_available_day_data* parameter in the request body as `true`.

You must have either the snc_internal or snc_external role to access this endpoint.

URL format

Versioned URL: `/api/sn_apptmnt_booking/{api_version}/appointment/availability`

Default URL: `/api/sn_apptmnt_booking/appointment/availability`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
catalog_id	Required. Sys_id of the record producer configured for the appointment booking service configuration. The record producer is defined in the **Catalog Item** field in the related appointment booking service configuration record - Appointment Booking Service Configuration [sn_apptmnt_booking_service_config] table. Data type: String
end_date	Required. End date and time for which to fetch appointments. Data type: String Format: UTC time zone and in the internal date and time format YYYY-MM-dd HH:mm:ss
full_day	Required. Flag that indicates whether to return all appointments for the specified date range passed regardless of the time values in start and end date. Possible values: • true: Return all appointments regardless of specified times. • false: Only return appointments that correspond to the specified dates and times. Data type: Boolean
get_next_available_slot	Flag that indicates whether to return the first available appointment slot with the response even if it isn't part of the passed-in *start_date* and *end_date* parameters. Possible values: • true: Return the first available appointment slot. • false: Don't return the first available appointment slot. Data type: Boolean Default: false
limit	Maximum number of appointments to return. Data type: Number Default: Value specified in the sn_apptmnt_booking .max_appointments_ returned property or 1000 if the property is empty.

Request body parameters (continued)

Name	Description
location	Required. Sys_id of the location record associated with the appointment. Located in the Location [cmn_location] table. Data type: String
opened_for	Required. Sys_id of the user for which the appointment is being booked. Located in the User [sys_user] table. Data type: String
otherInputs	Name-value pairs of any other values needed to calculate the availability in the scripted method. Typically these values are catalog item variables, however, if you customize your booking application you can pass any values needed by your implementation. For example: `"otherInputs": { "u_sn_point_of_sale_variable_set": "true", "short_description": "Point-of-Sale Installation", "contact": "6816f79cc0a8016401c5a33be04be441", "description": "Install new point-of-sale system with cash tray", "location": "32e8499cdb2d2200d75270f5bf9619d6" }` Data type: Object
service_config_rule	Sys_id of the service configuration rule to use to calculate the appointment slots and availability. Located in the Service Configuration Rule [sn_apptmnt_booking_config_rule] table. Data type: String
start_date	Required. Start date and time for which to fetch appointments. Data type: String Format: UTC time zone and in the internal date and time format YYYY-MM-dd HH:mm:ss
task_table	Required. Name of the table containing the task record for which the appointment is being booked. Data type: String
use_read_replica	Flag that indicates whether to use the read replica of the database when fetching the appointment slots and their availability. Valid values:

Appointment Open API

The *Appointment Open* API is a telecommunication API that allows you to interact with the appointment booking application. Use this API to book appointments and search available time slots.

The *Appointment Open* API is a ServiceNow® implementation of the Open API TMForum TMF646 Appointment REST API specification and is conformance certified by TM Forum. This implementation is based on TMF646 Appointment API REST Specification R16.0.1.

This API requires the following plugins available on the ServiceNow Store.

- Appointment Booking (com.snc.appointment_booking)
- Field Service Management (com.snc.work_management)
- Field Service Management for Telecommunications (com.sn_fsmt)
- Telecommunication Open APIs (com.sn_tmf_api)

Before using this API, Appointment Booking Configuration and Service Configuration must be set up. In addition, a task for which the appointment is being booked must exist.

This API is provided within the `sn_tmf_api` namespace. The calling user must have the sn_tmf_api.appointment_integrator role.

Appointment Open - GET /api/sn_tmf_api/appointment/appointment

Retrieves a list of appointment records.

URL format

Default URL: `/api/sn_tmf_api/appointment/appointment`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
category	Filter the appointment by category sys_id. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Query parameters (continued)

Name	Description
	Table: Location [cmn_location] Default: Returns all appointments if category sys_id is not provided.

relatedEntity	Details about the related entity associated with the work order.
	
	Data type: Object
	
	`"relatedEntity": {`
	`  "id": "String"`
	`}`

relatedEntity.id	Required. Sys_id of the related entity. Data type: String Table: workOrder [wm_order] Default: Returns all if sys_id is not provided.

relatedParty	Filter the appointment by the sys_id of the related party associated with the appointment.
	
	Data type: Object
	
	`"relatedParty": {`
	`  "id": "String",`
	`  "name": "String"`
	`}`
	
	Default: Returns all appointments if *`relatedParty`* is not provided.

relatedParty.id	Sys_id of the related party. Data type: String Table: User [sys_user]
relatedParty.name	Name of the related party. Data type: String

relatedPlace	Filter the appointment by the place where the service or repair is scheduled to happen.
	
	Data type: Object
	
	`"relatedPlace": {`
	`  "id": "String"`
	`}`
	
	Default: Returns all appointments if *`relatedPlace`* is not provided.

relatedPlace.id	Sys_id of the related place. Data type: String

Name	Description
validFor	Date range that the appointment is valid for. Data type: Object `"validFor": { "endDateTime": "String" "startDateTime": "String" }`
validFor.endDateTime	End date and time of the appointment. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
validFor.startDateTime	Start date and time of the appointment. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.

Example: cURL request

The following example shows how to return a list of appointments using the GET appointment method.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/appointment/appo
intment" \
--request GET\
--user 'username':'password'
```

The response body contains the details of two different appointments configured in the appointment booking service configuration:

```

Appointment Open - GET /api/sn_tmf_api/appointment/appointment/{id}

Retrieves an appointment record associated with a specified ID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Default URL: `/api/sn_tmf_api/appointment/appointment/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the appointment to retrieve. Data type: String Table: Appointment booking [sn_apptmnt_booking_appointment_booking]

Query parameters

Name	Description
category	Filter the appointment by category sys_id. Data type: String Table: Location [cmn_location] Default: Returns all appointments if category sys_id is not provided.

relatedEntity	Details about the related entity associated with the work order.
	
	Data type: Object
	
	`"relatedEntity": {`
	`  "id": "String"`
	`}`

relatedEntity.id	Required. Sys_id of the related entity. Data type: String Table: workOrder [wm_order] Default: Returns all if sys_id is not provided.

relatedParty	Filter the appointment by the sys_id of the related party associated with the appointment.
	
	Data type: Object
	
	`"relatedParty": {`
	`  "id": "String",`
	`  "name": "String"`
	`}`
	
	Default: Returns all appointments if *`relatedParty`* is not provided.

relatedParty.id	Sys_id of the related party. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Table: User [sys_user]
relatedParty.name	Name of the related party. Data type: String

relatedPlace	Filter the appointment by the place where the service or repair is scheduled to happen.
	
	Data type: Object
	
	`"relatedPlace": {`
	`  "id": "String"`
	`}`
	
	Default: Returns all appointments if *relatedPlace* is not provided.

relatedPlace.id	Sys_id of the related place. Data type: String Table: Location [cmn_location]

validFor	Filter the appointment by a date range that the appointment is valid for.
	
	Data type: Object
	
	`"validFor":`
	`{`
	`  "endDateTime": "String",`
	`  "startDateTime": "String"`
	`}`
	
	Default: Returns all appointments if *validFor* is not provided.

validFor.endDateTime	End date and time of the appointment. Only appointments with the specified end date and time are returned in the response. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43. Table: Location [cmn_location]
validFor.startDateTime	Start date and time of the appointment. Only appointments with the specified start date and time are returned in the response. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43. Table: Location [cmn_location]

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters

Name	Description
category	Sys_id of the record producer configured for the appointment booking service configuration. Data type: String Stored in: Catalog Item#field of the Appointment Booking Service Configuration [sn_apptmnt_booking_service_config] table.
creationDate	Date and time that the appointment was created. Data type: String

Name	Description
	Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
href	Hyperlink to the appointment record. Use this link in another Appointment Open API request to reschedule or delete the appointment. Data type: String
id	Sys_id of the appointment. Data type: String Stored in: Appointment Booking Service Configuration [sn_apptmnt_booking_service_config] table
lastUpdate	Date and time the appointment was last updated. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
relatedEntity	Details about the related entity of the appointment. Data type: Array of Objects `"relatedEntity": [ { "@referredType": "String", "id": "String", "role": "String" } ]`
relatedEntity.@referredType	Type of item or service. Data type: String Stored in: workOrder [wm_order] table
relatedEntity.id	Sys_id of the related entity. Data type: String Stored in: workOrder [wm_order] table
relatedEntity.role	Role description of the related entity. Possible value: work order Data type: String Stored in: workOrder [wm_order] table
relatedParty	List of contacts for the appointment. Each contact is an object in the array.

Appointment Open - GET /api/sn_tmf_api/appointment/searchTimeSlot

Returns time slots that were configured in the appointment booking service configuration along with their availability.

URL format

`/api/sn_tmf_api/appointment/searchTimeSlot`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
catalog_id	Required. Sys_id of the record producer configured with an appointment booking service configuration. Data type: String Table: Record Producer [sc_cat_item_producer]
end_date	Required. End date and time of the time period in which you want to search for the appointment. Data type: String Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 12:00:00`.
location	Sys_id of the appointment's location. Table: Location [cmn_location] Data type: String Default: Returns all locations if not specified.
opened_for	Required. Sys_id of the user for whom the appointment is being booked. Table: Contact [customer_contact] Data type: String
start_date	Required. Start date and time of the time period in which you want to search for the appointment. Data type: String Format: YYYY-MM-DD 00:00:00. For example, `2025-01-31 09:00:00`.

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
availableTimeSlot	List of appointment slots within the specified block of time requested. Data type: Array of Objects `'availableTimeSlot': [ { "available": Boolean, "end_date": "String", "end_date_display": "String", "end_dateUTC": "String", "start_date": "String", "start_date_display": "String", "start_dateUTC": "String" } ]`
availableTimeSlot.available	Flag that indicates whether the associated time slot is available. Possible values: • true: Time slot is available. • false: Time slot is unavailable. Data type: Boolean
availableTimeSlot.end_date	End date and time of the associated appointment. The time zone is based on the value in the *timeZone* parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
availableTimeSlot.end_date_display	Display end date and time of the associated appointment. The time zone is based on the value in the *`timeZone`* parameter. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
availableTimeSlot.end_dateUTC	End date and time of the associated appointment. Data type: String Format: UTC
availableTimeSlot.start_date	Start date and time of the associated appointment. Reflects the value of the *`timeZone`* parameter. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
availableTimeSlot.start_date_display	Display start date and time of the associated appointment. Reflects the value of the *`timeZone`* parameter. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
availableTimeSlot.start_dateUTC	Start date and time of the associated appointment. Data type: String Format: UTC
hasMore	Flag that indicates whether there are more appointment slots to fetch after returning the limit. The limit is specified in the Appointment Booking property, sn_apptmnt_booking.max_appointments_returned (Default: 100). See Appointment booking components for more details about this property. Possible values: • true: More appointment slots can be fetched. • false: No more appointment slots are available. Data type: Boolean

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
noApptAvailable	Flag that indicates whether there are more appointment slots available for the specified date and time. Valid values: • true: More appointment slots are available for the specified date and time. • false: No more appointment slots are available for the specified date and time. Data type: Boolean
searchResult	Results for appointment availability within the designated search time slot. Possible values: • success • fail Data type: String
status	Completion status of the search for available time slots. For example, done. Data type: String
timeZone	Time zone used when booking or updating the specified appointment slot. Date type: String Format: Country/city or area format, such as US/Eastern

Example: cURL request

The following code example shows how to call this endpoint.

```
curl --location --request GET
 'https://instance.service-now.com/api/sn_tmf_api/appointment/se
archTimeSlot?
start_date=2024-07-10 09:00:00&end_date=2024-07-20
 23:00:00&catalog_id=ada50a93f0220210f8776517d8c8e776&
opened_for=51670151c35420105252716b7d40ddfe&location=f48b21850a0
a0ba7004182b18099696d ' \
--user 'username':'password'
```

Result:

```
{
  "searchResult": "success",
  "status": "done",
  "availableTimeSlot": [
    {
      "start_date": "2024-07-10 09:00:00",
      "end_date": "2024-07-10 12:00:00",
```

Appointment Open - DELETE /api/sn_tmf_api/appointment/appointment/{id}

Deletes an appointment record with a given ID.

URL format

Default URL: `/api/sn_tmf_api/appointment/appointment/{id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the appointment record to delete. Data type: String Table: Appointment booking [sn_apptmnt_booking_appointment_booking]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON)

Name	Description
message	Response message acknowledging successful deletion. Success: "The appointment (<id>) is successfully cancelled." Errors: • "Appointment cancellation failed.": The ID can't be found in the system and returns a 404 status code. • "Appointment cancellation failed.": The appointment is already in a cancelled or completed state or can't be deleted, and returns a 404 status code. • "The appointment (<id>) can't be cancelled as it is beyond the Cancel by time.": The appointment is already beyond the 'cancel by time', which is configured in the appointment booking service configuration. Returns a 400 status code. Data type: String

Example: cURL request

The following example deletes an appointment with a specific ID.

```
curl
 "http://instance.servicenow.com/api/sn_tmf_api/appointment/appo
intment/68cc0a5a9314521060320dd548373" \
--request GET\
--user 'username':'password'
```

Response body:

```
"The appointment (68cc0a5a9314521060320dd548373cbd) is
 successfully cancelled."
```

Appointment Open - PATCH /api/sn_tmf_api/appointment/appointment/{id}

Reschedule appointments with a given ID for a#work order.

URL format

Default URL: PATCH `/api/sn_tmf_api/appointment/appointment/{id}`

Supported request parameters

Path parameters

Name	Description
id	Sys_id of the appointment to reschedule. Data type: String Table: Appointment booking [sn_apptmnt_booking_appointment_booking]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
note	If canceling the appointment, you can add work notes here. Updates the work notes of the work order and the message of the appointment. Data type: Array of Objects `"note": [ { "author": "String", "date": "String", "text": "String" } ]` Stored in: Appointment Booking [sn_apptmnt_booking_appointment_booking] table
note.author	Name of the person who writing the note. Data type: String
note.date	Date and time that the note was published. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2018-02-04T11:00:18.071Z.
note.text	Descriptive text about the work order that is attached to the appointment. For example, updates on the work order's progress. Data type: String
status	Status of the appointment. Valid values: • cancelled: The appointment reschedule is cancelled. • completed: The rescheduled appointment is completed. • confirmed: The appointment reschedule is accepted and booked. • new: The appointment rescheduling request was recently created. • pending: The appointment reschedule is pending. • ready: The appointment reschedule is requested. Data type: String
validFor	Filter the appointment by a date range that the appointment is valid for.

Request body parameters (JSON) (continued)

Name	Description
	Data type: Object `"validFor": { "endDateTime": "String", "startDateTime": "String" }` Default: Returns all appointments if *validFor* is not provided.
validFor.endDateTime	End date and time of the appointment. Only appointments with the specified end date and time are returned in the response. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43. Table: Location [cmn_location]
validFor.startDateTime	Start date and time of the appointment. Only appointments with the specified start date and time are returned in the response. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43. Table: Location [cmn_location]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
creationDate	Date and time that the appointment was created. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
href	Unique reference link of the appointment. You can use this link in another request to get an appointment. Data type: String
id	Sys_id of the appointment that was rescheduled. Data type: String Stored in: Appointment booking [sn_apptmnt_booking_appointment_booking] table
lastUpdate	Date and time the appointment was last updated. Data type: String Format: YYYY-MM-DD 00:00:00. For example, 2025-01-31 09:35:43.
reason	Purpose for updating the appointment. Possible values: • "Appointment rescheduled.": The PATCH method was used to reschedule the appointment. • "The appointment (id) is successfully cancelled.": The PATCH method was used to cancel the appointment. Data type: String
relatedParty	Customer details of the associated appointment. Data type: Array of Objects `"relatedParty": [ { "@referredType": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"id": "String",
	"name": "String",
	"role": "String"
	}
	]</pre>

relatedParty.id	Sys_id of the customer contact. Data type: String Stored in: Contact [customer_contact] table
relatedParty.name	Name of the customer contact. Data type: String
relatedPlace.@referredType	Type of customer. Data type: String Only possible value: Individual
relatedParty.role	Role of the contact. Data type: String Only possible value: Contact
success	Flag that indicates whether the request was successful. Possible values: • true: The appointment was successfully rescheduled. • false: The appointment couldn't be rescheduled. Data type: Boolean

Example: cURL request

The following example demonstrates how to use a PATCH method to reschedule an appointment with a given ID.

```
curl -X POST
 'https://instance.service-now.com/api/sn_tmf_api/appointment/ap
pointment/68cc0a5a9314521060320dd548373cbd ' \
-H "Accept: application/json" \
-H "Content-Type: application/json" \
-u "username":"password" \
-data {
  "validFor": {
      "startDateTime": "2024-07-30 00:0:00",
      "endDateTime": "2024-08-30 00:00:00"
              }
  "note": {
      "date": "85388c25b71011104eed4643ae11a993",
      "author": "Sarah Johnson",
      "text": "customer"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
  "state": "active"
   }
  ]
}
```

The response body shows a success message that the appointment was rescheduled.

```
{
  "relatedParty": [
    {
      "id": "85388c25b71011104eed4643ae11a993",
      "name": "Sarah Johnson",
      "role": "customer",
      "@referredType": "Individual"
    }
  ],
  "success": true,
  "reason": "Appointment rescheduled!",
  "id": "68cc0a5a9314521060320dd548373cbd",
  "href":

```

Attachment API

The *Attachment* API provides endpoints that allow you to upload and query file attachments.

You can upload or retrieve a single file with each request.

The *Attachment* API respects any system limitations on uploaded files, such as maximum file size and allowed attachment types. You can control these settings using the properties *com.glide.attachment.max_size*, 1024MB by default, and *glide.attachment.extensions*.

Note: The *Attachment* API accepts all Content-Type values (*/*). Specify the file content type when uploading an attachment. The content type is stored with file metadata allowing other tools to correctly identify and parse the file.

The following video provides more information on the *Attachment* API:

Attachment API role requirements

To create attachments, the user record used to authenticate the HTTP request with ServiceNow must have any roles required to create Attachment [sys_attachment] records. It must also have any roles required to read and write records on the target table, such as the itil role to add attachments to incident records.

By default there is no single role allowing a user to add attachments. You can create a role to explicitly allow adding attachments, then assign this role to the user account being used to make the request.

Attachment - DELETE /now/attachment/{sys_id}

This method deletes the attachment with a specific sys_id value.

URL format

Versioned URL: `/api/now/v1/attachment/{sys_id}`

Default URL: `/api/now/attachment/{sys_id}`

Supported request parameters

Path parameters

Name	Description
sys_id	Sys_id value of the attachment to delete. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/attachment/615ea769c0a
80166001cf5f2367302f5" \
--request DELETE \
--user 'username':'password'
```

```
""
```

Attachment - GET /now/attachment

Returns the metadata for multiple attachments.

URL format

Versioned URL: `api/now/v1/attachment`

Default URL: `api/now/attachment`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
sysparm_limit	Limit to be applied on pagination. **Note:** Unusually large `sysparm_limit` values can impact system performance. Data type: String Default: 1000
sysparm_offset	Number of records to exclude from the query. Use this parameter to get more records than specified in `sysparm_limit`. For example, if `sysparm_limit` is set to 500, but there are additional records you want to query, you can specify a `sysparm_offset` value of 500 to get the second set of records. Data type: String Default: 0
sysparm_query	Encoded query. Queries for the *`Attachment`* API are relative to the Attachments [sys_attachment] table. For example: *`(sysparm_query=file_name=attachment.doc)`* The encoded query provides support for *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in sysparm_query. For example,

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	`sysparm_query=ORDERBYfile_name^ORDERBYDESCtable_Name` orders the results in ascending order by name first, then in descending order by table name. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
Content-Type	The content type of the response. For metadata requests, this is the content type of the metadata, not the content type of the attachment files.
Link	Links to download the attachments.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

    }
  ]
}
```

Attachment - GET /now/attachment/{sys_id}/file

Returns the binary file attachment with a specific sys_id value.

URL format

Versioned URL: `/api/now/v1/attachment/{sys_id}/file`

Default URL: `/api/now/attachment/{sys_id}/file`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
sys_id	Sys_id of the attachment record from which to return binary data.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. For example, use `image/jpeg` or `image/png` to accept JPEG or PNG image files exclusively. To allow all image types, specify `image/*`; to allow any file type, specify `*/*`. Default: */*

Response headers

Header	Description
X-Attachment-Metadata	Metadata about the returned file, such as size, name, and file type.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

Status codes (continued)

Status code	Description
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
Binary file attachment	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/attachment/615ea769c0a
80166001cf5f2367302f5/file" \
--request GET \
--header "Accept:*/*" \
--user "username":"password"
```

```
Binary response not shown.
```

Attachment - GET /now/attachment/{sys_id}

Returns the metadata for the attachment file with a specific sys_id value.

URL format

Versioned URL: `/api/now/v1/attachment/{sys_id}`

Default URL: `/api/now/attachment/{sys_id}`

Supported request parameters

Path parameters

Name	Description
sys_id	Sys_id of the attachment record for which to retrieve the metadata.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Content-Type	The content type of the response. For metadata requests, this is the content type of the metadata, not the content type of the attachment files.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Indicates the specified attachment does not exist, or the current user cannot access it.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
Metadata specific to the specified attachment.	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/attachment/615ea769c0a
80166001cf5f2367302f5" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

}
```

Attachment - POST /now/attachment/file

Uploads a specified binary file as an attachment to a specified record.

Note: The file to attach must be specified after the last parameter in the passed-in request parameter list.

URL format

Versioned URL: `/api/now/v1/attachment/file`

Default URL: `/api/now/attachment/file`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
encryption_context	Sys_id of an encryption context record. Specify this parameter to allow only users with the specified encryption context to access the attachment. For additional information on encryption context records, see Column Level Encryption. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: File is encrypted using encryption context accessible to the user, otherwise the attached file is not encrypted with any encryption context.
file_name	Required. Name to give the attachment. Data type: String
table_name	Required. Name of the table to attach the file to. Data type: String
table_sys_id	Required. Sys_id of the record in the table specified in *table_name* that you want to attach the file to. Data type: String

Request body parameters (XML or JSON)

Name	Description
<String>	Path to the binary file to attach to the specified record.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Content type of the file to attach, such as image/jpeg or */*. This header is mandatory to post file attachments.

Response headers

Header	Description
Location	URL of the new attachment.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
201	Indicates the query ran successfully.
400	Indicates that one or more mandatory parameters were missing from the request.
404	Indicates the record specified by the *table_name* and *table_sys_id* parameters does not exist or is not accessible to the current user.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description
result	Metadata of the requested attachment. Data type: Object `"result": { "average_image_color": "String", "compressed": "String", "content_type": "String", "created_by_name": "String", "download_link": "String", "file_name": "String", "image_height": "String", "image_width": "String", "size_bytes": "String", "size_compressed": "String", "sys_created_by": "String", "sys_created_on": "String", "sys_id": "String", "sys_mod_count": "String", "sys_tags": "String", "sys_updated_by": "String", "sys_updated_on": "String", "table_name": "String", "table_sys_id": "String", "updated_by_name": "String" }`
result.average_image_color	If the attachment is an image, the sum of all colors. Data type: String Unit: RGB or number of pixels.
result.compressed	Flag that indicates whether the attachment file has been compressed. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	• true: File has been compressed. • false: File has not been compressed. Data type: String
result.content_type	Content-type of the associated attachment file, such as image or jpeg or application/x-shockwave-flash. Data type: String
result.created_by_name	Full name of entity that originally created the attachment file. Data type: String
result.download_link	Download URL of the attachment on the ServiceNow instance. Data type: String
result.file_name	File name of the attachment. Data type: String
result.image_height	If an image file, the height of the image. Data type: String Unit: Pixels
result.image_width	If an image file, the width of the image. Data type: String Unit: Pixels
result.size_bytes	Size of the attachment. Data type: String Unit: Bytes
result.size_compressed	Size of the compressed attachment file. If the file is not compressed, empty. Data type: String Unit: Bytes
result.sys_created_by	Entity that originally created the attachment file. Data type: String
result.sys_created_on	Date and time that the attachment file was initially saved to the instance. Data type: String
result.sys_id	Sys_id of the attachment file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
result.sys_mod_count	Number of times the attachment file has been modified (uploaded to the instance). Data type: String
result.sys_tags	Any system tags associated with the attachment file. Data type: String
result.sys_updated_by	Entity that last updated the attachment file. Data type: String
result.sys_updated_on	Date and time that the attachment file was last updated. Data type: String
result.table_name	Name of the table to which the attachment is associated. Data type: String
result.table_sys_id	Sys_id of the table associated with the attachment. Data type: String
result.updated_by_name	Full name of entity that last updated the attachment file. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/attachment/file?table_
name=incident&table_sys_id=d71f7935c0a8016700802b64c67c11c6&file
_name=Issue_screenshot" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type: image/jpeg" \
--user "username":"password" \
--data-binary "@ location of the file on file system"
```

```
{
  "result": {
    "table_sys_id": "d71f7935c0a8016700802b64c67c11c6",
    "size_bytes": "36597",
    "download_link":
 "https://instance.servicenow.com/api/now/attachment/6ea10fe64f4
11200adf9f8e18110c739/file",
    "sys_updated_on": "2016-01-22 15:14:07",
    "sys_id": "6ea10fe64f411200adf9f8e18110c739",
    "image_height": "",
    "sys_created_on": "2016-01-22 15:14:07",
    "file_name": "Issue_screenshot",
    "sys_created_by": "admin",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "compressed": "true",
    "average_image_color": "",
    "sys_updated_by": "admin",
    "sys_tags": "",
    "table_name": "incident",
    "image_width": "",
    "sys_mod_count": "0",
    "content_type": "image/jpeg",
    "size_compressed": "25130"
  }
}
```

Attachment - POST /now/attachment/upload

Uploads a multipart file attachment.

The multipart POST method does not accept any parameters. You must specify the table name and record sys_id values within the form body. See the cURL example for a sample of a multipart/form-data request.

Important: When using multipart POST, ensure that the file content is contained in the final part of the message only. Earlier parts should contain only metadata such as table name and record sys_id.

URL format

Versioned URL: `/api/now/v1/attachment/upload`

Default URL: `/api/now/attachment/upload`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Content type of the request. Set this value to multipart/form-data when using the multipart POST method.

Response headers

Header	Description
Location	URL of the new attachment.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Indicates the query ran successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Element	Description

result	Metadata of the requested attachment.

POST multipart mandatory values

When sending a multipart POST request to upload a file attachment, include attachment data in the message body, not in the URL parameters. You must specify these values in the message body:

Mandatory values

Value	Description
Content-Type	Content-Type of the file, included in the message body for multipart uploads. **Note:** The Content-Type must be defined within the file portion of the POST message, not within the form data. See the sample POST multipart message for an example of a multipart message. Data type: String
table_name	Name of the table to which you want to attach the file. Data type: String
table_sys_id	Sys_id of the record on the specified table to which you want to attach the file. Data type: String

Example: cURL request

```
curl "https://instance.servicenow.com/api/now/attachment/upload"
 \
--request POST \
--header "Accept:application/json"\
--user "username":"password"\
--header "Content-Type:multipart/form-data"\
 -F 'table_name=incident' \
 -F 'table_sys_id=d71f7935c0a8016700802b64c67c11c6'\
 -F 'uploadFile=@ location of the file on file system'
\
```

```
{
  "result": {
    "table_sys_id": "d71f7935c0a8016700802b64c67c11c6",
    "size_bytes": "36597",
    "download_link":
 "https://instance.service-now.com/api/now/attachment/994adbc64f

Automation Center API

The *Automation Center* API provides endpoints to create and update processes, robots, and execution jobs.

Using this API, you can define end-to-end automations for repetitive tasks and then manage and monitor those tasks.

This API enables you to create the following types of events within your ServiceNow instance:

- Robots: Software agents that runs a bot process. RPA robots can run attended or unattended.
- Process: Instance of an RPA on a specific robot. It is responsible for running jobs. To uniquely identify a process, you must specify both the process ID and the robot ID.
- Execution: Specific task to run in a robot process, such as copying information from one resource and copying it to another, as when copying information from emails to a spreadsheet.

For example, you can use this API to define the entities necessary to log into application, copy and paste information, move documents and files, and extract content from emails, PDFs, and forms.

Typically, you should create a robot first and then any processes associated to that robot, but this is not enforced by the API. You must however create the robot and process before you try to run any jobs for them or the job request will fail.

Note:

- You cannot delete an event using this API. Events are automatically removed from an instance after 14 days by default.
- You can pass in a maximum of 2,000 records per call. This value cannot be modified.

This API requires the Automation Center plugin to be active and requires the user to have either the sn_as.automation_technical_user or sn_ac.automation_admin role.

Automation Center - POST /sn_ac/automation/rpa

Creates robot, process, and execution events.

These events provide process automation. They appear in the Overview and Execution Automation Center dashboards to measure and monitor the output from multiple RPA vendors.

URL format

Versioned URL: `/api/sn_ac/{api_version}/automation/rpa`

Default URL: `/api/sn_ac/v1/automation/rpa`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
departmentName	Process and robot event types only. Name of the department to which the event belongs. This value is stored in the following tables depending on the event type: • process: department field in the Base Bot Process [cmdb_ci_base_rpa_process] table. • robot: department field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: String
domainId	Sys_id of the domain to which the event belongs. This value is stored in the following tables depending on the event type: • execution: sys_domain field in the Automation Execution [sn_ac_automation_execution] table. • process: sys_domain field in the Base Bot Process [cmdb_ci_base_rpa_process] table. • robot: sys_domain field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: String
endtime	Execution event type only. End time of the execution. This value is stored in the end_time field in the Automation Execution [sn_ac_automation_execution] table. Format: YYYY-MM-DD HH:MM:SS Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
environment	Execution event type only. Environment of the execution, such as a URL. This value is stored in the environment field in the Automation Execution [sn_ac_automation_execution] table. **Note:** This value is not used by the ServiceNow instance and can contain any value required by your implementation. Data type: String
errorMessage	Execution event type only. Name of the error message log. This value is stored in the message field in the Automation Execution [sn_ac_automation_execution] table. Data type: String
eventName	Required. Name of the event type. This value determines the type of event to process. Valid values (case-sensitive): • execution • process • robot Data type: String
id	Required. Unique numeric identifier of the associated event. This value is stored in the following tables depending on the event type: • execution: automation_execution_id field in the Automation Execution [sn_ac_automation_execution] table. • process: correlation_id field in the Base Bot Process [cmdb_ci_base_rpa_process] table. • robot: correlation_id field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: Integer
name	Process and robot event types only. Required. Name of the event. This value is stored in the following tables depending on the event type: • process: name field in the Base Bot Process [cmdb_ci_base_rpa_process] table. • robot: name field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: String
priority	Execution event type only. Priority of the execution. Possible values (case-sensitive):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• Critical • High • Medium • Low This value is stored in the priority field in the Automation Execution [sn_ac_automation_execution] table. Data type: String Default: None - not displayed in dashboard
processId	Execution event type only. Required. Unique identifier of the process on which to run the execution. This value is located in the correlation_id field of the corresponding process record in the Base Bot Process [cmdb_ci_base_rpa_process] table. This value is then stored in the automation field in the Automation Execution [sn_ac_automation_execution] table. Data type: String
robotId	Execution event type only. Required. Unique identifier of the robot on which to run the execution. This value is located in the correlation_id field of the corresponding robot record in the Base Robot [cmdb_ci_base_rpa_robot] table. This value is then stored in the robot field in the Automation Execution [sn_ac_automation_execution] table. Data type: String
source	Required. Source to which the event belongs, such as "servicenow_rpa". This value is located in the internal_name field of the Automation Source [sn_ac_automation_source] table. This value is then stored in the following tables depending on the event type: • execution: Source field in the Automation Execution [sn_ac_automation_execution] table. • process: Source field in the Base Bot Process [cmdb_ci_base_rpa_process] table. • robot: Source field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: String
starttime	Execution event type only. Start time of the execution. This value is stored in the start_time field in the Automation Execution [sn_ac_automation_execution] table. Format: YYYY-MM-DD HH:MM:SS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
state	Robot and execution event types only. State of the associated event. Possible values for robot (case-sensitive): • Cancelled • Complete • Error • Queued • Running Default: Queued Possible values for execution (case-sensitive): • Available • Busy • Disconnected • New • Responsive Default: New This value is stored in the following tables depending on the event type: • execution: state field in the Automation Execution [sn_ac_automation_execution] table. • robot: robot_state field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: String
status	Process event type only. Required. Status of the process. Possible values (case-sensitive): • Build • In Maintenance • In Use • Retired This value is stored in the life_cycle_stage_status field in the Base Bot Process [cmdb_ci_base_rpa_process] table. Data type: String
triggeredBy	Execution event type only. Trigger source of the execution. This value is stored in the trigger_by field in the Automation Execution [sn_ac_automation_execution] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Note: This value is not used by the ServiceNow instance and can contain any value required by your implementation. Data type: String
type	Process and robot event types only. Required for process, Optional for robot. Type of processing to perform. Possible values (case-sensitive): • Attended • Unattended This value is stored in the following tables depending on the event type: • process: process_type field in the Base Bot Process [cmdb_ci_base_rpa_process] table. • robot: robot_type field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: String Default: Unattended for robot
version	Robot event type only. Version of the robot. This value is stored in the version field in the Base Robot [cmdb_ci_base_rpa_robot] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Failure. The request was rejected, due to mandatory fields missing or the request contains invalid values. The associated error message describes the reason for failure.

Response body parameters

Name	Description

result	Empty if the request is successful. For failure, additional information is provided.
	
	Data type: Object
	
	`"result": { "fields": { "<record_number>": [ "<field_in_err_or_missing>": "String" ] } "reason": "String" }`
	
	For example, if records 1, 2, and 3 are all missing a required field, a message similar to the following is returned:
	
	`{ "result": { "fields": { "1": [ "id" ], "2": [ "status" ], "3": [ "name" ] }, "reason": "We are not able to process the data as following records have insufficient data"`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> } }</pre>

Example: cURL request

The following code example shows how to post three robot event type records.

```
curl "https://instance.servicenow.com/api/sn_ac/automation/rpa"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  records: [{
    id: 8001,
    name: "Quotes system Automation Robot",
    state: "Available",
    status: "In Use",
    version: 5.6,
    departmentName: "Customer Support",
    type: "Unattended",
    source: "servicenow_rpa",
    eventName: "robot"
  },
  {
    id: 8002,
    name: "Invoice Matching Robot",
    state: "Responsive",
    status: "In Maintenance",
    version: 3,
    departmentName: "HR",
    type: "Unattended",
    source: "servicenow_rpa",
    eventName: "robot"
  },
  {
    id: 8003,
    name: "Data Reconciliation Robot",
    state: "Busy",
    status: "Retired",
    version: 2,
    departmentName: "Finance",
    type: "Unattended",
    source: "servicenow_rpa",
    eventName: "robot"
  }]
} "\
--user "username":"password"
```

This endpoint only returns an HTTP status code on success and an HTTP status code and error message on failure.

```
None
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following code example shows how to post three process event type records.

```
curl "https://instance.servicenow.com/api/sn_ac/automation/rpa"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  records: [{
    id: 9001,
    name: "RPA Execution Process",
    status: "In Maintenance",
    type: "Attended",
    departmentName: "Customer Support",
    source: "servicenow_rpa",
    eventName: "process"
  },
  {
    id: 9002,
    name: "Customer Onboarding",
    status: "In Use",
    type: "Attended",
    departmentName: "Finance",
    source: "servicenow_rpa",
    eventName: "process"
  },
  {
    id: 9003,
    name: "Data Reconciliation",
    status: "Retired",
    type: "Unattended",
    departmentName: "HR",
    source: "servicenow_rpa",
    eventName: "process"
  }]
}" \
--user "username":"password"
```

This endpoint only returns an HTTP status code on success and an HTTP status code and error message on failure.

```
None
```

Example: cURL request

The following code example shows how to post three execution event type records.

```
curl "https://instance.servicenow.com/api/sn_ac/automation/rpa"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
  records: [{
    id: 7001,
    name: "Customer Onboarding",
```

```
    starttime: "2022-03-18 00:49:13",
    endtime: "2022-03-20 00:58:03",
    state: "Running",
    priority: "Critical",
    environment: "system",
    triggeredBy: "Schedule",
    processId: 9001,
    robotId: 8001,
    source: "servicenow_rpa",
    eventName: "execution"
  },
  {
    id: 7002,
    name: "Data Reconciliation",
    starttime: "2022-04-30 00:19:11",
    endtime: "2022-05-02 00:41:35",
    state: "Error",
    priority: "Low",
    environment: "system",
    triggeredBy: "API",
    processId: 9002,
    robotId: 8002,
    source: "servicenow_rpa",
    eventName: "execution"
  },
  {
    id: 7003,
    name: "Customer Onboarding",
    starttime: "2022-01-22 02:38:53",
    endtime: "2022-01-23 02:50:44",
    state: "Queued",
    priority: "Moderate",
    environment: "system",
    triggeredBy: "Schedule",
    processId: 9003,
    robotId: 8003,
    source: "servicenow_rpa",
    eventName: "execution"
  }]
} "\
--user "username":"password"
```

This endpoint only returns an HTTP status code on success and an HTTP status code and error message on failure.

```
None
```

Example: cURL request

The following code example shows how to create or update a process. You create a process by passing all of the mandatory parameters for a process to execute along with the *eventName* set to "process". The mandatory parameters needed to create a process are: *id*, *type*, *status*, *name*, and *source*.

```
curl "https://instance.servicenow.com/api/sn_ac/automation/rpa"
 \
--request POST \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
records: [{
id: 9001,
name: "RPA Execution Process",
status: "In Maintenance",
type: "Attended",
departmentName: "Customer Support",
source: "servicenow_rpa",
eventName: "process"
}]
} "\
--user "username":"password"
```

This endpoint only returns an HTTP status code on success and an HTTP status code and error message on failure.

```
None
```

Example: cURL request

The following code example shows how to publish a process. You can publish a process by passing the *status* parameter set to "Published".

```
curl "https://instance.servicenow.com/api/sn_ac/automation/rpa"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
records: [{
id: 9002,
name: "RPA Execution Process",
status: "Published",
type: "Attended",
departmentName: "Customer Support",
source: "servicenow_rpa",
eventName: "process"
}]
} "\
--user "username":"password"
```

This endpoint only returns an HTTP status code on success and an HTTP status code and error message on failure.

```
None
```

Example: cURL request

The following code example shows how to create or update a robot. You create a robot by passing all of the mandatory parameters for a robot along with the *eventName* set to "robot". The mandatory parameters needed to create a robot are: *id*, *status*, *name*, and *source*.

```
curl "https://instance.servicenow.com/api/sn_ac/automation/rpa"
 \
--request POST \
--header "Accept:application/json" \
```

AWA Agent API

The *AWA (Advanced Work Assignment) Agent* API provides endpoints to manage agent presence, channel availability, and workload.

This API requires the Advanced Work Assignment (com.glide.awa) plugin and the awa_integration_user role. For more information, refer to Advanced Work Assignment.

AWA Agent - GET /now/awa/agents/{user_id}

Returns the current agent presence state and channel availability.

URL format

Versioned URL: `/api/now/{api_version}/awa/agents/{user_id}`

Default URL: `/api/now/awa/agents/{user_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the work item. The work item must meet the following criteria: • Work item must be assigned to the specified agent. • Work item must be in **Pending Accept** state. Data type: String Table: AWA Work Item [awa_work_item]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Header	Description
presence.channels.available	Flag that indicates whether the channel is available. Possible values: • true: Channel is available. • false: Channel isn't available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Header	Description
	Data type: Boolean
presence.channels.sys_id	Channel sys_id. Data type: String Table: Service Channels [awa_service_channel]
presence.sys_id	Presence state sys_id. Data type: String Table: Presence States [awa_presence_state]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Response body parameters (JSON or XML)

Parameter	Description
error	Details describing an error encountered during the request process. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. Each error message has a corresponding description in the *`detail`* property. Possible values: • `Record Not Found`: Information provided in the request body is inaccurate or doesn't exist. • `User Not Authenticated`: User doesn't have the awa_integration_user role. Data type: String
presence	Information about an agent's current presence state and channel. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML) (continued)

Parameter	Description

	<pre>"presence": {
	  "available": Boolean,
	  "channels": [Array],
	  "name": "String",
	  "sys_id": "String"
	}</pre>

presence.available	Flag that indicates whether the agent is available. Possible values: • true: Agent is available. • false: Agent isn't available. Data type: Boolean

presence.channels	List of objects that describe the available channels of communication with the agent.
	
	Data type: Array of Objects
	<pre>"channels": [
	  {
	  "available": Boolean,
	  "name": "String",
	  "sys_id": "String"
	  }
	]</pre>

presence.channels.available	Flag that indicates whether the channel is available. Possible values: • true: Channel is available. • false: Channel isn't available. Data type: Boolean
presence.channels.name	Channel name, such as Chat or Phone. Data type: String
presence.channels.restrictable	Flag that indicates whether the user can restrict updates, that is, select the channel for availability. Possible values: • true: The user can select this channel for availability. • false: The user can't select this channel for availability. Data type: Boolean
presence.channels.service_channel_type	Service channel type, such as chat. Possible values vary depending on plugins installed.

Response body parameters (JSON or XML) (continued)

Parameter	Description
	Data type: String
presence.channels.sys_id	Channel sys_id. Data type: String Table: Service Channels [awa_service_channel]
presence.name	Name of the agent's presence state. Possible values: • Available • Unavailable Data type: String
presence.restrict_update	Flag that indicates whether the user can restrict updates. Possible values: • true: User can restrict updates. • false: User can't restrict updates. Data type: Boolean
presence.sys_id	Presence state sys_id. Data type: String Table: Presence States [awa_presence_state]
status	Status of an unsuccessful request. This property is only included in the response if there is an error. Valid value: `failure` Data type: String
sys_id	Agent sys_id. Data type: String
workItem	*`workItem`*: Information about the work item that is associated with the event. Data type: String
workItem.document	*`workItem.document`*: List of documents associated with the work item task. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML) (continued)

Parameter	Description
workItem.document.sys_id	*workItem.document.sys_id*: Sys_id of the document assigned to the work item task. Data type: String
workItem.document.table	*workItem.document.table*: Name of the document table assigned to the task. Data type: String
workItem.previousWorkItem	*workItem.previousWorkItem*: Sys_id of the previous work item for the same document ID. For the non-transfer work items this value is empty. Data type: String
workItem.serviceChannel	*workItem.serviceChannel*: List of service channels associated with the work item task. Data type: String
workItem.serviceChannel.name	*workItem.serviceChannel.name*: Name of the service channel, such as Chat or Phone. Data type: String
workItem.serviceChannel.sys_id	*workItem.serviceChannel.sys_id*: Sys_id of the service channel. Data type: String
workItem.size	*workItem.size*: Agent's capacity used when this work item is assigned to the agent. Data type: String
workItem.sys_id	*workItem.sys_id*: Sys_id of the work item that was accepted or offered. Data type: String
workItem.isQueueTransferred	*workItem.isQueueTransferred*: Flag that indicates whether the work item is queue transferred. Set to true if the work item is queue transferred, false if it isn't. For more information on queue transfers, see Transfer a chat to another queue. Data type: Boolean
workitem.isAutoAccepted	*workItem.isAutoAccepted*: Flag that indicates whether the work item was automatically accepted by the system. Set to true if the work item was auto-accepted. Data type: Boolean

Example: Sample cURL request

```
curl -X GET \
https://instance.servicenow.com/api/now/awa/agents/46d44a23a9fe1
9810012d100cca80666 \
-H 'Accept: application/json' \
-H 'Content-Type: application/json' \
-u 'username':'password'\
```

```
{
  "result": {
    "presence": {
      "name": "Available",
      "sys_id": "0b10223c57a313005baaaa65ef94f970",
      "available": true,
      "channels": [
        {
          "name": "Chat",
          "available": true,
          "sys_id": "27f675e3739713004a905ee515f6a7c3"
        }
      ]
    },
    "sys_id": "46d44a23a9fe19810012d100cca80666"
  }
}
```

AWA Agent - GET /now/awa/agents/{user_id}/capacities

Returns an agent's channel capacities, universal capacity, and the current workload to see if the agent can handle a case.

Use the AWA Agent - PUT /now/awa/agents/{user_id}/capacities method to modify the channel and universal capacities of an agent.

See also:

- Service channel capacity and utilization
- Create or configure a service channel
- Configure an agent's maximum universal capacity

URL format

Versioned URL: `/api/now/{api_version}/awa/agents/{user_id}/capacities`

Default URL: `/api/now/awa/agents/{user_id}/capacities`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
user_id	Sys_id of the agent listed. Data type: String Table: User [sys_user]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
channels	List of objects that describe the available channels of communication with the agent. `"channels": [ { "channel_sys_id": "String", "current_workload": Number, "max_capacity": Number } ]` Data type: Array
channels.channel_sys_id	Channel sys_id. Data type: String Table: Service Channels [awa_service_channel]
channels.current_workload	Number of work items on a specific service channel currently assigned to the agent. Data type: Number
channels.max_capacity	Maximum workload on a specific service channel that the agent can be actively assigned to at a time. Data type: String
error	Details describing an error encountered during the request process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. The description is provided in the *`error.detail`* property. Data type: String
status	Status of an unsuccessful request. This property is only included in the response if there is an error. Valid value: `failure` Data type: String
universal_capacity	Maximum capacity for the agent across all service channels. If an agent's current workload equals the maximum universal capacity, additional work items won't be assigned to the agent. This property only returns if a universal capacity record exists for this agent. Data type: Number
universal_workload	Number of work items across all service channels currently assigned to the specified agent. This property only returns if a universal capacity record exists for the agent. Data type: Number

Example: Sample cURL request

The following example shows how to get the capacity and workload values for a user.

```
curl
 "https://instance.service-now.com/api/now/awa/agents/46d44a23a9
fe19810012d100cca80666/capacities" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

A successful response includes capacity values and workload for each channel.

```
{
  "result": {
    "universal_workload": 2,
    "channels": [
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      {
        "channel_sys_id": "27f675e3739713004a905ee515f6a7c3",
        "current_workload": 2,
        "max_capacity": 4
      }
    ],
    "universal_capacity": 10
  }
}
```

AWA Agent - GET /now/awa/agents/{user_id}/presence_states

Returns an agent's presence states and indicates whether the agent is available or in another presence state.

URL format

Versioned URL: `/api/now/{api_version}/awa/agents/{user_id}/presence_states`

Default URL: `/api/now/awa/agents/{user_id}/presence_states`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the agent listed. Data type: String Table: User [sys_user]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

error	Details describing an error encountered during the request process.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "message": "String"
	}</pre>

error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. The description is provided in the *error.detail* property. Data type: String

<presence state>	List of the agent's presence state definitions as objects. Each object describes the state and includes the agent's channels.
	
	Data type: Array
	<pre>{
	  "available": Boolean,
	  "channels": [Array],
	  "disable_inactivity_check": Boolean,
	  "name": "String",
	  "show_channels": Boolean,
	  "sys_id": "String"
	}</pre>

<presence state>.available	Flag that indicates whether the agent is available. Possible values: • true: Agent is available. • false: Agent isn't available. Data type: Boolean

<presence state>.channels	List of objects that describe the available channels of communication with the agent.
	
	Data type: Array
	<pre>"channels": [
	 {
	  "available": Boolean,
	  "name": "String",
	  "restrict_update": Boolean,
	  "service_channel_type": "String",
	  "sys_id": "String"
	 }
	]</pre>

<presence state>.channels.available	Flag that indicates whether the channel is available. Possible values: • true: Channel is available. • false: Channel isn't available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Boolean
<presence state>.channels.name	Channel name, such as Chat or Phone. Data type: String
<presence state>.channels.sys_id	Channel sys_id. Data type: String Table: Service Channels [awa_service_channel]
<presence state>.disable_inactivity_check	Flag that indicates whether to check for inactivity of this presence state. Valid values: • true: The presence state inactivity check is disabled. • false: The presence state inactivity check is enabled. Data type: Boolean Default: false For information on how to modify this setting, see Configure agent presence states.
<presence state>.name	Name of the agent's presence state. The presence states installed by default are `Available`, `Away`, and `Offline`. Data type: String
<presence state>.order	Order in which this state is displayed in the agent inbox. Data type: Number
<presence state>.show_channels	Flag that indicates whether the agent has permission to change presence state, for example, from available to away. Valid values: • true: The user has permission to change the presence. • false: The user is restricted from changing the presence. Data type: Boolean
<presence state>.sys_id	Presence state sys_id. Data type: String Table: Presence States [awa_presence_state]
status	Status of an unsuccessful request. This property is only included in the response if there is an error. Valid value: `failure`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: Sample cURL request

The following example shows how to get the presence states for a specified agent.

```
curl
 "https://instance.service-now.com/api/now/awa/agents/46d44a23a9
fe19810012d100cca80666/presence_states" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The response body lists the agent's possible presence states and indicates that the agent is available.

```
{
  "result": [
    {
      "name": "Available",
      "order": 0,
      "show_channels": false,
      "sys_id": "0b10223c57a313005baaaa65ef94f970",
      "available": true,
      "channels": [
        {
          "name": "Chat",
          "available": true,
          "sys_id": "27f675e3739713004a905ee515f6a7c3",
          "restrict_update": false,
          "service_channel_type": "chat"
        }
      ],
      "disable_inactivity_check": false
    },
    {
      "name": "Away",
      "order": 1000,
      "show_channels": false,
      "sys_id": "41f9b8dfb31313005baa6e5f26a8dcac",
      "available": false,
      "channels": [],
      "disable_inactivity_check": false
    },
    {
      "name": "Offline",
      "order": 2000,
      "show_channels": false,
      "sys_id": "9cd83267575313005baaaa65ef94f98b",
      "available": false,
      "channels": [],
      "disable_inactivity_check": false
    }
  ]
}
```

AWA Agent - PUT /now/awa/agents/{user_id}

Sets the state of a specified agent's presence and, if provided, sets the agent's channel availability for that state.

URL format

Versioned URL: `/api/now/{api_version}/awa/agents/{user_id}`

Default URL: `/api/now/awa/agents/{user_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
user_id	Sys_id of the agent. Located in the User [sys_user] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
presence.channels	List of objects that define which channels are available for the agent. Data type: Array `"channels": [ { "available": Boolean, "sys_id": "String" } ]`
presence.channels.available	Flag that indicates whether the channel is available. Possible values: • true: Channel is available. • false: Channel isn't available. **Note:** This setting must be specified to include channels in the response body.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: Boolean Default: false
presence.channels.sys_id	Channel sys_id. Data type: String Table: Service Channels [awa_service_channel]
presence.sys_id	Presence state sys_id. Data type: String Table: Presence States [awa_presence_state]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Parameter	Description
error	Details describing an error encountered during the request process. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. Each error message has a corresponding description in the *`detail`* property. Possible values: • `Record Not Found`: Information provided in the request body is inaccurate or doesn't exist. • `User Not Authenticated`: User doesn't have the awa_integration_user role. Data type: String
presence	Information about an agent's current presence state and channel. Data type: Object `"presence": { "available": Boolean,`

Response body parameters (JSON or XML) (continued)

Parameter	Description

	<pre>"channels": [Array],
	"name": "String",
	"sys_id": "String"
	}</pre>

presence.available	Flag that indicates whether the agent is available. Possible values: • true: Agent is available. • false: Agent isn't available. Data type: Boolean

presence.channels	List of objects that describe the available channels of communication with the agent.
	
	Data type: Array of Objects
	<pre>"channels": [
	{
	"available": Boolean,
	"name": "String",
	"sys_id": "String"
	}
	]</pre>

presence.channels.available	Flag that indicates whether the channel is available. Possible values: • true: Channel is available. • false: Channel isn't available. Data type: Boolean
presence.channels.name	Channel name, such as Chat or Phone. Data type: String
presence.channels.restrictUpdate	Flag that indicates whether the user can restrict updates, that is, select the channel for availability. Possible values: • true: The user can select this channel for availability. • false: The user can't select this channel for availability. Data type: Boolean
presence.channels.service_channel_type	Service channel type, such as chat. Possible values vary depending on plugins installed. Data type: String

Response body parameters (JSON or XML) (continued)

Parameter	Description
presence.channels.sys_id	Channel sys_id. Data type: String Table: Service Channels [awa_service_channel]
presence.name	Name of the agent's presence state. Possible values: • Available • Unavailable Data type: String
presence.restrict_update	Flag that indicates whether the user can restrict updates. Possible values: • true: User can restrict updates. • false: User can't restrict updates. Data type: Boolean
presence.sys_id	Presence state sys_id. Data type: String Table: Presence States [awa_presence_state]
status	Status of an unsuccessful request. This property is only included in the response if there is an error. Valid value: `failure` Data type: String
sys_id	Agent sys_id. Data type: String
workItem	*`workItem`*: Information about the work item that is associated with the event. Data type: String
workItem.document	*`workItem.document`*: List of documents associated with the work item task. Data type: String
workItem.document.sys_id	*`workItem.document.sys_id`*: Sys_id of the document assigned to the work item task.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML) (continued)

Parameter	Description
	Data type: String
workItem.document.table	*workItem.document.table*: Name of the document table assigned to the task. Data type: String
workItem.previousWorkItem	*workItem.previousWorkItem*: Sys_id of the previous work item for the same document ID. For the non-transfer work items this value is empty. Data type: String
workItem.serviceChannel	*workItem.serviceChannel*: List of service channels associated with the work item task. Data type: String
workItem.serviceChannel.name	*workItem.serviceChannel.name*: Name of the service channel, such as Chat or Phone. Data type: String
workItem.serviceChannel.sys_id	*workItem.serviceChannel.sys_id*: Sys_id of the service channel. Data type: String
workItem.size	*workItem.size*: Agent's capacity used when this work item is assigned to the agent. Data type: String
workItem.sys_id	*workItem.sys_id*: Sys_id of the work item that was accepted or offered. Data type: String
workItem.isQueueTransferred	*workItem.isQueueTransferred*: Flag that indicates whether the work item is queue transferred. Set to true if the work item is queue transferred, false if it isn't. For more information on queue transfers, see Transfer a chat to another queue. Data type: Boolean
workitem.isAutoAccepted	*workItem.isAutoAccepted*: Flag that indicates whether the work item was automatically accepted by the system. Set to true if the work item was auto-accepted. Data type: Boolean

AWA Agent - PUT /now/awa/agents/{user_id}/capacities

Enables updating an agent's maximum capacity (workload) for channel capacities and universal capacity.

Use the AWA Agent - GET /now/awa/agents/{user_id}/capacities method to retrieve the current channel and universal capacities of an agent.

See also:

- Service channel capacity and utilization
- Create or configure a service channel
- Configure an agent's maximum universal capacity

URL format

Versioned URL: `/api/now/{api_version}/awa/agents/{user_id}/capacities`

Default URL: `/api/now/awa/agents/{user_id}/capacities`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
user_id	Sys_id of the agent listed. Data type: String Table: User [sys_user]

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
channels	Mandatory if updating the maximum value of one or more channels for the specified agent. JSON object containing one or more key-value pairs mapping the channel to its maximum capacity for each channel assigned to the agent. Data type: Object The pair is in the following format: • Key (channel sys_id) – Channel sys_id. Data type: String • Value (maximum capacity) – Maximum workload on a specific service channel that the agent can be actively assigned to at a time. Data type: Number `channels: {"<channel_sys_id>": <max_capacity>}`
universal_capacity	Mandatory if universal capacity is being updated. Maximum capacity for the agent across all service channels. If an agent's current workload equals the maximum universal capacity, additional work items won't be assigned to the agent. Data type: Number

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
channels	List of objects that describe the available channels of communication with the agent. `"channels": [ { "channel_sys_id": "String", "max_capacity": Number } ]` Data type: Array
channels.channel_sys_id	Channel sys_id. Data type: String Table: Service Channels [awa_service_channel]
channels.max_capacity	Maximum workload on a specific service channel that the agent can be actively assigned to at a time. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
error	Details describing an error encountered during the request process. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during the request process. Data type: String
error.message	Message for the error encountered during the request process. The description is provided in the *`error.detail`* property. Data type: String
status	Status of an unsuccessful request. This property is only included in the response if there is an error. Valid value: `failure` Data type: String
universal_capacity	Maximum capacity for the agent across all service channels. If an agent's current workload equals the maximum universal capacity, additional work items won't be assigned to the agent. This property only returns if a universal capacity record exists for this agent. Data type: Number

Example: Sample cURL request

The following example shows how to change the agent's universal capacity and the maximum capacity for a specified channel.

```
curl
 "https://instance.service-now.com/api/now/awa/agents/46d44a23a9
fe19810012d100cca80666/capacities" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
 \"channels\": { \"27f675e3739713004a905ee515f6a7c3\": 6 },
 \"universal_capacity\" : 12
}" \
--user 'username':'password'
```

A successful response includes the updated capacity values.

```
{
  "result": {
    "channels": [
      {
```

```
        "channel_sys_id": "27f675e3739713004a905ee515f6a7c3",
        "max_capacity": 6
      }
    ],
    "universal_capacity": 12
  }
}
```

AWA Manual Assignment API

The *AWA Manual Assignment* API provides an endpoint to manually assign available work items to available Advanced Work Assignment (AWA) agents.

A work item is a single piece of work handled by an AWA agent from start to finish. For example, one chat or one case is an object that can be routed and assigned to agents. For more information, refer to Advanced Work Assignment.

This API requires the Advanced Work Assignment (com.glide.awa) plugin. To call this API, you must have either the awa_manager or awa_integration_user role.

AWA Manual Assignment – POST /now/awa/workitems/{work_item_sys_id}/assignments

Assigns an available work item to an available Advanced Work Assignment (AWA) agent.

The primary use case for this endpoint is to enable external routing systems to route work items. If Advanced Work Assignment is configured to use external routing, work items in the queue are assigned using external routing and not AWA. You can assign the work item task by calling this endpoint. For more information, refer to Use external routing.

URL format

Versioned URL: `/now/{api_version}/awa/workitems/{sys_id}/assignments`

Default URL: `/now/awa/workitems/{sys_id}/assignments`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
work_item_sys_id	The sys_id of the work item to assign to an available agent. Located in the Work Items [awa_work_item] table. The work item must be unassigned and in the **Pending Accept** or **Queued** state. For more information, refer to Check unassigned task work items. Type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
after_timeout_presence	Sys_id of the presence state that the agent switches to if the *timeout* parameter expires. Located in the AWA Presence State [awa_presence_state] table. If the *timeout* parameter isn't passed, this parameter is ignored. For additional information on presence states, see Configure agent presence states. Data type: String Default: "" (Empty string)
agent_sys_id	Required. Sys_id of the available agent to receive the work item. Agents are users with the awa_agent role in the User [sys_user] table. For information on how to determine if an agent is available, refer to Agent Inbox controls. Data type: String
allowed_to_decline	Flag that indicates whether agents are allowed to reject work items. If this parameter is `true`, the inbox card displays both the **Accept** and **Reject** buttons on the inbox card. Valid values (not case-sensitive): • true/yes/1: Agent can reject work items. • false/no/0: Agent can't reject work items. Data type: Boolean Default: true
display_option	Display option for the card and tab when a work item is automatically assigned. This parameter is only valid if the *enable_auto_assign* is passed as `true`. Valid values: • card_only: Display only the card. • card_and_tab: Display both the card and tab. Data type: String Default: card_only

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
enable_auto_assign	Flag that indicates whether the work item should be automatically accepted or should allow the agent to manually accept or reject the work item. Valid values (not case-sensitive): • true/yes/1: Automatically accept. • false/no/0: Allow agent to manually accept or reject. Data type: Boolean Default: false
offered_on	Work item offer time. The offer time is used to calculate the remaining time the agent has left to accept the work item in the inbox. It helps account for the discrepancy between the time when the API request gets processed, and when the third-party routing system invokes the API request. This parameter allows external systems calling this endpoint to configure the offer time of the work item so that it stays in synchronization with the external system's internal tracking of the work item. For example, if the work item was offered on 11:30:30, the timeout is 30 seconds, and the current time is 11:30:45, the countdown timer displays 00:15 (as in 15 seconds remaining). This value is stored in the offered_on field on the work item. This parameter is ignored if the *timeout* parameter isn't passed. Data type: String Format: UTC timestamp (yyyy-MM-dd'T'HH:mm:ss.SSS)
timeout	Amount of time that the work item stays in the agent's inbox waiting for the agent to accept the work assignment. Data type: Number Unit: Seconds

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
409	Conflict. The request couldn't pass due to an error with the provided work item or agent sys_id.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
success	Flag that indicates whether the manual work item assignment is successful. Possible values: • true: Work item assignment successful. • false: Work item assignment unsuccessful. Data type: Boolean
message	Response message acknowledging successful assignment or an exception. Success: "Manual assignment successfully requested." Exceptions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• "<work_item_sys_id> is not a valid work item" – Provided work item sys_id does not exist. • "Caller <API_caller_sys_id> does not have the awa_manager or awa_integration_user role" – The authenticated user making the API request must have either the awa_manager or awa_integration_user role. • "Work item <work_item_sys_id> cannot be assigned" – Work item provided cannot be assigned because it is in **Accepted** or **Canceled** state. Refer to Check work items and AWA events. • "<agent_sys_id> is not a valid agent" – Agent does not have the awa_agent role. • "Work Item is already assigned to <agent_sys_id>" – Provided work item is assigned to another agent. • "Agent is not available" – Agent is not in the **Available** state in AWA. Refer to Agent Inbox controls. • "Timeout value cannot be negative" – Provided timeout value cannot be a negative value. • "<presence_state_sys_id> is not a valid presence state" – Provided presence state sys_id does not exist in the AWA Presence State [awa_presence_state] table. • "Offered time (<offered_on_timestamp>) must be in the following format: yyyy-MM-dd'T'HH:mm:ss.SSS" – Provided *offered_on* timestamp must be in the specified format. • "Offered time (<offered_on_timestamp >) must be before the current time, otherwise agent will have more time to accept the work item" – Provided *offered_on* timestamp can't be before the time the request is made. • "Timestamp after timeout (<offered_on_timestamp >) must be after the current time, otherwise agent has no time to accept the work item" – The timestamp after adding the timeout value to the provided *offered_on* timestamp must be after the time the request was made. • "<display_option> is not a valid display option" – Provided display_option must be either of the following values: "card_only" or "card_and_tab" • "%s is not a valid boolean value" – Provided Boolean-type value must be in one of the following Boolean formats: "yes"/"no", "true"/"false", "1"/"0" Data type: String

Example: cURL request

The following example shows how to assign a work item to an available AWA agent using only the required parameters.

```
curl
 "https://instance.servicenow.com/api/now/awa/workitems/<work_it
em_sys_id>/assignments" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"agent_sys_id\":\"<agent_sys_id>\"}" \
--user 'username':'password'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The result shows that the task has been successfully assigned to the agent. You can verify results in the **Assigned to** field of the Work Items [awa_work_item] table.

```
{
  "result": {
    "success": true,
    "message": "Manual assignment successfully requested."
  }
}
```

Example: cURL request

The following example shows how to assign a work item to an available AWA agent including the optional parameters.

```
curl
 "https://instance.servicenow.com/api/now/awa/workitems/<work_it
em_sys_id>/assignments" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data '{
    "agent_sys_id": "46d44a23a9fe19810012d100cca80666",
    "timeout":"10",
    "offered_on":"2024-04-03T23:09:31.000"
  }'
--user 'username':'password'
```

The result shows that the task has been successfully assigned to the agent. You can verify results in the **Assigned to** field of the Work Items [awa_work_item] table.

```
{
  "result": {
    "success": true,
    "message": "Manual assignment successfully requested."
  }
}
```

AWA Inbox Actions API

The *AWA Inbox Actions* API provides endpoints to accept or reject a work item on behalf of an agent. This API also retrieves reject reasons for rejected work items.

This API requires the Advanced Work Assignment (com.glide.awa) plugin and awa_integration_user role. For more information, refer to Advanced Work Assignment.

AWA Inbox Actions – GET /awa/inbox/actions/reject_reasons/{channel_id}

Gets the work item reject reasons for a specified service channel.

URL format

Versioned URL: `/api/now/awa/inbox/actions/reject_reasons/{channel_id}`

Default URL: `/api/now/{api_version}/awa/inbox/actions/reject_reasons/{channel_id}`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
404	Record not found. The channel ID provided is not valid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
display_value	Display value of the Reason field in the Reject Reasons [awa_reject_reason] table. Data type: String
order	Order in which the reject reasons are listed in the agent inbox. Data type: Number
value	Value of the reject reason field stored in the database. Data type: String
Sys_id	Sys_id of a rejection reason for this service channel. Data type: String Table: Reject Reasons [awa_reject_reason]

The following example shows how to retrieve reject reasons for the Chat service channel.

```
curl
 "https://instance.service-now.com/api/now/awa/inbox/actions/rej
ect_reasons/27f675e3739713004a905ee515f6a7c3" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response body displaying rejected tasks with reasons for rejection.

```
{
  "result": [
    {
      "order": 2,
      "value": "Not my expertise",
      "display_value": "Not my expertise",
      "sys_id": "31e3fa29b38023002e7b6e5f26a8dc17"
    },
    {
      "order": 1,
      "value": "Busy",
      "display_value": "Busy",
      "sys_id": "4e93fa29b38023002e7b6e5f26a8dc20"
    }
  ]
}
```

AWA Inbox Actions – POST /awa/inbox/actions/accept

Accepts a work item in **Pending Accept** state on behalf of an agent.

URL format

Versioned URL: `/api/now/{api_version}/awa/inbox/actions/accept`

Default URL: `/api/now/awa/inbox/actions/accept`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
agent_id	Sys_id of the agent listed. Data type: String Table: User [sys_user]
work_item_id	Sys_id of the work item. The work item must meet the following criteria:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	• Work item must be assigned to the specified agent. • Work item must be in **Pending Accept** state. Data type: String Table: AWA Work Item [awa_work_item]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Status codes (continued)

Status code	Description
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
documentTable	Name of the table listing the document assigned to this work item. Data type: String
documentSysId	Sys_id of the document record assigned to the task. Located in the table named in the *`documentTable`* field. Data type: String

error	Details describing an error encountered during the request process.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details of the error encountered during the request process. Possible values: • `Missing agent ID`: The *`agent_id`* wasn't provided in the request body. • `Missing work item ID`: The *`work_item_id`* wasn't provided in the request body. • `Work item is assigned to a different agent` – The specified work item is not assigned to the specified agent. • `Wrong work item ID` – The work item provided in the request body is inaccurate or does not exist. • `Work item is not in pending accept state` – The work item provided in the request body is in a state other than **Pending Accept**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
error.message	Message for the error encountered during the request process. The description is provided in the *`error.detail`* property. Data type: String
status	Status of an unsuccessful request. This property is only included in the response if there is an error. Valid value: `failure` Data type: String

Example: cURL request

The following example shows how to change the state of a selected agent's work item from **Pending Accept** to **Accepted**.

```
curl
 "https://instance.service-now.com/api/now/awa/inbox/actions/acc
ept" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
 \"agent_id\":\"46c9e158a9fe198101d44d0d22cb640d\",
 \"work_item_id\":\"fd69abfc878b01101ae365b83cbb35fe\"
}" \
--user 'username':'password'
```

The response body lists the sys_id and table of the document related to the work item.

```
{
  "result": {
    "documentSysId": "57af7aec73d423002728660c4cf6a71c",
    "documentTable": "incident"
  }
}
```

AWA Inbox Actions – POST /awa/inbox/actions/reject

Rejects a work item in **Pending Accept** state on behalf of an agent. On success, **Assigned to** field is empty and the value of the **Rejected** field is true for the specified work item.

URL format

Versioned URL: `/api/now/{api_version}/awa/inbox/actions/reject`

Default URL: `/api/now/awa/inbox/actions/reject`

Request body parameters (XML or JSON)

Name	Description
agent_id	Sys_id of the agent listed. Data type: String Table: User [sys_user]
reject_reason_id	Sys_id of a rejection reason for this service channel. Data type: String Table: Reject Reasons [awa_reject_reason]
work_item_id	Sys_id of the work item. The work item must meet the following criteria: • Work item must be assigned to the specified agent. • Work item must be in **Pending Accept** state. Data type: String Table: AWA Work Item [awa_work_item]

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Invalid request. Possible reasons: • Missing agent ID. • Missing work item ID. • Missing reject reason ID. • Work item is assigned to a different agent. • Work item isn't in pending accept state.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. Possible reasons: • The user doesn't have the awa_integration_user role. • The value of the glide.awa.enabled property isn't `true`. This property is listed in the System Property [sys_property] table if the Advanced Work Assignment (com.glide.awa) plugin is installed. For more information, see Components installed with Advanced Work Assignment.
404	Not found. The requested item was not found. Possible reasons: • Wrong agent ID – There is no record for the specified user. • Wrong reject reason ID – There is no record for the specified reject reason. • Wrong work item ID – There is no record for the specified work item.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
agent_id	Sys_id of the agent listed. Data type: String Table: User [sys_user]
error	Details describing an error encountered during the request process. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details of the error encountered during the request process. Possible values: • `Missing agent ID` – The *`agent_id`* was not provided in the request body. • `Missing reject reason item ID` – The *`reject_reason_id`* was not provided in the request body. • `Missing work item ID`: The *`work_item_id`* wasn't provided in the request body. • `There is no record for awa_reject_reason : <reason_sys_id>` – The *`reject_reason_id`* provided in the request body does not have a matching record in the Reject Reasons [awa_reject_reason] table. • `There is no record for awa_work_item : <work_item_sys_id>` – The *`work_item_id`* provided in the request body does not have a matching record in the AWA Work Item [awa_work_item] table. • `There is no record for sys_user : <agent_sys_id>` – The *`agent_id`* provided in the request body does not have a matching record in the User [sys_user] table. • `Work item is not in pending accept state`: The work item provided in the request body is in a state other than **Pending Accept**. Data type: String
error.message	Message for the error encountered during the request process. The description is provided in the *`error.detail`* property. Data type: String
status	Status of an unsuccessful request. This property is only included in the response if there is an error. Valid value: `failure`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
reject_reason_id	Sys_id of a rejection reason for this service channel. Data type: String Table: Reject Reasons [awa_reject_reason]
work_item_id	Sys_id of the work item. Data type: String

The following example shows how to reject an assigned work item with the "not my expertise" reason.

```
curl
 "https://instance.service-now.com/api/now/awa/inbox/actions/rej
ect" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"agent_id\":\"46c9e158a9fe198101d44d0d22cb640d\",
    \"work_item_id\":\"3ed5df4d87cf01101ae365b83cbb35af\",
    \"reject_reason_id\":\"31e3fa29b38023002e7b6e5f26a8dc17\"
}" \
--user 'username':'password'
```

Successful output displays the same work item, reject reason, and user ID provided in the request body. The specified work item in the AWA Work Item [awa_work_item] table has an empty **Assigned to** field and the value of the **Rejected** field is true.

```
{
  "result": {
    "work_item_id": "3ed5df4d87cf01101ae365b83cbb35af",
    "reject_reason_id": "31e3fa29b38023002e7b6e5f26a8dc17",
    "agent_id": "46c9e158a9fe198101d44d0d22cb640d"
  }
}
```

AWA Routing API

The *AWA Routing* API provides endpoints to route a document to a queue.

This API requires the Advanced Work Assignment plugin (com.glide.awa) and the awa_integration_user role.

AWA Routing - POST /now/awa/queues/{queue_sys_id}/work_item

If an active work item exists, routes a document to a queue. If an active work item does not exist for the specified document, creates a work item and set its fields accordingly.

URL format

Versioned URL: `/api/now/{api_version}/awa/queues/{queue_sys_id}/work_item`

Default URL: `/api/now/awa/queues/{queue_sys_id}/work_item`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
queue_sys_id	Sys_id of the queue record from the Queue [awa_queue] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
document_sys_id	Sys_id of the document to route to the queue. Data type: String
document_table	Name of the table associated with the document, such as incident. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
display_name	Name of the document to route by this work item, such as case record. Data type: String
document_sys_id	Sys_id of the document to route to the queue. Data type: String
document_table	Name of the table associated with the document. Data type: String
queue_sys_id	Sys_id of the queue on which to route a document. Data type: String
sys_id	Sys_id of the work item assigned to the queue. Data type: String

Example: Sample cURL request

```
curl -X POST \

 https://instance.servicenow.com/api/now/awa/queues/339eed3f3b89
2300a2bac9bb34efc4c3/work_item \
-H 'Content-Type: application/json' \
-H 'Accept: application/json' \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
-u 'username':'password'
-d '{
  "document_sys_id": "9c573169c611228700193229fff72400",
  "document_table": "incident"
}'
```

```
{
  "result": {
    "sys_id": "cd57f90ddbb26300db2051735e9619f0",
    "document_table": "incident",
    "document_sys_id": "9c573169c611228700193229fff72400",
    "queue_sys_id": "339eed3f3b892300a2bac9bb34efc4c3",
    "display_name": "Incident: INC0000001"
  }
}
```

Batch API

The *Batch* API provides endpoints to send a single request containing multiple REST API calls, and returns a stream of response payloads.

This REST API enables integrators to:

- Decrease the amount of time required to send API requests by batching them together, and reduce overhead by narrowing authentication, session setup, and round-trip traffic to a single step.
- Create more efficient code for client-side integrations.
- Mix batch item formats and include them in single batch request. For example, one batch can include a Bases64-encoded request in XML format to send to one endpoint and a Base64 encoded request in JSON format to send to a different endpoint.
- Receive a stream of response payloads in return.
- Apply existing ACLs to each API call in the batch.

You can include any API available on the instance in a *Batch* API call. For performance reasons, avoid including long-running requests and requests that retrieve large amounts of data.

Important: The Batch API has the same performance characteristics as individual API requests but avoids the overhead of multiple client-server requests. The Batch API is not intended for parallel transaction processing and long-running API requests may cause the API request to exceed the maximum transaction time and return a failure.

Size and processing limits

Payloads adhere to these size limits:

- Each item in the request: 5 MB. You can change this default by updating the *glide.rest.batch.max.inputSize* system property. Maximum value: 10 MB.
- Each item in the response: 10 MB. You can change this default by updating the *glide.rest.batch.max.outputSize* system property or adding the *X-BATCHREQUEST-MAX-OUTPUT-SIZE* header to your request. The *X-BATCHREQUEST-MAX-OUTPUT-SIZE* header value cannot exceed the value of the system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: If a request runs longer than 30 seconds, the *REST Batch API request timeout* transaction quota rule ends the transaction. Increasing the value of this transaction quota rule may result in performance issues.

When a batch request reaches a size or processing limit, the system cancels the transaction and returns unprocessed requests in the **unserviced** JSON array in the response.

Batch - POST /now/batch

Sends multiple REST API requests in a single call.

You can include any API available on the instance in a *Batch* API call. For performance reasons, avoid including long-running requests and requests that retrieve large amounts of data.

URL format

Versioned URL: `/api/now/{api_version}/batch`

Supported request parameters

Path parameters

Name	Description
api_version	Version of the endpoint to access. For example, `v1` or `v2`. Data type: String

Query parameters

Name	Description
None	

Request body parameters (JSON)

Name	Description
batch_request_id	ID that identifies the batch of requests. Data type: String
rest_requests	Required. List of request objects to include in the batch request. Data type: Array

```
"rest_requests":[
   {
      "body": "String",
      "exclude_response_headers":
 Boolean,
      "headers":[Array],
      "id": "String",
      "method": "String",
      "url": "String"
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description

	<pre>}
	]</pre>

rest_requests.body	Base64-encoded body of the request. Only applies to methods that require a body, for example POST. Before encoding, the body can be in any format. For example, XML or JSON. Data type: String
rest_requests.exclude_response_headers	Flag that indicates whether to exclude response headers from the response. Valid values: • true: Response headers are not included in the response. • false: Response headers are included in the response. Data type: Boolean Default: false

rest_requests.headers	List of request header objects to send to the endpoint.
	
	Data type: Array
	<pre>"headers":[
	  {
	  "name":"String",
	  "value":"String"
	  }
	]</pre>

rest_requests.headers.name	Name of the header. Data type: String
rest_requests.headers.value	Value of the header. Data type: String
rest_requests.id	Required. ID for each item in the batch. Data type: String
rest_requests.method	Required. Method to call for the associated endpoint. Data type: String
rest_requests.url	Required. Relative path of the endpoint to send the request to. Includes the query parameters.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.
X-BATCHREQUEST-MAX-OUTPUT-SIZE	Size limit for each item in the batch response. Add this header to provide a lower size limit than the default set by the *`glide.rest.batch.max.outputSize`* system property. You cannot set a value higher than the value in the system property. Default: 10 MB.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
batch_request_id	ID of the batch that matches the *`batch_request_id`* parameter in the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
serviced_requests	List of response objects from the batch request. Data type: Array `"serviced_requests":[ { "body": "String", "error_message": "String", "execution_time": Number, "headers": [Array], "id": "String", "redirect_url: "String", "status_code": Number, "status_text": "String" } ]`
serviced_requests.body	Base64 encoded body of the response. To get the value of the body, Base64 decode the content of this parameter. Data type: String
serviced_requests.error_message	If present, the error messages. Data type: String
serviced_requests.execution_time	Time it took to execute the batch item request. Data type: Number Unit: Milliseconds
serviced_requests.headers	Headers for the batch item. Data type: Array `"headers":[ { "name":"String", "value":"String" } ]`
serviced_requests.headers.name	Name of the header. Data type: String
serviced_requests.headers.value	Value of the header. Data type: String
serviced_requests.id	ID of the batch item that matches the *`rest_requests.id`* parameter in the request. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
serviced_requests.redirect_url	If present, the redirect URL. Data type: String
serviced_requests.status_code	Status code for the batch item. Data type: Number
serviced_requests.status_text	Text of the status code for the batch item. Data type: String
unserviced_requests	IDs of the requests that were not processed because the batch request reached a size or processing limit. Data type: Array

Example: cURL request

This batch request sends two GET requests to the instance and one POST request to the incident table. The body of the POST request is Base64 encoded.

```
curl "https://instance.servicenow.com/api/now/v1/batch" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user "username":"password"\
--data "{
   \"batch_request_id\":\"1\",
   \"rest_requests\":[
      {
         \"id\":\"11\",
         \"headers\":[
            {
               \"name\":\"Content-Type\",
               \"value\":\"application/xml\"
            },
            {
               \"name\":\"Accept\",
               \"value\":\"application/xml\"
            }
         ],
         \"url\":\"/api/global/user_role_inheritance\",
         \"method\":\"GET\"
      },
      {
         \"id\":\"12\",
         \"exclude_response_headers\":true,
         \"headers\":[
            {
               \"name\":\"Content-Type\",
               \"value\":\"application/json\"
            },
            {
               \"name\":\"Accept\",
               \"value\":\"application/json\"
```

Case API

The *Case* API provides endpoints that enable you to retrieve and update Customer Service Management (CSM) case records.

In addition, you can generate new social media profile records when creating a case.

The *Case* API requires the Customer Service plugin (com.sn_customerservice) and is provided within the sn_customerservice namespace.

Users must have the csm_ws_integration role for full API access. External users with the sn_customerservice.customer or sn_customerservice.consumer roles can also access the endpoints.

Case - GET /sn_customerservice/case/{id}/activities

Retrieves the activity stream for a specified Customer Service Management (CSM) case.

Use this endpoint to retrieve all entries from the activity stream for a specified record from the Case [sn_customerservice_case] table.

To use this endpoint, users must have the csm_ws_integration, sn_customerservice.customer, or sn_customerservice.consumer role.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/sn_customerservice/{api_version}/case/{id}/activities`

Default URL: `/api/sn_customerservice/case/{id}/activities`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id or case number of the case to retrieve. Located in the Case [sn_customerservice_case] table. Results will be unpredictable if a specified case number is shared by two or more cases. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
sysparm_activity_type	Filters the type of activities to return from the activity stream. The *entries.element* parameter contains the activity type for each activity. For example: • `sysparm_activity_type=attachment` • `sysparm_activity_type=work_notes` • `sysparm_activity_type=attachment,work_notes` • `sysparm_activity_type=attachment,work_notes,comments` Data type: String Default: Returns all types of activity.
sysparm_limit	Maximum number of records to return. Unusually large *sysparm_limit* values can impact system performance. For requests that exceed this number of records, use the *sysparm_offset* parameter to paginate record retrieval. Data type: Number
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record retrieval. This functionality enables the retrieval of all records, regardless of the number of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description

Link	REST response data can be split into multiple result sets. Where applicable, the response header contains different links for the first set, previous set, next set, and the last set of records.
	
	For example:
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="next",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="prev",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=0&sysparm_limit=1000>;rel="first",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=2780&sysparm_limit=1000>;rel="last"`

X-Total-Count	Response header showing the total number of records matching the request when the *sysparm_limit* or *sysparm_offset* query parameters are specified.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
display_value	Case number for the CSM case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
entries	Array of objects in which each object represents an activity stream entry from the CSM case. Data type: Array `"entries": [{ "attachment": {Object}, "contains_code": Boolean, "element": "String", "field_label": "String", "initials": "String", "login_name": "String", "name": "String", "sys_created_on": "String", "sys_created_on_adjusted": "String", "sys_id": "String", "user_sys_id": "String", "value": "String" }]`
entries.attachment	Description of a file attached to the CSM case in the activity stream entry. Data type: Object `"attachment": { "average_image_color": "String", "content_type": "String", "file_name": "String", "image_height": Number, "image_path": "String", "image_width": Number, "path": "String", "size": "String", "size_bytes": Number, "state": "String", "sys_id": "String", "thumbnail_path": "String" }`
entries.attachment.average_image_color	Hexadecimal representation of average color for image attachment. Data type: String
entries.attachment.content_type	MIME type for the attachment. Examples include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• application/pdf • image/jpeg • message/rfc822 Data type: String
entries.attachment.file_name	File name for the attachment. Data type: String
entries.attachment.image_height	Height of image attachment in pixels. Data type: Number
entries.attachment.image_path	Direct download link for image attachment. Data type: String
entries.attachment.image_width	Width of image attachment in pixels. Data type: Number
entries.attachment.path	Direct link to the attachment. Data type: String
entries.attachment.size	Size of the attachment. Examples: • 157.7 KB • 2.2 MB Data type: String
entries.attachment.size_bytes	Size of the attachment. Data type: Number Unit: Bytes
entries.attachment.state	State of the attachment record in the Attachment [sys_attachment] table. Possible values: • Available • Available Conditionally • Not available • Pending Data type: String
entries.attachment.sys_id	Sys_id for the attachment. Located in the Attachment [sys_attachment] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
entries.attachment.thumbnail_path	Direct download link for thumbnail of image attachment. Data type: String
entries.contains_code	Flag that indicates whether the activity stream entry contains code or not. Possible values: • true: The activity stream entry contains code. • false: The activity stream entry does not contain code. Data type: Boolean
entries.element	Name for the journal field associated with the activity stream entry. Located in Dictionary Entries [sys_dictionary] table. Data type: String
entries.field_label	Display name for the journal field associated with the activity stream entry. Data type: String
entries.initials	Initials of the user who created the activity stream entry. Data type: String
entries.login_name	Full user name for the user who created the activity stream entry. Data type: String
entries.name	Full user name for the user who created the activity stream entry. Data type: String
entries.sys_created_on	Date and time of creation for the activity stream entry, expressed in GMT timezone. Data type: String Format: YYYY-MM-DD hh:mm:ss
entries.sys_created_on_adjusted	Date and time of creation for the activity stream entry, expressed in logged-in user timezone. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Format: YYYY-MM-DD hh:mm:ss
entries.sys_id	Sys_id for the activity stream entry. Data type: String
entries.user_sys_id	Sys_id for user who created the activity stream entry. Located in User [sys_user] table. Data type: String
entries.value	Value for this journal entry. Data type: String
journal_fields	Array of objects in which each object represents a journal field present in the Case table from which activity entries are drawn. Data type: Array `"journal_fields": [ { "can read": Boolean, "can_write": Boolean, "color": "String", "label": "String", "name": "String" } ]`
journal_fields.can_read	Flag that indicates whether the logged-in user can read this journal field or not. Possible values: • true: The logged-in user can read this journal field. • false: The logged-in user cannot read this journal field. Data type: Boolean
journal_fields.can_write	Flag that indicates whether the logged-in user can write to the journal field or not. Possible values: • true: The logged-in user can write to this journal field. • false: The logged-in user cannot write to this journal field. Data type: Boolean
journal_fields.color	Color that represents the journal field in case activity stream on ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
journal_fields.label	Display name for the journal field. Data type: String
journal_fields.name	Name for the journal field. Located in Dictionary Entries [sys_dictionary] table. Data type: String
label	Display label for the table in which the CSM case record appears. Possible value: Case Data type: String
number	Case number for the CSM case. Data type: String
short_description	Short description for the CSM case. Data type: String
sys_created_on	Date and time of case creation, expressed in GMT timezone. Data type: String Format: YYYY-MM-DD hh:mm:ss
sys_created_on_adjusted	Date and time of case creation, expressed in logged-in user timezone. Data type: String Format: YYYY-MM-DD hh:mm:ss
sys_id	Sys_id for the CSM case. Located in the Case [sn_customerservice_case] table. Data type: String
table	Name of the table in which the CSM case appears. Possible value: sn_customerservice_case Data type: String
thumbnail_path	Direct link to get thumbnail for attachment (only for attachment of type images.) Data type: String
user_full_name	Full name for logged-in user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
user_login	User ID for logged-in user. Data type: String
user_sys_id	Sys_id for logged-in user. Located in User [sys_user] table. Data type: String

Example: cURL request

Retrieve the complete activity stream for a CSM case by sys_id.

```
curl --request GET
 'https://instance.servicenow.com/api/sn_customerservice/case/f3
52dc9387632300d6b0a7da0acb0b60/activities'  \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

The response shows a single activity stream entry for the specified case, an **Additional comments** journal entry submitted by the agent.

```
{
  "result": {
    "display_value": "CS0001401",
    "sys_id": "f352dc9387632300d6b0a7da0acb0b60",

}
```

Case - GET /sn_customerservice/case/field_values/{field_name}

Retrieves the list of possible field values for a choice or reference field in the Case [sn_customerservice_case] table.

To use this endpoint, users must have the csm_ws_integration, sn_customerservice.customer, or sn_customerservice.consumer role.

Use this endpoint to populate field value lists in case creation forms.

When you request values for a reference field, any reference qualifiers defined for the requested field in the Dictionary Entry [sys_dictionary] table are applied. For more information on reference qualifiers, see Reference qualifiers.

You can use the *sysparm_ref_qual_input* query parameter to specify field values to use when evaluating JavaScript reference qualifiers. For an example, see the query parameter listing below.

When you request values for a choice field that is dependent on another field, you can use the *sysparm_dependent_value* query parameter to specify a value for the dependency parent field and restrict the returned field values accordingly. For more details on dependent fields, see Make a field dependent.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/sn_customerservice/{api_version}/case/field_values/{field_name}`

Default URL: `/api/sn_customerservice/case/field_values/{field_name}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
field_name	Name of a choice or reference field in the Case [sn_customerservice_case] table. Data type: String

Query parameters

Name	Description
sysparm_dependent_value	Value to select in the Case [sn_customerservice_case] table choice field tha field is dependent on. Use only when requesting a choice field that is depen field. As an example, suppose you create a custom **Channel Instance** choice field the Case table which is dependent on the default *Channel* choice field. W *sysparm_dependent_value* is not specified, this endpoint returns the values for your custom field. To instead return only the subset of custom field available when the Phone CSM channel is chosen from the *Channel* field, `sysparm_dependent_value=Phone` Data type: String
sysparm_limit	Maximum number of records to return. Unusually large *sysparm_limit* v impact system performance. For requests that exceed this number of record *sysparm_offset* parameter to paginate record retrieval. Data type: Number
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to retrieval. This functionality enables the retrieval of all records, regardless of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set simply page through all available records, use `sysparm_offset=syspa +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0
sysparm_reference_field_columns	Comma-separated list of column names, from the table of the specified refe return in the response. For example, if Contact is the specified reference fie include a list of all the fields in the Contact table to return. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
sysparm_query	Encoded query used to filter the result set. Queries defined using this param appended to any encoded queries produced by reference qualifiers. For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^a` The encoded query supports *order by*. To sort responses based on certain f use the *ORDERBY* and *ORDERBYDESC* clauses in *`sysparm_query`*. For e `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESC` filters all active records and orders the results in ascending order by numbe in descending order by category. If part of the query is invalid, such as by specifying an invalid field name, the ignores the invalid part. It then returns rows using only the valid portion of th control this behavior using the property *`glide.invalid_query.retu`* Set this property to true to return no rows on an invalid query. **Note:** The *`glide.invalid_query.returns_no_rows`* propert controls the behavior of all queries across the instance, such as in lists, (*`GlideRecord.query()`*), and web service APIs. Data type: String
sysparm_ref_qual_input	Encoded set of field values representing a current object to pass to referenc use JavaScript functions. Use only when requesting a reference field. For example, when requesting values from the *`Asset`* field, you can set this parameter value to return only assets belonging to the specified product ins belonging to the product associated with the specified case: `sysparm_ref_qual_input=product=5d1b7bb053401010dc25c` Data type: String Syntax: `{field1}={value1}^{field2}={value2}[...]`

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description

Link	REST response data can be split into multiple result sets. Where applicable, the response header contains different links for the first set, previous set, next set, and the last set of records.
	
	For example:
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="next",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="prev",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=0&sysparm_limit=1000>;rel="first",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=2780&sysparm_limit=1000>;rel="last"`

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Array of objects in which each object describes a single value for the requested field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Array `"result": [ { "label": "String", "value": "String" } ]`
result.label	Display value for the field value. Data type: String
result.value	Field value. Data type: String

Example: cURL request

Retrieve values for the contact reference field from all cases:

```
curl
 'https://instance.servicenow.com/api/sn_customerservice/case/field_values/contact' \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

The response displays labels and values for matching contacts:

```
{
  "result": [
    {

Case - GET /sn_customerservice/case/{id}/field_values/{field_name}

Retrieves the list of possible field values for a choice or reference field for a specified record in the Case [sn_customerservice_case] table.

To use this endpoint, users must have the csm_ws_integration, sn_customerservice.customer, or sn_customerservice.consumer role.

Use this endpoint to populate field value lists in case update forms.

When you request values for a reference field, any reference qualifiers defined for the requested field in the Dictionary Entry [sys_dictionary] table are applied, using values from the specified case record. For more information on reference qualifiers, see Reference qualifiers.

You can use the *sysparm_ref_qual_input* query parameter to override values from the specified case when evaluating JavaScript reference qualifiers. For an example, see the query parameter listing below.

When you request values for a choice field that is dependent on another field, this endpoint limits returned field values based on the dependency parent field value selected in the specified case record. For more details on dependent fields, see Make a field dependent.

You can use the *sysparm_dependent_value* query parameter to override the selection from the dependency parent field. For an example, see the query parameter listing below.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/sn_customerservice/{api_version}/case/{id}/field_values/{field_name}`

Default URL: `/api/sn_customerservice/case/{id}/field_values/{field_name}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
field_name	Name of a choice or reference field. Located in the Case [sn_customerservice_case] table. Data type: String
id	Sys_id of a record. Located in the Case [sn_customerservice_case] table to use when evaluating reference qualifiers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
sysparm_dependent_value	Value to select in the Case [sn_customerservice_case] table choice field tha field is dependent on. Use only when requesting a choice field that is depen field. As an example, suppose you create a custom **Channel Instance** choice field the Case table which is dependent on the default *Channel* choice field. W *sysparm_dependent_value* is not specified, this endpoint returns the values for your custom field. To instead return only the subset of custom field available when the Phone CSM channel is chosen from the *Channel* field, `sysparm_dependent_value=Phone` Data type: String
sysparm_limit	Maximum number of records to return. Unusually large *sysparm_limit* v impact system performance. For requests that exceed this number of record *sysparm_offset* parameter to paginate record retrieval. Data type: Number
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to retrieval. This functionality enables the retrieval of all records, regardless of records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set simply page through all available records, use `sysparm_offset=syspa +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. Queries defined using this param appended to any encoded queries produced by reference qualifiers. For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^a` The encoded query supports *order by*. To sort responses based on certain f use the *ORDERBY* and *ORDERBYDESC* clauses in *sysparm_query*. For e `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESC` filters all active records and orders the results in ascending order by numbe in descending order by category.

Query parameters (continued)

Name	Description
	If part of the query is invalid, such as by specifying an invalid field name, the ignores the invalid part. It then returns rows using only the valid portion of th control this behavior using the property *glide.invalid_query.retu* Set this property to true to return no rows on an invalid query. **Note:** The *glide.invalid_query.returns_no_rows* propert controls the behavior of all queries across the instance, such as in lists, (*GlideRecord.query()*), and web service APIs. Data type: String
sysparm_reference_field_columns	Comma-separated list of column names, from the table of the specified refe return in the response. For example, if Contact is the specified reference fiel include a list of all the fields in the Contact table to return. Data type: String
sysparm_ref_qual_input	Encoded set of field values representing a current object to pass to referenc use JavaScript functions. Use only when requesting a reference field. For example, when requesting values from the *Asset* field, you can set this parameter value to return only assets belonging to the specified product ins belonging to the product associated with the specified case: `sysparm_ref_qual_input=product=5d1b7bb053401010dc25c` Data type: String Syntax: `{field1}={value1}^{field2}={value2}[…]`

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description

Link	REST response data can be split into multiple result sets. Where applicable, the response header contains different links for the first set, previous set, next set, and the last set of records.
	
	For example:
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="next",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="prev",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=0&sysparm_limit=1000>;rel="first",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=2780&sysparm_limit=1000>;rel="last"`

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Array of objects in which each object describes a single value for the requested field. Data type: Array `"result": [ { "label": "String", "value": "String" } ]`
result.label	Display value for the field value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.value	Field value. Data type: String

Example: cURL request

Retrieve the contact reference field value for an existing case:

```
curl
 'https://instance.servicenow.com/api/sn_customerservice/case/f3
52dc9387632300d6b0a7da0acb0b60/field_values/contact' \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

The response displays the label and value for the contact assigned to the specified case:

```
{
  "result": [
    {
      "label": "Alex Linde",
      "value": "60beb5e7d7600200e5982cf65e6103ad"
    }
  ]
}
```

Case - GET /sn_customerservice/case/{id}

Retrieves the specified Customer Service Management (CSM) case.

To use this endpoint, users must have the csm_ws_integration, sn_customerservice.customer, or sn_customerservice.consumer role.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/sn_customerservice/{api_version}/case/{id}`

Default URL: `/api/sn_customerservice/case/{id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
id	Sys_id or case number for the case to retrieve. Located in the Case [sn_customerservice_case] table. Results will be unpredictable if a specified case number is shared by two or more cases. Data type: String

Query parameters

Name	Description
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone. • Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false **Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).

Element	Description
account.sys_created_by	User that originally created the account. Data type: String Maximum length: 40
account.sys_created_on	Date and time that the account was originally created. Data type: String
account.sys_id	Sys_id for the account record. Data type: String
account.sys_mod_count	Number of times the account information has been updated. Data type: Number (Integer)
account.sys_updated_by	User that last modified the account information. Data type: String Maximum length: 40
account.sys_updated_on	Date and time the account information was last updated. Data type: String
account.theme	Sys_id of the customer portal theme used by this account. Located in the Theme [sys_ui_theme] table. Data type: String
account.vendor	Flag that indicates whether the company associated with this account is a vendor. Possible values: • true: Vendor • false: Not a vendor Data type: Boolean Default: false
account.vendor_manager	List of sys_ids of the vendor managers for the account. Located in the User [sys_user] table.

Element	Description
assignment_group	Sys_id of the customer service agent group assigned to the case. Located in the Group [sys_user_group] table. Data type: String
business_duration	Length in calendar work hours, work days, and work weeks that it took to complete the case. Data type: String
business_impact	Impact of the issue on the associated customer. Data type: String Maximum characters: 4,000
business_service	Sys_id of the service record associated with the case. Located in the Service [cmdb_ci_service] table. Data type: String
case	Case short description and case number. Data type: String Maximum length: 300
case_report	Sys_id of the associated case report. Located in the Case Report [sn_customerservice_case_report] table. Data type: String
category	Case category. Possible values: • 0: Question • 1: Issue • 2: Feature Data type: Number (Integer) Default: 1
cause	Details about the cause of the problem.

Element	Description
	Maximum length: 40
consumer.photo	Photo of the consumer. Data type: Image
consumer.preferred_language	Consumer primary language. Data type: String Maximum length: 3
consumer.prefix	Consumer name prefix such as, Dr., Mr., Mrs., or Ms. Data type: String Maximum length: 40
consumer.primary	Flag that indicates whether this is the primary consumer. Possible values: • true: Primary consumer • false: Not primary consumer Data type: Boolean Default: false
consumer.state	State in which the consumer resides. Data type: String Maximum length: 100
consumer.street	Consumer street address. Data type: String Maximum length: 255
consumer.suffix	Consumer name suffix such as Jr., Sr., or II. Data type: String
consumer.sys_created_by	User that created the consumer record. Data type: String Maximum length: 40
consumer.sys_created_on	Date and time the consumer record was originally created.

Element	Description
	Data type: String
consumer.sys_domain	ServiceNow domain in which the consumer information resides. Data type: String
consumer.sys_id	Unique identifier for the consumer. Data type: String
consumer.sys_mod_count	Number of times that the associated consumer information has been modified. Data type: Integer
consumer.sys_updated_by	User that last updated the consumer information. Data type: String Maximum length: 40
consumer.sys_updated_on	Date and time when the consumer information was last updated. Data type: String
consumer.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: blank (system time format)
consumer.time_zone	Consumer time zone, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
consumer.title	Consumer business title such as Manager, Software Developer, or Contractor.

Element	Description
	Data type: String Maximum length: 60
consumer.user	Sys_id of the consumer user. Located in the Consumer User [csm_consumer_user] table. Data type: String
consumer.zip	Consumer zip code. Data type: String Maximum length: 40
contact	Business-to-business based cases only. Sys_id of the person to contact regarding this case. Located in the Contact [customer_contact] table. Data type: String
contact	Array of contact parameters for business-to-business cases.
contact.account	Sys_id of the account record to which the contact is associated; Account [customer_account] table. Data type: String
contact.active	Flag that indicates whether the contact is active within the system. Possible values: • true: Contact is active • false: Contact is inactive Data type: Boolean Default: true
contact.agent_status	Status of the agent. Possible values: • Off work • On break • On route • On site

Element	Description
	Data type: String Maximum length: 40 Default: blank (system date format)
contact.default_perspective	Sys_id of the default perspective for the contact. Located in the Menu List [sys_perspective] table. Data type: String
contact.department	Sys_id of the department associated with the contact. Located in the Department [cmn_department] table. Data type: String
contact.edu_status	Education status of the associated contact. Data type: String Maximum length: 40 Default: faculty
contact.email	Contact email address. Data type: String
contact.employee_number	Contact employee number. Data type: String
contact.enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values: • true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false
contact.failed_attempts	Number of failed log in attempts. Data type: Number (Integer)

Element	Description
contact.sys_class_name	Table that contains the contact record. Data type: String Maximum length: 80
contact.sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
contact.sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)
contact.sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
contact.sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)
contact.sys_id	Unique identifier for the associated contact record. Data type: String
contact.sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
contact.sys_tags	System tags for the content. Data type: String
contact.sys_updated_by	User that last updated the associated contact information. Data type: String Maximum length: 40
contact.sys_updated_on	Data and time the associated contact information was updated. Data type: String (Date/time)

Element	Description
contact.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: Blank (system time format)
contact.time_sheet_policy	Sys_id of the record that contains the time sheet policy for the associated contact; Time Sheet Policy [time_sheet_policy] table. Data type: String
contact.time_zone	Time zone in which the contact resides, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
contact.title	Contact business title such as Manager, Software Developer, or Contractor. Data type: String Maximum length: 60
contact.user_name	Contact user ID. Data type: String Maximum length: 40
contact.vip	Flag that indicates whether the associated contact has VIP status. Possible values: • true: VIP • false: Not VIP Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Default: false
contact.web_service_access_only	Flag that indicates whether the contact can only access services through the web. Possible values: • true: Web access only • false: Access through all available methods Data type: Boolean Default: false
contact.zip	Contact zip code. Data type: String Maximum length: 40
contact_local_time	Contact local time. Data type: String Maximum length: 70
contact_time_zone	Time zone of the contact associated with the case. Data type: String Maximum length: 40
contact_type	Method in which the case was initially reported. Possible values: • chat • email • phone • social • web Data type: String Maximum length: 40
contract	Sys_id of the contract associated with the case. Located in the Contract [ast_contract] table. This contract contains information about the type of support that is provided to the company

Element	Description
resolution_code	Resolution state for the case, such as "Solved - Fixed by Support/ Guidance provided". Data type: String Maximum length: 40
resolved_at	Date and time that the case was resolved. Data type: String
resolved_by	Sys_id of the person that resolved the case. Located in the User [sys_user] table. Data type: String
result	Array of objects in which each object describes a single value for the requested field. Data type: Array `"result": [ { "label": "String", "value": "String" } ]`
result.label	Display value for the field value. Data type: String
result.value	Field value. Data type: String
short_description	Concise description of the case. Data type: String Maximum length: 160
skills	List of the unique identifiers (sys_id) of the skills needed to complete the case. Located in the Skill [cmn_skill] table. Data type: String
sla_due	Date/time at which the case must be closed based on the associated service level agreement.

Element	Description
	Data type: String
sn_app_cs_social_social_profile.consumer.sys_id	Unique identifier for the consumer. Data type: String
sn_app_cs_social_social_profile.consumer.sys_mod_count	Number of times that the associated consumer information has been modified. Data type: Integer
sn_app_cs_social_social_profile.consumer.sys_tags	Consumer system tags.
sn_app_cs_social_social_profile.consumer.sys_updated_by	User that last updated the consumer information. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.sys_updated_on	Date and time when the consumer information was last updated. Data type: String
sn_app_cs_social_social_profile.consumer.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: blank (system time format)
sn_app_cs_social_social_profile.consumer.time_zone	Consumer time zone, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.title	Consumer business title such as Manager, Software Developer, or Contractor. Data type: String

Element	Description
	Maximum length: 40 Default: blank (system date format)
sn_app_cs_social_social_profile.contact.default_perspective	Sys_id of the default perspective for the contact. Located in the Menu List [sys_perspective] table. Data type: String
sn_app_cs_social_social_profile.contact.department	Sys_id of the department associated with the contact. Located in the Department [cmn_department] table. Data type: String
sn_app_cs_social_social_profile.contact.edu_status	Education status of the associated contact. Data type: String Maximum length: 40 Default: faculty
sn_app_cs_social_social_profile.contact.email	Contact email address. Data type: String
sn_app_cs_social_social_profile.contact.employee_number	Contact employee number. Data type: String
sn_app_cs_social_social_profile.contact.enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values: • true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.failed_attempts	Number of failed log in attempts. Data type: Number (Integer)
sn_app_cs_social_social_profile.contact.first_name	Contact first name.

Element	Description
sn_app_cs_social_social_profile.contact.sys_class_name	Table that contains the contact record. Data type: String Maximum length: 80
sn_app_cs_social_social_profile.contact.sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
sn_app_cs_social_social_profile.contact.sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)
sn_app_cs_social_social_profile.contact.sys_id	Unique identifier for the associated contact record. Data type: String
sn_app_cs_social_social_profile.contact.sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
sn_app_cs_social_social_profile.contact.sys_tags	Contact system tags.
sn_app_cs_social_social_profile.contact.sys_updated_by	User that last updated the associated contact information. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.sys_updated_on	Data and time the associated contact information was updated. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.time_format	Format in which to display time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
support_manager	Sys_id of the CSM manager assigned to the case. Located in the User [sys_user] table. Data type: String
sync_driver	Flag that indicates whether there's driver synchronization. Possible values: • true: Driver is synchronized • false: Driver isn't synchronized Data type: Boolean
sys_class_name	Table that contains the case record. Data type: String Maximum length: 80
sys_created_by	Person that initially opened the case. Data type: String Maximum length: 40
sys_created_on	Date and time when the case was initially created. Data type: String
sys_domain	Domain associated with the case. Data type: String Maximum length: 32 Default: global
sys_domain_path	Domain path. Data type: String Maximum length: 255 Default: /
sys_id	Unique identifier for the case. Data type: String Maximum length: 32

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
sys_mod_count	Number of updates to the case since it was initially created. Data type: Number (Integer)
sys_tags	System tags.
sys_updated_by	Person that last updated the case. Data type: String Maximum length: 40
sys_updated_on	Date and time when the case was last updated. Data type: String
time_worked	Total amount of time worked on the case. Data type: String
upon_approval	Action to take if the case is approved. Possible values: • do_nothing • proceed Data type: String Maximum length: 40 Default: proceed
upon_reject	Action to take if the case is rejected. Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
urgency	Urgency of the case. Possible values:

Case - GET /sn_customerservice/case

Retrieves a specified set of Customer Service Management (CSM) cases.

To use this endpoint, users must have the csm_ws_integration, sn_customerservice.customer, or sn_customerservice.consumer role.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/sn_customerservice/{api_version}/case`

Default URL: `/api/sn_customerservice/case`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sysparm_display_value	Data retrieval operation for reference and choice fields. Based on this value, retrieves the display value and/or the actual value from the data Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • true: Returns the display values for all fields • false: Returns the actual values from the database • all: Returns both actual and display values Default: false **Note:** There is no preferred method for setting this parameter. However, specify the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For mo information on display values and actual values, see Table API FAQs (KB05349
sysparm_fields	Comma-separated list of fields to return in the response. Data type: String
sysparm_limit	Maximum number of records to return. Unusually large *sysparm_limit* values ca impact system performance. For requests that exceed this number of records, use th *sysparm_offset* parameter to paginate record retrieval. Data type: Number
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate retrieval. This functionality enables the retrieval of all records, regardless of the numb records, in small manageable chunks. For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply page through all available records, use `sysparm_offset=sysparm_off +sysparm_limit`, until you reach the end of all records. Do not pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^active` The encoded query supports *order by*. To sort responses based on certain fields, use the *ORDERBY* and *ORDERBYDESC* clauses in *sysparm_query*. For example, `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcatego` filters all active records and orders the results in ascending order by number first, an in descending order by category. If part of the query is invalid, such as by specifying an invalid field name, the instanc ignores the invalid part. It then returns rows using only the valid portion of the query. control this behavior using the property *glide.invalid_query.returns_no* Set this property to true to return no rows on an invalid query.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: The *glide.invalid_query.returns_no_rows* property controls the behavior of all queries across the instance, such as in lists, scripts (*GlideRecord.query()*), and web service APIs. Data type: String
sysparm_reference_fields	Whether or not to retrieve fields from reference tables such as account, contact, consumer, and sn_app_cs_social_social_profile. By default, these fields are returned if the user has read access to them, but this adds performance overhead. When retrieving a large number of case records, this overhead can be eliminated by setting `sysparm_reference_fields=false`. Data type: Boolean Default: true **Note:** When using this endpoint, you can omit the *sysparm_* prefix for this qu parameter and specify it as *reference_fields*.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
Link	REST response data can be split into multiple result sets. Where applicable, the response header contains different links for the first set, previous set, next set, and the last set of records. For example: `https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="next",`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers (continued)

Header	Description

	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=40&sysparm_limit=1000>;rel="prev",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=0&sysparm_limit=1000>;rel="first",`
	
	`https://<instance name>.service-now.com/api/now/table/cmdb_ci?sysparm_offset=2780&sysparm_limit=1000>;rel="last"`

X-Total-Count	Response header showing the total number of records matching the request when the *sysparm_limit* or *sysparm_offset* query parameters are specified.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Element	Description
account	Sys_id of the account record associated with the case. Located in the Account [customer_account] table. Data type: String
account	Account details. Data type: Object `"account": { "account_code": "String", "account_parent": "String", "account_path": "String", "active_escalation": "String", "apple_icon": Image,`

Element	Description
	"sys_created_by": "String", "sys_created_on": "String", "sys_id": "String", "sys_mod_count": Number, "sys_updated_by": "String", "sys_updated_on": "String", "theme": "String", "vendor": Boolean, "vendor_manager": "String", "vendor_type": "String", "website": "String", "zip": "String" }
account.account_code	Unique combination of values that an application uses to identify budget forecasts and budget plans. Data type: String Maximum length: 255
account.account_parent	Sys_id of the parent account of this account. Located in the Account [customer_account] table. Data type: String
account.account_path	Path from the parent to the child accounts in the account hierarchy. Data type: String Maximum length: 255
account.active_escalation	Sys_id of the active escalation associated with the account. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
account.apple_icon	Icon for iPhone home page bookmarks. Data type: Image

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
account.banner_image	Banner image that appears on the customer portal. Data type: Image
account.banner_image_light	Small banner image. Data type: Image
account.banner_text	Banner text that appears on the customer portal. Data type: String Maximum length: 4,000
account.city	City in which the company that is associated with this account resides. Data type: String Maximum length: 50
account.contact	Sys_id of a contact record associated with this account. Located in the User [sys_user] table. Data type: String
account.country	Country in which the company that is associated with this account resides. Data type: String Maximum length: 40 Default: USA
account.customer	Flag that indicates whether the account is a customer account, as opposed to a partner account. Possible values: • true: Customer account • false: Partner account Data type: Boolean Default: false
account.discount	Discount given to the account on purchases. Data type: Number

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Maximum length: 15
account.fax_phone	Primary fax phone number for the company associated with this account. Data type: String Maximum length: 40
account.fiscal_year	Fiscal year for the company associated with the account. Data type: String
account.lat_long_error	Difference in the actual location as compared to latitude and longitude information. Data type: String Maximum length: 1,000
account.latitude	Latitude of the company associated with this account. Data type: Number (floating point number) Maximum length: 40
account.longitude	Longitude of the company associated with this account. Data type: Number (floating point number) Maximum length: 40
account.manufacturer	Flag that indicates whether the company associated with this account manufactures goods. Possible values: • true: Manufactures goods • false: Does not manufacture goods Data type: Boolean Default: false
account.market_cap	Market value of the associated company's publicly traded stock shares.

Element	Description
	Data type: Number (currency) Maximum length: 20
account.name	Name of the company associated with this account. Data type: String Maximum length: 80
account.notes	Additional information about the company. Data type: String Maximum length: 4,000
account.num_employees	Number of people employed by the company. Data type: Number (Integer) Maximum length: 40
account.number	Number that identifies this account. Data type: String Maximum length: 40
account.parent	Sys_id of the parent account of this account. Located in the Company [core_company] table. Data type: String
account.partner	Flag that indicates whether the account is a partner account or a customer account. Possible values: • true: Partner account • false: Customer account Data type: Boolean Default: false
account.phone	Primary phone number for the company. Data type: String

Element	Description
	Data type: String
account.sys_mod_count	Number of times the account information has been updated. Data type: Number (Integer)
account.sys_updated_by	User that last modified the account information. Data type: String Maximum length: 40
account.sys_updated_on	Date and time the account information was last updated. Data type: String
account.theme	Sys_id of the customer portal theme used by this account. Located in the Theme [sys_ui_theme] table. Data type: String
account.vendor	Flag that indicates whether the company associated with this account is a vendor. Possible values: • true: Vendor • false: Not a vendor Data type: Boolean Default: false
account.vendor_manager	List of sys_ids of the vendor managers for the account. Located in the User [sys_user] table. Data type: String
account.vendor_type	List of sys_ids of the type of vendor such as, applications, hardware, services, or software. Located in the Vendor Type [vendor_type] table. Data type: String
account.website	URL of the website for the company.

Element	Description
	Data type: String Maximum length: 1,024
account.zip	Zip code of the company. Data type: String Maximum length: 40
active	Flag that indicates whether the case is open and active. Possible values: • true: Case is active • false: Case is closed Data type: Boolean Default: true
active_account_escalation	Sys_id of the active account escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
active_escalation	Sys_id of the active escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
activity_due	Date for which the associated case is expected to be completed. Data type: String
additional_assignee_list	List of the sys_ids of the additional persons (other than the primary assignee) that have been assigned to the account. Located in the User [sys_user] table. Data type: Array Maximum: 4,000
approval	String that describes the type of approval required.

Element	Description
business_impact	Impact of the issue on the associated customer. Data type: String Maximum characters: 4,000
business_service	Sys_id of the service record associated with the case. Located in the Service [cmdb_ci_service] table. Data type: String
case	Case short description and case number. Data type: String Maximum length: 300
case_report	Sys_id of the associated case report. Located in the Case Report [sn_customerservice_case_report] table. Data type: String
category	Case category. Possible values: • 0: Question • 1: Issue • 2: Feature Data type: Number (Integer) Default: 1
cause	Details about the cause of the problem. Data type: String Maximum length: 4,000
caused_by	Sys_id of the change request that caused the case to be created. Located in the Change Request [change_request] table. Data type: String
change	Sys_id of the change request that caused the case to be created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	Located in the Change Request [change_request] table. Data type: String
child_case_creation_progress	Flag that indicates whether the case is a child case that was created from a major case. Possible values: • true: Child case created from a major case • false: Not a child case Data type: Boolean
closed_at	Date and time that the case was closed. Data type: String
closed_by	Sys_id of the user that closed the case. Located in the User [sys_user] table. Data type: String
close_notes	Notes made when the case was closed. Data type: String Maximum length: 4,000
cmdb_ci	Sys_id of the configuration item associated with the case. Located in the Configuration Item [cmdb_ci] table. Data type: String
comments	Additional comments about the case. Data type: String Maximum length: 4,000
comments_and_work_notes	Comments and work notes entered for the case. Data type: String Maximum length: 4,000

© 2026 ServiceNow, Inc. All rights reserved.

Element	Description
company	Sys_id of the company associated with the case. Located in the Company [core_company] table. Data type: String
consumer	Business-to-consumer cases only. Sys_id of the person to contact with regard to this case. Located in the Consumer [csm_consumer] table. Data type: String
consumer	Array of parameters for business-to-consumer cases.
consumer.active	Flag that indicates whether the consumer is active. Possible values: • true: Consumer active • false: Consumer de-activated Data type: Boolean Default: true
consumer.business_phone	Business phone number of the consumer. Data type: String Maximum length: 40
consumer.city	City in which the consumer resides. Data type: String Maximum length: 100
consumer.country	Country in which the consumer resides. Data type: String Maximum length: 40
consumer.date_format	Format in which to display dates. Valid values: • dd-mm-yyyy • dd/mm/yyyy • dd.mm.yyyy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	• mm-dd-yyyy • yyyy-mm-dd Data type: String Maximum length: 40 Default: blank (system date format)
consumer.email	Email address of the consumer. Data type: String Maximum length: 100
consumer.fax	Fax number of the consumer. Data type: String Maximum length: 40
consumer.first_name	Consumer first name. Data type: String Maximum length: 50
consumer.gender	Gender of the consumer. Data type: String Maximum length: 40
consumer.home_phone	Home phone number of the consumer. Data type: String Maximum length: 40
consumer.household	Sys_id of the record that describes the household characteristics. Located in the Household [csm_household] table. Data type: String
consumer.last_name	Consumer last name. Data type: String Maximum length: 50
consumer.middle_name	Consumer middle name. Data type: String

Element	Description
	Maximum length: 50
consumer.mobile_phone	Consumer mobile phone number. Data type: String Maximum length: 40
consumer.name	Consumer full name; first_name +middle_name+last_name. Data type: String Maximum length: 152
consumer.notes	Notes on consumer. Data type: String Maximum length: 4,000
consumer.notification	Indicates whether the consumer should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Integer Maximum length: 40 Default: 2
consumer.number	Unique number associated with the consumer. Data type: String Maximum length: 40
consumer.photo	Photo of the consumer. Data type: Image
consumer.preferred_language	Consumer primary language. Data type: String Maximum length: 3
consumer.prefix	Consumer name prefix such as, Dr., Mr., Mrs., or Ms. Data type: String Maximum length: 40

© 2026 ServiceNow, Inc. All rights reserved.

Element	Description
consumer.primary	Flag that indicates whether this is the primary consumer. Possible values: • true: Primary consumer • false: Not primary consumer Data type: Boolean Default: false
consumer.state	State in which the consumer resides. Data type: String Maximum length: 100
consumer.street	Consumer street address. Data type: String Maximum length: 255
consumer.suffix	Consumer name suffix such as Jr., Sr., or II. Data type: String
consumer.sys_created_by	User that created the consumer record. Data type: String Maximum length: 40
consumer.sys_created_on	Date and time the consumer record was originally created. Data type: String
consumer.sys_domain	ServiceNow domain in which the consumer information resides. Data type: String
consumer.sys_id	Unique identifier for the consumer. Data type: String
consumer.sys_mod_count	Number of times that the associated consumer information has been modified. Data type: Integer

Element	Description
	Data type: Number (Integer) Default: 1
contact.city	City in which the contact resides. Data type: String Maximum length: 40
contact.company	Sys_id of the company record to which the contact is associated; Company [core_company] table. Data type: String
contact.cost_center	Sys_id of the cost center associated with the contact; Cost Center [cmn_cost_center] table. Data type: String
contact.country	Country code of the country in which the contact resides. Data type: String Maximum length: 3
contact.date_format	Format in which to display dates to contacts. Valid values: • dd/mm/yyyy • dd-mm-yyyy • dd.mm.yyyy • mm-dd-yyyy • yyyy-mm-dd Data type: String Maximum length: 40 Default: blank (system date format)
contact.default_perspective	Sys_id of the default perspective for the contact. Located in the Menu List [sys_perspective] table. Data type: String
contact.department	Sys_id of the department associated with the contact.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Located in the Department [cmn_department] table. Data type: String
contact.edu_status	Education status of the associated contact. Data type: String Maximum length: 40 Default: faculty
contact.email	Contact email address. Data type: String
contact.employee_number	Contact employee number. Data type: String
contact.enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values: • true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false
contact.failed_attempts	Number of failed log in attempts. Data type: Number (Integer)
contact.first_name	Contact first name. Data type: String Maximum length: 50
contact.gender	Contact gender. Data type: String Maximum length: 40
contact.geolocation_tracked	Flag that indicates whether the contact location is obtained through geotracking.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	Possible values: • true: Contact location obtained through geotracking • false: Contact location not obtained through geotracking Data type: Boolean Default value: false
contact.home_phone	Contact home phone number. Data type: String Maximum length: 40
contact.internal_integration_user	Flag that indicates whether the contact is an internal integration user. Possible values: • true: Internal integration user • false: Other type of user Data type: Boolean Default: false
contact.introduction	Introduction Data type: String Maximum length: 40
contact.last_login	Date on which the contact last logged into the system. Data type: String (Date)
contact.last_login_device	Device the consumer used the last time they logged in to the system. Data type: String Maximum length: 40
contact.last_login_time	Date and time the contact logged in to the system. Data type: String (Date/time)
contact.last_name	Contact last name.

Element	Description
	Data type: String Maximum length: 50
contact.last_position_update	Date and time the last position was updated. Data type: String (Date/time)
contact.latitude	Latitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
contact.ldap_server	Sys_id of the LDAP server used by the contact to last log in to the system; LDAP Server [ldap_server_config] table. Data type: String
contact.location	Sys_id of the record that describes the location of the contact; Location [cmn_location] table. Data type: String
contact.locked_out	Flag that indicates if the contact is locked-out. Possible values: • true: Contact locked-out • false: Contact not locked-out Data type: Boolean Default: false
contact.longitude	Longitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
contact.manager	Sys_id of the record that describes the direct supervisor of the contact; User [sys_user] table. Data type: String
contact.middle_name	Contact middle name. Data type: Number (Floating point)

Element	Description
	Maximum length: 50
contact.mobile_phone	Contact mobile phone number. Data type: String Maximum length: 40
contact.name	Contact full name. Data type: String Maximum length: 151
contact.notification	Indicates whether the contact should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Number (Integer) Default: 2
contact.on_schedule	Indicates the timeliness of dispatched service personnel. Valid values: • Ahead: Ahead of schedule. • behind_less30: Behind schedule, but less than 30 minutes. • behind_30to60: Behind schedule between 30 and 60 minutes. • behind_more60: Behind schedule more than 60 minutes. • on_time: On schedule. Data type: String Maximum length: 40
contact.phone	Contact business phone number. Data type: String Maximum length: 40
contact.photo	Photo image of the contact. Data type: Image

Element	Description
contact.preferred_language	Country code of the contact primary language. Data type: String Maximum length: 3
contact.roles	List of user roles associated with the contact. Data type: String Maximum length: 40
contact.schedule	Sys_id of the record that describes the work schedule for the associated contact; Schedule [cmn_schedule] table. Data type: String
contact.source	Source of the contact. Data type: String Maximum length: 255
contact.state	State in which the contact resides. Data type: String Maximum length: 40
contact.street	Contact street address. Data type: String Maximum length: 255
contact.sys_class_name	Table that contains the contact record. Data type: String Maximum length: 80
contact.sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
contact.sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
contact.sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
contact.sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)
contact.sys_id	Unique identifier for the associated contact record. Data type: String
contact.sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
contact.sys_tags	System tags for the content. Data type: String
contact.sys_updated_by	User that last updated the associated contact information. Data type: String Maximum length: 40
contact.sys_updated_on	Data and time the associated contact information was updated. Data type: String (Date/time)
contact.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: Blank (system time format)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 40
contact_local_time	Contact local time. Data type: String Maximum length: 70
contact_time_zone	Time zone of the contact associated with the case. Data type: String Maximum length: 40
contact_type	Method in which the case was initially reported. Possible values: • chat • email • phone • social • web Data type: String Maximum length: 40
contract	Sys_id of the contract associated with the case. Located in the Contract [ast_contract] table. This contract contains information about the type of support that is provided to the company associated to the case. A contract can include a company and contact and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs. Data type: String
correlation_display	Correlation display. Data type: String Maximum length: 100
correlation_id	Correlation identifier.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 100
delivery_plan	Sys_id of the parent execution plan for this case. Located in the Execution Plan [sc_cat_item_delivery_plan] table. Data type: String
delivery_task	Sys_id of the execution plan task. Located in the Execution Plan Task [sc_cat_item_delivery_task] table. Data type: String
description	Detailed description of the problem associated with the case. Data type: String Maximum length: 4,000
due_date	Date that the case is due to be closed. Data type: String
entitlement	Sys_id of the entitlement record associated with the case. Located in the Entitlement [service_entitlement] table. Entitlements define the type of support that a customer receives as well as the supported communication channels. An entitlement can be associated with a product, an asset, an account, or a contract. Data type: String
escalation	Current escalation level. Possible values: • 0: Normal • 1: Moderate • 2: High • 3: Overdue Data type: Number (Integer)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Default: 0
expected_start	Date and time when work is scheduled to begin on the case. Data type: String
first_response_time	Date and time when the first action was taken on the case. Data type: String
follow_the_sun	Flag that indicates whether the case should be handed-off for global follow-up. If a customer enters additional comments on a Priority 1 - Critical or a Priority 2 - High case, or if the case is escalated, the flag is automatically set to true. Possible values: • true: Case should be handed-off for global follow-up • false: Case shouldn't be handed-off for global follow-up Data type: Boolean Default: false
follow_up	Date and time of the next follow-up action. Data type: String
group_list	List of sys_ids of the group records associated with the case. Located in the Group [sys_user_group] table. Data type: Array
impact	Impact on customer. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Default: 3
knowledge	Flag that indicates if there is a knowledge base article available for the specified issue. Possible values: • true: Knowledge base article is available for this issue • false: Knowledge base article is not available for this issue Data type: Boolean Default: false
location	Sys_id of the record describing the company location. Located in the Location [cmn_location] table. Data type: String
made_sla	Flag that indicates whether the case was resolved in alignment with the associated service level agreement. Possible values: • true: Case was resolved in alignment with SLA • false: Case was not resolved according to the SLA Data type: Boolean Default: true
major_case_state	Current state of the major case. Possible values: • accepted: Initial state when a manager creates a major case or when a manager promotes a candidate case. • canceled: Case is canceled. • proposed: Initial state when an agent or manager creates or proposes a candidate case. • rejected: Manager rejected candidate case.

Element	Description
opened_by	Sys_id of the person that initially opened the case. Located in the User [sys_user] table. Data type: String
order	Order of the case. Data type: Number (Integer)
parent	Sys_id of the parent case to which this case (child) is associated. Located in the Task [task] table. Data type: String
partner	Sys_id of the partner associated with the case. Located in the Account [customer_account] table. Data type: String
partner_contact	Sys_id of the partner contact associated with the case. Located in the Contact [customer_contact] table. Data type: String
priority	Priority of the case. Possible values: • 1: Critical • 2: High • 3: Moderate • 4: Low Data type: Number (Integer) Default: 4
probable_cause	Possible cause of the issue associated with the case. Data type: String Maximum length: 4,000
problem	Sys_id of the issue that the customer is encountering. Located in the Problem [problem] table. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
product	Sys_id of the product model of the asset associated to the case. Located in the Product Model [cmdb_model] table. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). Data type: String
reassignment_count	Number of times that the case was reassigned to a person that is responsible for moving the case forward. Data type: Number (Integer) Default: 0
recipient_list	Sys_id of the record that contains the list of recipients for communications about this case. Located in the Recipients List [sn_publications_recipients_list] table. Data type: String
rejection_goto	Sys_id of the task to execute if the case is rejected. Located in the Task [task] table. Data type: String
resolution_code	Resolution state for the case, such as "Solved - Fixed by Support/ Guidance provided". Data type: String Maximum length: 40
resolved_at	Date and time that the case was resolved. Data type: String
resolved_by	Sys_id of the person that resolved the case. Located in the User [sys_user] table. Data type: String
result	Array of objects in which each object describes a single value for the requested field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: Array `"result": [ { "label": "String", "value": "String" } ]`
result.label	Display value for the field value. Data type: String
result.value	Field value. Data type: String
short_description	Concise description of the case. Data type: String Maximum length: 160
skills	List of the unique identifiers (sys_id) of the skills needed to complete the case. Located in the Skill [cmn_skill] table. Data type: String
sla_due	Date/time at which the case must be closed based on the associated service level agreement. Data type: String
sn_app_cs_social_social_profile	Array of objects that contain details for a specific social media profile, such as Facebook, Twitter, or YouTube. Data type: Array `"sn_app_cs_social_social_profile": [ { "account": "String", "channel": [Array], "contact": {Object}, "consumer": {Object}, "created_on": "String",`

Element	Description
	"sys_update_name": "String", "sys_updated_by": "String", "sys_updated_on": "String" }
sn_app_cs_social_social_profile.channel.name	Name of the social media channel. Data type: String Maximum length: 100
sn_app_cs_social_social_profile.channel.sys_class_name	Table that contains the social media channel record. Data type: String Maximum length: 80
sn_app_cs_social_social_profile.channel.sys_created_by	Person that created the social media channel. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.channel.sys_created_on	Date and time the social media profile was created. Data type: Date/time Maximum length: 40
sn_app_cs_social_social_profile.channel.sys_id	Unique identifier of the associated social media profile channel. Data type: String
sn_app_cs_social_social_profile.channel.sys_mod_count	Number of times that information was modified for the associated social media profile channel. Data type: Integer
sn_app_cs_social_social_profile.channel.sys_name	System name of channel. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.channel.sys_package	Unique identifier of the record that contains information about the package associated with the profile; Package [sys_package] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	Maximum length: 100
sn_app_cs_social_social_profile.consumer.fax	Fax number of the consumer. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.first_name	Consumer first name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.consumer.gender	Gender of the consumer. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.home_phone	Home phone number of the consumer. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.household	Sys_id of the record that describes the household characteristics. Located in the Household [csm_household] table. Data type: String
sn_app_cs_social_social_profile.consumer.last_name	Consumer last name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.consumer.middle_name	Consumer middle name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.consumer.mobile_phone	Consumer mobile phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.name	Consumer full name; first_name +middle_name+last_name. Data type: String

Element	Description
	Maximum length: 152
sn_app_cs_social_social_profile.consumer.notes	Notes on consumer. Data type: String Maximum length: 4,000
sn_app_cs_social_social_profile.consumer.notification	Indicates whether the consumer should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Integer Maximum length: 40 Default: 2
sn_app_cs_social_social_profile.consumer.number	Unique number associated with the consumer. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.photo	Photo of the consumer. Data type: Image
sn_app_cs_social_social_profile.consumer.preferred_language	Consumer primary language. Data type: String Maximum length: 3
sn_app_cs_social_social_profile.consumer.prefix	Consumer name prefix such as, Dr., Mr., Mrs., or Ms. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.primary	Flag that indicates whether this is the primary consumer. Possible values: • true: Primary consumer • false: Not primary consumer Data type: Boolean Default: false

Element	Description
sn_app_cs_social_social_profile.consumer.state	State in which the consumer resides. Data type: String Maximum length: 100
sn_app_cs_social_social_profile.consumer.street	Consumer street address. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.consumer.suffix	Consumer name suffix such as Jr., Sr., or II. Data type: String
sn_app_cs_social_social_profile.consumer.sys_created_by	User that created the consumer record. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.sys_created_on	Date and time the consumer record was originally created. Data type: String
sn_app_cs_social_social_profile.consumer.sys_domain	ServiceNow domain in which the consumer information resides. Data type: String
sn_app_cs_social_social_profile.consumer.sys_id	Unique identifier for the consumer. Data type: String
sn_app_cs_social_social_profile.consumer.sys_mod_count	Number of times that the associated consumer information has been modified. Data type: Integer
sn_app_cs_social_social_profile.consumer.sys_tags	Consumer system tags.
sn_app_cs_social_social_profile.consumer.sys_updated_by	User that last updated the consumer information. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.sys_updated_on	Date and time when the consumer information was last updated.

Element	Description
	Data type: String
sn_app_cs_social_social_profile.consumer.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: blank (system time format)
sn_app_cs_social_social_profile.consumer.time_zone	Consumer time zone, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.title	Consumer business title such as Manager, Software Developer, or Contractor. Data type: String Maximum length: 60
sn_app_cs_social_social_profile.consumer.user	Sys_id of the consumer user. Located in the Consumer User [csm_consumer_user] table. Data type: String
sn_app_cs_social_social_profile.consumer.zip	Consumer zip code. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact	For business-to-business cases. Unique identifier of the record containing details about the social media profile that belongs to the contact associated with the case. Located in the Contact [customer_contact] table. Data type: String

Element	Description
	Default: faculty
sn_app_cs_social_social_profile.contact.email	Contact email address. Data type: String
sn_app_cs_social_social_profile.contact.employee_number	Contact employee number. Data type: String
sn_app_cs_social_social_profile.contact.enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values: • true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.failed_attempts	Number of failed log in attempts. Data type: Number (Integer)
sn_app_cs_social_social_profile.contact.first_name	Contact first name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.contact.gender	Contact gender. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.geolocation_tracked	Flag that indicates whether the contact location is obtained through geotracking. Possible values: • true: Contact location obtained through geotracking • false: Contact location not obtained through geotracking Data type: Boolean Default value: false

Element	Description
sn_app_cs_social_social_profile.contact.home_phone	Contact home phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.internal_itegration_user	Flag that indicates whether the contact is an internal integration user. Possible values: • true: Internal integration user • false: Other type of user Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.introduction	Introduction Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.last_login	Date on which the contact last logged into the system. Data type: String (Date)
sn_app_cs_social_social_profile.contact.last_login_device	Device the consumer used the last time they logged in to the system. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.last_login_time	Date and time the contact logged in to the system. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.last_name	Contact last name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.contact.last_position_update	Date and time the last position was updated. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.latitude	Latitude coordinate of the contact. Data type: Number (Floating point)

Element	Description
	Maximum length: 40
sn_app_cs_social_social_profile.contact.ldap_server	Sys_id of the LDAP server used by the contact to last log in to the system; LDAP Server [ldap_server_config] table. Data type: String
sn_app_cs_social_social_profile.contact.location	Sys_id of the record that describes the location of the contact; Location [cmn_location] table. Data type: String
sn_app_cs_social_social_profile.contact.locked_out	Flag that indicates if the contact is locked-out. Possible values: • true: Contact locked-out • false: Contact not locked-out Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.longitude	Longitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
sn_app_cs_social_social_profile.contact.manager	Sys_id of the record that describes the direct supervisor of the contact; User [sys_user] table. Data type: String
sn_app_cs_social_social_profile.contact.middle_name	Contact middle name. Data type: Number (Floating point) Maximum length: 50
sn_app_cs_social_social_profile.contact.mobile_phone	Contact mobile phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.name	Contact full name. Data type: String Maximum length: 151

Element	Description
sn_app_cs_social_social_profile.contact.notification	Indicates whether the contact should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Number (Integer) Default: 2
sn_app_cs_social_social_profile.contact.on_schedule	Indicates the timeliness of dispatched service personnel. Valid values: • Ahead: Ahead of schedule. • behind_less30: Behind schedule, but less than 30 minutes. • behind_30to60: Behind schedule between 30 and 60 minutes. • behind_more60: Behind schedule more than 60 minutes. • on_time: On schedule. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.phone	Contact business phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.photo	Photo image of the contact. Data type: Image
sn_app_cs_social_social_profile.contact.preferred_language	Country code of the contact primary language. Data type: String Maximum length: 3
sn_app_cs_social_social_profile.contact.roles	List of user roles associated with the contact. Data type: String

Element	Description
	Maximum length: 40
sn_app_cs_social_social_profile.contact.schedule	Sys_id of the record that describes the work schedule for the associated contact; Schedule [cmn_schedule] table. Data type: String
sn_app_cs_social_social_profile.contact.source	Source of the contact. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.contact.state	State in which the contact resides. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.street	Contact street address. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.contact.sys_class_name	Table that contains the contact record. Data type: String Maximum length: 80
sn_app_cs_social_social_profile.contact.sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
sn_app_cs_social_social_profile.contact.sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)

Element	Description
sn_app_cs_social_social_profile.contact.sys_id	Unique identifier for the associated contact record. Data type: String
sn_app_cs_social_social_profile.contact.sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
sn_app_cs_social_social_profile.contact.sys_tags	Contact system tags.
sn_app_cs_social_social_profile.contact.sys_updated_by	User that last updated the associated contact information. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.sys_updated_on	Data and time the associated contact information was updated. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: Blank (system time format)
sn_app_cs_social_social_profile.contact.time_sheet_policy	Sys_id of the record that contains the time sheet policy for the associated contact; Time Sheet Policy [time_sheet_policy] table. Data type: String
sn_app_cs_social_social_profile.contact.time_zone	Time zone in which the contact resides, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40

Element	Description
sn_app_cs_social_social_profile.profile_url	URL to use to access the social media profile. Data type: String Maximum length: 1,024
sn_app_cs_social_social_profile.social_id	Unique social media account provider identifier for the associated social media account. Data type: String Maximum length: 100
sn_app_cs_social_social_profile.source	Source of the social profile. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.sys_created_by	User that initially created the social media profile. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.sys_created_on	Date and time the social media profile was initially created. Data type: String (Date/time)
sn_app_cs_social_social_profile.sys_id	Unique identifier for the social media profile. Data type: String
sn_app_cs_social_social_profile.sys_mod_count	Number of times that information was modified for the associated social media profile. Data type: Number (Integer)
sn_app_cs_social_social_profile.sys_tags	Profile system tags.
sn_app_cs_social_social_profile.sys_updated_by	User that initially created the social media profile. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.sys_updated_on	User that initially created the social media profile. Data type: String

Element	Description
	Maximum length: 40
state	Current state of the case. Possible values: • 1: New • 3: Closed • 6: Resolved • 10: Open • 18: Awaiting Info Data type: Number (Integer) Default: 1
subcategory	Case subcategory. Possible values: 0: Question Data type: Number (Integer) Default: 0
support_manager	Sys_id of the CSM manager assigned to the case. Located in the User [sys_user] table. Data type: String
sync_driver	Flag that indicates whether there's driver synchronization. Possible values: • true: Driver is synchronized • false: Driver isn't synchronized Data type: Boolean
sys_class_name	Table that contains the case record. Data type: String Maximum length: 80
sys_created_by	Person that initially opened the case. Data type: String Maximum length: 40

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
sys_created_on	Date and time when the case was initially created. Data type: String
sys_domain	Domain associated with the case. Data type: String Maximum length: 32 Default: global
sys_domain_path	Domain path. Data type: String Maximum length: 255 Default: /
sys_id	Unique identifier for the case. Data type: String Maximum length: 32
sys_mod_count	Number of updates to the case since it was initially created. Data type: Number (Integer)
sys_tags	System tags.
sys_updated_by	Person that last updated the case. Data type: String Maximum length: 40
sys_updated_on	Date and time when the case was last updated. Data type: String
time_worked	Total amount of time worked on the case. Data type: String
upon_approval	Action to take if the case is approved. Possible values: • do_nothing • proceed

Element	Description
	Data type: String Maximum length: 40 Default: proceed
upon_reject	Action to take if the case is rejected. Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
urgency	Urgency of the case. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
user_input	Additional user input. Data type: String Maximum length: 4,000
variable_pool	Grouping of variables.
variables	Name-value pairs of variables associated with the case. Data type: String Maximum length: 40
watch_list	List of sys_ids of the users who receive notifications about this case when additional comments are added or if the state of a case is changed to Resolved or Closed. Located in the User [sys_user] table. Data type: Array

Element	Description
wf_activity	Sys_id of the workflow activity record associated with the case. Located in the Workflow Activity [wf_activity] table. Data type: String
work_end	Date and time work ended on the case. Data type: String
work_notes	Information about how to resolve the case, or steps taken to resolve it. Data type: String Maximum length: 4,000
work_notes_list	List of sys_ids of the internal users who receive notifications about this case when work notes are added. Located in the User [sys_user] table. Data type: Array
work_start	Date and time that work started on the case. Data type: String

Example: cURL request

Retrieve the third and fourth CSM cases listed for a specific account.

```
curl
 "https://instance.servicenow.com/api/sn_customerservice/case?sy
sparm_query=account=86837a386f0331003b3c498f5d3ee4ca&sysparm_lim
it=2&sysparm_offset=2" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

The response shows the two cases.

Case - POST /sn_customerservice/case

Creates a new Customer Service Management (CSM) case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To use this endpoint, users must have the csm_ws_integration, sn_customerservice.customer, or sn_customerservice.consumer role.

You can create different types of cases depending on whether you are working in a business-to-business (B2B) or business-to-consumer (B2C) environment, or creating a case for an order or product.

In addition, you can create a social media profile for a contact, consumer, or account using this endpoint. To create a social media profile, you must specify the following parameters in the request body:

- *social_channel*
- *social_handle*
- *social_handle_type*
- *social_handle_url*
- *social_post_url*

All request body parameters are optional. Some parameters are only valid in one environment or the other (B2B or B2C), and are noted as such in the request body parameter descriptions. If you specify a contact, the account, case report, contract, and entitlement parameters are defaulted to the values defined in the contact/account records. If you specify an account, the case report, contract, and entitlement parameters are defaulted to the values defined in the account record (unless overridden by passed in parameters.) If you do not pass any parameters to the endpoint, the case record is created with only default information (defined in the table below) and instance generated values (*sys_ **). All other parameters are set with their equivalent of a null value. In addition to the list of parameters defined below, which define the parameters found in a base system, the endpoint also accepts custom case fields and any additional case fields configured in your instance. For additional information on these elements, refer to your specific table definitions [**System Definition** > **Tables**].

Warning: This endpoint does not perform parameter validation as doing so can create excessive overhead. If a request parameter is misspelled, is not valid for the type of case, or is not supported by the endpoint, it is either ignored without warning or can cause unexpected results. For example, if you create a consumer or contact for the wrong type of case or mismatch a contact with an account.

Warning: By default, external users who have the sn_customerservice.customer or sn_customerservice.consumer role can only set the account, asset, comments, consumer, contact, contact_type, partner, partner_contact, priority, product, short_description, and state fields using this endpoint.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/sn_customerservice/{api_version}/case`

Default URL: `/api/sn_customerservice/case`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Element	Description
account	Sys_id of the account associated with the case; located in the Account [customer_account] table. Data type: String Default: If *contact* specified, defaults to account specified in contact record.
active	Flag that indicates whether the case is open and active. Possible values: • true: Case is active • false: Case is closed Data type: Boolean Default: true
active_account_escalation	Sys_id of the active account escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
active_escalation	Sys_id of the active escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
activity_due	Date for which the associated case is expected to be completed. Data type: String

Request body parameters (XML or JSON) (continued)

Element	Description
additional_assignee_list	List of the sys_ids of the additional persons (other than the primary assignee) that have been assigned to the account. Located in the User [sys_user] table. Data type: Array Maximum: 4,000
approval	String that describes the type of approval required. Possible values: • approved • cancelled • duplicate • not_required • not requested • rejected • requested Data type: String Maximum characters: 40 Default: not requested
assigned_to	Sys_id of the person assigned to the case. Located in the User [sys_user] table. Data type: String
assignment_group	Sys_id of the customer service agent group assigned to the case. Located in the Group [sys_user_group] table. Data type: String
business_duration	Length in calendar work hours, work days, and work weeks that it took to complete the case. Data type: String
business_impact	Impact of the issue on the associated customer. Data type: String Maximum characters: 4,000
business_service	Sys_id of the service record associated with the case. Located in the Service [cmdb_ci_service] table. Data type: String

Request body parameters (XML or JSON) (continued)

Element	Description
category	Case category. Possible values: • 0: Question • 1: Issue • 2: Feature Data type: Number (Integer) Default: 1
cause	Details about the cause of the problem. Data type: String Maximum length: 4,000
caused_by	Sys_id of the change request that caused the case to be created. Located in the Change Request [change_request] table. Data type: String
change	Sys_id of the change request that caused the case to be created. Located in the Change Request [change_request] table. Data type: String
child_case_creation_progress	Flag that indicates whether the case is a child case that was created from a major case. Possible values: • true: Child case created from a major case • false: Not a child case Data type: Boolean
close_notes	Notes made when the case was closed. Data type: String Maximum length: 4,000
closed_at	Date and time that the case was closed. Data type: String
closed_by	Sys_id of the user that closed the case. Located in the User [sys_user] table.

Element	Description
	company associated to the case. A contract can include a company and contact and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs. Data type: String
correlation_display	Correlation display. Data type: String Maximum length: 100
correlation_id	Correlation identifier. Data type: String Maximum length: 100
delivery_plan	Sys_id of the parent execution plan for this case. Located in the Execution Plan [sc_cat_item_delivery_plan] table. Data type: String
delivery_task	Sys_id of the execution plan task. Located in the Execution Plan Task [sc_cat_item_delivery_task] table. Data type: String
description	Detailed description of the problem associated with the case. Data type: String Maximum length: 4,000
due_date	Date that the case is due to be closed. Data type: String
entitlement	Sys_id of the entitlement record associated with the case. Located in the Entitlement [service_entitlement] table. Entitlements define the type of support that a customer receives as well as the supported communication channels. An entitlement can be associated with a product, an asset, an account, or a contract. Data type: String
escalation	Current escalation level. Possible values: • 0: Normal • 1: Moderate

Request body parameters (XML or JSON) (continued)

Element	Description
	• 2: High • 3: Overdue Data type: Number (Integer) Default: 0
expected_start	Date and time when work is scheduled to begin on the case. Data type: String
first_response_time	Date and time when the first action was taken on the case. Data type: String
follow_the_sun	Flag that indicates whether the case should be handed-off for global follow-up. If a customer enters additional comments on a Priority 1 - Critical or a Priority 2 - High case, or if the case is escalated, the flag is automatically set to true. Possible values: • true: Case should be handed-off for global follow-up • false: Case shouldn't be handed-off for global follow-up Data type: Boolean Default: false
group_list	List of sys_ids of the group records associated with the case. Located in the Group [sys_user_group] table. Data type: Array
impact	Impact on customer. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
knowledge	Flag that indicates if there is a knowledge base article available for the specified issue. Possible values:

Request body parameters (XML or JSON) (continued)

Element	Description
	• true: Knowledge base article is available for this issue • false: Knowledge base article is not available for this issue Data type: Boolean Default: false
location	Sys_id of the record describing the company location. Located in the Location [cmn_location] table. Data type: String
made_sla	Flag that indicates whether the case was resolved in alignment with the associated service level agreement. Possible values: • true: Case was resolved in alignment with SLA • false: Case was not resolved according to the SLA Data type: Boolean Default: true
major_case_state	Current state of the major case. Possible values: • accepted: Initial state when a manager creates a major case or when a manager promotes a candidate case. • canceled: Case is canceled. • proposed: Initial state when an agent or manager creates or proposes a candidate case. • rejected: Manager rejected candidate case. Data type: String Maximum length: 40
notes_to_comments	Flag that indicates whether to add the resolution notes to the comments. Possible values: • true: Resolutions notes, when added, are also added to the comments • false: Resolution notes in comments are not required Data type: Boolean
notify	Method to use to notify contact/consumer.

Request body parameters (XML or JSON) (continued)

Element	Description
	Data type: Number (Integer) Default: 4
probable_cause	Possible cause of the issue associated with the case. Data type: String Maximum length: 4,000
problem	Sys_id of the issue that the customer is encountering. Located in the Problem [problem] table. Data type: String
product	Sys_id of the product model of the asset associated to the case. Located in the Product Model [cmdb_model] table. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). Data type: String
reassignment_count	Number of times that the case was reassigned to a person that is responsible for moving the case forward. Data type: Number (Integer) Default: 0
recipient_list	Sys_id of the record that contains the list of recipients for communications about this case. Located in the Recipients List [sn_publications_recipients_list] table. Data type: String
rejection_goto	Sys_id of the task to execute if the case is rejected. Located in the Task [task] table. Data type: String
resolution_code	Resolution state for the case, such as "Solved - Fixed by Support/Guidance provided". Data type: String Maximum length: 40
resolved_at	Date and time that the case was resolved. Data type: String
resolved_by	Sys_id of the person that resolved the case. Located in the User [sys_user] table. Data type: String

Request body parameters (XML or JSON) (continued)

Element	Description
short_description	Concise description of the case. Data type: String Maximum length: 160
skills	List of the unique identifiers (sys_id) of the skills needed to complete the case. Located in the Skill [cmn_skill] table. Data type: String
sla_due	Date/time at which the case must be closed based on the associated service level agreement. Data type: String
social_channel	Type of social media channel such as Twitter, Facebook, or Instagram. Data type: String
social_handle	User handle on the channel. Data type: String
social_handle_type	Type of case to associate the social media profile. Valid values: • account • consumer • contact Data type: String
social_handle_url	URL of the user's social media handle. Data type: String
social_post_url	URL of the social message from which the case is being generated. Data type: String
state	Current state of the case. Possible values: • 1: New • 3: Closed • 6: Resolved

Request body parameters (XML or JSON) (continued)

Element	Description
	Default: proceed
upon_reject	Action to take if the case is rejected. Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
urgency	Urgency of the case. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
user_input	Additional user input. Data type: String Maximum length: 4,000
variables	Name-value pairs of variables associated with the case. Data type: String Maximum length: 40
watch_list	List of sys_ids of the users who receive notifications about this case when additional comments are added or if the state of a case is changed to Resolved or Closed. Located in the User [sys_user] table. Data type: Array
wf_activity	Sys_id of the workflow activity record associated with the case. Located in the Workflow Activity [wf_activity] table. Data type: String
work_end	Date and time work ended on the case. Data type: String

Request body parameters (XML or JSON) (continued)

Element	Description
work_notes_list	List of sys_ids of the internal users who receive notifications about this case when work notes are added. Located in the User [sys_user] table. Data type: Array
work_start	Date and time that work started on the case. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	New case record was successfully created.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Element	Description
number	Associated case number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
sys_id	Sys_id of the new case record created in the Case [sn_customerservice_case] table. Data type: String

Example: cURL request

The following example illustrates how to create a case based on a consumer and also create a new social media account that is associated with the case.

```
curl
 "https://instance.servicenow.com/api/sn_customerservice/case" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{ \
    consumer: \"cd97ef1ddb8bc7006b7a9646db9619ac\", \
    contact_type: \"social\", \
    priority: \"4\", \
    short_description: \"Consumer Test Case\", \
    social_channel: \"TWITTER\", \
    social_handle: \"consumertwo\", \
    social_handle_type: \"Consumer\", \
    social_handle_url: \"https://www.twitter.com/consumertwo\",
 \
    social_post_url:
 \"https://twitter.com/MuleSoft/status/829092185022750720\"}" \
--user "username":"password"
```

```
{
  "result": {
    "sys_id": "0397c743db436f0057c3fd441d96197f",
    "number": "CS0001005"
  }
}
```

Example: cURL request

The following example illustrates how to create a case for an account.

```
curl
 "https://instance.servicenow.com/api/sn_customerservice/case" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{ \
    account: \"051f62b0d7300200e5982cf65e610333\", \
    contact_type: \"phone\", \
    priority: \"1\", \
    short_description: \"Power Outage\"}" \
--user "username":"password"
```

```
{
  "result": {
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "sys_id": "b88366ffdb1b0b00216e9ee6db96190b",
    "number": "CS0001021"
  }
}
```

Example: cURL request

The following example illustrates how to create a case for a specific contact. Note that if an account is specified within the contact record, that account is automatically assigned to the case.

```
curl
 "https://instance.servicenow.com/api/sn_customerservice/case" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{ \
    contact: \"62fe1c97db76c3006b7a9646db961999\", \
    contact_type: \"phone\", \
    priority: \"3\", \
    short_description: \"Power Outage\"}" \
--user "username":"password"
```

```
{
  "result": {
    "sys_id": "bf916affdb1b0b00216e9ee6db961937",
    "number": "CS0001013"
  }
}
```

Case - PUT /sn_customerservice/case/{id}

Updates the specified existing Customer Service Management (CSM) case with the passed-in parameters.

Warning: This endpoint does not perform parameter validation as doing so can create excessive overhead. If a request parameter is misspelled, is not valid for the type of case, or is not supported by the endpoint, it is either ignored without warning or can cause unexpected results. For example, if you create a consumer or contact for the wrong type of case or mismatch a contact with an account.

Warning: By default, external users who have the sn_customerservice.customer or sn_customerservice.consumer role can only set the comments and state fields using this endpoint. Admins can enable external users to set additional fields by specifying the field names in the UPDATE_ALLOWED_FIELDS array defined in the *CaseRESTAPIValidatorForExternalUser* script include. Exercise caution when adding new fields to this array, as there may not be existing validators for input into those fields. For more information on script includes, see Script includes.

Note: You can reference all sysparm query parameters using either their full name or their shortened name (without the *sysparm_* prefix). For example, for *sysparm_limit* you can also use *limit*.

URL format

Versioned URL: `/api/sn_customerservice/{api_version}/case/{id}`

Default URL: `/api/sn_customerservice/case/{id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
id	Sys_id of the case to update. Located in the Case [sn_customerservice_case] table.

Query parameters

Name	Description
sysparm_display_value	Determines the type of data returned, either the actual values from the database or the display values of the fields. Display values are manipulated based on the actual value in the database and user or system settings and preferences. If returning display values, the value that is returned is dependent on the field type. • Choice fields: The database value may be a number, but the display value will be more descriptive. • Date fields: The database value is in UTC format, while the display value is based on the user's time zone. • Encrypted text: The database value is encrypted, while the displayed value is unencrypted based on the user's encryption context. • Reference fields: The database value is sys_id, but the display value is a display field of the referenced record. Data type: String Valid values: • true: Returns the display values for all fields. • false: Returns the actual values from the database. • all: Returns both actual and display values. Default: false **Note:** There is no preferred method for setting this parameter. However, specifying the display value may cause performance issues since it is not reading directly from the database and may include referencing other fields and records. For more information on display values and actual values, see Table API FAQs (KB0534905).
sysparm_fields	Comma-separated list of fields to return in the response.

Query parameters (continued)

Name	Description
	Data type: String
sysparm_get_case_details	Flag that indicates whether to return the updated case record. Valid values: • true: Return updated case record. • false: Do not return the updated case record. Data type: Boolean Default: false

Request body parameters (XML or JSON)

Element	Description
account	Sys_id of the account associated with the case. Located in the Account [customer_account] table. Data type: String Default: If *contact* specified, defaults to account specified in contact record.
active	Flag that indicates whether the case is open and active. Possible values: • true: Case is active • false: Case is closed Data type: Boolean Default: true
active_account_escalation	Sys_id of the active account escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
active_escalation	Sys_id of the active escalation record associated with the case. Located in the Escalation [sn_customerservice_escalation] table. Data type: String
activity_due	Date for which the associated case is expected to be completed. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Element	Description
	• true: Knowledge base article is available for this issue • false: Knowledge base article is not available for this issue Data type: Boolean Default: false
location	Sys_id of the record describing the company location. Located in the Location [cmn_location] table. Data type: String
made_sla	Flag that indicates whether the case was resolved in alignment with the associated service level agreement. Possible values: • true: Case was resolved in alignment with SLA • false: Case was not resolved according to the SLA Data type: Boolean Default: true
major_case_state	Current state of the major case. Possible values: • accepted: Initial state when a manager creates a major case or when a manager promotes a candidate case. • canceled: Case is canceled. • proposed: Initial state when an agent or manager creates or proposes a candidate case. • rejected: Manager rejected candidate case. Data type: String Maximum length: 40
notes_to_comments	Flag that indicates whether to add the resolution notes to the comments. Possible values: • true: Resolutions notes, when added, are also added to the comments • false: Resolution notes in comments are not required Data type: Boolean
notify	Method to use to notify contact/consumer.

Request body parameters (XML or JSON) (continued)

Element	Description
	Possible values: • 1: Do not notify • 2: Send email • 3: Telephone Data type: Number (Integer) Default: 1
number	Case number. Data type: String Maximum length: 40
opened_at	Date and time that the case was opened. Data type: String
opened_by	Sys_id of the person that initially opened the case. Located in the User [sys_user] table. Data type: String
order	Order of the case. Data type: Number (Integer)
parent	Sys_id of the parent case to which this case (child) is associated. Located in the Task [task] table. Data type: String
partner	Sys_id of the partner associated with the case. Located in the Account [customer_account] table. Data type: String
partner_contact	Sys_id of the partner contact associated with the case. Located in the Contact [customer_contact] table. Data type: String
priority	Priority of the case. Possible values: • 1: Critical • 2: High • 3: Moderate • 4: Low

Request body parameters (XML or JSON) (continued)

Element	Description
	Data type: Number (Integer) Default: 4
probable_cause	Possible cause of the issue associated with the case. Data type: String Maximum length: 4,000
problem	Sys_id of the issue that the customer is encountering. Located in the Problem [problem] table. Data type: String
product	Sys_id of the product model of the asset associated to the case. Located in the Product Model [cmdb_model] table. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). Data type: String
reassignment_count	Number of times that the case was reassigned to a person that is responsible for moving the case forward. Data type: Number (Integer) Default: 0
recipient_list	Sys_id of the record that contains the list of recipients for communications about this case. Located in the Recipients List [sn_publications_recipients_list] table. Data type: String
rejection_goto	Sys_id of the task to execute if the case is rejected. Located in the Task [task] table. Data type: String
resolution_code	Resolution state for the case, such as "Solved - Fixed by Support/Guidance provided". Data type: String Maximum length: 40
resolved_at	Date and time that the case was resolved. Data type: String
resolved_by	Sys_id of the person that resolved the case. Located in the User [sys_user] table. Data type: String

Request body parameters (XML or JSON) (continued)

Element	Description
short_description	Concise description of the case. Data type: String Maximum length: 160
skills	List of the unique identifiers (sys_id) of the skills needed to complete the case. Located in the Skill [cmn_skill] table. Data type: String
sla_due	Date/time at which the case must be closed based on the associated service level agreement. Data type: String
social_channel	Type of social media channel such as Twitter, Facebook, or Instagram. Data type: String
social_handle	User handle on the channel. Data type: String
social_handle_type	Type of case to associate the social media profile. Valid values: • account • contact • consumer Data type: String
social_handle_url	URL of the user's social media handle. Data type: String
social_post_url	URL of the social message from which the case is being generated. Data type: String
state	Current state of the case. Possible values: • 1: New • 3: Closed • 6: Resolved

Request body parameters (XML or JSON) (continued)

Element	Description
work_notes_list	List of sys_ids of the internal users who receive notifications about this case when work notes are added. Located in the User [sys_user] table. Data type: Array
work_start	Date and time that work started on the case. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
contact.agent_status	Status of the agent. Possible values: • Off work • On break • On route • On site Data type: String Maximum length: 40
contact.building	Sys_id of the record that describes the building in which the contact resides; Building [cmn_building] table. Data type: String
contact.calendar_integration	Calendar application that the contact uses. 1: Outlook Data type: Number (Integer) Default: 1
contact.city	City in which the contact resides. Data type: String Maximum length: 40
contact.company	Sys_id of the company record to which the contact is associated; Company [core_company] table. Data type: String
contact.cost_center	Sys_id of the cost center associated with the contact; Cost Center [cmn_cost_center] table. Data type: String
contact.country	Country code of the country in which the contact resides. Data type: String Maximum length: 3
contact.date_format	Format in which to display dates to contacts.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Valid values: • dd/mm/yyyy • dd-mm-yyyy • dd.mm.yyyy • mm-dd-yyyy • yyyy-mm-dd Data type: String Maximum length: 40 Default: blank (system date format)
contact.default_perspective	Sys_id of the default perspective for the contact. Located in the Menu List [sys_perspective] table. Data type: String
contact.department	Sys_id of the department associated with the contact. Located in the Department [cmn_department] table. Data type: String
contact.edu_status	Education status of the associated contact. Data type: String Maximum length: 40 Default: faculty
contact.email	Contact email address. Data type: String
contact.employee_number	Contact employee number. Data type: String
contact.enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values:

Element	Description
	• true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false
contact.failed_attempts	Number of failed log in attempts. Data type: Number (Integer)
contact.first_name	Contact first name. Data type: String Maximum length: 50
contact.gender	Contact gender. Data type: String Maximum length: 40
contact.geolocation_tracked	Flag that indicates whether the contact location is obtained through geotracking. Possible values: • true: Contact location obtained through geotracking • false: Contact location not obtained through geotracking Data type: Boolean Default value: false
contact.home_phone	Contact home phone number. Data type: String Maximum length: 40
contact.internal_integration_user	Flag that indicates whether the contact is an internal integration user. Possible values: • true: Internal integration user • false: Other type of user Data type: Boolean

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Default: false
contact.introduction	Introduction Data type: String Maximum length: 40
contact.last_login	Date on which the contact last logged into the system. Data type: String (Date)
contact.last_login_device	Device the consumer used the last time they logged in to the system. Data type: String Maximum length: 40
contact.last_login_time	Date and time the contact logged in to the system. Data type: String (Date/time)
contact.last_name	Contact last name. Data type: String Maximum length: 50
contact.last_position_update	Date and time the last position was updated. Data type: String (Date/time)
contact.latitude	Latitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
contact.ldap_server	Sys_id of the LDAP server used by the contact to last log in to the system; LDAP Server [ldap_server_config] table. Data type: String
contact.location	Sys_id of the record that describes the location of the contact; Location [cmn_location] table. Data type: String

Element	Description
contact.locked_out	Flag that indicates if the contact is locked-out. Possible values: • true: Contact locked-out • false: Contact not locked-out Data type: Boolean Default: false
contact.longitude	Longitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
contact.manager	Sys_id of the record that describes the direct supervisor of the contact; User [sys_user] table. Data type: String
contact.middle_name	Contact middle name. Data type: Number (Floating point) Maximum length: 50
contact.mobile_phone	Contact mobile phone number. Data type: String Maximum length: 40
contact.name	Contact full name. Data type: String Maximum length: 151
contact.notification	Indicates whether the contact should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Number (Integer) Default: 2
contact.on_schedule	Indicates the timeliness of dispatched service personnel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Valid values: • Ahead: Ahead of schedule. • behind_less30: Behind schedule, but less than 30 minutes. • behind_30to60: Behind schedule between 30 and 60 minutes. • behind_more60: Behind schedule more than 60 minutes. • on_time: On schedule. Data type: String Maximum length: 40
contact.phone	Contact business phone number. Data type: String Maximum length: 40
contact.photo	Photo image of the contact. Data type: Image
contact.preferred_language	Country code of the contact primary language. Data type: String Maximum length: 3
contact.roles	List of user roles associated with the contact. Data type: String Maximum length: 40
contact.schedule	Sys_id of the record that describes the work schedule for the associated contact; Schedule [cmn_schedule] table. Data type: String
contact.source	Source of the contact. Data type: String Maximum length: 255

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
contact.state	State in which the contact resides. Data type: String Maximum length: 40
contact.street	Contact street address. Data type: String Maximum length: 255
contact.sys_class_name	Table that contains the contact record. Data type: String Maximum length: 80
contact.sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
contact.sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)
contact.sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
contact.sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)
contact.sys_id	Unique identifier for the associated contact record. Data type: String
contact.sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
contact.sys_tags	System tags for the content. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 40
contract	Sys_id of the contract associated with the case. Located in the Contract [ast_contract] table. This contract contains information about the type of support that is provided to the company associated to the case. A contract can include a company and contact and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs. Data type: String
correlation_display	Correlation display. Data type: String Maximum length: 100
correlation_id	Correlation identifier. Data type: String Maximum length: 100
delivery_plan	Sys_id of the parent execution plan for this case. Located in the Execution Plan [sc_cat_item_delivery_plan] table. Data type: String
delivery_task	Sys_id of the execution plan task. Located in the Execution Plan Task [sc_cat_item_delivery_task] table. Data type: String
description	Detailed description of the problem associated with the case. Data type: String Maximum length: 4,000
due_date	Date that the case is due to be closed. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
entitlement	Sys_id of the entitlement record associated with the case. Located in the Entitlement [service_entitlement] table. Entitlements define the type of support that a customer receives as well as the supported communication channels. An entitlement can be associated with a product, an asset, an account, or a contract. Data type: String
escalation	Current escalation level. Possible values: • 0: Normal • 1: Moderate • 2: High • 3: Overdue Data type: Number (Integer) Default: 0
expected_start	Date and time when work is scheduled to begin on the case. Data type: String
first_response_time	Date and time when the first action was taken on the case. Data type: String
follow_the_sun	Flag that indicates whether the case should be handed-off for global follow-up. If a customer enters additional comments on a Priority 1 - Critical or a Priority 2 - High case, or if the case is escalated, the flag is automatically set to true. Possible values: • true: Case should be handed-off for global follow-up • false: Case shouldn't be handed-off for global follow-up Data type: Boolean

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Default: false
follow_up	Date and time of the next follow-up action. Data type: String
group_list	List of sys_ids of the group records associated with the case. Located in the Group [sys_user_group] table. Data type: Array
impact	Impact on customer. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
knowledge	Flag that indicates if there is a knowledge base article available for the specified issue. Possible values: • true: Knowledge base article is available for this issue • false: Knowledge base article is not available for this issue Data type: Boolean Default: false
location	Sys_id of the record describing the company location. Located in the Location [cmn_location] table. Data type: String
made_sla	Flag that indicates whether the case was resolved in alignment with the associated service level agreement. Possible values:

Element	Description
	Data type: Boolean
notify	Method to use to notify contact/ consumer. Possible values: • 1: Do not notify • 2: Send email • 3: Telephone Data type: Number (Integer) Default: 1
number	Case number. Data type: String Maximum length: 40
opened_at	Date and time that the case was opened. Data type: String
opened_by	Sys_id of the person that initially opened the case. Located in the User [sys_user] table. Data type: String
order	Order of the case. Data type: Number (Integer)
parent	Sys_id of the parent case to which this case (child) is associated. Located in the Task [task] table. Data type: String
partner	Sys_id of the partner associated with the case. Located in the Account [customer_account] table. Data type: String
partner_contact	Sys_id of the partner contact associated with the case. Located in the Contact [customer_contact] table. Data type: String
priority	Priority of the case.

Element	Description
	Possible values: • 1: Critical • 2: High • 3: Moderate • 4: Low Data type: Number (Integer) Default: 4
probable_cause	Possible cause of the issue associated with the case. Data type: String Maximum length: 4,000
problem	Sys_id of the issue that the customer is encountering. Located in the Problem [problem] table. Data type: String
product	Sys_id of the product model of the asset associated to the case. Located in the Product Model [cmdb_model] table. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). Data type: String
reassignment_count	Number of times that the case was reassigned to a person that is responsible for moving the case forward. Data type: Number (Integer) Default: 0
recipient_list	Sys_id of the record that contains the list of recipients for communications about this case. Located in the Recipients List [sn_publications_recipients_list] table. Data type: String
rejection_goto	Sys_id of the task to execute if the case is rejected. Located in the Task [task] table.

Element	Description
	Data type: String
resolution_code	Resolution state for the case, such as "Solved - Fixed by Support/ Guidance provided". Data type: String Maximum length: 40
resolved_at	Date and time that the case was resolved. Data type: String
resolved_by	Sys_id of the person that resolved the case. Located in the User [sys_user] table. Data type: String
result	Array of objects in which each object describes a single value for the requested field. Data type: Array `"result": [ { "label": "String", "value": "String" } ]`
result.label	Display value for the field value. Data type: String
result.value	Field value. Data type: String
short_description	Concise description of the case. Data type: String Maximum length: 160
skills	List of the unique identifiers (sys_id) of the skills needed to complete the case. Located in the Skill [cmn_skill] table. Data type: String
sla_due	Date/time at which the case must be closed based on

Element	Description
sn_app_cs_social_social_profile.consumer.household	Sys_id of the record that describes the household characteristics. Located in the Household [csm_household] table. Data type: String
sn_app_cs_social_social_profile.consumer.last_name	Consumer last name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.consumer.middle_name	Consumer middle name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.consumer.mobile_phone	Consumer mobile phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.name	Consumer full name; first_name +middle_name+last_name. Data type: String Maximum length: 152
sn_app_cs_social_social_profile.consumer.notes	Notes on consumer. Data type: String Maximum length: 4,000
sn_app_cs_social_social_profile.consumer.notification	Indicates whether the consumer should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Integer Maximum length: 40 Default: 2
sn_app_cs_social_social_profile.consumer.number	Unique number associated with the consumer. Data type: String

Element	Description
	Maximum length: 40
sn_app_cs_social_social_profile.consumer.photo	Photo of the consumer. Data type: Image
sn_app_cs_social_social_profile.consumer.preferred_language	Consumer primary language. Data type: String Maximum length: 3
sn_app_cs_social_social_profile.consumer.prefix	Consumer name prefix such as, Dr., Mr., Mrs., or Ms. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.primary	Flag that indicates whether this is the primary consumer. Possible values: • true: Primary consumer • false: Not primary consumer Data type: Boolean Default: false
sn_app_cs_social_social_profile.consumer.state	State in which the consumer resides. Data type: String Maximum length: 100
sn_app_cs_social_social_profile.consumer.street	Consumer street address. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.consumer.suffix	Consumer name suffix such as Jr., Sr., or II. Data type: String
sn_app_cs_social_social_profile.consumer.sys_created_by	User that created the consumer record. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.sys_created_on	Date and time the consumer record was originally created.

Element	Description
	Data type: String
sn_app_cs_social_social_profile.consumer.sys_domain	ServiceNow domain in which the consumer information resides. Data type: String
sn_app_cs_social_social_profile.consumer.sys_id	Unique identifier for the consumer. Data type: String
sn_app_cs_social_social_profile.consumer.sys_mod_count	Number of times that the associated consumer information has been modified. Data type: Integer
sn_app_cs_social_social_profile.consumer.sys_tags	Consumer system tags.
sn_app_cs_social_social_profile.consumer.sys_updated_by	User that last updated the consumer information. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.consumer.sys_updated_on	Date and time when the consumer information was last updated. Data type: String
sn_app_cs_social_social_profile.consumer.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: blank (system time format)
sn_app_cs_social_social_profile.consumer.time_zone	Consumer time zone, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40

Element	Description
sn_app_cs_social_social_profile.consumer.title	Consumer business title such as Manager, Software Developer, or Contractor. Data type: String Maximum length: 60
sn_app_cs_social_social_profile.consumer.user	Sys_id of the consumer user. Located in the Consumer User [csm_consumer_user] table. Data type: String
sn_app_cs_social_social_profile.consumer.zip	Consumer zip code. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact	For business-to-business cases. Unique identifier of the record containing details about the social media profile that belongs to the contact associated with the case. Located in the Contact [customer_contact] table. Data type: String
sn_app_cs_social_social_profile.contact.account	Sys_id of the account record to which the contact is associated; Account [customer_account] table. Data type: String
sn_app_cs_social_social_profile.contact.active	Flag that indicates whether the contact is active within the system. Possible values: • true: Contact is active • false: Contact is inactive Data type: Boolean Default: true
sn_app_cs_social_social_profile.contact.agent_status	Status of the agent. Possible values: • Off work • On break

Element	Description
	• On route • On site Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.building	Sys_id of the record that describes the building in which the contact resides; Building [cmn_building] table. Data type: String
sn_app_cs_social_social_profile.contact.calendar_integration	Calendar application that the contact uses. 1: Outlook Data type: Number (Integer) Default: 1
sn_app_cs_social_social_profile.contact.city	City in which the contact resides. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.company	Sys_id of the company record to which the contact is associated; Company [core_company] table. Data type: String
sn_app_cs_social_social_profile.contact.cost_center	Sys_id of the cost center associated with the contact; Cost Center [cmn_cost_center] table. Data type: String
sn_app_cs_social_social_profile.contact.country	Country code of the country in which the contact resides. Data type: String Maximum length: 3
sn_app_cs_social_social_profile.contact.date_format	Format in which to display dates to contacts. Valid values: • dd/mm/yyyy • dd-mm-yyyy • dd.mm.yyyy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	• mm-dd-yyyy • yyyy-mm-dd Data type: String Maximum length: 40 Default: blank (system date format)
sn_app_cs_social_social_profile.contact.default_perspective	Sys_id of the default perspective for the contact. Located in the Menu List [sys_perspective] table. Data type: String
sn_app_cs_social_social_profile.contact.department	Sys_id of the department associated with the contact. Located in the Department [cmn_department] table. Data type: String
sn_app_cs_social_social_profile.contact.edu_status	Education status of the associated contact. Data type: String Maximum length: 40 Default: faculty
sn_app_cs_social_social_profile.contact.email	Contact email address. Data type: String
sn_app_cs_social_social_profile.contact.employee_number	Contact employee number. Data type: String
sn_app_cs_social_social_profile.contact.enable_multifactor_authn	Flag that indicates whether multifactor authorization is required for the contact to log in to the service portal. Possible values: • true: Multifactor authorization enabled • false: Multifactor authorization disabled Data type: Boolean Default: false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
sn_app_cs_social_social_profile.contact.failed_attempts	Number of failed log in attempts. Data type: Number (Integer)
sn_app_cs_social_social_profile.contact.first_name	Contact first name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.contact.gender	Contact gender. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.geolocation_tracked	Flag that indicates whether the contact location is obtained through geotracking. Possible values: • true: Contact location obtained through geotracking • false: Contact location not obtained through geotracking Data type: Boolean Default value: false
sn_app_cs_social_social_profile.contact.home_phone	Contact home phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.internal_itegration_user	Flag that indicates whether the contact is an internal integration user. Possible values: • true: Internal integration user • false: Other type of user Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.introduction	Introduction Data type: String Maximum length: 40

Element	Description
sn_app_cs_social_social_profile.contact.last_login	Date on which the contact last logged into the system. Data type: String (Date)
sn_app_cs_social_social_profile.contact.last_login_device	Device the consumer used the last time they logged in to the system. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.last_login_time	Date and time the contact logged in to the system. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.last_name	Contact last name. Data type: String Maximum length: 50
sn_app_cs_social_social_profile.contact.last_position_update	Date and time the last position was updated. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.latitude	Latitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
sn_app_cs_social_social_profile.contact.ldap_server	Sys_id of the LDAP server used by the contact to last log in to the system; LDAP Server [ldap_server_config] table. Data type: String
sn_app_cs_social_social_profile.contact.location	Sys_id of the record that describes the location of the contact; Location [cmn_location] table. Data type: String
sn_app_cs_social_social_profile.contact.locked_out	Flag that indicates if the contact is locked-out. Possible values: • true: Contact locked-out • false: Contact not locked-out

Element	Description
	Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.longitude	Longitude coordinate of the contact. Data type: Number (Floating point) Maximum length: 40
sn_app_cs_social_social_profile.contact.manager	Sys_id of the record that describes the direct supervisor of the contact; User [sys_user] table. Data type: String
sn_app_cs_social_social_profile.contact.middle_name	Contact middle name. Data type: Number (Floating point) Maximum length: 50
sn_app_cs_social_social_profile.contact.mobile_phone	Contact mobile phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.name	Contact full name. Data type: String Maximum length: 151
sn_app_cs_social_social_profile.contact.notification	Indicates whether the contact should receive notifications. Valid values: • 1: Disabled • 2: Enabled Data type: Number (Integer) Default: 2
sn_app_cs_social_social_profile.contact.on_schedule	Indicates the timeliness of dispatched service personnel. Valid values: • Ahead: Ahead of schedule. • behind_less30: Behind schedule, but less than 30 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	• behind_30to60: Behind schedule between 30 and 60 minutes. • behind_more60: Behind schedule more than 60 minutes. • on_time: On schedule. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.phone	Contact business phone number. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.photo	Photo image of the contact. Data type: Image
sn_app_cs_social_social_profile.contact.preferred_language	Country code of the contact primary language. Data type: String Maximum length: 3
sn_app_cs_social_social_profile.contact.roles	List of user roles associated with the contact. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.schedule	Sys_id of the record that describes the work schedule for the associated contact; Schedule [cmn_schedule] table. Data type: String
sn_app_cs_social_social_profile.contact.source	Source of the contact. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.contact.state	State in which the contact resides. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.street	Contact street address.

Element	Description
	Data type: String Maximum length: 255
sn_app_cs_social_social_profile.contact.sys_class_name	Table that contains the contact record. Data type: String Maximum length: 80
sn_app_cs_social_social_profile.contact.sys_created_by	User that originally created the associated contact record. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.sys_created_on	Data and time the associated contact was originally created. Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.sys_domain	ServiceNow instance domain of the associated contact record. Data type: String
sn_app_cs_social_social_profile.contact.sys_domain_path	Contact record domain path. Data type: String Maximum length: 255 Default: / (global)
sn_app_cs_social_social_profile.contact.sys_id	Unique identifier for the associated contact record. Data type: String
sn_app_cs_social_social_profile.contact.sys_mod_count	Number of times that the associated contact record has been modified. Data type: Number (Integer)
sn_app_cs_social_social_profile.contact.sys_tags	Contact system tags.
sn_app_cs_social_social_profile.contact.sys_updated_by	User that last updated the associated contact information. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.sys_updated_on	Data and time the associated contact information was updated.

Element	Description
	Data type: String (Date/time)
sn_app_cs_social_social_profile.contact.time_format	Format in which to display time. Valid values: • hh.mm.ss a: hh.mm.ss (12 hour) • hh:mm:ss a: hh:mm:ss (12 hour) • HH.mm.ss: hh.mm.ss (24 hour) • HH:mm:ss: hh:mm:ss (24 hour) Data type: String Maximum length: 40 Default: Blank (system time format)
sn_app_cs_social_social_profile.contact.time_sheet_policy	Sys_id of the record that contains the time sheet policy for the associated contact; Time Sheet Policy [time_sheet_policy] table. Data type: String
sn_app_cs_social_social_profile.contact.time_zone	Time zone in which the contact resides, such as Canada/Central or US/Eastern. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.title	Contact business title such as Manager, Software Developer, or Contractor. Data type: String Maximum length: 60
sn_app_cs_social_social_profile.contact.user_name	Contact user ID. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.contact.vip	Flag that indicates whether the associated contact has VIP status. Possible values: • true: VIP • false: Not VIP

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.web_service_access_only	Flag that indicates whether the contact can only access services through the web. Possible values: • true: Web access only • false: Access through all available methods Data type: Boolean Default: false
sn_app_cs_social_social_profile.contact.zip	Contact zip code. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.created_on	Date and time the associated social media profile was initially created.
sn_app_cs_social_social_profile.profile	Social profile. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.profile_url	URL to use to access the social media profile. Data type: String Maximum length: 1,024
sn_app_cs_social_social_profile.social_id	Unique social media account provider identifier for the associated social media account. Data type: String Maximum length: 100
sn_app_cs_social_social_profile.source	Source of the social profile. Data type: String Maximum length: 255
sn_app_cs_social_social_profile.sys_created_by	User that initially created the social media profile.

© 2026 ServiceNow, Inc. All rights reserved.

Element	Description
	Data type: String Maximum length: 40
sn_app_cs_social_social_profile.sys_created_on	Date and time the social media profile was initially created. Data type: String (Date/time)
sn_app_cs_social_social_profile.sys_id	Unique identifier for the social media profile. Data type: String
sn_app_cs_social_social_profile.sys_mod_count	Number of times that information was modified for the associated social media profile. Data type: Number (Integer)
sn_app_cs_social_social_profile.sys_tags	Profile system tags.
sn_app_cs_social_social_profile.sys_updated_by	User that initially created the social media profile. Data type: String Maximum length: 40
sn_app_cs_social_social_profile.sys_updated_on	User that initially created the social media profile. Data type: String Maximum length: 40
state	Current state of the case. Possible values: • 1: New • 3: Closed • 6: Resolved • 10: Open • 18: Awaiting Info Data type: Number (Integer) Default: 1
subcategory	Case subcategory. Possible values: 0: Question

Element	Description
	Data type: Number (Integer) Default: 0
support_manager	Sys_id of the CSM manager assigned to the case. Located in the User [sys_user] table. Data type: String
sync_driver	Flag that indicates whether there's driver synchronization. Possible values: • true: Driver is synchronized • false: Driver isn't synchronized Data type: Boolean
sys_class_name	Table that contains the case record. Data type: String Maximum length: 80
sys_created_by	Person that initially opened the case. Data type: String Maximum length: 40
sys_created_on	Date and time when the case was initially created. Data type: String
sys_domain	Domain associated with the case. Data type: String Maximum length: 32 Default: global
sys_domain_path	Domain path. Data type: String Maximum length: 255 Default: /
sys_id	Unique identifier for the case. Data type: String

Element	Description
	Maximum length: 32
sys_mod_count	Number of updates to the case since it was initially created. Data type: Number (Integer)
sys_tags	System tags.
sys_updated_by	Person that last updated the case. Data type: String Maximum length: 40
sys_updated_on	Date and time when the case was last updated. Data type: String
time_worked	Total amount of time worked on the case. Data type: String
upon_approval	Action to take if the case is approved. Possible values: • do_nothing • proceed Data type: String Maximum length: 40 Default: proceed
upon_reject	Action to take if the case is rejected. Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
urgency	Urgency of the case. Possible values:

Element	Description
	• 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
user_input	Additional user input. Data type: String Maximum length: 4,000
variable_pool	Grouping of variables.
variables	Name-value pairs of variables associated with the case. Data type: String Maximum length: 40
watch_list	List of sys_ids of the users who receive notifications about this case when additional comments are added or if the state of a case is changed to Resolved or Closed. Located in the User [sys_user] table. Data type: Array
wf_activity	Sys_id of the workflow activity record associated with the case. Located in the Workflow Activity [wf_activity] table. Data type: String
work_end	Date and time work ended on the case. Data type: String
work_notes	Information about how to resolve the case, or steps taken to resolve it. Data type: String Maximum length: 4,000
work_notes_list	List of sys_ids of the internal users who receive notifications about this case when work notes

Element	Description
	are added. Located in the User [sys_user] table. Data type: Array
work_start	Date and time that work started on the case. Data type: String

Notes on request body parameters

All request body parameters are optional. Not all parameters apply to all case types (B2B vs B2C and order vs product.) Ensure that the parameters that you set do not conflict, such as a mismatch between the account and contact or consumer. In addition to the list of elements defined below (which define the elements found in a base system), the endpoint also accepts custom case fields and any additional case fields configured in your instance. For additional information on these elements, refer to your specific table definitions [**System Definition** > **Tables**].

Example: cURL request

The following example illustrates how to update a consumer-based case.

```
curl
 "https://instance.servicenow.com/api/sn_cusomerservice/case/039
7c743db436f0057c3fd441d96197f" \
--request PUT \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{ \
  consumer: \"cd97ef1ddb8bc7006b7a9646db9619ac\", \
  contact_type: \"phone\", \
  priority: \"4\", \
  short_description: \"Consumer Test Case\"}" \
--user "username":"password"
```

```
{
  "result": {
    "sys_id": "0397c743db436f0057c3fd441d96197f",
    "number": "CS0001005"
  }
}
```

CCCIF Media Resource API

The *Custom Chat Chatbot Interoperability Framework (CCCIF) Media Resource* API provides endpoints that enable a primary bot to upload attachments to the associated ServiceNow instance.

Call this API in your primary bot to upload private attachments from a user that is having a conversation through Virtual Agent (VA). You must then send the *mediaUrl* parameter that is returned by this API to the VA API.

If the attachment is public, you can just send the attachment URL in the request body of your *Virtual Agent Bot Integration* call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access this API, the Conversational Custom Chat Integration (com.glide.cs.custom.adapter) plugin must be activated. In addition, the attachment system properties must be configured.

For additional information on the capabilities of the Virtual Agent API, see Virtual Agent API.

CCCIF - POST /cccif/media/upload

Uploads a private attachment to the called ServiceNow instance which stores the attachment in the Attachments [sys_attachment] table.

Call this method in your primary bot to upload private attachments from a user that is having a conversation through Virtual Agent (VA). You must then send the *`mediaUrl`* parameter that is returned by this method to the VA API using the Virtual Agent Bot Integration API.

URL format

Versioned URL: `/api/now/{api_version}/cccif/media/upload`

Default URL: `/api/now/cccif/media/upload`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
file	Required. Path of the file to upload. Data type: String, such as @File path <file_path>
provider_application_id	Sys_id of the sys_cs_provider_application interacting with the VA bot. Default: Sys_id of the VA Bot to Bot Provider Application
user_id	Required. Unique user identifier of the user interacting with the VA bot. This can be any string that is unique for each user. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *multipart/form-data*.

Response headers

Header	Description
Content-Type	Data format of the response body. Only supports *application/json*.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON)

Name	Description
attachmentId	Sys_id of the attachment that was stored. Data type: String

error	Description of any error detected while processing the request.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details about the error that was encountered.

Name	Description
	Data type: String
error.message	Message describing the error that was thrown. Data type: String
mediaUrl	Attachment URL to send to the primary bot to access the attachment. The primary bot must send this URL in the *`message.attachment.url`* parameter of the request body of the *`POST /sn_va_as_service/bot/integration`* endpoint. Data type: String
name	File name of the attachment. Data type: String
state	State of the attachment in the Attachment table. Possible values: • available • conditionally available • not available • pending Data type: String

Example: cURL request

This example shows how to upload a .png file attachment.

```
curl --location --request POST
 'https://instance.servicenow.com/api/now/v1/cccif/media/upload'
 \
--header 'Authorization: Basic xxxxxxxxxxxx' \
--header 'Content-Type:multipart/form-data' \
--form 'user_id="lincoln"' \
--form 'file=@"/Users/Desktop/Screenshot 2021-10-25 at 5.08.14
 PM.png"'
```

Response:

```
Response :{
  "result": {
    "mediaUrl":
 "https://instance.servicenow.com/api/now/v1/cs/media/vGfewkfAv0
VBo2RxmlTM448L789Pp6rqLFLUNYQxZsUUFrsgMA8aW9W0zWx1a5fG",
    "name": "Screenshot 2021-10-25 at 5.08.14 PM.png",
    "state": "pending",
    "attachmentId": "299c648887b73c1022b6a6cd0ebb3534"
  }
```

CdmApplicationsApi

The `CdmApplicationsApi` provides endpoints that enable you to `uploadzoominsoftware.io/utah-devops/` configuration data to the component, collection, deployable, and component variable folders found in the DevOps Config Workspace UI. It also has endpoints that enable you to export deployable configuration data to your DevOps pipeline and manage shared components and shared applications.

The export and upload endpoints use an asynchronous queuing implementation. With this type of implementation, you first call the desired export or upload request endpoint. These endpoints queue your request and return a request identifier. You then use this request identifier to call the appropriate status endpoint, one for uploads and a different one for exports, to obtain the status of the upload/export. For export requests, once the export is complete, you can also request the content of the export.

This API does not provide endpoints that perform simple retrieval of application records. To retrieve these records, use the Table API.

You must have one of the following roles to access this API:

- Scripted REST CDM View ACL (sn_cdm.cdm.viewer)
- Scripted REST CDM Editor ACL (sn_cdm.cdm_editor)

In addition, the Configuration Data Management (CDM) plugin must be activated for this API to be available in an instance.

For additional information on Configuration Data Management and the DevOps Config Workspace UI, see Uploading your config data.

For additional information on shared components and shared libraries, see Sharing components among applications — Component libraries.

CdmApplicationsApi - DELETE /sn_cdm/applications/deployables

Deletes a specified Configuration Data Management (CDM) deployable.

The caller of this endpoint must have the CDM Admin role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/deployables`

Default URL: `/api/sn_cdm/applications/deployables`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
appName	Required. Name of the CDM application to which the deployable is associated. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
name	Name of the deployable to delete. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
None	

Example: cURL request

The following code example shows how to remove a deployable.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/deployables?appName=testApp&name=Dep-1" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password1'
```

For a successful deletion of the deployable, no response is returned other than the HTTP status code.

```
None - results defined by the HTTP status code
```

CdmApplicationsApi - DELETE /sn_cdm/applications/shared_components

Removes the shared component usage reference from a specified Configuration Data Management (CDM) application.

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/shared_components`

Default URL: `/api/sn_cdm/applications/shared_components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the application from which to remove the specified shared component association. Located in the CDM Application [sn_cdm_application] table. The specified application must have the type field set to "shared_library". Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
sharedComponentName	Required. Unique name of the shared component to remove from the specified application. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Empty. The HTTP status code indicates the result of the call.
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code example shows how to delete the "paymentService-V1.1" shared component from the "App1" application.

```
curl
 "https://instance-name.service-now.com/api/sn_cdm/applicatio
ns/shared_components?appName=App1&sharedComponentName=paymentSer
vice-V1.1&changesetNumber=Chset-25" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
""
```

CdmApplicationsApi - GET /sn_cdm/applications/deployables/exports/{export_id}/content

Returns the content associated with a specified configuration data export request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only call this endpoint once you have received a `complete` response from the CdmApplicationsApi - GET /sn_cdm/applications/deployables/exports/{export_id}/status endpoint. If you call this endpoint before the export is complete, a 400 status error is returned.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/deployables/exports/{export_id}/content`

Default URL: `/api/sn_cdm/applications/deployables/exports/{export_id}/content`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
export_id	Unique identifier for the export request whose configuration data to return. This value is returned by the CdmApplicationsApi - POST /sn_cdm/applications/deployables/exports endpoint.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
errors	Description of the errors encountered during export. Data type: String
export_id	Export request ID. Same as that passed into the endpoint. Data type: String
exporter_result	Content of the specified configuration data export. Data type: • JSON object: If the request was to export data in JSON format. • String: If the request was to export data in any other format.
request_id	Export request ID. Same as that passed into the endpoint. Data type: String
state	Current state of the specified export. Value from state column in the CDM Request Queue [sn_cdm_request_queue] table. Possible values: • completed • error • in_progress • new • ready Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following example requests the configuration data of an export request with the ID of 3ab14a7d53b1301096edddeeff7b12f.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/deployables/exports/3ab14a7d53b1301096edddeeff7b12f/content" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The following shows the possible return results.

```
// Successful completion of the export request
{
  "result": {
    "export_id": "3ab14a7d53b1301096edddeeff7b12f"
    "exporter_result": "DEP1.COMP.cdi_1=cdi-1-value"
  }
}

// Response when an incorrect export_id is passed. Note: Status code is 200.
{
  "result": {
    "request_id": "3ab14a7d53b1301096edddeeff7b12e",
    "state": "error",
    "errors": "Invalid requestId '3ab14a7d53b1301096edddeeff7b12fe'",
    "export_id": "3ab14a7d53b1301096edddeeff7b12e"
  }
}
```

CdmApplicationsApi - GET /sn_cdm/applications/deployables/exports/{export_id}/status

Returns the current status of the specified configuration data export request.

Use the CdmApplicationsApi - POST /sn_cdm/applications/deployables/exports endpoint to make an export request.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/deployables/exports/{export_id}/status`

Default URL: `/api/sn_cdm/applications/deployables/exports/{export_id}/status`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.

Path parameters (continued)

Name	Description
	Data type: String
export_id	Sys_id of the export request whose status to return. This value is returned by the CdmApplicationsApi - POST /sn_cdm/applications/deployables/exports endpoint.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
errors	Description of the errors encountered during export. Data type: String
export_id	Export request ID. Same as that passed into the endpoint. Data type: String
exporter_result	Details about the associated error. Data type: Object
exporter_result.errors	Description of the error(s) encountered during export. Data type: Array
exporter_result.execution_id	Unique identifier for the exporter execution record. Located in the sn_cdm_exporter_execution table. Data type: String
exporter_result.state	Current state of the specified export. Located in the sn_cdm_exporter_execution table. Possible values: • complete • error • in_progress • new Data type: String
request_id	Export request ID. Same as that passed into the endpoint. Data type: String
state	Current state of the specified export. Value from state column in the CDM Request Queue [sn_cdm_request_queue] table. Possible values: • completed • error • in_progress • new • ready Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

The following example requests the status of an export with the ID of 3ab14a7d53b1301096edddeeff7b12f.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/deployables/exports/3ab14a7d53b1301096edddeeff7b12f/status" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The following are the possible return results.

```
// Successful completion of the export request
{
  "result": {
    "state": "completed",
    "export_id": "3ab14a7d53b1301096edddeeff7b12f0"
  }
}

// Response when an incorrect export_id is passed. Note: Status code is 200.
{
  "result": {
    "request_id": "3ac8e1b05311301096edddeeff7b123c",
    "state": "error",
    "errors": "Invalid requestId '3ac8e1b05311301096edddeeff7b123c'",
    "export_id": "3ac8e1b05311301096edddeeff7b123c"
  }
}

// Response when the export encounters an error. The exporter_result array contains the error information. Note: Status code is 200.
{
  "result": {
    "state": "completed",
    "export_id": "24536c3353f9301096edddeeff7b12b1",
    "exporter_result": {
      "execution_id": "81536c3353f9301096edddeeff7b129e",
      "state": "failure",
      "errors": [
        "Snapshot 'SNA-001-published-non_compliant' has not passed validation. All snapshots of deployable '/ApplicationA/deployables/DEP3' are required to pass validation"
      ]
    }
  }
}
```

CdmApplicationsApi - GET /sn_cdm/applications/shared_components

Returns the list of shared components used by a specified application. You can also specify to only return those shared components that have a new version available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/shared_components`

Default URL: `/api/sn_cdm/applications/shared_components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the application whose list of shared components you want returned. Located in the CDM Application [sn_cdm_application] table. The type field of the application must be set to shared_library. Data type: String
withUpdatesOnly	Flag that indicates whether to only return shared components that have a new updated version available. Valid values: • true: Only return shared components that have a new updated version available. • false: Return all shared components used by the specified application. Default: false

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
currentVersion	Current version of the CDM application. Data type: Integer
currentVersionName	Name of shared component version currently in use. Data type: String
description	Description of shared component. Data type: String

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
name	Unique name of the shared component. Data type: String
sharedLibraryName	Name of shared library to which the shared component belongs. Data type: String
status	Error status of the request. Possible values: failure Data type: String
updateVersionName	Name of shared component version available for update. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to retrieve the shared components that have a new version used by "App1".

```
curl
 "https://instance-name.service-now.com/api/sn_cdm/applicatio
ns/shared_components?updatesOnly=true&appName=App1" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
{
  "result": [
    {
      "name": "Component_Name",
      "description": "",
      "sharedLibraryName": "Shared Library",
      "currentVersion": "2",
      "currentVersionName": "Component_A-v2.shc",
      "updateVersionName": "Component_A-v3.shc"
    }
  ]
}
```

CdmApplicationsApi - GET /sn_cdm/applications/shared_libraries/components/applications

Returns a map of shared components and the applications that use them that are within a specified library.

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/shared_libraries/components/applications`

Default URL: `/api/sn_cdm/applications/shared_libraries/components/applications`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
sharedComponentName	Required. Name of the shared component to include in the map. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
sharedLibraryName	Required. Name of the shared library to include in the map. Located in the CDM Application [sn_cdm_application] table. The specified application must have the type field set to "shared_library". Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
managed_by_group	Comma-separated list of sys_ids of the groups that can manage the application. Data type: String
name	Unique name of the application using the component. Data type: String
status	Error status of the request. Possible values: failure Data type: String
sys_id	Sys_id of the application utilizing the shared component. Data type: String

Example: cURL request

The following code example shows how to call this endpoint to retrieve the map that shows the applications in the "OracleG-Library-10" shared library that use the "paymentService-V1.1" shared component.

```
curl
 "https://instance-name.service-now.com/api/sn_cdm/applicatio
ns/shared_libraries/components/applications?sharedLibraryName=Or
acleG-Library-10&sharedComponentName=paymentService-V1.1" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
{
  "result": {
    "component_name": [
      {
        "name": "App Name",
        "description": "desc",
        "managed_by_group": null,

CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id}

Returns the current status of the specified configuration data upload request.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/upload-status/{upload_id}`

Default URL: `/api/sn_cdm/applications/upload-status/{upload_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
upload_id	Sys_id of the upload request whose status to return. This value is returned by the various CdmApplications upload request endpoints.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
errors	Description of the error(s) encountered during upload. Data type: String
output	Description of the uploaded data or if an error occurred during the upload, an error message describing the error that was encountered. Data type: Array of String `"output": { "auto_validate": "String", "cdm_application": "String", "committed_at": "String", "committed_by": "String", "description": "String", "last_conflict_detection_time": "String", "number": "String", "publish_option": "String", "snapshot_description": "String", "snapshot_name": "String", "state": "String", "sys_created_by": "String", "sys_id": "String", "title": "String" }`
output.auto_validate	Indicates whether to invoke validation after the commit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
output.cdm_application	Name of application under which the upload was performed. Data type: String
output.committed_at	Date and time that the uploaded content was committed. Data type: String
output.committed_by	Sys_id of the record of the entity that performed the commit. Data type: String
output.description	Not currently used. Data type: String
output.last_conflict_detection_time	Date and time conflict detection invocation. Data type: String
output.number	Unique number of the changeset. Data type: String
output.publish_option	Publish option for the associated configured snapshots. Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none **Note:** This option is only available if the value for the *autoCommit* parameter is true.
output.snapshot_description	Description of the associated snapshot. Data type: String
output.snapshot_name	Name of the associated snapshot. Data type: String
output.state	State of the upload content. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• blocked • checking_for_conflict • commit_failed • commit_in_progress • committed • open Data type: String
output.sys_created_by	Sys_id of the entity that created the record. Data type: String
output.sys_id	Sys_id of the record containing the changeset. Data type: String
output.title	Title of changeset created as part of the upload. Data type: String
processing_state	Current processing state of the upload request. Possible values: • NOT_PROCESSED • PROCESSED Data type: String
state	Current state of the upload request. Possible values: • completed • error • in_progress • new • ready
type	Type of upload request. Possible values: • commit • upload_and_commit Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload.

Name	Description
	Data type: String

Example: cURL request

The following example show requesting the status for an upload with the ID of 5560a6895326301096edddeeff7b1230.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uplo
ad-status/5560a6895326301096edddeeff7b1230" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The following are the possible return results.

```
// Successful completion of the upload request
{
  "result": {
    "type": "upload_and_commit",
    "state": "completed",
    "output": {
      "sys_id": "be681dc95362301096edddeeff7b12ba",
      "number": "Chset-102",
      "title": "admin2021-09-10 08:09:07",
      "description": null,
      "committed_at": "2021-09-10 20:23:37",
      "committed_by": "6816f79cc0a8016401c5a33be04be441",
      "sys_created_by": "admin",
      "state": "committed",
      "publish_option": "publish_none",
      "auto_validate": false,
      "snapshot_name": null,
      "snapshot_description": null,
      "cdm_application": "Demo_App1631126164773",
      "last_conflict_detection_time": "1631305417894"
    },
    "processing_state": "PROCESSED",
    "upload_id": "5560a6895326301096edddeeff7b1230"
  }
}

// Response when an incorrect upload_id is passed. Note: Status
 code is 200.
{
  "result": {
    "state": "error",
    "errors": "Invalid requestId
 '5560a6895326301096edddeeff7b1240'",
    "upload_id": "5560a6895326301096edddeeff7b1240"
  }
}
```

}
```

CdmApplicationsApi - POST /sn_cdm/applications/deployables

Creates a new deployable and automatically connects it to a specified Configuration Data Management (CDM) application.

You can create a deployable for any one of three environment types: Development, Test, or Production.

To access this endpoint the caller must have the CDM Admin role.

If you need to create multiple deployables, use the CdmApplicationsApi - POST /sn_cdm/applications/deployables/create endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/deployables`

Default URL: `/api/sn_cdm/applications/deployables`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of an existing, active CDM application to associate with the deployable. Located in the CDM Application [sn_cdm_application] table. Data type: String
envType	Required. Environment type for the deployable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values (case-sensitive): • Development • Production • Test **Note:** The deployable environment type can't be changed after creation. Data type: String
name	Required. Name of the CDM deployable. Should not be more than 255 chars. Default allowed characters are 0-9, A-Z, a-z, _,-,., %, $, whitespace, :, #. Data type: String Maximum length: 255 characters Allowable characters: 0-9, A-Z, a-z, _, -, ., %, $, whitespace, :, and #
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
cdi_count	Number of configuration data items (CDIs) contained in the associated CDM application. Data type: Integer
cdi_usage	Percentage of the CDIs used by the deployable. Data type: Integer

cdm_app	CDM application object associated with the deployable.
	
	Data type: Object
	`"cdm_app": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_app.link	Call to use to access the CDM application record using the REST *Table* API. Data type: String
cdm_app.value	Sys_id of the associated CDM application record. Located in the CDM Application [sn_cdm_application] table. Data type: String
cdm_ci	Application service object associated with the deployable. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"cdm_ci": {
	  "link": "String",
	  "value": "String"
	}</pre>

cdm_ci.link	Call to use to access the application service record using the REST *Table* API. Data type: String
cdm_ci.value	Sys_id of the associated application service record. Located in the Configuration Item [cmdb_ci] table. Data type: String
description	Description of the generated CDM deployable. Data type: String
environment_type	Environment type of the deployable. Possible values: • Development • Production • Test Data type: String

error	Only returned if an error occurred during processing.
	
	Data type: Object
	<pre>"error": {
	  "detail": "String",
	  "message": "String"
	}</pre>

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
name	Name of the CDM deployable. Data type: String

node	Details about the deployable node.
	
	Data type: Object
	<pre>"node": {
	  "link": "String",</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"value": "String"
	}</pre>

node.link	Call to use to access the deployable node record using the REST *Table* API. Data type: String
node.value	Sys_id of the deployable node record. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
snapshot_version_counter	Number of snapshots created for the deployable. Data type: Integer
state	Current state of the deployable. Possible values: • active • deleted Data type: String
sys_created_by	User name of the user that created the CDM deployable. For example, able.tuter. Data type: String
sys_created_on	Date and time when the CDM deployable was created. Format: YYYY-mm-DD hh:mm:ss Data type: String
sys_id	Sys_id of the created deployable. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
sys_updated_by	User name of the user that last updated the CDM deployable. For example, able.tuter. Data type: String
sys_updated_on	Date and time when the CDM deployable was last updated. Format: YYYY-mm-DD hh:mm:ss Data type: String

Example: cURL request

The following code example shows how to create and associate a deployable to a CDM application.

© 2026 ServiceNow, Inc. All rights reserved.

      "state": "active",
      "sys_created_by": "admin"
    }
  ]
}
```

CdmApplicationsApi - POST /sn_cdm/applications/deployables/create

Creates one or more new deployables.

You can create one of two types of deployables:

- Deployables that must be manually connected to an Application Model (CI Service).
- Deployables that are automatically connected to new, dynamically created Application Models (CI Services).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create a deployable for any one of three environment types: Development, Test, or Production. When creating multiple deployables, the auto-generated names of the deployables follow the pattern: `DeployableType_Number`, where `Number` is a running sequence number based on the creation of a new deployable. For example, if you create three deployables of type `Test` in an endpoint call, they are named Test_1, Test_2, and Test_3. If you then call the endpoint again, and create a different Test deployable, its auto-gen'd name is Test_4. These numbers are never reused, even if a deployable is deleted.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/deployables/create`

Default URL: `/api/sn_cdm/applications/deployables/create`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appSysId	Required. Sys_id of an active CDM Application to associate with the deployables. Data type: String
autoConnect	Required. Flag that determines whether to automatically connect the newly created deployables to dynamically generated Application Models. Valid values: • true: Connect the newly created deployables to dynamically generated Application Models. • false: Just create the deployables. These deployables must be manually mapped to Application Models using the UI. Data type: Boolean
envType	Required. Environment type for the deployable. Valid values (case-sensitive): • Development • Production • Test

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: The deployable environment type can't be changed after creation. Data type: String
quantity	Required. Number of deployables to create. Data type: Number

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
result	Sys_ids of the created deployables. Data type: Array
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following example shows how to create a single deployable and associate it with and existing CDM application.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/deployables/create?envType=Production&appSysId=5e118055b712011054c1e5a6ce11a9d4&quantity=5&autoConnect=true" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
```

The following shows the possible responses to this call, both as a success and an error.

```
// Successful completion of the upload request
{
  "result": [
    "8ba43a3db7d6011054c1e5a6ce11a9a4",
    "93a47a3db7d6011054c1e5a6ce11a90d",
    "dba47a3db7d6011054c1e5a6ce11a91d",
    "6fa47a3db7d6011054c1e5a6ce11a921",
    "efa47a3db7d6011054c1e5a6ce11a925"
  ]
}
```

```
// Error response
{
  "error": {
    "message": "Error: CDM Application with SysID
 5e118055b712011054c1e5a6ce11a9d1 was not found.
 (sys_script_include.8cf0fbf453626010a1d3ddeeff7b12fe.script;
 line 211)",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - POST /sn_cdm/applications/deployables/exports

Submits a request to export the current snapshot for a specified application and one or more deployables into the CDM Exporter Cache [sn_cdm_exporter_cache] table.

This endpoint returns a unique identifier for the request, which you then use to call the CdmApplicationsApi - GET /sn_cdm/applications/deployables/exports/{export_id}/status endpoint to retrieve the status of the export. Once the export is complete, you can use the CdmApplicationsApi - GET /sn_cdm/applications/deployables/exports/{export_id}/content endpoint to retrieve the associated application's configuration data.

A snapshot is the complete data model of a deployable at the time a configuration change is committed. This includes any included components, collections, and vars, as well as deployable-specific vars and overrides. For additional information on deployables, see Create and update a deployable.

Note: Snapshots cannot exceed 10,000 configuration data items (CDIs) per deployable or 100,000 CDIs per application.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/deployables/exports`

Default URL: `/api/sn_cdm/applications/deployables/exports`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
additionalDeployables	Non-primary deployables to export. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description

	<pre>"additionalDeployables": [
	  {
	  "app_name": "String",
	  "deployable_name": "String"
	  }
	]</pre>
	For example: `[{'app_name':'TestApp', "deployable_name:'DEP-1'}]`
	
	Default: Empty array - []

additionalDeployables.app_name	Required if *`additionalDeployables`* array is specified. Name of the application associated with the deployable whose configuration data you want to export. Data type: String
additionalDeployables.deployable_name	Required if *`additionalDeployables`* array is specified. Name of the non-primary deployable whose configuration data you want to export. Data type: String
appName	Required. Name of the application whose configuration data you want to export. Data type: String
args	A JSON object containing key-value pairs for custom arguments. Data type: Object
dataFormat	Output format of the exported data. Valid values (case-sensitive): • ini • json • properties • raw (Data is returned in String format) • xml • yaml Data type: String Default: json
deployableName	Required. Name of the deployable whose configuration data you want to export.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
exporterName	Required. Name of the exporter to use to export the snapshot data. Exporters are custom to the implementer. For details on creating a custom exporter, see Create a custom exporter. Data type: String
restrictExport	Flag that indicates whether the endpoint validates snapshots when exporting the data. Valid values: • true: Validate snapshots. • false: Do not validate snapshots. Data type: Boolean Default: false
snapshotName	Name of the snapshot to export. This can only be one of the snapshot names associated with the deployable as specified in *deployableName* or *additionalDeployables.deployable_name*. Default: The endpoint exports the latest published snapshot. If there is not a published snapshot, the system throws the error "Failed to find latest published snapshot for deployable '{0}'"

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. Possible error messages: • Error: Missing required param 'appName' • Error: User does not have necessary permission to create Export request • Error: Invalid Boolean value (<xyz>).
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
error	Details about the error that occurred. `"error": { "detail": "String", "message": "String" }` Data type: Array
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
export_id	Unique identifier of the export request. Use this ID when calling the CdmApplicationsApi - GET /sn_cdm/applications/deployables/exports/{export_id}/status endpoint to check the current status of the export request. Data type: String
status	Error status of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: failure Data type: String

Example: cURL request

The following example requests the export of the configuration data for the following: application name = TestAppA, deployable name = DEP, using the exporter = exporter-1-primary_deployable.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/deployables/exports?appName=TestAppA&args=%7B%22arg_A_required%22%20%3A%20%22value%20A%22%7D&exporterName=exporter-1-primary_deployable&deployableName=DEP1" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
```

Returns the unique identifier of the export request.

```
{
  "result": {
    "export_id": "64b5f79f5379301096edddeeff7b12eb"
  }
}
```

CdmApplicationsApi - POST /sn_cdm/applications/shared_components

Associates the specified shared component to the application within a specified changeset.

The CDM Admin role is required to access this endpoint.

Note: The specified shared component must have an associated published version (snapshot).

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/shared_components`

Default URL: `/api/sn_cdm/applications/shared_components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
appName	Required. Name of the application to associate with the shared component. Data type: String
changesetNumber	Required. Unique identifier of the changeset associated with the component. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint
sharedComponentName	Required. Name of the shared component to associate with the specified application. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
sharedLibraryName	Required. Name of the shared library under which to create the component. Located in the CDM Application [sn_cdm_application] table. The shared library must have the following fields defined as follows: • state = active • available = true • type = shared_library Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The passed changeset does not exist.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

The response fields depend on what fields were specified in the *returnFields* parameter in the request. The following describes some of the more important fields.

Name	Description

changeset_id	Details of the changeset record associated with the node.
	
	Data type: Object
	`"changeset_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

changeset_id.link	Call syntax for querying this changeset record using the *Table* REST API. Data type: String
changeset_id.value	Unique identifier of the changeset record. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
description	Description of the CDM node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
error	Only returned if an error occurred during processing. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details about the error that occurred. Data type: String
error.message	Message that provides an overview of the error. Data type: String
linked_to	ID of the main node associated with the shared component. Data type: String
linked_to_version	Details of the CDM snapshot record associated with the node. Data type: Object `"linked_to_version": { "link": "String", "value": "String" }`
linked_to_version.link	Call syntax for querying this version record using the *Table* REST API. Data type: String
linked_to_version.value	Sys_id of the version record. Data type: String
main	Flag that indicates whether the associated snapshot was published. Valid values: • true: Snapshot was published. • false: Snapshot was not published.
main_id	Unique ID of the newly created main node. Data type: String
main_id_encoded	Encoded ID of the newly created main node. Data type: String
name	Name of the CDM node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
node	Sys_id of the shared component node. Data type: String
node_path	Path to the new linked node created when adding the shared component. Data type: String
status	Status of the node. Possible values: New Data type: String
sys_created_by	User name of the user that create the CDM node. For example, able.tuter. Data type: String
sys_created_on	Date and time when the CDM node was created. Format: YYYY-mm-DD hh:mm:ss Data type: String
sys_id	Sys_id of the node. Located in the CDM Node [sn_cdm_node] table. Data type: String
sys_updated_by	User name of the user that last updated the CDM node. For example, able.tuter. Data type: String
sys_updated_on	Date and time when the CDM node was last updated. Format: YYYY-mm-DD hh:mm:ss Data type: String
type	Node type. Data type: String

Example: cURL request

The following example shows how to call this endpoint to associate the application "App1" with the shared component "paymentService-V1.1" under the shared library "OracleG-Library-10" within the "Chset-20" changeset.

```
curl
 "https://instance.servicenow.com/api/sn_cdm/applications/shared
_components?appName=App1&changesetNumber=Chset-20&sharedLibraryN
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ame=OracleG-Library-10&sharedComponentName=paymentService-V1.1"
 \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
{
  "result": {
    "changeset_id": {
      "value": "74b7ff6fc33711100c257e2cc840dd6b",
      "link":

}
```

CdmApplicationsApi - POST /sn_cdm/applications/uploads/components

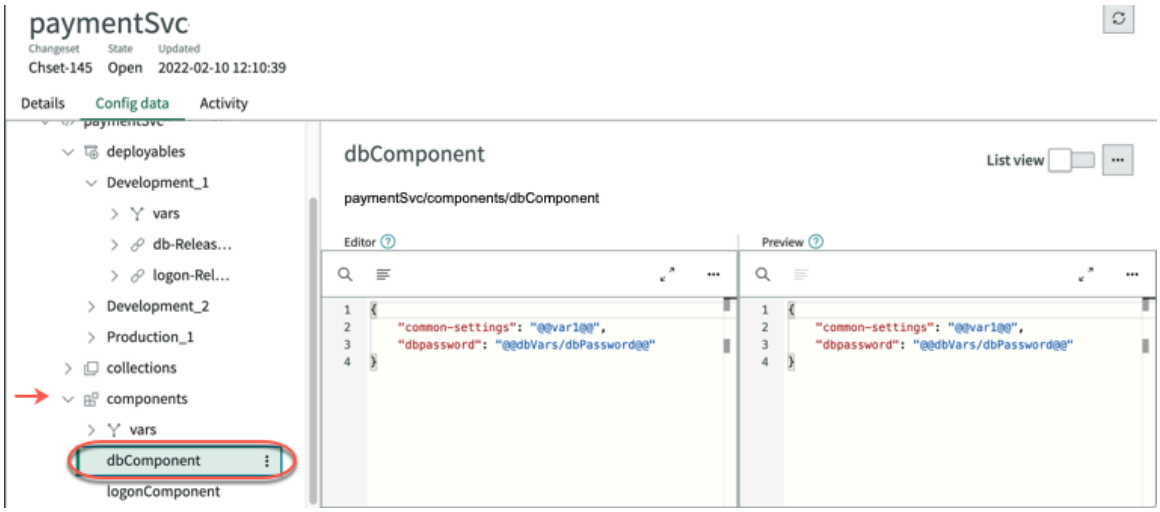
Submits a request to upload the passed-in configuration data for a specific component, within the system components folder, for the specified application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This endpoint returns the ID of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload.

Note: The maximum default upload content size is 2 MB. You can modify this default by updating the property sn_cdm.max_allowed_upload_file_size.

The following image shows an example of where the component configuration data is uploaded in reference to the ServiceNow DevOps Config UI. Assumes the component is **dbComponent** and the application is **paymentSvc**.



Note: This upload method cannot be used to modify nodes. Use the alternative CdmApplicationsApi - POST sn_cdm/applications/uploads/components/file method to modify nodes.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/uploads/components`

Default URL: `/api/sn_cdm/applications/uploads/components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Name of the application to associate with the configuration data. This application must be in the active state. Located in the CDM Application [sn_cdm_application] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
autoCommit	Flag that indicates whether the changeset identified in the *changesetNumber* parameter is committed to the data model after upload. Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoDelete	Flag that indicates whether the existing nodes, that aren't part of the upload content, are deleted after the processing is complete. Valid values: • true: Automatically delete existing nodes. • false: Don't automatically delete existing nodes. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. **Note:** This option is only available if the *autoCommit* parameter is `true`. Data type: Boolean Default: false
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
dataFormat	Required. Format of the configuration data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • csv • ini • json • properties • raw • xml • yaml Data type: String
dataFormatAttributes	Only supported when the *dataFormat* parameter is set to `csv`. Attributes that define the CSV data format. For additional information, see Parsing of CSV files in CDM. Data type: Object `"dataFormatAttributes" { "containsHeader": Boolean, "delimeter": "String" "headers": [Array], "securedHeaders": [Array] }`

dataFormatAttributes.containsHeaders	Flag that indicates whether the data contains a header row.
	
	Valid values:
	• true: Data contains a header row. The first row in the data is considered the header row.
	
	`First Name,Last Name,Location,salary`
	`David,Ben,NYC,1000`
	`Jakes D,Ron,IRE,1220`
	`"George, R",Martin,US,12120`
	`"Antony, ""Ron",Mohan,US,1210`
	
	• false: Data doesn't contain a header row. You must pass the header information in the *dataFormatAttributes.headers* parameter.
	
	Data type: Boolean
	
	Default: false

dataFormatAttributes.delimeter	Character to use to delineate fields within the data. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: Comma ","
dataFormatAttributes.headers	Required if *dataFormatAttributes.containsHeaders* parameter is `false`. Fields in the data that comprise the header. These headers are converted to the key names of the CDIs in the JSON format. The number of headers must match the number of record fields. Data type: Array Default: Empty array
dataFormatAttributes.securedHeaders	Fields in the data that are secure fields and must be encrypted in the data uploaded to CDM. The name of the secured headers must match the name of the headers in the headers attribute or data file. These fields are stored in a column of type Password (2 Way Encrypted). **Note:** You can only secure fields using this attribute. You can't unsecure the secured fields. Data type: Array Default: Empty array
deleteRedundantOverrides	Flag that indicates whether to create an override where redundant values are present. Valid values: • true: If redundant values are present, an override isn't created. • false: If redundant values are present, proceeds with an override. Default: true
fileName	Name of the file to upload. This name can differ from than the actual file name and contain the file extension. For example, .txt/.scv/.jar. The fileName value is applied when downloading the file. Data type: String
fileNodeName	Name of the file node. This file name is used in the configuration data when exporting it. This name doesn't require a file extension nor does it affect the download. Data type: String
identifierKeys	List of names that indicate which key in an array child to use to identify the same node. For example, if you're uploading: `[ {"name" : "Allan, "city" : "Paris"}, {"name" : "Karen, "city" : "Sydney"} ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description

	in the following existing model:
	`[ {"name" : "Karen, "city" : "Manila"}, {"name" : "Allan, "city" : "Brussels"} ]`
	and you set *identifierKeys* to `name`, it produces the following output:
	`[ {"name" : "Karen, "city" : "Sydney"}, {"name" : "Allan, "city" : "Paris"} ]`
	Otherwise, it produces the following output:
	`[ {"name" : "Karen, "city" : "Manila"}, {"name" : "Allan, "city" : "Brussels"}, {"name" : "Allan, "city" : "Paris"}, {"name" : "Karen, "city" : "Sydney"} ]`
	Data type: Array of Strings

ignoreAttributes	Flag that indicates whether the given data format supports attributes (currently only XML). Valid values: • true: If the given data format supports attributes, any attributes in the input data are skipped during the upload. • false: If the given data format supports attributes, any attributes in the input data are included in the upload. Data type: Boolean Default: false
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called). You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Backend name path with replacement characters: `testApp␀deployables␀Development1␀cdi1` • Array: `['testApp','deployables','Development1','cdi1']` **Note:** If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
sharedLibraryName	Required. Name of the shared library where the component to delete is located. Located in the CDM Application [sn_cdm_application] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. This can be any data in the format defined by the *dataFormat* parameter of the query parameters.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Supported types: *text/plain* and *application/x-www-form-urlencoded*. Default: *text/plain*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

The following example shows an upload request for the application Demo_App1631126164773.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uploa
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ds/components?namePath=%2FSettings%2FdbSettings&dataFormat=json&
appName=Demo_App1631126164773&changesetNumber=Chset-8&autoCommit
=false&publishOption=publish_none&autoValidate=false&autoDelete=
true" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "{
  \"dbIPAddress\": \"10.10.10.110\",
  \"dbPort\": \"8080\",
  \"dbConnectionString\": \"admin:admin server1.xyz.com:8080
 dbName_payments\",
  \"dbConnectionStringBackup\": \"admin:admin server2.xyz.com
 dbName_payments_backup\
"}" \
--user 'username':'password'
```

The following return results show both a successful and an error response for this request.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}

// Error response. Payload is too large.
{
  "error": {
    "message": "Size of uploaded data:6853632.0(bytes) is
 greater than max allowed upload limit of 2097152.0(bytes)",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - POST sn_cdm/applications/uploads/components/file

Uploads files as part of the Configuration Data Model (CDM) to the components folder.

Use this method to upload to a components file node.

URL format

Versioned URL: POST `/api/sn_cdm/{api_version}/applications/uploads/components/file`

Default URL: POST `/api/sn_cdm/applications/uploads/components/file`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
appName	Name of the application to associate with the configuration data. This application must be in the active state. Located in the CDM Application [sn_cdm_application] table. Data type: String
autoCommit	Flag that indicates whether the changeset identified in the *changesetNumber* parameter is committed to the data model after upload. Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. **Note:** This option is only available if the *autoCommit* parameter is `true`. Data type: Boolean Default: false
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
fileName	Name of the file to upload. This name can differ from than the actual file name and contain the file extension. For example, .txt/.scv/.jar. The fileName value is applied when downloading the file.

Query parameters (continued)

Name	Description
	Data type: String
fileNodeName	Name of the file node. This file name is used in the configuration data when exporting it. This name doesn't require a file extension nor does it affect the download. Data type: String
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called). You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp&#xFFFD;deployables&#xFFFD;Development1&#xFFFD;cdi1` • Array: `['testApp','deployables','Development1','cdi1']` **Note:** If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
publishOption	Publish option for the associated configured snapshots. Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none **Note:** This option is only available if the value for the *autoCommit* parameter is true.

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. By default, file size uploads are limited to 5 MB. For information about how to adjust your upload file sizes and type, see this Now Support article. Data type: String/stream

Headers

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data type of the file to be uploaded. Supported types: *application/zip*, *text/plain*, *application/json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

The following example shows how to upload a content to a text file.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uploa
ds/components/file?autoValidate=true&appName=testApp&namePath=te
stComponent%2FfilesFolder&fileName=testFileNodeName.txt&publishO
ption=publish_valid&changesetNumber=Chset-108&autoCommit=true&fi
leNodeName=testFile.txt" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "This is sample content that will be uploaded to a plain
 text file."\
--user 'username':'password'
```

The following return results show both a successful and an error response for this request.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}
```

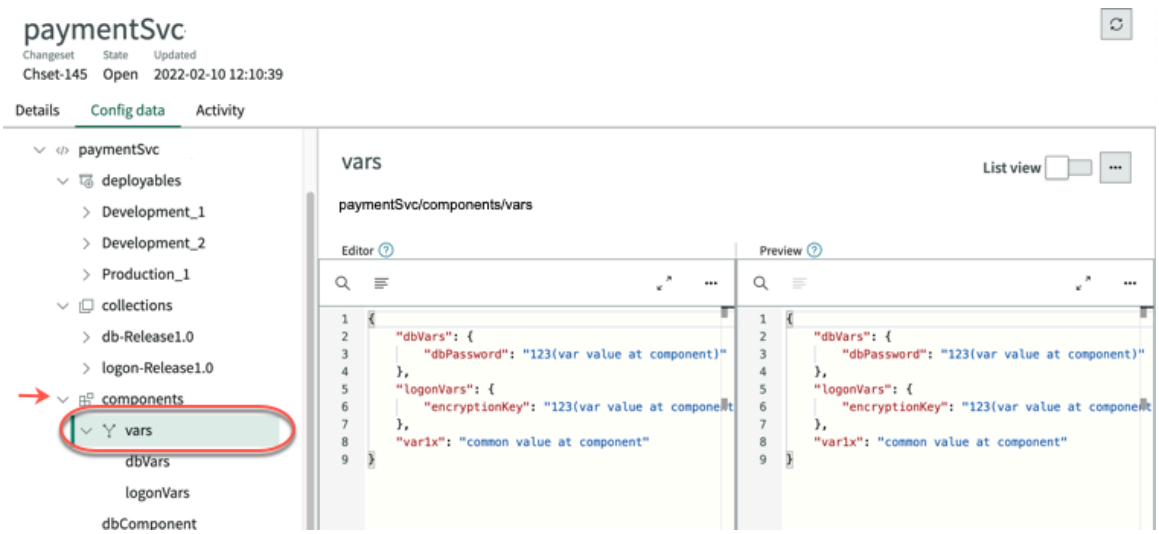
```
// Error response. Payload is too large.
{
  "error": {
    "message": "Could not find active application with name:
 'testApp' of type application",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - POST /sn_cdm/applications/uploads/components/vars

Submits a request to upload the passed-in configuration data under the vars folder, within the system components folder, for the specified application.

The following image shows an example of where the component's vars configuration data is uploaded in reference to the ServiceNow DevOps Config Workspace UI. Assumes the application is **paymentSvc**.



Note: The maximum default upload content size is 2 MB. You can modify this default by updating the property sn_cdm.max_allowed_upload_file_size.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/uploads/components/vars`

Default URL: `/api/sn_cdm/applications/uploads/components/vars`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
appName	Name of the application to associate with the configuration data. This application must be in the active state. Located in the CDM Application [sn_cdm_application] table. Data type: String
autoCommit	Flag that indicates whether the changeset identified in the *changesetNumber* parameter is committed to the data model after upload. Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoDelete	Flag that indicates whether the existing nodes, that aren't part of the upload content, are deleted after the processing is complete. Valid values: • true: Automatically delete existing nodes. • false: Don't automatically delete existing nodes. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. **Note:** This option is only available if the *autoCommit* parameter is `true`. Data type: Boolean Default: false
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
dataFormat	Required. Format of the configuration data. Valid values: • ini • json • properties • raw • xml • yaml Data type: String
deleteRedundantOverrides	Flag that indicates whether to create an override where redundant values are present. Valid values: • true: If redundant values are present, an override isn't created. • false: If redundant values are present, proceeds with an override. Default: true
fileName	Name of the file to upload. This name can differ from than the actual file name and contain the file extension. For example, .txt/.scv/.jar. The fileName value is applied when downloading the file. Data type: String
fileNodeName	Name of the file node. This file name is used in the configuration data when exporting it. This name doesn't require a file extension nor does it affect the download. Data type: String

identifierKeys	List of names that indicate which key in an array child to use to identify the same node.
	
	For example, if you're uploading:
	`[ {"name" : "Allan, "city" : "Paris"}, {"name" : "Karen, "city" : "Sydney"} ]`
	
	in the following existing model:
	`[ {"name" : "Karen, "city" : "Manila"},`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description

	<pre> {"name" : "Allan, "city" : "Brussels"}
	]</pre>
	and you set *identifierKeys* to `name`, it produces the following output:
	<pre>[
	  {"name" : "Karen, "city" : "Sydney"},
	  {"name" : "Allan, "city" : "Paris"}
	]</pre>
	Otherwise, it produces the following output:
	<pre>[
	  {"name" : "Karen, "city" : "Manila"},
	  {"name" : "Allan, "city" : "Brussels"},
	  {"name" : "Allan, "city" : "Paris"},
	  {"name" : "Karen, "city" : "Sydney"}
	]</pre>
	Data type: Array of Strings

ignoreAttributes	Flag that indicates whether the given data format supports attributes (currently only XML). Valid values: • true: If the given data format supports attributes, any attributes in the input data are skipped during the upload. • false: If the given data format supports attributes, any attributes in the input data are included in the upload. Data type: Boolean Default: false
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called). You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp&#65533;deployables&#65533;Development1&#65533;cdi1` • Array: `['testApp','deployables','Development1','cdi1']`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Note: If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
sharedLibraryName	Required. Name of the shared library where the component to delete is located. Located in the CDM Application [sn_cdm_application] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. This can be any data in the format defined by the *`dataFormat`* parameter of the query parameters.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Supported types: *`text/plain`* and *`application/x-www-form-urlencoded`*. Default: *`text/plain`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

The following example shows a vars upload request for the application Demo_App1631126164773.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uploa
ds/components/vars?changesetNumber=Chset-102&autoValidate=false&
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
autoDelete=true&publishOption=publish_none&appName=Demo_App16311
26164773&namePath=%2FSettings%2FdbSettings&autoCommit=false&data
Format=json" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "{
  \"dbSettings\": {
    \"dbIPAddress\": \"10.10.10.110\",
    \"dbPort\": \"8080\",
    \"dbConnectionString\": \"username:password
 server1.xyz.com:8080 dbName_payments\",
    \"dbConnectionStringBackup\": \"username:password
 server2.xyz.com dbName_payments_backup\"
  }
}"
--user 'username':'password'
```

The following return results show both a successful and an error response for this request.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "d21f71f45322301096eccceaff7b1ce3"
  }
}

// Error response. Payload is too large.
{
  "error": {
    "message": "Size of uploaded data:6853632.0(bytes) is
 greater than max allowed upload limit of 2097152.0(bytes)",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - POST /sn_cdm/applications/uploads/collections

Submits a request to upload the passed-in configuration data for a specific collection, within the system collections folder, for the specified application.

This endpoint returns the ID of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload.

Note: The maximum default upload content size is 2 MB. You can modify this default by updating the property sn_cdm.max_allowed_upload_file_size.

The following image shows an example of where the configuration data is uploaded in reference to the ServiceNow DevOps Config Workspace UI. Assumes the collection is **db0Release1.0** and the application is **paymentSvc**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This upload method cannot be used to modify nodes. Use the alternative CdmApplicationsApi - POST /sn_cdm/applications/uploads/collections/file method to modify nodes.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/uploads/collections`

Default URL: `/api/sn_cdm/applications/uploads/collections`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Name of the application to associate with the configuration data. This application must be in the active state. Located in the CDM Application [sn_cdm_application] table. Data type: String
autoCommit	Flag that indicates whether the changeset identified in the *`changesetNumber`* parameter is committed to the data model after upload. Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: Boolean Default: false
autoDelete	Flag that indicates whether the existing nodes, that aren't part of the upload content, are deleted after the processing is complete. Valid values: • true: Automatically delete existing nodes. • false: Don't automatically delete existing nodes. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. **Note:** This option is only available if the *autoCommit* parameter is `true`. Data type: Boolean Default: false
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
collectionName	Required. Name of the collection under which to store the uploaded payload. **Note:** If the specified *namePath* does not exist under this collection, the system automatically creates the component(s) under this collection and then uploads the configuration content. For example, if you want to upload the collection `collA`, with the path `compA/comp/compC`, the data is uploaded under `/collA/collections/compa/compB/compC`. If `compA` exists but not `compB` and `compC`, then the endpoint creates these components and uploads the data under `compC`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
dataFormat	Required. Format of the configuration data. Valid values: • csv • ini • json • properties • raw • xml • yaml Data type: String
dataFormatAttributes	Only supported when the *dataFormat* parameter is set to `csv`. Attributes that define the CSV data format. For additional information, see Parsing of CSV files in CDM. Data type: Object `"dataFormatAttributes" { "containsHeader": Boolean, "delimeter": "String" "headers": [Array], "securedHeaders": [Array] }`

dataFormatAttributes.containsHeaders	Flag that indicates whether the data contains a header row.
	
	Valid values:
	• true: Data contains a header row. The first row in the data is considered the header row.
	
	`First Name,Last Name,Location,salary`
	`David,Ben,NYC,1000`
	`Jakes D,Ron,IRE,1220`
	`"George, R",Martin,US,12120`
	`"Antony, ""Ron",Mohan,US,1210`
	
	• false: Data doesn't contain a header row. You must pass the header information in the *dataFormatAttributes.headers* parameter.
	
	Data type: Boolean
	
	Default: false

dataFormatAttributes.delimeter	Character to use to delineate fields within the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String Default: Comma ","
dataFormatAttributes.headers	Required if *`dataFormatAttributes.containsHeaders`* parameter is `false`. Fields in the data that comprise the header. These headers are converted to the key names of the CDIs in the JSON format. The number of headers must match the number of record fields. Data type: Array Default: Empty array
dataFormatAttributes.securedHeaders	Fields in the data that are secure fields and must be encrypted in the data uploaded to CDM. The name of the secured headers must match the name of the headers in the headers attribute or data file. These fields are stored in a column of type Password (2 Way Encrypted). **Note:** You can only secure fields using this attribute. You can't unsecure the secured fields. Data type: Array Default: Empty array
deleteRedundantOverrides	Flag that indicates whether to create an override where redundant values are present. Valid values: • true: If redundant values are present, an override isn't created. • false: If redundant values are present, proceeds with an override. Default: true
ignoreAttributes	Flag that indicates whether the given data format supports attributes (currently only XML). Valid values: • true: If the given data format supports attributes, any attributes in the input data are skipped during the upload. • false: If the given data format supports attributes, any attributes in the input data are included in the upload. Data type: Boolean Default: false
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called).

Query parameters (continued)

Name	Description
	You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp&#xFFFD;deployables&#xFFFD;Development1&#xFFFD;cdi1` • Array: `['testApp','deployables','Development1','cdi1']` **Note:** If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. This can be any data in the format defined by the *dataFormat* parameter of the query parameters.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Supported types: *text/plain* and *application/x-www-form-urlencoded*. Default: *text/plain*

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

This example shows how to upload JSON-formatted *dbSettings* configuration date into the collections folder for the application Demo_App1631126164773.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uploa
ds/collections?dataFormat=json&autoValidate=false&changesetNumbe
r=Chset-102&appName=Demo_App1631126164773&autoDelete=true&namePa
th=%2FSettings%2FdbSettings&collectionName=release-1.0&autoCommi
t=false&publishOption=publish_none" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "{
  \"dbSettings\": {
    \"dbIPAddress\": \"10.10.10.110\",
    \"dbPort\": \"8080\",
    \"dbConnectionString\": \"admin:admin server1.xyz.com:8080
 dbName_payments\",
    \"dbConnectionStringBackup\": \"admin:admin server2.xyz.com
 dbName_payments_backup\"
  }
}" \
--user 'username':'password'
```

The following shows the possible responses to this call, both as a success and an error.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}

// Error response. Payload is too large.
{
  "error": {
    "message": "Size of uploaded data:6853632.0(bytes) is
 greater than max allowed upload limit of 2097152.0(bytes)",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - POST /sn_cdm/applications/uploads/collections/file

Uploads a file to the collections folder in the Configuration Data Model (CDM).

URL format

Versioned URL: POST /api/sn_cdm/{api_version}/applications/uploads/collections/file

Default URL: POST /api/sn_cdm/applications/uploads/collections/file

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Name of the application to associate with the configuration data. This application must be in the active state. Located in the CDM Application [sn_cdm_application] table. Data type: String
autoCommit	Flag that indicates whether the changeset identified in the *`changesetNumber`* parameter is committed to the data model after upload. Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. **Note:** This option is only available if the *`autoCommit`* parameter is `true`. Data type: Boolean Default: false
collectionName	Required. Name of the collection under which to store the uploaded payload.

Query parameters (continued)

Name	Description
	Note: If the specified `namePath` does not exist under this collection, the system automatically creates the component(s) under this collection and then uploads the configuration content. For example, if you want to upload the collection `collA`, with the path `compA/comp/compC`, the data is uploaded under `/collA/collections/compa/compB/compC`. If `compA` exists but not `compB` and `compC`, then the endpoint creates these components and uploads the data under `compC`. Data type: String
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
fileName	Name of the file to upload. This name can differ from than the actual file name and contain the file extension. For example, .txt/.scv/.jar. The fileName value is applied when downloading the file. Data type: String
fileNodeName	Name of the file node. This file name is used in the configuration data when exporting it. This name doesn't require a file extension nor does it affect the download. Data type: String
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called). You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp␀deployables␀Development1␀cdi1` • Array: `['testApp','deployables','Development1','cdi1']`

Query parameters (continued)

Name	Description
	Note: If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
publishOption	Publish option for the associated configured snapshots. Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none **Note:** This option is only available if the value for the *autoCommit* parameter is true.

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. By default, file size uploads are limited to 5 MB. For information about how to adjust your upload file sizes and type, see this Now Support article. Data type: String/stream

Headers

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Content Type of the file to be uploaded. Examples: application/zip, text/plain, application/json.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

The following call uploads a plain text file to the CDM collections folder.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uploa
ds/collections/file?autoValidate=true&collectionName=collA&appNa
me=testApp&namePath=testComponent%2FfilesFolder&fileName=testFil
eNodeName.txt&publishOption=publish_valid&changesetNumber=Chset-
108&autoCommit=true&fileNodeName=testFile.txt" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "This is sample content that will be uploaded to a plain
 text file."\
--user 'username':'password'
```

The following return results show both a successful and an error response to this request.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}

// Error response. Payload is too large.
{
  "error": {
    "message": "Could not find active application with name:
 'testApp' of type application",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - POST /sn_cdm/applications/uploads/deployables

Submits a request to upload the configuration content for a specific deployable within the deployables system folder of a specified application.

This endpoint returns the ID of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload.

Note: The maximum default upload content size is 2 MB. You can modify this default by updating the property sn_cdm.max_allowed_upload_file_size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following image shows an example of where the deployable configuration data is uploaded in reference to the ServiceNow DevOps Config UI. Assumes the deployable is **Development_1** and the application is **paymentSvc**.

Note: This upload method cannot be used to modify nodes. Use the alternative CdmApplicationsApi - POST /sn_cdm/applications/uploads/deployables/file method to modify nodes.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/uploads/deployables`

Default URL: `/api/sn_cdm/applications/uploads/deployables`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Name of the application to associate with the configuration data. This application must be in the active state. Located in the CDM Application [sn_cdm_application] table. Data type: String
autoCommit	Flag that indicates whether the changeset identified in the *`changesetNumber`* parameter is committed to the data model after upload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoDelete	Flag that indicates whether the existing nodes, that aren’t part of the upload content, are deleted after the processing is complete. Valid values: • true: Automatically delete existing nodes. • false: Don't automatically delete existing nodes. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. **Note:** This option is only available if the *autoCommit* parameter is `true`. Data type: Boolean Default: false
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
dataFormat	Required. Format of the configuration data. Valid values: • csv • ini • json • properties

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• raw • xml • yaml Data type: String
dataFormatAttributes	Only supported when the *dataFormat* parameter is set to `csv`. Attributes that define the CSV data format. For additional information, see Parsing of CSV files in CDM. Data type: Object `"dataFormatAttributes" { "containsHeader": Boolean, "delimeter": "String" "headers": [Array], "securedHeaders": [Array] }`
dataFormatAttributes.containsHeaders	Flag that indicates whether the data contains a header row. Valid values: • true: Data contains a header row. The first row in the data is considered the header row. • false: Data doesn't contain a header row. You must pass the header information in the *dataFormatAttributes.headers* parameter. Data type: Boolean Default: false
dataFormatAttributes.delimeter	Character to use to delineate fields within the data. Data type: String Default: Comma ","
dataFormatAttributes.headers	Required if *dataFormatAttributes.containsHeaders* parameter is `false`. Fields in the data that comprise the header. These headers are converted to the key names of the CDIs in the JSON format. The number of headers must match the number of record fields. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: Empty array
dataFormatAttributes.securedHeaders	Fields in the data that are secure fields and must be encrypted in the data uploaded to CDM. The name of the secured headers must match the name of the headers in the headers attribute or data file. These fields are stored in a column of type Password (2 Way Encrypted). **Note:** You can only secure fields using this attribute. You can't unsecure the secured fields. Data type: Array Default: Empty array
deleteRedundantOverrides	Flag that indicates whether to create an override where redundant values are present. Valid values: • true: If redundant values are present, an override isn't created. • false: If redundant values are present, proceeds with an override. Default: true
deployableName	Required. Name of the deployable under which to store the uploaded payload. **Note:** If the specified *namePath* does not exist under this deployable, the system automatically creates the component(s) under this deployable and then uploads the configuration content.

identifierKeys	List of names that indicate which key in an array child to use to identify the same node.
	
	For example, if you're uploading:
	
	`[ {"name" : "Allan, "city" : "Paris"}, {"name" : "Karen, "city" : "Sydney"} ]`
	
	in the following existing model:
	
	`[ {"name" : "Karen, "city" : "Manila"}, {"name" : "Allan, "city" : "Brussels"} ]`
	
	and you set *identifierKeys* to `name`, it produces the following output:
	
	`[ {"name" : "Karen, "city" : "Sydney"},`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description

	<pre>{"name" : "Allan, "city" : "Paris"}
	]</pre>
	Otherwise, it produces the following output:
	<pre>[
	{"name" : "Karen, "city" : "Manila"},
	{"name" : "Allan, "city" : "Brussels"},
	{"name" : "Allan, "city" : "Paris"},
	{"name" : "Karen, "city" : "Sydney"}
	]</pre>
	Data type: Array of Strings

ignoreAttributes	Flag that indicates whether the given data format supports attributes (currently only XML). Valid values: • true: If the given data format supports attributes, any attributes in the input data are skipped during the upload. • false: If the given data format supports attributes, any attributes in the input data are included in the upload. Data type: Boolean Default: false
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called). You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp&#xFFFD;deployables&#xFFFD;Development1&#xFFFD;cdi1` • Array: `['testApp','deployables','Development1','cdi1']` **Note:** If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
publishOption	Publish option for the associated configured snapshots.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none **Note:** This option is only available if the value for the *autoCommit* parameter is true.

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. This can be any data in the format defined by the *dataFormat* parameter of the query parameters.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Supported types: *text/plain* and *application/x-www-form-urlencoded*. Default: *text/plain*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

The following example shows an upload request for the application Demo_App1631126164773.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uploa
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ds/deployables?deployableName=TST-1&autoValidate=false&dataForma
t=json&autoDelete=false&changesetNumber=Chset-102&appName=Demo_A
pp1631126164773&publishOption=publish_none&autoCommit=true&nameP
ath=%2FSettings%2FdbSettings" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "{
  \"dbIPAddress\": \"10.10.10.110\",
  \"dbPort\": \"8080\",
  \"dbConnectionString\": \"admin:admin server1.xyz.com:8080
 dbName_payments\",
  \"dbConnectionStringBackup\": \"admin:admin server2.xyz.com
 dbName_payments_backup\"
}" \
--user 'username':'password'
```

The following return results show both a successful and an error response for this request.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}

// Error response. Payload is too large.
{
  "error": {
    "message": "Size of uploaded data:6853632.0(bytes) is
 greater than max allowed upload limit of 2097152.0(bytes)",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - POST /sn_cdm/applications/uploads/deployables/file

Uploads files to the deployables folder in the Configuration Data Model (CDM).

URL format

Versioned URL: POST `/api/sn_cdm/{api_version}/applications/uploads/deployables/file`

Default URL: POST `/api/sn_cdm/applications/uploads/deployables/file`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Query parameters

Name	Description
appName	Name of the application to associate with the configuration data. This application must be in the active state. Located in the CDM Application [sn_cdm_application] table. Data type: String
autoCommit	Flag that indicates whether the changeset identified in the *changesetNumber* parameter is committed to the data model after upload. Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. **Note:** This option is only available if the *autoCommit* parameter is `true`. Data type: Boolean Default: false
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
deployableName	Required. Name of the CDM deployable for which to map the policy. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
fileName	Name of the file to upload. This name can differ from than the actual file name and contain the file extension. For example, .txt/.scv/.jar. The fileName value is applied when downloading the file. Data type: String

Query parameters (continued)

Name	Description
fileNodeName	Name of the file node. This file name is used in the configuration data when exporting it. This name doesn't require a file extension nor does it affect the download. Data type: String
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called). You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp␀deployables␀Development1␀cdi1` • Array: `['testApp','deployables','Development1','cdi1']` **Note:** If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
publishOption	Publish option for the associated configured snapshots. Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none **Note:** This option is only available if the value for the *autoCommit* parameter is true.

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. By default, file size uploads are limited to 5 MB. For information about how to adjust your upload file sizes and type, see this Now Support article. Data type: String/stream

Headers

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data type of the file to be uploaded. Supported types: *application/zip*, *text/plain*, *application/json*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

The following request uploads a plain text file to the deployables folder of the CDM application.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/applications/uploa
ds/deployables/file?autoValidate=true&deployableName=depA&appNam
e=testApp&namePath=testComponent%2FfilesFolder&fileName=testFile
NodeName.txt&publishOption=publish_valid&changesetNumber=Chset-1
08&autoCommit=true&fileNodeName=testFile.txt" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "This is sample content that will be uploaded to a plain
 text file."\
--user 'username':'password'
```

The following return results show both a successful and an error response to this request.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Error response. Payload is too large.
{
  "error": {
    "message": "Could not find active application with name:
 'testApp' of type application",
    "detail": ""
  },
  "status": "failure"
}
```

CdmApplicationsApi - PUT /sn_cdm/applications/deployables

Updates the specified shared component in an application within a specified changeset.

Allows an update to the following fields:

- Name
- Description
- Application Service\Dynamic CI Group
- Deployable identifier

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/deployables`

Default URL: `/api/sn_cdm/applications/deployables`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, v1 or v2. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the CDM Application. Data type: String
name	Required. Name of the CDM Deployable. Data type: String
newDescription	Optional. A description for the CDM Deployable. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
newServiceId	Optional. The ID of the desired Application Service/Dynamic CI Group. In the cURL request, provide `''` to disconnect the Deployable from the service.
newIdentifier	Optional. The identifier of the Deployable. Data type: Choice (Development/Test/Production
newName	Optional. The new name of the Deployable. Data type: String
returnFields	Optional. Comma-separated list of fields to be returned as part of the response.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: application/json

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. A bad request type or malformed request was detected.
500	Internal Server Error. An unexpected error occurred while processing the request. The response contains additional information about the error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
sys_id	CDM deployable sys_Id.
name	Name of the CDM Deployable.
node	Deployable node object. `{ 'value': '<sysId>', 'link': 'http://localhost:8081/api/now/table/*'}`
description	CDM deployable description.
identifier	An identifier for the deployable.
cmdb_ci	The app service object which is connected to a deployable. `{ 'value': '<sysId>', 'link': 'http://localhost:8081/api/now/table/*'}`
cmdb_app	The CDM application object. `{ 'value': '<sysId>', 'link': 'http://localhost:8081/api/now/table/*'}`
snapshot_version_counter	The count of snapshots created for a deployable.
cdi_count	The number of CDIs contained in this CDM deployable.
cdi_usage	The CDI usage percentage.
environment_type	The environment type. Possible values: • development • production • test
state	The active or deleted state . Possible values: • active • deleted
sys_created_by	CDM deployable created by <username>.
sys_created_on	CDM deployable creation timestamp in the format of <yyyy-MM-dd hh:mm:ss>.
sys_updated_by	CDM deployable updated by <username>.
sys_updated_on	CDM deployable updated by timestamp in the format of <yyyy-MM-dd hh:mm:ss>.

CdmApplicationsApi - PUT /sn_cdm/applications/shared_components

Updates the specified shared component in an application within a specified changeset.

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/applications/shared_components`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_cdm/applications/shared_components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Unique identifier of the changeset associated with the component. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint
sharedComponentName	Required. Name of the shared component associated with the specified application. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
sharedLibraryName	Required. Name of the shared library under which the component resides. Located in the CDM Application [sn_cdm_application] table. The shared library must have the following fields defined as follows: • state = active • available = true • type = shared_library Data type: String
version	Required. Version name associated with the shared component. Located in the CDM Snapshot [sn_cdm_snapshot] table. Data type: String

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The passed changeset does not exist.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

The response fields depend on what fields were specified in the *returnFields* parameter in the request. The following describes some of the more important fields.

Name	Description

changeset_id	Details of the changeset record associated with the node.
	
	Data type: Object
	
	`"changeset_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

changeset_id.link	Call syntax for querying this changeset record using the *Table* REST API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
changeset_id.value	Unique identifier of the changeset record. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
description	Description of the CDM node. Data type: String
error	Only returned if an error occurred during processing. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Details about the error that occurred. Data type: String
error.message	Message that provides an overview of the error. Data type: String
linked_to	ID of the main node associated with the shared component. Data type: String
linked_to_version	Details of the CDM snapshot record associated with the node. Data type: Object `"linked_to_version": { "link": "String", "value": "String" }`
linked_to_version.link	Call syntax for querying this version record using the *Table* REST API. Data type: String
linked_to_version.value	Sys_id of the version record. Data type: String
main	Flag that indicates whether the associated snapshot was published. Valid values: • true: Snapshot was published. • false: Snapshot was not published.
main_id	Unique ID of the newly created main node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
main_id_encoded	Encoded ID of the newly created main node. Data type: String
name	Name of the CDM node. Data type: String
node	Sys_id of the shared component node. Data type: String
node_path	Path to the new linked node created when adding the shared component. Data type: String
status	Status of the node. Possible values: New Data type: String
sys_created_by	User name of the user that create the CDM node. For example, able.tuter. Data type: String
sys_created_on	Date and time when the CDM node was created. Format: YYYY-mm-DD hh:mm:ss Data type: String
sys_id	Sys_id of the node. Located in the CDM Node [sn_cdm_node] table. Data type: String
sys_updated_by	User name of the user that last updated the CDM node. For example, able.tuter. Data type: String
sys_updated_on	Date and time when the CDM node was last updated. Format: YYYY-mm-DD hh:mm:ss Data type: String
type	Node type. Data type: String

Example: cURL request

The following example shows how to call this endpoint to update the application "App1" with the shared component "paymentService-V1.1" under the shared library "OracleG-Library-10" within the "Chset-20" changeset.

```
"https://instance-name.service-now.com/api/sn_cdm/applications/s
hared_components?sharedComponentName=paymentService-V1.1&sharedL
ibraryName=OracleG-Library-10&changesetNumber=Chset-20&versionNa
me=sComp3-v2.shc&appName=App1" \
--request PUT \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
"result": {

CdmChangesetsApi

The *CdmChangesetsApi* provides endpoints that enable you to manage changesets.

Using these endpoints you can:

- Create new changesets.
- Deploy changesets.
- Retrieve lists of or individual changesets.
- Retrieves the node changes within a changeset.
- Retrieve a list of applications or deployables that are impacted by a changeset.
- Delete changesets.
- Return a list of shared components that are associated with a specified changeset.

The create changesets endpoints use an asynchronous queuing implementation. With this type of implementation, you first call the create changeset request endpoint. This endpoint queues your request and returns a commit identifier. You then use this commit identifier to call the appropriate status endpoint to obtain the status of the create request.

You must have one of the following roles to access this API:

- Scripted REST CDM View ACL (sn_cdm.cdm.viewer)
- Scripted REST CDM Editor ACL (sn_cdm.cdm_editor)

In addition, the Configuration Data Management (CDM) plugin must be activated for this API to be available in an instance.

For additional information on changesets, see Changesets and version control in CDM.

CdmChangesetsApi - DELETE /sn_cdm/changesets

Deletes a specified changeset.

The caller must have the CDM Editor role to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets`

Default URL: `/api/sn_cdm/changesets`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
None	

Example: cURL request

The following code example shows how to remove a changeset.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets?changeset
Number=Chset-760" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

For a successful deletion of the changeset, no response is returned other than the HTTP status code.

```
None - results defined by the HTTP status code
```

CdmChangesetsApi - GET /sn_cdm/changesets

Retrieves all changesets associated with a Configuration Data Management (CDM) application or a specified changeset record.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets`

Default URL: `/api/sn_cdm/changesets`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the CDM application whose changesets you want returned. This must be an active application. Located in the CDM Application [sn_cdm_application] table. Data type: String
number	Changeset number. Located in the CDMChangeset [sn_cdm_changeset] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	If you pass this value, only the specified changeset is returned. It must be a changeset that is associated with the CDM application specified in the *appName* parameter. Data type: String Default: None - return all changesets associated with the CDM application or the ones specified by the *state* parameter.
state	State of the changesets to return. Only return the changesets associated with the specified CDM application for the specified state. Valid values: • Blocked • Checking for conflict • Commit failed • Commit in progress • Committed • Open Data type: String Default: Return all changesets for all states

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
auto_validate	Flag that indicates whether the changesets created upon commit are validated. Valid values: • true: Validate the changesets. • false: Do not validate the changesets. Data type: Boolean
cdm_application	Details of the CDM application associated with the changeset. Data type: Object `"cdm_application": { "link": "String", "value": "String" }`
cdm_application.link	Query to use to call the *Table* REST endpoint to retrieve the associated CDM application. Data type: String
cdm_application.value	Sys_id of the associated CDM application. Located in the CDM Application [sn_cdm_application] table. Data type: String
committed_at	Date and time that the changeset was last committed. Data type: String Format: YYYY-mm-DD hh:mm:ss
committed_by	Details about the user that committed the changeset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"committed_by": { "link": "String", "value": "String" }`
committed_by.link	Call to obtain the record of the user that committed the changeset using the REST *Table* API. Data type: String
committed_by.value	Sys_id of the user who committed the changeset. Data type: String
description	Brief description of the purpose of the changeset. Data type: String
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
last_conflict_detection_time	Amount of time since the last conflict detection was run. Conflict detection is performed whenever a changeset is committed. Data type: Number Unit: Milliseconds
last_updated	Date and time when a change was made to the associated configuration data through this changeset. Format: YYYY-mm-DD hh:mm:ss Data type: String
number	Unique changeset number. Data type: String
publish_option	Publish option for the associated configured snapshots.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none
state	Current state of the changeset. Possible values: • Blocked • Checking for conflict • Commit failed • Commit in progress • Committed • Open Data type: String
sys_created_by	User name of the user that created the changeset. For example, able.tuter. Data type: String
sys_created_on	Date and time when the changeset was created. Format: YYYY-mm-DD hh:mm:ss Data type: String
sys_id	Sys_id of the changeset. Located in the CDMChangeset [sn_cdm_changeset] table. Data type: String
sys_updated_by	User name of the user that last updated the changeset. For example, able.tuter. Data type: String
sys_updated_on	Date and time when the changeset was last updated. Format: YYYY-mm-DD hh:mm:ss Data type: String
title	Title of the changeset.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

changeset_id	Details of the requested changeset.
	
	Data type: Object
	
	`"changeset_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

changeset_id.link	Query to use to call the *Table* REST endpoint to retrieve the associated changeset. Data type: String
changeset_id.value	Sys_id of the associated changeset. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
conflict	Flag that indicates whether there is a conflict in the associated changeset. Valid values: • true: Conflict detected. • false: No conflict found. Data type: Boolean
created	Date and time when the node was created. Format: YYYY-mm-DD hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
created_by	User name of the user that create the node. For example, able.tuter. Data type: String
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
name_path	Node path name. Data type: String
new_name	Current name of the node. Data type: String
new_value	Current value of the node. For leaf nodes and array literals. Data type: String
old_name	Previous name of the node. Data type: String
old_value	Previous value of the node. For leaf nodes and array literals. Data type: String
updated	Date and time when the node was last updated. Format: YYYY-mm-DD hh:mm:ss Data type: String
updated_by	User name of the user that last updated the node. For example, able.tuter. Data type: String
secure	Flag that indicates whether the associated leaf node was secured. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Node was secured. • false: Node was not secured. Data type: Boolean
type	Node type. Possible values: • sn_cdm_node_collection • sn_cdm_node_component • sn_cdm_node_folder • sn_cdm_node_cdi • sn_cdm_node_variable Data type: String

Example: cURL request

This code example shows how to retrieve the node changes for a specific changeset.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/activi
ty?changesetNumber=Chset-783" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": [
    {
      "sys_id": "ed5d6c0f53141110a1d3ddeeff7b1233",
      "changeset_id": "955d6c0f53141110a1d3ddeeff7b1233",
      "new_value": null,
      "new_state": "Deleted",
      "new_name": "Dep-1",
      "new_type": "Deployable",
      "new_encrypted": false,
      "updated_on": "2022-06-29 13:09:46",
      "updated_by": "admin",
      "resolution_method": "",
      "conflict": null,
      "path": "deployables/Dep-1",
      "created_by": null,

```

CdmChangesetsApi - GET /sn_cdm/changesets/commit-status/{commit_id}

Returns the current status of the specified changeset commit request.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets/commit-status/{commit_id}`

Default URL: `/api/sn_cdm/changesets/commit-status/{commit_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
commit_id	Sys_id for the commit request whose status to return. This value is returned by the CdmChangesetsApi - POST /sn_cdm/changesets/{changeset_id}/commit endpoint.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
commit_id	Commit request record sys_id. Same as that passed into the endpoint. Data type: String
errors	Description of the error(s) encountered during upload. Data type: String
output	Description of the uploaded data or if an error occurred during the upload, an error message describing the error that was encountered. Data type: Object `"output": { "auto_validate": "String", "cdm_application": "String", "committed_at": "String", "committed_by": "String", "description": "String", "last_conflict_detection_time": "String", "number": "String", "publish_option": "String", "snapshot_description": "String", "snapshot_name": "String", "state": "String", "sys_created_by": "String", "sys_id": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "title": "String"
	}</pre>

output.auto_validate	Indicates whether to invoke validation after the commit. Data type: String
output.cdm_application	Name of application under which the upload was performed. Data type: String
output.committed_at	Date and time that the uploaded content was committed. Data type: String
output.committed_by	Sys_id of the record of the entity that performed the commit. Data type: String
output.description	Not currently used. Data type: String
output.last_conflict_detection_time	Date and time conflict detection invocation. Data type: String
output.number	Unique number of the changeset. Data type: String
output.publish_option	Publish option for the associated configured snapshots. Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none
output.snapshot_description	Description of the associated snapshot. Data type: String
output.snapshot_name	Name of the associated snapshot. Data type: String
output.state	State of the upload content.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • committed • completed • error • in_progress • new • ready Data type: String
output.sys_created_by	Sys_id of the entity that created the record. Data type: String
output.sys_id	Sys_id of the record containing the changeset. Data type: String
output.title	Title of changeset created as part of the upload. Data type: String
processing_state	Current processing state of the commit request. Possible values: • NOT_PROCREED • PROCESSED Data type: String
request_id	Request ID. Same as that passed into the endpoint and *commit_id*. Data type: String
state	Current state of the specified commit. Value from state column in the CDM Request Queue [sn_cdm_request_queue] table. Possible values: • completed • error • in_progress • new • ready Data type: String
type	Type of request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • commit • export • upload_and_commit Data type: String

Example: cURL request

The following example shows how to call this endpoint to obtain the status of the specified commit.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/commit-st
atus/bf506e69537c3010a1d3ddeeff7b12c0"\
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The following shows examples of a success and error response.

```
// Successful response

{
  "result": {
    "type": "commit",
    "state": "completed",
    "output": {
      "sys_id": "4a4407e953124110da35ddeeff7b1235",
      "number": "Chset-1207",
      "title": "admin064407e953124110da35ddeeff7b1235",
      "description": "A description of my changeset provided
 during creation",
      "committed_at": "2022-03-17 22:19:33",
      "committed_by": "6816f79cc0a8016401c5a33be04be441",
      "sys_created_by": "admin",
      "state": "committed",
      "publish_option": "publish_none",
      "auto_validate": false,
      "snapshot_name": null,
      "snapshot_description": null,
      "cdm_application": "DemoApp",
      "last_conflict_detection_time": null
    },
    "processing_state": "PROCESSED",
    "commit_id": "9cd583e953124110da35ddeeff7b128a"
  }
}

// Example of an error response

  }
}
```

CdmChangesetsApi - GET /sn_cdm/changesets/impacted-deployables

Returns the list of deployables that are associated with a specified changeset.

The CDM Viewer role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets/impacted-deployables`

Default URL: `/api/sn_cdm/changesets/impacted-deployables`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
cdi_count	Number of configuration data items (CDIs) contained in the associated CDM application. Data type: Integer
cdi_usage	Percentage of the CDIs used by the deployable. Data type: Integer

cdm_app	CDM application object associated with the deployable.
	
	Data type: Object
	`"cdm_app": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
cdm_app.link	Call to use to access the CDM application record using the REST *Table* API. Data type: String
cdm_app.value	Sys_id of the associated CDM application record. Located in the CDM Application [sn_cdm_application] table. Data type: String

cdm_ci	Application service object associated with the deployable.
	
	Data type: Object
	
	`"cdm_ci": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_ci.link	Call to use to access the application service record using the REST *Table* API. Data type: String
cdm_ci.value	Sys_id of the associated application service record. Located in the Configuration Item [cmdb_ci] table. Data type: String
description	Description of the generated CDM deployable. Data type: String
environment_type	Environment type of the deployable. Possible values: • Development • Production • Test Data type: String

error	Only returned if an error occurred during processing.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
error.message	Error message that was generated while trying to process the request. Data type: String
name	Name of the CDM deployable. Data type: String
node	Details about the deployable node. Data type: Object `"node": { "link": "String", "value": "String" }`
node.link	Call to use to access the deployable node record using the REST *Table* API. Data type: String
node.value	Sys_id of the deployable node record. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
snapshot_version_counter	Number of snapshots created for the deployable. Data type: Integer
state	Current state of the deployable. Possible values: • active • deleted Data type: String
sys_created_by	User name of the user that created the CDM deployable. For example, able.tuter. Data type: String
sys_created_on	Date and time when the CDM deployable was created. Format: YYYY-mm-DD hh:mm:ss Data type: String
sys_id	Sys_id of the created deployable. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
sys_updated_by	User name of the user that last updated the CDM deployable. For example, able.tuter. Data type: String
sys_updated_on	Date and time when the CDM deployable was last updated. Format: YYYY-mm-DD hh:mm:ss Data type: String

Example: cURL request

The following code example shows how to retrieve the impacted deployables for a specified changeset.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/impact
ed-deployables?changesetNumber=Chset-783" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": [
    {
      "cmdb_ci": {

CdmChangesetsApi - GET /sn_cdm/changesets/impacted-shared-components

Returns a list of shared components that are associated with a specified changeset.

The CDM Viewer role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets/impacted-shared-components`

Default URL: `/api/sn_cdm/changesets/impacted-shared-components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The passed changeset does not exist.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
cdm_shared__library	Sys_id of the shared library under which the component resides. Data type: String
description	Description of the CDM shared component. Data type: String

error	Only returned if an error occurred during processing.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Details about the error that occurred.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
error.message	Message that provides an overview of the error. Data type: String
name	Name of the CDM shared component. Data type: String
node	Sys_id of the shared component node. Located in the CDM Node [sn_cdm_node] table. Data type: String
node_main	Sys_id of the main_id of the shared component node record. Located in the CDM Node Main [sn_cdm_node_main] table. Data type: String
state	Current state of the shared component. Possible values: • active • deleted Data type: String
sys_created_by	User name of the user that create the CDM shared component. For example, able.tuter. Data type: String
sys_created_on	Date and time when the CDM shared component was created. Format: YYYY-mm-DD hh:mm:ss Data type: String
sys_id	Sys_id of the shared component. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
sys_updated_by	User name of the user that last updated the CDM shared component. For example, able.tuter. Data type: String
sys_updated_on	Date and time when the CDM shared component was last updated. Format: YYYY-mm-DD hh:mm:ss Data type: String
version_counter	Number of versions created for the shared component.

CdmChangesetsApi - GET /sn_cdm/changesets/{changeset_id}/impacted-deployables

Returns the list of deployables that are associated with a specified changeset.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets/{changeset_id}/impacted-deployables`

Default URL: `/api/sn_cdm/changesets/{changeset_id}/impacted-deployables`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
changeset_id	Sys_id of the changeset record to process. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
changeset_id	Sys_id of the last changeset associated with the deployable node. Data type: String
conflict	Flag that indicates whether the associated deployable is in conflict. Valid values: • 0: Not in conflict. • 1: Conflicted - refer to the *conflict_type* return result for additional information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Number
conflict_type	Type of deployable conflict. Possible values: • corrupted_node • deleted_node • duplicated_node • incomplete_deleted_parent • incomplete_deleted_ref • incomplete_renamed_ref • invalid_include • orphaned_descendant • related_conflict • unlinked_include • unrenamed_include • updated_node Data type: String
description	Description of the deployable node. Data type: String
effective_from	Timestamp when the node is valid. This value is `null` until you commit a changeset in which the node was created. Data type: Number
effective_to	Timestamp when the node is no longer valid. If this value is `null`, the node stays in affect until it is replaced with a new version. Data type: Number
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
level	Depth of the node starting from the application level, which is 0. Data type: Number

linked_to	ID of the reference node within a collection and component.
	
	For example, the following node snippet shows a link between the collection collA and the component compA. For this example, the *linkedTo* value is 1:
	
	`{`
	`components : {compA:{} //MainId: 1},`
	
	`Collections : { collA : {`
	`compA :{} //Include, linkedTo: 1`
	`}`
	`}`
	`}`
	
	Data type: String

main_id	Unique identifier of the deployable node. This value is generated when the node is created and used to identify the deployable node. Data type: Number
main_id_encoded	Encoded value of the *mainId* return results, using Radix 57 string representation. Data type: String
name	Name of the deployable. Data type: String
node_classifier	Node classification, such as Development, Production, or Test. In the format: • /application/deployables/env:Development • /application/deployables/env:Production • /application/deployables/env:Test Data type: String

position	Deployable node position. Only applicable to arrays.
	
	For example, for the array:
	
	`node1:{`
	`arrayNode: [{}, "literal1", "literal2", []] }`
	
	{} is position 1000,
	
	"literal1" is position 2000,
	
	"literal2" is position 3000,

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	[] is position 4000 Data type: Number
previous_version	Sys_id of the previous version of the associated deployable node. Data type: String
restricted_to	List of sys_ids of the users that are allowed to access the associated deployable node. This information comes from the CDM Restricted Groups [sn_cdm_restricted_groups] table. This value is `null` if all groups can access the deployable. Data type: String
secure_value	Secure value of the CDI or variable. Only returned for leaf nodes and array literals. This is the same as the *`value`* return result, but is encrypted. Data type: String
status	Status of deployable node or the status of a failed request. Possible values: • deleted • failure (passed if endpoint call fails.) • new • superseded • updated • valid Data type: String
system_folder	Flag that indicates whether the associated folder is a system folder. Valid values: • 0: Not a system folder. • 1: System folder. Data type: Number
sys_id	Sys_id of the impacted deployable. Data type: String
type	Node type, such as sn_cdm_node_deployable. This value enables you to determine whether the node is a component, config data item (CDI), or deployable. This value is generated when the node is created. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
value	Value of the CDI or variable. Only returned for leaf nodes and array literals. If this information is encrypted, it is returned in the *secure_value* return result. For example, if this node is the CDI `nodeA:{cdi1: 1}`, the *value* return result is 1. If it is an array node such as `node1: {arrayNode: [{}, "literal1", "literal2", []]}`, the *value* return result is `literal1`. Data type: String

Example: cURL request

The following example shows how to request the deployables that are associated with the changeset whose sys_id is bf506e69537c3010a1d3ddeeff7b12c0.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/bf506e695
37c3010a1d3ddeeff7b12c0/impacted-deployables"\
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

The following shows both a successful and an error response for this endpoint.

```
// Successful response
{
  "result": [
    {
      "sys_id": "833527a953924110da35ddeeff7b12c1",

}
```

CdmChangesetsApi - POST /sn_cdm/changesets/{changeset_id}/commit

Commits the specified changeset. Once committed, the changeset is persisted into the CDM tables within the associated instance.

The system updates the application to persist the changes to the configuration data within the changeset. The changeset state changes to **Committed**. The system then generates a snapshot of each deployable that is affected by the changeset.

This endpoint returns the ID of the commit request. Use this ID to call the CdmChangesetsApi - GET /sn_cdm/changesets/commit-status/{commit_id} endpoint to obtain the current status of the changeset commit.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets/{changeset_id}/commit`

Default URL: `/api/sn_cdm/changesets/{changeset_id}/commit`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
changeset_id	Sys_id of the changeset record to process. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String

Query parameters

Name	Description
autoValidate	Flag that indicates whether the snapshots created upon commit are validated, meaning any associated policies are run against the snapshot. Valid values: • true: Validate the snapshots. • false: Do not validate the snapshots. Default: false
publishOption	Publish option for the associated configuration snapshots. Valid values: • publish_none: Do not publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. **Note:** This option is only available if the value for the *autoCommit* parameter is true. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Error: <Error message> Validate that the *changeset_id* parameter that you passed in was correct. Ensure that you have the required roles to access this endpoint.
500	Internal Server Error Error: Invalid boolean value. If you passed in the *autoValidate* parameter, verify that it is a boolean value.

Response body parameters

Name	Description
commit_id	Sys_id of the commit request. Use this ID when calling the CdmChangesetsApi - GET /sn_cdm/changesets/commit-status/{commit_id} endpoint to check the status of the commit request. Data type: String
error	If an error occurred during processing, the details about the error. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"error": {
	  "detail": "String",
	  "message": "String"
	}</pre>

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Status of the commit. Only returned when an error occurs. Possible values: failure Data type: String

Example: cURL request

The following example shows how to call this endpoint to commit a changeset record.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/29e240015
33030104bacddeeff7b120c/commit?publishOption=publish_valid"\
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
```

The following shows the response for a successful changeset commit request.

```
// Successful response
{
  "result": {
    "commit_id": "64b5f79f5379301096edddeeff7b12eb"
  }
}

// Example of an error response
{
  "error": {
    "message": "Error: Unexpected error occurred in commit
 request.Error:Failed to insert request in queue",
    "detail": ""
  },
  "status": "failure"
}
```

CdmChangesetsApi - POST /sn_cdm/changesets/create

Creates a new changeset in the open state for a specified CDM application or shared library.

The CDM Editor role is required to access this endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets/create/`

Default URL: `/api/sn_cdm/changesets/create/`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the CDM application or shared library to associate with this changeset. This must be an active application or shared library. Data type: String
description	Changeset description. Enter something that will allow others to understand the purpose of the changeset. Data type: String Default: None
returnFields	Comma separated list of fields in the CDM Changeset [sn_cdm_changeset] table to return as part of the response. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Error: <Error message> Ensure that the specified CDM application or shared library exists and in the active state.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
auto_validate	Flag that indicates whether auto validation was performed. Possible values: • true: Auto validation was performed. • false: Auto validation was not preformed. Data type: Boolean

cdm_application	Details about the CDM application associated with the changeset.
	
	Data type: Object
	`"cdm_application": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	For example: `{"value": "<sysId>", "link": "http://localhost:8081/api/now/table/*'}"`
cdm_application.link	URL of the associated CDM application. Data type: String
cdm_application.value	Sys_id of the associated CDM application. Data type: String
committed_at	Date and time that the changeset was committed to the associated repository. Data type: String
committed_by	Sys_id of the entity that created the changeset. Data type: String
description	Description of the changeset as passed when the endpoint was called. Data type: String

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
last_conflict_detection_time	Last time conflict detection ran. Data type: Number Unit: Milliseconds
number	Unique identifier for the new changeset. Data type: String
publish_option	Publish option for the associated configured snapshots. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none
snapshot_description	Description of the snapshot associated with the changeset. Data type: String
state	State of the changeset creation. Possible values: • Blocked • Checking for conflict • Commit failed • Commit in progress • Committed • Open Data type: String
status	Status of the changeset creation. Only returned when an error occurs. Possible values: failure Data type: String
sys_created_by	Sys_id of the entity that created the changeset record. Data type: String
sys_id	Sys_id of the new changeset. Data type: String
title	Title of the changeset associated with the application. Typically auto-generated by the system. Data type: String

Example: cURL request

The following example shows how to create a changeset associated with the App Service1 CDM application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/create?ap
pName=App%20Service1&description=Sample%20Description \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
```

The following shows the response for a successful creation of the changeset.

```
// Example of a successful response
{
"result": {
    "sys_id": "42748779c370301054c1582e1340ddcd",
    "number": "Chset-8",
    "title": "admin2021-06-18 10:06:46",
    "description": null,
    "committed_at": "",
    "committed_by": null,
    "sys_created_by": "admin",
    "state": "open",
    "publish_option": "publish_none",
    "auto_validate": false,
    "snapshot_name": null,
    "snapshot_description": null,
    "cdm_application": "App%20Service1"
  }
}

// Example of an error response
{
  "error": {
    "message": "Error: Unexpected error occurred in create
 request.Error:Application not found",
    "detail": ""
  },
  "status": "failure"
}
```

Example: cURL request

The following example shows how to create a changeset for the shared library "javalib".

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/create?sh
aredLibraryName=javalib&description=description of changeset" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
```

CdmChangesetsApi - PUT /sn_cdm/changesets/commit

Updates and commits a specified changeset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system updates the application to persist the changes to the configuration data within the changeset. The changeset state changes to **Committed**. The system then generates a snapshot of each deployable that is affected by the changeset.

This endpoint returns the ID of the commit request. Use this ID to call the CdmChangesetsApi - GET /sn_cdm/changesets/commit-status/{commit_id} endpoint to obtain the current status of the changeset commit.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/changesets/{changeset_id}/commit`

Default URL: `/api/sn_cdm/changesets/{changeset_id}/commit`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
autoValidate	Flag that indicates whether the snapshots created during the commit are validated, meaning any associated policies are run against the snapshot. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots. Data type: Boolean Default: false
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
publishOption	Publish option for the associated configured snapshots. Valid values: • publish_none: Don't publish any snapshots. • publish_valid: Publish only those snapshots that pass validation after the commit. For additional information on publishing snapshots, see Publish or unpublish a snapshot.

Query parameters (continued)

Name	Description
	Data type: String Default: publish_none

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Error: <Error message> Validate that the *`changeset_id`* parameter that you passed in was correct. Ensure that you have the required roles to access this endpoint.
500	Internal Server Error: Invalid boolean value. If you passed in the *`autoValidate`* parameter, verify that it is a boolean value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
commit_id	Sys_id of the commit request. Use this ID when calling the CdmChangesetsApi - GET /sn_cdm/changesets/commit-status/{commit_id} endpoint to check the status of the commit request. Data type: String
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Status of the commit. Only returned when an error occurs. Possible values: failure Data type: String

Example: cURL request

The follow code example shows how to use this endpoint to update a changeset.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/changesets/commit?ch
angesetNumber=Chset-146" \
--request PUT \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "commit_id": "cca8190f53141110a1d3ddeeff7b129e"
  }
}
```

CdmEditorApi

The *CdmEditorApi* provides endpoints that enable you to create nodes, update nodes, include existing nodes under other nodes, delete nodes, and retrieve nodes and node includes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must have one of the following roles to access this API:

- Scripted REST CDM View ACL (sn_cdm.cdm.viewer)
- Scripted REST CDM Editor ACL (sn_cdm.cdm_editor)

To view fields that have been encrypted, you must have the CDM Secret role.

In addition, the Configuration Data Management (CDM) plugin must be activated for this API to be available in an instance.

Note: The *CdmEditorApi* API cannot be used to modify any files. Only file deletion is allowed currently.

CdmEditorApi - DELETE /sn_cdm/editor/nodes

Deletes a specified node.

The caller of this endpoint must have the CDM Editor role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/editor/nodes`

Default URL: `/api/sn_cdm/editor/nodes`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
fullNamePath	Required. Path name of the node to delete. You can pass the name path in any of the following formats. For example, to delete the following node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Backend name path with replacement characters: `testApp%2Fdeployables%2FDevelopment1%2Fcdi1` • Array: `['testApp','deployables','Development1','cdi1']` Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
None	

Example: cURL request

The following code example shows how to delete the node "cdi88".

```
curl
 "http://instance.servicenow.com/api/sn_cdm/editor/nodes?changes
etNumber=Chset783&fullNamePath=%2FtestApp%2Fdeployables%2FDevelo
pment-1%2Fcdi88" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

Return result:

```
None - just the associated HTTP status code
```

CdmEditorApi - GET /sn_cdm/editor/includes

Returns the list of nodes that were include within a specified node path.

The caller of this endpoint must have the CDM Viewer role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/editor/includes`

Default URL: `/api/sn_cdm/editor/includes`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
changesetNumber	Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (continued)

Name	Description
	Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint
sourceFullNamePath	Required. Path name of the source node for which to return the included nodes. You can pass the name path in any of the following formats. For example, to return the includes for the `collectionA` node in the `testApp/collections` directory: • Backslash format: `testApp/collections/collectionA` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp␀collections␀collectionA` • Array: `['testApp','collections','collectionA']` Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
changeset_id	Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
conflict	Flag that indicates whether there was a conflict when processing the node. Possible values: • true: Conflict detected. • false: No conflict was detected. Data type: Boolean
conflict_type	If the *conflict* parameter is true, the type of conflict detected. Null if no conflict is detected. Possible values: • corrupted_node • deleted_node • duplicated_node • incomplete_deleted_parent • incomplete_deleted_ref • incomplete_renamed_ref • invalid_include • orphaned_descendant • related_conflict • unlinked_include • unrenamed_include • updated_node Data type: String
description	Short description of the purpose of the node. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
effective_from	Timestamp (converted to a long integer) when the node was committed as part of the changeset. If the node hasn't been committed, this value is "null". Data type: Integer
effective_to	Timestamp (converted to a long integer) of the node when it was either deleted or superseded by another node, otherwise "null". Data type: Integer

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
level	Level of the node, starting from the root node, which is always 0. For example, the node `/AppA/components/compA` has two levels. Data type: String
linked_to	The *`main_id`* parameter of the referenced node to which this node is linked. If this node isn't linked to a reference node, the value is "null". Data type: String
main_id	Primary identifier for the node. You can use this value in the *`CdmQuery()`* script include to retrieve a JSON tree. For example: `CdmQuery().mainId('123')/query().getTree();` Data type: String
main_id_encoded	RADIX 57 string representation of the node's *`main_id`* parameter. Data type: String
name	Name of the node that was included under the target path. Data type: String
node_classifier	Classifier hierarchy of the node. Use this information to locate a node within the folder hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	For example, a deployable would have a hierarchy of `/application/deployables/env:Development` While a collection would have a hierarchy of `/applications/collections` Data type: String
node_path	Full path name of the node that was included in the target path, such as `/Production/deployables/Development1/cdi1`. Data type: String
position	Node position. For example: If you upload the following array: `arrayNode1: [ "literal1", {"cdi1": 1}, "literal3" ]` The position values are set as follows: • arrayNode1.literal1 = 1000 • arrayNode1.2000 = 2000 • arrayNode1.literal3 = 3000 If a complex object is uploaded under an array, in this case `{"cdi1": 1}`, the endpoint creates a new virtual node with the name equal to its position. In the example above, this is 2000. For includes, the position is always empty. Data type: String
previous_version	Details of the previous version of the node record. **Note:** If a new node was created, the endpoint returns `"previous_version" = null` for this parameter. Data type: Object `"previous_version": { "link": "String", "value": "String" }`
restricted_to	Details of the group that has access the associated the node. Data type: Object `"restricted_to": { "link": "String", "value": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
secure_value	If this value was flagged to be secured, the encrypted field (returned masked). A user must have the sn_cdm.cdm_secrets role to decrypt this information. You can direct the endpoint not to return these fields by setting the *returnFields* query parameter field. Data type: String
status	Node status. Possible values: • DELETED • NEW • SUPERSEDED • UPDATED • VALID Data type: String
sys_id	Sys_id of the node. Located in the CDM Node [sn_cdm_node] table. Data type: String
system_folder	Flag that indicates whether the associated node is a system folder. Possible values: • true: Node is a system folder. • false: Node isn't a system folder. Data type: Boolean
type	Node type. Possible values: • sn_cdm_node_cdi • sn_cdm_node_collection • sn_cdm_node_component • sn_cdm_node_folder • sn_cdm_node_variable Data type: String
value	Node value. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

This code example shows how retrieve the includes in the source path `/testApp/collections/collA`.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/editor/includes?chan
gesetNumber=Chset5&sourceFullNamePath=%2FtestApp%2Fcollections%2
FcollA" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return result:

```
{
  "result": [
    {
      "sys_id": "a1c517a953b70110a1d3ddeeff7b129b",
      "type": "sn_cdm_node_deployable",
      "main_id": "6",
      "main_id_encoded": ",",
      "node_path": "!$!+!,",
      "level": 2,
      "status": "valid",
      "node_classifier":
 "/application/deployables/env:Development",
      "position": null,
      "restricted_to": null,
      "changeset_id": "e9c517a953b70110a1d3ddeeff7b1299",
      "previous_version": null,
      "effective_from": "1654002206866",
      "effective_to": null,
      "name": "Development_1",
      "description": null,
      "value": null,
      "secure_value": null,
      "system_folder": "0",
      "linked_to": null,
      "conflict": "0",
      "conflict_type": null
    }
  ]
}
```

CdmEditorApi - GET /sn_cdm/editor/nodes

Returns the details of a specified node or a list of child Configuration Data Management (CDM) nodes for a specified parent node.

The caller of this endpoint must have the CDM Viewer role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/editor/nodes`

Default URL: `/api/sn_cdm/editor/nodes`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
decryptPassword	Flag that indicates whether the value should be encrypted for the leaf nodes. Valid values: • true: Encrypted • false: Not encrypted Data type: Boolean Default: false
name	Node name. If you pass this parameter, only the results for the specified node are returned. Data type: String Default: All nodes within the parent node
parentFullNamePath	Required. Path name of the parent node for which to return the child nodes or to which the node specified in the *name* parameter resides. You can pass the name path in any of the following formats. For example, to return the nodes for the `collectionA` node in the `testApp/collections` directory: • Backslash format: `testApp/collections/collectionA` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp␀collections␀collectionA` • Array: `['testApp','collections','collectionA']` Data type: String

Query parameters (continued)

Name	Description
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint
type	Node type. Possible values: • sn_cdm_node_cdi OR cdi • sn_cdm_node_collection OR collection • sn_cdm_node_component OR component • sn_cdm_node_folder OR folder • sn_cdm_node_variable OR variable Data type: String Default: All

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
changeset_id	Details of the changeset record associated with the node. Data type: Object `"changeset_id": { "link": "String", "value": "String" }`
changeset_id.link	Call syntax for querying this changeset record using the *Table* REST API. Data type: String
changeset_id.value	Unique identifier of the changeset record. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
conflict	Flag that indicates whether there was a conflict when processing the node. Possible values: • true: Conflict detected. • false: No conflict was detected. Data type: Boolean
conflict_type	If the *conflict* parameter is true, the type of conflict detected. Null if no conflict is detected. Possible values: • corrupted_node • deleted_node • duplicated_node • incomplete_deleted_parent • incomplete_deleted_ref • incomplete_renamed_ref

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• invalid_include • orphaned_descendant • related_conflict • unlinked_include • unrenamed_include • updated_node Data type: String
description	Short description of the purpose of the node. Data type: String
effective_from	Timestamp (converted to a long integer) when the node was committed as part of the changeset. If the node hasn't been committed, this value is "null". Data type: Integer
effective_to	Timestamp (converted to a long integer) of the node when it was either deleted or superseded by another node, otherwise "null". Data type: Integer

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
level	Level of the node, starting from the root node, which is always 0. For example, the node `/AppA/components/compA` has two levels. Data type: String
linked_to	The *`main_id`* parameter of the referenced node to which this node is linked. If this node isn't linked to a reference node, the value is "null". Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
main_id	Primary identifier for the node. You can use this value in the *CdmQuery()* script include to retrieve a JSON tree. For example: `CdmQuery().mainId('123')/query().getTree();` Data type: String
main_id_encoded	RADIX 57 string representation of the node's *main_id* parameter. Data type: String
name	Name of the node. Data type: String
node_classifier	Classifier hierarchy of the node. Use this information to locate a node within the folder hierarchy. For example, a deployable would have a hierarchy of `/application/deployables/env:Development` While a collection would have a hierarchy of `/applications/collections` Data type: String
node_path	Full node path name. Data type: String
position	Node position. For example: If you upload the following array: `arrayNode1: [ "literal1", {"cdi1": 1}, "literal3" ]` The position values are set as follows: • arrayNode1.literal1 = 1000 • arrayNode1.2000 = 2000 • arrayNode1.literal3 = 3000 If a complex object is uploaded under an array, in this case `{"cdi1": 1}`, the endpoint creates a new virtual node with the name equal to its position. In the example above, this is 2000. For includes, the position is always empty. Data type: String
previous_version	Details of the previous version of the node record. **Note:** If a new node was created, the endpoint returns `"previous_version" = null` for this parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"previous_version": { "link": "String", "value": "String" }`
previous_version.link	Call syntax for querying this node record using the *Table* REST API. Data type: String
previous_version.value	Sys_id of the node record. Located in the CDM Node [sn_cdm_node] table. Data type: String
reason_for_conflict	Detailed explanation of the conflict. Data type: String
restricted_to	Details of the group that has access the associated the node. Data type: Object `"restricted_to": { "link": "String", "value": "String" }`
restricted_to.link	Call syntax for querying this group record using the *Table* REST API. Data type: String
restricted_to.value	Sys_id of the group record. Located in the CDM Group [sys_user_group] table. Data type: String
secure_value	If this value was flagged to be secured, the encrypted field (returned masked). A user must have the sn_cdm.cdm_secrets role to decrypt this information. You can direct the endpoint not to return these fields by setting the *returnFields* query parameter field. Data type: String
status	Node status. Possible values: • DELETED • NEW • SUPERSEDED • UPDATED • VALID

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
system_folder	Flag that indicates whether the associated node is a system folder. Possible values: • true: Node is a system folder. • false: Node isn't a system folder. Data type: Boolean
sys_class_name	Table in which the node resides. Data type: String
sys_created_by	Name of the user that created the node. Data type: String
sys_created_on	Date and time when the node was created. Data type: String Format: yyyy-mm-dd hh:mm:ss
sys_id	Sys_id of the node. Located in the CDM Node [sn_cdm_node] table. Data type: String
sys_updated_by	Name of the user that updated the node. Data type: String
sys_updated_on	Date and time when the node was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss
type	Node type. Possible values: • sn_cdm_node_cdi • sn_cdm_node_collection • sn_cdm_node_component • sn_cdm_node_folder • sn_cdm_node_variable Data type: String Default: All
value	Node value. Data type: String

Example: cURL request

This code example shows how to retrieve the child nodes of type sn_cdm_node_cdi under the `/testApp/Fdeployables/Development_1` parent node.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/editor/nodes?decrypt
Password=true&name=cdi45&changesetNumber=Chset3&parentFullNamePa
th=%2FtestApp%2Fdeployables%2FDevelopment_1&type=sn_cdm_node_c
di" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return result:

```
{
  "result": [
    {
      "changeset_id": {
        "value": "d403648653b70110a1d3ddeeff7b12c5",
        "link":
 "http://instance.servicenow.com/api/now/table/sn_cdm_changes
et/d403648653b70110a1d3ddeeff7b12c5"
      },
      "node_path": "!$!+!,![:",
      "description": null,
      "sys_updated_on": "2022-06-30 09:24:07",
      "type": "sn_cdm_node_cdi",

CdmEditorApi - POST /sn_cdm/editor/includes

Includes an existing node into another node, such as a component node into a collection node or a collection node into a deployable node. After including a node, the new node has its own unique sys_id and main_Id.

The caller of this endpoint must have the CDM Editor role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/editor/includes`

Default URL: `/api/sn_cdm/editor/includes`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Unique number of the open changeset to include in the target node. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint
sourceFullNamePath	Required. Path name of the node to include in the target node. You can pass the name path in any of the following formats. For example, to include the following node `Staging/deployables/Development1/cdi1`: • Backslash format: `Staging/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `Staging&#65533;deployables&#65533;Development1&#65533;cdi1` • Array: `['Staging','deployables','Development1','cdi1']`

Query parameters (continued)

Name	Description
	Data type: String
targetFullNamePath	Required. Path name of the node under which the source node is to be included. You can pass the name path in any of the following formats. For example, to include the following node `Production/deployables/Development1`: • Backslash format: `Production/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `Production␀deployables␀Development1␀cdi1` • Array: `['Production','deployables','Development1','cdi1']` Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
changeset_id	Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
conflict	Flag that indicates whether there was a conflict when processing the node. Possible values: • true: Conflict detected. • false: No conflict was detected. Data type: Boolean
conflict_type	If the *conflict* parameter is true, the type of conflict detected. Null if no conflict is detected. Possible values: • corrupted_node • deleted_node • duplicated_node • incomplete_deleted_parent • incomplete_deleted_ref • incomplete_renamed_ref • invalid_include • orphaned_descendant • related_conflict • unlinked_include • unrenamed_include • updated_node

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
description	Short description of the purpose of the node. Data type: String
effective_from	Timestamp (converted to a long integer) when the node was committed as part of the changeset. If the node hasn't been committed, this value is "null". Data type: Integer
effective_to	Timestamp (converted to a long integer) of the node when it was either deleted or superseded by another node, otherwise "null". Data type: Integer
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
level	Level of the node, starting from the root node, which is always 0. For example, the node `/AppA/components/compA` has two levels. Data type: String
linked_to	The *`main_id`* parameter of the referenced node to which this node is linked. If this node isn't linked to a reference node, the value is "null". Data type: String
main_id	Primary identifier for the node. You can use this value in the *`CdmQuery()`* script include to retrieve a JSON tree. For example: `CdmQuery().mainId('123')/query().getTree();` Data type: String
main_id_encoded	RADIX 57 string representation of the node's *`main_id`* parameter. Data type: String
name	Name of the node that was included under the target path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
node_classifier	Classifier hierarchy of the node. Use this information to locate a node within the folder hierarchy. For example, a deployable would have a hierarchy of `/application/deployables/env:Development` While a collection would have a hierarchy of `/applications/collections` Data type: String
node_path	Full path name of the node that was included in the target path, such as `/Production/deployables/Development1/cdi1`. Data type: String
position	Node position. For example: If you upload the following array: `arrayNode1: [ "literal1", {"cdi1": 1}, "literal3" ]` The position values are set as follows: • arrayNode1.literal1 = 1000 • arrayNode1.2000 = 2000 • arrayNode1.literal3 = 3000 If a complex object is uploaded under an array, in this case `{"cdi1": 1}`, the endpoint creates a new virtual node with the name equal to its position. In the example above, this is 2000. For includes, the position is always empty. Data type: String
previous_version	Details of the previous version of the node record. **Note:** If a new node was created, the endpoint returns `"previous_version" = null` for this parameter. Data type: Object `"previous_version": { "link": "String", "value": "String" }`
restricted_to	Details of the group that has access the associated the node. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"restricted_to": {
	  "link": "String",
	  "value": "String"
	}</pre>

secure_value	If this value was flagged to be secured, the encrypted field (returned masked). A user must have the sn_cdm.cdm_secrets role to decrypt this information. You can direct the endpoint not to return these fields by setting the *returnFields* query parameter field. Data type: String
status	Node status. Possible values: • DELETED • NEW • SUPERSEDED • UPDATED • VALID Data type: String
sys_id	Sys_id of the node. Located in the CDM Node [sn_cdm_node] table. Data type: String
system_folder	Flag that indicates whether the associated node is a system folder. Possible values: • true: Node is a system folder. • false: Node isn't a system folder. Data type: Boolean
type	Node type. Possible values: • sn_cdm_node_cdi • sn_cdm_node_collection • sn_cdm_node_component • sn_cdm_node_folder • sn_cdm_node_variable Data type: String
value	Node value.

Name	Description
	Data type: String

Example: cURL request

The following code example shows how to include the node `/testApp/collections/collA` under `/testApp/deployables/Development_1`.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/editor/includes?chan
gesetNumber=Chset5&targetFullNamePath=%2FtestApp%2Fdeployables%2
FDevelopment_1&sourceFullNamePath=%2FtestApp%2Fcollecti
ons%2FcollA" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Return result:

```
{
  "result": {
    "changeset_id": {
      "value": "d403648653b70110a1d3ddeeff7b12c5",
      "link":
 "http://192.168.0.233:8080/api/now/table/sn_cdm_changeset/d4036
48653b70110a1d3ddeeff7b12c5"
    },
    "node_path": "!$!+!,![?",
    "description": null,
    "sys_updated_on": "2022-06-30 09:19:47",
    "type": "sn_cdm_node_linked",
    "sys_class_name": "sn_cdm_node",
    "sys_id": "1642015b53981110a1d3ddeeff7b1232",
    "sys_updated_by": "admin",
    "previous_version": null,
    "sys_created_on": "2022-06-30 09:19:47",
    "value": null,
    "effective_from": null,
    "linked_to": "2870",
    "sys_created_by": "admin",
    "restricted_to": null,
    "level": "3",
    "conflict_type": null,
    "main_id": "2872",
    "effective_to": null,
    "secure_value": null,
    "node_classifier":
 "/application/deployables/env:Development",
    "main_id_encoded": "[?",
    "name": "collA",
    "position": null,

```
    }
}
```

CdmEditorApi - POST /sn_cdm/editor/nodes

Creates a specific type of node, such as component, collection, folder, configuration data item (CDI), or variable.

You can also specify whether to automatically generate any parent nodes that are not currently defined.

The caller of this endpoint must have either the CDM Editor or CDM Secret role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/editor/nodes`

Default URL: `/api/sn_cdm/editor/nodes`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
autoCreateParents	Flag that indicates whether to automatically create the non-existent parents in the name path as components. Exceptions to this are the app, deployable, and collection. If you do not set this flag and the parents do not already exist, the endpoint fails. Valid values: • true: Automatically create the non-existent parents. • false: Don't automatically create the non-existent parents. Data type: Boolean Default: false
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
fullNamePath	Required. Path name of the node. You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp␀deployables␀Development1␀cdi1` • Array: `['testApp','deployables','Development1','cdi1']` Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint
secure	Flag that indicates whether the value should be encrypted for the leaf nodes. Valid values: • true: Encrypted • false: Not encrypted Data type: Boolean Default: false
type	Required. Type of new node. Valid values: • sn_cdm_node_collection OR collection • sn_cdm_node_component OR component • sn_cdm_node_folder OR folder • sn_cdm_node_cdi OR cdi • sn_cdm_node_variable or variable Data type: String
value	Value of the new node. Data type: String Default: Equivalent of "null"

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
changeset_id	Details of the changeset record associated with the node. Data type: Object `"changeset_id": { "link": "String", "value": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
changeset_id.link	Call syntax for querying this changeset record using the *Table* REST API. Data type: String
changeset_id.value	Unique identifier of the changeset record. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
conflict	Flag that indicates whether there was a conflict when processing the node. Possible values: • true: Conflict detected. • false: No conflict was detected. Data type: Boolean
conflict_type	If the *conflict* parameter is true, the type of conflict detected. Null if no conflict is detected. Possible values: • corrupted_node • deleted_node • duplicated_node • incomplete_deleted_parent • incomplete_deleted_ref • incomplete_renamed_ref • invalid_include • orphaned_descendant • related_conflict • unlinked_include • unrenamed_include • updated_node Data type: String
description	Short description of the purpose of the node. Data type: String
effective_from	Timestamp (converted to a long integer) when the node was committed as part of the changeset. If the node hasn't been committed, this value is "null". Data type: Integer
effective_to	Timestamp (converted to a long integer) of the node when it was either deleted or superseded by another node, otherwise "null".

Name	Description
	Data type: Integer
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
level	Level of the node, starting from the root node, which is always 0. For example, the node `/AppA/components/compA` has two levels. Data type: String
linked_to	The *`main_id`* parameter of the referenced node to which this node is linked. If this node isn't linked to a reference node, the value is "null". Data type: String
main_id	Primary identifier for the node. You can use this value in the *`CdmQuery()`* script include to retrieve a JSON tree. For example: `CdmQuery().mainId('123')/query().getTree();` Data type: String
main_id_encoded	RADIX 57 string representation of the node's *`main_id`* parameter. Data type: String
name	Name of the node. Data type: String
node_classifier	Classifier hierarchy of the node. Use this information to locate a node within the folder hierarchy. For example, a deployable would have a hierarchy of `/application/deployables/env:Development` While a collection would have a hierarchy of `/applications/collections` Data type: String
node_path	Full node path name.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
position	Node position. For example: If you upload the following array: `arrayNode1: [ "literal1", {"cdi1": 1}, "literal3" ]` The position values are set as follows: • arrayNode1.literal1 = 1000 • arrayNode1.2000 = 2000 • arrayNode1.literal3 = 3000 If a complex object is uploaded under an array, in this case `{"cdi1": 1}`, the endpoint creates a new virtual node with the name equal to its position. In the example above, this is 2000. For includes, the position is always empty. Data type: String
previous_version	Details of the previous version of the node record. **Note:** If a new node was created, the endpoint returns `"previous_version" = null` for this parameter. Data type: Object `"previous_version": { "link": "String", "value": "String" }`
previous_version.link	Call syntax for querying this node record using the *Table* REST API. Data type: String
previous_version.value	Sys_id of the node record. Located in the CDM Node [sn_cdm_node] table. Data type: String
reason_for_conflict	Detailed explanation of the conflict. Data type: String
restricted_to	Details of the group that has access the associated the node. Data type: Object `"restricted_to": { "link": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"value": "String"
	}</pre>

restricted_to.link	Call syntax for querying this group record using the *Table* REST API. Data type: String
restricted_to.value	Sys_id of the group record. Located in the CDM Group [sys_user_group] table. Data type: String
secure_value	If this value was flagged to be secured, the encrypted field (returned masked). A user must have the sn_cdm.cdm_secrets role to decrypt this information. You can direct the endpoint not to return these fields by setting the *returnFields* query parameter field. Data type: String
status	Node status. Possible values: • DELETED • NEW • SUPERSEDED • UPDATED • VALID Data type: String
system_folder	Flag that indicates whether the associated node is a system folder. Possible values: • true: Node is a system folder. • false: Node isn't a system folder. Data type: Boolean
sys_class_name	Table in which the node resides. Data type: String
sys_created_by	Name of the user that created the node. Data type: String
sys_created_on	Date and time when the node was created. Data type: String Format: yyyy-mm-dd hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
sys_id	Sys_id of the node. Located in the CDM Node [sn_cdm_node] table. Data type: String
sys_updated_by	Name of the user that updated the node. Data type: String
sys_updated_on	Date and time when the node was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss
type	Node type. Possible values: • sn_cdm_node_cdi • sn_cdm_node_collection • sn_cdm_node_component • sn_cdm_node_folder • sn_cdm_node_variable Data type: String Default: All
value	Node value. Data type: String

Example: cURL request

The following code example shows how to create a node using this endpoint.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/editor/nodes?fullNam
ePath=%2FtestApp%2Fdeployables%2FDevelopment1%2Fcdi1&secure=true
&value=someVal&type=cdi&changesetNumber=Chset-760" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Return result:

```
{
  "result": {
    "changeset_id": {
      "value": "d403648653b70110a1d3ddeeff7b12c5",
      "link":
 "http://instance.servicenow.com/api/now/table/sn_cdm_changes
et/d403648653b70110a1d3ddeeff7b12c5"
    },
    "node_path": "!$!+!,![:",
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
fullNamePath	Required. Path name of the node. You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp&#65533;deployables&#65533;Development1&#65533;cdi1` • Array: `['testApp','deployables','Development1','cdi1']` Data type: String
newName	New name for the associated node. Data type: String
newValue	New value for the associated node. Data type: String
secure	Flag that indicates whether the value should be encrypted for the leaf nodes. Valid values: • true: Encrypted • false: Not encrypted Data type: Boolean Default: false
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
changeset_id	Details of the changeset record associated with the node. Data type: Object `"changeset_id": { "link": "String", "value": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
changeset_id.link	Call syntax for querying this changeset record using the *Table* REST API. Data type: String
changeset_id.value	Unique identifier of the changeset record. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
conflict	Flag that indicates whether there was a conflict when processing the node. Possible values: • true: Conflict detected. • false: No conflict was detected. Data type: Boolean
conflict_type	If the *conflict* parameter is true, the type of conflict detected. Null if no conflict is detected. Possible values: • corrupted_node • deleted_node • duplicated_node • incomplete_deleted_parent • incomplete_deleted_ref • incomplete_renamed_ref • invalid_include • orphaned_descendant • related_conflict • unlinked_include • unrenamed_include • updated_node Data type: String
description	Short description of the purpose of the node. Data type: String
effective_from	Timestamp (converted to a long integer) when the node was committed as part of the changeset. If the node hasn't been committed, this value is "null". Data type: Integer
effective_to	Timestamp (converted to a long integer) of the node when it was either deleted or superseded by another node, otherwise "null".

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Integer
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
level	Level of the node, starting from the root node, which is always 0. For example, the node `/AppA/components/compA` has two levels. Data type: String
linked_to	The *`main_id`* parameter of the referenced node to which this node is linked. If this node isn't linked to a reference node, the value is "null". Data type: String
main_id	Primary identifier for the node. You can use this value in the *`CdmQuery()`* script include to retrieve a JSON tree. For example: `CdmQuery().mainId('123')/query().getTree();` Data type: String
main_id_encoded	RADIX 57 string representation of the node's *`main_id`* parameter. Data type: String
name	Name of the node. Data type: String
node_classifier	Classifier hierarchy of the node. Use this information to locate a node within the folder hierarchy. For example, a deployable would have a hierarchy of `/application/deployables/env:Development` While a collection would have a hierarchy of `/applications/collections` Data type: String
node_path	Full node path name.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
position	Node position. For example: If you upload the following array: `arrayNode1: [ "literal1", {"cdi1": 1}, "literal3" ]` The position values are set as follows: • arrayNode1.literal1 = 1000 • arrayNode1.2000 = 2000 • arrayNode1.literal3 = 3000 If a complex object is uploaded under an array, in this case `{"cdi1": 1}`, the endpoint creates a new virtual node with the name equal to its position. In the example above, this is 2000. For includes, the position is always empty. Data type: String
previous_version	Details of the previous version of the node record. **Note:** If a new node was created, the endpoint returns `"previous_version" = null` for this parameter. Data type: Object `"previous_version": { "link": "String", "value": "String" }`
previous_version.link	Call syntax for querying this node record using the *Table* REST API. Data type: String
previous_version.value	Sys_id of the node record. Located in the CDM Node [sn_cdm_node] table. Data type: String
reason_for_conflict	Detailed explanation of the conflict. Data type: String
restricted_to	Details of the group that has access the associated the node. Data type: Object `"restricted_to": { "link": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "value": "String"
	}</pre>

restricted_to.link	Call syntax for querying this group record using the *Table* REST API. Data type: String
restricted_to.value	Sys_id of the group record. Located in the CDM Group [sys_user_group] table. Data type: String
secure_value	If this value was flagged to be secured, the encrypted field (returned masked). A user must have the sn_cdm.cdm_secrets role to decrypt this information. You can direct the endpoint not to return these fields by setting the *returnFields* query parameter field. Data type: String
status	Node status. Possible values: • DELETED • NEW • SUPERSEDED • UPDATED • VALID Data type: String
system_folder	Flag that indicates whether the associated node is a system folder. Possible values: • true: Node is a system folder. • false: Node isn't a system folder. Data type: Boolean
sys_class_name	Table in which the node resides. Data type: String
sys_created_by	Name of the user that created the node. Data type: String
sys_created_on	Date and time when the node was created. Data type: String Format: yyyy-mm-dd hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
sys_id	Sys_id of the node. Located in the CDM Node [sn_cdm_node] table. Data type: String
sys_updated_by	Name of the user that updated the node. Data type: String
sys_updated_on	Date and time when the node was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss
type	Node type. Possible values: • sn_cdm_node_cdi • sn_cdm_node_collection • sn_cdm_node_component • sn_cdm_node_folder • sn_cdm_node_variable Data type: String Default: All
value	Node value. Data type: String

Example: cURL request

The following code example shows how to update the value of a node.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/editor/nodes?newValu
e=cdcdc&fullNamePath=%2FtestApp%2Fdeployables%2FDe
velopment-1%2Fcdi45&changesetNumber=Chset-5" \
--request PUT \
--header "Accept:application/json" \
--user 'username':'password'
```

Return result:

```
{
  "result": {
    "changeset_id": {
      "value": "d403648653b70110a1d3ddeeff7b12c5",
      "link":
 "http://instance.servicenow.com/api/now/table/sn_cdm_changes
et/d403648653b70110a1d3ddeeff7b12c5"
    },
    "node_path": "!$!+!,![",
```

}
```

CdmPoliciesApi

The *CdmPoliciesApi* provides endpoints that enable you to manage policy mappings of deployables in Configuration Data Management (CDM). Policies that are properly mapped to a deployable are executed when a snapshot of the deployable is validated.

You must have one of the following roles to access the endpoints in this API:

- Scripted REST CDM View ACL
- Scripted REST CDM Admin ACL

In addition, the Configuration Data Management (CDM) plugin must be activated for this API to be available in an instance.

For additional information on policy mappings, see Map policies to a deployable.

CdmPoliciesApi - DELETE /sn_cdm/policies/mappings

Deletes the mapping of a specified policy to a deployable.

The caller of this endpoint must have the CDM Admin role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/policies/mappings`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_cdm/policies/mappings`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the Configuration Data Management (CDM) application for which to remove the mapping to the policy. Located in the CDM Application [sn_cdm_application] table. Data type: String
deployableName	Required. Name of the CDM deployable for which to remove the mapping to the policy. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
policyName	Required. Name of the associated policy. Located in the Policy [sn_pace_policy] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The *policyName* parameter passed is invalid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String

Example: cURL request

The following code example shows how to remove a policy mapping.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/policies/mappings?de
ployableName=Development_1&policyName=testALPolicy1&appName=test
App" \
--request DELETE \
--header "Accept:application/json" \
--user 'username':'password'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a successful deletion of the mapping, no response is returned other than the HTTP status code.

```
None - results defined by the HTTP status code
```

CdmPoliciesApi - GET /sn_cdm/policies/mappings/inputs/resolved

Returns the resolved inputs for a specified policy mapping of a deployable.

For additional information on policy mappings, see Map policies to a deployable and Validating and correcting configuration data.

The caller of this endpoint must have the CDM Viewer role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/policies/mappings/inputs/resolved`

Default URL: `/api/sn_cdm/policies/mappings/inputs/resolved`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the Configuration Data Management (CDM) application associated with the deployable for which to return the resolved policy inputs. Located in the CDM Application [sn_cdm_application] table. Data type: String
deployableName	Required. Name of the CDM deployable for which to return the resolved policy. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
policyName	Required. Name of the associated policy. Located in the Policy [sn_pace_policy] table. Data type: String

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The *policyName* parameter passed is invalid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Name-value pair list of all resolved inputs for the specified policy mapping. For example: `{"input_name": "user_1", "input_password": "" }` Data type: Object

Example: cURL request

The following example shows how to use this endpoint to obtain the resolved policy inputs.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/policies/mappings/in
puts/resolved?policyName=testALPolicy1&deployableName=Developmen
t_1&appName=testApp" \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Return result:

```
{
  "result": {
    "key1": "someVal",
    "additionalDeployablesInput":
 "[{\"id\":\"e7e34a531b501110636e0fe0604bcba9\",\"label\":
\"testApp-Development_2\"}]"
  }
}
```

CdmPoliciesApi - POST /sn_cdm/policies/mappings

Maps a specified policy to a deployable.

The caller of this endpoint must have the CDM Admin role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/policies/mappings`

Default URL: `/api/sn_cdm/policies/mappings`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the Configuration Data Management (CDM) application for which to map the policy. Located in the CDM Application [sn_cdm_application] table. Data type: String
deployableName	Required. Name of the CDM deployable for which to map the policy. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
policyName	Required. Name of the associated policy. Located in the Policy [sn_pace_policy] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters

Name	Description
description	Description of the mapping. Data type: String
document	Sys_id of the document. Data type: String
document_ref	Details of the document_ref record associated with the node. Data type: Object `"document_ref": { "link": "String", "value": "String" }`
document_ref.link	Call syntax for querying the deployable record mapped to the policy using the *Table* REST API. PaCE uses this field to store the reference to the deployable that is mapped to a policy. Data type: String
document_ref.sys_id	Sys_id of the deployable record mapped to the policy. Data type: String
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
exception	If there's an exception while trying to perform the mapping, the link to the exception record. Data type: String
exception_allowed	Flag that indicates whether exceptions are allowed for the policy. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Exceptions are allowed. • false: Exceptions aren't allowed. Data type: Boolean
input_status	Status of the inputs. Possible values: • invalid • valid Data type: String
last_updated_by	Details of the user that last updated the policy mapping. Data type: Object `"last_updated_by": { "link": "String", "value": "String" }`
last_updated_by.link	Call syntax for querying the user record using the *Table* REST API. Data type: String
last_updated_by.sys_id	Sys_id of the user record. Located in the User [sys_user] table. Data type: String
number	Unique number that identifies the mapping. This value provides a human-readable identifier for the mapping. Data type: String
policy	Details of the policy record associated with the mapping. Data type: Object `"policy": { "link": "String", "value": "String" }`
policy.link	Call syntax for querying the policy record mapped to the policy using the *Table* REST API. Data type: String
policy.sys_id	Sys_id of the policy record. Located in the Policy [sn_pace_policy] table. Data type: String
reason	Description of the reason for the current state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
state	Current state of the mapping. Possible values: • active • inactive Data type: String
sys_class_name	Table name of the policy mapping. Data type: String
sys_created_by	Name of the user that created the mapping. Data type: String
sys_created_on	Date and time when the mapping was created. Data type: String Format: yyyy-mm-dd hh:mm:ss
sys_id	Sys_id of the mapping. Located in the Policy Mapping [sn_pace_policy_mapping] table. Data type: String
sys_updated_by	Name of the user that updated the mapping. Data type: String
sys_updated_on	Date and time when the mapping was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss

Example: cURL request

This code example shows how to map a specific policy to a deployable.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/policies/mappings?ap
pName=testApp&deployableName=Development_1&policyName=testALPoli
cy1" \
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
    "exception": null,
```

  }
}
```

CdmPoliciesApi - PUT /sn_cdm/policies/mappings/inputs/additional-deployables

Updates the additionalDeployablesInput input variable of a Configuration Data Management (CDM) policy mapping.

The additionalDeployablesInput input variable contains the additional deployables you can assign to an existing policy mapping. They are similar to mapping inputs, but they have a specific array structure.

For additional information on policy mappings, see Map policies to a deployable.

The caller of this endpoint must have the CDM Admin role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/policies/mappings/inputs/additional-deployables`

Default URL: `/api/sn_cdm/policies/mappings/inputs/additional-deployables`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
additionalDeployables	Required. List of deployables to add to the additionalDeployablesInput input variable. Data type: Array of Objects `"additionalDeployables": [ { "appName": "String", "deployableName": "String" } ]`
additionalDeployables.appName	Required. Name of the CDM application to which the deployable is associated. Located in the CDM Application [sn_cdm_application] table. Data type: String
additionalDeployables.deployableName	Required. Name of the CDM deployable to add to the additionalDeployablesInput input variable. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
appName	Required. Name of the CDM application for which to update the additionalDeployablesInput input variable. Located in the CDM Application [sn_cdm_application] table. Data type: String
deployableName	Required. Name of the CDM deployable for which to update the additionalDeployablesInput input variable. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
policyName	Required. Name of the associated policy. Located in the Policy [sn_pace_policy] table. Data type: String

Query parameters (continued)

Name	Description
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The *`policyName`* parameter passed is invalid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
io_definition	Details about the associated PaCE IO definition record. For additional information on PaCE, see Policy as Code Engine (PaCE). Data type: Object `"io_definition": { "link": "String", "value": "String" }`
io_definition.link	Call syntax for querying this PaCE IO definition record using the *Table* REST API. Data type: String
io_definition.value	Sys_id of the PaCE IO definition record. Located in the IO Mapping [sn_pace_io_mapping] table. Data type: String
is_unused	Flag that indicates whether the mapping input variable is unused. Possible values: • true: Associated mapping input variable isn't currently used. • false: Associated mapping input variable is currently used. Data type: Boolean
mapped_value	Current value of the mapping input variable. Data type: Array of Objects or String
policy_mapping	Details about the PaCE policy-mapping record. For additional information on PaCE, see Policy as Code Engine (PaCE). Data type: Object `"policy_mapping": { "link": "String", "value": "String" }`
policy_mapping.link	Call syntax for querying the policy mapping record using the *Table* REST API. Data type: String
policy_mapping.value	Sys_id of the PaCE policy-mapping record. Located in the Policy Mapping [sn_pace_policy_mapping] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
sys_created_by	Name of the user that created the mapping input variable. Data type: String
sys_created_on	Date and time when the mapping input variable was created. Data type: String Format: yyyy-mm-dd hh:mm:ss
sys_id	Sys_id of the associated mapping record. Located in the IO Mapping [sn_pace_io_mapping] table. Data type: String
sys_updated_by	Name of the user that updated the mapping input variable. Data type: String
sys_updated_on	Date and time when the mapping input variable was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss

Example: cURL request

The following example shows how to add deployables to an additionalDeployablesInput input variable.

```
curl
 "https://instance.servicenow.com/api/sn_cdm/policies/mappings/i
nputs/additional-deployables?additionalDeployables=%5B%7B
%22appName%22%3A%20%22testApp%22%2C%20%22deployableName%22%3A%22
Development_2%22%7D%5D&policyName=testALPolicy1&deployableName=D
evelopment_1&appName=testApp" \
--request PUT \
--header "Accept:application/json" \
--user 'admin':'admin
```

Return result:

```
{
  "result": {
    "sys_id": "6bb746171b501110636e0fe0604bcb1c",
    "policy_mapping": {
      "value": "6bb746171b501110636e0fe0604bcb1b",
      "link":
 "https://instance.servicenow.com/api/now/table/sn_cdm_pace_poli
cy_mapping/6bb746171b501110636e0fe0604bcb1b"
    },
    "sys_updated_by": "ameya",
    "sys_created_on": "2022-06-30 14:23:15",
    "io_definition": {
      "value": "4d0b061b1b501110636e0fe0604bcb2f",
```

}
```

CdmPoliciesApi - PUT /sn_cdm/policies/mappings/inputs

Updates a specified input variable for a Configuration Data Management (CDM) policy mapping.

For additional information on policy mappings, see Map policies to a deployable.

The caller of this endpoint must have the CDM Admin role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/policies/mappings/inputs`

Default URL: `/api/sn_cdm/policies/mappings/inputs`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the CDM application for which to update the policy mapping inputs. Located in the CDM Application [sn_cdm_application] table. Data type: String
deployableName	Required. Name of the CDM deployable for which to update the policy mapping inputs. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
inputName	Required. Name of the input variable to update. The available input variables are defined in the IO Mapping [sn_pace_io_mapping] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
inputValue	Required. Value to assign to the input variable. Data type: Dependant on the input variable. You can find the data type in the IO Mapping [sn_pace_io_mapping] table.
policyName	Required. Name of the associated policy. Located in the Policy [sn_pace_policy] table. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *`application/json`*.
Content-Type	Data format of the request body. Only supports *`application/json`*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The *policyName* parameter passed is invalid.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
io_definition	Details about the associated PaCE IO definition record. For additional information on PaCE, see Policy as Code Engine (PaCE). Data type: Object `"io_definition": { "link": "String", "value": "String" }`
io_definition.link	Call syntax for querying this PaCE IO definition record using the *Table* REST API. Data type: String
io_definition.value	Sys_id of the PaCE IO definition record. Located in the IO Mapping [sn_pace_io_mapping] table. Data type: String
is_unused	Flag that indicates whether the mapping input variable is unused. Possible values: • true: Associated mapping input variable isn't currently used. • false: Associated mapping input variable is currently used. Data type: Boolean
mapped_value	Current value of the mapping input variable. Data type: Array of Objects or String
policy_mapping	Details about the PaCE policy-mapping record. For additional information on PaCE, see Policy as Code Engine (PaCE). Data type: Object

Name	Description

	<pre>"policy_mapping": {
	  "link": "String",
	  "value": "String"
	}</pre>

policy_mapping.link	Call syntax for querying the policy mapping record using the *Table* REST API. Data type: String
policy_mapping.value	Sys_id of the PaCE policy-mapping record. Located in the Policy Mapping [sn_pace_policy_mapping] table. Data type: String
sys_created_by	Name of the user that created the mapping input variable. Data type: String
sys_created_on	Date and time when the mapping input variable was created. Data type: String Format: yyyy-mm-dd hh:mm:ss
sys_id	Sys_id of the associated mapping record. Located in the IO Mapping [sn_pace_io_mapping] table. Data type: String
sys_updated_by	Name of the user that updated the mapping input variable. Data type: String
sys_updated_on	Date and time when the mapping input variable was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss

Example: cURL request

The following example shows how to update the key1 input variable associated with the testALPolicy.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/policies/mappings/in
puts?policyName=testALPolicy1&appName=testApp&inputValue=value1&
inputName=key1&deployableName=Development_1" \
--request PUT \
--header "Accept:application/json" \
--user 'username':'password'
```

Return results:

```
{
  "result": {
```

}
```

CdmSharedLibraryApi

The *CdmSharedLibraryApi* provides endpoints that enable you to create and manage shared libraries and shared components. It also has endpoints that enable you to upload and export the configuration data of a shared component.

This API requires the Configuration Data Management (CDM) plugin to be activated for these APIs to be available in the instance. In addition, you must have one of the following roles to access this API:

- CDM Editor Role
- CDM Admin Role

For additional information on shared libraries and shared components, see Sharing components among applications — Component libraries.

CdmSharedLibraryApi - DELETE /sn_cdm/shared_libraries

Deletes the shared library with the specified name.

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries`

Default URL: `/api/sn_cdm/shared_libraries`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
name	Required. Name of the shared library to delete. Located in the CDM Application [sn_cdm_application] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code example shows how delete the shared library "javalib".

```
curl
 "http://instance.servicenow.com/sn_cdm/shared_libraries?name='j
avalib'\
--request DELETE\
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
""
```

CdmSharedLibraryApi - DELETE /sn_cdm/shared_libraries/components

Deletes the specified shared component from the specified library.

The CDM Editor role is required to access this endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: You can only delete a component if it is not currently being used. Also, you cannot delete a component if the associated shared library is not active.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries/components`

Default URL: `/api/sn_cdm/shared_libraries/components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Number of the changeset associated with the component. Located in the CDM Changeset [sn_cdm_changeset] table Data type: String
name	Required. Name of the shared component to delete. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
sharedLibraryName	Required. Name of the shared library where the component to delete is located. Located in the CDM Application [sn_cdm_application] table. Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Possible issues: • Shared library does not exist. • Shared library is not active. • Shared component is in use. Cannot delete it. • User is restricted from deleting the shared component.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

error	If an error occurred during processing, the details about the error.
	Data type: Object
	`"error": {`
	`  "detail": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "message": "String"
	}</pre>

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code example shows how to delete the component "TestComponent" under the "javalib" shared library.

```
curl
 "http://instance.servicenow.com/sn_cdm/shared_libraries/compone
nts?sharedLibraryName='javalib&changesetNumber='chset-8'&name='T
estComponent'\
--request DELETE\
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
""
```

CdmSharedLibraryApi - GET /sn_cdm/shared_libraries/upload-status/{upload-id}

Returns the current status of the specified shared library upload request.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries/upload-status/{upload-id}`

Default URL: `/api/sn_cdm/shared_libraries/upload-status/{upload-id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
upload-id	Sys_id of the upload request whose status to return. This value is returned by various CdmSharedLibrary upload request endpoints. Data type: String

Query parameters

Name	Description
None	

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
errors	Description of the error(s) encountered during upload. Data type: String
output	Description of the uploaded data or if an error occurred during the upload, an error message describing the error that was encountered. Data type: Array of String `"output": { "auto_validate": "String", "cdm_application": "String", "committed_at": "String", "committed_by": "String", "description": "String", "last_conflict_detection_time": "String", "number": "String", "publish_option": "String", "sharedLibraryName": "String", "snapshot_description": "String", "snapshot_name": "String", "state": "String", "sys_created_by": "String", "sys_id": "String", "title": "String" }`
output.auto_validate	Indicates whether to invoke validation after the commit. Data type: String
output.cdm_application	Name of application under which the upload was performed. Data type: String
output.committed_at	Date and time that the uploaded content was committed. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
output.committed_by	Sys_id of the record of the entity that performed the commit. Data type: String
output.description	Not currently used. Data type: String
output.last_conflict_detection_time	Date and time conflict detection invocation. Data type: String
output.number	Unique changeset identification value, such as Chset-124. Data type: String
output.publish_option	Value of the publish option passed in the associated upload call. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String
output.sharedLibraryName	Name of the shared library as passed in the original upload call. Data type: String
output.snapshot_description	Description of the associated snapshot. Data type: String
output.snapshot_name	Name of the associated snapshot. Data type: String
output.state	State of the upload. Possible values: • COMPLETED: Upload has completed. • EXPIREDERROR: Error while processing the upload request. The job ran for more than 15 minutes and was terminated by the system. • IN_PROGRESS: Upload is in process. • NEW: Processing has not yet started. • READY: Request has been queued. Data type: String
output.sys_created_by	Sys_id of the entity that created the record. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
output.sys_id	Sys_id of the record containing the changeset. Data type: String
output.title	Title of the changeset created as part of the upload. Data type: String
processing_state	Current processing state of the upload request. Possible values: PROCESSED Data type: String
state	Current state of the upload request. Possible values: • completed • error
type	Type of upload request. Possible values: upload_and_commit Data type: String
upload_id	Sys_id of the record containing the uploaded configuration payload. Data type: String

Example: cURL request

This code example shows how to request the status for the upload-id 0d91d9891b2b19109524cae0604bcbe6.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/shared_libraries/upl
oad-status/0d91d9891b2b19109524cae0604bcbe6" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
// Successful response
{
  "result": {
    "type": "upload_and_commit",
    "state": "completed",
    "output": {
      "sys_id": "0002ea107768a1109ac0cf0bbb5a9963",

CdmSharedLibraryApi - POST /sn_cdm/shared_libraries

Creates a new shared library with the specified name.

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries`

Default URL: `/api/sn_cdm/shared_libraries`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
description	Description of the shared library.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String Default: Empty
name	Required. Name of the shared library to create. This name must be unique across all CDM applications and libraries. Data type: String
returnFields	Comma separated list of fields to return as part of the response. Located in the CDM Application [sn_cdm_application] table. Data type: String Default: All non-system fields are returned.
userGroupIds	Comma-separated list of sys_ids of the user groups that can edit the associated shared library. All users with the proper roles can view the shared library. Located in the Group [sys_user_group] table. Data type: String Default: All users with the CDM Editor role can edit data within the shared library.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
<fields>	Requested fields from the CDM Application [sn_cdm_application] table. Data type: Variable

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code example shows how to call this endpoint to create the shared library Java11Lib with all user groups able to access the library.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/shared_libraries?nam
e=Java11Lib&description=The%20new%20java%20library" \
--request POST \
--header "Accept:application/json" \
--user 'userName':'password
```

Response:

```
{
  "result": {
    "sdlc_component": null,
    "cdi_count": "0",
    "available": false,
    "description": "Description of LibraryA",
    "managed_by_group": null,
    "sys_updated_on": "2023-01-18 11:34:43",
    "type": "shared_library",
    "node": {
      "value": "d852b15877a4a1109ac0cf0bbb5a99aa",
      "link":
 "http://instance.servicenow.com/api/now/table/sn_cdm_node/d852b
15877a4a1109ac0cf0bbb5a99aa"
    },
    "sys_id": "185235dc77a4a1109ac0cf0bbb5a994e",
    "sys_updated_by": "admin",
    "node_main": {

    "sys_created_by": "admin"
  }
}
```

CdmSharedLibraryApi - POST /sn_cdm/shared_libraries/components

Creates the specified shared component under the specified library.

The CDM Editor role is required to access this endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries/components`

Default URL: `/api/sn_cdm/shared_libraries/components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Unique identifier of the associated changeset, such as "Chset-10". Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
description	Description of the shared component. Data type: String
name	Required. Name of the shared component to create in the shared library. This name must be unique. Data type: String
returnFields	Comma separated list of fields in the CDM Node [sn_cdm_node] table to return as part of the response. Data type: String Default: All non-internal fields are returned.
sharedLibraryName	Required. Name of the shared library under which to create the component. This library must already exist and be in the active state. Data type: String

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
<requested fields>	Requested fields from the CDM Node [sn_cdm_node] table.

error	Only returned if an error occurred during processing.
	Data type: Object
	`"error": {`
	`  "detail": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> "message": "String" }</pre>
error.detail	Details about the error that occurred. Data type: String
error.message	Message that provides an overview of the error. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code example stores the component named "SharedComponent" under the shared library "javalib".

```
curl
 "http://instance.servicenow.com/sn_cdm/shared_libraries/compone
nts/?
sharedLibraryName=javalib&changeSetNumber='Chset-9'&name='Shared
Component'\
--request POST\
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
{
  "result": {
    "changeset_id": {
      "value": "ca7e6a501b202110636e0fe0604bcb71",
      "link":

CdmSharedLibraryApi - POST /sn_cdm/shared_libraries/uploads/components

Enables you to create and manage shared libraries and shared components. This endpoint creates a shared component node in the CDM Node [sn_cdm_node] table and a shared component record in the CDM Shared Component [sn_cdm_shared_component] table.

The CDM Editor role is required to access this endpoint.

Note: By default, the maximum content upload size is 2MB. You can modify this default by updating the sn_cdm.max_allowed_upload_file_size property.

Note: This upload method cannot be used to modify nodes. Use the alternative CdmSharedLibraryApi - POST /sn_cdm/shared_libraries/uploads/components/file method to modify nodes.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries/uploads/components`

Default URL: `/api/sn_cdm/shared_libraries/uploads/components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
autoCommit	Flag that indicates whether the changeset identified in the *`changesetNumber`* parameter is committed to the data model after upload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoDelete	Flag that indicates whether the existing nodes, that aren’t part of the upload content, are deleted after the processing is complete. Valid values: • true: Automatically delete existing nodes. • false: Don't automatically delete existing nodes. Data type: Boolean Default: false
changesetNumber	Required. String that uniquely identifies the changeset associated with the application, such as Chset-102. Located in the CDM Changeset [sn_cdm_changeset] table. This changeset must be in the "Open" state. Data type: String
dataFormat	Required. Format of the configuration data. Valid values: • csv • ini • json • properties • raw • xml • yaml Data type: String
deleteRedundantOverrides	Flag that indicates whether to create an override where redundant values are present. Valid values: • true: If redundant values are present, an override isn’t created. • false: If redundant values are present, proceeds with an override. Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description

identifierKeys	List of names that indicate which key in an array child to use to identify the same node.
	
	For example, if you're uploading:
	`[ {"name" : "Allan, "city" : "Paris"}, {"name" : "Karen, "city" : "Sydney"} ]`
	
	in the following existing model:
	`[ {"name" : "Karen, "city" : "Manila"}, {"name" : "Allan, "city" : "Brussels"} ]`
	
	and you set *identifierKeys* to `name`, it produces the following output:
	`[ {"name" : "Karen, "city" : "Sydney"}, {"name" : "Allan, "city" : "Paris"} ]`
	
	Otherwise, it produces the following output:
	`[ {"name" : "Karen, "city" : "Manila"}, {"name" : "Allan, "city" : "Brussels"}, {"name" : "Allan, "city" : "Paris"}, {"name" : "Karen, "city" : "Sydney"} ]`
	
	Data type: Array of Strings

ignoreAttributes	Flag that indicates whether the given data format supports attributes (currently only XML). Valid values: • true: If the given data format supports attributes, any attributes in the input data are skipped during the upload. • false: If the given data format supports attributes, any attributes in the input data are included in the upload. Data type: Boolean Default: false
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format. • Backend name path with replacement characters: `testApp&#xFFFD;deployables&#xFFFD;Development1&#xFFFD;cdi1` • Array: `['testApp','deployables','Development1','cdi1']` **Note:** If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
publishOption	Publish option for the associated configured snapshots. Valid values: • publish_new_and_unpublish_old: Publish the new snapshot created after the commit and unpublish the existing snapshot. • publish_none: Do not publish any snapshots. For additional information on publishing snapshots, see Publish or unpublish a snapshot. Data type: String Default: publish_none
sharedLibraryName	Required. Name of the shared library to create or manage. Located in the CDM Application [sn_cdm_application] table. Data type: String

Request body parameters

Name	Description
Variable upload data	Configuration data to upload. This can be any data in the format defined by the *dataFormat* parameter of the query parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Supported types: *text/plain* and *application/x-www-form-urlencoded*. Default: *text/plain*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The upload request has been rejected. Possible issues: • Size of the configuration payload is greater that the allowed maximum - 2MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"message": "String"
	}</pre>

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
upload_id	Sys_id of the upload request. Use this ID to call the endpoint to obtain the status of the upload. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following example shows how to upload the shared library called Demo_App1631126164773 with the configuration data being plain text.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/sharedlibrary/compon
ent/upload?namePath=%2FSettings%2FdbSettings&dataFormat=json&app
Name=Demo_App1631126164773&changesetNumber=Chset-8&autoCommit=fa
lse&publishOption=publish_none&autoDelete=true" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "{
  \"dbIPAddress\": \"10.10.10.110\",
\"dbPort\": \"8080\",
\"dbConnectionString\": \"admin:admin server1.xyz.com:8080
 dbName_payments\",
\"dbConnectionStringBackup\": \"admin:admin server2.xyz.com
 dbName_payments_backup\ "}" \
--user 'username':'password'
```

The following return results show both a successful and an error response to this request.

```
// Successful response
{
"result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}

// Error response

{
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"error": {
   "message": "Size of uploaded data:6853632.0(bytes) is greater
 than max allowed upload limit of 2097152.0(bytes)",
   "detail": ""
},
"status": "failure"
}
```

CdmSharedLibraryApi - POST /sn_cdm/shared_libraries/uploads/components/file

Uploads files as part of the Configuration Data Model (CDM) under the components folder in a shared library.

URL format

Versioned URL: `/api/sn_cdm/{api_version}shared_libraries/uploads/components/file`

Default URL: `/api/sn_cdm/shared_libraries/uploads/components/file`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

autoCommit	Flag that indicates whether the changeset identified in the *`changesetNumber`* parameter is committed to the data model after upload. Valid values: • true: Changeset is committed after upload. • false: Changeset isn't committed after upload. Data type: Boolean Default: false
autoValidate	Flag that indicates whether the snapshots created when committed are validated. Valid values: • true: Validate the snapshots. • false: Don't validate the snapshots.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

	Note: This option is only available if the *autoCommit* parameter is `true`. Data type: Boolean Default: false
changesetNumber	String that uniquely identifies the changeset associated with the application, such as Chset-102. This changeset must be in the "Open" state. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String Default: Creates a changeset to use. The changeset details are returned as part of the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} results.
fileName	Name of the file to upload. This name can differ from than the actual file name and contain the file extension. For example, .txt/.scv/.jar. The fileName value is applied when downloading the file. Data type: String
fileNodeName	Name of the file node. This file name is used in the configuration data when exporting it. This name doesn't require a file extension nor does it affect the download. Data type: String
namePath	Path of the targeted node under which the configuration data should be uploaded. This path is relative to the components, collection, or deployable folder (depending on the endpoint being called). You can pass the name path in any of the following formats. For example, to define the name path for the node `testApp/deployables/Development1/cdi1`: • Backslash format: `testApp/deployables/Development1/cdi1` **Note:** If your node name contains a backslash ("/"), you can't use this format.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

	• Backend name path with replacement characters: `testApp&#xfffd;deployables&#xfffd;Development1&#xfffd;cdi1` • Array: `['testApp','deployables','Development1','c` **Note:** If the specified component doesn't exist at the specified path, the system automatically creates the component at the specified path and then uploads the data. Data type: String
sharedLibraryName	Required. Name of the shared library where the component to delete is located. Located in the CDM Application [sn_cdm_application] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
Variable upload data	Configuration data to upload. By default, file size uploads are limited to 5 MB. For information about how to adjust your upload file sizes and type, see this Now Support article. Data type: String/stream

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Content Type of the file to be uploaded. Examples: application/zip, text/plain, application/json.

© 2026 ServiceNow, Inc. All rights reserved.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Upload request has been rejected. Possible issues: • Size of configuration payload is greater that the allowed maximum - 2 MB by default. • Required parameters are missing from the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
upload_id	Sys_id of the upload request. Use this ID to call the CdmApplicationsApi - GET /sn_cdm/applications/upload-status/{upload_id} endpoint to obtain the status of the upload. Data type: String

Example: cURL request

The following call demonstrates how to upload a plain text file to the components folder in the Shared Library.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/shared_libraries/upl
oads/components/file?autoValidate=true&sharedLibraryName=sharedL
ibA
 &namePath=testComponent%2FfilesFolder&fileName=testFileNodeName
.txt&publishOption=publish_valid&changesetNumber=Chset-108&autoC
ommit=true&fileNodeName=testFile.txt" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:text/plain" \
--data "This is sample content that will be uploaded to a plain
 text file."\
--user 'username':'password'
```

The following return results show both a successful and an error response to this request.

```
// Successful completion of the upload request
{
  "result": {
    "upload_id": "ec1f71f45322301096edddeeff7b12b3"
  }
}

// Error response. Payload is too large.
{
  "error": {
    "message": "Could not find active application with name:
 ‘testApp’ of type application",
    "detail": ""
  },
  "status": "failure"
}
```

CdmSharedLibraryApi - PUT /sn_cdm/shared_libraries

Updates the shared library information. Use this endpoint to update the name, description, state of a shared library, and the user groups that can access the library.

The CDM Admin role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries`

Default URL: `/api/sn_cdm/shared_libraries`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
name	Required. Name of the shared library to update. Located in the CDM Application [sn_cdm_application] table. Data type: String
newAvailableState	Flag that indicates the state of the shared library. Valid values: • true: The shared library is active. • false: The shared library is inactive. No users are allowed to access this library. Default: true
newDescription	Updated description of the shared library. Data type: String
newName	New name of the shared library. Data type: String
newUserGroupIds	Comma separated list of sys_ids of the user groups that can access the associated shared library. Located in the Group [sys_user_group] table. Data type: String
returnFields	Comma separated list of fields in the CDM Application [sn_cdm_application] table to return as part of the response. Data type: String Default: All non-system fields are returned.

Request body parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
<fields>	Requested fields from the CDM Application [sn_cdm_application] table. Data type: Variable
error	If an error occurred during processing, the details about the error. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"error": {
	  "detail": "String",
	  "message": "String"
	}</pre>

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code example shows how to call this endpoint for the shared library Java11Lib and update the library name and description.

```
curl
 "http://instance.servicenow.com/sn_cdm/shared_libraries?name='
 javalib'&newName='NewLibraryName'&newDescription='new%20descrip
tion%20of%20library'\
--request PUT\
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
{
  "result": {
    "sdlc_component": null,
    "cdi_count": "0",

}
```

CdmSharedLibraryApi - PUT /sn_cdm/shared_libraries/components

Updates the name and description of the specified shared component.

The CDM Editor role is required to access this endpoint.

Note: Renaming is only allowed if a component has never been used, as when the component's snapshot has never been imported. The renaming scenario is primarily for the purpose of fixing typos when creating new components.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/shared_libraries/components`

Default URL: `/api/sn_cdm/shared_libraries/components`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
changesetNumber	Required. Name of the associated changeset. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
name	Required. Name of the shared component to update. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
newName	Required. Updated name of the shared component.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
newDescription	Updated description of the shared component. Data type: String Default: Empty
returnFields	Comma separated list of fields in the CDM Shared Component [sn_cdm_shared_component] table to return as part of the response. Data type: String Default: All non-system fields are returned.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
<fields>	Requested fields from the CDM Shared Component [sn_cdm_shared_component] table. Data type: Variable
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String", "message": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code sample shows how to update the description of the component SharedComponentTest.

```
curl
 "http://instance.servicenow.com/sn_cdm/shared_libraries/compone
nts/?
sharedLibraryName=javalib&changeSetNumber='chset-9'&name='Shared
ComponentTest'&newDescription='The shared component
 description'\
--request POST\
--header "Accept:application/json" \
--user 'username':'password
```

```

CdmSnapshotApi

The *CdmSnapshotApi* provides endpoints that enable you to publish, unpublish, and re-validate snapshots in Configuration Data Management (CDM).

You publish a snapshot so that it can be exported, enabling the Continuous Integration and Continuous Delivery (CICD) pipeline to access and use the associated configuration data. Exporters can only execute on published snapshots. When snapshots are no longer needed, you can unpublish them to reduce the confusion as to whether the snapshot is viable anymore.

You must have one of the following roles to access this API:

- Scripted REST CDM View ACL (sn_cdm.cdm.viewer)
- Scripted REST CDM Editor ACL (sn_cdm.cdm_editor)

In addition, the Configuration Data Management (CDM) plugin must be activated for this API to be available in an instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For additional information on snapshots, see View snapshots.

CdmSnapshotAPI - POST /sn_cdm/snapshots/{snapshot_id}/publish

Publishes a specified unpublished snapshot.

Before a snapshot can be published, it must be validated. You can use the CdmSnapshotAPI - POST /sn_cdm/snapshots/{snapshot_id}/validate endpoint to validate snapshots or have them automatically validated when you do a commit. A deployable must be connected to a service to publish its snapshots. Also, if the snapshot has already been published, the request will fail.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/snapshots/{snapshot_id}/publish`

Default URL: `/api/sn_cdm/snapshots/{snapshot_id}/publish`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
snapshot_id	Sys_id of the snapshot record to process. Located in the CDM Snapshot [sn_cdm_snapshot] table. Data type: String

Query parameters

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String

Example: cURL request

The following example shows how to publish the snapshot with the sys_id of 3a168d9dc342301054c1582e1340dd68.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/snapshots/3a168d9dc3
42301054c1582e1340dd68/publish"\
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
```

The following shows both a success and failure response to the publish request.

```
// Example of a successful response
{
  ""
}

// Example of an error response
{
  "error": {
    "message": "Error: Unexpected error occurred in publish
 request.Error:Snapshot not found",
    "detail": ""
  },
  "status": "failure"
}
```

CdmSnapshotAPI - POST /sn_cdm/snapshots/{snapshot_id}/unpublish

Unpublishes a previously published snapshot.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/snapshots/{snapshot_id}/unpublish`

Default URL: `/api/sn_cdm/snapshots/{snapshot_id}/unpublish`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
snapshot_id	Sys_id of the snapshot record to process. Located in the CDM Snapshot [sn_cdm_snapshot] table.

CdmSnapshotAPI - POST /sn_cdm/snapshots/{snapshot_id}/validate

Validates a specified unpublished snapshot.

The validation is performed as an asynchronous process. Calling this endpoint only starts the validation process. The return results from this call only indicate whether the validation process started, not the results of the validation itself. To find out if the snapshot has validated, use the *Table* API to locate the snapshot and check its validation status.

Note: You cannot validate a published snapshot.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/snapshots/{snapshot_id}/validate`

Default URL: `/api/sn_cdm/snapshots/{snapshot_id}/validate`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
snapshot_id	Sys_id of the snapshot record to process. Located in the CDM Snapshot [sn_cdm_snapshot] table. Data type: String

Name	Description
	Data type: String

Example: cURL request

The following example shows how to validate the snapshot with the sys_id of 3a168d9dc342301054c1582e1340dd68.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/snapshots/3a168d9dc3
42301054c1582e1340dd68/validate"\
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user 'username':'password'
```

The following shows both a success and failure response to the validate request.

```
// Example of a successful response
{
  ""
}

// Example of an error response
{
  "error": {
    "message": "Invalid Snapshot id:test",
    "detail": ""
  },
  "status": "failure"
}
```

CdmSnapshotApi - PUT /sn_cdm/snapshots/publish

Publishes a specified unpublished snapshot.

Before a snapshot can be published, it must be validated. You can use the CdmSnapshotApi - PUT /sn_cdm/snapshots/validate endpoint to validate snapshots or have them automatically validated when you do a commit. A deployable must be connected to a service to publish its snapshots. Also, if the snapshot has already been published, the request will fail.

The caller of this endpoint must have the CDM Editor role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/snapshots/publish`

Default URL: `/api/sn_cdm/snapshots/publish`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
appName	Required. Name of the Configuration Data Management (CDM) application for which to create the snapshot. Located in the CDM Application [sn_cdm_application] table. Data type: String
deployableName	Required. Name of the CDM deployable for which to create the snapshot. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
name	Required. Name of the snapshot. Located in the CDM Snapshot [sn_cdm_snapshot] table. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

cdm_application_id	Details about the CDM application associated with the snapshot.
	
	Data type: Object
	
	`"cdm_application_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_application_id.link	Call to use to access the CDM application record using the REST *Table* API. Data type: String
cdm_application_id.value	Sys_id of the associated CDM application record. Located in the CDM Application [sn_cdm_application] table. Data type: String

cdm_deployable_id	Details about the CDM deployable associated with the snapshot.
	
	Data type: Object
	
	`"cdm_deployable_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_deployable_id.link	Call syntax for querying this deployable record using the *Table* REST API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
cdm_deployable_id.value	Sys_id of the deployable record. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String

changeset_id	Details about the changeset associated with the snapshot.
	
	Data type: Object
	
	`"changeset_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

changeset_id.link	Call syntax for querying this changeset record using the *Table* REST API. Data type: String
changeset_id.value	Unique identifier of the changeset record. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
description	Brief description of the snapshot. Data type: String

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
last_published	Date and time that the snapshot was last published. Data type: String Format: yyyy-mm-dd hh:mm:ss
last_validated	Date and time that the snapshot was last validated. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Format: yyyy-mm-dd hh:mm:ss
name	Name of the snapshot. Data type: String
number	Unique number that identifies the snapshot. This value provides a human-readable identifier for the mapping. Data type: String
published	Flag that indicates whether the snapshot was published. Possible values: • true: Snapshot was published. • false: Snapshot wasn't published. Data type: Boolean
sys_created_by	Name of the user that created the snapshot. Data type: String
sys_created_on	Date and time when the snapshot was created. Data type: String Format: yyyy-mm-dd hh:mm:ss
sys_id	Sys_id of the snapshot. Located in the CDM Snapshot [sn_cdm_snapshot] table. Data type: String
sys_updated_by	Name of the user that updated the snapshot. Data type: String
sys_updated_on	Date and time when the snapshot was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss
validation	Current validation state of the snapshot. Possible values: • execution_error • failed • in_progress • not_validated • passed

CdmSnapshotApi - PUT /sn_cdm/snapshots/unpublish

Unpublishes a previously published snapshot.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/snapshots/unpublish`

Default URL: `/api/sn_cdm/snapshots/unpublish`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
appName	Required. Name of the Configuration Data Management (CDM) application for which to create the snapshot. Located in the CDM Application [sn_cdm_application] table. Data type: String
deployableName	Required. Name of the CDM deployable for which to create the snapshot. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String
name	Required. Name of the snapshot. Located in the CDM Snapshot [sn_cdm_snapshot] table. Data type: String
returnFields	List of fields to return as part of the response. Pass the record column names such as sys_id, sys_updated_by, or state. Data type: Array Default: All fields as determined by the endpoint

Request body parameters

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Only supports *application/json*.
Content-Type	Data format of the request body. Only supports *application/json*.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

cdm_application_id	Details about the CDM application associated with the snapshot.
	
	Data type: Object
	
	`"cdm_application_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_application_id.link	Call to use to access the CDM application record using the REST *Table* API. Data type: String

Name	Description
	Data type: String Format: yyyy-mm-dd hh:mm:ss
validation	Current validation state of the snapshot. Possible values: • execution_error • failed • in_progress • not_validated • passed • passed_with_exception • requested Data type: String

Example: cURL request

This code example shows how to unpublish a snapshot.

Return results:

CdmSnapshotApi - PUT /sn_cdm/snapshots/validate

Validates a specified unpublished snapshot against its mapped policies.

The validation is performed as an asynchronous process. Calling this endpoint only starts the validation process. The return results from this call only indicate whether the validation process started, not the results of the validation itself. To find out if the snapshot has validated, use the *Table* API to locate the snapshot and check its validation status.

Note: You cannot validate a published snapshot.

The caller of this endpoint must have the CDM Editor role.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/snapshots/validate`

Default URL: `/api/sn_cdm/snapshots/validate`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. The specified snapshot is already published or cannot be located.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description

cdm_application_id	Details about the CDM application associated with the snapshot.
	
	Data type: Object
	
	`"cdm_application_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_application_id.link	Call to use to access the CDM application record using the REST *Table* API. Data type: String
cdm_application_id.value	Sys_id of the associated CDM application record. Located in the CDM Application [sn_cdm_application] table. Data type: String

cdm_deployable_id	Details about the CDM deployable associated with the snapshot.
	
	Data type: Object
	
	`"cdm_deployable_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_deployable_id.link	Call syntax for querying this deployable record using the *Table* REST API.

CdmVersionApi

The `CdmVersionApi` provides endpoints that enable you to publish, unpublish, and export versions (snapshots) in Configuration Data Management (CDM) for shared components under shared libraries.

You publish a snapshot so that it can be exported, enabling the Continuous Integration and Continuous Delivery (CICD) pipeline to access and use the associated shared components and libraries. Exporters can only execute on published snapshots. When snapshots are no longer needed, you can unpublish them to reduce the confusion as to whether the snapshot is viable anymore.

You must have one of the following roles to access this API:

- Scripted REST CDM View ACL (sn_cdm.cdm.viewer)
- Scripted REST CDM Editor ACL (sn_cdm.cdm_editor)

In addition, the Configuration Data Management (CDM) plugin must be activated for this API to be available in an instance.

For additional information on snapshots, see View snapshots.

CdmVersionApi - GET /sn_cdm/versions/export

Returns the configuration data for a specified shared component within a specified shared library for a specified published version.

The CDM Editor role is required to access this endpoint.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/versions/export`

Default URL: `/api/sn_cdm/versions/export`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
dataFormat	Required. Format of the configuration data. Valid values: • csv • ini • json • properties

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• raw • xml • yaml Data type: String
decryptPassword	Flag that indicates whether to show encoded or decrypted password values. Valid values: • true: Decrypt password and show decrypted value. • false: Show encrypted password value. Default: false
sharedComponentName	Required. Name of the shared component whose configuration data to export. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
sharedLibraryName	Required. Name of the shared library that contains the component whose configuration data you want to return. Located in the CDM Application [sn_cdm_application] table. The specified application must have the type field set to "shared_library". Data type: String
substituteVariables	Flag that indicates whether to follow the variables. For information on following the variables, see Validating and correcting configuration data. Valid values: • true: Follow the variables. • false: Do not follow variables. Default: true

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. One of the follow problems may have occurred: • Shared library is not active. • Shared component is not active. • Version s not published. • Parameter is missing in the call.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
result	Configuration data in the specified format.
error	If an error occurred during processing, the details about the error. Data type: Object `"error": { "detail": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "message": "String"
	}</pre>

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
status	Error status of the request. Possible values: failure Data type: String

Example: cURL request

The following code example shows how to export the configuration data of the "jdk8" component under the "JavaLib" shared library.

```
curl
 "http://instance.servicenow.com/api/sn_cdm/shared_libraries/com
ponents/exports?sharedLibraryName=JavaLib&componentName=jdk8
--request POST \
--header "Accept:application/json" \
--user 'username':'password'
```

Response:

```
{
"result": {
    "sharedComponentA": { "cdi": "val" }
 }
}
```

CdmVersionApi - PUT /sn_cdm/versions/publish

Publishes a version of a shared component under a specified shared library.

The CDM Editor role is required to access this endpoint.

Note: Snapshots and versions are synonymous in meaning for this implementation.

URL format

Versioned URL: `/api/sn_cdm/{api_version}/versions/publish`

Default URL: `/api/sn_cdm/versions/publish`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
name	Required. Name of the version of the shared component to publish. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
returnFields	Comma-separated list of fields in the CDM Snapshot [sn_cdm_snapshot] table to return as part of the response. Data type: String Default: Returns all non-system fields.
sharedComponentName	Required. Name of the shared component to publish. Located in the CDM Shared Component [sn_cdm_shared_component] table. Data type: String
sharedLibraryName	Required. Name of the shared library in which the specified component resides. Located in the CDM Application [sn_cdm_application] table. The type field in the associated record must be set to "shared_library". Data type: String

Request body parameters

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: • *application/json* • *application/xml* • *text/xml* Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Error occurred during publishing. Possible issues: • Version name not found. • Component version is already published.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters

Name	Description
cdm_application_id	Details about the CDM application associated with the snapshot. Data type: Object `"cdm_application_id": { "link": "String", "value": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
cdm_application_id.link	Call to use to access the CDM application record using the REST *Table* API. Data type: String
cdm_application_id.value	Sys_id of the associated CDM application record. Located in the CDM Application [sn_cdm_application] table. Data type: String

cdm_deployable_id	Details about the CDM deployable associated with the snapshot.
	
	Data type: Object
	`"cdm_deployable_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

cdm_deployable_id.link	Call syntax for querying this deployable record using the *Table* REST API. Data type: String
cdm_deployable_id.value	Sys_id of the deployable record. Located in the CDM Deployable [sn_cdm_deployable] table. Data type: String

changeset_id	Details about the changeset associated with the snapshot.
	
	Data type: Object
	`"changeset_id": {`
	`  "link": "String",`
	`  "value": "String"`
	`}`

changeset_id.link	Call syntax for querying this changeset record using the *Table* REST API. Data type: String
changeset_id.value	Unique identifier of the changeset record. Located in the CDM Changeset [sn_cdm_changeset] table. Data type: String
description	Brief description of the snapshot. Data type: String

error	If an error occurred during processing, the details about the error.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>{
	  "message": "String"
	}</pre>

error.detail	Additional information about the error. Data type: String
error.message	Error message that was generated while trying to process the request. Data type: String
last_published	Date and time that the snapshot was last published. Data type: String Format: yyyy-mm-dd hh:mm:ss
last_validated	Date and time that the snapshot was last validated. Data type: String Format: yyyy-mm-dd hh:mm:ss
name	Name of the snapshot. Data type: String
number	Unique number that identifies the snapshot. This value provides a human-readable identifier for the mapping. Data type: String
published	Flag that indicates whether the snapshot was published. Possible values: • true: Snapshot was published. • false: Snapshot wasn't published. Data type: Boolean
sys_created_by	Name of the user that created the snapshot. Data type: String
sys_created_on	Date and time when the snapshot was created. Data type: String Format: yyyy-mm-dd hh:mm:ss
sys_id	Sys_id of the snapshot. Located in the CDM Snapshot [sn_cdm_snapshot] table. Data type: String
sys_updated_by	Name of the user that updated the snapshot.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
sys_updated_on	Date and time when the snapshot was last updated. Data type: String Format: yyyy-mm-dd hh:mm:ss
validation	Current validation state of the snapshot. Possible values: • execution_error • failed • in_progress • not_validated • passed • passed_with_exception • requested Data type: String

Example: cURL request

This code example shows how to publish the shared component "Development" with the version name of "Development-v1.shc".

```
curl
 "http://instance.servicenow.com/api/sn_cdm/versions/publish?sha
redLibraryName=LibraryJdk&componentName=Development&name=Develop
ment-v1.shc" \
--request PUT\
--header "Accept:application/json" \
--user 'username':'password
```

Response:

```
{
  "result": {
    "changeset_id": {
      "value": "1a2bd15c7764a1109ac0cf0bbb5a99fc",

}
```

Change Management API

The *Change Management* API provides endpoints that enable third-party application integration with the ServiceNow Change Management process.

By integrating your application with the ServiceNow Change Management process, all change requests, regardless of where they are initiated, have a single source of truth, providing a single audit source.

Use this REST API to integrate your change management process with external applications and when developing ServiceNow client-side applications.

This REST API enables integrators to:

- Initiate a standard change request from a published standard change request template.
- Create a change request of type emergency or normal.
- Update any field that exists in the change request table for any change request.
- Update any field that exists in the change task table and work tasks from creation through closure/cancellation.
- Retrieve a specific change request, standard template, change request task, or change model.
- Retrieve multiple change requests, standard templates, change request tasks using pagination.
- Perform risk evaluation.
- Refresh impacted services.
- Generate and process any related approval activity associated with a change request.
- Identify potential scheduling conflicts and identify periods where conflicts do not exist.
- Delete change requests, change request tasks, and conflict checking processes.
- Create a change request record based on a change model record.
- Retrieves a list of available states for the specified change request, including the current state.

The *Change Management* API supports ITIL types and change models using Workflow Studio and Workflow. Change models deliver fit-for-purpose change. Types and models define transition criteria that must be met before the change request can progress to the next state. You can define this criteria using states, workflows, tools, and business rules.

- Traditional ITIL types: Standard, Emergency, and Normal.
- Change model states: New, Scheduled, Implement, Review, and Closed.

You can configure additional change models within your ServiceNow instance and then create change requests based on those change models using endpoints in this API. Use the Change

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Management - GET /sn_chg_rest/change/model/{sys_id} and Change Management - GET /sn_chg_rest/change/model endpoints to obtain the available change models in an instance. Then use the Change Management - POST /sn_chg_rest/change to create a change request based on a specified change model.

For information on configuring change models, see Configure Change Management.

The following roles are required to access the *Change Management* endpoints:

- DELETE: change_manager or admin
- GET: change_manager, itil, sn_change_read, or admin
- PATCH/POST: change_manager, itil, or admin

In addition, administrators can set change properties to configure Change Management behavior. For a list of these properties and a description of their available functionality, see Change Management properties.

Change Management - DELETE /sn_chg_rest/change/{change_sys_id}/task/{task_sys_id}

Deletes the change request task identified by the specified sys_ids.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{change_sys_id}/task/{task_sys_id}`

Default URL: `/api/sn_chg_rest/change/{change_sys_id}/task/{task_sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
change_sys_id	Sys_id of the change request to which the task is associated. Located in the Change Request [change_request] table. Verifies that the task is actually associated to the specified change request. Data type: String
task_sys_id	Sys_id of the change request task to delete. Located in the Change Tasks [change_task] table. Data type: String

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	All fields (key) with their associated values for the identified change request task prior to the delete. Data type: Object
parent	Information for the change request to which this task was associated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `parent: { display_value: "String", value: "String" }`
parent.display_value	Sys_id of the parent task to display in a UI. Data type: String
parent.value	Sys_id of the parent task. Data type: String
sys_id	Sys_id information for the deleted change request. Data type: Object `sys_id: { display_value: "String", value: "String" }`
sys_id.display_value	Sys_id of the change request to display in a UI. Data type: String
sys_id.value	Sys_id of the change request. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/task/12629ec4b750230096c3e4f6ee11a9
d5" \
--request DELETE \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "12629ec4b750230096c3e4f6ee11a9d5",
        display_value: "12629ec4b750230096c3e4f6ee11a9d5"
      },
      parent: {
        value: "0f4ac6c4b750230096c3e4f6ee11a9fe",
        display_value: "CHG0033046 "
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Retire both nodes",
```

Change Management - DELETE /sn_chg_rest/change/{sys_id}

Deletes the change request associated with the specified sys_id.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}`

Default URL: `/api/sn_chg_rest/change/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request record to delete. Located in the Change Request [change_request] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
result	Change request record that was deleted. Each element in this object corresponds to a field in the record of the Change Request [change_request] table. Data type: Object

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/b0db
da5347c12200e0ef563dbb9a718f" \
--request DELETE \
--header "Accept:application/json" \
--user "username":"password"
```

```

```

Change Management - DELETE /sn_chg_rest/change/{sys_id}/conflict

Cancels the running conflict checking process for the specified change request (sys_id).

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/conflict`

Default URL: `/api/sn_chg_rest/change/{sys_id}/conflict`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
sys_id	Sys_id of the change request record for which to cancel the running conflict checking process. Located in the Change Request [change_request] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad request. Cancel request failed.
401	Unauthorized. The user credentials are incorrect or have not been passed.

Status codes (continued)

Status code	Description
404	Not Found. The specified record could not be found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/conflict" \
--request DELETE \
--user "username":"password"
```

```
None
```

Change Management - DELETE /sn_chg_rest/change/emergency/{sys_id}

Deletes the emergency change request identified by the specified sys_id.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/emergency/{sys_id}`

Default URL: `/api/sn_chg_rest/change/emergency/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the emergency change request to delete. Located in the Change Request [change_request] table.

Query parameters

Name	Description
None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Values for all fields in the associated change request. Data type: Object
state	State of the change request prior to the delete. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "b0dbda5347c12200e0ef563dbb9a718f",
        display_value: "b0dbda5347c12200e0ef563dbb9a718f"
      },
      state: {
        value: "-5",
        display_value: "New"
      },
      type: {
        value: "emergency",
        display_value: "Emergency"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Remove server",
        display_value: "Remove server"
      },
    },
  ]
}
```

Change Management - DELETE /sn_chg_rest/change/normal/{sys_id}

Deletes the normal change request identified by the specified sys_id.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/normal/{sys_id}`

Default URL: `/api/sn_chg_rest/change/normal/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the normal change request to delete Located in the Change Request [change_request] table. Data type: String

      state: {
        value: "-5",
        display_value: "New"
      },
      type: {
        value: "normal",
        display_value: "Normal"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Remove server",
        display_value: "Remove server"
      },
    },
  ]
}
```

Change Management - DELETE /sn_chg_rest/change/standard/{sys_id}

Deletes the standard change request identified by the specified sys_id.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/standard/{sys_id}`

Default URL: `/api/sn_chg_rest/change/standard/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the standard change request to delete. Located in the Change Request [change_request] table. Data type: String

Query parameters

Name	Description
None

Name	Description
	<pre> value: "String" }</pre>
state.display_value	State to display in the UI. Data type: String
state.value	Internal state value. Data type: String
sys_id	Unique identifier of the change request.

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/stan
dard/1c87925347c12200e0ef563dbb9a7177" \
--request DELETE \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: "1c87925347c12200e0ef563dbb9a7177",
      state: {
        value: "-5",
        display_value: "New"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Add network switch to cabinet",
        display_value: "Add network switch to cabinet"
      },
    },
  ]
}
```

Change Management - GET /sn_chg_rest/change/ci/{cmdb_ci_sys_id}/schedule

Enables retrieving available time slots by configuration item ID and duration, with an option to include planned start time.

Role required: sn_change_writer.

Note: Running this endpoint does not list the available start and end times. Use the link provided in the response body *worker.link* property to get the schedule data.

See also:

- GET /sn_chg_rest/change/{change_sys_id}/schedule
- PATCH /sn_chg_rest/change/{change_sys_id}/schedule/first_available

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/ci/{cmdb_ci_sys_id}/schedule`

Default URL: `/api/sn_chg_rest/change/ci/{cmdb_ci_sys_id}/schedule`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
cmdb_ci_sys_id	Sys_id of a record in the Configuration Items [cmdb_ci] table. This endpoint does not require a change request.

Query parameters

Name	Description
duration_in_seconds	Duration of change in seconds, that is, how much time is required to complete the change request task. Data type: Integer
planned_start_time	Optional. Date and time that the change request is planned to start implementation in UTC. Retrieve the available time slot start at or later than this time. If not provided, the system uses the current time as the start time. Time format: yyyy-mm-dd hh:mm:ss Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	System accepted the request.
400	Bad Request. A bad request type or malformed request was detected. Possible issues: • Cannot find the cmdb_ci with the provided sys_id. The record either does not exist the or the user does not have read access to it. • The duration_in_seconds query parameter value was not provided. • Invalid duration_in_seconds or planned_start_time query parameter value provided.

Response body parameters (JSON or XML)

Name	Description
error	Information on any errors encountered while processing the endpoint request. Data type: Object `"error": { "detail": "String", "message": "String", "status": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
messages	Message information. Data type: Object `"messages": { "errorMessages": [Array], "infoMessages": [Array], "warningMessages": [Array] }`
messages.errorMessages	Error messages encountered while processing the request. Data type: Array
messages.infoMessages	Information messages encountered while processing the request. Data type: Array
messages.warningMessages	Warning messages encountered while processing the request. Data type: Array
request	Original endpoint request. Data type: String
state	Information on the current state of the worker. Data type: Object `state: { display_value: "String", value: Number }`
state.display_value	Display value of the state of the worker. These values directly correlate to the *`state.value`* parameter. Possible values: • Complete • Error • In-Progress • Waiting Data type: String
state.value	Numeric value of the state of the worker. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• 1 • 2 • 3 • 4 Data type: Number
type	Indicates the type of request. Valid value: schedule Data type: String

worker	Information about the associated worker.
	
	Data type: Object
	`"worker": {`
	`  "link": "String",`
	`  "sysId": "String"`
	`}`

worker.link	Link for retrieving time slot data. Use the sys_id in GET /sn_chg_rest/change/worker/{sys_id} to view results. Data type: String
worker.sysId	Sys_id of the worker associated with the change request. Data type: String
status	Only appears if an error is encountered. Status of the endpoint processing. Possible value: failure Data type: String

Get available time slots

Use the value provided in the *`worker.link`* to get schedule window details. The value is in the following format:

`https://instance.service-now.com/api/sn_chg_rest/change/worker/<worker_sys_id>`

Use the worker_sys_id in GET /sn_chg_rest/change/worker/{sys_id} to view results.

The response body contains the status and provides results when processing is complete.

Worker response body parameter results vary depending on time slot availability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the provided time slot is available for the change request within the schedule time slot, the worker API lists the available time slots in the *payload.spans* property. The *payload.spans* property is not listed in the results otherwise.
- If there are no time slots available for change request duration provided within the defined scheduling time slot, the *messages.infoMessages* states the following: D

Note: The change request scheduling time slot default value is 90 days. To change this value, modify the *change.conflict.next_available.schedule_window* property. For more information, see Configure conflict analysis properties.

The following *GET /sn_chg_rest/change/worker/{sys_id}* example shows output provided using the ID provided in the worker.link detail. The results list open time spans available for the task duration.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs to use to filter the result set. The name is the field on which the specified valu filtered. This parameter is mutually exclusive with *sysparm_query*. For example, instead of u `&sysparm_query=active=true`, you can simplify the calling statement by using `&activ` can also use the display value when the field is a choice or reference type field, such as `&stat` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, s `&active=true&assigned_to=john.smith`. Data type: String
order	Field by which to sort the returned change requests. Data type: String Default: *name*
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record ret functionality enables the retrieval of all records, regardless of the number of records, in small m For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply pa available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

sysparm_query	Encoded query used to filter the result set. You can use a UI filter to obtain a properly encode
	
	Syntax: `sysparm_query=<col_name><operator><value>`.
	• <col_name>: Name of the table column to filter against.
	• <operator>: Supports the following values:
	  ○ =: Exactly matches <value>.
	  ○ !=: Does not match <value>.
	  ○ ^: Logically AND multiple query statements.
	  ○ ^OR: Logically OR multiple query statements.
	  ○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose da

Query parameters (continued)

Name	Description
	○ STARTSWITH: <col_name> starts with the specified string. Only works for <col_name> field string. ○ ENDSWITH: <col_name> ends with the specified string. Only works for <col_name> fields w string. <value>: Value to match against. All parameters are case-sensitive. Queries can contain more than one entry, such as `sysparm_query=<col_name><operator><value>[<operator><col_name><op` For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)` Encoded queries also support order by functionality. To sort responses based on certain fields, and `ORDERBYDESC` clauses in *`sysparm_query`*. Syntax: • `ORDERBY<col_name>` • `ORDERBYDESC<col_name>` For example: `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcate` This query filters all active records and orders the results in ascending order by number, and th order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores th It then returns rows using only the valid portion of the query. You can control this behavior using *`glide.invalid_query.returns_no_rows`*. Set this property to true to return no rows c **Note:** The *`glide.invalid_query.returns_no_rows`* property controls the beha across the instance, such as in lists, scripts (*`GlideRecord.query()`*), and web service Data type: String
textSearch	String to use to search all normal change request record fields. This search uses ServiceNow fu functionality. For more information on ServiceNow search capabilities, see Search administratio Default: `IR_AND_OR_QUERY`

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Element	Description
result	List containing one or more change request record objects. Each object describes a change request. Each element in the change request object corresponds to a field in its associated record in the Change Request [change_request] table. All elements contain *value* and *display_value* name-value pairs. Date fields also contain *display_value_internal* name-value pairs. Data type: Array
action_status	Current action status of the associated change request. Possible values: • 1: Blocked internally • 2: Blocked by customer • 3: Blocked internally and by customer • 4: Needs attention

Element	Description
	Data type: Number
active	Flag that indicates whether the change request is active. Possible values: • true: Change request is active • false: Change request is not active Data type: Boolean Default: true
activity_due	Date and time for which the associated case is expected to be completed. Data type: String
additional_assignee_list	List of sys_ids of additional persons assigned to work on the change request. Data type: Array
approval	Type of approval process required. Data type: String Default: not requested
approval_history	Most recent approval history journal entry. Data type: String
approval_set	Date and time that the associated action was approved. Data type: String
assigned_to	Sys_id of the user assigned to the change request. Data type: String
assignment_group	Sys_id of the group assigned to the change request. Data type: String
backout_plan	Description of the plan to execute if the change must be reversed. Data type: String
business_duration	Length in scheduled work hours, work days, and work weeks that it took to complete the change. Data type: String
business_service	Sys_id of the business service associated with the change request. Located in the Service [cmdb_ci_service] table.

Element	Description
	Data type: String
cab_date	Date on which the Change Advisory Board (CAB) meets. Data type: String
cab_delegate	Sys_id of the user that can substitute for the CAB manager during a CAB meeting. Located in the User [sys_user] table Data type: String
cab_recommendation	Description of the CAB recommendations for the change request. Data type: String Maximum length: 4,000
cab_required	Flag that indicates whether the CAB is required. Possible values: • true: Change Advisory Board is required. • false: Change Advisory Board is not required. Data type: Boolean Default: false
calendar_duration	Not currently used by Change Management. Data type: String
category	Category of the change, for example hardware, network, or software. Data type: String Default: Other
change_plan	Activities and roles for managing and controlling the change request. Data type: String
chg_model	Sys_id of the change model that the associated change request was based on. Located in the Change Model [chg_model] table. The Change Model defines the state flow, transitions, and process activities that must be completed for the change request. Data type: String
closed_at	Date and time that the associated change request was closed.

Element	Description
	Data type: String
closed_by	Sys_id of the person that closed the change request. Located in the User [sys_user] table. Data type: String
close_code	Code assigned to the change request when it was closed. For example, Successful, Successful with issues, and Unsuccessful. Data type: String
close_notes	Notes that the person entered when closing the change request. Data type: String
cmdb_ci	Sys_id of the configuration item associated with the change request. Located in the Configuration Item [cmdb_ci] table. Data type: String
comments	List of customer-facing work notes entered in the associated change request. Data type: Array
comments_and_work_notes	List of both internal and customer-facing work notes entered for the associated change request. Data type: Array Maximum length: 4,000
company	Sys_id of the company associated with the change request. Located in the Company [core_company] table. Data type: String
conflict_last_run	Date and time that the conflict detection script was last run on the change request. Data type: String
conflict_status	Current conflict status as detected by the conflict detection script, such as Conflict and Not Run. Data type: String Maximum length: 40 Default: Not Run
contact_type	Method in which the change request was initially requested.

Element	Description
	Possible values: • chat • email • phone • social • web Data type: String
contract	Sys_id of the contract associated with the change request. Located in the Contract [ast_contract] table. Data type: String
correlation_display	User-friendly name for the *correlation_id*. Data type: String Maximum length: 100
correlation_id	Globally unique ID (GUID) of a matching change request record in a third-party system. Data type: String Maximum length: 100
delivery_plan	No longer in use. Sys_id of the delivery plan associated with the change request. Located in the Execution Plan [sc_cat_item_delivery_plan] table. Data type: String
delivery_task	No longer in use. Sys_id of the delivery task associated with the change request. Located in the Execution Plan Task [sc_cat_item_delivery_task] table. Data type: String
description	Detailed description of the change request. Data type: String Maximum length: 4,000
due_date	Task due date. Not used by change request process. Data type: String
end_date	Date and time when the change request is to be completed. Data type: String

Element	Description
escalation	Current escalation level. Possible values: • 0: Normal • 1: Moderate • 2: High • 3: Overdue Data type: Number (Integer) Default: 0
expected_start	Date and time when the task is to start. Not used by the change request process. Data type: String
follow_up	Date and time when a user followed-up with the person requesting the change request. Data type: String
group_list	List of sys_ids and names of the groups associated with the change request. Data type: Array Maximum length: 4,000
impact	Impact on the change request will have on the customer. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
implementation_plan	Sequential steps to execute to implement this change. It also contains any dependencies between steps and assignee details for each step. Data type: String Maximum length: 4,000
justification	Benefits of implementing this change and the impact if this change is not implemented. Data type: String

Element	Description
	Maximum length: 4,000
knowledge	Flag that indicates whether there are any knowledge base ()KB) articles associated with the change request. Possible values: • true: Associated KB articles • false: No associated KB articles Data type: Boolean
location	Sys_id and name of the location of the equipment referenced in the change request. Located in the Location Located in the Location [cmn_location] table. Data type: String
made_sla	No longer used. Flag that indicates whether the change request was implemented in alignment with the associated service level agreement. Data type: Boolean
needs_attention	Flag that indicates whether the change request needs attention. Possible values: • true: Change request needs additional attention. • false: Change request does not need additional attention. Data type: Boolean Default: false
number	Change number assigned to the change request by the system, such as CHG0040007. Data type: String
on_hold	Flag that indicates whether the change request is currently on hold. Possible values: • true: On hold • false: Not on hold Data type: Boolean Default: false
on_hold_reason	If the *on_hold* parameter is "true", description of the reason why the change request is being held up.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 4,000
on_hold_task	If the *on_hold* parameter is "true", list of the sys_ids of the tasks that must be completed before the hold is released. Data type: String Maximum length: 4,000
opened_at	Date and time that the change release was created. Data type: String
opened_by	Sys_id and name of the user that created the change release. Located in the User [sys_user] table. Data type: String
order	Not used by Change Management. Optional numeric field by which to order records, such as when retrieving them from a database. Data type: Number (Integer)
outside_maintenance_schedule	Flag that indicates whether maintenance by an outside company has been schedule for the change request. Possible values: • true: Outside maintenance scheduled • false: No outside maintenance scheduled Data type: Boolean Default: false
parent	Sys_id and name of the parent task to this change request, if any. Located in the Task [task] table. Data type: String
phase	Current phase of the change request. This defines what the change is doing in greater detail. Possible values: • accept • build • plan • requested Data type: String

Element	Description
phase_state	Change_phase records that should be created for a change. They are dependent on the category, such that each type of change may have different change_phase records. The change_phase records provide an opportunity to control the approval process as each change_phase can have a schedule and a set of approvers. Possible values: • complete • on hold • open • rejected • requested • work in progress Data type: String
priority	Priority of the change request. Possible values: • 1: Critical • 2: High • 3: Moderate • 4: Low Data type: Number (Integer) Default: 4
production_system	Flag that indicates whether the change request is for a ServiceNow instance that is in a production environment. Possible values: • true: Production environment • false: Non-production environment Data type: Boolean
reason	Description of why the change request was initiated. Possible values: • Business requirements • Hardware upgrade • Legislation • Location change • Network requirements

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	• New or removed CI • Other • Problem resolved • Product or service changed • Software upgrade • User requested Data type: String Maximum length: 40
reassignment_count	Number of times that the change request has been reassigned to a new owner. Data type: Number (Integer) Default: 0
rejection_goto	Sys_id of the task to perform if the change request is rejected. Located in the Task [table]. Data type: String
requested_by	Sys_id of the user that requested the change. Located in the User [sys_user] table. Data type: String
requested_by_date	Date and time when the change is requested to be implemented by. Data type: String
review_comments	Comments entered when the change request was reviewed. Data type: String Maximum length: 4,000
review_date	Date that the change request was reviewed. Data type: String
review_status	Current status of the requested change request review. Data type: String
risk	Level of risk associated with the change request. Valid values:

Element	Description
	• 1: High • 2: Moderate • 3: Low Data type: Number Default: 3
risk_impact_analysis	Description of the risk and analysis of implementing the change request. Data type: String Maximum length: 4,000
route_reason	Not currently used by Change Management. Reason that the change request was transferred. Possible values: • 1: Transfer with Resolution • 9: Transfer without Resolutions Data type: Number
scope	Size of the change request. Possible values: • 1: Massive • 2: Large • 3: Medium • 4: Small • 5: Tiny Data type: Number Default: 3
service_offering	Sys_id of the service offering associated with the change request. Service offerings uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Located in the Offering [service_offering] table. Data type: String
short_description	Description of the change request. Data type: String Maximum length: 40

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
skills	List of the sys_ids of all of the skills required to implement the change request. Located in the Skill [cmn_skill] table. Data type: Array
sla_due	No longer in use. Date and time that the change request must be completed based on the associated service level agreement. Data type: String
sn_esign_document	Sys_id of any E-signed document attached to the change request. Located in the Attachment [sys_attachment] table. Data type: String
sn_esign_esignature_configuration	Sys_id of the E-signed signature template used for the associated document. Located in the E-signature Template [sn_esign_configuration] table. Data type: String
start_date	Date and time that the change request is planned to start implementation. Data type: String
state	Current state of the change request. Possible values are defined in the change model. Data type: Number (Integer) Default: 1
std_change_producer_version	Sys_id of the record producer and change proposal associated with the change request. It also includes the number and percentage of successful and unsuccessful change requests created from the proposal. Located in the Standard Change Template Version [std_change_producer_version] table. Data type: String
sys_class_name	Name of the table in which the change request is located. Data type: String
sys_created_by	Name of the user that initially created the change request. Data type: String Maximum length: 40
sys_created_on	Date and time that the associated change request record was originally created.

Element	Description
	Data type: String
sys_domain	If using domains in the instance, the name of the domain to which the change module record is associated. Data type: String
sys_domain_path	If using domains in the instance, the domain path in which the associated change module record resides. Data type: String
sys_id	Unique identifier of the associated change request record. Data type: String
sys_mod_count	Number of updates to the case since it was initially created. Data type: Number (Integer)
sys_updated_by	Person that last updated the case. Data type: String Maximum length: 40
sys_updated_on	Date and time when the case was last updated. Data type: String
task_effective_number	Universal request number. Data type: String Maximum length: 40
task_for	Not used by Change Management. Sys_id of the user that the task was created for. Located in the User [sys_user] table. Data type: String
test_plan	Description of the associated test plan for the change. Data type: String Maximum length: 4,000
time_worked	Total amount of time worked on the change request. Data type: String
type	Change request type. Possible values:

Element	Description
	• emergency • normal • standard Data type: String Maximum length: 40
unauthorized	Flag that indicates whether the change request is unauthorized Possible values: • true: Unauthorized • false: Authorized Data type: Boolean
universal_request	Sys_id of the Parent Universal request to which this change request is a part of. Located in the Task [task] table. Data type: String
upon_approval	Action to take if the change request is approved. Possible values: • do_nothing • proceed Data type: String Maximum length: 40 Default: proceed
upon_reject	Action to take if the change request is rejected. Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
urgency	Urgency of the change request. Possible values:

Element	Description
	• 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
user_input	Additional user input. Data type: String Maximum length: 4,000
variables	Name-value pairs of variables associated with the change request. Data type: String Maximum length: 40
watch_list	List of sys_ids of the users who receive notifications about this change request when additional comments are added or if the state of a change request is changed to Resolved or Closed. Located in the User [sys_user] table. Data type: Array
wf_activity	Sys_id of the workflow activity record associated with the change request. Located in the Workflow Activity [wf_activity] table. Data type: String
work_end	Date and time work ended on the change request. Data type: String
work_notes	Information about how to resolve the change request, or steps taken to resolve it. Data type: String Maximum length: 4,000
work_notes_list	List of sys_ids of the internal users who receive notifications about this change request when work notes are added. Located in the User [sys_user] table. Data type: Array
work_start	Date and time that work started on the change request. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change?sysp
arm_query=active=true^ORDERBYnumber" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

For brevity, the results only contain a single change request record.

```

Change Management - GET /sn_chg_rest/change/{change_sys_id}/nextstates

Retrieves a list of available states for the specified change request, including the current state.

If available, it also provides how to transition to the next state based on the version of the implemented Change Management. If the changes are change model driven, the endpoint returns conditions which have passed or not. It also provides information on whether all conditions have passed for a given transition. This information is not available for type driven and legacy change requests.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{change_sys_id}/nextstates`

Default URL: `/api/sn_chg_rest/change/{change_sys_id}/nextstates`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
change_sys_id	Sys_id of the change request. Located in the Change Request [change_request] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
404	Not found. The requested item wasn't found.

Response body parameters (JSON or XML)

Name	Description
available_states	Values for the states that are available for the specified change request, including the current state. Data type: Array
state_label	Key-value pairs that associate labels with the available states. Data type: Object
state_transitions	Information on what is required to transition to each available state. Each distinct available "to state" is in its own Array with each differing set of conditions for that to state being in its own Object. Data type: Array `"state_transitions": [ { "automatic_transition": Boolean, "conditions": [Array],`

Name	Description

	<pre>"display_value": "String",
	"from_state": "String",
	"sys_id": "String",
	"to_state": "String",
	"transition_available": Boolean
	}
	]</pre>

state_transitions.automatic_transition	Flag that indicates whether to automatically transition to this state. Valid values: • true: Change request automatically transitions to this state. • false: Change request does not automatically transition to this state. Data type: Boolean

state_transitions.conditions	List of the conditions associated with the state.
	
	Data type: Array of Objects
	<pre>"conditions": [
	{
	"condition": {Object},
	"passed": Boolean
	}
	]</pre>

state_transitions.conditions.condition	Values of a specific condition.
	
	Data type: Object
	<pre>"condition": {
	"description": "String",
	"name": "String",
	"sys_id": "String"
	}</pre>

state_transitions.conditions.condition.description	Description of the condition. Data type: String
state_transitions.conditions.condition.name	Name of the condition. Data type: String
state_transitions.conditions.condition.sys_id	Sys_id of the condition. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
state_transitions.conditions.passed	Flag that indicates whether the change request met the associated condition. Valid values: • true: Met the condition. • false: Did not meet the condition.
state_transitions.display_value	Displayed description of the state. Data type: String
state_transitions.from_state	Value of the state that the change request is transitioning from. Data type: String
state_transitions.sys_id	Sys_id of the transition state. Data type: String
state_transitions.to_state	Value of the state that the change request is transitioning to. Data type: String
state_transitions.transition_available	Flag that indicates whether the change request can transition from its current state to this state. Valid values: • true: Can transition to this state. • false: Cannot transition to this state.

Example: cURL request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/b0db
da5347c12200e0ef563dbb9a718f"/nextstates \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Return results:

```
{
  "result": {
    "available_states": [ "0", "4", "-1" ], // State values
    "state_transitions": [
      [
        {
          "sys_id": "7a0d2ccdc343101035ae3f52c1d3ae2e", //
 sttrm_state_transition sys id
```

Change Management - GET /sn_chg_rest/change/{change_sys_id}/schedule

Enables retrieving the available time slots for a change request.

Role required: sn_change_writer.

Note: Running this endpoint does not list the available start and end times. Use the link provided in the response body *worker.link* property to get the schedule data.

See also:

- GET /sn_chg_rest/change/ci/{cmdb_ci_sys_id}/schedule
- PATCH /sn_chg_rest/change/{change_sys_id}/schedule/first_available

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{change_sys_id}/schedule`

Default URL: `/api/sn_chg_rest/change/{change_sys_id}/schedule`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
change_sys_id	Sys_id of the change request on which to find the next available time slot. Located in the [change_request] table. The selected change request must have a configuration item (cmdb_ci) with planned start and planned end times.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	System accepted the request.
400	Bad Request. A bad request type or malformed request was detected. Possible issues: • The specified change request is missing the planned start and end times. • The specified change request does not have an associated configuration item (cmdb_ci). • User does not have read access to the fields of the change request.
404	Not Found. The specified record could not be found. Possible issues: • System cannot find the change request based on information provided. • User does not have read access to the record.

Response body parameters (JSON or XML)

Name	Description
error	Information on any errors encountered while processing the endpoint request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"error": { "detail": "String", "message": "String", "status": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error. Data type: String
messages	Message information. Data type: Object `"messages": { "errorMessages": [Array], "infoMessages": [Array], "warningMessages": [Array] }`
messages.errorMessages	Error messages encountered while processing the request. Data type: Array
messages.infoMessages	Information messages encountered while processing the request. Data type: Array
messages.warningMessages	Warning messages encountered while processing the request. Data type: Array
request	Original endpoint request. Data type: String
state	Information on the current state of the worker. Data type: Object `state: { display_value: "String", value: Number }`
state.display_value	Display value of the state of the worker. These values directly correlate to the *`state.value`* parameter. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Complete • Error • In-Progress • Waiting Data type: String
state.value	Numeric value of the state of the worker. Possible values: • 1 • 2 • 3 • 4 Data type: Number
type	Indicates the type of request. Valid value: schedule Data type: String

worker	Information about the associated worker.
	
	Data type: Object
	
	`"worker": {`
	`  "link": "String",`
	`  "sysId": "String"`
	`}`

worker.link	Link for retrieving time slot data. Use the sys_id in GET /sn_chg_rest/change/worker/{sys_id} to view results. Data type: String
worker.sysId	Sys_id of the worker associated with the change request. Data type: String
status	Only appears if an error is encountered. Status of the endpoint processing. Possible value: failure Data type: String

Get available time slots

Use the value provided in the *`worker.link`* to get schedule window details. The value is in the following format:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
https://instance.service-now.com/api/sn_chg_rest/change/worker/
<worker_sys_id>
```

Use the worker_sys_id in GET /sn_chg_rest/change/worker/{worker_sys_id} to view results.

The response body contains the status and provides results when processing is complete.

Worker response body parameter results vary depending on time slot availability.

- If the provided time slot is available for the change request within the schedule time slot, the worker API lists the available time slots in the *payload.spans* property. The *payload.spans* property is not listed in the results otherwise.
- If there are no time slots available for change request duration provided within the defined scheduling time slot, the *messages.infoMessages* states the following: D

Note: The change request scheduling time slot default value is 90 days. To change this value, modify the *change.conflict.next_available.schedule_window* property. For more information, see Configure conflict analysis properties.

The following *GET /sn_chg_rest/change/worker/{sys_id}* example shows output provided using the ID provided in the worker.link detail. The results list open time spans available for the task duration.

```

      "display_value": "Waiting"
    },
    "type": "schedule",
    "messages": {
      "errorMessages": [],
      "warningMessages": [],
      "infoMessages": []
    }
  }
}
```

Change Management - GET /sn_chg_rest/change/{change_sys_id}/task

Retrieves one or more tasks associated with a specified change request based on the specified criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{change_sys_id}/task`

Default URL: `/api/sn_chg_rest/change/{change_sys_id}/task`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
change_sys_id	Sys_id of the change request whose tasks are to be retrieved. Located in the Change Request [change_request] table. Data type: String

Query parameters

Name	Description
key-value pairs	Fields to modify when creating the request. The key is the field name within the template and th information to populate in the field. Fields that cannot be modified and are ignored if passed in: • Business rules • Read-only fields as defined in ACLs • Fields that do not exist Data type: String
order	Field by which to sort the returned change requests. Default: *`number`* Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the parameter to paginate record retrieval. Data type: Number Default: 500
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record ret functionality enables the retrieval of all records, regardless of the number of records, in small m For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply pa available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you records. Don't pass a negative number in the *`sysparm_offset`* parameter.

Query parameters (continued)

Name	Description
	Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. You can use a UI filter to obtain a properly encode Syntax: `sysparm_query=<col_name><operator><value>`. • <col_name>: Name of the table column to filter against. • <operator>: Supports the following values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>. ○ ^: Logically AND multiple query statements. ○ ^OR: Logically OR multiple query statements. ○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose da ○ STARTSWITH: <col_name> starts with the specified string. Only works for <col_name> field string. ○ ENDSWITH: <col_name> ends with the specified string. Only works for <col_name> fields w string. <value>: Value to match against. All parameters are case-sensitive. Queries can contain more than one entry, such as `sysparm_query=<col_name><operator><value>[<operator><col_name><op` For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)` Encoded queries also support order by functionality. To sort responses based on certain fields, and `ORDERBYDESC` clauses in *`sysparm_query`*. Syntax: • `ORDERBY<col_name>` • `ORDERBYDESC<col_name>` For example: `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcate` This query filters all active records and orders the results in ascending order by number, and th order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores t It then returns rows using only the valid portion of the query. You can control this behavior using *`glide.invalid_query.returns_no_rows`*. Set this property to true to return no rows c **Note:** The *`glide.invalid_query.returns_no_rows`* property controls the beha across the instance, such as in lists, scripts (*`GlideRecord.query()`*), and web service Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
textSearch	String to use to search all change task record fields. This search uses ServiceNow full text searc functionality and defaults to `IR_AND_OR_QUERY`. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	All fields (key) with their associated values for the identified change request task prior to the delete. Data type: Object
parent	Information for the change request associated to the task. Data type: Object `parent: { display_value: "String", value: "String" }`
parent.display_value	Change request information to display in a UI. Data type: String
parent.value	Sys_id of the change request associated to the task. Data type: String
sys_id	Sys_id information for the change request task. Data type: Object `sys_id: { display_value: "String", value: "String" }`
sys_id.display_value	Sys_id of the change request task to display in a UI. Data type: String
sys_id.value	Sys_id of the change request task. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/task?sysparm_query=active=true^ORDE
RBYnumber" \
--request GET \
--header "Accept:application/json" \
--user 'username':'password'
```

```
{
    result: [
        {
            sys_id: {
                value: "12629ec4b750230096c3e4f6ee11a9d5",
```

```
                display_value:
 "12629ec4b750230096c3e4f6ee11a9d5"
            },
            parent: {
                value: "0f4ac6c4b750230096c3e4f6ee11a9fe ",
                display_value: "CHG0033046 "
            },
            ..., // all valid fields in record, example below
            short_description: {
                value: "Retire node",
                display_value: "Retire node"
            }
        },
        { // next record found }, ... // and so on
    ]
}
```

Change Management - GET /sn_chg_rest/change/{sys_id}

Retrieves the change request identified by the specified sys_id.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}`

Default URL: `/api/sn_chg_rest/change/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request record to retrieve from Change Request [change_request] table. Data type: String

Query parameters

Name	Description
None

200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Element	Description
result	List containing one or more change request record objects. Each object describes a change request. Each element in the change request object corresponds to a field in its associated record in the Change Request [change_request] table. All elements contain *value* and *display_value* name-value pairs. Date fields also contain *display_value_internal* name-value pairs. Data type: Array
action_status	Current action status of the associated change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Possible values: • 1: Blocked internally • 2: Blocked by customer • 3: Blocked internally and by customer • 4: Needs attention Data type: Number
active	Flag that indicates whether the change request is active. Possible values: • true: Change request is active • false: Change request is not active Data type: Boolean Default: true
activity_due	Date and time for which the associated case is expected to be completed. Data type: String
additional_assignee_list	List of sys_ids of additional persons assigned to work on the change request. Data type: Array
approval	Type of approval process required. Data type: String Default: not requested
approval_history	Most recent approval history journal entry. Data type: String
approval_set	Date and time that the associated action was approved. Data type: String
assigned_to	Sys_id of the user assigned to the change request. Data type: String
assignment_group	Sys_id of the group assigned to the change request. Data type: String
backout_plan	Description of the plan to execute if the change must be reversed.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
business_duration	Length in scheduled work hours, work days, and work weeks that it took to complete the change. Data type: String
business_service	Sys_id of the business service associated with the change request. Located in the Service [cmdb_ci_service] table. Data type: String
cab_date	Date on which the Change Advisory Board (CAB) meets. Data type: String
cab_delegate	Sys_id of the user that can substitute for the CAB manager during a CAB meeting. Located in the User [sys_user] table Data type: String
cab_recommendation	Description of the CAB recommendations for the change request. Data type: String Maximum length: 4,000
cab_required	Flag that indicates whether the CAB is required. Possible values: • true: Change Advisory Board is required. • false: Change Advisory Board is not required. Data type: Boolean Default: false
calendar_duration	Not currently used by Change Management. Data type: String
category	Category of the change, for example hardware, network, or software. Data type: String Default: Other
change_plan	Activities and roles for managing and controlling the change request. Data type: String
chg_model	Sys_id of the change model that the associated change request was based on. Located in the Change Model

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Element	Description
	[chg_model] table. The Change Model defines the state flow, transitions, and process activities that must be completed for the change request. Data type: String
closed_at	Date and time that the associated change request was closed. Data type: String
closed_by	Sys_id of the person that closed the change request. Located in the User [sys_user] table. Data type: String
close_code	Code assigned to the change request when it was closed. For example, Successful, Successful with issues, and Unsuccessful. Data type: String
close_notes	Notes that the person entered when closing the change request. Data type: String
cmdb_ci	Sys_id of the configuration item associated with the change request. Located in the Configuration Item [cmdb_ci] table. Data type: String
comments	List of customer-facing work notes entered in the associated change request. Data type: Array
comments_and_work_notes	List of both internal and customer-facing work notes entered for the associated change request. Data type: Array Maximum length: 4,000
company	Sys_id of the company associated with the change request. Located in the Company [core_company] table. Data type: String
conflict_last_run	Date and time that the conflict detection script was last run on the change request. Data type: String
conflict_status	Current conflict status as detected by the conflict detection script, such as Conflict and Not Run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 40 Default: Not Run
contact_type	Method in which the change request was initially requested. Possible values: • chat • email • phone • social • web Data type: String
contract	Sys_id of the contract associated with the change request. Located in the Contract [ast_contract] table. Data type: String
correlation_display	User-friendly name for the *correlation_id*. Data type: String Maximum length: 100
correlation_id	Globally unique ID (GUID) of a matching change request record in a third-party system. Data type: String Maximum length: 100
delivery_plan	No longer in use. Sys_id of the delivery plan associated with the change request. Located in the Execution Plan [sc_cat_item_delivery_plan] table. Data type: String
delivery_task	No longer in use. Sys_id of the delivery task associated with the change request. Located in the Execution Plan Task [sc_cat_item_delivery_task] table. Data type: String
description	Detailed description of the change request. Data type: String Maximum length: 4,000
due_date	Task due date. Not used by change request process.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
end_date	Date and time when the change request is to be completed. Data type: String
escalation	Current escalation level. Possible values: • 0: Normal • 1: Moderate • 2: High • 3: Overdue Data type: Number (Integer) Default: 0
expected_start	Date and time when the task is to start. Not used by the change request process. Data type: String
follow_up	Date and time when a user followed-up with the person requesting the change request. Data type: String
group_list	List of sys_ids and names of the groups associated with the change request. Data type: Array Maximum length: 4,000
impact	Impact on the change request will have on the customer. Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
implementation_plan	Sequential steps to execute to implement this change. It also contains any dependencies between steps and assignee details for each step. Data type: String

Element	Description
	Maximum length: 4,000
justification	Benefits of implementing this change and the impact if this change is not implemented. Data type: String Maximum length: 4,000
knowledge	Flag that indicates whether there are any knowledge base ()KB) articles associated with the change request. Possible values: • true: Associated KB articles • false: No associated KB articles Data type: Boolean
location	Sys_id and name of the location of the equipment referenced in the change request. Located in the Location Located in the Location [cmn_location] table. Data type: String
made_sla	No longer used. Flag that indicates whether the change request was implemented in alignment with the associated service level agreement. Data type: Boolean
needs_attention	Flag that indicates whether the change request needs attention. Possible values: • true: Change request needs additional attention. • false: Change request does not need additional attention. Data type: Boolean Default: false
number	Change number assigned to the change request by the system, such as CHG0040007. Data type: String
on_hold	Flag that indicates whether the change request is currently on hold. Possible values: • true: On hold • false: Not on hold

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: Boolean Default: false
on_hold_reason	If the *on_hold* parameter is "true", description of the reason why the change request is being held up. Data type: String Maximum length: 4,000
on_hold_task	If the *on_hold* parameter is "true", list of the sys_ids of the tasks that must be completed before the hold is released. Data type: String Maximum length: 4,000
opened_at	Date and time that the change release was created. Data type: String
opened_by	Sys_id and name of the user that created the change release. Located in the User [sys_user] table. Data type: String
order	Not used by Change Management. Optional numeric field by which to order records, such as when retrieving them from a database. Data type: Number (Integer)
outside_maintenance_schedule	Flag that indicates whether maintenance by an outside company has been schedule for the change request. Possible values: • true: Outside maintenance scheduled • false: No outside maintenance scheduled Data type: Boolean Default: false
parent	Sys_id and name of the parent task to this change request, if any. Located in the Task [task] table. Data type: String
phase	Current phase of the change request. This defines what the change is doing in greater detail. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	• accept • build • plan • requested Data type: String
phase_state	Change_phase records that should be created for a change. They are dependent on the category, such that each type of change may have different change_phase records. The change_phase records provide an opportunity to control the approval process as each change_phase can have a schedule and a set of approvers. Possible values: • complete • on hold • open • rejected • requested • work in progress Data type: String
priority	Priority of the change request. Possible values: • 1: Critical • 2: High • 3: Moderate • 4: Low Data type: Number (Integer) Default: 4
production_system	Flag that indicates whether the change request is for a ServiceNow instance that is in a production environment. Possible values: • true: Production environment • false: Non-production environment Data type: Boolean
reason	Description of why the change request was initiated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Possible values: • Business requirements • Hardware upgrade • Legislation • Location change • Network requirements • New or removed CI • Other • Problem resolved • Product or service changed • Software upgrade • User requested Data type: String Maximum length: 40
reassignment_count	Number of times that the change request has been reassigned to a new owner. Data type: Number (Integer) Default: 0
rejection_goto	Sys_id of the task to perform if the change request is rejected. Located in the Task [table]. Data type: String
requested_by	Sys_id of the user that requested the change. Located in the User [sys_user] table. Data type: String
requested_by_date	Date and time when the change is requested to be implemented by. Data type: String
review_comments	Comments entered when the change request was reviewed. Data type: String Maximum length: 4,000
review_date	Date that the change request was reviewed. Data type: String
review_status	Current status of the requested change request review.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String
risk	Level of risk associated with the change request. Valid values: • 1: High • 2: Moderate • 3: Low Data type: Number Default: 3
risk_impact_analysis	Description of the risk and analysis of implementing the change request. Data type: String Maximum length: 4,000
route_reason	Not currently used by Change Management. Reason that the change request was transferred. Possible values: • 1: Transfer with Resolution • 9: Transfer without Resolutions Data type: Number
scope	Size of the change request. Possible values: • 1: Massive • 2: Large • 3: Medium • 4: Small • 5: Tiny Data type: Number Default: 3
service_offering	Sys_id of the service offering associated with the change request. Service offerings uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Located in the Offering [service_offering] table. Data type: String
short_description	Description of the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Data type: String Maximum length: 40
skills	List of the sys_ids of all of the skills required to implement the change request. Located in the Skill [cmn_skill] table. Data type: Array
sla_due	No longer in use. Date and time that the change request must be completed based on the associated service level agreement. Data type: String
sn_esign_document	Sys_id of any E-signed document attached to the change request. Located in the Attachment [sys_attachment] table. Data type: String
sn_esign_esignature_configuration	Sys_id of the E-signed signature template used for the associated document. Located in the E-signature Template [sn_esign_configuration] table. Data type: String
start_date	Date and time that the change request is planned to start implementation. Data type: String
state	Current state of the change request. Possible values are defined in the change model. Data type: Number (Integer) Default: 1
std_change_producer_version	Sys_id of the record producer and change proposal associated with the change request. It also includes the number and percentage of successful and unsuccessful change requests created from the proposal. Located in the Standard Change Template Version [std_change_producer_version] table. Data type: String
sys_class_name	Name of the table in which the change request is located. Data type: String
sys_created_by	Name of the user that initially created the change request. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
	Maximum length: 40
sys_created_on	Date and time that the associated change request record was originally created. Data type: String
sys_domain	If using domains in the instance, the name of the domain to which the change module record is associated. Data type: String
sys_domain_path	If using domains in the instance, the domain path in which the associated change module record resides. Data type: String
sys_id	Unique identifier of the associated change request record. Data type: String
sys_mod_count	Number of updates to the case since it was initially created. Data type: Number (Integer)
sys_updated_by	Person that last updated the case. Data type: String Maximum length: 40
sys_updated_on	Date and time when the case was last updated. Data type: String
task_effective_number	Universal request number. Data type: String Maximum length: 40
task_for	Not used by Change Management. Sys_id of the user that the task was created for. Located in the User [sys_user] table. Data type: String
test_plan	Description of the associated test plan for the change. Data type: String Maximum length: 4,000
time_worked	Total amount of time worked on the change request. Data type: String

Element	Description
type	Change request type. Possible values: • emergency • normal • standard Data type: String Maximum length: 40
unauthorized	Flag that indicates whether the change request is unauthorized Possible values: • true: Unauthorized • false: Authorized Data type: Boolean
universal_request	Sys_id of the Parent Universal request to which this change request is a part of. Located in the Task [task] table. Data type: String
upon_approval	Action to take if the change request is approved. Possible values: • do_nothing • proceed Data type: String Maximum length: 40 Default: proceed
upon_reject	Action to take if the change request is rejected. Possible values: • cancel • goto Data type: String Maximum length: 40 Default: cancel
urgency	Urgency of the change request.

Element	Description
	Possible values: • 1: High • 2: Medium • 3: Low Data type: Number (Integer) Default: 3
user_input	Additional user input. Data type: String Maximum length: 4,000
variables	Name-value pairs of variables associated with the change request. Data type: String Maximum length: 40
watch_list	List of sys_ids of the users who receive notifications about this change request when additional comments are added or if the state of a change request is changed to Resolved or Closed. Located in the User [sys_user] table. Data type: Array
wf_activity	Sys_id of the workflow activity record associated with the change request. Located in the Workflow Activity [wf_activity] table. Data type: String
work_end	Date and time work ended on the change request. Data type: String
work_notes	Information about how to resolve the change request, or steps taken to resolve it. Data type: String Maximum length: 4,000
work_notes_list	List of sys_ids of the internal users who receive notifications about this change request when work notes are added. Located in the User [sys_user] table. Data type: Array
work_start	Date and time that work started on the change request.

Change Management - GET /sn_chg_rest/change/{sys_id}/ci

Retrieves multiple configuration items (CIs) associated to a specified change request based on the specified association type.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/ci`

Default URL: `/api/sn_chg_rest/change/{sys_id}/ci`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request for which to return the associated CMDB CIs. Data type: String

Query parameters

Name	Description
association_type	Required. Type of association between the CMDB CI and the change request. Valid values: • affected: CIs that are affected by the change request • impacted: Services impacted by the change request • offering: Impacted service offerings Data type: String
name-value pairs	Name-value pairs to use to filter the result set. The name is the field on which the specified va filtered. This parameter is mutually exclusive with *sysparm_query*. For example, instead of `&sysparm_query=active=true`, you can simplify the calling statement by using `&acti` can also use the display value when the field is a choice or reference type field, such as `&sta` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, `&active=true&assigned_to=john.smith`. Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use t parameter to paginate record retrieval. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Default: 500
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record re functionality enables the retrieval of all records, regardless of the number of records, in small For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply p available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until y records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0

sysparm_query	Encoded query used to filter the result set. You can use a UI filter to obtain a properly enco
	
	Syntax: `sysparm_query=<col_name><operator><value>`.
	• <col_name>: Name of the table column to filter against.
	• <operator>: Supports the following values:
	○ =: Exactly matches <value>.
	○ !=: Does not match <value>.
	○ ^: Logically AND multiple query statements.
	○ ^OR: Logically OR multiple query statements.
	○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose
	○ STARTSWITH: <col_name> starts with the specified string. Only works for <col_name> fiel
	string.
	○ ENDSWITH: <col_name> ends with the specified string. Only works for <col_name> fields
	string.
	<value>: Value to match against.
	
	All parameters are case-sensitive. Queries can contain more than one entry, such as
	`sysparm_query=<col_name><operator><value>[<operator><col_name><`
	
	For example:
	
	`(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)`
	
	Encoded queries also support order by functionality. To sort responses based on certain field
	and ORDERBYDESC clauses in *sysparm_query*.
	
	Syntax:
	• `ORDERBY<col_name>`
	• `ORDERBYDESC<col_name>`
	
	For example: `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcat`
	
	This query filters all active records and orders the results in ascending order by number, and
	order by category.

Query parameters (continued)

Name	Description
	If part of the query is invalid, such as by specifying an invalid field name, the instance ignores It then returns rows using only the valid portion of the query. You can control this behavior usi *glide.invalid_query.returns_no_rows*. Set this property to true to return no rows **Note:** The *glide.invalid_query.returns_no_rows* property controls the beh across the instance, such as in lists, scripts (*GlideRecord.query()*), and web servic Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected. The error response contains pertinent messages to help troubleshoot the problem.

Status codes (continued)

Status code	Description
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
ci_item|cmdb_ci_service	Either the ci_item or cmdb_ci_service variables, depending upon the association type. Data type: Array `ci_item|cmdb_ci_service : { display_value: "String", value: "String" }`
ci_item|cmdb_ci_service.value	Sys_id of the ci_item or cmdb_ci_service. Data type: String
ci_item| cmdb_ci_service.display_value	Display value of the ci_item or cmdb_ci_service. Data type: String
sys_id	Change request sys_id information. Data type: Object `sys_id: { display_value: "String", value: "String" }`
sys_id.value	Sys_id of the change request. Data type: String
sys_id.display_value	Sys_id of the change request to display in a UI. Data type: String
<record_fields>	All valid fields in the ci_item or cmdb_ci_service record; table based on association type. Data type: Object

  result: [
    {
      sys_id: {
        value: "92b8544047810200e90d87e8dee490b0",
        display_value: "92b8544047810200e90d87e8dee490b0"
      },
      ci_item|cmdb_ci_service : {
        value: "3a27d4370a0a0bb4006316812bf45439",
        display_value: "PS Apache01"
      },
      ..., // all valid fields in record, table based on
 association type
    },
    { // next record found }, ... // and so on
  ]
}
```

Change Management - GET /sn_chg_rest/change/{sys_id}/conflict

Retrieves the status of the currently running change request conflict checking process or the results of the last completed conflict checking process for the specified change request.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/conflict`

Default URL: `/api/sn_chg_rest/change/{sys_id}/conflict`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request for which to return the status of the running/completed conflict checking process. Located in the Change Request [change_request] table. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
conflicts	List of conflicts found for the change request. An empty object indicates that no conflicts were detected. Data type: Array
job_status	Status of the actual conflict checking job. Data type: String
last_run	Date and time the last conflict checking process started. Data type: String
record_count	Number of records checked. Data type: String
status	Outcome of the conflict checking process, such as "Conflict" or "Not run". **Note:** Even if the change request does not have any conflicts, this field is set to "Conflict." However, the *conflicts* object is empty. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/conflict" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Successful response - no conflicts

```
{
  result: {
    status: "Conflict",
    last_run": "2018-08-30 12:58:05",
    record_count: "1",
    job_status: "2",
    conflicts: []
  }
}
```

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/conflict" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Values for all fields in the associated change request. Data type: Object
state	State of the change request. Data type: Object `state: { display_value: "String", value: "String" }`
state.display_value	State to display in a UI. Data type: String
state.value	Internal state value. Data type: String
sys_id	Sys_id information for the change request. Data type: Object `sys_id: { display_value: "String", value: "String" }`
sys_id.display_value	Sys_id of the change request to display in a UI. Data type: String
sys_id.value	Sys_id of the change request. Data type: String
type	Type of change request.

Name	Description
	Data type: Object `type: { display_value: "String", value: "String" }`
type.display_value	Change type to display in a UI. Value is always "Emergency". Data type: String
type.value	Internal type value. Value is always "emergency". Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/emer
gency?sysparm_query=active=true^ORDERBYnumber" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "1c87925347c12200e0ef563dbb9a7177",
        display_value: "1c87925347c12200e0ef563dbb9a7177"
      },
      state: {
        value: "-5",
        display_value: "New"
      },
      type: {
        value: "emergency",
        display_value: "Emergency"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Reboot server",
        display_value: "Reboot server"
      },
    },
    { // next record found }, ... // and so on
  ]
}
```

Change Management - GET /sn_chg_rest/change/emergency/{sys_id}

Retrieves the emergency change request identified by the specified sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Change Management - GET /sn_chg_rest/change/model

Retrieves one or more change models based on the specified criteria.

Use this endpoint to find a change model that best fits the change request that you are trying to create. For additional information, see Change Models.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/model`

Default URL: `/api/sn_chg_rest/change/model`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs to use to filter the result set. The name is the field on which the specified valu filtered. This parameter is mutually exclusive with *`sysparm_query`*. For example, instead of u `&sysparm_query=active=true`, you can simplify the calling statement by using `&activ` can also use the display value when the field is a choice or reference type field, such as `&stat` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, s `&active=true&assigned_to=john.smith`. Data type: String
order	Field by which to sort the returned change models. Data type: String Default: *`name`*
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record ret functionality enables the retrieval of all records, regardless of the number of records, in small m For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply pa available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. You can use a UI filter to obtain a properly encode Syntax: `sysparm_query=<col_name><operator><value>`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• <col_name>: Name of the table column to filter against. • <operator>: Supports the following values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>. ○ ^: Logically AND multiple query statements. ○ ^OR: Logically OR multiple query statements. ○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose da ○ STARTSWITH: <col_name> starts with the specified string. Only works for <col_name> field string. ○ ENDSWITH: <col_name> ends with the specified string. Only works for <col_name> fields w string. <value>: Value to match against. All parameters are case-sensitive. Queries can contain more than one entry, such as `sysparm_query=<col_name><operator><value>[<operator><col_name><op` For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)` Encoded queries also support order by functionality. To sort responses based on certain fields, and `ORDERBYDESC` clauses in *`sysparm_query`*. Syntax: • `ORDERBY<col_name>` • `ORDERBYDESC<col_name>` For example: `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcate` This query filters all active records and orders the results in ascending order by number, and th order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores th It then returns rows using only the valid portion of the query. You can control this behavior using *`glide.invalid_query.returns_no_rows`*. Set this property to true to return no rows c **Note:** The *`glide.invalid_query.returns_no_rows`* property controls the beha across the instance, such as in lists, scripts (*`GlideRecord.query()`*), and web service Data type: String
textSearch	String to use to search all change model record fields. This search uses ServiceNow full text sea functionality. For more information on ServiceNow search capabilities, see Search administratio Data type: String Default: `IR_AND_OR_QUERY`

Name	Description
	Data type: String
result.state_field	Choice list field from which to collect choices, based on the provided in *table_* "state". Data type: String
result.sys_class_name	Change module table name. Always Change Model/chg_model. Data type: String
result.sys_created_by	Name of the user that initially created the associated change module record. Data type: String
result.sys_created_on	Date and time that the change module record was originally created. Data type: String
result.sys_domain	If using domains in the instance, the name of the domain to which the change mo Data type: String
result.sys_domain_path	If using domains in the instance, the domain path in which the associated change Data type: String
result.sys_id	Unique identifier of the associated change model record. Data type: String
result.sys_mod_count	Number of times that the associated change model record has been modified. Data type: Number
result.sys_name	Name of the change model. Always the same as the *name* parameter. Data type: String
result.sys_tags	System tags associated with the change model record. Data type: String
result.sys_updated_by	Name of the user that last updated the associated change model record. Data type: String Maximum length: 40
result.sys_updated_on	Date and time the associated change model record was last updated. Data type: String
result.table_name	Table that defines the Choice list field from which to collect choices. For change r Data type: String Maximum length: 80

Example: cURL request

This example shows a request for obtaining all change model records.

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/mo
del \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

For brevity, this response only shows a single change model object.

Change Management - GET /sn_chg_rest/change/normal

Retrieves one or more normal change requests based on the specified criteria.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/normal`

Default URL: `/api/sn_chg_rest/change/normal`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs to use to filter the result set. The name is the field on which the specified valu filtered. This parameter is mutually exclusive with *`sysparm_query`*. For example, instead of u `&sysparm_query=active=true`, you can simplify the calling statement by using `&activ` can also use the display value when the field is a choice or reference type field, such as `&stat` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, s `&active=true&assigned_to=john.smith`. Data type: String
order	Field by which to sort the returned change requests. Default: *`number`* Data type: String
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the parameter to paginate record retrieval. Data type: Number Default: 500
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record ret functionality enables the retrieval of all records, regardless of the number of records, in small m For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply pa available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number

Query parameters (continued)

Name	Description
	Default: 0

sysparm_query	Encoded query used to filter the result set. You can use a UI filter to obtain a properly encode
	
	Syntax: `sysparm_query=<col_name><operator><value>`.
	• <col_name>: Name of the table column to filter against.
	• <operator>: Supports the following values:
	  ○ =: Exactly matches <value>.
	  ○ !=: Does not match <value>.
	  ○ ^: Logically AND multiple query statements.
	  ○ ^OR: Logically OR multiple query statements.
	  ○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose da
	  ○ STARTSWITH: <col_name> starts with the specified string. Only works for <col_name> field string.
	  ○ ENDSWITH: <col_name> ends with the specified string. Only works for <col_name> fields w string.
	<value>: Value to match against.
	
	All parameters are case-sensitive. Queries can contain more than one entry, such as `sysparm_query=<col_name><operator><value>[<operator><col_name><op`
	
	For example:
	
	`(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)`
	
	Encoded queries also support order by functionality. To sort responses based on certain fields, and ORDERBYDESC clauses in *sysparm_query*.
	
	Syntax:
	• `ORDERBY<col_name>`
	• `ORDERBYDESC<col_name>`
	
	For example: `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcate`
	
	This query filters all active records and orders the results in ascending order by number, and th order by category.
	
	If part of the query is invalid, such as by specifying an invalid field name, the instance ignores th It then returns rows using only the valid portion of the query. You can control this behavior using *glide.invalid_query.returns_no_rows*. Set this property to true to return no rows o
	
	Note: The *glide.invalid_query.returns_no_rows* property controls the beha across the instance, such as in lists, scripts (*GlideRecord.query()*), and web service
	
	Data type: String

textSearch	String to use to search all normal change request record fields. This search uses ServiceNow fu functionality and defaults to `IR_AND_OR_QUERY`.

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/norm
al?sysparm_query=active=true^ORDERBYnumber" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "1c87925347c12200e0ef563dbb9a7177",
        display_value: "1c87925347c12200e0ef563dbb9a7177"
      },
      state: {
        value: "-5",
        display_value: "New"
      },
      type: {
        value: "normal",
        display_value: "Normal"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Add network switch to cabinet",
        display_value: "Add network switch to cabinet"
      },
    },
    { // next record found }, ... // and so on
  ]
}
```

Change Management - GET /sn_chg_rest/change/normal/{sys_id}

Retrieves the normal change request identified by the specified sys_id.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/normal/{sys_id}`

Default URL: `/api/sn_chg_rest/change/normal/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the normal change request to retrieve from Change Request [change_request] table.

```

Change Management - GET /sn_chg_rest/change/standard/template

Retrieves one or more standard change templates based on the specified criteria.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/standard/template`

Default URL: `/api/sn_chg_rest/change/standard/template`

© 2026 ServiceNow, Inc. All rights reserved.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs to use to filter the result set. The name is the field on which the specified valu filtered. This parameter is mutually exclusive with *`sysparm_query`*. For example, instead of u `&sysparm_query=active=true`, you can simplify the calling statement by using `&activ` can also use the display value when the field is a choice or reference type field, such as `&stat` instead of `&state=7`. To specify multiple key-value pairs, separate each with an ampersand, s `&active=true&assigned_to=john.smith`. Data type: String
order	Field by which to sort the returned standard change templates. Data type: String Default: Number
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the parameter to paginate record retrieval. Data type: Number Default: 500
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record ret functionality enables the retrieval of all records, regardless of the number of records, in small m For example, the first time you call this endpoint, *`sysparm_offset`* is set to "0". To simply pa available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you records. Don't pass a negative number in the *`sysparm_offset`* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. You can use a UI filter to obtain a properly encode Syntax: `sysparm_query=<col_name><operator><value>`. • <col_name>: Name of the table column to filter against. • <operator>: Supports the following values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>.

Query parameters (continued)

Name	Description
	○ ^: Logically AND multiple query statements. ○ ^OR: Logically OR multiple query statements. ○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose da ○ STARTSWITH: <col_name> starts with the specified string. Only works for <col_name> field string. ○ ENDSWITH: <col_name> ends with the specified string. Only works for <col_name> fields w string. <value>: Value to match against. All parameters are case-sensitive. Queries can contain more than one entry, such as `sysparm_query=<col_name><operator><value>[<operator><col_name><op` For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)` Encoded queries also support order by functionality. To sort responses based on certain fields, and `ORDERBYDESC` clauses in *`sysparm_query`*. Syntax: • `ORDERBY<col_name>` • `ORDERBYDESC<col_name>` For example: `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcate` This query filters all active records and orders the results in ascending order by number, and th order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores th It then returns rows using only the valid portion of the query. You can control this behavior using *`glide.invalid_query.returns_no_rows`*. Set this property to true to return no rows c **Note:** The *`glide.invalid_query.returns_no_rows`* property controls the beha across the instance, such as in lists, scripts (*`GlideRecord.query()`*), and web service Data type: String
textSearch	String to use to search all standard change request record fields. This search uses ServiceNow platform functionality and defaults to `IR_AND_OR_QUERY`. Data type: String

Request body parameters (XML or JSON)

Name	Description
None

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	All fields with their associated values for the identified standard change template. Data type: Object

sys_id	Sys_id information for the change request.
	
	Data type: Object
	`sys_id: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

sys_id.display_value	Sys_id of the change request to display in a UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
sys_id.value	Sys_id of the change request. Data type: String
template	Information about the standard change template. Data type: Object `template: { display_value: "String", value: "String" }`
template.display_value	Template information to display in the UI. Data type: String
template.value	Template sys_id. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/stan
dard/template?sysparm_query=active=true^ORDERBYnumber" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "92b8544047810200e90d87e8dee490b0",
        display_value: "92b8544047810200e90d87e8dee490b0"
      },
      template : {
        value: "1c8e02ec47410200e90d87e8dee49057",
        display_value: "Add network switch to datacenter
 cabinet"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Standard change template to add network switch
 to cabinet",
        display_value: "Standard change template to add network
 switch to cabinet"
      },
    },
    { // next record found }, ... // and so on
  ]
}
```

Change Management - GET /sn_chg_rest/change/standard/template/{sys_id}

Retrieves the standard change template identified by the specified sys_id.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/standard/template/{sys_id}`

Default URL: `/api/sn_chg_rest/change/standard/template/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the standard change template to retrieve from the [std_change_record_producer] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	All fields with their associated values for the identified standard change template. Data type: Object
sys_id	Sys_id of the change request. Data type: String

template	Information about the standard change template.
	
	Data type: Object
	`template: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

template.display_value	Template information to display in a UI. Data type: String
template.value	Template sys_id. Data type: String

        value: "Standard change template to add network switch
 to cabinet",
        display_value: "Standard change template to add network
 switch to cabinet"
      },
    },
  ]
}
```

Change Management - GET /sn_chg_rest/change/worker/{sys_id}

Retrieves the current status, information, and errors for the specified asynchronous worker.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/worker/{sys_id}`

Default URL: `/api/sn_chg_rest/{change/worker/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change management asynchronous worker. Located in the Change Management Worker [chg_mgt_worker] table. Data type: String

Response body parameters (JSON or XML)

Name	Description
messages	Message information. Data type: Object `"messages": { "errorMessages": [Array], "infoMessages": [Array], "warningMessages": [Array] }`
messages.errorMessages	Error messages encountered while processing the request. For example: `Invalid CMDB_CI sys_id provided` Data type: Array
messages.infoMessages	Information messages encountered while processing the request. For example: `CMDB_CI sys_id already associated to provided.` Data type: Array
messages.warningMessages	Warning messages encountered while processing the request. For example: `Invalid CMDB_CI sys_id provided.` Data type: Array
payload	Unique payload provided when using a worker sys_id from the successful response body of a scheduling endpoint. • GET /ci/{cmdb_ci_sys_id}/schedule • GET /sn_chg_rest/change/{change_sys_id}/schedule `"payload": { "spans": [Array] }` Data type: Object
payload.spans	If a timespan is available within the duration provided in the schedule endpoint, the worker API lists the available time spans. `"payload": { "spans": [ { "start": {Object}, "end": {Object}`

Name	Description

	<pre>}
	]
	}</pre>
	Data type: Array

payload.spans.start	<pre>"start": {
	"value": "String",
	"display_value": "String"
	}</pre>
	Data type: Object

payload.spans.start.value	Date and time that the change request is planned to start implementation. Data type: String
payload.spans.start.display_value	Displays the value of the change request start time. Time format: yyyy-mm-dd hh:mm:ss Data type: String

payload.spans.end	<pre>"end": {
	"value": "String",
	"display_value": "String"
	}</pre>
	Data type: Object

payload.spans.end.value	Date and time that the change request is planned for completion. Time format: yyyy-mm-dd hh:mm:ss Data type: String
payload.spans.end.display_value	Displays the value of the change request completion time. Data type: String
request	Original endpoint request. Data type: String

state	Information on the current state of the worker.
	
	Data type: Object
	<pre>state: {
	display_value: "String",
	value: Number
	}</pre>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
state.display_value	Display value of the state of the worker. These values directly correlate to the *state.value* parameter. Possible values: • Complete • Error • In-Progress • Waiting Data type: String
state.value	Numeric value of the state of the worker. Possible values: • 1 • 2 • 3 • 4 Data type: Number
type	Type of association between the CMDB CI and the change request. Data type: String

worker	Information about the associated worker.
	
	Data type: Object
	
	`"worker": {`
	`  "link": "String",`
	`  "sysId": "String"`
	`}`

worker.link	URL to retrieve the status of the associated worker and other worker pertinent information. Data type: String
worker.sysId	Sys_id of the worker associated with the change request. Data type: String
<other_params>	Other parameters that are process-specific, such as *ignored_cmdb_ci_sys_ids*.

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/work
er/0644cd02dbec330084f07ffdbf9619c1" \
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  "result": {
    "worker": {
      "sysId": "0644cd02dbec330084f07ffdbf9619c1",
      "link":
 "https://instance.service-now.com/api/sn_chg_rest/change/worker
/0644cd02dbec330084f07ffdbf9619c1"
    },
    "request":
 "{\"task\":\"c286d61347c12200e0ef563dbb9a71df\"}",
    "state": {
      "value": 3,
      "display_value": "Complete"
    },
    "type": "impacted",
    "messages": {
      "errorMessages": [],
      "warningMessages": [],
      "infoMessages": []
    }
  }
}
```

Change Management - PATCH /sn_chg_rest/change/{sys_id}

Updates the change request identified by the specified sys_id with the key-value pairs in the request body or URL.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}`

Default URL: `/api/sn_chg_rest/change/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request to modify. Located in the Change Request [change_request] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
name-value pairs	Name-value pairs representing the fields to update. Request body parameters override URL parameters. However, required parameters must be specified in the URL. Data type: String
encrypted_fields	List of comma-separated fields to encrypt. These fields are encrypted before they are stored in the associated record. When specified, the endpoint calls the GlideRecord `setDisplayValue()` method, instead of calling the `setValue()` method. Because of this, you can also use this parameter to pass display values for non-encrypted fields, such as reference or choice fields, instead of passing sys_ids or values. Data type: String

Request body parameters (XML or JSON)

Name	Description
data	Name-value pairs representing the field(s) to update in the associated change request. For example, to update the short description file, enter a name-value pair similar to the following: `--data "{\"short_description\": \"my short desc\" }" \`. Data type: String
encrypted_fields	List of comma-separated fields to encrypt. These fields are encrypted before they are stored in the associated record. When specified, the endpoint calls the GlideRecord `setDisplayValue()` method, instead of calling the `setValue()` method. Because of this, you can also use this parameter to pass display values for non-encrypted fields, such as reference or choice fields, instead of passing sys_ids or values. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: `application/json` or `application/xml`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
	Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
result	Updated change request record. Each element in this object corresponds to a field in the record in the Change Request [change_request] table. All elements contain *value* and *display_value* name-value pairs. Some contain *display_value_internal* name-value pairs. Data type: Object

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/b0db
da5347c12200e0ef563dbb9a718f" \
--request PATCH \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
```

Example: cURL request

The following example shows how to pass encrypted fields in the request body.

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/b0db
da5347c12200e0ef563dbb9a718f" \
--request PATCH \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"encrypted_fields\":\"short_description,description\",
    \"short_description\":\"my short desc\",
    \"description\":\"my desc\"
}" \
--user "username":"password"
```

Example: cURL request

The following example shows how to pass encrypted fields as query parameters.

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/b0db
da5347c12200e0ef563dbb9a718f?encrypted_fields=short_description%
2Cdescription&short_description=my%20short%20desc&description
=my%20desc" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{}" \
--user "username":"password"
```

Change Management - PATCH /sn_chg_rest/change/{sys_id}/approvals

Allows the current user to approve or reject a change request approval record for the specified change request.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/approvals`

Default URL: `/api/sn_chg_rest/change/{sys_id}/approvals`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request for which the approval/rejection applies. Located in the Change Request [change_request] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
comments	Required if *state* is `rejected`. Reason that the change was rejected. Data type: String
state	Required. Approval state. For example: `--data "{\"state\": \"approved\"}"` Valid values: • approved • rejected Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
400	Bad request. Indicates a bad request type such as the user not having the authority to approve or reject the change request.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Values for all fields in the associated change request. Data type: Object
state	Current state of the change request. Data type: Object `state: { display_value: "String", value: "String" }`
state.display_value	State to display in a UI. Data type: String
state.value	Internal state value. Data type: String
sys_id	Sys_id of the change request being approved/rejected. Data type: String
type	Type of change request. Data type: Object `type: { display_value: "String", value: "String" }`
type.display_value	Change type to display in a UI. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Emergency • Normal • Standard Data type: String
type.value	Internal type value. Possible values: • emergency • normal • standard Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/approvals" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data "{\"state\": \"approved\"}" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: "0f4ac6c4b750230096c3e4f6ee11a9fe",
      state: {
        value: "-2",
        display_value: "Scheduled"
      },
      type: {
        value: "normal",
        display_value: "Normal"
      },
      ..., // all valid fields in record, single parameter
 example below
      short_description: {
        value: "Remove server",
        display_value: "Remove server"
      }
    }
  ]
}
```

Change Management - PATCH /sn_chg_rest/change/{change_sys_id}/schedule/first_available

Updates the planned start and end times of a change request using the first available time slot found.

Role required: sn_change_writer.

Note: Use the link provided in the response body *worker.link* property to view the schedule status.

See also:

- GET /sn_chg_rest/change/ci/{cmdb_ci_sys_id}/schedule
- GET /sn_chg_rest/change/{change_sys_id}/schedule

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{change_sys_id}/schedule/first_available`

Default URL: `/api/sn_chg_rest/change/{change_sys_id}/schedule/first_available`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
change_sys_id	Sys_id of the change request on which to update with the next available time slot. Located in the Change Requests [change_request] table. The selected change request must have a configuration item (cmdb_ci).

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
duration_in_seconds	Duration of change in seconds, that is, how much time is required to complete the change request task. Data type: Integer
planned_start_time	Optional. Date and time that the change request is planned to start implementation in UTC. Retrieve the available time slot start at or later than this time. If not provided, the system uses the current time as the start time. Time format: yyyy-mm-dd hh:mm:ss Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
202	System accepted the request.
400	Bad Request. A bad request type or malformed request was detected. Possible issues: • The duration_in_seconds body parameter value is invalid or was not provided. • Invalid planned_start_time body parameter value provided. • The specified change request does not have an associated configuration item (cmdb_ci). • User does not have read access to the fields of the change request.
403	Forbidden. User does not have write access to the planned start and end date values of the change request.
404	Not Found. The specified record could not be found. Possible issues: • System cannot find the change request based on information provided. • User does not have read access to the record.

Response body parameters (JSON or XML)

Name	Description
error	Information on any errors encountered while processing the endpoint request. Data type: Object `"error": { "detail": "String", "message": "String", "status": "String" }`
error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error. Data type: String
messages	Message information. Data type: Object `"messages": { "errorMessages": [Array], "infoMessages": [Array], "warningMessages": [Array] }`
messages.errorMessages	Error messages encountered while processing the request. Data type: Array
messages.infoMessages	Information messages encountered while processing the request. Data type: Array
messages.warningMessages	Warning messages encountered while processing the request. Data type: Array
request	Original endpoint request. Data type: String
state	Information on the current state of the worker. Data type: Object `state: { display_value: "String", value: Number }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
state.display_value	Display value of the state of the worker. These values directly correlate to the *state.value* parameter. Possible values: • Complete • Error • In-Progress • Waiting Data type: String
state.value	Numeric value of the state of the worker. Possible values: • 1 • 2 • 3 • 4 Data type: Number
type	Indicates the type of request. Valid value: schedule Data type: String

worker	Information about the associated worker.
	
	Data type: Object
	
	`"worker": {`
	`  "link": "String",`
	`  "sysId": "String"`
	`}`

worker.link	Link for retrieving change request schedule status. Use the sys_id in GET /sn_chg_rest/change/worker/{sys_id} to view results. Data type: String
worker.sysId	Sys_id of the worker associated with the change request. Data type: String
status	Only appears if an error is encountered. Status of the endpoint processing. Possible value: failure Data type: String

Get change request schedule status

Use the value provided in the *worker.link* to determine if the change record has been successfully scheduled for the first available time slot. The value is in the following format:

`https://instance.service-now.com/api/sn_chg_rest/change/worker/<worker_sys_id>`

Use the worker.link details to run the provided sys_id in GET /sn_chg_rest/change/worker/{sys_id} to view results.

The response body contains the status and provides results when processing is complete.

If an available time slot is found, the system updates the change request with the first available slot. When the state is complete, the *messages.infoMessages* reveals that the first available time slot has been set.

One of the following scheduling response values for *messages.infoMessages* are provided in the response body:

- `Change has been updated` – Change requested has been updated for time slot.
- `No slots found for <number> days from now` – No time slots available for change request duration provided within the number of days defined in the schedule window.

> **Note:** The change request scheduling time slot default value is 90 days. To change this value, modify the *change.conflict.next_available.schedule_window* property. For more information, see Configure conflict analysis properties.

The following *GET /sn_chg_rest/change/worker/{sys_id}* example shows output provided using the ID provided in the worker.link detail. The results indicate that processing is complete and the change request has been updated with the first available time slot.

```
{
  "result": {
    "worker": {
      "sysId": "355c62e0a4c87010f87712198fe9cacf",
      "link":
 "https://instance.service-now.com/api/sn_chg_rest/change/worker
/355c62e0a4c87010f87712198fe9cacf"
    },
    "request":
 "{\"change_sys_id\":
\"87ae5e900a0a2c3e263e8304e727c646\",\"duration_in_seconds\":108
00,\"timezone\":\"America/Los_Angeles\"}",
    "state": {
      "value": 3,
      "display_value": "Complete"
    },
    "type": "schedule",
    "messages": {
      "errorMessages": [],
      "warningMessages": [],
      "infoMessages": [
        "Change has been updated"
      ]
    }
  }
}
```

    },
    "request":
 "{\"change_sys_id\":
\"87ae5e900a0a2c3e263e8304e727c646\",\"duration_in_seconds\":108
00,\"timezone\":\"America/Los_Angeles\"}",
    "state": {
      "value": 1,
      "display_value": "Waiting"
    },
    "type": "schedule",
    "messages": {
      "errorMessages": [],
      "warningMessages": [],
      "infoMessages": []
    }
  }
}
```

Change Management - PATCH /sn_chg_rest/change/{change_sys_id}/task/{task_sys_id}

Updates the change request task identified by the specified sys_ids with the key-value pairs in the request body or the URL.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{change_sys_id}/task/{task_sys_id}`

Default URL: `/api/sn_chg_rest/change/{change_sys_id}/task/{task_sys_id}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
change_sys_id	Sys_id of the change request to which the task is associated. Verifies whether the specified task is associated with the specified change request. Located in the Change Request [change_request] table. Data type: String
task_sys_id	Sys_id of the task to modify. Located in the Change Task [change_task] table. Data type: String

Query parameters

Name	Description
key-value pairs	Name-value pairs representing the fields to update. Request body parameters override URL parameters. However, required parameters must be specified in the URL. Data type: String

Request body parameters (XML or JSON)

Name	Description
data	Name-value pairs representing the field(s) to update in the associated change request. For example, to update the short description file, enter a name-value pair similar to the following: `--data "{\"short_description\": \"my short desc\" }" \`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

© 2026 ServiceNow, Inc. All rights reserved.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	All fields (key) with their associated values for the identified change request task prior to the delete. Data type: Object

sys_id	Sys_id information for the change request task.
	
	Data type: Object
	`sys_id: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

sys_id.display_value	Sys_id of the change request task to display in a UI. Data type: String
sys_id.value	Sys_id of the change request task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
parent	Unique identifier information for the change request associated to this task. Data type: Object `parent: { display_value: "String", value: "String" }`
parent.display_value	Task information to display in a UI. Data type: String
parent.value	Sys_id of the parent task. Data type: String
__meta.ignoredFields	Key-value pairs that were passed in the call, but were not applied to the change request as they either do not exist in the base record or the fields are read-only. Data type: Array

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/task/12629ec4b750230096c3e4f6ee11a9
d5?short_description=Retire both nodes" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type: application/json" \
--data "{\"state\": \"assess\", \"no_such_field\": \"this will
 be ignored\" }" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "12629ec4b750230096c3e4f6ee11a9d5",
        display_value: "12629ec4b750230096c3e4f6ee11a9d5"
      },
      parent: {
        value: "0f4ac6c4b750230096c3e4f6ee11a9fe",
        display_value: "CHG0033046 "
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Retire both nodes",
        display_value: "Retire both nodes"
      }
```

```

Change Management - PATCH /sn_chg_rest/change/emergency/{sys_id}

Updates the emergency change request identified by the specified sys_id with the key-value pairs in the request body or the URL.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/emergency/{sys_id}`

Default URL: `/api/sn_chg_rest/change/emergency/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request to modify. Located in the [change_request] table. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs representing the fields to update. Request body parameters override URL parameters. However, required parameters must be specified in the URL. Data type: String

Request body parameters (XML or JSON)

Name	Description
data	Name-value pairs representing the field(s) to update in the associated change request. For example, to update the short description file, enter a name-value pair similar to the following: `--data "{\"short_description\": \"my short desc\" }" \`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Values for all fields in the associated change request. Data type: String
state	Current state of the change request. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>state: {
	  display_value: "String",
	  value: "String"
	}</pre>

state.display_value	State to display in a UI. Data type: String
state.value	Internal state value. Data type: String
sys_id	Sys_id of the change request. Data type: String

type	Type of change request.
	
	Data type: Object
	<pre>type: {
	  display_value: "String",
	  value: "String"
	}</pre>

type.display_value	Change type to display in a UI. Value is always "Emergency". Data type: String
type.value	Internal type value. Value is always "emergency". Data type: String
__meta.ignoredFields	Name-value pairs that were passed in the call, but were not applied to the change request as they either do not exist in the base record or the fields are read-only. Data type: Array

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/emer
gency/b0dbda5347c12200e0ef563dbb9a718f" \
--request PATCH \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--data "{\"no_such_field\": \"this will be ignored\", }" \
--user "username":"password"
```

```

sys_id	Sys_id of the change request to modify. Located in the [change_request] table. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs representing the fields to update. Request body parameters override URL parameters. However, required parameters must be specified in the URL. Data type: String

Request body parameters (XML or JSON)

Name	Description
data	Name-value pairs representing the field(s) to update in the associated change request. For example, to update the short description file, enter a name-value pair similar to the following: `--data "{\"short_description\": \"my short desc\" }" \`. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	All fields (key) with their associated values for the identified change request. Data type: Object

state	State of the change request.
	
	Data type: Object
	
	`state: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

state.display_value	State to display in a UI. Data type: String
state.value	Internal state value. Data type: String

sys_id	Sys_id information for the change request.
	
	Data type: Object
	
	`sys_id: {`
	`  display_value: "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> value: "String" }</pre>
sys_id.display_value	Sys_id of the change request to disply in a UI. Data type: String
sys_id.value	Sys_id of the change request. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/stan
dard/1c87925347c1220Oe0ef563dbb9a7177?description=Reboot my
 email server" \
--request PATCH \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"short_description\": \"my short desc\" }" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "1c87925347c1220Oe0ef563dbb9a7177",
        display_value: "1c87925347c1220Oe0ef563dbb9a7177"
      },
      state: {
        value: "-5",
        display_value: "New"
      },

      ..., // all valid fields in record, example below
      short_description: {
        value: "Reboot my email server",
        display_value: "Reboot my email server"
      },
    }
  ]
}
```

Change Management - PATCH /sn_chg_rest/change/standard/{sys_id}/risk

Calculates the risk and impact of the specified standard change based on an evaluation of the risk conditions.

If the Change Risk Assessment plugin is installed, it also calculates the cumulative highest risk once the risk assessment is complete.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/risk`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default URL: `/api/sn_chg_rest/change/{sys_id}/risk`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the standard change to evaluate. Located in the Change Request [change_request] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Risk assessment completed successfully.
400	Risk assessment failed. Details of the type of failure are included in the error data.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

impact	Impact associated with the specified standard change.
	
	Data type: Object
	
	`impact: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

impact.display_value	Impact information to display in a UI. Data type: String
impact.value	Internal impact value. Data type: String
name-value pairs	All valid fields within the standard change record. Data type: Object

risk	Risk calculated for the specified standard change.
	
	Data type: Object
	
	`risk: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

risk.display_value	Risk information to display in a UI. Data type: String
risk.value	Internal risk value. Data type: String
sys_id	Sys_id information for the standard change request.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `sys_id: { display_value: "String", value: "String" }`
sys_id.display_value	Sys_id of the change request to display in a UI. Data type: String
sys_id.value	Sys_id of the change request. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/1c87
925347c12200e0ef563dbb9a7177/risk" \
--request PATCH \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  sys_id: {
    value: "1c87925347c12200e0ef563dbb9a7177",
    display_value: "1c87925347c12200e0ef563dbb9a7177"
  },
  risk: {
    value: "4",
    display_value: "Low"
  },
  impact: {
    value: "3",
    display_value: "3 - Low"
  }
  ..., // all valid fields in record
}
```

Change Management - POST /sn_chg_rest/change

Creates a change request record based on the change request. Creating multiple change requests within a single call isn't supported.

You can obtain the list of available change models using the Change Management - GET /sn_chg_rest/change/model or Change Management - GET /sn_chg_rest/change/model/{sys_id} endpoints.

When creating a change request, set the change model (*chg_model*) or *type*. If both *chg_model*and *type* are set, the type is simply a categorization of the change. Not providing at least one of these values results in a default setting that is subject to change by release. It is strongly advised to set at least one of these values.

Values can be set either as a query parameter or request body parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change`

Default URL: `/api/sn_chg_rest/change`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
name-value pairs	Name-value pairs representing the fields to update. Request body parameters override URL parameters. However, required parameters must be specified in the URL. The same values can be set as request body parameters instead. **Note:** When creating a change request, set the change model (*`chg_model`*) or *`type`*. If both *`chg_model`*and *`type`* are set, the type is simply a categorization of the change. Not providing at least one of these values results in a default setting that is subject to change by release. It is strongly advised to set at least one of these values. Data type: String
chg_model	Name of a change model listed in the Change Model [chg_model] table. Provided in the following format: `chg_model=Normal`. For more information, see Change models. **Note:** Not providing either the change model (*`chg_model`*) or *`type`* value results in a default setting that is subject to change by release. It is strongly advised to set at least one of these values. Data type: String
encrypted_fields	List of comma-separated fields to encrypt. These fields are encrypted before they are stored in the associated record. When specified, the endpoint calls the GlideRecord *`setDisplayValue()`* method, instead of calling the *`setValue()`* method. Because of this, you can also use this parameter to pass display values for non-encrypted fields, such as reference or choice fields, instead of passing sys_ids or values. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
type	Name of the change request type listed in the Choices [sys_choice] table. If the *chg_model* is also populated, this field is only used as a change categorization. Provided in the following format: `type=Normal`. For more information, see Add a new change request type. **Note:** Not providing either the change model (*chg_model*) or *type* value results in a default setting that is subject to change by release. It is strongly advised to set at least one of these values. Data type: String

Request body parameters (JSON)

Name	Description
Object	Name-value pairs representing the field(s) to update in the associated change request. For example, to update the short description file, enter a name-value pair similar to the following: `--data "{\"short_description\": \"my short desc \" }" \`. The same properties can be set as query parameters instead. Data type: String
Object.chg_model	Name of a change model listed in the Change Model [chg_model] table. Provided as a name-value pair in the following format: `{"chg_model" : "Cloud Infrastructure"}` For more information, see Change models. **Note:** Not providing either the change model (*chg_model*) or *type* value results in a default setting that is subject to change by release. It is strongly advised to set at least one of these values. Data type: String
Object.encrypted_fields	List of comma-separated fields to encrypt. These fields are encrypted before they are stored in the associated record. When specified, the endpoint calls the GlideRecord *setDisplayValue()* method, instead of calling the *setValue()* method. Because of this, you can also use this parameter to pass display values for non-encrypted fields, such as reference or choice fields, instead of passing sys_ids or values. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (JSON) (continued)

Name	Description
Object.type	Name of the change request type listed in the Choices [sys_choice] table. If the *chg_model* is also populated, this field is only used as a change categorization. Provided as a name-value pair in the following format: `{"type" : "emergency"}` For more information, see Add a new change request type. **Note:** Not providing either the change model (*chg_model*) or *type* value results in a default setting that is subject to change by release. It is strongly advised to set at least one of these values. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
result	New change request record. The elements of this object correspond to the record format in the Change Request [change_request] table. All values that are not specified in the request are set to their defaults or are empty/null. Data type: Object

Example: cURL request

The following example shows how to create a change request record based on the Standard change model and Standard type. In this example, the Change Request is driven by the model and the type field is only used as a categorization.

```
curl "https://instance.servicenow.com/api/sn_chg_rest/v1/change"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"chg_model\" : \"Standard\",
    \"description\" : \"Describes the change request.\",
    \"short_description\" : \"My change request\",
    \"type\" : \"Standard\"
}" \
--user "username":"password"
```

Results show that the record was successfully added to the Change Request [change_request] table with the value CHG0030022.

```
{
  "result":
    "upon_reject": {
      "display_value": "Cancel all future Tasks",
      "value": "cancel"
    },
    "sys_updated_on": {
      "display_value": "2022-12-08 17:18:57",
      "value": "2022-12-09 01:18:57",
      "display_value_internal": "2022-12-08 17:18:57"
    },
    "type": {
      "display_value": "Standard",

```

Example: cURL request

The following example shows how to pass encrypted fields in the request body.

```
curl "https://instance.servicenow.com/api/sn_chg_rest/v1/change"
 \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{
    \"encrypted_fields\":\"short_description,description\",
    \"short_description\":\"my short desc\",
    \"description\":\"my desc\"
}" \
--user "username":"password"
```

Example: cURL request

The following example shows how to pass encrypted fields as query parameters.

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change?encr
```

--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{}" \
--user "username":"password"
```

Change Management - POST /sn_chg_rest/change/{sys_id}/ci

Creates the association between a change request and Configuration Management Database (CMDB) configuration items (CI).

The creation of the association is done asynchronously, which means that a response is provided immediately and contains details for the worker. The worker does the actual work after the response.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/ci`

Default URL: `/api/sn_chg_rest/change/{sys_id}/ci`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request to associate with the CMDB CI. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
association_type	Required. Type of association between the CMDB CI and the change request. Valid values: • affected: CIs that are affected by the change request • impacted: Services impacted by the change request • offering: Impacted service offerings

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
cmdb_ci_sys_ids	Required. List of CMDB CI sys_ids to associate to the change request. Data type: Array or comma-separated string
refresh_impacted_services	Flag used when `association_type=affected` to populate impacted services based on the list of affected CIs. Valid values: • true: Populate impacted services based on the list of affected CIs • false: Do not automatically populate impacted services Data type: Boolean Default: false

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*
Content-Type	Data format of the request body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
202	Accepted. The request was accepted for processing.
400	Bad Request. A bad request type or malformed request was detected. The error response contains pertinent messages to help troubleshoot the problem.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
messages	Message information. Data type: Object `"messages": { "errorMessages": [Array], "infoMessages": [Array], "warningMessages": [Array] }`
messages.errorMessages	Error messages encountered while processing the request. For example: `Invalid CMDB_CI sys_id provided` Data type: Array
messages.infoMessages	Information messages encountered while processing the request. For example: `CMDB_CI sys_id already associated to provided.` Data type: Array
messages.warningMessages	Warning messages encountered while processing the request. For example: `Invalid CMDB_CI sys_id provided.` Data type: Array
request	Original endpoint request. Data type: String

Name	Description
state	Information on the current state of the worker. `state: { display_value: "String", value: "String" }`
state.display_value	Display value of the state of the worker. These values directly correlate to the *`state.value`* element. Possible values: • Complete • Error • In-Progress • Waiting Data type: String
state.value	Numeric value of the state of the worker. Possible values: • 1 • 2 • 3 • 4 Data type: Number
type	Type of association between the CMDB CI and the change request. Data type: String
worker	Information about the associated worker. Data type: Object `"worker": { "link": "String", "sysId": "String" }`
worker.link	URL to retrieve the status of the associated worker and other worker pertinent information. Data type: String
worker.sysId	Sys_id of the worker associated with the change request. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/c286
d61347c12200e0ef563dbb9a71df/ci" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{cmdb_ci_sys_ids:'caf043a3b7fb23000999e4f6ee11a9c0,06f043a3b7f
b23000999e4f6ee11a9c1', association_type:'affected'}" \
--user "username":"password"
```

```
{
  "result": {
    "worker": {
      "sysId": "f490f4c6dbac330084f07ffdbf961952",
      "link":
 "instance.service-now.com/api/sn_chg_rest/change/worker/f490f4c
6dbac330084f07ffdbf961952"
    },
    "request":
 "{\"cmdb_ci_sys_ids\":
[\"caf043a3b7fb23000999e4f6ee11a9c0\",\"06f043a3b7fb23000999e4f6
ee11a9c1\"],\"association_type\":\"affected\",\"task\":
\"c286d61347c12200e0ef563dbb9a71df\"}",
    "state": {
      "value": 1,
      "display_value": "Waiting"
    },
    "type": "affected",
    "messages": {
      "errorMessages": [],
      "warningMessages": [],
      "infoMessages": []
    }
  }
}
```

Change Management - POST /sn_chg_rest/change/{sys_id}/conflict

Starts a change request conflict checking process for the specified change request (sys_id).

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/conflict`

Default URL: `/api/sn_chg_rest/change/{sys_id}/conflict`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
sys_id	Sys_id of the change management request for which to start the conflict checking process. Located in the Change Request [change_request] table. For additional information on the conflict checking process, see Conflict detection. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. Request was unable to start due to unresolvable errors. The returned message may provide additional details.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Sys_id of the change request conflict checking process. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/0f4a
c6c4b750230096c3e4f6ee11a9fe/conflict" \
--request POST \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
    result: "c0b5afe4b710230096c3e4f6ee11a93f"
}
```

Change Management - POST /sn_chg_rest/change/emergency

Creates one emergency change request based on the default emergency change request record. Multiple emergency change request creations within a single call is not supported.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/emergency`

Default URL: `/api/sn_chg_rest/change/emergency`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
key-value pairs	Key-value pairs of fields to modify when creating the request. The key is the field name within the template and the value is the information to populate in the field. Fields that cannot be modified and are ignored if passed in: • Business rules • Read-only fields as defined in ACLs • Fields that do not exist Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Name-value pairs of the fields that were created in the emergency change request. Data type: Object
state	State of the change request prior to the delete. Data type: Object `state: { display_value: "String", value: "String" }`
state.display_value	State to display in a UI. Value is always "New". Data type: String
state.value	Internal state value. Value is always "-5". Data type: String
sys_id	Sys_id of the newly created emergency change request. Data type: String
type	Type of change request. Data type: Object `type: { display_value: "String", value: "String" }`
type.display_value	Change type to display in a UI. Value is always "Emergency".

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
type.value	Internal type value. Value is always "emergency". Data type: String
__meta.ignoredFields	Key-value pairs that were passed in the call, but were not applied to the change request as they either do not exist in the base record or the fields are read-only. Data type: Array

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/emer
gency?no_such_field=something&description=test&short_description
=Reboot server" \
--request POST \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: "b0dbda5347c12200e0ef563dbb9a718f",
      state: {
        value: "-5",
        display_value: "New"
      },
      type: {
        value: "emergency",
        display_value: "Emergency"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Reboot server",
        display_value: "Reboot server"
      }
      __meta: {
        ignoredFields: ["no_such_field"]
      }
    }
  ]
}
```

Change Management - POST /sn_chg_rest/change/normal

Creates one normal change request based on the default normal change request record. Multiple normal change request creations within a single call is not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/normal`

Default URL: `/api/sn_chg_rest/change/normal`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
key-value pairs	Fields to modify when creating the request. The key is the field name within the template and the value is the information to populate in the field. Fields that cannot be modified and are ignored if passed in: • Business rules • Read-only fields as defined in ACLs • Fields that do not exist Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Values for all fields in the associated change request. Data type: Object
state	State of the newly created change request. Data type: Object `state: { display_value: "String", value: "String" }`
state.display_value	State to display in a UI. Value is always "New". Data type: String
state.value	Internal state value. Value is always "-5". Data type: String
sys_id	Sys_id of the newly created normal change request. Data type: String
type	Type of change request. Data type: Object

Change Management - POST /sn_chg_rest/change/{sys_id}/refresh_impacted_services

Populates the impacted services/configuration items (CIs) related list based on the primary CI.

The primary CI appears on the change request form and affected CI related list.

Note: All work items for this endpoint are performed asynchronously.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{sys_id}/refresh_impacted_services`

Default URL: `/api/sn_chg_rest/change/{sys_id}/refresh_impacted_services`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the change request to use to refresh the impacted services. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers (continued)

Header	Description
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

messages	Message information.
	
	Data type: Object
	
	`"messages": {`
	`  "errorMessages": [Array],`
	`  "infoMessages": [Array],`
	`  "warningMessages": [Array]`
	`}`

messages.errorMessages	Error messages encountered while processing the request. For example: `Invalid CMDB_CI sys_id provided` Data type: Array
messages.infoMessages	Information messages encountered while processing the request. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	`CMDB_CI sys_id already associated to provided.` Data type: Array
messages.warningMessages	Warning messages encountered while processing the request. For example: `Invalid CMDB_CI sys_id provided.` Data type: Array
request	Original endpoint request. Data type: String

state	Information on the current state of the worker.
	
	Data type: Object
	`state: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

state.display_value	Display value of the state of the worker. These values directly correlate to the *`state.value`* element. Possible values: • Complete • Error • In-Progress • Waiting Data type: String
state.value	Numeric value of the state of the worker. Possible values: • 1 • 2 • 3 • 4 Data type: Number
type	Type of association between the CMDB CI and the change request. Data type: String

Name	Description
worker	Information about the associated worker. Data type: Object `"worker": { "link": "String", "sysId": "String" }`
worker.link	URL to retrieve the status of the associated worker and other worker pertinent information. Data type: String
worker.sysId	Sys_id of the worker associated with the change request. Data type: String

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/sn_chg_rest/v1/change/c286
d61347c12200e0ef563dbb9a71df/refresh_impacted_services" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--user "username":"password"
```

```
{
  result: {
    worker: {
      sysId: "aa31c308b75033000999e4f6ee11a9c2",
      link:
 "http://instance.service-now.com/api/sn_chg_rest/change/work
er/aa31c308b75033000999e4f6ee11a9c2"
    },
    request: "",
    state: {
      value: 1,
      display_value: "Waiting"
    },
    type: "impacted",
    messages: {
      errorMessages: [],
      warningMessages: [],
      infoMessages: []
    }
  }
}
```

Change Management - POST /sn_chg_rest/change/standard/{standard_change_template_id}

Creates one standard change request based on an existing standard change template as specified by the passed-in template sys_id. Multiple standard change request creations within a single call is not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/standard/{standard_change_template_id}`

Default URL: `/api/sn_chg_rest/change/standard/{standard_change_template_id}`

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
standard_change_template_id	Sys_id of the standard change template on which to base the new standard change request. Located in the Standard Change Template [std_change_record_producer] table. Data type: String

Query parameters

Parameter	Description
name-value pairs	Fields within the specified standard change template to modify when creating the request. The key is the field name within the template and the value is the information to populate in the field. Fields that cannot be modified and are ignored if passed in: • Description • Backout plan • Test plan • Implementation plan • Read-only fields as defined in ACLs • Fields that do not exist in the specified standard change template Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body

The API returns these JSON or XML elements in the response body.

Elements returned in the response body

Element	Description
name-value pairs	Name-value pairs of the fields that were created in the standard change request. Data type: Object
sys_id	Sys_id information of the newly created standard change request. Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements returned in the response body (continued)

Element	Description
	`sys_id: { display_value: "String", value: "String" }`
sys_id.display_value	Sys_id of the standard change request to display in a UI. Data type: String
sys_id.value	Sys_id of the standard change request. Data type: String
__meta.ignoredFields	Key-value pairs that were passed in the call, but were not applied to the change request as they either do not exist in the base record or the fields are read-only. Data type: Array

Example: Sample cURL request

```
curl "https://instance.servicenow.com" \
--request POST \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "1c87925347c12200e0ef563dbb9a7177",
        display_value: "1c87925347c12200e0ef563dbb9a7177"
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Add network switch to cabinet",
        display_value: "Add network switch to cabinet"
      }
      __meta: {
        ignoredFields: ["no_such_field"]
      }
    }
  ]
}
```

Change Management - POST /sn_chg_rest/change/{change_sys_id}/task

Creates one change request task based on the default change request task record and associates it with the specified change request. Multiple change request task creations within a single call is not supported.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

URL format

Versioned URL: `/api/sn_chg_rest/{api_version}/change/{change_sys_id}/task`

Default URL: `/api/sn_chg_rest/change/{change_sys_id}/task`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
change_sys_id	Sys_id of the change request to which to associate this task. Located in the Change Request [change_request] table. Data type: String

Query parameters

Name	Description
key-value pairs	Fields to modify when creating the request. The key is the field name within the template and the value is the information to populate in the field. Fields that cannot be modified and are ignored if passed in: • Business rules • Read-only fields as defined in ACLs • Fields that do not exist Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Request completed successfully.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not Found. The specified record could not be found.
500	Internal Server Error. A logic error on the server-side code occurred.

Response body parameters (JSON or XML)

Name	Description
name-value pairs	Name-value pairs of the fields that were created in the change request task. Data type: Object

parent	Information for the change request associated to the task.
	
	Data type: Object
	`parent: {`
	`  display_value: "String",`
	`  value: "String"`
	`}`

parent.display_value	Information to display in the UI for the change request associated to the task. Data type: String
parent.value	Sys_id of the change request associated to the task. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
sys_id	Sys_id information of the newly created change request task. Data type: Object `sys_id: { display_value: "String", value: "String" }`
sys_id.display_value	Sys_id of the change request task to display in a UI. Data type: String
sys_id.value	Sys_id of the change request task. Data type: String
__meta.ignoredFields	Key-value pairs that were passed in the call, but were not applied to the change request as they either do not exist in the base record or the fields are read-only. Data type: Array

Example: cURL request

```
curl
 "https://instance.servicenow.com/api/now/change/0f4ac6c4b750230
096c3e4f6ee11a9fe/task?short_description=Retire
 node&no_such_field=test" \
--request POST \
--header "Accept:application/json" \
--user "username":"password"
```

```
{
  result: [
    {
      sys_id: {
        value: "12629ec4b750230096c3e4f6ee11a9d5",
        display_value: "12629ec4b750230096c3e4f6ee11a9d5"
      },
      parent: {
        value: "0f4ac6c4b750230096c3e4f6ee11a9fe ",
        display_value: "CHG0033046 "
      },
      ..., // all valid fields in record, example below
      short_description: {
        value: "Retire node",
        display_value: "Retire node"
      }
      __meta.ignoredFields": ["no_such_field"]
    }
  ]
}
```

CI Lifecycle Management API

The `CI Lifecycle Management` API provides endpoints to manipulate configuration item (CI) operational states and apply CI actions.

The API interfaces adhere to restrictions and allowances specified by not allowed CI actions, compatible CI actions, and not allowed operational transitions. If an interface attempts a restricted operation, the operation is blocked, an error is logged, and a task is created if appropriate.

CI Lifecycle Management - DELETE /now/cilifecyclemgmt/actions

Removes a configuration item (CI) action for a list of CIs.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/actions`

Default URL: `/api/now/cilifecyclemgmt/actions`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
actionName	Required. Configuration item action name. Data type: String
requestorId	Required. Sys_id of a workflow context, or an operator user ID returned from the CI Lifecycle Management - POST /now/cilifecyclemgmt/operators endpoint. Operator user IDs are located in the CI State Registered Users [statemgmt_register_users] table. Data type: String
sysIds	Required. Comma-separated list of CI sys_ids. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint. Review the response body *result.result* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object encapsulating the result of the request.
	
	Data type: Object
	
	`"result": {`
	`  "errors": [Array],`
	`  "result": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.errors	List of objects in which each object represents an error encountered while processing the request. Data type: Array `"errors": [ { "error": "String", "message": "String" } ]`
result.errors.error	Identifier for a state management error encountered while processing the request. Possible values: • CI_ACTION_ALREADY_SET • CI_ACTION_NOT_SET • DUPLICATE_CI_ACTION_RECORD • DUPLICATE_OPS_STATE_RECORD • DUPLICATE_SYS_ID • INCOMPATIBLE_CI_ACTION • INVALID_CI_ACTION • INVALID_DELETE • INVALID_INPUT_PARAMETERS • INVALID_LEASETIME • INVALID_OPS_STATE • INVALID_OPS_STATE_TRANSITION • INVALID_REQUESTOR • INVALID_REQUESTOR_FOR_CI • INVALID_SYS_ID • MUTEX_UNAVAILABLE • NOT_ALLOWED_CI_ACTION • OPS_STATE_NOT_SET • UNPRIORITIZED_OPS_STATE • UNSUPPORTED_SYS_ID Data type: String
result.errors.message	Message providing details on the associated *`error`*. Data type: String
result.result	Flag indicating whether the CI action was successfully removed. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: CI action was removed. • false: CI action was not removed. Data type: String

Example: cURL request

Remove a CI action from two CIs.

```
curl --request DELETE \
'https://instance.service-now.com/api/now/cilifecyclemgmt/actio
ns?actionName=Patching&requestorId=621b5a09309e5010f877773aa7167
c0a&sysIds=00a9a80d3790200044e0bfc8bcbe5d1c,d0fdbc8437201000deea
bfc8bcbe5d33' \
--header 'Accept: application/json' \
--user "username":"password"
```

The response body confirms that the CI action was removed from the CIs.

```
{
  "result": {
    "result": true
  }
}
```

CI Lifecycle Management - DELETE /now/cilifecyclemgmt/operators/{req_id}

Unregisters an operator for non-workflow users.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/operators/{req_id}`

Default URL: `/api/now/cilifecyclemgmt/operators/{req_id}`

Supported request parameters

Path parameters

Parameter	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_id	Sys_id of a workflow context, or an operator user ID returned from the CI Lifecycle Management - POST /now/cilifecyclemgmt/operators endpoint. Operator user IDs are located in the CI State Registered Users [statemgmt_register_users] table. Data type: String

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• UNPRIORITIZED_OPS_STATE • UNSUPPORTED_SYS_ID Data type: String
result.errors.message	Message providing details on the associated *error*. Data type: String
result.result	Flag indicating whether the operator was successfully unregistered. Possible values: • true: Operator was successfully unregistered. • false: Operator was not successfully unregistered. Data type: String

Example: cURL request

Unregister an operator by user ID.

```
curl --request DELETE \
"https://instance.service-now.com/api/now/cilifecyclemgmt/operat
ors/3cf1b3cc30121010f877773aa7167c6e" \
--header "Accept: application/json" \
--user "username":"password"
```

The response body verifies that the operator was unregistered.

```
{
  "result": {
    "result": true
  }
}
```

CI Lifecycle Management - GET /now/cilifecyclemgmt/actions/{sys_id}

Returns a list of active configuration item (CI) actions for the specified CI.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/actions/{sys_id}`

Default URL: `/api/now/cilifecyclemgmt/actions/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.

Path parameters (continued)

Name	Description
	Data type: String
sys_id	Sys_id of the CI for which to return associated CI actions. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	Review the response body *result.ciActions* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Object encapsulating the result of the request. Data type: Object `"result": { "errors": [Array], "result": "String" }`
result.ciActions	Comma-separated list of active CI actions for the CI, or `no_active_action` if none were found. Data type: String
result.errors	List of objects in which each object represents an error encountered while processing the request. Data type: Array `"errors": [ { "error": "String", "message": "String" } ]`
result.errors.error	Identifier for a state management error encountered while processing the request. Possible values: • CI_ACTION_ALREADY_SET • CI_ACTION_NOT_SET • DUPLICATE_CI_ACTION_RECORD • DUPLICATE_OPS_STATE_RECORD • DUPLICATE_SYS_ID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• INCOMPATIBLE_CI_ACTION • INVALID_CI_ACTION • INVALID_DELETE • INVALID_INPUT_PARAMETERS • INVALID_LEASETIME • INVALID_OPS_STATE • INVALID_OPS_STATE_TRANSITION • INVALID_REQUESTOR • INVALID_REQUESTOR_FOR_CI • INVALID_SYS_ID • MUTEX_UNAVAILABLE • NOT_ALLOWED_CI_ACTION • OPS_STATE_NOT_SET • UNPRIORITIZED_OPS_STATE • UNSUPPORTED_SYS_ID Data type: String
result.errors.message	Message providing details on the associated *error*. Data type: String
result.result	Flag indicating whether the list of active CI actions was returned for all specified CIs. Possible values: • true: List of active CI actions was returned. • false: List of active CI actions was not returned. Data type: String

Example: cURL request

```
curl --request GET \
'https://instance.service-now.com/api/now/cilifecyclemgmt/actions/00a9a80d3790200044e0bfc8bcbe5d1c' \
--header 'Accept: application/json' \
--user "username":"password"
```

The response body shows that no CI actions are active for the specified CI.

```
{
  "result": {
    "ciActions": [
      "no_active_action"
    ],
    "result": true
```

```
    }
}
```

CI Lifecycle Management - GET /now/cilifecyclemgmt/compatActions

Determines whether two specified configuration item (CI) actions are compatible.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/compatActions`

Default URL: `/api/now/cilifecyclemgmt/compatActions`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
actionName	Required. Name of CI action to compare. Data type: String
otherActionName	Required. Name of CI action to compare. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*.

Request headers (continued)

Header	Description
	Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint. Review the response body *result.result* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Flag indicating whether the two specified CI actions are compatible. Possible values: • true: CI actions are compatible. • false: CI actions are not compatible. Data type: String

Example: cURL request

Check compatibility of Patching and Provisioning CI actions.

```
curl --request GET \
'https://instance.service-now.com/api/now/cilifecyclemgmt/compat
Actions?actionName=Patching&otherActionName=Provisioning' \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header 'Accept: application/json' \
--user "username":"password"
```

The response body confirms that the two CI actions are compatible.

```
{
  "result": true
}
```

CI Lifecycle Management - GET /now/cilifecyclemgmt/leases/{sys_id}/expired

Determines whether the lease has expired for the requestor of a configuration item (CI) action applied to the specified CI.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/leases/{sys_id}/expired`

Default URL: `/api/now/cilifecyclemgmt/leases/{sys_id}/expired`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the CI that is the target of the applied CI action. Data type: String

Query parameters

Name	Description
actionName	Required. Name of the CI action applied to the specified CI. Data type: String
requestorId	Required. Sys_id of a workflow context, or an operator user ID returned from the CI Lifecycle Management - POST /now/cilifecyclemgmt/operators endpoint. Operator user IDs are located in the CI State Registered Users [statemgmt_register_users] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint. Review the response body *result.result* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object encapsulating the result of the request.
	
	Data type: Object
	
	`"result": {`
	`  "errors": [Array],`
	`  "result": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.errors	List of objects in which each object represents an error encountered while processing the request. Data type: Array `"errors": [ { "error": "String", "message": "String" } ]`
result.errors.error	Identifier for a state management error encountered while processing the request. Possible values: • CI_ACTION_ALREADY_SET • CI_ACTION_NOT_SET • DUPLICATE_CI_ACTION_RECORD • DUPLICATE_OPS_STATE_RECORD • DUPLICATE_SYS_ID • INCOMPATIBLE_CI_ACTION • INVALID_CI_ACTION • INVALID_DELETE • INVALID_INPUT_PARAMETERS • INVALID_LEASETIME • INVALID_OPS_STATE • INVALID_OPS_STATE_TRANSITION • INVALID_REQUESTOR • INVALID_REQUESTOR_FOR_CI • INVALID_SYS_ID • MUTEX_UNAVAILABLE • NOT_ALLOWED_CI_ACTION • OPS_STATE_NOT_SET • UNPRIORITIZED_OPS_STATE • UNSUPPORTED_SYS_ID Data type: String
result.errors.message	Message providing details on the associated *`error`*. Data type: String
result.result	Flag indicating whether the lease for the requestor of the applied CI action has expired. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• true: Requestor's lease has expired. • false: Requestor's lease has not expired. Data type: String

Example: cURL request

```
curl --request GET \
'https://instance.service-now.com/api/now/cilifecyclemgmt/leases
/00a9a80d3790200044e0bfc8bcbe5d1c/expired?actionName=Patching&re
questorId=621b5a09309e5010f877773aa7167c0a' \
--header 'Accept: application/json' \
--user "username":"password"
```

The response body shows that the lease for the requestor of the applied CI action has not expired.

```
{
  "result": {
    "result": false
  }
}
```

CI Lifecycle Management - GET /now/cilifecyclemgmt/notAllowedAction

Determines whether a specified configuration item (CI) action is not allowed for a CI of a specified class when in a specified operational state.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/notAllowedAction`

Default URL: `/api/now/cilifecyclemgmt/notAllowedAction`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
actionName	Required. Name of the CI action to check. Data type: String
ciClass	Required. CI class.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
opsLabel	Required. Operational state to check. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint. Review the response body *result.result* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Flag indicating whether the CI action is restricted (not allowed) for CIs of the specified type when in the specified operational state. Possible values: • true: CI action is restricted (not allowed). • false: CI action is unrestricted (allowed). Data type: String

Example: cURL request

Check whether the Patching CI action is restricted (not allowed) for computers in the DR Standby operational state.

```
curl --request GET \
"https://instance.service-now.com/api/now/cilifecyclemgmt/notAll
owedAction?actionName=Patching&ciClass=cmdb_ci_computer&opsLabel
=DR+Standby" \
--header "Accept: application/json" \
--user "username":"password"
```

The response body confirms that this action is restricted (not allowed) for the specified CI class when in the specified operational state.

```
{
  "result": true
}
```

CI Lifecycle Management - GET /now/cilifecyclemgmt/notAllowedOpsTransition

Determines whether a configuration item (CI) from a specified class can transition from a specified operational state to a second specified operational state.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/notAllowedOpsTransition`

Default URL: `/api/now/cilifecyclemgmt/notAllowedOpsTransition`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
ciClass	Required. CI class to check transition restrictions for. Data type: String
opsLabel	Required. Label of current CI operational state. Data type: String
transitionOpsLabel	Required. Label of operational state that is the target of the transition. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint. Review the response body *result.result* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Flag indicating whether the specified operational state transition is restricted (not allowed) for the specified CI class. Possible values: • true: Operational state transition is restricted (not allowed). • false: Operational state transition is unrestricted (allowed). Data type: String

Example: cURL request

Check whether transition from Retired operational state to DR Standby operational state is restricted (not allowed) for Linux server CIs.

```
curl --request GET \
"https://instance.service-now.com/api/now/cilifecyclemgmt/notAll
owedOpsTransition?ciClass=cmdb_ci_computer&opsLabel=Retired&tran
sitionOpsLabel=DR+Standby" \
--header "Accept: application/json" \
--user "username":"password"
```

The response body shows that the specified operational state transition is unrestricted (allowed) for this CI class.

```
{
  "result": false
}
```

CI Lifecycle Management - GET /now/cilifecyclemgmt/requestors/{req_id}/valid

Determines whether the specified active workflow user or registered user is a valid requestor.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/requestors/{req_id}/valid`

Default URL: `/api/now/cilifecyclemgmt/requestors/{req_id}/valid`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
req_id	Sys_id of a workflow context, or an operator user ID returned from the CI Lifecycle Management - POST /now/cilifecyclemgmt/operators endpoint. Operator user IDs are located in the CI State Registered Users [statemgmt_register_users] table. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

```
{
  "result": {
    "result": true
  }
}
```

CI Lifecycle Management - GET /now/cilifecyclemgmt/statuses/{sys_id}

Returns the current operational state for the specified configuration item (CI).

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/statuses/{sys_id}`

Default URL: `/api/now/cilifecyclemgmt/statuses/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the CI. Data type: String

Query parameters

```
{
  "result": {
    "operationalState": "Repair in Progress",
    "result": true
  }
}
```

CI Lifecycle Management - PATCH /now/cilifecyclemgmt/leases/{sys_id}

Extends the specified configuration item (CI) action's lease expiration time for the specified user.

If the previous lease has expired, the new lease time starts immediately.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/leases/{sys_id}`

Default URL: `/api/now/cilifecyclemgmt/leases/{sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
sys_id	Sys_id of the CI for which to extend the lease. Data type: String

Query parameters

Name	Description
actionName	Required. Name of the associated CI action. Data type: String
leaseTime	Required. Time duration for which the lease is valid for the CI action specified in *`actionName`*. Data type: String Format: HH:MM:SS
requestorId	Required. Sys_id of a workflow context, or an operator user ID returned from the CI Lifecycle Management - POST /now/cilifecyclemgmt/operators endpoint. Operator user IDs are located in the CI State Registered Users [statemgmt_register_users] table. Data type: String

Name	Description
	• UNPRIORITIZED_OPS_STATE • UNSUPPORTED_SYS_ID Data type: String
result.errors.message	Message providing details on the associated *error*. Data type: String
result.result	Flag indicating whether the lease time was extended. Possible values: • true: Lease time was extended. • false: Lease time was not extended. Data type: String

Example: cURL request

Extend the duration of a Patching CI action requestor lease by 24 hours.

```
curl --request PATCH
 'https://instance.service-now.com/api/now/cilifecyclemgmt/leas
es/affd3c8437201000deeabfc8bcbe5dc3?actionName=Patching&leaseTim
e=24:00:00&requestorId=e7c3402d305a9010f877773aa7167c2a' \
--header 'Accept: application/json' \
--header 'Content-Type: application/json' \
--user "username":"password"
```

```
{
  "result": {
    "result": true
  }
}
```

CI Lifecycle Management - POST /now/cilifecyclemgmt/actions

Adds a specified configuration item (CI) action to a specified list of CIs.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/actions`

Default URL: `/api/now/cilifecyclemgmt/actions`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String

Query parameters

Name	Description
actionName	Required. Name of the CI action to add to the list. Data type: String
leaseTime	Time duration for which the lease is valid for specified CI action. Data type: String Format: HH:MM:SS
oldActionNames	Comma-separated list of old CI actions that all CIs should be in. Data type: String
requestorId	Required. Sys_id of a workflow context, or an operator user ID returned from the CI Lifecycle Management - POST /now/cilifecyclemgmt/operators endpoint. Operator user IDs are located in the CI State Registered Users [statemgmt_register_users] table. Data type: String
sysIds	Required. Comma-separated list of CI sys_ids to which to add the CI action. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*.

	Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint. Review the response body *result.result* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description

result	Object encapsulating the result of the request.
	
	Data type: Object
	
	`"result": {`
	`  "errors": [Array],`
	`  "result": "String"`
	`}`

result.errors	List of objects in which each object represents an error encountered while processing the request. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"errors": [
	  {
	  "error": "String",
	  "message": "String"
	  }
	]</pre>

result.errors.error	Identifier for a state management error encountered while processing the request. Possible values: • CI_ACTION_ALREADY_SET • CI_ACTION_NOT_SET • DUPLICATE_CI_ACTION_RECORD • DUPLICATE_OPS_STATE_RECORD • DUPLICATE_SYS_ID • INCOMPATIBLE_CI_ACTION • INVALID_CI_ACTION • INVALID_DELETE • INVALID_INPUT_PARAMETERS • INVALID_LEASETIME • INVALID_OPS_STATE • INVALID_OPS_STATE_TRANSITION • INVALID_REQUESTOR • INVALID_REQUESTOR_FOR_CI • INVALID_SYS_ID • MUTEX_UNAVAILABLE • NOT_ALLOWED_CI_ACTION • OPS_STATE_NOT_SET • UNPRIORITIZED_OPS_STATE • UNSUPPORTED_SYS_ID Data type: String
result.errors.message	Message providing details on the associated *`error`*. Data type: String
result.result	Flag indicating whether the CI action was set for all CIs in the list. Possible values: • true: CI actions were set. • false: CI actions were not set. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: cURL request

Add a Patching CI action to two CIs.

```
curl --request POST \
"https://instance.service-now.com/api/now/cilifecyclemgmt/actio
ns?actionName=Patching&requestorId=621b5a09309e5010f877773aa7167
c0a&sysIds=00a9a80d3790200044e0bfc8bcbe5d1c,d0fdbc8437201000deea
bfc8bcbe5d33" \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password"
```

```
{
  "result": {
    "result": true
  }
}
```

CI Lifecycle Management - POST /now/cilifecyclemgmt/operators

Registers an operator for a non-workflow user.

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/operators`

Default URL: `/api/now/cilifecyclemgmt/operators`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
None

Name	Description
	Data type: String
result.result	Flag indicating whether the operator was successfully registered. Possible values: • true: Operator was successfully registered. • false: Operator was not successfully registered. Data type: String

Example: cURL request

```
curl --request POST \
"https://instance.service-now.com/api/now/cilifecyclemgmt/operat
ors" \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password"
```

```
{
  "result": {
    "result": true,
    "requestorId": "6f992b8430121010f877773aa7167c42"
  }
}
```

CI Lifecycle Management - POST /now/cilifecyclemgmt/statuses

Sets the operational state for a specified list of configuration items (CIs).

URL format

Versioned URL: `/api/now/{api_version}/cilifecyclemgmt/statuses`

Default URL: `/api/now/cilifecyclemgmt/statuses`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String

Query parameters

Name	Description
oldOpsLabels	Comma-separated list of old CI operational states in which all CIs should be included.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: String
opsLabel	Required. Label of the operational state to set for the specified CIs. Data type: String
requestorId	Required. Sys_id of a workflow context, or an operator user ID returned from the CI Lifecycle Management - POST /now/cilifecyclemgmt/operators endpoint. Operator user IDs are located in the CI State Registered Users [statemgmt_register_users] table. Data type: String
sysIds	Required. Comma-separated list of sys_ids of CIs for which the operational state is to be set. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed by the endpoint. Review the response body *result.result* parameter to verify the outcome of the operation. If the endpoint encounters errors while processing the request, error codes and messages appear in the response body *result.errors* parameter.
401	Unauthorized. The user credentials are incorrect or have not been passed.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
result	Object encapsulating the result of the request. Data type: Object `"result": { "errors": [Array], "result": "String" }`
result.errors	List of objects in which each object represents an error encountered while processing the request. Data type: Array `"errors": [ { "error": "String", "message": "String" } ]`
result.errors.error	Identifier for a state management error encountered while processing the request. Possible values: • CI_ACTION_ALREADY_SET • CI_ACTION_NOT_SET • DUPLICATE_CI_ACTION_RECORD • DUPLICATE_OPS_STATE_RECORD

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• DUPLICATE_SYS_ID • INCOMPATIBLE_CI_ACTION • INVALID_CI_ACTION • INVALID_DELETE • INVALID_INPUT_PARAMETERS • INVALID_LEASETIME • INVALID_OPS_STATE • INVALID_OPS_STATE_TRANSITION • INVALID_REQUESTOR • INVALID_REQUESTOR_FOR_CI • INVALID_SYS_ID • MUTEX_UNAVAILABLE • NOT_ALLOWED_CI_ACTION • OPS_STATE_NOT_SET • UNPRIORITIZED_OPS_STATE • UNSUPPORTED_SYS_ID Data type: String
result.errors.message	Message providing details on the associated *error*. Data type: String
result.result	Flag indicating whether the desired state was set for all CIs included in the request. Possible values: • true: Operational state set. • false: Operational state not set. Data type: String

Example: cURL request

Set the `Repair in Progress` operational state for two CIs.

```
curl --request POST \
"https://instance.service-now.com/api/now/cilifecyclemgmt/statuses?opsLabel=Repair%20in%20Progress&requestorId=23d58bc030121010f877773aa7167c83&sysIds=affd3c8437201000deeabfc8bcbe5dc3,aac0b1213784200044e0bfc8bcbe5de3" \
--header "Accept: application/json" \
--header "Content-Type: application/json" \
--user "username":"password"
```

The response body shows that the desired operational state was set for both CIs specified in the request.

```
{
  "result": {
    "result": true
  }
}
```

Cloud Services Catalog API

The *Cloud Services Catalog* API provides methods related to Day-1 (provisioning) and Day-2 (modification) operations available in the Cloud Services Catalog, such as creating cloud service stacks and calling resource operation requests. You can also retrieve information about catalog requests, stacks getting status, and other information.

This API is included in the now namespace and requires the sn_cmp.cloud_service_user role. The Cloud Services Catalog (CSC) application is available as a separate subscription and requires either the ITOM Enterprise bundle or ITOM Cloud Accelerate product Entitlement.

The *Cloud Services Catalog* API features actions you perform during Day 2 operations. In the context of this API, resource catalog items refer to catalog items related to Day 2 operations.

To use this API, ensure that you have completed the Cloud Services Catalog guided setup process or have a working configuration where provisioning and catalog operations are working in the UI. For more information about these steps, see Cloud Services Catalog.

Cloud Services Catalog - GET /now/cmp_catalog_api/itemsbyciclass

Returns a list of resource catalog items based on a given configuration item (CI) class.

URL format

Default URL: `/api/now/cmp_catalog_api/itemsbyciclass`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
ci_class	Required. Name of the CI class to get the resource catalog items from (for example, "cmdb_ci_vm_instance"). Located in the Reference CI Type field in the Configuration Item [cmdb_ci] table. Data type: String
display_variables	Flag that indicates whether to list catalog item variables associated with each catalog item. Valid values: • true: Displays list catalog item variables. • false: Doesn't display list catalog item variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	Data type: Boolean Default: False
operation_name	Optional. Name of the operation. Located in the Name column of the resource interface in the OperationSignature [sn_cmp_rb_op_signature] table. **Note:** This parameter can query part or whole of the operation. For example, if you want to list all interfaces starting with "Servicenow", you can set the variable as `operation_name = Servicenow`. Default: All catalog items of all operation types are returned. Data type: String
resource_interface	Optional. Resource interface that the resource catalog item is hosted on. Located in the Name column of the ResourceInterfaces [sn_cmp_rb_resourceinterface] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
active	The active state of the resource operation catalog item. Possible values: • true: The resource operation catalog item is active. • false: The resource operation catalog item is inactive. Data type: String
created_on	Time stamp from when the resource operation catalog item was created. Format: yyyy-MM-dd HH:mm:ss. Data type: String
display_name	Name of the resource interface. Located in the ResourceInterfaces [sn_cmp_rb_resourceinterface] table. Data type: String
id	Sys_id of the resource operation catalog item. Located in the Resource Operation Catalog Item [sn_cmp_rsrc_opr_cat_item] table. Data type: String
name	Name of the resource operation catalog item. Located in the Resource Operation Catalog Item [sn_cmp_rsrc_opr_cat_item] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
short_description	Brief description of the resource operation catalog item. Located in the Resource Operation Catalog Item [sn_cmp_rsrc_opr_cat_item] table. Data type: String
updated_on	Time stamp from when the resource operation catalog item was last updated. Required format: yyyy-MM-dd HH:mm:ss. Data type: String

Example: cURL request

The following example requests and returns the status of the request item.

```
curl
 "https://instance.servicenow.com/api/now/cmp_catalog_api/itemsb
yciclass?ci_class=cmdb_ci_vm_instance&resource_interface=Virt
ual%20Machine%20Store%20Extension%20Interface&operation_name=Exe
cute%20Job%20Template" \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

Response:

```
[
  {
    "display_name": "Virtual Server-Virtual Machine Store
 Extension Interface-Execute Job Template",
    "id": "01b2341a56789012345d6ddeeff7b89fc",
    "created_on": "2019-04-28 12:58:26",
    "updated_on": "2019-04-28 12:58:26",
    "name": "Virtual Server-Virtual Machine Store Extension
 Interface-Execute Job Template",
    "short_description": "Catalog item to invoke operation",
    "active": true
  }
]
```

Cloud Services Catalog - GET /now/cmp_catalog_api/itemsbyrb

Returns a list of resource catalog items based on a given resource block.

URL format

Default URL: `/api/now/cmp_catalog_api/itemsbyrb`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Query parameters

Name	Description
display_variables	Flag that indicates whether to list catalog item variables associated with each catalog item. Valid values: • true: Displays list catalog item variables. • false: Doesn't display list catalog item variables. Data type: Boolean Default: False
operation_name	Optional. Name of the operation. Located in the Name column of the resource interface in the OperationSignature [sn_cmp_rb_op_signature] table. **Note:** This parameter can query part or whole of the operation. For example, if you want to list all interfaces starting with "Servicenow", you can set the variable as `operation_name = Servicenow`. Default: All catalog items of all operation types are returned. Data type: String
resource_block	Required. The name of the resource block to get its related resource operation catalog items from (for example, Virtual Server). Available in the Resource Block [sn_cmp_rb_resourceblock] table. Default: All catalog items of all operation types are returned. Data type: String
resource_interface	Optional. Resource interface that the resource catalog item is hosted on. Located in the Name column of the ResourceInterfaces [sn_cmp_rb_resourceinterface] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
active	The active state of the resource operation catalog item. Possible values: • true: The resource operation catalog item is active. • false: The resource operation catalog item is inactive. Data type: String
display_name	Name of the resource interface. Located in the ResourceInterfaces [sn_cmp_rb_resourceinterface] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
id	Sys_id of the resource operation catalog item. Located in the Resource Operation Catalog Item [sn_cmp_rsrc_opr_cat_item] table. Data type: String
name	Name of the resource operation catalog item. Located in the Resource Operation Catalog Item [sn_cmp_rsrc_opr_cat_item] table. Data type: String
short_description	Brief description of the resource operation catalog item. Located in the Resource Operation Catalog Item [sn_cmp_rsrc_opr_cat_item] table. Data type: String
variables	List of extra details about the resource catalog item. The variables returned in this API vary based on the query parameters that were passed. Data type: Array of objects `"variables": [ { "parameter1": "String", "parameter2": "String" } ]`

This example list of resource catalog items based on a Virtual Server resource block:

```
curl
 "https://instance.servicenow.com/api/now/cmp_catalog_api/itemsb
yrb?resource_interface=Virtual%20Machine%20Store%20Extension%20I
nterface&operation_name=Execute%20Job%20Template&resource_block=
Virtual%20Server" \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

Response:

```
[
  {
    "display_name": "Virtual Server-Virtual Machine Store
 Extension Interface-Execute Job Template",
    "id": "01b2341a56789012345d6ddeeff7b89fc",
    "created_on": "2019-04-28 12:58:26",
    "updated_on": "2019-04-28 12:58:26",
    "name": "Virtual Server-Virtual Machine Store Extension
 Interface-Execute Job Template",
    "short_description": "Catalog item to invoke operation",
    "active": true
  }
]
```

Cloud Services Catalog - GET /now/cmp_catalog_api/services

Returns a list of catalog items based on the given blueprint of a Provision or Lifecycle catalog type.

URL format

Default URL: `/api/now/cmp_catalog_api/services`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
catalog_type	Optional. Type of catalog item. Accepted values (case-sensitive): • `Provision` - Returns all Blueprint type catalog items. • `LifeCycle` - Returns all Day 2 Operation type catalog items. If the input is empty (default), all services of both catalog types are returned. Data type: String
display_variables	Flag that indicates whether to list catalog item variables associated with each catalog item. Valid values: • true: Displays list catalog item variables. • false: Doesn't display list catalog item variables. Data type: Boolean Default: False
blueprint_name	Optional. Name of the blueprint in which to fetch the related catalog items. Located in the Category Item [sn_cmp_bp_cat_item] table. **Note:** This parameter can query part or whole of the blueprint name. For example, if you want to list all blueprints starting with "Servicenow", you can set the variable as `blueprint_name = Servicenow`. Default: all services of all blueprints are returned. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
active	Flag that indicates whether the catalog is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Possible values: • true: Catalog is active. • false: Catalog isn't active. Data type: String
blueprint	sys_id of the blueprint. Located in the Blueprint [sn_cmp_bp_blueprint] table. Data type: String
blueprint_category	sys_id of the blueprint category. Located in the Cloud Service Category [sn_capi_service_category] table. Data type: String
blueprint_category_name	Name of the blueprint category. Located in the Cloud Service Category [sn_capi_service_category] table. Possible values: • Access • Analytics • Application Services • Blockchain • Business Productivity • Compute • Config Management • Containers • Database • Developer Tools • Event • Hybrid Cloud • IOT • IPAM • Loud Balancer • Machine Learning • Management Tools • Marketplace • Mobile • Network • Productivity • Security • Shell Access

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Storage • Tools • Unknown • Virtual Reality Data type: String
blueprint_name	Name of the blueprint. Located in the Blueprint [sn_cmp_bp_blueprint] table. Data type: String
blueprint_type	Type of blueprint. Possible value: `Custom Blueprint` Data type: String
catalog_name	Name of the catalog. Located in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
catalog_type	The type of catalog. Possible values: • `1`: Catalog is of type provision. • `2`: Catalog is of type lifecycle. Data type: String
catalog_type	The type of catalog. Possible values: • `1`: Catalog is of type provision. • `2`: Catalog is of type lifecycle. Data type: String
createdOn	Time stamp from when the catalog item was created. Data type: String
createdBy	User that created the catalog item. Data type: String
id	sys_id of the blueprint. Located in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
last_updated_on	Time stamp from when the catalog item was last updated. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
last_updated_by	User that last updated the catalog item, such as an admin or the system. Data type: String
operation	sys_id of the operation. Available in the OperationSignature [sn_cmp_rb_op_signature] table.
operation_name	Name of the operation. Possible values: • Start: Starts the resources that are in an off state. • Stop: Stops the resources that are in an on state. • ModifySchedule: Modifies the schedule for provisioned resources. • Deprovision: Deletes resources with a terminated state and updates resource CMDB tables accordingly. • ModifyLease: Modifies the lease operation scheduled on provisioned resources. Data type: String
variables	An object containing extra details about the list catalog item. The variables returned in this API vary based on the query parameters that are passed in the request. Data type: Object `"variables": [ { "parameter1": "String", "parameter2": "String" } ]`

This example returns all the catalog items of a Lifecycle type blueprint named "classiclb".

```
curl
 "https://instance.servicenow.comapi/now/cmp_catalog_api/servic
es?display_variables=true&catalog_type=LifeCycle&blueprint_name=
classiclb" \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

Response:

```

Cloud Services Catalog - GET /now/cmp_catalog_api/stacks

Returns a list of catalog items based on Provision-type blueprints (also known as stacks).

URL format

Default URL: `/api/now/cmp_catalog_api/stacks`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
blueprint_name	Optional. Name of the blueprint in which to fetch the related catalog items. Located in the Category Item [sn_cmp_bp_cat_item] table. **Note:** This parameter can query part or whole of the blueprint name. For example, if you want to list all blueprints starting with "Servicenow", you can set the variable as `blueprint_name = Servicenow`. Default: all services of all blueprints are returned. Data type: String
display_variables	Flag that indicates whether to list catalog item variables associated with each catalog item. Valid values: • true: Displays list catalog item variables. • false: Doesn't display list catalog item variables. Data type: Boolean Default: False

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
active	Flag that indicates whether the catalog is active.

Name	Description
	Possible values: • true: Catalog is active. • false: Catalog isn't active. Data type: String
blueprint	sys_id of the blueprint. Located in the Blueprint [sn_cmp_bp_blueprint] table. Data type: String
blueprint_category	sys_id of the blueprint category. Located in the Cloud Service Category [sn_capi_service_category] table. Data type: String
blueprint_category_name	Name of the blueprint category. Located in the Cloud Service Category [sn_capi_service_category] table. Possible values: • Access • Analytics • Application Services • Blockchain • Business Productivity • Compute • Config Management • Containers • Database • Developer Tools • Event • Hybrid Cloud • IOT • IPAM • Loud Balancer • Machine Learning • Management Tools • Marketplace • Mobile • Network • Productivity • Security • Shell Access

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Storage • Tools • Unknown • Virtual Reality Data type: String
blueprint_name	Name of the blueprint. Located in the Blueprint [sn_cmp_bp_blueprint] table. Data type: String
blueprint_type	Type of blueprint. Possible value: `Custom Blueprint` Data type: String
catalog_name	Name of the catalog. Located in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
catalog_type	The type of catalog. Possible values: • `1`: Catalog is of type provision. • `2`: Catalog is of type lifecycle. Data type: String
catalog_type_name	The name of the catalog type. Possible values: • Provision Operation (Day 1): Catalog type is named provision. • LifeCycle Operation (Day 2): Catalog type is named lifecycle. Data type: String
id	sys_id of the blueprint. Located in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
lifecycleOperations	Object containing the life cycle operation's name and sys_id. Date type: Array of objects `"lifecycleOperations": [ { "id": "String", "name": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
lifecycleOperations.id	sys_id of the life cycle operation. Available in the OperationSignature [sn_cmp_rb_op_signature] table.
lifeCycleOperations.name	Type of life cycle operations. Possible values: 1. Deprovision: Deletes resources in a terminated state and updates resource CMDB tables accordingly. 2. ModifySchedule: Performs business hours scheduling on stacks at the time of provisioning or on existing stacks. 3. Stop: Stops the resources that are in an on state. 4. Cleanup: Cleans up resources with a terminated state. 5. ModifyLease: Modifies the lease operation scheduled on provisioned resources. 6. Start: Starts the resources that are in an off state. Date type: Object
operation	sys_id of the operation. Available in the OperationSignature [sn_cmp_rb_op_signature] table.
operation_name	Name of the operation. Possible values: • Start: Starts the resources that are in an off state. • Stop: Stops the resources that are in an on state. • ModifySchedule: Modifies the schedule for provisioned resources. • Deprovision: Deletes resources with a terminated state and updates resource CMDB tables accordingly. • ModifyLease: Modifies the lease operation scheduled on provisioned resources. Data type: String
shortDescription	A brief description of the catalog. Data type: String
template_name	Name of the template. Available in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
template_type	sys_id of the template type. Available in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
template_cloud_product_name	Name of the product. Available in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String

Name	Description
variables	An object containing extra details about the list catalog item. The variables returned in this API vary based on the query parameters that are passed in the request. Data type: Object `"variables": [ { "parameter1": "String", "parameter2": "String" } ]`

The following example returns all catalog items in the instance with the provision catalog type.

```
curl
 "https://instance.servicenow.com/api/now/cmp_catalog_api/stac
ks" \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

Return:

```

Cloud Services Catalog - GET /now/cmp_catalog_api/status

Returns the status and details of a given catalog RITM (request item).

Use this method to identify and trace the request's origin and monitor its flow. The response includes the following:

1. RITM number for the submitted request
2. The stage the request is in
3. The users who opened and is assigned the request
4. The group assigned to the request
5. When the request was opened
6. The state the request is in
7. Submission data

URL format

Default URL: `/api/now/cmp_catalog_api/status`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
req_item	Unique request item number in the Requested Item [sc_req_item] table. For example, `RITM0000001`. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *`application/json`* or *`application/xml`*. Default: *`application/json`*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
assignmentGroup	The group assigned to the request. Data type: String
assignedTo	The user email assigned to the request. Data type: String
catItem	sys_id of the catalog item request. Located in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
error	A message with details about a returned error. Possible error messages: • Record Not Found: The request item doesn't exist. • User Not Authenticated: The user's credentials aren't authorized to make this request. Data type: String
number	The unique Request Item Number (RITM) given to the new request item. Located in the Request Item [sc_req_item] table. Data type: String
openedAt	Time stamp from when the request item was opened. Format: yyyy-MM-dd HH:mm:ss. Date type: String
openedBy	sys_id of the user who opened the request. Data type: String
stage	Current processing stage of the request item. Possible values: • Task Created for User • Deployment Successful • Waiting for Provision Approval • Resource Limit Exceeded

Name	Description
	• Deployment Failed • Deployment Cancelled • Retrying Stack Deployment • Deploying Stack Data type: String
state	The current completion state of the request item. Possible values: • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped • Pending Data type: String
submissionData	Information about the request submission, like cloud account, location, application, and cost center data. Submission data varies depending on the request item number passed in the request. Data type: Object `"submissionData": "{\"key1\":\"value\", \"key2\":\"value\"}" }`
sys_id	sys_id of the request item record. Located in the Request Item [sc_req_item] table. Data type: String

Example: cURL request

The following example returns status information for the request item number, RITM0010076.

```
curl
 "https://instance.servicenow.com/api/now/cmp_catalog_api/status
req_item=RITM0010076" \
--request GET \
--header 'Accept: application/json' \
--user 'username':'password'
```

Response:

```

Cloud Services Catalog - POST /now/cmp_catalog_api/submitoprequest

Submits a resource operation request to perform day 2 operations on provisioned resources.

URL format

Default URL: `/api/now/cmp_catalog_api/submitoprequest`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
cat_id	Required. sys_id of the cloud catalog item to invoke. Available in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
CloudAccount	Required. Name of the cloud account in which to submit the request. Account names are available in the Cloud Account [cmdb_ci_cmp_cloud_account] table. Data type: String
Location	Required. Datacenter location in which to provision the resource. For example, `us-west-1` or `asia-south-2`. This value should match the datacenter location of the cloud account's platform provider. Available in the Associated Datacenter [sn_cmp_ca_assc_datacenter] table. Data type: String
StackName	Required. Name of the stack. The stack name is dynamic and is reflected in resource management. Data type: String
resourceId	Required. The sys_id of the resource where Day 2 operations will be performed. Located in the Stack Items [sn_cmp_stack_item] table.
resource_block	Required. The name of the resource block to get its related resource operation catalog items from (for example, Virtual Server). Available in the Resource Block [sn_cmp_rb_resourceblock] table. Default: All catalog items of all operation types are returned. Data type: String
operation_name	Optional. Name of the operation. Located in the Name column of the resource interface in the OperationSignature [sn_cmp_rb_op_signature] table. The operation name you enter depends on the value passed in the *`resourceBlock`* parameter. **Note:** This parameter can query part or whole of the operation. For example, if you want to list all interfaces starting with "Servicenow", you can set the variable as `operation_name = Servicenow`. Default: All catalog items of all operation types are returned.Data type: String
resourceInterface	Required. The name of the resource block to get its related resource operation catalog items from (for example, Virtual Server). Available in the Resource Block [sn_cmp_rb_resourceblock] table. The resource interface you enter depends on the value passed in the *`resourceBlock`* and *`operation_name`* parameters. Default: All catalog items of all operation types are returned. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
assignmentGroup	The group assigned to the request. Data type: String
assignedTo	The user email assigned to the request. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
catItem	sys_id of the catalog item request. Located in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String
number	The unique Request Item Number (RITM) given to the new request item. Located in the Request Item [sc_req_item] table. Data type: String
openedAt	Time stamp from when the request item was opened. Format: yyyy-MM-dd HH:mm:ss. Date type: String
openedBy	sys_id of the user who opened the request. Data type: String
stage	Current processing stage of the request item. Possible values: • Task Created for User • Deployment Successful • Waiting for Provision Approval • Resource Limit Exceeded • Deployment Failed • Deployment Cancelled • Retrying Stack Deployment • Deploying Stack Data type: String
state	The current completion state of the request item. Possible values: • Open • Work in Progress • Closed Complete • Closed Incomplete • Closed Skipped • Pending Data type: String
submissionData	Information about the request submission, like cloud account, location, application, and cost center data. Submission data varies depending on the request item number passed in the request.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object `"submissionData": "{\"key1\":\"value\", \"key2\":\"value\"}" }`
sys_id	sys_id of the request item record. Located in the Request Item [sc_req_item] table. Data type: String

The following example creates a Day 2 operation request item.

```
curl
 "https://instance.servicenow.com/api/now/cmp_catalog_api/submit
oprequest?cat_id=e44dcd238731e5101126cbb4dabb3506" /
--request POST\
--header 'Accept: application/json' \
--user 'username':'password'

//Request body:
{"StackName":"sa02292143","CloudAccount":"AWS","Location":"AWS
 Datacenter -
 us-
east-1","resourceId":"df8c61e3eb2cc210d298fbbdbad0cd74","operati
onName":"Deprovision","resourceInterface":"S3
 Interface","resourceBlock":"S3"}
```

Response body:

```
{
  "number": "RITM0010078",
  "catItem": "e44dcd238731e5101126cbb4dabb3506",
  "stage": "request_approved",
  "sys_id": "9bf5cab3c3594610bc89b33605013190",
  "assignedTo": null,
  "assignmentGroup": null,
  "openedAt": "2024-04-08 09:08:47",
  "openedBy": "6816f79cc0a8016401c5a33be04be441",
  "state": "Open",
  "submissionData":
 "{\"StackName\":\"sa02292143\",\"CloudAccount\":\"AWS\",

```
onName":"Deprovision","resourceInterface":"S3
 Interface","resourceBlock":"S3"}
```

Cloud Services Catalog - POST /now/cmp_catalog_api/submitrequest

Submits a cloud services request. This method accepts provisioned requests for both day 2 operations and stacks or resource operation catalog items.

URL format

Default URL: `/api/now/cmp_catalog_api/submitrequest`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
cat_id	Required. sys_id of the cloud catalog item to invoke. Available in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
CloudAccount	Required. Name of the cloud account in which to submit the request. Account names are available in the Cloud Account [cmdb_ci_cmp_cloud_account] table. Data type: String
Location	Required. Datacenter location in which to provision the resource. For example, `us-west-1` or `asia-south-2`. This value should match the datacenter location of the cloud account's platform provider. Available in the Associated Datacenter [sn_cmp_ca_assc_datacenter] table. Data type: String
StackName	Required. Name of the stack. The stack name is dynamic and is reflected in resource management. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
403	Forbidden. The user doesn't have access rights to the specified record.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
assignmentGroup	The group assigned to the request. Data type: String
assignedTo	The user email assigned to the request. Data type: String
catItem	sys_id of the catalog item request. Located in the Cloud Catalog Item [sn_cmp_bp_cat_item] table. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Name	Description

	<pre>"submissionData": "{\"key1\":\"value\",
	\"key2\":\"value\"}"
	}</pre>

sys_id	sys_id of the request item record. Located in the Request Item [sc_req_item] table. Data type: String

The following example submits a cloud resource request in the instance's AWS Cloud Account.

```
curl
 "https://instance.servicenow.com/api/now/cmp_catalog_api/submit
request?cat_id=022e3deec3122910a769f44ed40131b9" /
--request POST \
--header 'Accept: application/json' \
--user 'username':'password'

//Request body:
{"CloudAccount":"AWS","Location":"us-east-1","StackName":"ss"}
```

Response:

```
{
  "number": "RITM0010001",
  "catItem": "022e3deec3122910a769f44ed40131b9",
  "stage": "check_permissions",
  "sys_id": "86d34233c3594610bc89b336050131dd",
  "assignedTo": null,
  "assignmentGroup": null,
  "openedAt": "2024-04-08 08:59:25",
  "openedBy": "6816f79cc0a8016401c5a33be04be441",
  "state": "Open",
  "submissionData":
 "{\"CloudAccount\":\"AWS\",\"Location\":
\"us-east-1\",\"StackName\":\"ss\"}"
}
```

Cloud Runner Test Generation REST API

Manages test job generation to be executed in a cloud runner for Automated Test Framework (ATF).

The *Cloud Runner Test Generation* API requires the ATF Test Generator and Cloud Runner (sn_atf_tg) plugin. The methods available with this API run in the **now** namespace and can be called using API Name, **One-click regression testing for ATF**, in the REST API Explorer. The admin role is required to access this API.

You can use this API for the following tasks:

- Start the test generation job.
- Check the progress of the test generation job.
- Cancel the test generation job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The *Cloud Runner Test Generation* API may be used in tandem with the Cloud Runner Test Runner REST API and Cloud Runner Test User REST API. For instance, you can call the Test Generation API to run a test and then get the progress of the test in the browser orchestration queue (Cloud Runner TEST Generation API) and then check the number of tests that passed or failed.

To view the Server API reference documentation of this API, see Cloud Runner TestGenerationApi – Scoped, Global.

Cloud Runner Test Generation - GET /now/sn_atf_tg/test_generation_progress

Provides the status of each generated test for a provided Browser Orchestration Queue (BOQ) record.

URL format

Default URL: GET `/api/now/sn_atf_tg/test_generation_progress`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
snboqId	Required. The BOQ record sys_id of the test generation job to get the progress of. Located in the BOQ [sn_atf_tg_sn_boq] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully retrieved the progress of the BOQ job.
400	Error getting BOQ record status. Returns one of the following messages: • No BOQ ID passed in – No BOQ ID was provided. Add the BOQ ID to the request body. • Unable to find BOQ record – Invalid Sys ID. Verify that the sys_id of the BOQ record is valid and the record exists.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the progress results of the generated test job or a message explaining why the request failed.
	
	Data type: Object
	
	`"result": { "testsSucceeded": Number, "testsFailed": Number, "testsPending": Number, "testsInProgress": Number, "testsSkipped": Number } }`
	
	Or:
	
	`{ "result": { "message": "String" } }`

result.message	Error message detailing why the test generation progress cannot be retrieved. The message parameter is not returned in a successful response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: String
result.testsSucceeded	Number of generated tests that passed. Data type: Number
result.testsFailed	Number of generated tests that failed. Data type: Number
result.testsPending	Number of use cases that are waiting for generated tests. Data type: Number
result.testsInProgress	Number of use cases that tests are created for. Data type: Number
result.testsSkipped	Number of tests skipped due to the job cancellation. Data type: Number

Example: cURL request

The following GET call returns progress information about generated tests associated with the snboqId 1234.

```
curl
 "https://instance.service-now.com/api/now/sn_atf_tg/test_genera
tion_progress?snboqId=1234" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Output:

```
{
  "result": {
    "testsSucceeded": 0,
    "testsFailed": 0,
    "testsPending": 0,
    "testsInProgress": 0,
    "testsSkipped": 161
  }
}
```

The following example returns a 400 error message when no BOQ ID is passed.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_generat
ion_progress" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Response:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "result": {
    "message": "No SNBOQ ID passed in, add snboqId to request
 body"
  }
}
```

The following example returns a 400 error message when an invalid BOQ ID is passed.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_generat
ion_progress?snboqId=invalid_sys_id" \
--request GET \
--header "Accept:application/json" \
--user "username":"password"
```

Response:

```
{
  "result": {
    "message": "Invalid SNBOQ sys_id passed in"
  }
}
```

Cloud Runner Test Generation - POST /now/sn_atf_tg/cancel_test_generation

Sets the test generation job and its associated update set record to complete status. Cancels the root trackers of any generated tests that are running. If any test jobs are in progress on cancellation, this method sets any of the in-progress test records generated to skipped.

Tests can fail or cancel automatically due to business rules or access control rule (ACL) issues. View the generated test table for more details about failed or canceled tests.

URL format

Default URL: POST `/api/now/sn_atf_tg/cancel_test_generation`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
snboqId	Required. sys_id of the Browser Orchestration Queue (BOQ) record to cancel. Located in the the BOQ [sn_atf_tg_sn_boq] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully canceled the BOQ job.
400	Error canceling job. Returns one of the following messages: • No BOQ ID passed in – No BOQ ID was provided. Add the BOQ ID to the request body. • Unable to find BOQ record – Invalid Sys ID. Verify that the sys_id of the BOQ record is valid and the record exists.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
result	Object containing the results of the cancellation request. Data type: Object `"result": { "message": String }`
result.message	Message detailing whether the test cancellation was successful. Data type: String

Example: cURL request

The following request cancels the test generation job of a specified BOQ record.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/cancel_test_
generation" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"snboqId\":\"<sys_id of BOQ record>\"}" \
--user "username":"password"
```

The response body returns a success message of the cancellation.

```
{
  "result": {
    "message": "success"
  }
}
```

The following example returns a 400 error message when no BOQ ID is passed.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/cancel_test_
generation" \
--request POST \
--header "Accept:application/json" \
--user "username":"password"
```

Response:

```
{
  "result": {
    "message": "No SNBOQ ID passed in, add snboqId to request
 body"
  }
}
```

The following example returns a 400 error message when an invalid BOQ ID is passed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/cancel_test_
generation" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"snboqId\":\"invalid_sys_id\"}" \
--user "username":"password"
```

Response:

```
{
  "result": {
    "message": "No SNBOQ ID passed in, add snboqId to request
 body"
  }
}
```

Cloud Runner Test Generation - POST /now/sn_atf_tg/test_generation

Inserts a record into the Browser Orchestration Queue (BOQ) [sn_atf_tg_sn_boq] table to start a test job.

URL format

Default URL: POST `/api/now/sn_atf_tg/test_generation`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
catalogEncodedQuery	Encoded query specifying which catalog items to generate tests on. An empty string defaults to all catalog items. For more information about forming encoded queries, see Encoded query strings. Data type: String
email	Email address to alert when test generation is complete. Data type: String
maxTestCount	Number of overall tests to generate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Accepted values: Any number between 1 and 9999. Data type: Number Default: 9999
maxTestCountPerItem	Number of tests to generate per catalog item. Accepted values: Any number between 1 and 10. Data type: Number Default: 10
maxTestCountPerTable	Number of tests to generate per table. Accepted values: Any number between 1 and 10. Data type: Number Default: 10
tableEncodedQuery	Encoded query specifying the tables on which to generate tests. An empty string defaults to all tables. For more information about forming encoded queries, see Encoded query strings. Data type: String
separateUpdateSetPerScope	Flag that indicates whether to separate generated tests into respective suites, update sets, and scopes, or to place tests into one suite, update set, and scope. Valid values: • true: Tests are placed into their respective suite and update set according to the scope of each table or catalog item. • false: All generated tests are placed in the same suite, update set, and scope. If false, *scopeForGeneratingTests* is required in the request. Data type: Boolean Default: true
scopeForGeneratingTests	Required when *separateUpdateSetPerScope* is set to false. Sys_id of the scope in which to place all generated tests. Data type: String
userEncodedQuery	Encoded query specifying which users to generate tests on. An empty string input defaults to all tables. For more information about forming encoded queries, see Encoded query strings. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully inserted a test generation BOQ job. Any errors are shown in the BOQ record logs during processing. All inputs default to generate the maximum number of tests for all tables and service catalog items.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the results of the request.
	
	`"result": {`
	`  "snboqId": String`
	`}`
	
	Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.snboqId	Sys_id of the record inserted in the sn_atf_tg_sn_boq table when the test generation starts. Data type: String

Example: cURL request

The following request example starts a new test job in the instance without any request parameters and inserts the job in the BOQ table.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_generat
ion" \
--request POST \
--header "Accept:application/json" \
--user "username":"password"
```

Response body:

```
{
  "result": {
    "snboqId": <sys_id of newly inserted BOQ record>
  }
}
```

The following request example starts a new test job with a maximum test count of 2 and filters the tests to the Incident table, and then inserts the job in the BOQ table.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_generat
ion" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data
 "{\"maxTestCount\":\"2\",\"tableEncodedQuery\":
\"name=incident\"}" \
--user "username":"password"
```

Response body:

```
{
  "result": {
    "snboqId": <sys_id of newly inserted BOQ record>
  }
}
```

Cloud Runner Test Runner REST API

Manages tests to be executed in a cloud runner for Automated Test Framework (ATF).

The *`Cloud Runner Test Runner`* API requires the ATF Test Generator and Cloud Runner (sn_atf_tg) plugin. The methods available with this API run in the **now** namespace and can be called using API Name, **One-click regression testing for ATF**, in the REST API Explorer. The admin role is required to access this API.

You can use this API for the following tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Start an ATF test or test suite in the Cloud Runner browser.
- Check the progress of the test job.
- Cancel the test job.

The `Cloud Runner Test Runner` API may be used in tandem with the Cloud Runner Test Generation REST API and Cloud Runner Test User REST API. For instance, you can generate a test (Cloud Runner Test Generation API) and then get the progress of the test in the browser orchestration queue (Cloud Runner TEST Generation API) and check the number of tests that passed or failed.

To view the Server API reference documentation of this API, see Cloud Runner TestRunnerApi – Scoped, Global.

Cloud Runner Test Runner - GET /now/sn_atf_tg/test_runner_progress

Provides the status of each test ran for a provided Browser Orchestration Queue (BOQ) record.

URL format

Default URL: GET `/api/now/sn_atf_tg/test_runner_progress`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
snboqId	Required. The BOQ record sys_id of the test runner job to get the progress of. Located in the BOQ [sn_atf_tg_sn_boq] table. Data type: String

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully retrieved the progress of the BOQ job.
400	Error getting BOQ record status. Returns one of the following messages: • No BOQ ID passed in – No BOQ ID was provided. Add the BOQ ID to the request body. • Unable to find BOQ record – Invalid Sys ID. Verify that the sys_id of the BOQ record is valid and the record exists.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the progress results of the test runner job or a message explaining why the request failed.
	
	Data type: Object
	
	`"result": { "progress": 100, "state": "completed" }`
	
	Or:
	
	`{ "result": { "message": "String"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	<pre> } }</pre>
result.message	Error message detailing why the test runner progress cannot be retrieved. The message parameter is not returned in a successful response. Data type: String
result.progress	A percentage indicating how close to completion a test is while in a running state. Data type: Number
result.state	The current status of the BOQ record. Possible values: • Pending – The requested test activity has been created and waiting to be executed. • Processing – The instance is scanning for records to ensure that the execution trackers are marked for cloud runner before the request is sent to the cloud infrastructure. • Browsers requested – A request has been sent to the cloud infrastructure to start browsers for test generation or test running. • Running – Cloud infrastructure browsers find and execute pending tests. • Completed – The test task is complete. • Failed state – The test task failed. Data type: String

Example: cURL request

The following request retrieves the test runner job progress of the BOQ record.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_runner_
progress?snboqId=<sys_id of SNBOQ record>" \
--request GET \
--header "Accept:application/json" \
--user "username:password"
```

The response indicates that the test is 100% complete.

```
{
  "result": {
    "progress": 100,
    "state": "completed"
  }
}
```

The following example returns a 400 error message when no BOQ ID is passed.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_runner_
progress" \
--request GET \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept:application/json" \
--user "username:password"
```

Response:

```
{
  "result": {
    "message": "No SNBOQ ID passed in, add snboqId to request
 body"
  }
}
```

The following example returns a 400 error message when an invalid BOQ ID is passed.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_runner_
progress?snboqId=invalid_sys_id" \
--request GET \
--header "Accept:application/json" \
--user "username:password"
```

Response:

```
{
  "result": {
    "message": "Invalid SNBOQ sys_id passed in"
  }
}
```

Cloud Runner Test Runner - POST /now/sn_atf_tg/cancel_test_runner

Sets the test runner job to complete status and cancels the root trackers of any generated tests that are running.

URL format

Default URL: GET `/now/sn_atf_tg/cancel_test_runner`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
snboqId	Sys_id of the Browser Orchestration Queue (BOQ) record (sn_atf_tg_sn_boq) associated with the test runner job to cancel. Located in the BOQ [sn_atf_tg_sn_boq] table.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Error canceling job. Returns one of the following messages: • No BOQ ID passed in – No BOQ ID was provided. Add the BOQ ID to the request body. • Unable to find BOQ record – Invalid Sys ID. Verify that the sys_id of the BOQ record is valid and the record exists.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description
result	Object containing the results of the request. `"result": { "message": String }` Data type: Object
result.message	Message detailing whether the test cancellation was successful. Data type: String

Example: cURL request

The following example shows how to form a cancel test runner request according to the sys_id of the BOQ record.

```
curl
 "https://instance.service-now.com/api/now/sn_atf_tg/cancel_test
_runner" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"snboqId\":\"<sys_id of BOQ record>\"}" \
--user "username:password"
```

The response message indicating that the test runner is successfully canceled.

```
{
  "result": {
    "message": "success"
  }
}
```

Cloud Runner Test Runner - POST /now/sn_atf_tg/test_runner

Inserts a test runner job into the BOQ [sn_atf_tg_sn_boq] table for given test or test suite, which is then run on the cloud runner.

URL format

Default URL: POST `api/now/sn_atf_tg/test_runner`

Supported request parameters

Path parameters

Name	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
testId	Sys_id of the test [sys_atf_test] or test suite [sys_atf_test_suite] to run on the cloud runner.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully inserted a test runner BOQ job.
400	Error starting the test runner job. Returns one of the following messages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
	• Unable to find test or test suite with Sys ID <testId> – Invalid test ID. Ensure that the sys_id of the test (sys_atf_test) or test suite (sys_atf_test_suite) record is valid and the record exists. • No Test ID passed in – No test ID was passed. Add the test ID to the request body.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the results of the request.
	`{ "result": { "snboqId": "String" } }`
	Or:
	`"result": { "message": "String" }`
	Data type: Object

result.snboqId	Sys_id of the BOQ record that is inserted when test runner starts. Located in the BOQ [sn_atf_tg_sn_boq] table.
result.message	Error message detailing why the test runner cannot be started.

Example: cURL request

The following request inserts a test runner job into the BOQ [sn_atf_tg_sn_boq] table.

```
curl
 "https://instance.service-now.com/api/now/sn_atf_tg/test_runn
er" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"testId\":\"<sys_id of ATF test or test suite>\"}" \
--user "username:password"
```

The response body returns the sys_id of the test runner job that was successfully inserted.

```
{
  "result": {
    "snboqId": "<sys_id of newly inserted SNBOQ record>"
```

© 2026 ServiceNow, Inc. All rights reserved.

```
    }
}
```

Cloud Runner Test User REST API

Manages test user jobs to be executed in a cloud runner for Automated Test Framework (ATF).

The *Cloud Runner Test User* API requires the ATF Test Generator and Cloud Runner (sn_atf_tg) plugin. The methods available with this API run in the **now** namespace and can be called using API Name, **One-click regression testing for ATF**, in the REST API Explorer. The admin role is required to access this API.

You can use this API for the following tasks:

- Start the user test job.
- Set the cloud user.
- Check if the user specified is valid.
- Check the progress of the user test job.
- Cancel the test job.

The *Cloud Runner Test Runner* API may be used in tandem with the Cloud Runner Test Generation REST API and Cloud Runner Test User REST API. For instance, you can generate a test (Cloud Runner Test Generation API) and then get the progress of the test in the browser orchestration queue (Cloud Runner TEST Generation API) and check the number of tests that passed or failed.

To view the Server API reference documentation of this API, see Cloud Runner TestUserApi – Scoped, Global.

Cloud Runner Test User - GET /now/sn_atf_tg/test_user_progress

Provides the status of the test user job for a provided Browser Orchestration Queue (BOQ) record.

URL format

Default URL: GET `/api/now/sn_atf_tg/test_user_progress`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
snboqId	Required. The BOQ record sys_id of the test user job to get the progress of. Located in the BOQ [sn_atf_tg_sn_boq] table. Data Type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully retrieved the progress of the test user job.
400	Error getting BOQ record status. Returns one of the following messages: • No BOQ ID passed in – No BOQ ID was provided. Add the BOQ ID to the request body. • Unable to find BOQ record – Invalid Sys ID. Verify that the sys_id of the BOQ record is valid and the record exists.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

Response body parameters (JSON or XML)

Name	Description
result	Object containing the progress results of the test runner job or a message explaining why the request failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description

	<pre>"result": {
	    "progress": 100,
	    "state": "completed"
	  }</pre>
	Or:
	<pre>"result": {
	    "message": "String"
	}</pre>
	Data type: Object

result.message	Error message detailing why the test runner progress cannot be retrieved. The message parameter is not returned in a successful response. Data type: String
result.progress	A percentage indicating how close to completion a test is while in a running state. Data type: Number
result.state	The current status of the BOQ record. Possible values: • Pending – The requested test activity has been created and waiting to be executed. • Processing – The instance is scanning for records to ensure that the execution trackers are marked for cloud runner before the request is sent to the cloud infrastructure. • Browsers requested – A request has been sent to the cloud infrastructure to start browsers for test generation or test running. • Running – Cloud infrastructure browsers find and execute pending tests. • Completed – The test task is complete. • Failed state – The test task failed. Data type: String

Example: cURL request

The following request example shows how to check the progress of a test user job.

```
curl
 "https://instance.service-now.com/api/now/sn_atf_tg/test_user_p
rogress?snboqId=<sys_id of SNBOQ record>" \
--request GET \
--header "Accept:application/json" \
--user "username:password"
```

Response body:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "result": {
    "progress": 100,
    "state": "completed"
  }
}
```

Cloud Runner Test User - GET /now/sn_atf_tg/is_valid_cloud_user

Checks whether a provided user is a valid cloud user.

This method checks if the user passes the following criteria:

- Exists,
- Is active,
- Is not locked out,
- Needs a password reset,
- Is an admin,
- Is read-only,
- Is web services-only

URL format

Default URL: GET `/api/now/sn_atf_tg/is_valid_cloud_user`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
username	Required. User name of the sys_user to check if the user passes the following baseline criteria. • Exists, • Is active, • Is not locked out, • Needs a password reset, • Is an admin, • Is read-only, • Is web services-only If any of these conditions fail, the API returns a false boolean with a message about which criteria failed. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Returns true or false if the user is valid and satisfies cloud user criteria.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

Response body parameters (JSON or XML)

Name	Description
result	Object containing the results of the request. `"result": { "validUser": Boolean }` Data type: Object

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
result.validUser	Flag that indicates whether the user satisfies cloud user criteria. When true, the user satisfies the criteria. Data type: Boolean

Example: cURL request

The following request checks if the provided sys_user meets the criteria to use cloud functionality.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/is_valid_clo
ud_user?username=<username of sys_user to check>" \
--request GET \
--header "Accept:application/json" \
--user "username:password"
```

Response body:

```
{
  "result": {
    "validUser": <Boolean value indicating whether user is valid
 cloud user>
  }
}
```

Cloud Runner Test User - POST /now/sn_atf_tg/test_user

Inserts a test user job into the BOQ [sn_atf_tg_sn_boq] table for a given user name, which is then run on cloud runner.

URL format

Default URL: POST `/api/now/sn_atf_tg/test_user`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
username	Required. Username of the sys_user to test the end-to-end infrastructure of the cloud runner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully inserted a test user BOQ job.
400	Error starting test user job. If an empty user name is provided or a user can't be found in sys_user table, the server throws an error.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the results of the request.
	`"result": { "snboqId": String }`
	Or:
	`"result": { "message": "String" }`
	Data type: Object

result.message	Error message detailing why the username cannot be assigned test capabilities. The message parameter is not returned in a successful response. Data type: String
result.snboqId	Sys_id of the BOQ record that is inserted when test user job starts successfully. Located in the BOQ [sn_atf_tg_sn_boq] table. Data type: String

Example: cURL request

The following request example shows how to insert a test user job into the BOQ [sn_atf_tg_sn_boq] table for a given username.

```
curl
 "http://instance.service-now.com/api/now/sn_atf_tg/test_user" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"username\":\"<username of sys_user to test cloud
 infrastructure>\"}" \
--user "username:password"
```

The response returns a sys_id of the BOQ record that is inserted when test user job starts.

```
{
  "result": {
    "snboqId": "<sys_id of newly inserted BOQ record>"
  }
}
```

The following example returns a 400 error message when no user name or an invalid user name is passed.

```
curl
 "https://instance.service-now.com/api/now/sn_atf_tg/test_user"
 \
--request POST \
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
--header "Accept:application/json" \
--user "username:password"
```

Response:

```
{
  "result": {
    "message": "Unable to set cloud user as cloud user not
 valid"
  }
}
```

Cloud Runner Test User - POST /now/sn_atf_tg/cancel_test_user

Sets the test user job status in the Browser Orchestration Queue (BOQ) [sn_atf_tg_sn_boq] table to complete.

URL format

Default URL: POST `/api/now/sn_atf_tg/cancel_test_user`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
snboqId	Required. Sys_id of the BOQ record to cancel associated with the test user job. Located in the SNBOQ [sn_atf_tg_sn_boq] table. Data Type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Example: cURL request

The following request demonstrates how to cancel a test user job in the Browser Orchestration Queue [sn_atf_tg_sn_boq] table.

```
curl
 "https://instance.service-now.com/api/now/sn_atf_tg/cancel_test
_user" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"snboqId\":\"<sys_id of BOQ record>\"}" \
--user "username:password"
```

Successful response body:

```
{
  "result": {
    "message": "success"
  }
}
```

Cloud Runner Test User - POST /now/sn_atf_tg/select_cloud_user

Starts an end-to-end test user job on cloud runner. If the user is able to log in with the admin role, the cloud user property defaults to this user for future test runs and test generations.

URL format

Default URL: POST `/api/now/sn_atf_tg/select_cloud_user`

Supported request parameters

Path parameters

Name	Description
None	

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
username	Required. User name of the sys_user to test and set the cloud user for future test runner and test generation jobs. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successfully tested the end to end cloud runner infrastructure and set the cloud user for future test run and test generation jobs.
400	Error testing the full end to end cloud runner infrastructure and setting the cloud user. Ensure that the user name isn't empty or that the user exists in the sys_user table for a given user name.
403	Error granting user access to the endpoint. Ensure that the user has the admin role.

Response body parameters (JSON or XML)

Name	Description

result	Object containing the results of the request.
	
	`"result": {`
	`  "message": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Data type: Object
result.message	Message detailing whether the user was successfully selected for future test runs and test generations on the cloud runner infrastructure. Data type: String

Example: cURL request

The following example shows how to request a specific user to be selected for future test runs and test generations on the cloud runner infrastructure.

```
curl
 "https://instance.service-now.com/api/now/sn_atf_tg/select_clou
d_user" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json" \
--data "{\"username\":\"<username of sys_user to set as cloud
 user>\"}" \
--user "username:password"
```

The response body returns a success message indicating that the cloud user is successfully selected for test runs and generations.

```
{
  "result": {
    "message": "success"
  }
}
```

CMDB Data Ingestion API

The *CMDB Data Ingestion* API provides endpoints that enable the batch ingestion of an array of objects into an Import Set table.

Warning: This API is no longer recommended. For the same functionality with improved scalability and stability, use the Import Set - POST /now/import/{stagingTableName}/insertMultiple endpoint. From the Quebec release onward, any usage of the *CMDB Data Ingestion API* should be migrated to use the *Import Set - insertMultiple* endpoint instead.

In addition, this API will not work by default for zbooted instances.

This API is activated through the Configuration Management Database (CMDB) (com.snc.cmdb) plugin and requires the cmdb_import_api_admin role.

CMDB Data Ingestion - POST /cmdb/ingest/{data_source_sys_id}

Inserts records into the Import Set table associated with the data source record identified by the passed-in sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

> **Warning:** This API is no longer recommended. For the same functionality with improved scalability and stability, use the Import Set - POST /now/import/{stagingTableName}/insertMultiple endpoint. From the Quebec release onward, any usage of the *CMDB Data Ingestion API* should be migrated to use the *Import Set - insertMultiple* endpoint instead.
>
> In addition, this API will not work by default for zbooted instances.

The request body must contain the JSON array of objects (payload) to insert in the Import Set table. Each object equates to a row in the table, each name-value pair equates to a column. The JSON payload must leverage the field names from the import set without the "u_" prefix. For example, the field name "u_matching_record" should be "matching_record" in the request body payload. If the Import Set table exists, the endpoint appends the rows (objects) to the existing Import Set table. No checking for duplicates or updating of existing records is performed.

If you are initially building an application, you must first create the associated data source record in your instance before calling this endpoint. If you are just using this endpoint to add records to an existing Import Set table, you do not need to create the data source record, but you must know its sys_id. The data source record describes the Import Set table in which to insert the specified payload. This table must extend the Import Set Rows [sys_import_set_row] table. Also, the data source must be set to `Attachment` and the format set to `JSON`. For more information on data sources, see Data sources.

If the Import Set table defined in the data source record does not exist, the endpoint attaches the passed-in payload to the data source record. To create the initial Import Set table, you must manually import the data into the Import Set table. To import the data, on the associated Data Source form, click the **Test Load 20 Records** or **Load All Records** link in the Related Links section. Once the Import Set table is created, you cannot add columns to the table using this endpoint. If name-value pairs are later passed in that do not exist in the Import Set table, they are ignored without warning. If you need to modify the columns within the Import Set table, you can manually add them to the table. You can also delete or rename the Import Set table, and call the endpoint again using the new payload.

You must have the cmdb_import_api_admin role to access this endpoint.

URL format

Versioned URL: `/api/now/{api_version}/cmdb/ingest/{data_source_sys_id}`

Default URL: `/api/now/cmdb/ingest/{data_source_sys_id}`

Supported request parameters

Path parameters

Name	Description
api_version	Optional. Version of the endpoint to access. For example, `v1` or `v2`. Only specify this value to use an endpoint version other than the latest. Data type: String
data_source_sys_id	Sys_id of the data source record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
Array	Free-form array of objects that describe the data to append to the associated Import Set table. Each object in the array defines a row in the Import Sets table; each name-value pair a column. **Note:** This array must be named, such as `"{\"records\": [{\"hostname\": \"Hostname1\", \"serialnumber\": \"2acd3873-7fc5-454c-8844-e7769e4d6cfc\", \"model\": \"Model Id\"},{\"vendor\": \"ABC Co\"}]}"`.

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
201	Created. An attachment was added to the data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
202	Accepted. Rows were added to the Import Set table.
400	Bad Request. A bad request type or malformed request was detected.
404	Not found. The requested item wasn't found.
409	Conflict. Attachment already exists on the data source.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.
501	Not Implemented. Request format is not supported.

Response body parameters (JSON or XML)

Name	Description
error	Describes an encountered error. Data type: Object `"error": { "details": "String", "message": "String" }`
error.details	Additional information about the error. Data type: String
error.message	Message describing the error. Data type: String
import_set	Name of the Import Set table to which the payload was appended. Data type: String
staged_row_count	Number of rows appended to the Import Set table. Data type: Number
staging_table	Name of the data source record used to stage the payload. Data type: String
status	Error status. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.

Example: Sample cURL request

```
curl
 "instance.service-now.com/api/now/cmdb/ingest/4dd9686d1b9800103
d374087bc4bcb3d" \
--request POST \
--header "Accept: application/json" \
--header "Content-Type:application/json" \
--data "{\"records\":[{\"hostname\": \"Hostname1\",
 \"serialnumber\": \"2acd3873-7fc5-454c-8844-e7769e4d6cfc\",
 \"model\": \"Model 5100"},{\"vendor\": \"ABC Co\"},
{\"hostname\": \"Hostname2\", \"serialnumber\":
 \"3adb3873-7fc5-564d-8844-e7769e4d6ded\", \"model\": \"Model
 5200"},{\"vendor\": \"ACME Co\"}]}"
--user "username":"password"
```

Successful response:

```
{
  "result": {
    "staged_row_count": 2,
    "import_set": "ISET0010010",
    "staging_table": "sn_my_demo_integra_demo_data_source_01"
  }
}
```

CMDB Instance API

The *CMDB Instance* API provides endpoints to create, read, update, and delete operations on existing Configuration Management Database (CMDB) tables. You can only insert, update, or delete one record at a time.

This API requires the user have the ITIL role.

CMDB Instance - DELETE /now/cmdb/instance/{classname}/{sys_id}/relation/{rel_sys_id}

Deletes the relation for the specified configuration item (CI).

URL format

Versioned URL: `/api/now/v1/cmdb/instance/{className}/{sys_id}/relation/{rel_sys_id}`

Default URL: `/api/now/cmdb/instance/{className}/{sys_id}/relation/{rel_sys_id}`

Supported request parameters

Path parameters

Name	Description
className	CMDB class name. This is the name of the table that contains the desired CI records, such as cmdb_ci_linux_server or cmdb_ci_apache_web_server. Data type: String
rel_sys_id	Sys_id of the relation to remove.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Path parameters (continued)

Name	Description
	Data type: String
sys_id	Sys_id of the CI. Data type: String

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
None	

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
None	

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Name	Description
None	

Example: Sample cURL request

```
curl
 "https://instance.servicenow.com/api/now/cmdb/instance/cmdb_ci_
linux_server/0f4ac6c4b750230096c3e4f6ee11a9fe/relation/b0dbda534
7c12200e0ef563dbb9a718f" \
--request DELETE \
--user 'username':'password'
```

CMDB Instance - GET /now/cmdb/instance/{classname}

Returns the available configuration items (CI) for a specified Configuration Management Database (CMDB) class (table).

URL format

Versioned URL: `/api/now/v1/cmdb/instance/{className}`

Default URL: `/api/now/cmdb/instance/{className}`

Supported request parameters

Path parameters

Name	Description
className	CMDB class name. This is the name of the table that contains the desired CI records, such as cmdb_ci_linux_server or cmdb_ci_apache_web_server. Data type: String

Query parameters

Name	Description
sysparm_limit	Maximum number of records to return. For requests that exceed this number of records, use the parameter to paginate record retrieval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	This limit is applied before ACL evaluation. If no records return, including records you have acc record order so records you have access to return first. **Note:** Unusually large *sysparm_limit* values can impact system performance. Data type: Number Default: 10000
sysparm_offset	Starting record index for which to begin retrieving records. Use this value to paginate record ret functionality enables the retrieval of all records, regardless of the number of records, in small m For example, the first time you call this endpoint, *sysparm_offset* is set to "0". To simply pa available records, use `sysparm_offset=sysparm_offset+sysparm_limit`, until you records. Don't pass a negative number in the *sysparm_offset* parameter. Data type: Number Default: 0
sysparm_query	Encoded query used to filter the result set. You can use a UI filter to obtain a properly encode Syntax: `sysparm_query=<col_name><operator><value>`. • <col_name>: Name of the table column to filter against. • <operator>: Supports the following values: ○ =: Exactly matches <value>. ○ !=: Does not match <value>. ○ ^: Logically AND multiple query statements. ○ ^OR: Logically OR multiple query statements. ○ LIKE: <col_name> contains the specified string. Only works for <col_name> fields whose da ○ STARTSWITH: <col_name> starts with the specified string. Only works for <col_name> field string. ○ ENDSWITH: <col_name> ends with the specified string. Only works for <col_name> fields w string. <value>: Value to match against. All parameters are case-sensitive. Queries can contain more than one entry, such as `sysparm_query=<col_name><operator><value>[<operator><col_name><op` For example: `(sysparm_query=caller_id=javascript:gs.getUserID()^active=true)` Encoded queries also support order by functionality. To sort responses based on certain fields, and ORDERBYDESC clauses in *sysparm_query*. Syntax:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters (continued)

Name	Description
	• `ORDERBY<col_name>` • `ORDERBYDESC<col_name>` For example: `sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcate` This query filters all active records and orders the results in ascending order by number, and th order by category. If part of the query is invalid, such as by specifying an invalid field name, the instance ignores t It then returns rows using only the valid portion of the query. You can control this behavior using *`glide.invalid_query.returns_no_rows`*. Set this property to true to return no rows c **Note:** The *`glide.invalid_query.returns_no_rows`* property controls the beha across the instance, such as in lists, scripts (*`GlideRecord.query()`*), and web service Data type: String

500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Response parameters

Name	Description
attributes	Data attributes currently in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. Data type: Object

error	Information on any errors encountered while processing the endpoint request.
	
	Data type: Object
	
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error. Data type: String
inbound_relations	List of objects that define the inbound relations associated with the CI. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response parameters (continued)

Name	Description

	<pre>"inbound_relations": [
	  {
	  "sys_id": "String",
	  "target": {Object},
	  "type": {Object}
	  }
	]</pre>

inbound_relations.sys_id	Sys_id of the inbound CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String

inbound_relations.target	Information that describes the target inbound relation.
	
	Data type: Object
	<pre>"target": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

inbound_relations.target.display_value	Name of the inbound relation to display in a user interface. Data type: String
inbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the inbound relation from the Configuration Item [cmdb_ci] table. Data type: String
inbound_relations.target.value	Sys_id of the inbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String

inbound_relations.type	Information about the type of inbound relationship.
	
	Data type: Object
	<pre>"type": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

inbound_relations.type.display_value	Name of the inbound type to display in a user interface. Data type: String

```

CMDB Instance - POST /now/cmdb/instance/{classname}

Creates a single configuration item (CI) with the specified outbound and inbound relations within the specified Configuration Management Database (CMDB) table.

Note: If the CMDB class has a dependent identification rule defined, then the input payload must contain the sys_id of an existing CI. For example, for *outbound_relations*, the *target* parameter must contain the sys_id of an existing CI, which then becomes the child. For *inbound_relations*, it becomes the parent.

```
"depends_on": {
  "outbound_relations":
    {
      "target": "b4fd7c8437201000deeabfc8bcbe5dc1",
      "type": "60bc4e22c0a8010e01f074cbe6bd73c3"
    }
  }
```

URL format

Versioned URL: `/api/now/v1/cmdb/instance/{className}`

Default URL: `/api/now/cmdb/instance/{className}`

Supported request parameters

Path parameters

Name	Description
className	CMDB class name. This is the name of the table that contains the desired CI records, such as cmdb_ci_linux_server or cmdb_ci_apache_web_server. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Query parameters

Name	Description
None	

Request body parameters (XML or JSON)

Name	Description
attributes	Data attributes to define in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. Data type: Object
inbound_relations	List of objects that define the inbound relations to associate with the CI. Data type: Array `"inbound_relations": [ { "target": "String", "type": "String" } ]`
inbound_relations.target	Required if *inbound_relations* is specified. Sys_id of the target inbound relation to associate with the specified CI. Located in the Configuration Item [cmdb_ci] table. Data type: String
inbound_relations.type	Required if *inbound_relations* is specified. Sys_id of the type of inbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations	List of objects that define the outbound relations to associate with the CI. Data type: Array `"outbound_relations": [ { "target": "String", "type": "String" } ]`
outbound_relations.target	Required if *outbound_relations* is specified. Sys_id of the target outbound relation. Located in the Configuration Item [cmdb_ci] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request body parameters (XML or JSON) (continued)

Name	Description
	Data type: String
outbound_relations.type	Required if *outbound_relations* is specified. Sys_id of the type of outbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
source	Required. Entity that updated the information. This must be one of the choice values specified in the discovery_source field in the Configuration Item [cmdb_ci] table. Data type: String

Headers

The following request and response headers apply to this HTTP action only, or apply to this action in a distinct way. For a list of general headers used in the REST API, see Supported REST API headers.

Request headers

Header	Description
Accept	Data format of the response body. Supported types: *application/json* or *application/xml*. Default: *application/json*
Content-Type	Data format of the request body. Supported types: *application/json* or *application/xml*. Default: *application/json*

Response headers

Header	Description
None	

Status codes

The following status codes apply to this HTTP action. For a list of possible status codes used in the REST API, see REST API HTTP response codes.

Status codes

Status code	Description
200	Successful. The request was successfully processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status codes (continued)

Status code	Description
400	Bad Request. A bad request type or malformed request was detected.
401	Unauthorized. The user credentials are incorrect or have not been passed.
404	Not found. The requested item wasn't found.
405	Invalid method. The functionality is disabled.
500	Internal server error. An unexpected error occurred while processing the request. The response contains additional information about the error.

Response body parameters (JSON or XML)

Response parameters

Name	Description
attributes	Data attributes currently in the CI record. The available attributes depend on the specified CMDB class. You can locate the available attributes in the associated CMDB table which typically begins with "cmdb_ci", such as cmdb_ci_linux_server or cmdb_ci_mfp_printer. Data type: Object

error	Information on any errors encountered while processing the endpoint request.
	
	Data type: Object
	`"error": {`
	`  "detail": "String",`
	`  "message": "String"`
	`}`

error.detail	Additional information about the error. Data type: String
error.message	Message that identifies the error. Data type: String

inbound_relations	List of objects that define the inbound relations associated with the CI.
	
	Data type: Array
	`"inbound_relations": [`
	`  {`
	`  "sys_id": "String",`
	`  "target": {Object},`
	`  "type": {Object}`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response parameters (continued)

Name	Description
	<pre> }]</pre>
inbound_relations.sys_id	Sys_id of the inbound CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String

inbound_relations.target	Information that describes the target inbound relation.
	
	Data type: Object
	<pre>"target": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

inbound_relations.target.display_value	Name of the inbound relation to display in a user interface. Data type: String
inbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the inbound relation from the Configuration Item [cmdb_ci] table. Data type: String
inbound_relations.target.value	Sys_id of the inbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String

inbound_relations.type	Information about the type of inbound relationship.
	
	Data type: Object
	<pre>"type": {
	  "display_value": "String",
	  "link": "String",
	  "value": "String"
	}</pre>

inbound_relations.type.display_value	Name of the inbound type to display in a user interface. Data type: String
inbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the inbound relation type from the CI Relationship Type [cmdb_rel_type] table.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Response parameters (continued)

Name	Description
	Data type: String
inbound_relations.type.value	Sys_id of the type of inbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations	List of objects that define the outbound relations associated with the CI. Data type: Array `"outbound_relations": [ { "sys_id": "String", "target": {Object}, "type": {Object} } ]`
outbound_relations.sys_id	Sys_id of the outbount CI relationship. Located in the CI Relationship [cmdb_rel_ci] table. Data type: String
outbound_relations.target	Required. Information about the target outbound relation. Data type: Object `"target": { "display_value": "String", "link": "String", "value": "String" }`
outbound_relations.target.display_value	Name of the outbound relation to display in a user interface. Data type: String
outbound_relations.target.link	CMDB REST endpoint URL to use to retrieve the outbound relation from the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.target.value	Sys_id of the outbound CI. Located in the Configuration Item [cmdb_ci] table. Data type: String
outbound_relations.type	Information about the type of outbound relationship. Data type: Object

Response parameters (continued)

Name	Description
	`"type": { "display_value": "String", "link": "String", "value": "String" }`
outbound_relations.type.display_value	Name of the outbound type to display in a user interface. Data type: String
outbound_relations.type.link	*Table* REST endpoint URL to use to retrieve the outbound relation from the CI Relationship Type [cmdb_rel_type] table. Data type: String
outbound_relations.type.value	Sys_id of the type of outbound relationship. Located in the CI Relationship Type [cmdb_rel_type] table. Data type: String
status	Only appears if an error is encountered. Status of the endpoint processing. Possible value: failure Data type: String

Example: cURL Request

The following code example shows how to call this endpoint.

```
curl
 "https://instance.servicenow.com/api/now/cmdb/instance/cmdb_ci_
linux_server" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json"\
--user "username":"password" \
--data {
  "outbound_relations": [
    {
      "type" : "1a9cb166f1571100a92eb60da2bce5c5",
      "target" : "3a307c930a0a0bb400353965d0b8861f"
    },

```

Example: cURL Request

The following code example shows how to call this endpoint for a class that has a dependant identification rule defined. The *outbound_relations.target* must be included in the payload and contain the sys_id of an existing CI.

```
curl
 "https://instance.servicenow.com/api/now/cmdb/instance/cmdb_ci_
linux_server" \
--request POST \
--header "Accept:application/json" \
--header "Content-Type:application/json"\
--user "username":"password" \
--data {
  "attributes": {
    "name": "test",
    "sys_class_name":"cmdb_ci_db_mssql_instance",
    "instance_name":"Iname"
  },
  "source": "ServiceNow",
  "depends_on": {
    "outbound_relations":
      {
        "target": "b4fd7c8437201000deeabfc8bcbe5dc1",
        "type": "60bc4e22c0a8010e01f074cbe6bd73c3"
      }
    }
  }
}
```

```
{
  "result": {
    "outbound_relations": [
      {
        "sys_id": "505cfa3a53662110af64ddeeff7b1217",

    }
  }
}
```

```
{
  "error": {
    "detail": "Exception while executing request: null Check
 logs for error trace or enable glide.rest.debug property to
 verify REST request processing",
    "message": "Exception while executing request: null"
  },
  "status": "failure"
}
```

CMDB Instance - PUT /now/cmdb/instance/{classname}/{sys_id}

Updates the specified configuration item (CI) record with the specified attribute name-value pairs. This endpoint does not create, update, or delete the associated relations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This endpoint does not conform to the HTML specifications. Standard PUT endpoints are destructive in that they remove any elements that are not included in the request. This endpoint does not remove non-specified elements.

URL format
