Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideRecord - next()

Moves to the next record in the GlideRecord object.

Note: This method fails if there is a field in the table called "next". If that is the case, use the method _next().

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates if there is a "next" record in the GlideRecord. Valid values: • true: Move to the next record was successful. • false: No more records in the result set.

```
var rec = new GlideRecord('incident');
rec.query();
while (rec.next()) {
 gs.info(rec.getValue('number') + ' exists');
}
```

Output:

```
INC0010112 exists
INC0010114 exists
INC0010119 exists
INC0010127 exists
```

Scoped GlideRecord - _next()

Moves to the next record in the GlideRecord. Provides the same functionality as `next()`, use this method if the GlideRecord has a column named next.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether there are more records in the query set. Possible values: • true: More records in the query set. • false: No more records in the query set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to list each record in the Incidents [incident] table.

```
var rec = new GlideRecord('incident');
rec.query();
while (rec._next()) {
  gs.info(rec.getValue('number') + ' exists');
}
```

Output:

```
INC0000060 exists
INC0009002 exists
INC0000009 exists
INC0000010 exists
INC0000011 exists
INC0000012 exists
...
```

Scoped GlideRecord - operation()

Determines if an operation is insert, update, or delete.

Knowing the operation enables using `current.operation()` to make a generic business rule which can handle each operation uniquely.

For information on using the global variable `current`, refer to Global variables in business rules.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current operation. Possible values: • delete • insert • update

The following example shows how to use this method in a business rule. The `operation()` method detects which operation triggered an event and performs a different action depending for update and insert operations.

```
if(current.operation() == "update") {
  current.updates ++; }
if(current.operation() == "insert") {
  current.updates = 0; }
```

Scoped GlideRecord - orderBy(String name)

Specifies an orderBy column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Call this method more than once to order by multiple columns. Results are arranged in ascending order. To arrange records in descending order, see Scoped GlideRecord - orderByDesc(String name).

Parameters

Name	Type	Description
name	String	Column name to use to order the records in this GlideRecord object.

Returns

Type	Description
void	

The following example shows how to order incident records in ascending order by Short Description.

```
var queryString = "priority=2";
var now_GR = new GlideRecord('incident');
now_GR.orderBy('short_description'); // Ascending Order
now_GR.addEncodedQuery(queryString);
now_GR.query();
while (now_GR.next()) {
  gs.info(now_GR.getValue('short_description'));
}
```

Output:

```
Can't launch 64-bit Windows 7 virtual machine
Can't log into SAP from my laptop today
Network storage unavailable
Please remove the latest hotfix from my PC
```

Scoped GlideRecord - orderByDesc(String name)

Specifies a descending orderBy column.

Call this method more than once to order by multiple columns. Results are arranged in descending order. To arrange records in ascending order, see Scoped GlideRecord - orderBy(String name).

Parameters

Name	Type	Description
name	String	Column name to use to order the records in a GlideRecord object.

Returns

Type	Description
void	

The following example shows how to order incident records in descending order by Short Description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var queryString = "priority=2";
var now_GR = new GlideRecord('incident');
now_GR.orderByDesc('short_description'); //Descending Order
now_GR.addEncodedQuery(queryString);
now_GR.query();
while (now_GR.next()) {
  gs.info(now_GR.getValue('short_description'));
}
```

Output:

```
Please remove the latest hotfix from my PC
Network storage unavailable
Can't log into SAP from my laptop today
Can't launch 64-bit Windows 7 virtual machine
```

Scoped GlideRecord - query(String field, String value)

Runs a query against the table based on the filters specified in the query methods such as *addQuery()* and *addEncodedQuery()*.

This method queries the GlideRecord table as well as any references of the table. For more information, see Querying tables in script.

Note: This method fails if there is a field in the table called "query". If that is the case, use the_query() method instead.

See the GlideRecord article for details on building and running queries.

See also:

- GlideAggregate - Scoped
- GlideQuery - Scoped, Global
- GlideQueryCondition - Scoped

Parameters

Name	Type	Description
name	String	Optional - must also specify a value parameter. Name of the field to search for the value specified in the value parameter. **Note:** This method is typically run without arguments, but you can specify a name-value pair to filter records containing the specified values. If the parameters are specified, the "name=value" condition is added to the query.
value	String	Optional - must also specify a field parameter. Value to search for in the specified field parameter.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to scan the System Dictionary [sys_dictionary] for tables with a query field.

```
var tableArr = [];

var now_GR = new GlideRecord('sys_dictionary');
now_GR.addQuery('element', 'query');
now_GR.setLimit(6);

now_GR.query();

while(now_GR.next()){
   tableArr.push(now_GR.name.getValue());
};

gs.info('The following tables have a field column called
 "query":');

for (i = 0; i < tableArr.length; i++) {
   gs.info(tableArr[i]);
};
```

Output:

```
The following tables have a field column called "query":
cmdb_convert_bulk_services
cmdb_multisource_query_status
cmdb_qb_result_base
cmdb_qb_table_mapping
discovery_probes_cim_query
kb_feedback
```

Scoped GlideRecord - _query(String field, String value)

Runs a query against the table based on the filters specified in the query methods such as *addQuery()* and *addEncodedQuery()*. This method is intended to be used on tables in which there's a column named "query", which might cause errors running the query() method.

This method queries the GlideRecord table as well as any references of the table. For more information, see Querying tables in script.

See the GlideRecord article for details on building and running queries.

See also:

- GlideAggregate - Scoped
- GlideQuery - Scoped, Global
- GlideQueryCondition - Scoped

Parameters

Name	Type	Description
name	String	Optional - must also specify a value parameter. Name of the field to search for the value specified in the value parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Note: This method is typically run without arguments, but you can specify a name-value pair to filter records containing the specified values. If the parameters are specified, the "name=value" condition is added to the query.
value	String	Optional - must also specify a field parameter. Value to search for in the specified field parameter.

Returns

Type	Description
void	

The following example shows how query the Knowledge Feedback [kb_feedback] table and list KB articles with comments that include Excel.

```
var rec = new GlideRecord('kb_feedback');
rec.addQuery('comments', 'CONTAINS', 'Excel');
rec._query();
while (rec.next()) {
 gs.info(rec.getDisplayValue('article') + " comment: " +
 rec.getValue('comments'));
}
```

Output:

```
KB0000005 comment:
      Can you please add the version of Excel this applies to?
 All?

KB0000005 comment:
      Does this work for all Excel versions? OSX and Windows
 alike?
```

Scoped GlideRecord - setAbortAction(Boolean b)

Sets a flag to indicate if the next database action (insert, update, delete) is to be aborted. This is often used in business rules.

Use in an `onBefore` business rule to prevent the database action from being done. The business rule continues to run after *`setAbortAction()`* is called. Calling *`setAbortAction()`* does not stop subsequent business rules from executing. Calling this method only prevents the database action from occurring.

Parameters

Name	Type	Description
b	Boolean	True to abort the next action. False if the action is to be allowed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
// Often used in business rule to check whether the current
 operation should be aborted.
if (current.size > 16) {
  current.setAbortAction(true);
}
```

Scoped GlideRecord - setLimit(Number maxNumRecords)

Sets the limit for number of records are fetched by the GlideRecord query.

Using setLimit() with chooseWindow()

The *setLimit()* method implicitly calls the *chooseWindow()* method and might cause unexpected results when used with *chooseWindow()* in a query.

- If the *chooseWindow()* method is called first, its record window is overwritten by the *setLimit()* method.

  Using the following lines in a query returns 100 records starting at row 1:

  ```
  grIncident.chooseWindow(20,30);
  grIncident.setLimit(100);
  ```

- If the *setLimit()* method is called first, the window set by *chooseWindow()* is used and the limit is overwritten.

  Using the following lines in a query returns 10 records starting at row 21:

  ```
  grIncident.setLimit(5);
  grIncident.chooseWindow(20,30);
  ```

  Note: Running *query()* with the *chooseWindow()* method triggers a COUNT(*) query, which can result in slow performance on tables with a large number of records. You can use *setLimit()* before *chooseWindow()* to skip running the COUNT(*) query, but the same performance benefit is achievable using *setNoCount()*.

See also:

- chooseWindow()
- query()
- setNoCount()

Parameters

Name	Type	Description
maxNumRecords	Number	The maximum number of records to fetch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var now_GR = new GlideRecord('incident');
now_GR.orderByDesc('sys_created_on');
now_GR.setLimit(10);
now_GR.query(); // this retrieves latest 10 incident records
 created
```

Scoped GlideRecord - setNewGuidValue(String guid)

Sets the sys_id value for the current record.

Parameters

Name	Type	Description
guid	String	GUID to assign to the current record.

Returns

Type	Description
void	

```
var now_GR = new GlideRecord('incident');
now_GR.setValue('short_description', 'The third floor printer is
 broken');
now_GR.setNewGuidValue('eb4636ca6f6d31005be8883e6b3ee333');
now_GR.insert();
gs.info(now_GR.getValue('sys_id'));
```

Scoped GlideRecord - setNoCount()

Stops a GlideRecord query from running a `COUNT(*)` query.

Running *`query()`* with some methods trigger a `COUNT(*)` query, such as the *`chooseWindow()`* and *`getRowCount()`* methods. The `COUNT(*)` query might cause slow performance on tables with a million or more records. For more information, see the Performance Improvement - Remove Pagination Count [KB0817996] article in the Now Support Knowledge Base.

Note: The *`setLimit()`* method also stops a `COUNT(*)`. Using *`setNoCount()`* is unnecessary if the *`setLimit()`* method is included in the query.

See also:

- chooseWindow()
- query()

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

The following code example shows how to use `setNoCount()` to skip the COUNT(*) query on a windowed query set using the `chooseWindow()` method.

```
var  grIncident = new GlideRecord('incident');

grIncident.chooseWindow(6915, 6920, true);
grIncident.setNoCount();
grIncident.query();

while (grIncident.next()) { // Iterate through the returned
 records
    gs.info('Incident Number: ' + grIncident.number + ', Short
 Description: ' + grIncident.short_description);
};
```

Output:

```
Incident Number: INC0006811, Short Description: Request an
 account to be created for Fidelity 401(k) Plans
Incident Number: INC0006918, Short Description: Please grant me
 additional roles in Oracle Fin Collections
Incident Number: INC0006812, Short Description: Taxware
 Value-added Tax crashes when I try to launch it
Incident Number: INC0006919, Short Description: Unable to Access
 SuccessFactors Learning
Incident Number: INC0010004, Short Description: Incident for
 assessment not generating
```

Scoped GlideRecord - setValue(String name, Object value)

Sets the value of the field with the specified name to the specified value.

Normally the script does a `now_GR.category = value`. However, if the element name is itself a variable then you can use `now_GR.setValue(elementName, value)`. When setting a value, ensure the data type of the field matches the data type of the value you enter.

Note: If the Column Level Encryption Enterprise plugin is enabled and the instance has access to the key, this method can insert encrypted data into encrypted fields. If the instance does not have access to the key, this method returns an error. For more information, see Platform Encryption.

Not for authentication with password2 fields

The `setValue()` method passes password2 data as clear text, which results in an error about expecting encrypted data. Additionally, using the setValue() method for password2 fields exposes data that should be encrypted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For password2 authentication, use the `setDisplayValue()` method instead.

See also:

- Deprecate GlideEncrypter usage of 3DES for password2 fields
- Alternatives to GlideEncrypter usage in knowledge base article KB1320986
- Password2 encryption with the Key Management Framework (KMF)

Parameters

Name	Type	Description
name	String	Name of the field.
value	Object	Value to assign to the field.

Returns

Type	Description
None	

```
var elementName = 'short_description';
var now_GR = new GlideRecord('incident');
now_GR.initialize();
now_GR.setValue(elementName, "My DB is not working");
now_GR.insert();
```

Scoped GlideRecord - setWorkflow(Boolean enable)

Enables or disables the running of business rules, script engines, and audit.

Warning: Disabling the running of business rules, script engines, and audit can have a significant impact on your ServiceNow® instance and how it operates. Ensure that you thoroughly test this change before deploying it to production.

Note: This method can't be set for cross scoped applications. For additional information, see the following KB article https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB0820691.

Parameters

Name	Type	Description
enable	Boolean	Flag that indicates whether to enable or disable the running of business rules, script engines, and audit. Valid values: • true: Enable the running of business rules, script engines, and audit. • false: Disable the running of business rules, script engines, and audit. Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
//Enable business rules, scripts engines for x_app_table
var now_GR = new GlideRecord("x_app_table");
now_GR.setWorkflow(true);
```

Scoped GlideRecord - update(String reason)

Updates the GlideRecord with any changes that have been made. If the record does not already exist, it is inserted.

Parameters

Name	Type	Description
reason	String	Optional. Reason for the update. The reason appears in the audit record.

Returns

Type	Description
String	Sys_id of the new or updated record. Returns null if the update fails.

The following example shows how to update the Short Description field of an incident.

```
var now_GR = new GlideRecord('incident');
now_GR.get('99ebb4156fa831005be8883e6b3ee4b9');
now_GR.setValue('short_description', 'Update the short
 description');
now_GR.update();
gs.info(now_GR.getElement('short_description'));
```

Output:

```
Update the short description.
```

Scoped GlideRecord - updateMultiple()

Updates each GlideRecord in a stated query with a specified set of changes.

This method does not support adding multiple journal entries.

The *glide.db.forced.chunk.threshold* system property sets the threshold above which forces chunk record deletions and updates. Chunking helps to prevent non-primary key deletions on huge tables from causing replication problems. For more information, see Available system properties.

Note: To ensure expected results, use the *setValue()* method instead of direct assignments. That is, use `gr_Now.setValue('<field_name>', '4'));` instead of `gr_Now.<field_name> = 4`.

Note: Do not use this method with the *chooseWindow()* or *setLimit()* methods when working with large tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method sets new values and does not clear existing values. To clear an existing value, use the *setValue()* method and set the field to 'NULL'. For more information, see Setting a GlideRecord variable to 'NULL'.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example shows how to update the state of all active incidents to 4 - "Awaiting User Info".

```
var now_GR = new GlideRecord('incident');
now_GR.addQuery('active', true);
now_GR.setValue('state',  4);
now_GR.updateMultiple();
```

This example shows how to clear existing values of the description field for priority 1 incidents.

```
var test = new GlideRecord('incident');
test.addEncodedQuery('priority=1');
test.query();

test.setValue('description','NULL');
test.updateMultiple();
```

Scoped GlideRecord - updateWithReferences(Object reason)

Updates a record and also inserts or updates any related records with the information provided.

Parameters

Name	Type	Description
reason	Object	Reason for the updates. The reason is displayed in the audit record.

Returns

Type	Description
String	The sys_id for the record being updated.

If processing an incident where the Caller ID is set to reference sys_user record 'John Doe,' then the following code would update John Doe's user record. If processing an incident where there's no caller ID specified, then the following code creates a new sys_user record with the provided information (first_name, last_name) and sets the caller ID value to the newly created sys_user record.

```
var inc = new GlideRecord('incident');
inc.get(inc_sys_id);  // Looking up an existing incident record
 where 'inc_sys_id' represents the sys_id of a incident record
inc.caller_id.first_name = 'John';
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
inc.caller_id.last_name = 'Doe';
inc.updateWithReferences();
}
```

GlideRecordUtil - Global

The *GlideRecordUtil* script include is a utility class for working with GlideRecords.

This script include is available in server-side scripts. For use cases, see Using discovery script includes.

GlideRecordUtil - getCIGR(String sys_id)

Returns the GlideRecord object for the specified configuration item (CI) using just the sys_id of the CI.

Use this method to quickly obtain a specific CI without knowing its associated class/table.

Parameters

Name	Type	Description
sys_id	String	Sys_id of the desired CI.

Returns

Type	Description
GlideRecord	GlideRecord object of the specified CI.

The following example returns the GlideRecord object for the specified CI using just the sys_id of the CI.

```
var now_GR = new
 GlideRecordUtil().getCIGR("2dfd7c8437201000deeabfc8bcbe5d56");
```

GlideRecordUtil - getFields(GlideRecord gr)

Returns an array of all the fields in the specified GlideRecord.

Note: If there is a field name which is the same as the table name, the *getFields()* method does not return the value of the field.

Parameters

Name	Type	Description
gr	GlideRecord	GlideRecord instance positioned to a valid record.

Returns

Type	Description
Array	Field names for the specified GlideRecord.

```
var queryString = "priority=1^ORpriority=2";
var now_GR = new GlideRecord('incident');
now_GR.addEncodedQuery(queryString);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
now_GR.query();
now_GR.next();

var gRU = new GlideRecordUtil();
var fieldList = gRU.getFields(now_GR);
gs.info(fieldList);
```

Output: Line breaks added for presentation.

```
sys_id,skills,closed_by,assigned_to,contract,category,escalation
,state,reassignment_count,location,

_plan,work_notes_list
```

GlideRecordUtil - getGR(String baseTable, String sys_id)

Returns a GlideRecord instance for the given table, positioned to the given sys_id, and of the right class (table).

This method is useful when you need to load a GlideRecord from a sys_id, but you don't know what the actual table is (because it may be extended from the base table). This method always returns a GlideRecord of the correct type base_table: the name of the base table that the specified sys_id is in.

Parameters

Name	Type	Description
baseTable	String	The name of the base table containing the sys_id.
sys_id	String	The sys_id of the desired record.

Returns

Type	Description
GlideRecord	The GlideRecord for the specified sys_id.

```
var now_GR = new GlideRecordUtil().getGR("cmdb_ci_computer",
 "2dfd7c8437201000deeabfc8bcbe5d56");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideRecordUtil - getTables(String tableName)

Returns a Java ArrayList of the ancestors of the specified table name.

For example, given cmdb_ci_linux_server, this would return cmdb_ci_linux_server, cmdb_ci_server, cmdb_ci_computer, cmdb_ci_hardware, cmdb_ci, and cmdbr.

Parameters

Name	Type	Description
tableName	String	Name of the table.

Returns

Type	Description
ArrayList	List of ancestors of the specified table.

The following example shows the ancestors of the cmdb_ci_linux_server table.

```
var tables = new
 GlideRecordUtil().getTables("cmdb_ci_linux_server");
gs.info("Tables returned: " + tables);
```

Output:

```
Tables returned: [cmdb_ci_linux_server, cmdb_ci_server,
 cmdb_ci_computer, cmdb_ci_hardware, cmdb_ci, cmdb]
```

GlideRecordUtil - mergeToGR(Object hashMap, GlideRecord now_GR, Object ignore)

Sets the fields in the specified GlideRecord with the field values contained in the specified hashmap, unless that field name is in the ignore hashmap.

Parameters

Name	Type	Description
hashMap	Object	An Object instance (being used as a hashmap), with properties named for fields and containing the fields' value.
GlideRecord	GR	The GlideRecord instance to receive the field values.
ignore	Object	An optional hashmap of field names to ignore.

Returns

Type	Description
void	

This example updates a computer record's name and os fields, but does not update the sys_created_by field:

```
var now_GR = new GlideRecordUtil().getGR("cmdb_ci_computer",
 "2dfd7c8437201000deeabfc8bcbe5d56");
var obj = {"name": "xyz", "os": "windows 2000",
 "sys_created_by", "aleck.lin"};
var ignore = {"sys_created_by": true};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
new GlideRecordUtil().mergeToGR(obj, now_GR, ignore);
now_GR.update();
```

GlideRecordUtil - populateFromGR(Object hashMap, GlideRecord now_GR, Object ignore)

Populates the given hashmap from the given GlideRecord instance. Each field in the GlideRecord becomes a property in the hashmap.

Parameters

Name	Type	Description
hashMap	Object	An object being used as a hashmap.
now_GR	GlideRecord	A GlideRecord instance positioned to a valid record.
ignore	Object	An optional hashmap of file names not to populate.

Returns

Type	Description
void	

```
var objectToPopulate = {};
var now_GR = new GlideRecordUtil().getGR("cmdb_ci_computer",
 "2dfd7c8437201000deeabfc8bcbe5d56");
var ignore = {"sys_created_on": true, "sys_updated_by": true};
new GlideRecordUtil().populateFromGR(objectToPopulate, now_GR,
 ignore);
// Now the objectToPopulate contains field/value pairs from the
 computer GlideRecord
```

GlideSchedule - Scoped

The scoped *GlideSchedule* API provides methods for performing operations on GlideSchedule objects, such as adding new schedule segments to a schedule, determining if a date/time is within the schedule, or setting the schedule timezone.

GlideSchedule - GlideSchedule()

Instantiates an empty GlideSchedule object.

Parameters

Name	Type	Description
None		

GlideSchedule - GlideSchedule(String sysID, String timeZone)

Instantiates a GlideSchedule object and loads the schedule information. If a time zone is not specified, the current session time zone is used.

Parameters

Name	Type	Description
sysID	String	The system ID for the schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
timeZone	String	Optional. The time zone to use. Default: The current session time zone. Time zones can be provided in the following formats. • `Country/City`. For example, `America/Los_Angeles`. • `Country/Time zone`. For example, `US/Pacific`. • `Time zone abbreviation`. For example, `PST`. For a complete list of valid timezones, see the **Time zone** field in the User [sys_user] table. For more information about time zones, see Time zones.

```
var schedule = new
 GlideSchedule('090eecae0a0a0b260077e1dfa71da828',
 'US/Pacific');
```

GlideSchedule - add(GlideDateTime startDate, GlideDuration offSet)

Adds a new schedule segment to the current schedule.

Parameters

Name	Type	Description
startDate	GlideDateTime	The starting date of the new schedule segment.
offSet	GlideDuration	The time offset of the new schedule segment.

Returns

Type	Description
GlideDateTime	The schedule updated with the new schedule segment.

```
var startDate = new GlideDateTime('2014-01-02');
var days = 2;
var dur = new GlideDuration(60 * 60 * 24 * 1000 * days);
var schedule = new GlideSchedule();
var end = schedule.add(startDate, dur);
gs.info(end);
```

Output:

```
2014-01-04 00:00:00
```

GlideSchedule - duration(GlideDateTime startDate, GlideDateTime endDate)

Determines the elapsed time in the schedule between two date time values using the timezone of the schedule or, if that is not specified, the timezone of the session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
startDate	GlideDateTime	The starting datetime.
endDate	GlideDateTime	The ending datetime.

Returns

Type	Description
GlideDuration	The difference between the starting and ending datetime.

```
var startDate = new GlideDateTime('2014-10-16 02:00:00');
var endDate = new GlideDateTime('2014-10-18 04:00:00');
var schedule = new GlideSchedule();

schedule.load('090eecae0a0a0b260077e1dfa71da828'); // loads "8-5
 weekdays excluding holidays" schedule
var duration = schedule.duration(startDate, endDate);
gs.info(duration.getDurationValue()); // gets the elapsed time
 in schedule
```

GlideSchedule - getName()

Retrieves the schedule name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the current schedule.

```
sys_id ='04e664654a36232701a2247dcd8fc4cf'; // sys_id for
 "Application" schedule record
var sched = new GlideSchedule(sys_id);
gs.info(sched.getName());
```

GlideSchedule - isInSchedule(GlideDateTime time)

Determines if the specified date and time is within the current schedule.

Parameters

Name	Type	Description
time	GlideDateTime	Date and time value to check.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the specified date and time is within the schedule. Valid values: • true: Date and time is within the schedule. • false: Date and time are outside of the schedule.

```
var glide = new GlideRecord('cmn_schedule');
glide.addQuery('type', 'blackout');
glide.query();
if (glide.next()) {
   var sched = new GlideSchedule(glide.sys_id);
   var date = new GlideDateTime();
   date.setDisplayValue("2007-09-18 12:00:00");
   if (sched.isInSchedule(date))
      gs.info("Is in the schedule");
   else
      gs.info("Is NOT in the schedule");
}
```

GlideSchedule - isValid()

Determines if the current schedule is valid. A schedule is valid if it has at least one schedule span.

Returns

Type	Description
Boolean	True if the schedule is valid.

```
var glide = new GlideRecord('cmn_schedule');
glide.addQuery('type', 'blackout');
glide.query();
if (glide.next()) {
   var sched = new GlideSchedule(glide.sys_id);
   var date = new GlideDateTime();
   date.setDisplayValue("2007-09-18 12:00:00");
   if (sched.isValid())
      gs.info("Is valid");

   else
      gs.info("Is not valid");
}
```

GlideSchedule - load(String sysID, String timeZone, String excludeSpanID)

Loads a schedule with the schedule information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysID	String	The system ID of the schedule.
timeZone	String	(Optional) The timezone. If a timezone is not specified, or is nil, the current session timezone is used for the schedule.
excludeSpanID	String	Any span to exclude.

Returns

Type	Description
void	

```
var x = new GlideSchedule();
x.load('08fcd0830a0a0b2600079f56b1adb9ae');
```

GlideSchedule - setTimeZone(String timeZone)

Sets the timezone for the current schedule.

Parameters

Name	Type	Description
timeZone	String	The time zone to use. Time zones can be provided in the following formats. • `Country/City`. For example, `America/Los_Angeles`. • `Country/Time zone`. For example, `US/Pacific`. • `Time zone abbreviation`. For example, `PST`. For a complete list of valid timezones, see the **Time zone** field in the User [sys_user] table. For more information about time zones, see Time zones.

Returns

Type	Description
void	

This example sets the timezone for the schedule to US/Pacific.

```
var schedule = new GlideSchedule();
schedule.setTimeZone('US/Pacific');
```

GlideSchedule - whenNext(GlideDateTime time, String timeZone)

Determines how much time (in milliseconds) until start time of the next schedule item.

This function is intended to be called when the GlideSchedule object (cmn_schedule table) is not currently in the schedule window. The whenNext() call returns duration (in ms) until the GlideSchedule object is within the schedule. This function does not return a meaningful value if called when the GlideSchedule object is within the schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
time	GlideDateTime	Time to be evaluated
timeZone	String	Timezone

Returns

Type	Description
Number	Number of milliseconds until the start time of the next schedule item. Returns -1 if never.

```
var startDate = new GlideDateTime('2014-10-25 08:00:00');
var glideSchedule = new
 GlideSchedule('08fcd0830a0a0b2600079f56b1adb9ae', 'UTC');
gs.info(glideSchedule.whenNext(startDate));
```

Output:

```
172800000
```

```
testScript();
function testScript() {
var now = new GlideDateTime(); //current date and time
var sched = new GlideSchedule("<sys_id>"); // Use a cmn_schedule
 sys_id
if (sched.isInSchedule(now)){
gs.info('We are in an active schedule window so whenNext() is
 not helpful');
} else{
gs.info('Not currently in schedule so call whenNext()');
var msUntilNext = sched.whenNext(new GlideDateTime(),
 'US/Pacific');
gs.info('Next schedule starts in '+msUntilNext+' milliseconds');
}
}
\\ Output [schedule inactive)]:
\\ *** Script: Not currently in schedule so call whenNext()
\\ *** Script: Next schedule starts in -1 milliseconds
```

Output:

```
[Scheduled for future] *** Script: Not currently in schedule ***
 Script: Next schedule starts in 332894000 milliseconds
```

GlideScriptableInputStream - Scoped, Global

A GlideScriptableInputStream object cannot be instantiated directly, but is used as an opaque object which is used to connect an input stream from *GlideSysAttachment.getContentStream()* with other streaming APIs.

The public APIs that can consume this input stream include:

- *GlideDigest*
- *GlideExcelParser*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *GlideTextReader*
- *XMLDocument2*

GlideScriptedExtensionPoint - Scoped

The *GlideScriptedExtensionPoint* API provides a method that returns the extension instances associated with a specified extension point.

From these extension instances, you can extend the functionality of an application without altering the original application code. You can use pre-existing extension points available in selected ServiceNow AI Platform applications, or you can add extension points when you develop custom applications in your own instance.

This API is available in the base ServiceNow instance.

For more information on extension points, see Using extension points to extend application functionality.

GlideScriptedExtensionPoint - getExtensions(String name)

Returns the extension instances associated with a specified extension point.

These extension instances are persisted in the Extension Instance [sys_extension_instance] table. For more information on extension points, see Using extension points to extend application functionality.

Note: The script include instances returned by the *getExtensions()* method are uninitialized. If your interface includes an initialize method, call that method before calling other methods on the returned instance. For example:

```
var eps = new
 GlideScriptedExtensionPoint().getExtensions("RelatedListIte
mCandidateFilter");
 for (var i = 0; i < eps.length; i++) {
   eps[i].initialize(tableName, parentFieldName,
 parentRecordSysId, referencedFieldName);
   eps[i].getFilterQuery();
 }
```

Parameters

Name	Type	Description
name	String	Name of the extension point for which to return the extension instances. Located in the Extension Instance [sys_extension_instance] table.

Returns

Type	Description
Array of Objects	Extension instances associated with the specified endpoint.

The following code example returns the extension instances for the RelatedListItemCandidateFilter extension point. The "class" listed for each instance represents a script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var eps = new
 GlideScriptedExtensionPoint().getExtensions("RelatedListItemCan
didateFilter");
```

Response:

```
global.RelatedListItemCandidateFilter
 RelatedListItemCandidateFilter
global.RelatedListItemCandidateFilter
 ProblemRelatedListChangeRequestItemFilter
global.RelatedListItemCandidateFilter
 RelatedListConfigItemFilter
global.RelatedListItemCandidateFilter
 RelatedListItemCandidateFilterForAgileDevelopment
global.RelatedListItemCandidateFilter
 ProblemRelatedListIncidentItemFilter
global.RelatedListItemCandidateFilter
 RelatedListIncidentItemCandidateFilter
global.RelatedListItemCandidateFilter
 RelatedListCIItemCandidateFilter
```

GlideScriptedProcessor - Scoped

The *GlideScriptedProcessor* API provides a customizable URL endpoint that can execute arbitrary server-side JavaScript code and produce output such as TEXT, JSON, or HTML. ServiceNow processors are equivalent to Java servlets.

Use this API in processor scripts to access the processor (servlet) capabilities. There are no constructors for the *ScopedGlideScriptedProcessor* APIs. The methods are called using the global variable *g_processor*.

A useful global variable, *g_target*, is available in processor scripts. It contains the table name extracted from the URL.

The URL to a processor has the format: `https://<instance name.servicenow.com>/<path endpoint>.do?<parameter endpoint>=<value>` where the path endpoint and parameter endpoint are defined on the processor form.

GlideScriptedProcessor - redirect(String url)

Redirects to the specified URL.

Parameters

Name	Type	Description
url	String	Destination URL

Returns

Type	Description
void	

```
//Do whatever processing you need and redirect to the homepage
g_processor.redirect("/navpage.do")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideScriptedProcessor - writeJSON(Object o)

Encodes an object as a JSON string and writes it to the current URL.

Parameters

Name	Type	Description
o	Object	The object to encode to a JSON string.

Returns

Type	Description
void	

```
var map = {"key1":"value1","key2":"value2"};
g_processor.writeJSON(map);
```

GlideScriptedProcessor - writeOutput(String s)

Writes the specified string to the current URL.

Parameters

Name	Type	Description
s	String	The string to write.

Returns

Type	Description
void	

```
var name = g_request.getParameter("name");
g_processor.writeOutput("Hello " + name);
```

GlideScriptedProcessor - writeOutput(String contentType, String s)

Writes the specified string to the current URL in the specified character-encoding.

Parameters

Name	Type	Description
contentType	String	Sets the content type of the response sent to the client, if the response has not been committed, and may include a character-encoding specification.
s	String	String to write.

Returns

Type	Description
void

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var name = g_request.getParameter("name");
g_processor.writeOutput("text/plain", "Hello " + name);
```

GlideSecureRandomUtil - Scoped, Global

The *GlideSecureRandomUtil* API provides methods for generating integers, long values, and strings.

There is no constructor for this class. Methods are accessed through the static object GlideSecureRandomUtil. The *GlideSecureRandomUtil* class is available in both global and scoped applications.

GlideSecureRandomUtil - getSecureRandomInt()

Generates a pseudo-random integer.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The pseudo-randomly generated integer.

```
gs.info(GlideSecureRandomUtil.getSecureRandomInt());
```

Output:

```
1976146969
```

GlideSecureRandomUtil - getSecureRandomIntBound(Number bound)

Generates a pseudo-random integer between 0 (inclusive) and the bound (exclusive) value that you pass into the method.

Parameters

Name	Type	Description
bound	Number	The bound value.

Returns

Type	Description
Number	The pseudo-randomly generated integer.

```
gs.info(GlideSecureRandomUtil.getSecureRandomIntBound(100));
```

Output:

```
55
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSecureRandomUtil - getSecureRandomLong()

Generates pseudo-random long value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The pseudo-randomly generated 64-bit integer.

```
gs.info(GlideSecureRandomUtil.getSecureRandomLong());
```

Output:

```
792836514424092500
```

GlideSecureRandomUtil - getSecureRandomString(Number length)

Generates a random alpha-numeric String with the specified length.

Parameters

Name	Type	Description
length	Number	The length of the string in number of characters.

Returns

Type	Description
String	The randomly generated string.

```
gs.info(GlideSecureRandomUtil.getSecureRandomString(12));
```

Output:

```
1XzVIOsLfVlT
```

GlideSecurityManager - Global

The `GlideSecurityManager` API provides methods that enable you to retrieve a SecurityManager object and to check if the current user has access rights, both table-level and field-level, to a specified GlideRecord table based on the configured Access Control Rules (ACLs).

GlideSecurityManager - get()

Returns a SecurityManager object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	SecurityManager object.

The following code example shows how to call the *GlideSecurityManager.get()* method to obtain a GlideSecurityManager object that is then used by the *GlideSecurityManager.hasRightsTo()* method.

```
var sm = GlideSecurityManager.get();
var grInc = new GlideRecord('incident');
var path = 'record/incident/read';

gs.info(sm.hasRightsTo(path, grInc));
```

Output:

```
true
```

GlideSecurityManager - hasRightsTo(String path_to_resource, Object context)

Indicates whether the current user has table-level access rights to a specified GlideRecord table based on the configured Access Control Rules (ACLs). This method evaluates all available ACLs for the specific resource.

For additional information on ACLs, see Access Controls Evaluation Order.

Parameters

Name	Type	Description
path_to_resource	String	Resource path to the GlideRecord table to check for access rights. For example: `record/incident/read` Format: <type>/<name>/<operation> • <type>: Type of resource. Valid values: Existing ACL types. Available from the drop-down choice list on the ACL form. • <name>: Name of the table to check. • <operation>: Name of the operation that you want to check access rights for. In this case "read".
context	Object	Optional. For table-level validation this field is not required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the user's roles permit table-level reading of the specified table. Valid values: • true: Specified access is permitted. • false: Specified access isn't permitted.

The following code example shows how to use the *hasRightsTo()* method to check if the current user has table-level read rights to all records in the Incident [incident] table.

```
var sm = GlideSecurityManager.get();
var grInc = new GlideRecord('incident');
var path = 'record/incident/read';

gs.info(sm.hasRightsTo(path, grInc));
```

Output:

```
false
```

GlideSecurityUtils - Scoped, Global

The *GlideSecurityUtils* API provides methods to work with URLs.

Access these methods using the static object GlideSecurityUtils. This class is available in scoped and global scripts.

GlideSecurityUtils - cleanURL(String url)

Removes suspicious encoding to prevent reflected or DOM based cross site scripting.

Parameters

Name	Type	Description
url	String	The URL to be checked.

Returns

Type	Description
String	The URL stripped of problem elements.

```
myurl='javascript%3Aalert(1)';
var clean=GlideSecurityUtils.cleanURL(myurl);
gs.info(clean);
```

Output: null

GlideSecurityUtils - enforceRelativeURL(String url)

Removes the domain address from the URL, which leaves the page name and parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
url	String	The URL to be turned into a relative URL.

Returns

Type	Description
String	A relative URL.

```
myurl='http://evildomain.com/test.do';
relativeURL=GlideSecurityUtils.enforceRelativeURL(myurl);
gs.info(relativeURL);
```

Output: test.do

GlideSecurityUtils - escapeScript(String script)

Add escape characters to a script.

Adding escape characters to a script helps prevent cross-site scripting.

Parameters

Name	Type	Description
script	String	The script to have escape characters added.

Returns

Type	Description
String	The script with escape characters added.

```
theScript="<script> alert(1)</script>";
var escapedScript=GlideSecurityUtils.escapeScript(theScript);
gs.info(escapedScript);
```

Output: `<script> alert(1)</script>`

GlideSecurityUtils - isURLWhiteListed(String url)

Check the specified URL against the system defined allow list.

Parameters

Name	Type	Description
url	String	The URL to be checked against the URL allow list.

Returns

Type	Description
Boolean	Returns true if the specified URL is in the allow list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
myURL="http://evil.com/badscript.do";
isWhitelisted=GlideSecurityUtils.isURLWhiteListed(myURL);
gs.info(isWhitelisted);
```

Output: false

GlideServletRequest - Scoped

The *GlideServletRequest* API provides methods to use in processor scripts.

ServiceNow processor scripts are equivalent to Java servlets. Processor scripts provide a customizable URL endpoint that can execute arbitrary server-side JavaScript code and produce output such as TEXT, JSON, or HTML. Use the *GlideServletRequest* API in processor scripts to access the HttpServletRequest object. The GlideServletRequest object provides a subset of the *HttpServletRequest* APIs. The methods are called using the global variable *g_request*.

A useful global variable, *g_target*, is available in processor scripts. It contains the table name extracted from the URL.

The URL to a processor has the format: `https://<instance name.servicenow.com>/<path endpoint>.do?<parameter endpoint>=<value>` where the path endpoint and parameter endpoint are defined on the processor form.

GlideServletRequest - getContentType()

Returns the MIME type of the body of the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The content type, returns null if the content type is not known.

```
var contentType = g_request.getContentType();
```

GlideServletRequest - getHeader(String name)

Returns the header value.

Parameters

Name	Type	Description
name	String	The name of the header to be retrieved.

Returns

Type	Description
String	The header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var headerValue = g_request.getHeader("host");
```

Output:

```
demonightlyus.service-now.com
```

GlideServletRequest - getHeaderNames()

Returns a comma-separated list of header names.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of header names as a string.

```
var headerList = g_request.getHeaderNames();
```

Output:

```
host,connection,cache-control,authorization,accept,user-agent,ac
cept-encoding,accept-language,
cookie,x-forwarded-proto,x-forwarded-host,x-forwarded-for
```

GlideServletRequest - getHeaders(String name)

Returns the header values.

Parameters

Name	Type	Description
name	String	Names of the headers to be retrieved.

Returns

Type	Description
Array	An array of header values as a string.

```
var headerValue = g_request.getHeaders("host");
```

Output:

```
demonightlyus.service-now.com
```

GlideServletRequest - getParameter(String name)

Returns the value of the parameter contained in the request URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	The name of the parameter to be retrieved. This can be the parameter endpoint from the processor form.

Returns

Type	Description
Object	The parameter value. Returns null if the parameter is not found.

```
var name = g_request.getParameter("x_snc_custom_x_snc_name");
```

GlideServletRequest - getParameterNames()

Returns a list of URL parameters that were used in the request URI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of parameter names as a string.

```
var paramList = g_request.getParameterNames();
```

GlideServletRequest - getQueryString()

Returns the query string from the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The query string.

This example uses the request URL: `https://instance.service-now.com/x_custom_app_customApp.do?x_custom_app_name=George&bell=rung`.

```
var queryString = g_request.getQueryString();
g_processor.writeOutput("The query string is: " + queryString);
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
The query string is: x_custom_app_name=George&bell=rung
```

GlideServletResponse - Scoped

The *GlideServletResponse* API provides methods to use in processor scripts.

ServiceNow processor scripts are equivalent to Java servlets. Processor scripts provide a customizable URL endpoint that can execute arbitrary server-side JavaScript code and produce output such as TEXT, JSON, or HTML. Use the *GlideServletResponse* API in processor scripts to access the HttpServletResponse object. The GlideServletResponse object provides a subset of the *HttpServletResponse* APIs. The methods are called using the global variable *g_response*.

A useful global variable, *g_target*, is available in processor scripts. It contains the table name extracted from the URL.

The URL to a processor has the format: `https://<instance name.servicenow.com>/<path endpoint>.do?<parameter endpoint>=<value>` where the path endpoint and parameter endpoint are defined on the processor form.

GlideServletResponse - sendRedirect(String location)

Sends a temporary redirect to the client.

Parameters

Name	Type	Description
location	String	The URL to receive the response.

Returns

Type	Description
void	

GlideServletResponse - setContentType(String type)

Sets the MIME type of the response

Parameters

Name	Type	Description
type	String	The MIME type.

Returns

Type	Description
void	

```
g_response.setContentType('text/html;charset=UTF-8');
```

GlideServletResponse - setHeader(String key, String value)

Sets a response header to the specified value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
key	String	Specifies the header.
value	String	The value to be assigned to the header. If the header exists, it is overwritten.

Returns

Type	Description
void	

```
g_response.setHeader("host", "instance.service-now.com");
```

GlideServletResponse - setStatus(Number status)

Sets the status code for the response.

Parameters

Name	Type	Description
status	Number	The status to be set.

Returns

Type	Description
void	

```
// set the status to okay
g_response.setStatus(200);
```

GlideSession - Global

The *GlideSession* API provides methods to find information about the current session.

GlideSession - clearClientData(String paramName)

Clears a session client value previously set with *putClientData()*.

This method is used in a client script to clear data values that were set by a server script using the *putClientData()* method.

Parameters

Name	Type	Description
paramName	String	Name of the client data to clear.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var session = gs.getSession();
session.putClientData('custName', 'Harry');
var clientData = session.getClientData('custName');
gs.info(clientData);

session.clearClientData('custName');
clientData = session.getClientData('custName');
gs.info(clientData);
```

Output:

```
Harry

null
```

GlideSession - getClientData(String paramName)

Returns a session client value previously set with *putClientData()*.

This method is used in a client script to retrieve data values that were set by a server script that used the *putClientData()* method.

Parameters

Name	Type	Description
paramName	String	Name of the client data to retrieve.

Returns

Type	Description
String	The client data as a string.

```
var session = gs.getSession();
session.putClientData('test1', 'Harry');
var clientData = session.getClientData('test1');
gs.info(clientData);
```

Output:

```
Harry
```

Scoped equivalent

To use the *getClientData()* method in a scoped application, use the corresponding scoped method: getClientData().

GlideSession - getLanguage()

Gets the session's language code.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The session's language code.

```
var session = gs.getSession();
var language = session.getLanguage();
gs.info(language);
```

Output:

```
en
```

Scoped equivalent

To use the *getLanguage()* method in a scoped application, use the corresponding scoped method: getLanguage().

GlideSession - getRoles()

Gets a list of roles for the current user.

The list of roles does not reflect any changes made during the current user session. To get the updated list of roles, the user must log out and log back in.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A comma separated list of roles.

```
gs.info(gs.getSession().getRoles());
```

Output:

```
admin,hr_fulfiller,itsa_fulfiller,security_admin
```

GlideSession - getTimeZoneName()

Gets the name of the session's time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The name of the session's time zone.

```
var session = gs.getSession();
var zoneName = session.getTimeZoneName();
gs.info(zoneName);
```

Output:

```
US/Pacific
```

Scoped equivalent

To use the *getTimeZoneName()* method in a scoped application, use the corresponding scoped method: getTimeZoneName().

GlideSession - isInteractive()

Determines if the current session is interactive.

An interactive session is one that involves an end-user interacting with a user interface that then retrieves information from a server. An example of this type of session is when a user logs in using the log-in screen or uses a form to query a data store. A non-interactive session is one that only involves programmatic interaction with a server such as a SOAP request to retrieve data.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the session is interactive.

Note: The *isInteractive()* method will always return a false value for all user sessions using the classic or current mobile applications.

```
var interActive = gs.getSession().isInteractive();
gs.info(interActive);
```

Output:

```
false
```

Scoped equivalent

To use the *isInteractive()* method in a scoped application, use the corresponding scoped method: isInteractive().

GlideSession - isLoggedIn()

Determines if the current user is currently logged in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the current user is logged in.

```
var session = gs.getSession();
var loggedIn = session.isLoggedIn();
gs.info(loggedIn);
```

Output:

```
true
```

Scoped equivalent

To use the `isLoggedIn()` method in a scoped application, use the corresponding scoped method: isLoggedIn().

GlideSession - putClientData(String paramName, String paramValue)

Sets a session client value that can be retrieved with `getClientData()`. This method is used in a server side script that runs when a form is created.

Parameters

Name	Type	Description
paramName	String	Name of the client parameter to set.
paramValue	String	Parameter value.

Returns

Type	Description
void	

```
var session = gs.getSession();
session.putClientData('test1', 'Harry');
var clientData = session.getClientData('test1');
gs.info(clientData);
```

Output:

```
Harry
```

Scoped equivalent

To use the `putClientData()` method in a scoped application, use the corresponding scoped method: putClientData().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSession - Scoped

The scoped `GlideSession` API provides methods to find information about the current session.

There are no constructors for creating an instance of a scoped GlideSession object. Instead, use the `getSession()` method of the scoped `GlideSystem` API.

Scoped GlideSession - getClientData(String paramName)

Retrieves a session client value previously set with `putClientData()`.

Use this method to retrieve data values that were set using the `putClientData()` method.

Parameters

Name	Type	Description
paramName	String	Name of the client data to retrieve.

Returns

Type	Description
String	Client data.

```
var session = gs.getSession();
session.putClientData('test1', 'Harry');
var clientData = session.getClientData('test1');
gs.info(clientData);
```

Output:

```
Harry
```

Scoped GlideSession - getClientIP()

Returns the client IP address.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	IP address.

```
var session = gs.getSession();
var addr = session.getClientIP();
gs.info(addr);
```

Output:

```
50.59.164.97
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideSession - getCurrentApplicationId()

Returns the application currently selected in the application picker.

This method requires admin privileges.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Currently selected application.

```
var session = gs.getSession();
var appID = session.getCurrentApplicationId();
gs.info(appID);
```

Output:

```
ce05b9f32b840200c5244f74b4da1501
```

Scoped GlideSession - getCurrentDomainID()

Returns the sys_id of the current domain for the logged-in user session.

The identifier that is returned depends on the domain type and the instantiation of that domain.

- If the user is configured in the global domain, and does not use the domain picker to switch domains, the method returns null.
- If the user uses the domain picker to switch to the global domain, the method returns the string "global".
- For all other domains, the method returns the sys_id of that domain.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the session domain of the current logged-in user. This is the same information that appears in the domain picker.

This example shows the current sys_email record's domain being set to the user's session domain, if the user domain is global or null.

```
// Set domain based on parent record's domain
setDomain();

// If the domain is global, set to user's domain
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if (current.sys_domain == 'global' || current.sys_domain.nil())
   current.sys_domain = gs.getSession().getCurrentDomainID();

function setDomain() {
   if (current.target_table.nil())
      return;

   var d = new GlideRecord(current.target_table);
   if (!d.isValid())
      return;

   if (!d.get('sys_id', current.instance))
      return;

   if (typeof(d.sys_domain) == 'object')
      current.sys_domain = d.sys_domain;
```

Scoped GlideSession - getLanguage()

Returns the session's language code.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Session's language code.

```
var session = gs.getSession();
var language = session.getLanguage();
gs.info(language);
```

Output:

```
en
```

Scoped GlideSession - getSessionToken()

Returns the session token.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Session token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var session = gs.getSession();
var token = session.getSessionToken();
gs.info(token);
```

Output:

```
4284b5372b840200c5244f74b4da15f2c3476cf7fcb6572afa4ef9d5e6d307a5
fd9e1da7
```

Scoped GlideSession - getTimeZoneName()

Returns the name of the session's time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the session's time zone.

```
var session = gs.getSession();
var zoneName = session.getTimeZoneName();
gs.info(zoneName);
```

Output:

```
US/Pacific
```

Scoped GlideSession - getUrlOnStack()

Returns the URL on the stack. Returns null if the stack is empty.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	URL on the stack. Returns null if the stack is empty.

```
var session = gs.getSession();
var URL = session.getUrlOnStack();
gs.info(URL);
```

Output: line breaks added for clarity.

```
sys_app.do?sys_id=ce05b9f32b840200c5244f74b4da1501&sysparm_goto_
url=sys_app.do
%3Fsys_id%3Dce05b9f32b840200c5244f74b4da1501
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideSession - isImpersonating()

Returns true if the user is impersonating another user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates the user is impersonating another user. Possible values: • true: User is impersonating. • false: User isn't impersonating.

```
var isImpersonator = gs.getSession().isImpersonating();
gs.info(isImpersonator);
```

Scoped GlideSession - isInteractive()

Returns true if the session is interactive.

An interactive session is one that involves an end-user interacting with a user interface that then retrieves information from a server. An example of this type of session is when a user logs in using the log-in screen or uses a form to query a data store. A non-interactive session is one that only involves programmatic interaction with a server such as a SOAP request to retrieve data.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the session is interactive. Possible values: • true: Session is interactive. • false: Session isn't interactive.

```
var interActive = gs.getSession().isInteractive();
gs.info(interActive);
```

Scoped GlideSession - isLoggedIn()

Returns true if the user is logged in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the user is logged in Possible values: • true: User is logged in. • false: User isn't logged in.

```
var session = gs.getSession();
var loggedIn = session.isLoggedIn();
gs.info(loggedIn);
```

Output:

```
true
```

Scoped GlideSession - putClientData(String paramName, String paramValue)

Sets a session client value that can be retrieved with *`getClientData()`*. This method is used in a server side script that runs when a form is created.

Parameters

Name	Type	Description
paramName	String	Name of the client data to set.
paramValue	String	Value of the client data.

Returns

Type	Description
void	

```
var session = gs.getSession();
session.putClientData('test1', 'Harry');
var clientData = session.getClientData('test1');
gs.info(clientData);
```

Output:

```
Harry
```

GlideSPScriptable - Scoped

The *`GlideSPScriptable`* API provides methods to interact with data and perform record operations in Service Portal widgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You access *GlideSPScriptable* methods by using the global `$sp` object.

GlideSPScriptable - canReadRecord(GlideRecord now_GR)

Returns true if the user can read the specified GlideRecord.

If the record type is `kb_knowledge`, `sc_cat_item`, or `sc_category`, the method checks if the user can view the item.

Parameters

Name	Type	Description
now_GR	GlideRecord	The GlideRecord to check.

Returns

Type	Description
Boolean	True if the record is valid and readable.

Server script

```
//Server script
data.items = [];
data.userName = gs.getUserDisplayName();
var now_GR = new GlideRecord("sc_cat_item");
now_GR.query();
while(now_GR.next() && data.items.length < 10) {
    if ($sp.canReadRecord(now_GR)) {
    data.items.push(now_GR.getDisplayValue("name"));
    }
}

//HTML template
<div class="panel panel-default">
    <div class="panel-heading">Hi, {{c.data.userName}}!</div>
    <div class="panel-body">
        Here are some things you can order:
        <ul><li ng-repeat="item in
 c.data.items">{{item}}</li></ul>
    </div>
</div>
```

GlideSPScriptable - canReadRecord(String table, String sysId)

Returns true if the user can read the specified GlideRecord.

If the record type is `kb_knowledge`, `sc_cat_item`, or `sc_category`, the method checks if the user can view the item.

Parameters

Name	Type	Description
table	String	Name of the table to query.
sysId	String	Sys_id of the record to query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the record is valid and readable.

GlideSPScriptable - canSeePage(String pageID)

Returns true if the currently logged in user has permission to view the specified page.

The system determines permission using roles and user criteria. For more information, see Configure page security by role and User criteria for Service Portal.

Parameters

Name	Type	Description
pageID	String	Page ID from the Pages [sp_page] table.

Returns

Type	Description
Boolean	Flag that indicates whether the currently logged in user has permissions to view the specified page. Values include: • true: The user can view the page. • false: Either the user cannot view the page, the given pageID is not valid, or the user is not logged in.

This example adds a condition to the Knowledge menu item in the SP Header Menu to only show the menu item to users who have permission to view the kb_view2 page.

```
GlideSPScriptable.canSeePage("kb_view2")
```

GlideSPScriptable - getCatalogItem(String sysId)

Returns a model and view model for a `sc_cat_item` or `sc_cat_item_guide`.

This method is deprecated. Use the *`getCatalogItem(String sysId, Boolean isOrdering)`* method instead. This method calls the *`getCatalogItem(String sysId, Boolean isOrdering)`* method with the *`isOrdering`* parameter set to false, which means that write roles security checking is done.

This method is a quick way to get the data necessary to render and order a catalog item using `<sp-model />`. If you just need to get a catalog item to show its picture or name, use GlideRecord to query the `sc_cat_item` table.

Parameters

Name	Type	Description
sysId	String	The sys_id of the catalog item (`sc_cat_item`) or order guide (`sc_cat_item_guide`).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	An object containing the catalog item variable model, view, sections, pricing, and client scripts.

```
// Server script
(function() {
    var sys_id = $sp.getParameter("sys_id")
    data.catItem = $sp.getCatalogItem(sys_id);
})();

// Client script
function($http, spUtil) {
    var c = this;
    var submitting = false;
    c.getIt = function() {
        if (submitting) return;
        $http.post(spUtil.getURL('sc_cat_item'),
 c.data.catItem).success(function(response) {
            if (response.answer) {
                c.req = response.answer;
                c.req.page = c.req.table == 'sc_request' ?
 'sc_request' : 'ticket';
            }
        });
    }
}

//SCSS
.img-bg {
    padding: 5px;
    background-color: $brand-primary;
}

.img-responsive {
    margin: 0 auto;
}

.cat-icon {
    display: block;
    margin: -40px auto 0;
}

// HTML template
<div class="col-sm-4">
  <div class="panel panel-default">
    <div class="img-bg">
      <img ng-src="{{::data.catItem.picture}}"
 class="img-responsive" />
    </div>
    <span class="cat-icon fa fa-stack fa-lg fa-3x hidden-xs">
      <i class="fa fa-circle fa-stack-2x text-success"></i>
      <i class="fa fa-desktop fa-stack-1x fa-inverse"></i>
    </span>
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    <div class="panel-body">
      <p class="lead text-center">{{::data.catItem.name}}</p>
      <ul class="list-unstyled">
        <li class="text-center"
 ng-if="::data.catItem.price">${Price}:
 {{::data.catItem.price}}</li>
      </ul>
      <sp-model form-model="::data.catItem"
 mandatory="mandatory"></sp-model>
      <p ng-if="c.req" class="text-center text-success">
        ${Request created!} <a
 href="?id={{c.req.page}}&table={{c.req.table}}&sys_id={{c.req.s
ys_id}}">{{c.req.number}}</a>
      </p>
      <button ng-if="!c.req" class="btn btn-default btn-block"
 ng-click="c.getIt()">${Get it}</button>
    </div>
  </div>
</div>
```

GlideSPScriptable - getCatalogItem(String sysId, Boolean isOrdering)

Returns a model and view model for a `sc_cat_item` or `sc_cat_item_guide`.

Parameters

Name	Type	Description
sysId	String	The sys_id of the catalog item (`sc_cat_item`) or order guide (`sc_cat_item_guide`).
isOrdering	Boolean	When true, uses create roles security check. When false, uses write roles security check. When users are ordering an item or have it in their cart, check using the create roles. If users are not ordering, for example, somebody is looking at a requested item to see the variables associated with that item, then check using the write roles.

Returns

Type	Description
Object	An object containing the catalog item variable model, view, sections, pricing, and client scripts.

GlideSPScriptable - getDisplayValue(String fieldName)

Returns the display value of the specified field (if it exists and has a value) from either the widget's `sp_instance` or the `sp_portal` record.

Parameters

Name	Type	Description
fieldName	String	Name of the field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The display value from either the `sp_instance` or `sp_portal` record.

```
//Server script
(function() {
    data.title = $sp.getDisplayValue("title");
    data.catalog = $sp.getDisplayValue("sc_catalog");
})();

//HTML template
<div>
    <h1>sp_instance.title: {{::data.title}}</h1>
    <h1>sp_portal.sc_catalog: {{::data.catalog}}</h1>
</div>
```

GlideSPScriptable - getField(GlideRecord now_GR, String fieldName)

Returns information about the specified field in the specified GlideRecord.

Parameters

Name	Type	Description
now_GR	GlideRecord	The GlideRecord to check
fieldName	String	The field to find information for

Returns

Type	Description
Object	An object containing the field's label, value, displayValue, and type. Returns null if the GlideRecord of field name are not valid, or if the field is not readable.

GlideSPScriptable - getFields(GlideRecord now_GR, String fieldNames)

Checks the specified list of field names, and returns an array of valid field names.

Parameters

Name	Type	Description
now_GR	GlideRecord	The GlideRecord to check
field Names	String	A comma separated list of field names.

Returns

Type	Description
Array	An array of valid fields.

GlideSPScriptable - getFieldsObject(GlideRecord now_GR, String fieldNames)

Checks the specified list of field names and returns an object of valid field names.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
now_GR	GlideRecord	The GlideRecord to check
field Names	String	A comma separated list of field names.

Returns

Type	Description
Object	An object containing valid field names.

GlideSPScriptable - getForm(String tableName, String sysId)

Return the form.

Parameters

Name	Type	Description
tableName	String	The name of the table
sysId	String	The form's sys_id

Returns

Type	Description
Object	The form

GlideSPScriptable - getKBCategoryArticles(String sys_id, Number limit)

Returns KB articles in the specified category and its subcategories.

To avoid performance issues, do not use this method to return articles in large categories or articles with inline images. Instead, use *`getKBArticleSummaries()`*.

Parameters

Name	Type	Description
sys_id	String	Sys_id of the KB article category.
limit	Number	Maximum number of KB articles returned.

Returns

Type	Description
Array	The articles within the category and its subcategories with: • A **workflow_state** of **published**. • A **valid_to** date greater than or equal to the current date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Server script
(function() {
    data.kbs =
 $sp.getKBCategoryArticles("0ac1bf8bff0221009b20fffffffffec",
 5);
})();

//HTML template
<div>
articles: {{::data.kbs}}
</div>
```

GlideSPScriptable - getKBCategoryArticleSummaries(String sys_id, Number limit, Number maxChars)

Returns Knowledge Base article summaries in the specified category and its subcategories.

Parameters

Name	Type	Description
sys_id	String	Sys_id of the KB article category.
limit	Number	Maximum number of KB articles returned.
maxChars	Number	Maximum number of characters to return from the article text. For full article text, set the value to `-1`.

Returns

Type	Description
Array	The articles within the category and its subcategories with: • A **workflow_state** of **published**. • A **valid_to** date greater than or equal to the current date.

```
//Server script
(function() {
    data.summary =
 $sp.getKBCategoryArticleSummaries("0ac1bf8bff0221009b20fffffffffec", 5, 200);
})();

//HTML template
<div>
articles: {{::data.summary}}
</div>
```

GlideSPScriptable - getKBCount(String sys_id)

Returns the number of articles in the defined Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sys_id	String	Sys_id of a Knowledge Base record.

Returns

Type	Description
Number	Number of knowledge articles in the defined Knowledge Base with: • A **workflow_state** of **published**. • A **valid_to** date greater than or equal to the current date.

```
//Server script
(function() {
    data.count =
 $sp.getKBCount("a7e8a78bff0221009b20ffffffffff17");
})();

//HTML template
<div>
articles: {{::data.count}}
</div>
```

GlideSPScriptable - getListColumns(String tableName, String view)

Returns a list of the specified table's columns in the specified view.

Parameters

Name	Type	Description
tableName	String	Name of the table
view	String	The view by which to filter the columns

Returns

Type	Description
Object	An object containing the column names.

GlideSPScriptable - getMenuItems(String sysId)

Returns an array of menu items for the specified instance.

Parameters

Name	Type	Description
sysId	String	sysId of the instance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	Menu items for the specified instance

GlideSPScriptable - getMenuHREF(GlideRecord page)

Returns the (?id=) portion of the URL based on the sp_menu type.

Parameters

Name	Type	Description
page	GlideRecord	The page

Returns

Type	Description
String	The href portion of the URL.

GlideSPScriptable - getParameter(String name)

Returns the value of the specified parameter.

Parameters

Name	Type	Description
name	String	The name of the key from the query string or post body.

Returns

Type	Description
Object	Returns the specified parameter as an object. Returns null if there is no request, JSON request, or widget.

GlideSPScriptable - getPortalRecord()

Returns the portal record from the Service Portals [sp_portal] table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	The portal record for the current portal from the Service Portals [sp_portal] table.

```
//Server script
(function() {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var portalGr = $sp.getPortalRecord();
    data.logo = portalGr.getDisplayValue("logo");
    data.homepage = portalGr.getDisplayValue("homepage.id");
})();

//HTML template
<div>
    <img ng-src="{{::c.data.logo}}" />
    <a href="?id={{::c.data.homepage}}">Click here to go
 home</a>
</div>
```

GlideSPScriptable - getRecord(String table, String sys_id)

If parameters are provided, returns the GlideRecord identified by the provided table and Sys ID. If no parameters are provided, returns the record identified by the current URL.

Parameters

Name	Type	Description
table	String	Optional. The table of the record to return. If no parameters are included, returns the table and Sys ID identified by the current URL.
sys_id	String	Optional. The Sys ID of the record to return. If no parameters are included, returns the record identified by the current URL.

Returns

Type	Description
GlideRecord	If parameters are provided, returns the record identified by the provided table and Sys ID. If no parameters are provided, returns the record identified by the current URL. Returns null if the widget is embedded by another widget, or if the record for the provided parameters is not found.

```
//Server script
(function(){
var now_GR = $sp.getRecord();
data.tableLabel = now_GR.getLabel();
})();

//HTML template
<div class="panel-heading">
<h4 class="panel-title">${{{data.tableLabel}} details}</h4>
</div>
```

GlideSPScriptable - getRecordDisplayValues(Object data, GlideRecord from, String names)

Copies display values for the specified fields into the data parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
data	Object	The display values for the specified fields are copied to this object.
from	GlideRecord	The GlideRecord to process.
names	String	A comma-separated list of field names.

Returns

Type	Description
void	

GlideSPScriptable - getRecordElements(Object data, GlideRecord from, String names)

For the specified fields, copies the element's name, display value, and value into the data parameter.

Parameters

Name	Type	Description
data	Object	The element's name, display value, and value for the specified fields are copied to this object.
from	GlideRecord	The GlideRecord to process.
names	String	A comma-separated list of field names.

Returns

Type	Description
void	

GlideSPScriptable - getRecordValues(Object data, GlideRecord from, String names)

Copies values for the specified field names from the GlideRecord into the data parameter.

Parameters

Name	Type	Description
data	Object	The value for the specified fields are copied to this object.
from	GlideRecord	The GlideRecord to process.
names	String	A comma-separated list of field names.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSPScriptable - getRecordVariables(GlideRecord now_GR, Boolean includeNilResponses)

Returns Service Catalog variables associated with a record in String format.

Parameters

Name	Type	Description
now_GR	GlideRecord	The record to retrieve Service Catalog variables for. Must be a record with Service Catalog variables defined, such as a requested item [sc_req_item] record or an incident submitted through a record producer.
includeNilResponses	Boolean	Optional. If true, the API includes variables with no user-defined value.

Returns

Type	Description
String	Service Catalog variables associated with the record.

```
//Server script
(function() {
var itemsGR = new GlideRecord("sc_req_item");
itemsGR.get('585d1bc44f4f13008a959a211310c77d');

data.scVars = $sp.getRecordVariables(itemsGR);

})();

//HTML template
<div>
Requested item variables: {{::data.scVars}}
</div>
```

Output:

```
Requested item variables: [
  {
    "display_value":"MetroPCS",
    "name":"carrier",
    "visible_summary":true,
    "id":"585d1bc44f4f13008a959a211310c77c",
    "label":"Allocated carrier",
    "type":"5",
    "value":"metropcs",
    "visible_standalone":true,
    "visible_guide":true
  },
  {
    "display_value":"Unlimited",
    "name":"data_plan",
    "visible_summary":true,
    "id":"d05d1bc44f4f13008a959a211310c77c",
    "label":"Monthly data allowance",
    "type":"5",
    "value":"unlimited",
```

    "visible_standalone":true,
    "visible_guide":true
  }
]
```

GlideSPScriptable - getRecordVariablesArray(GlideRecord now_GR, Boolean includeNilResponses)

Returns an array of Service Catalog variables associated with a record.

Parameters

Name	Type	Description
now_GR	GlideRecord	The record to retrieve Service Catalog variables for. Must be a record with Service Catalog variables defined, such as a requested item [sc_req_item] record or an incident submitted through a record producer.
includeNilResponses	Boolean	Optional. If true, the API includes variables with no user-defined value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Array of Service Catalog variables associated with the record.

```
//Server script
(function() {
var itemsGR = new GlideRecord("sc_req_item");
itemsGR.get('585d1bc44f4f13008a959a211310c77d');

data.scVars = $sp.getRecordVariablesArray(itemsGR);

})();

//HTML template
<div>
Requested item variables: {{::data.scVars}}
</div>
```

Output:

```
Requested item variables: [
  {
    "display_value":"MetroPCS",
    "name":"carrier",
    "visible_summary":true,
    "id":"585d1bc44f4f13008a959a211310c77c",
    "label":"Allocated carrier",
    "type":"5",
    "value":"metropcs",
    "visible_standalone":true,
    "visible_guide":true
  },
  {
    "display_value":"Unlimited",
    "name":"data_plan",
    "visible_summary":true,
    "id":"d05d1bc44f4f13008a959a211310c77c",
    "label":"Monthly data allowance",
    "type":"5",
    "value":"unlimited",
    "visible_standalone":true,
    "visible_guide":true
  },
  {
    "display_value":"12 Months",
    "name":"duration",
    "visible_summary":true,
    "id":"d85d1bc44f4f13008a959a211310c77c",
    "label":"Contract duration",
    "type":"5",
    "value":"twelve_months",
    "visible_standalone":true,
    "visible_guide":true
  },
  {
```

    "visible_summary":true,
    "id":"d45d1bc44f4f13008a959a211310c77c",
    "label":"Storage",
    "type":"5",
    "value":"sixtyfour",
    "visible_standalone":true,
    "visible_guide":true
  }
]
```

GlideSPScriptable - getStream(String table, String sysId)

Gets the activity stream for the specified record. This method works on tables that extend the task table.

Parameters

Name	Type	Description
table	String	The table name
sysID	String	The sys_id of the record

Returns

Type	Description
Object	If a table extending the task table is specified, contains the display_value, sys_id, short_description,number, entries, user_sys_id, user_full_name, user_login, label, table, and journal_fields properties; otherwise contains the table and sys_id properties. **Note:** The user_login property contains the User ID of the current user. The user_sys_id and iser_full_name properties reference the creator of the queried record.

GlideSPScriptable - getUserInitials()

Returns the user's initials.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The user's initials

GlideSPScriptable - getValue(String name)

Returns the named value of the JSON request, instance, or portal.

Parameters

Name	Type	Description
name	String	Name of the JSON request, instance, or portal.

Returns

Type	Description
Object	Value of the specified parameter. Null if the specified entity does not exist or has no such parameter.

```
//Server script
(function() {
    data.title = $sp.getValue("title");
    data.catalog = $sp.getValue("sc_catalog");
})();

//HTML templage
<div>
    <h1>sp_instance.title: {{::data.title}}</h1>
    <h1>sp_portal.sc_catalog: {{::data.catalog}}</h1>
</div>
```

GlideSPScriptable - getValues(Object data, String names)

Copies values from the request or instance to the data parameter.

Parameters

Name	Type	Description
data	Object	Receives the parameter values.
names	String	Comma-separated string of field names.

Returns

Type	Description
void	

GlideSPScriptable - getVariablesArray(Boolean includeNilResponses)

Returns an array of Service Catalog variables associated with the record in the URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if the URL includes the parameters `id=form&table=sc_req_item&sys_id=832e9620db4f330083766b984b9619cf`, the API returns the variables associated with the given record in the Requested item [sc_req_item] table. Must be a record with Service Catalog variables defined, such as a requested item [sc_req_item] record or an incident submitted through a record producer.

Parameters

Name	Type	Description
includeNilResponses	Boolean	Optional. If true, the API includes variables with no user-defined value.

Returns

Type	Description
Object	Array of variables associated with the table.

```
//Server script
(function() {
data.scVars = $sp.getVariablesArray();
})();

//HTML template
<div
Current record variables: {{::data.scVars}}
</div>
```

Output:

```
Current record variables: [
  {
    "display_value":"unlimited",
    "name":"data","visible_summary":
    true,"id":"472e5620db4f330083766b984b96198a",
    "label":"Data",
    "type":"6",
    "value":"unlimited",
    "visible_standalone":true,
    "visible_guide":true
  },
  {
    "display_value":"Black",
    "name":"color",
    "visible_summary":true,
    "id":"c72e5620db4f330083766b984b96198a",
    "label":"Color",
    "type":"6",
    "value":"Black",
    "visible_standalone":true,
    "visible_guide":true
  }
]
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSPScriptable - getWidget(String sysID, Object options)

Gets a widget by id or sys_id, executes that widget's server script using the provided options, then returns the widget model.

Parameters

Name	Type	Description
sysID	String	The widget sys_id or widget_id
options	Object	An object to pass to the widget's server script. Refer to this object as `options` in your server script. **Note:** Any options passed into this function will only be available in the embedded widget's server script on the **first execution** of that script. Any subsequent calls into the server script from the embedded widget will not contain the object properties passed in.

Returns

Type	Description
Object	A widget model to be used with sp-widget.

```
//Server script
data.myWidget = $sp.getWidget('widget_id', {p1: param1, p2:
 param2});

//HTML
<sp-widget widget="c.data.myWidget"></sp-widget>
```

GlideSPScriptable - isRTLEnabled()

Checks whether the associated portal is enabled for right-to-left language (RTL) and whether the current user's language is directionally RTL.

Use this method to determine if there’s a need for a RTL-specific CSS in the portal UI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the RTL flag is enabled and the current user's session language is directionally RTL. Possible values: • true: The RTL flag is enabled. • false: The RTL flag isn’t enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Boolean

The following code example shows how to use this method to determine the type of icon to display on the portal page.

```
// Server script
(function() {
  data.isRTLEnabled = $sp.isRTLEnabled();
 })();

// HTML template
<div> <i ng-class="c.data.isRTLEnabled ? 'fa fa-arrow-right' :
 'fa fa-arrow-left'"></i> </div>
```

GlideSPScriptable - isUserCriteriaEnabled()

Returns true if user criteria is enabled.

This method returns true if the **Service Portal User Criteria Support** plugin (com.glide.service-portal.user-criteria) is active and the **Enable use of User Criteria records instead of Roles fields for Service Portal entitlements** (glide.service_portal.user_criteria_enabled) system property is set to true.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if user criteria is enabled.

GlideSPScriptable - log(Object message)

Logs output to the Service Portal Log Entries [sp_log] table. The logged in user must have the sp_admin or admin role.

Parameters

Name	Type	Description
message	Object	JavaScript object or string representing the message to send as output on a Service Portal page.

Returns

Type	Description
None	

The following example shows how to log a predefined error if it occurs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var demo_data = null;
var params = null;
if (gr.getValue("demo_data")) {
   try {
 demo_data = JSON.parse(gr.getValue("demo_data"));
 params = (demo_data.options) ? demo_data.options : null;
 } catch(e) {
 $sp.log(e);
   }
}
```

GlideSPScriptable - mapUrlToSPUrl(String url)

Transforms a URL requesting a list or form in the platform UI into the URL of the corresponding `id=list` or `id=form` Service Portal page.

Use this method to perform tasks such as redirecting a user after login to the correct Service Portal page when they request a platform UI form or list URL. Note that the `id=list` and `id=form` page targets are not customizable.

Note: Table, sys_id, and sysparm_query values are preserved from the original URL; sysparm_view is not.

Parameters

Name	Type	Description
url	String	Platform UI URL

Returns

Type	Description
String	Transformed Service Portal URL. If the passed-in URL does not request a list or a form in the platform UI, a null value is returned.

List example

```
GlideSPScriptable().mapUrlToSPUrl("http://
demo.service-now.com/task_list.do?sysparm_userpref_module=1523b8
d4c611227b00be8216ec331b9a&sysparm_query=assigned_to=javascript:
getMyAssignments()&sysparm_clear_stack=true"))
```

Returns

```
id=list&table=task&filter=assigned_to=javascript:getMyAssignment
s()&sys_id=&v=
```

Form example

```
GlideSPScriptable().mapUrlToSPUrl("incident.do?sys_id=12bc12bc12
bc12bc12bc12bc12bc12bc")
```

Returns

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
id=form&table=incident&filter=&sys_id=12bc12bc12bc12bc12bc12bc12bc12bc&v=
```

GlideSPScriptable - userCanSeeSearchSourceByCriteria(String searchSourceID)

Returns true if the current user can see a search source specified by the searchSourceID.

Returns true if the user is not restricted by user criteria. For more detail on how user criteria affects Service Portal assets, see User criteria for Service Portal.

Note: This method does not evaluate role-based permissions of the search source, and should only be used if User Criteria is enabled.

Parameters

Name	Type	Description
searchSourceID	String	Sys_id of the search source record.

Returns

Type	Description
Boolean	True if current user has read access to the search source.

GlideSPSearchAnalytics - Global

The `GlideSPSearchAnalytics` API provides methods to generate search analytics from custom ServiceNow search widgets.

By default, the Search Events [sys_search_event] and Search Source Events [sys_search_source_event] tables collect search data from base system search widgets. However, custom search widgets do not benefit from this feature. Use this API in the server script of custom search widgets in global environments to send search data to the search events tables. Generate relevant search suggestions for your users and monitor search analytics to understand what your users are searching for and whether they're finding what they need.

This API collects the following search data:

- Searched terms
- Rank of clicked items
- Filters used to refine search results
- Table names and record identifiers from the first page of search results
- Search results clicked, including browser and location

Search Suggestions is a ServiceNow AI Platform feature. For more information, see Search Suggestions.

GlideSPSearchAnalytics - publish(String payload)

Sends search data to the Search Event [sys_search_event], Search Event per source [sys_search_source_event], and Search Signal Event [sys_search_signal_event] tables for search results, or to the Search Result Clicked [sys_search_result_clicked] and Search Signal Result Event [sys_search_signal_result_event] tables when a user clicks a search result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
payload	String	JSON payload in String format containing the search data to send to the Search Event [sys_search_event], Search Event per source [sys_search_source_event], and Search Signal Event [sys_search_signal_event] tables for search results, or to the Search Result Clicked [sys_search_result_clicked] and Search Signal Result Event [sys_search_signal_result_event] tables when a user clicks a search result. Structure the payload as key-value pairs according to the type of search data you would like to collect. • Collect data when the user searches for a term: ◦ `query`: String. The query being searched. ◦ `portal_id`: String. Sys_id of the portal record from the Service Portals [sp_portal] table. ◦ `page_id`: String. Sys_id of the page record from the Pages [sp_page] table. ◦ `results_per_source`: Array. Number of results returned from each search source. ▪ `source_id`: String. Sys_id of the search source record from the Search Sources [sp_search_source] table. ▪ `number_of_results`: Number. Number of results returned from the query for the specific search source. ◦ `ais_profile`: String. Sys_id of the search profile applied to the search. Only applicable for searches made with the AI Search engine. ◦ `search_results`: Array. Results returned in the first page of search results. ▪ `record_id`: String. Sys_id of the search result record. ▪ `table_name`: String. Name of the table in which the search result record was found. ◦ `refinement_occurred`: Boolean. True if the user filtered the search results; otherwise false. • Collect data when a user refines their search results: ◦ `query`: String. The query being searched. ◦ `portal_id`: String. Sys_id of the portal record from the Service Portals [sp_portal] table. ◦ `page_id`: String. Sys_id of the page record from the Pages [sp_page] table. ◦ `refinement_occurred`: Boolean. True if the user filtered the search results; otherwise false.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• Collect the rank of the search result that the user selected. ◦ `query`: String. The query being searched. ◦ `portal_id`: String. Sys_id of the portal record from the Service Portals [sp_portal] table. ◦ `click_rank`: Number. Rank of the item the user selected. For example, if the user clicked the third item in a list of search results, the value is 3. • Collect information on the search result that the user clicks. Data logs to the Search Result Clicked [sys_search_result_clicked] table. ◦ `query`: String. The query being searched. ◦ `portal_id`: String. Sys_id of the portal record from the Service Portals [sp_portal] table. ◦ `page_id`: String. Sys_id of the page record from the Pages [sp_page] table. ◦ `results_per_source`: Array. Number of results returned from each search source. ▪ `source_id`: String. Sys_id of the search source record from the Search Sources [sp_search_source] table. ▪ `number_of_results`: Number. Number of results returned from the query for the specific search source. ◦ `refinement_occurred`: Boolean. True if the user filtered the search results; otherwise false. ◦ `click_rank`: Number. Rank of the item the user selected. For example, if the user clicked the third item in a list of search results, the value is 3. ◦ `browser_info`: String. Logs browser name, version, and platform. ◦ `location`: Float. Logs latitude and longitude coordinates of the user location. ◦ `result_clicked_sys_id`: String. Sys_id of the result the user selected. ◦ `label_description`: String. Description of the result that the user selected. ◦ `source_table`: String. Name of the source table containing the selected result. ◦ `ais_doc_id`: String. Underscore-separated name of the source table and sys_id of the result record for each result the user selected. For example, if the user clicked a result from the Knowledge [kb_knowledge] table, the value is of the form

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`kb_knowledge_3020c9b14843210e9db4b5b08b9a712d`. Only applicable for searches made with the AI Search engine. • Collect data when a user searches for a term and collect the rank of the search result that the user clicked: ◦ `query`: String. The query being searched. ◦ `portal_id`: String. Sys_id of the portal record from the Service Portals [sp_portal] table. ◦ `page_id`: String. Sys_id of the page record from the Pages [sp_page] table. ◦ `results_per_source`: Array. Number of results returned from each search source. ▪ `source_id`: String. Sys_id of the search source record from the Search Sources [sp_search_source] table. ▪ `number_of_results`: Number. Number of results returned from the query for the specific search source. ◦ `ais_profile`: String. Sys_id of the search profile applied to the search. Only applicable for searches made with the AI Search engine. ◦ `search_results`: Array. Summary of records returned in the first page of search results. ▪ `record_id`: String. Sys_id of the search result record. ▪ `table_name`: String. Name of the table in which the search result record was found. ◦ `click_rank`: Number. Rank of the item the user selected. For example, if the user clicked the third item in a list of search results, the value is `3`. ◦ `ais_doc_id`: String. Underscore-separated name of the source table and sys_id of the result record for each result the user selected. For example, if the user clicked a result from the Knowledge [kb_knowledge] table, the value is of the form `kb_knowledge_3020c9b14843210e9db4b5b08b9a712d`. Only applicable for searches made with the AI Search engine.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example passes direct search data to the search analytics tables.

```
var searchObject = new GlideSPSearchAnalytics();
var payload = {
  'query': 'how do i get a new computer',
  'portal_id': '81b75d3147032100ba13a5554ee4902b',
  'page_id': '87466b63c3223100c8b837659bba8feb',
  'results_per_source': [{
    'source_id': 'bf2c4c15b3a31300e64be12b86a8dcb7',
    'number_of_results': 2,
  }, {
    'source_id': 'c96eb1686721220023c82e08f585efff',
    'number_of_results': 1
  }],
  'refinement': false,
  'search_results': [{
    'record_id': 'KB Article 1',
    'table_name': 'knowledge'
  }, {
    'record_id': 'KB Article 2',
    'table_name': 'knowledge'
  }, {
    'record_id': 'Employee Help',
    'table_name': 'userportal'
  }]
};
var directSearchData =
 searchObject.publish(JSON.stringify(payload));
```

This example dynamically collects direct search data from a custom search widget and passes it to the search analytics tables.

```
//client script
var payload = {
  query: this.data.query,
  portal_id: this.data.portalID,
  page_id: this.data.pageID,
  results_per_source: getSearchSources(),
  refinement_occurred: false,
};
var payloadObject = {
  action: "TestAction",
  payload: payload,
};
c.server.get(payloadObject);
```

```
//server script
if (input && input.action === "TestAction") {
  input.action = "";
  var textSearchAnalytics = new
 GlideSPSearchAnalytics().publish(JSON.stringify(input.payload
));
  return;
}
```

This example collects direct search-results-clicked data from a custom search widget and passes it to the search analytics [sys_search_result_clicked] table.

 GlideSPSearchAnalytics().publish(JSON.stringify(input.payload
));
  return;
}
```

GlideSPUtil - Global

The *GlideSPUtil* API provides utility methods to perform common backend functions that support a Service Portal.

Available utility methods:

- Resolve variables specified in the Dynamic page variables [sp_page_title_variable] table associated with a specified Service Portal page located in the Page [sp_page] table.
- Other methods

For additional information, see Service Portal pages.

GlideSPUtil - GlideSPUtil()

Instantiates a GlideSPUtil object.

Parameters

Name	Type	Description
None		

The following code example shows how to instantiate a GlideSPUtil object before calling any of its associated methods.

```
function() {
  var spUtil = new GlideSPUtil();
  var pageGR = spUtil.getPageRecordWithPageRoute('kb_article',
 '81b75d3147032100ba13a5554ee4902b', false);
  var queryParams = RP.getParameters();
  var hrUrl = spUtil.getHumanReadableUrl(pageGR, queryParams);
}
```

GlideSPUtil - getHumanReadableUrl()

Considers ‘id’ query parameter to identify the portal page (pageGR) and uses query string of the current transaction to call getHumanReadableUrl(GlideRecord pageGR, String queryString) and returns the final human readable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Human readable URL for the specified Service Portal record with the variables replaced with the contents of the *queryParams* string map.

The following code example shows how to.

```
function() {
  var spUtil = new GlideSPUtil();
  var hrUrl = spUtil.getHumanReadableUrl();
}
```

Output:

GlideSPUtil - getHumanReadableUrl(GlideRecord pageGR, String queryParams)

Converts the passed *queryParms* string parameter into a string map and then resolves the variables in the "Human readable url structure" string provided in the sp_page record and returns the final human readable part of the URL.

Parameters

Name	Type	Description
pageGR	GlideRecord	GlideRecord object of the record in the Page [sp_page] table on which to resolve the URL variables.
queryString	String	Query string.

Returns

Type	Description
String	Human readable URL for the specified Service Portal record with the variables replaced with the contents of the *queryParams* string map.

The following code example shows how to.

```
function() {
  var spUtil = new GlideSPUtil();
  var pageGR = spUtil.getPageRecordWithPageRoute('kb_article',
 '81b75d3147032100ba13a5554ee4902b', false);
  var queryString =
 GlideTransaction.get().getRequest().getQueryString();
  var hrUrl = spUtil.getHumanReadableUrl(pageGR, queryParams);
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSPUtil - getHumanReadableUrl(GlideRecord pageGR, StringMap queryParams)

Resolves the variables in the **Human readable url structure** field of the passed-in Service Portal template page object and returns a URL containing the specified query parameters and the resolved human readable parameters.

Use human readable keywords in a URL to:

- Enable your customers to better understand the purpose of the URL when it is not in the context of the associated page.
- Provide search engines with keywords to better locate the page.

For example, instead of just having a URL that contains unrecognisable key-value pairs such as this:

```
https://instance_name.servicenow.com/sp/en?
id=sc_cat_item&sys_id=ec80c13297968d1021983d1e6253af32&sysparm_catgory=1e80c1
```

You can add the item name to the URL so it is easier to understand the purpose of the URL:

```
https://instance_name.servicenow.com/sp/en/apple-iphone-13?
id=sc_cat_item&sys_id=ec80c13297968d1021983d1e6253af32&sysparm_catgory=1e80c1
```

Before you can use this method, you must define the dynamic page variables that are available for each of the Service Portal templates for which you want to include dynamic content in the URL. For details on adding these variables, see Add human readable keywords to page URLs.

Parameters

Name	Type	Description
pageGR	GlideRecord	GlideRecord object of theService Portal template page for which to resolve the dynamic URL variables. Located in the Page [sp_page] table.
queryParams	StingMap	URL query parameters to use to obtain the desired Service Portal page. For example: `{ "id": "sc_cat_item", "sys_id": "ec80c13297968d1021983d1e6253af32", "sysparm_catgory": "1e80c15697969f1032083d1e6253be15" }`

Returns

Type	Description
String	URL containing the resolved human readable elements for the dynamic variables specified in the Service Portal template page. For example, if the defined dynamic variable is *%item_name*, the URL contains the name of the item that the user selected, such as "apple-iphone-13, and all of the specified query parameters:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`https://instance_name.servicenow.com/sp/en/apple-iphone-13?id=sc_cat_item&sys_id=ec80c13297968d1021983d1e6253af32&syspa`

The following code example shows how to obtain a specific KB article and call the *`getHumanReaadableUrl()`* to apply the associated dynamic variables.

```
function() {
  var spUtil = new GlideSPUtil();
  var pageGR = spUtil.getPageRecordWithPageRoute('kb_article',
 '81b75d3147032100ba13a5554ee4902b', false);
  var queryParams = RP.getParameters();
  var hrUrl = spUtil.getHumanReadableUrl(pageGR, queryParams);
}
```

Output:

GlideStringUtil - Scoped, Global

The *`GlideStringUtil`* API provides string handling methods.

Access these methods using the static object GlideStringUtil. This class is available in scoped and global scripts.

GlideStringUtil - dotToUnderBar(String sourceString)

Replaces periods with underscore characters.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with periods replaced with underscores.

```
var filename="../../../../../../etc/passwd";
cleanFilename=GlideStringUtil.dotToUnderBar(filename);
gs.info(cleanFilename);
```

Output:

```
__/__/__/__/__/__/etc/passwd
```

GlideStringUtil - escapeAllQuotes(String sourceString)

Removes quotes from a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sourceString	String	The string to be processed.

Returns

Type	Description
String	The string with quotes removed.

```
mystring="let's escape some quotes";
escapeQuote=GlideStringUtil.escapeAllQuotes(mystring);
gs.info(escapeQuote);
```

Output:

```
lets escape some quotes
```

GlideStringUtil - escapeForHomePage(String sourceString)

Replaces problem characters with escape characters.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with problem characters replaced with escape characters.

```
mystring="<test> string \n to escape";
escapedString=GlideStringUtil.escapeForHomePage(mystring);
gs.info(escapedString);
```

Output:

```
%3ctest%3e string \n to escape
```

GlideStringUtil - escapeHTML(String htmlString)

Replaces illegal characters with their escape codes.

Using this method removes illegal characters that might cause the UI to render improperly, or trigger a client side attack such as JavaScript or HTML injection.

Parameters

Name	Type	Description
htmlString	String	Text to process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Text with illegal characters replaced with their escape codes.

```
mydata='"<>&';
mydata=GlideStringUtil.escapeHTML(mydata);
gs.info(mydata);
```

Output:

```
&amp;quot;&amp;lt;&amp;gt;&amp;amp;
```

GlideStringUtil - escapeNonPrintable(String sourceString)

Replaces non-printable characters with their printable notation.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with non-printable characters replaced with printable notation.

```
mystring="test \x09 non \x00 printable \x07 chars";
escapedString=GlideStringUtil.escapeNonPrintable(mystring);
gs.info(escapedString);
```

Output:

```
test \t non \u0000 printable \u0007 chars
```

GlideStringUtil - escapeQueryTermSeparator(String sourceString)

Replaces query term separators "^" with their escape sequence "^^".

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with query term separators replaced with the escape characters.

```
myquery="test^Test";
escapedQuery=GlideStringUtil.escapeQueryTermSeparator(myquery);
gs.info(escapedQuery);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
test^^Test
```

GlideStringUtil - escapeTicks(String sourceString)

Replaces quotes with escape characters by adding a backslash before each quote.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with backslashes added before quotes.

```
mystring="let's try escapeTicks";
escaped=GlideStringUtil.escapeTicks(mystring);
gs.info(escaped);
```

Output:

```
let\'s try escapeTicks
```

GlideStringUtil - getHTMLValue(String sourceString)

Replaces illegal HTML characters into HTML notation.

Using this method removes illegal characters that might cause the UI to render improperly, or trigger a client side attack such as JavaScript or HTML injection.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with illegal characters replaced with HTML notation.

```
mydata='&';
htmlvalue=GlideStringUtil.getHTMLValue(mydata);
gs.info(htmlvalue);
```

Output:

```
&amp;
```

GlideStringUtil - getNumeric(String sourceString)

Extracts numeric characters from a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text containing only numeric characters.

```
mystring='123 test 456 String 789 cleaning';
onlyNumeric=GlideStringUtil.getNumeric(mystring);
gs.info(onlyNumeric);
```

Output:

```
123456789
```

GlideStringUtil - isBase64(String sourceString)

Validates whether the specified string is a valid base64 string.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
Boolean	Flag that indicates whether the specified string is in valid base64 format. Possible values: • true: Valid base64 formatted string. • false: Invalid base64 formatted string.

```
//(adding a "*" to corrupt the base64 format)
base64="GethdTYehdtshetB*";
isValid=GlideStringUtil.isBase64(base64);
gs.info(isValid);
```

Output:

```
false
```

GlideStringUtil - isEligibleSysID(String sourceString)

Validates whether the specified string is in valid sys_id format.

The sys_id format is a sequence of 32 hexadecimal characters where all the characters are in the range [0-9, a-f, A-F].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
Boolean	Flag that indicates whether the specified string is in valid sys_id format. Possible values: • true: Valid sys_id formatted string. • false: Invalid sys_id formatted string.

```
sysID="62826bf03710200044e0bfc8bcbe5df1";
isElig=GlideStringUtil.isEligibleSysID(sysID);
gs.info(isElig);
```

Output:

```
true
```

GlideStringUtil - newLinesToBreaks(String sourceString)

Replaces the new line character, `/n`, with a break code, `<br/>`.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with new line characters replaced with HTML break code.

```
mystring="new line break \n, this is after the break";
replaceNewLine=GlideStringUtil.newLinesToBreaks(mystring);
gs.info(replaceNewLine);
```

Output:

```
new line break <br/>, this is after the break
```

GlideStringUtil - normalizeWhitespace(String sourceString)

Replaces carriage returns, line feeds, and tabs with spaces, and then removes leading, trailing, and duplicate spaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sourceString	String	Text to process.

Returns

Type	Description
String	Text with carriage returns, line feeds, and tabs replaced with spaces, and then leading, trailing, and duplicate spaces removed.

```
mystring="test with \n (new line) and \t (tabulation)";
normalizedString=GlideStringUtil.normalizeWhitespace(mystring);
gs.info(normalizedString);
```

Output:

```
test with (new line) and (tabulation)
```

GlideStringUtil - unEscapeHTML(String htmlString)

Replaces escape characters with their respective character.

This method replaces these escape characters: `< &gt:   & &quote;`.

Note: In scoped applications call this method as *`unescapeHTML(String)`*. In global applications call this method as *`unEscapeHTML(String)`*.

Parameters

Name	Type	Description
htmlString	String	String to process.

Returns

Type	Description
String	String with the escape characters replaced.

This code example shows the method being called in a global application.

```
mydata='&quot;&lt;&gt;&amp;';
unescaped=GlideStringUtil.unEscapeHTML(mydata);
gs.info(unescaped);
```

Output:

```
"<>&
```

This code example shows the method being called in a scoped application.

```
mydata='&quot;&lt;&gt;&amp;';
unescaped=GlideStringUtil.unescapeHTML(mydata);
gs.info(unescaped);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
" < > &
```

GlideStringUtil - urlEncode(String url)

Encodes non-ASCII characters, unsafe ASCII characters, and spaces so you can use the returned string on the Internet. Uses UTF-8 encoding. Uses percent (%) encoding.

Note: Only available in global scope.

Parameters

Name	Type	Description
url	String	String to encode.

Returns

Type	Description
String	String with non-ASCII characters, unsafe ASCII characters, and spaces encoded.

```
var mystring='Test characters: " < > & &quot; &lt; &gt; &amp;';
escapedString=GlideStringUtil.urlEncode(mystring);
gs.info(escapedString);
```

Output:

```
Test+characters%3A+%22+%3C+%3E+%26+%26quot%3B+%26lt%3B+%26gt%3B+
%26amp%3B
```

GlideSysAttachment - Global

The `GlideSysAttachment` API provides methods for handling attachments.

Content is returned as a GlideScriptableInputStream object when `getContentStream()` is called. The GlideScriptableInputStream contains the actual bytes not converted into a string.

GlideSysAttachment - GlideSysAttachment()

Creates an instance of the GlideSysAttachment class.

Parameters

Name	Type	Description
None		

GlideSysAttachment - copy(String sourceTable, String sourceID, String targetTable, String targetID)

Copies attachments from the source record to the target record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sourceTable	String	Name of the table with the attachments to be copied.
sourceID	String	Source table's sys_id.
targetTable	String	Name of the table on which to add the attachments.
targetID	String	Target table's sys_id.

Returns

Type	Description
String	Array of sys_ids of the attachments that were copied.

```
var attachment = new GlideSysAttachment();
var incidentSysID = 'ab1b30031b04ec101363ff37dc4bcbfc';
var incGR = new GlideRecord('incident');
incGR.get(incidentSysID);

var copiedAttachments = attachment.copy('incident',
 incidentSysID, 'problem', incGR.getValue('problem_id'));
gs.info('Copied attachments: ' + copiedAttachments);
```

Output:

```
Copied attachments:
 6e4621df1bc420501363ff37dc4bcbb0,a87769531b0820501363ff37dc4bc
ba2
```

GlideSysAttachment - deleteAttachment(String attachmentID)

Deletes the specified attachment.

Parameters

Name	Type	Description
attachmentID	String	Attachment's sys_id.

Returns

Type	Description
void	

```
var attachment = new GlideSysAttachment();
var attachmentSysID = 'a87769531b0820501363ff37dc4bcba2';
attachment.deleteAttachment(attachmentSysID);
```

GlideSysAttachment - getAttachments(String tableName, String sys_id)

Returns a GlideRecord containing the matching attachment metadata such as name, type, or size.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
tableName	String	Name of the table to which the attachment belongs; for example, incident.
sys_id	String	Sys_id of record to which the attachment belongs.

Returns

Type	Description
GlideRecord	GlideRecord object containing the matching attachment metadata such as name, type, or size.

The following script lists attachment file names for a record with two attachments.

```
var attachment = new GlideSysAttachment();

var agr = attachment.getAttachments('<table_name>',
 '<record_sys_id>');

while(agr.next())
gs.info(agr.getValue('file_name'));
```

Output:

```
*** Script: filename1.txt
*** Script: filename2.txt
```

GlideSysAttachment - getContentStream(String sysID)

Returns a GlideScriptableInputStream object given the sys_id of an attachment.

You can use the GlideTextReader API to read the content stream.

Parameters

Name	Type	Description
sysID	String	Attachment sys_id.

Returns

Type	Description
GlideScriptableInputStream	Stream that contains the attachment content.

```
var attachment = new GlideSysAttachment();
var attachmentSysID = '6e4621df1bc420501363ff37dc4bcbb0';
var attachmentContentStream =
 attachment.getContentStream(attachmentSysID);
gs.info('Attachment content stream: ' +
 attachmentContentStream);
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Attachment content stream:
 com.glide.communications.GlideScriptableInputStream@14bd299
```

GlideSysAttachment - write(GlideRecord record, String fileName, String contentType, String content)

Attaches a specified attachment to the specified record.

Parameters

Name	Type	Description
record	GlideRecord	Record to which to attach the attachment.
fileName	String	Attachment file name.
contentType	String	MIME type of the attachment, such as `image/png`. Located in the Attachment [sys_attachment] table in the **Content type** field.
content	String	Attachment content.

Returns

Type	Description
String	Attachment sys_id. Returns null if the attachment was not added.

```
var attachment = new GlideSysAttachment();

//set up inputs
var rec = new GlideRecord('incident');
rec.get('78271e1347c12200e0ef563dbb9a7109');
var fileName = 'example.txt';
var contentType = 'text/csv';
var content = 'The text that is stored inside my file';

var agr = attachment.write(rec, fileName, contentType, content);

gs.info('The attachment sys_id is: ' + agr);
```

Output:

```
The attachment sys_id is: 01271e4317c13311e0ef563dbb9abe34
```

GlideSysAttachment - writeContentStream(GlideRecord now_GR, String fileName, String contentType, GlideScriptableInputStream inputStream)

Inserts an attachment using the input stream.

Parameters

Name	Type	Description
now_GR	GlideRecord	Record to which to attach the attachment.
fileName	String	Attachment file name.
contentType	String	MIME type of the attachment, such as `image/png`. Located in the Attachment [sys_attachment] table in the **Content type** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
content	GlideScriptableInputStream	Attachment content.

Returns

Type	Description
String	Sys_id of the attachment created.

Attaches a content stream from the sys_attachment table to a test_table record.

```
function copyAttachmentToGlideRecord(conceptSysId) {

  // Get record from test_table using sys_id
  var targetGlideRecord = new GlideRecord("test_table");
  if (!targetGlideRecord.get(conceptSysId)) {
     throw ("Cannot find record created by test with sys_id: " +
 conceptSysId);
  }

  // Get record from sys_attachment table
  var sourceAttachmentGlideRecord = new
 GlideRecord('sys_attachment');
  sourceAttachmentGlideRecord.query();
  sourceAttachmentGlideRecord.next();

  // Get field values from retrieved sys_attachment record
  var fileName =
 sourceAttachmentGlideRecord.getValue('file_name');
  var contentType =
 sourceAttachmentGlideRecord.getValue('content_type');
  var sourceAttachmentSysId =
 sourceAttachmentGlideRecord.getValue('sys_id');

  // Attach sys_attachment record content stream to test_table
 record
  var gsa = new GlideSysAttachment();
  gsa.writeContentStream(
    targetGlideRecord,
    fileName,
    contentType,
    gsa.getContentStream(sourceAttachmentSysId));
  gs.info("Attachment created");
}
```

GlideSysAttachment - Scoped

The *GlideSysAttachment* API provides methods to handle attachments.

Content is returned as a string, not as a byte array when *getContent()* is called.

Content is returned as a GlideScriptableInputStream object when *getContentStream()* is called. The GlideScriptableInputStream contains the actual bytes not converted into a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideSysAttachment - GlideSysAttachment()

Creates an instance of the GlideSysAttachment class.

Parameters

Name	Type	Description
None		

Scoped GlideSysAttachment - copy(String sourceTable, String sourceID, String targetTable, String targetID)

Copies attachments from the source record to the target record.

Parameters

Name	Type	Description
sourceTable	String	Name of the table with the attachments to be copied.
sourceID	String	Source table's sys_id.
targetTable	String	Name of the table on which to add the attachments.
targetID	String	Target table's sys_id.

Returns

Type	Description
String	Array of sys_ids of the attachments that were copied.

```
var attachment = new GlideSysAttachment();
var incidentSysID = 'ab1b30031b04ec101363ff37dc4bcbfc';
var incGR = new GlideRecord('incident');
incGR.get(incidentSysID);

var copiedAttachments = attachment.copy('incident',
 incidentSysID, 'problem', incGR.getValue('problem_id'));
gs.info('Copied attachments: ' + copiedAttachments);
```

Output:

```
Copied attachments:
 6e4621df1bc420501363ff37dc4bcbb0,a87769531b0820501363ff37dc4bc
ba2
```

Scoped GlideSysAttachment - deleteAttachment(String attachmentID)

Deletes the specified attachment.

Parameters

Name	Type	Description
attachmentID	String	Attachment's sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var attachment = new GlideSysAttachment();
var attachmentSysID = 'a87769531b0820501363ff37dc4bcba2';
attachment.deleteAttachment(attachmentSysID);
```

Scoped GlideSysAttachment - getAttachments(String tableName, String sys_id)

Returns a GlideRecord containing the matching attachment metadata such as name, type, or size.

Parameters

Name	Type	Description
tableName	String	Name of the table to which the attachment belongs; for example, incident.
sys_id	String	Sys_id of record to which the attachment belongs.

Returns

Type	Description
GlideRecord	GlideRecord object containing the matching attachment metadata such as name, type, or size.

The following script lists attachment file names for a record with two attachments.

```
var attachment = new GlideSysAttachment();

var agr = attachment.getAttachments('<table_name>',
 '<record_sys_id>');

while(agr.next())
gs.info(agr.getValue('file_name'));
```

Output:

```
*** Script: filename1.txt
*** Script: filename2.txt
```

Scoped GlideSysAttachment - getContent(GlideRecord sysAttachment)

Returns the attachment content as a string.

This method is for use in scoped applications only. This method returns `undefined` when used in the global scope. To read attachment content in the global scope, use the *`getContentStream()`* method from the GlideSysAttachment - Global API.

This method supports the following file types for attachments.

- CSV (*.csv)
- JSON (*.json)
- Text (*.txt)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysAttachment	GlideRecord	Attachment record.

Returns

Type	Description
String	Attachment contents as a string. Returns up to 5MB of data.

```
var attachment = new GlideSysAttachment();

var agr = attachment.getAttachments('incident',
 '78271e1347c12200e0ef563dbb9a7109'); //create attachment
 GlideRecord

while(agr.next()) { //for each attachment on the incident record
   gs.info(agr.getValue('file_name')); //print file name of
 attachment
   var attachmentContent = attachment.getContent(agr);
   gs.info('Attachment content: ' + attachmentContent); //print
 attachment content
}
```

Output:

```
Doc1.txt
Attachment content: I am text in a txt file attached to a
 record.
```

Scoped GlideSysAttachment - getContentBase64(GlideRecord sysAttachment)

Returns the attachment content as a string with base64 encoding.

This method is for use in scoped applications only. This method returns `undefined` when used in the global scope. To read attachment content in the global scope, use the *`getContentStream`* method from the *`GlideSysAttachment - Global`* API.

Parameters

Name	Type	Description
sysAttachment	GlideRecord	Attachment record.

Returns

Type	Description
String	Attachment contents as a string with base64 encoding. Returns up to 5MB of data.

```
var attachment = new GlideSysAttachment();

var agr = attachment.getAttachments('incident',
 '78271e1347c12200e0ef563dbb9a7109'); //create attachment
 GlideRecord
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
while(agr.next()) { //for each attachment on the incident record
   gs.info(agr.getValue('file_name')); //print file name of
 attachment
   var attachmentContent = attachment.getContentBase64(agr);
   gs.info('Attachment content: ' + attachmentContent); //print
 attachment content
}
```

Output:

```
Doc1.txt
Attachment content:
 SSBhbSBOZXhOIGluIGEgdHhOIGZpbGUgYXROYWNoZWQgdG8gYSByZWNvcmQuI
AO=
```

Scoped GlideSysAttachment - getContentStream(String sysID)

Returns a GlideScriptableInputStream object given the sys_id of an attachment.

You can use the GlideTextReader API to read the content stream.

Parameters

Name	Type	Description
sysID	String	Attachment sys_id.

Returns

Type	Description
GlideScriptableInputStream	Stream that contains the attachment content.

```
var attachment = new GlideSysAttachment();
var attachmentSysID = '6e4621df1bc420501363ff37dc4bcbb0';
var attachmentContentStream =
 attachment.getContentStream(attachmentSysID);
gs.info('Attachment content stream: ' +
 attachmentContentStream);
```

Output:

```
Attachment content stream:
 com.glide.communications.GlideScriptableInputStream@14bd299
```

Scoped GlideSysAttachment - write(GlideRecord record, String fileName, String contentType, String content)

Attaches a specified attachment to the specified record.

Parameters

Name	Type	Description
record	GlideRecord	Record to which to attach the attachment.
fileName	String	Attachment file name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
contentType	String	MIME type of the attachment, such as `image/png`. Located in the Attachment [sys_attachment] table in the **Content type** field.
content	String	Attachment content.

Returns

Type	Description
String	Attachment sys_id. Returns null if the attachment was not added.

```
var attachment = new GlideSysAttachment();

//set up inputs
var rec = new GlideRecord('incident');
rec.get('78271e1347c12200e0ef563dbb9a7109');
var fileName = 'example.txt';
var contentType = 'text/csv';
var content = 'The text that is stored inside my file';

var agr = attachment.write(rec, fileName, contentType, content);

gs.info('The attachment sys_id is: ' + agr);
```

Output:

```
The attachment sys_id is: 01271e4317c13311e0ef563dbb9abe34
```

Scoped GlideSysAttachment - writeBase64(GlideRecord now_GR, String fileName, String contentType, String content_base64Encoded)

Inserts an attachment for the specified record using base64 encoded content.

Parameters

Name	Type	Description
now_GR	GlideRecord	Record to which the attachment is to be attached.
fileName	String	Attachment's file name.
contentType	String	Attachment's content type.
content	String	Attachment content in base64 format.

Returns

Type	Description
String	Sys_id of the attachment created.

```
var attachment = new GlideSysAttachment();

var rec = new GlideRecord('incident');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var incidentSysID = 'ab1b30031b04ec101363ff37dc4bcbfc';
rec.get(incidentSysID);
var fileName = 'example.txt';
var contentType = 'text/csv';
var base64Encodedcontent = 'SSBhbSB0ZXh0Lg==';

var agr = attachment.writeBase64(rec, fileName, contentType,
 base64Encodedcontent);

gs.info('The attachment sys_id is: ' + agr);
```

Output:

```
The attachment sys_id is: 10cde9971b0820501363ff37dc4bcba6
```

Scoped GlideSysAttachment - writeContentStream(GlideRecord now_GR, String fileName, String contentType, GlideScriptableInputStream inputStream)

Inserts an attachment using the input stream.

Parameters

Name	Type	Description
now_GR	GlideRecord	Record to which to attach the attachment.
fileName	String	Attachment file name.
contentType	String	MIME type of the attachment, such as `image/png`. Located in the Attachment [sys_attachment] table in the **Content type** field.
content	GlideScriptableInputStream	Attachment content.

Returns

Type	Description
String	Sys_id of the attachment created.

Attaches a content stream from the sys_attachment table to a test_table record.

```
function copyAttachmentToGlideRecord(conceptSysId) {

  // Get record from test_table using sys_id
  var targetGlideRecord = new GlideRecord("test_table");
  if (!targetGlideRecord.get(conceptSysId)) {
     throw ("Cannot find record created by test with sys_id: " +
 conceptSysId);
  }

  // Get record from sys_attachment table
  var sourceAttachmentGlideRecord = new
 GlideRecord('sys_attachment');
  sourceAttachmentGlideRecord.query();
  sourceAttachmentGlideRecord.next();

  // Get field values from retrieved sys_attachment record
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var fileName =
 sourceAttachmentGlideRecord.getValue('file_name');
  var contentType =
 sourceAttachmentGlideRecord.getValue('content_type');
  var sourceAttachmentSysId =
 sourceAttachmentGlideRecord.getValue('sys_id');

  // Attach sys_attachment record content stream to test_table
 record
  var gsa = new GlideSysAttachment();
  gsa.writeContentStream(
    targetGlideRecord,
    fileName,
    contentType,
    gsa.getContentStream(sourceAttachmentSysId));
  gs.info("Attachment created");
}
```

GlideSysListControl - Scoped

The *GlideSysListControl* API provides methods that enable you to determine if the **New** or **Edit** buttons are displayed.

GlideSysListControl - GlideSysListControl(String tableName)

Instantiates a GlideSysListControl object.

Parameters

Name	Type	Description
tableName	String	Name of the table

GlideSysListControl - getControlID()

Returns the sys_id for the control.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	sys_id of the control

```
var sysListCtrl = new GlideSysListControl("incident");
var controlID = sysListCtrl.getControlID();
gs.info(controlID);
```

Output:

```
91a807a60a0a3c74012113e28b47ca2e
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSysListControl - isOmitEditButton()

Returns true if the edit button is not displayed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True when the edit button is not displayed.

```
var sysListCtrl = new GlideSysListControl("incident");
var isOmitted = sysListCtrl.isOmitEditButton();
gs.info(isOmitted);
```

Output:

```
false
```

GlideSysListControl - isOmitNewButton()

Returns true when the New button is not displayed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True when the new button is not displayed.

```
var sysListCtrl = new GlideSysListControl("incident");
var isOmitted = sysListCtrl.isOmitNewButton();
gs.info(isOmitted);
```

Output:

```
false
```

GlideSystem - Global

The *GlideSystem* API, which is referred to by the variable name `gs` in any server-side JavaScript, provides a number of convenient methods to get information about the system, the current logged in user, and date/time information.

Many of the *GlideSystem* methods facilitate the easy inclusion of dates in query ranges, and are most often used in filters and reporting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - addErrorMessage(Object message)

Adds an error message for the current session.

Use *getErrorMessages()* to retrieve a list of error messages currently being shown.

Parameters

Name	Type	Description
message	Object	The message to add.

Returns

Type	Description
void	

```
gs.include("PrototypeServer");
  var ValidatePasswordStronger = Class.create();
  ValidatePasswordStronger.prototype = {
       process : function() {
          var user_password =
 request.getParameter("user_password");
          var min_len = 8;
          var rules = "Password must be at least " + min_len +
             " characters long and contain a digit, an uppercase
 letter, and a lowercase letter.";
          if (user_password.length() < min_len) {
             gs.addErrorMessage("TOO SHORT: " + rules);
             return false;
          }
          var digit_pattern = new RegExp("[0-9]", "g");
          if (!digit_pattern.test(user_password)) {
             gs.addErrorMessage("DIGIT MISSING: " + rules);
             return false;
          }
          var upper_pattern = new RegExp("[A-Z]", "g");
          if (!upper_pattern.test(user_password)) {
             gs.addErrorMessage("UPPERCASE MISSING: " + rules);
             return false;
          }
          var lower_pattern = new RegExp("[a-z]", "g");
          if (!lower_pattern.test(user_password)) {
             gs.addErrorMessage("LOWERCASE MISSING: " + rules);
             return false;
          }
          return true; // password is OK
       }
  }
[edit]
```

Scoped equivalent

To use the *addErrorMessage()* method in a scoped application, use the corresponding scoped method: addErrorMessage().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - addInfoMessage(Object message)

Adds an info message for the current session.

Use `getInfoMessages()` to retrieve the list of info messages being shown. This method is not supported for asynchronous business rules and cannot be used within transform scripts.

Parameters

Name	Type	Description
message	Object	The message to add.

Returns

Type	Description
void	

```
if ((!current.u_date1.nil()) && (!current.u_date2.nil())) {
  var start =
 current.u_date1.getGlideObject().getNumericValue();
  var end = current.u_date2.getGlideObject().getNumericValue();
  if (start > end) {
    gs.addInfoMessage('start must be before end');
    current.u_date1.setError('start must be before end');
    current.setAbortAction(true);
  }
}
```

Scoped equivalent

To use the `addInfoMessage()` method in a scoped application, use the corresponding scoped method: addInfoMessage().

GlideSystem - addMessage(String type, Object message)

Adds a message for the current session.

Parameters

Name	Type	Description
type	String	Type of message, such as `error` or `info`.
message	Object	Message to add to the current session.

Returns

Type	Description
void	

GlideSystem - beginningOfLastMonth()

Gets the date and time for the beginning of last month in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The GMT beginning of last month, in the format yyyy-mm-dd hh:mm:ss.

This example sets the date and time of the GlideDateTime object to the beginning of last month.

```
var date = new GlideDate();
date.setValue(gs.beginningOfLastMonth());
var dateasint = date.toString().replace('-','');
gs.print(dateasint);
```

Scoped equivalent

To use the *beginningOfLastMonth()* method in a scoped application, use the corresponding scoped method: beginningOfLastMonth().

GlideSystem - beginningOfLastWeek()

Returns the date and time for the beginning of last week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of last week. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of last week.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfLastWeek());
```

Scoped equivalent

To use the *beginningOfLastWeek()* method in a scoped application, use the corresponding scoped method: beginningOfLastWeek().

GlideSystem - beginningOfNextWeek()

Returns the date and time for the beginning of next week in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of next week. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of next week.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfNextWeek());
```

Scoped equivalent

To use the *beginningOfNextWeek()* method in a scoped application, use the corresponding scoped method: beginningOfNextWeek().

GlideSystem - beginningOfNextMonth()

Returns the date and time for the beginning of next month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of next month. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of next month.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfNextMonth());
```

Scoped equivalent

To use the *beginningOfNextMonth()* method in a scoped application, use the corresponding scoped method: beginningOfNextMonth().

GlideSystem - beginningOfNextYear()

Returns the date and time for the beginning of next year in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The GMT beginning of next year, in the format yyyy-mm-dd hh:mm:ss.

This example sets the value of the current Glide date/time record to the beginning of next year.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfNextYear());
```

Scoped equivalent

To use the *beginningOfNextYear()* method in a scoped application, use the corresponding scoped method: beginningOfNextYear().

GlideSystem - beginningOfThisMonth()

Returns the date and time for the beginning of the current month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of the current month. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of this month.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfThisMonth());
```

Scoped equivalent

To use the *beginningOfThisMonth()* method in a scoped application, use the corresponding scoped method: beginningOfThisMonth().

GlideSystem - beginningOfThisQuarter()

Returns the date and time for the beginning of the current quarter in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of the current quarter. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of the current quarter.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfThisQuarter());
```

Scoped equivalent

To use the *beginningOfThisQuarter()* method in a scoped application, use the corresponding scoped method: beginningOfThisQuarter().

GlideSystem - beginningOfThisWeek()

Returns the date and time for the beginning of this week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of the current week. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of the current week.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfThisWeek());
```

Scoped equivalent

To use the *beginningOfThisWeek()* method in a scoped application, use the corresponding scoped method: beginningOfThisWeek().

GlideSystem - beginningOfThisYear()

Returns the date and time for the beginning of this year in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of the current year. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of the current year.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfThisYear());
```

Scoped equivalent

To use the *`beginningOfThisYear()`* method in a scoped application, use the corresponding scoped method: beginningOfThisYear().

GlideSystem - beginningOfToday()

Retrieves the date and time for the beginning of today in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of the current day. Format: yyyy-mm-dd hh:mm:ss

This example sets the value of the current Glide date/time record to the beginning of the current day.

```
var gdt2 = new GlideDateTime(dt);
gdt2.setValue(gs.beginningOfToday());
```

GlideSystem - beginningOfTomorrow()

Retrieves the (UTC) beginning of tomorrow adjusted for the timezone of the current session.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of tomorrow. Format: yyyy-mm-dd hh:mm:ss

```
var today = new
 GlideDateTime(gs.beginningOfTomorrow()).getNumericValue();
```

GlideSystem - beginningOfYesterday()

Retrieves the date and time for the beginning of yesterday in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The GMT beginning of yesterday, in the format yyyy-mm-dd hh:mm:ss.

```
var start = new GlideDateTime();
start.setValue(gs.beginningOfYesterday());
```

GlideSystem - calDateDiff(String startDate, String endDate, Boolean numericValue)

Calculate the difference between two dates using the default calendar.

Calendars are now legacy. If Schedules are being used, see the 'Calculate during a given schedule' section of the topic Scheduling script use cases.

Parameters

Name	Type	Description
startDate	String	Starting date to compare in the current user's date format.
endDate	String	Ending date to compare in the current user's date format.
numericValue	Boolean	Flag that indicates ther format of the returned time value. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Return value is formatted in number of seconds • false: Return value is formatted ddd hh:mm:ss.

Returns

Type	Description
String	If the *numericValue* parameter is true, returns the difference between the two dates as an integer number of seconds. If false, returns the difference between the two dates in the format ddd hh:mm:ss.

```
var endDateTime = gs.nowDateTime();
gs.print('--- Total records: ' + countRecordsTotal);
gs.print('--- End time: ' + endDateTime);
gs.print('Time diff: ' + gs.calDateDiff(startDateTime,
 endDateTime));
```

GlideSystem - dateDiff(String startDate, String endDate, Boolean numericValue)

Calculates the difference between two dates.

This method expects the earlier date as the first parameter and the later date as the second parameter; otherwise, the method returns the difference as a negative value. Use *getDisplayValue()* to convert the strings to the expected format.

This method expects parameters in the user/system date time format, which may not be the same as the internal format. Using parameters in formats other than the user/system date time format may return invalid results.

If you are working with GlideDateTime objects use the GlideDateTime *subtract()* method instead of *dateDiff()*.

Parameters

Name	Type	Description
startDate	String	The starting date to compare in the current user's date format.
endDate	String	The ending date to compare in the current user's date format.
numericValue	Boolean	If true, the return value will be formatted in number of seconds; if false the return value will be formatted ddd hh:mm:ss.

Returns

Type	Description
String	If the numericValue parameter is true, returns the difference between the two dates as an integer number of seconds; if false, returns the difference between the two dates in the format ddd hh:mm:ss.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Given two date/times as DateTime objects
// Set the values this way to ensure a consistent input time
var date1 = new GlideDateTime();
var date2 = new GlideDateTime();
date1.setDisplayValueInternal('2014-01-01 12:00:00');
date2.setDisplayValueInternal('2014-01-01 13:00:00');

// Determine the difference as number of seconds (returns a
 string)
// Use getDisplayValue() to convert the string to the format
 expected by dateDiff()
var diffSeconds = gs.dateDiff(date1.getDisplayValue(),
 date2.getDisplayValue(), true);

// JavaScript will coerce diffSeconds from a string to a number
// since diffSeconds is being compared to a number
var msg = (diffSeconds <= 0) ? ' is on or after ' : ' is before
 ';
gs.print(date1.getDisplayValue() + msg +
 date2.getDisplayValue())
```

GlideSystem - dateGenerate(String date, String range)

Generates a date and time for the specified date in GMT.

Parameters

Name	Type	Description
date	String	Date to generate in GMT. Format: yyyy-mm-dd
range	String	Start, end, or a time. Format: 24-hour hh:mm:ss

Returns

Type	Description
String	Generated date and time. If the range is `start`, the returned value is yyyy-mm-dd 00:00:00. If range is `end` the return value is yyyy-mm-dd 23:59:59. Format: yyyy-mm-dd hh:mm:ss

This example shows using *`dateGenerate()`* to set the start date when querying records in the Incident table.

```
var tableData = new GlideRecord('incident');
tableData.addEncodedQuery("sys_created_onBETWEENjavascript:gs.da
teGenerate('2015-10-07','00:00:00')@javascript:gs.daysAgoEnd(0)^
priority=1^severityIN1,2");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
tableData.query();
gs.info("Count: " + tableData.getRowCount());
```

Output:

```
Count: 7
```

Scoped equivalent

To use the *dateGenerate()* method in a scoped application, use the corresponding scoped method: dateGenerate().

GlideSystem - daysAgo(Number days)

Returns a date and time for a certain number of days ago.

Parameters

Name	Type	Description
days	Number	Number of days

Returns

Type	Description
String	GMT of the specified number of days ago. Format: yyyy-mm-dd hh:mm:ss.

```
function contractNoticeDue() {
  var now_GR = new GlideRecord("contract");
  now_GR.addQuery("u_contract_status", "Active");
  now_GR.query();
  while (now_GR.next()) {
    if ((now_GR.u_termination_date <= gs.daysAgo(-90)) &&
 (now_GR.u_contract_duration == "Long")) {
      now_GR.u_contract_status = "In review";
    }
    else if ((now_GR.u_termination_date <= gs.daysAgo(-50)) &&
 (now_GR.u_contract_duration == "Medium")) {
      now-GR.u_contract_status = "In review";
    }
    else if ((now_GR.u_termination_date <= gs.daysAgo(-10)) &&
 (now_GR.u_contract_duration == "Short")) {
      now_GR.u_contract_status = "In review";
    }
  }
  now_GR.update();
}
```

Scoped equivalent

To use the *daysAgo()* method in a scoped application, use the corresponding scoped method: daysAgo().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - daysAgoEnd(Number days)

Returns a date and time for the end of the day a specified number of days ago.

Parameters

Name	Type	Description
days	Number	Integer number of days

Returns

Type	Description
String	The GMT end of the day in the format yyyy-mm-dd hh:mm:ss.

This example shows using *daysAgoEnd()* to set the end date when querying records in the Incident table.

```
var tableData = new GlideRecord('incident');
tableData.addEncodedQuery("sys_created_onBETWEENjavascript:gs.da
teGenerate('2015-10-07','00:00:00')@javascript:gs.daysAgoEnd(0)^
priority=1^severityIN1,2");
tableData.query();
gs.addInfoMessage("Count: " +tableData.getRowCount());
```

Scoped equivalent

To use the *daysAgoEnd()* method in a scoped application, use the corresponding scoped method: daysAgoEnd().

GlideSystem - daysAgoLocal(Number days)

Returns the date and time of the beginning of the day for the specified number of days ago. The returned date and time reflect the time zone of the current session (local time).

Parameters

Name	Type	Description
days	Number	Number of days ago

Returns

Type	Description
String	Local date and time for the beginning of the day in the user-defined date time format. If the date time format is not modified from its initial value the format is yyyy-mm-dd hh:mm:ss.

```
if (due_in == "1 Day") {
  dd = gs.daysAgoLocal(-1);
}
if (due_in == "1 Week") {
  dd = gs.daysAgoLocal(-7);
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - daysAgoStart(Number days)

Returns a date and time for the beginning of the day a specified number of days ago.

Parameters

Name	Type	Description
days	String	Integer number of days

Returns

Type	Description
String	GMT start of the day in the format yyyy-mm-dd hh:mm:ss

```
var now_GR = new GlideRecord('sysapproval_approver');
now_GR.addQuery('state', 'requested');
now_GR.addQuery('sys_updated_on', '<', gs.daysAgoStart(5));
now_GR.query();
```

Scoped equivalent

To use the *daysAgoStart()* method in a scoped application, use the corresponding scoped method: daysAgoStart().

GlideSystem - endOfLastMonth()

Returns the date and time for the end of last month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT of the end of last month. Format: yyyy-mm-dd hh:mm:ss

This example shows how to query a report record from the last day of last month.

```
var month = gs.endOfLastMonth();
var monthd = new GlideDateTime(month);
monthd.addDays(-1);

var queueLast = new
 GlideRecord('u_amazon_connect_phone_metrics');
queueMtd.addQuery('u_queue_name',queueNames[i]);
queueMtd.addEncodedQuery('u_time_range=MTD');
queueMtd.addEncodedQuery('u_report_date'+ monthd);
queueMtd.orderByDesc('u_report_date');
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
queueMtd.query();

if(queueMtd.next()){
  gs.info(queueMtd.u_report_date);
}
```

Scoped equivalent

To use the *endOfLastMonth()* method in a scoped application, use the corresponding scoped method: endOfLastMonth().

GlideSystem - endOfLastWeek()

Returns the date and time for the end of last week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT end of last week. Format: yyyy-mm-dd hh:mm:ss

This example shows how to query records opened on the last week of the previous month.

```
var inc = new GlideRecord('incident');
inc.addQuery('active=true^priority=1^opened_atONLast
 month@javascript:gs.beginningOfLastMonth()@javascript:gs.endOfL
astMonth()^opened_atONLast
 week@javascript:gs.beginningOfLastWeek()@javascript:gs.endOfLas
tWeek()');
inc.query();
while(inc.next())
 {
   gs.addInfoMessage(inc.getRowCount());
 }
```

Scoped equivalent

To use the *endOfLastWeek()* method in a scoped application, use the corresponding scoped method: endOfLastWeek().

GlideSystem - endOfLastYear()

Returns the date and time for the end of last year in GMT.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	GMT in format yyyy-mm-dd hh:mm:ss.

This example shows how to query records created for all records created in the last year.

```
var inc = new GlideRecord('incident');
inc.addEncodedQuery('sys_created_onONLast
 year@javascript:gs.beginningOfLastYear()@javascript:gs.endOfLas
tYear()');
inc.query();
while(inc.next()){
  inc.assignment_group = "d625dccec0a8016700a222a0f7900d06";
  inc.update();
}
```

Scoped equivalent

To use the *endOfLastYear()* method in a scoped application, use the corresponding scoped method: endOfLastYear().

GlideSystem - endOfNextMonth()

Returns the date and time for the end of next month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT data and time. Format yyyy-mm-dd hh:mm:ss

This example shows how to query KB knowledge records created since the beginning of today until the end of next month.

```
var query =
 "kb_knowledge_base=e81c9a0ddbc15810c38f0763b99619c1^ORkb_knowle
dge_base=21302e89db055810c38f0763b99619cc^valid_toBETWEENjavascr
ipt:gs.beginningOfToday()@javascript:gs.endOfNextMonth()^ORworkf
low_state=pending_retirement^latest=true";
var rec = new GlideRecord('kb_knowledge');
rec.addEncodedQuery(query);
rec.addQuery('author', current.author);
rec.query();
while (rec.next()) {
  var Kbtitle = rec.getValue('short_description');
  articles.push(rec.number.toString()+ '' + Kbtitle);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  template.print('Click here to view record<a href="https://give
 urs instance url here/nav_to.do?uri=kb_knowledge.do?sys_id=' +
 rec.sys_id + '">' + rec.number + '</a>');
}
var articlesList = "<ul>";
for (i = 0; i <= articles.length-1; i++) {
  articlesList = articlesList + "<li>" + articles[i] + "</li>";
}
articlesList = articlesList + "</ul>";
```

Scoped equivalent

To use the *endOfNextMonth()* method in a scoped application, use the corresponding scoped method: endOfNextMonth().

GlideSystem - endOfNextWeek()

Returns the date and time for the end of next week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT date and time for the end of next week. Format yyyy-mm-dd hh:mm:ss

This example shows how to use *endOfNextWeek()* in a query to obtain all visitors in the past week.

```
var title = 'Visitors arriving this Week';
var visitorQuery =
 'active=true^category=visitor_request^u_my_start_dateONThis
 week@javascript:gs.beginningOfThisWeek()@javascript:gs.endOfNex
tWeek()';
```

Scoped equivalent

To use the *endOfNextWeek()* method in a scoped application, use the corresponding scoped method: endOfNextWeek().

GlideSystem - endOfNextYear()

Returns the date and time for the end of next year in GMT.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	GMT date and time for the end of next year. Format: yyyy-mm-dd hh:mm:ss

This example shows how to use *endOfNextYear()* to set the GlideDateTime object to the end of next year.

```
setEndDate : function(dt) {
  var gdt2 = new GlideDateTime(dt);
  gdt2.setValue(gs.endOfNextYear());
}
```

Scoped equivalent

To use the *endOfNextYear()* method in a scoped application, use the corresponding scoped method: endOfNextYear().

GlideSystem - endOfThisMonth()

Returns the date and time for the end of this month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT date and time for the end of this month. Format yyyy-mm-dd hh:mm:ss

This example shows how to use *endOfThisMonth()* to set the GlideDateTime object to the end of the current month.

```
setEndDate : function(dt) {
  var gdt2 = new GlideDateTime(dt);
  gdt2.setValue(gs.endOfThisMonth());
}
```

Scoped equivalent

To use the *endOfThisMonth()* method in a scoped application, use the corresponding scoped method: endOfThisMonth().

GlideSystem - endOfThisQuarter()

Returns the date and time for the end of this quarter in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT date and time for the end of this quarter. Format: yyyy-mm-dd hh:mm:ss

This example shows how to use *endOfThisQuarter()* to set the GlideDateTime object to the end of the current month.

```
setEndDate : function(dt) {
  var gdt2 = new GlideDateTime(dt);
  gdt2.setValue(gs.endOfThisQuarter());
}
```

Scoped equivalent

To use the *endOfThisQuarter()* method in a scoped application, use the corresponding scoped method: endOfThisQuarter().

GlideSystem - endOfThisWeek()

Returns the date and time for the end of this week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT date and time for the end of this week. Format: yyyy-mm-dd hh:mm:ss

This example shows how to use *endOfThisWeek()* to set the GlideDateTime object to the end of the current month.

```
setEndDate : function(dt) {
  var gdt2 = new GlideDateTime(dt);
  gdt2.setValue(gs.endOfThisWeek());
}
```

Scoped equivalent

To use the *endOfThisWeek()* method in a scoped application, use the corresponding scoped method: endOfThisWeek().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - endOfThisYear()

Returns the date and time for the end of this year in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT date and time for the end of this year. Format yyyy-mm-dd hh:mm:ss

This example shows how to use *endOfThisYear()* to set the GlideDateTime object to the end of the current month.

```
setEndDate : function(dt) {
  var gdt2 = new GlideDateTime(dt);
  gdt2.setValue(gs.endOfThisYear());
}
```

Scoped equivalent

To use the *endOfThisYear()* method in a scoped application, use the corresponding scoped method: endOfThisYear().

GlideSystem - endOfToday()

Retrieves the date and time for the end of today in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss.

```
var beginToday = gs.beginningOfToday();
        var endToday = gs.endOfToday();
        var beginTomorrow = gs.beginningOfTomorrow();
        var endTomorrow = gs.endOfTomorrow();
        var beginYesterday = gs.beginningOfYesterday();
        var endYesterday = gs.endOfYesterday();

        gs.info('beginningOfToday: ' + beginToday);
        gs.info('endOfToday: ' + endToday);
        gs.info('-----------');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        gs.info('beginningOfTomorrow: ' + beginTomorrow);
        gs.info('endOfTomorrow: ' + endTomorrow);
        gs.info('beginningOfYesterday: ' + beginYesterday);
        gs.info('endOfYesterday: ' + endYesterday);
        gs.info('-----------');
        var gdt1 = new GlideDateTime(beginToday);
        var gdt2 = new GlideDateTime(beginTomorrow);
        var dur = GlideDateTime.subtract(gdt1, gdt2); //the
difference between gdt1 and gdt2
        gs.info('BeginTomorrow: ' + dur.getDisplayValue());

        var gdt1 = new GlideDateTime(endToday);
        var gdt2 = new GlideDateTime(endTomorrow);
        var dur = GlideDateTime.subtract(gdt1, gdt2); //the
difference between gdt1 and gdt2
        gs.info('EndTomorrow: ' + dur.getDisplayValue());

        var gdt1 = new GlideDateTime(beginToday);
        var gdt2 = new GlideDateTime(beginYesterday);
        var dur = GlideDateTime.subtract(gdt2, gdt1); //the
difference between gdt1 and gdt2
        gs.info('BeginningYesterday: ' + dur.getDisplayValue());

        var gdt1 = new GlideDateTime(endToday);
        var gdt2 = new GlideDateTime(endYesterday);
        var dur = GlideDateTime.subtract(gdt2, gdt1); //the
difference between gdt1 and gdt2
        gs.info('EndYesterday: ' + dur.getDisplayValue());
```

GlideSystem - endOfTomorrow()

Retrieves the date and time for the end of tomorrow in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss.

```
var tomorrowEnd = new GlideDateTime();
tomorrowEnd.setValue(gs.endOfTomorrow());
```

GlideSystem - endOfYesterday()

Gets the date and time for the end of yesterday in GMT.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	GMT in the format (yyyy-mm-dd huh:mm:ss).

```
var yesterdayEnd = new GlideDateTime();
yesterdayEnd.setValue(gs.endOfYesterday());
```

GlideSystem - eventQueue(String name, Object glideRecord, String parm1, String parm2, String queue)

Queues an event for the event manager.

Parameters

Name	Type	Description
name	String	Name of the event being queued.
glideRecord	Object	GlideRecord object, such as "current".
parm1	String	(Optional) Saved with the instance if specified.
parm2	String	(Optional) Saved with the instance if specified.
queue	String	Name of the queue.

Returns

Type	Description
void	

```
if (current.operation() != 'insert' &&
 current.comments.changes()) {
    gs.eventQueue("incident.commented", current, gs.getUserID(),
 gs.getUserName());
}
```

Scoped equivalent

To use the *eventQueue()* method in a scoped application, use the corresponding scoped method: eventQueue().

GlideSystem - eventQueueScheduled(String name, Object glideRecord, String parm1, String parm2, Object expiration)

Queues an event for the event manager at a specified date and time.

Parameters

Name	Type	Description
name	String	Name of the event being queued.
glideRecord	Object	GlideRecord object, such as "current".
parm1	String	(Optional) Saved with the instance if specified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
parm2	String	(Optional) Saved with the instance if specified.
expiration	Object	Date and time to process this event.

Returns

Type	Description
void	

```
if (current.operation() != 'insert' &&
 current.comments.changes()) {
    gs.eventQueueScheduled("incident.commented", current,
 gs.getUserID(), gs.getUserName(), new GlideDateTime('2018-06-02
 20:00:00'));
}
```

Scoped equivalent

To use the *eventQueueScheduled()* method in a scoped application, use the corresponding scoped method: eventQueueScheduled().

GlideSystem - flushMessages()

Clears session messages saved using *addErrorMessage()* or *addInfoMessage()*.

Session messages are shown at the top of the form. In client side scripts, use *g_form.clearMessages()* to remove session messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to parse through and pass back error messages and then clears the messages using *flushMessages()*.

```
MySessionUtil.getSessionError = function() {
  var msg = null;
  var msgs = gs.getErrorMessages().toArray();
  if (msgs.length > 0) {
    msg = msgs[0] + '';
    gs.flushMessages();
  }
  return msg;
};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - getAvatar()

Returns the file path to the user's avatar.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The file path to the user's avatar.

```
var avatarFile = gs.getUser().getAvatar();
gs.addInfoMessage('User avatar ID: ' + avatarFile);
```

Output:

```
User avatar ID: c148e1d13741310042106710ce41f149.iix?t=small
```

GlideSystem - getCurrentScopeName()

Returns the name of the current application scope.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Current scope name.

This example shows how to use *getCurrentScopeName()* to get the scope of the processor.

```
var incident_GR = new GlideRecord('Incident');

if (incident_GR.get("2e3f6baddb9ad600added8fdbf9618cb")) {
  gs.debug("processor scope = "+ gs.getCurrentScopeName());
  var w = new global.Workflow();
  var context = w.startFlow('1f4a4baddb9ad600affed8fdbf9619bc',
 incident_GR, "update");   //id = id workflow
}
```

Scoped equivalent

To use the *getCurrentScopeName()* method in a scoped application, use the corresponding scoped method: getCurrentScopeName().

GlideSystem - getDateFormat()

Returns the date format associated with the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The date format associated with the current user.

The following example returns the date format associated with the user.

```
var userDateFormat = gs. getDateFormat();
gs.info(userDateFormat);
```

Output:

```
yyyy-MM-dd
```

GlideSystem - getDateTimeFormat()

Returns the date and time format associated with the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The date and time format associated with the current user.

The following example returns the format of the date and time that is associated with the user.

```
var userDateTimeFormat = gs.getDateTimeFormat();
gs.info(userDateTimeFormat);
```

Output:

```
yyyy-MM-dd HH:mm:ss
```

GlideSystem - getDisplayColumn(String tableName)

Retrieves the display column for the table.

Parameters

Name	Type	Description
tableName	String	Name of the table from which to get the display column name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Display column name

```
// Return the sys_id value for a given table and its display
 value
function GetIDValue(table, displayValue) {
    var rec = new GlideRecord(table);
    var dn = gs.getDisplayColumn(table);
    if (rec.get(dn, displayValue))
        return rec.sys_id;
    else
        return null;
}
```

GlideSystem - getDisplayValueFor(String tableName, String recordID, String fieldName)

Returns the display value for a specified field on a specified record.

Parameters

Name	Type	Description
tableName	String	Name of the table.
recordID	String	Sys_id for the record.
fieldName	String	Name of the field whose display value to return.

Returns

Type	Description
String	Display value for the field.

This example shows how to use *`getDisplayValueFor()`* to return the display value of the *`number`* field.

```
var value =
 gs.getDisplayValueFor(current.getTableName(),current.getValue('
sys_id'),'number');
```

GlideSystem - getErrorMessages()

Returns the list of error messages for the session that were added by *`addErrorMessage()`*.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	List of error messages

This example shows how to parse through and pass back error messages using *getErrorMessages()*.

```
MySessionUtil.getSessionError = function() {
  var msg = null;
  var msgs = gs.getErrorMessages().toArray();
  if (msgs.length > 0) {
    msg = msgs[0] + '';
    gs.flushMessages();
  }
  return msg;
};
```

Scoped equivalent

To use the *getErrorMessages()* method in a scoped application, use the corresponding scoped method: getErrorMessages().

GlideSystem - getEscapedProperty(String key, Object substituteObject)

Retrieves the property and escapes it for XML parsing.

Parameters

Name	Type	Description
key	String	Key for the property whose value should be returned.
substituteObject	Object	Optional. Object to return if the property is not found.

Returns

Type	Description
String	Property, or the substituteObject if the property is not found.

```
var propValue =
 gs.getEscapedProperty("com.example.my_test_property");
gs.addInfoMessage("This is my property value " + propValue);
```

GlideSystem - getImpersonatingUserDisplayName()

Returns the display name of the impersonating user.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Display name of the impersonating user.

This example shows how to obtain the impersonator's user display name.

```
var user = gs.getUserDisplayName();
gs.print ("The current user display name is: " + user);

var name = gs.getImpersonatingUserDisplayName();
gs.print("Impersonating user display name: " + name);
```

Output:

```
The current user display name is: abel.tuter
Impersonating user display name: admin
```

GlideSystem - getImpersonatingUserName()

Returns the name of the impersonating user or null if not impersonating.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of impersonating user

This example shows how to obtain the impersonator's user name.

```
var name = gs.getImpersonatingUserName();
var actual_user = null;
if (name == null || name == '')
  actual_user = user;
else
  actual_user = Packages.com.glide.sys.User.getUser(name);

var recent_impersonations =
 actual_user.getPreference('recent.impersonations');
var admin_role=actual_user.hasRole("admin");
```

GlideSystem - getInfoMessages()

Retrieves the list of info messages for the session that were added by *addInfoMessage()*.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	List of info messages.

This example shows how to obtain the information messages.

```
var messages = gs.getInfoMessages();
if (messages.toString().indexOf('Conflicts Detected') == -1)
  gs.addInfoMessage(msg);
```

GlideSystem - getInitials()

Returns the user's initials.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user's initials.

```
var userInitials = gs.getUser().getInitials();
gs.addInfoMessage('User initials: ' + userInitials);
```

Output:

```
User initials: SA
```

GlideSystem - getMessage(String messageID, Object args)

Retrieves translated messages from the Message [sys_ui_message] table to display in a UI.

If the specified message identifier (key) exists in the Message [sys_ui_message] table for the current language, the method returns the translated message. If the specified message identifier does not exist for the current language, the method returns the English version of the message. If the message identifier does not exist in the table, then it returns the message ID.

For additional information about the Message table, see Message table.

Note: If the UI message has a tick ('), there may be issues with the message in the script; to escape the ticks ('), use *`getMessageS(String, Object)`*.

Parameters

Name	Type	Description
messageID	String	Message identifier. You can locate this value in the Key field of the Message [sys_ui_message] table. Note the Key field may look exactly like the actual message string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
args	Object	Optional. List of strings or other values defined by java.text.MessageFormat that replace the variables within the specified message. For example: `gs.getMessage("Abort adding action '{0}', same subflow can't be added twice in this subflow.", current.action.name);` In this example *`'{0}'`* is replaced with the content of *`current.action.name`*. **Note:** The passed in values are not translated. They are inserted verbatim in the message.

Returns

Type	Description
String	Requested UI message.

This example shows the message returned for the current user when Spanish is the current language.

```
var my_message = gs.getMessage("rows will not be updated");
alert(my_message);
```

Output:

```
las filas no se actualizarán
```

This example shows how to replace a single variable within a message.

```
// current.action.name is "update record"
var my_message = gs.getMessage("Abort adding action '{0}',
 same subflow can't be added twice in this subflow.",
 current.action.name);
alert(my_message);
```

Output:

```
Abort adding action update record, same subflow can't be added
 twice in this subflow.
```

This example shows how to replace multiple variables within a message.

```
// current.sub_flow.name is 'schedule users'
// current.action.name is "update record"
var my_message = gs.getMessage("Abort adding action '{0}',
 same subflow can't be added twice in {1} subflow.",
 [current.action.name, current.sub_flow.name]);
alert(my_message);
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Abort adding action update record, same subflow can't be added
 twice in schedule users subflow.
```

Scoped equivalent

To use the *getMessage()* method in a scoped application, use the corresponding scoped method: getMessage().

GlideSystem - getMessageS(String messageID, Object args)

Retrieves translated messages to display in the UI and escapes all ticks (').

If the specified message identifier (key) exists in the Message [sys_ui_message] table for the current language, the method returns the translated message. If the specified message identifier does not exist for the current language, the method returns the English version of the message. If the message identifier does not exist in the table, then it returns the message ID.

For additional information about the Message table, see Message table.

Useful if you are inserting into a JavaScript expression from Jelly.

Parameters

Name	Type	Description
MessageID	String	Message identifier. You can locate this value in the Key field of the Message [sys_ui_message] table. Note the Key field may look exactly like the actual message string.
args	Object	Optional. List of strings or other values defined by java.text.MessageFormat that replace the variables within the specified message. For example: `gs.getMessage("Abort adding action '{0}', same subflow can't be added twice in this subflow.", current.action.name);` In this example *'{0}'* is replaced with the content of *current.action.name*. **Note:** The passed in values are not translated. They are inserted verbatim in the message.

Returns

Type	Description
String	Specified message with ticks escaped.

```
/*
"I love France" translates to "J'aime la France" in French.
Rendering this without escaping the tick in "J'aime" would break
 Jelly, because
the tick would prematurely end the variable assignment, and
 everything that
follows (aime la France') would be a jelly syntax error.
*/
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var my_message = '${gs.getMessageS("I love France")}';
alert(my_message);
```

Output:

```
J'aime la France
```

GlideSystem - getMessageLang(String message, String language, Array args)

Translates the specified message into the specified language.

You can also embed variables in the passed message. The method resolves those variables with the values passed in the *args* array.

Parameters

Name	Type	Description
message	String	Message to translate.
language	String	Language in which to translate the message. Format: BCP 47 standard
args	Array	Optional. List of strings or other values defined by java.text.MessageFormat that replace the variables within the specified message. For example: `gs.getMessageLang("Abort adding action '{0}', same subflow can't be added twice in this subflow.", current.action.name);` In this example *'{0}'* is replaced with the content of *current.action.name*. **Note:** The passed in values are not translated. They are inserted verbatim in the message.

Returns

Type	Description
String	Translated message.

The following example transforms the specified message into Spanish.

```
var my_message = gs.getMessageLang("New email", "es");
gs.info(my_message);
```

Output:

```
Nuevo correo electrónico
```

The following example shows how to replace variables within a message.

```
var my_message = gs.getMessageLang("There are {0} new emails for
 {1}", "es", [current.numEmails, current.userName]);
gs.info(my_message);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
Hay 7 correos nuevos para John Smith
```

GlideSystem - getNodeName(Object obj, Number index)

Returns the node name for the specified index.

Parameters

Name	Type	Description
obj	Object	Object to examine.
index	Number	Index from which to obtain the node name.

Returns

Type	Description
String	Node's name

```
function doInsert(nodeList) {
  gs.print('Doing insert');
  var task = new GlideRecord('task');
  task.initialize();
  for (var x=0; x < nodeList.size(); x++) {
    var name = gs.getNodeName(nodeList, x);
    var value = gs.getNodeValue(nodeList, x);
    task.setValue(name, value);
  }
  task.insert();
}
```

GlideSystem - getNodeValue(Object obj, Number index)

Returns the node value for the specified index.

Parameters

Name	Type	Description
obj	Object	Object to examine.
index	Number	Index from which to get the node valu.e

Returns

Type	Description
Object	Node value

```
function doInsert(nodeList) {
  gs.print('Doing insert');
  var task = new GlideRecord('task');
  task.initialize();
  for (var x=0; x < nodeList.size(); x++) {
    var name = gs.getNodeName(nodeList, x);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var value = gs.getNodeValue(nodeList, x);
    task.setValue(name, value);
  }
  task.insert();
}
```

GlideSystem - getPreference(String key, Object default)

Returns the specified user preference.

Parameters

Name	Type	Description
key	String	Key for the preference.
default	Object	Default value to use if the specified preference is not found.

Returns

Type	Description
String	Preference value. If no preference, returns the specified default value.

```
function getSelectedProject() {
  var array= new Array();
  var prj_id = gs.getPreference("prj_id"); //This will fetch
 value from user preference
  var gr = new GlideRecord('pm_project_task');
  gr.addQuery('parent', prj_id);
  gr.addActiveQuery();
  while(gr.next()) {
    array.push(gr.sys_id.toString());
  }
  return array;
}
```

GlideSystem - getProperty(String key, Object alt)

Returns the value of a Glide property. If the property is not found, returns the specified *alt* value.

Parameters

Name	Type	Description
key	String	Key for the property whose value should be returned.
alt	Object	Optional. Alternate object to return if the property is not found.

Returns

Type	Description
String	Value of the Glide property, or the alternate object defined above.

```
//Check for attachments and add link if there are any
var attachment_link = '';
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var rec = new GlideRecord('sc_req_item');
rec.addQuery('sys_id', current.request_item);
rec.query();
if(rec.next()){
  if(rec.hasAttachments()){
    attachment_link = gs.getProperty('glide.servlet.uri') +
 rec.getLink();
  }
}
```

GlideSystem - getScriptError(String script)

Returns the script error found in the specified script, if there is one.

Note: The script is not executed by this function, it is only checked for syntax errors.

Parameters

Name	Type	Description
script	String	Script to check for errors.

Returns

Type	Description
String	Error message. Null if there is no error.

```
if (gs.isValidScript(current.script) == false)
  {
    current.setAbortAction(true);
    var error = gs.getScriptError(current.script);
    current.script.setError(error);
  }
```

GlideSystem - getSession()

Returns a GlideSession object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideSession Object	GlideSession object for the current session

```
if(!gs.hasRole("admin") && gs.getSession().isInteractive() &&
 gs.getUserName() != "guest"){
  var qc = current.addQuery('u_visibility', "both");
  qc.addOrCondition('u_visibility', '');
  if (gs.getImpersonatingUserName() != null) {
    gs.getSession().clearClientData('navQuery');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
  var navQuery = gs.getSession().getClientData('navQuery');
  if (navQuery == null) {
    var isManager =
 gs.getUser().getRecord().getValue('u_is_manager');
      if (!isManager) {
        qc.addOrCondition('u_visibility', 'nonmanager');
        gs.getSession().putClientData('navQuery', 'nonmanager');
      } else {
        qc.addOrCondition('u_visibility', 'manager');
        gs.getSession().putClientData('navQuery', 'manager');
        }
  } else {
  qc.addOrCondition('u_visibility', navQuery);
  }
}
```

Scoped equivalent

To use the *getSession()* method in a scoped application, use the corresponding scoped method: getSession().

GlideSystem - getSessionID()

Returns the GlideSession session ID.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Session ID

```
var gr_NOW = new GlideRecord('v_user_session');
var sessionId = gs.getSessionID();
gs.log("Session ID is: " + sessionId);
```

Output

```
Session ID is: FEE589B3DB7EE4103DD9C39D139619D7
```

Scoped equivalent

To use the *getSessionID()* method in a scoped application, use the corresponding scoped method: getSessionID.

GlideSystem - getStyle(String tableName, String fieldName, String fieldValue)

Returns the style defined for the table, field, and field value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
tableName	String	Table name
fieldName	String	Field name
fieldValue	String	Field value

Returns

Type	Description
String	Style of the specified field.

```
var returnString = gs.getStyle('<tableName>', '<fieldName>',
 '<fieldValue>');
gs.print(returnString);
```

GlideSystem - getTimeFormat()

Returns the time format associated with the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The time format associated with the current user.

```
var userTimeFormat = gs. getTimeFormat();
gs.info(userTimeFormat);
```

Output:

```
HH:mm:ss
```

GlideSystem - getUser()

Returns a reference to the user object for the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideUser	Reference to a user object for the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to get the current user object.

```
var user = gs.getUser();
gs.print ("The current user is: " + user);
```

Output:

```
The current user is: com.glide.sys.User@db5dd9
```

The following example shows how to check whether the current user has the workflow_admin role.

```
var role = gs.getUser().hasRole('workflow_admin');
gs.print ("Does the current user have the workflow_admin role: "
 + role);
```

Output:

```
Does the current user have the workflow_admin role: true
```

Scoped equivalent

To use the *getUser()* method in a scoped application, use the corresponding scoped method: getUser().

GlideSystem - getUserDisplayName()

Gets the display name of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name field of the current user. For example, this method returns Abel Tuter as opposed to abel.tuter.

This example gets the current user's display name.

```
gs.info(gs.getUserDisplayName());
```

Output:

```
System Administrator
```

Scoped equivalent

To use the *getUserDisplayName()* method in a scoped application, use the corresponding scoped method: getUserDisplayName().

GlideSystem - getUserID()

Returns the sys_id of the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the current user.

This example gets the current user's sys_id.

```
var currentUserId = gs.getUserID();
gs.print("Current user ID: " + currentUserId);
```

Output:

```
Current user ID: 6816f79cc0a8016401c5a33be04be441
```

Scoped equivalent

To use the *`getUserID()`* method in a scoped application, use the corresponding scoped method: getUserID().

GlideSystem - getUserName()

Returns the user name of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user name of the current user. For example, this method returns abel.tuter as opposed to Abel Tuter.

This example gets the user name of the current user and an impersonated user.

```
var user = gs.getUserName();
gs.info("The current user name is: " + user);

var impUser = new GlideImpersonate();
impUser.impersonate("62826bf03710200044e0bfc8bcbe5df1");
var user2 = gs.getUserName();
gs.info("The impersonated user name is: " + user2);
```

Output:

```
The current user name is: admin
The impersonated user name is: abel.tuter
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *getUserName()* method in a scoped application, use the corresponding scoped method: getUserName().

GlideSystem - getUserNameByUserID(String user_id)

Returns the user display name based on a provided user login name.

Parameters

Name	Type	Description
user_id	String	Login name of the user from which to retrieve the associated display name.

Returns

Type	Description
String	Display name of the requested user. **Note:** If this method can't find a user with the requested ID, it returns the input value provided.

The following example shows how to get the specified user's display name.

```
var displayName = gs.getUserNameByUserID('abel.tuter');
gs.info('User display name is: ' + displayName);
```

Output:

```
User display name is: Abel Tuter
```

GlideSystem - getXMLNodeList(String xml)

Constructs an array of all the nodes and values in an XML document.

Parameters

Name	Type	Description
xml	String	XML document to parse.

Returns

Type	Description
Array list	List of names and values of the outer most XML node.

The following example shows how to get a list of XML nodes and their associated values in an array list.

```
var nodeList =
 gs.getXMLNodeList("<note><to>Tove</to><from>Jani</from><heading
>Reminder</heading><body>Don't forget me this
 weekend!</body></note>");
gs.print ("The node contains: " + nodeList);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
The node contains: [to : Tove, from : Jani, heading : Reminder,
 body : Don't forget me this weekend!]
```

GlideSystem - getXMLText(String xml, String xpathQuery)

Returns the XML text for the first element in the XML string that matches the XPath query.

Parameters

Name	Type	Description
xml	String	XML string to search.
xpathQuery	String	XPath query to match.

Returns

Type	Description
String	XML node matching the search parameters.

The following example shows how to get the value of a specified XML element within a passed-in node.

```
var nodeList =
 gs.getXMLText("<outer><note><to>Tove</to><from>Jani</from><head
ing>Reminder</heading><body>Don't forget me this
 weekend!</body></note></outer>", "//from");
gs.print ("The from element contains: " + nodeList);
```

Output:

```
The from element contains: Jani
```

GlideSystem - hasRole(String roleName)

Determines if the current user has at least one of the passed-in roles.

Parameters

Name	Type	Description
roleName	String	Comma-separated list of roles.

Returns

Type	Description
Boolean	Flag that indicates whether the current user has at least one of the specified roles. Possible values: • true: User has at least one of the passed-in roles. Also returns true if the user has the administrator role. • false: User does not have any of the passed-in roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to check whether the current user has the admin or groups_admin role.

```
if (!gs.hasRole("admin, groups_admin") &&
 gs.getSession().isInteractive()) {
  var qc = current.addQuery("u_hidden", "!=", "true"); //cannot
 see hidden groups...
  qc.addOrCondition("sys_id",
 "javascript:getMyGroups()"); //...unless in the hidden group
}
```

Scoped equivalent

To use the *hasRole()* method in a scoped application, use the corresponding scoped method: hasRole().

GlideSystem - hasRoleInGroup(Object roleName, Object group)

Determines if the current user has the specified role within a specified group.

Parameters

Name	Type	Description
roleName	Object	Name of the role.
group	Object	Sys_id of the group to check for the specified role.

Returns

Type	Description
Boolean	Flag that indicates whether the current user has the specified role in the specified group. Possible values: • true: The logged-in user is assigned to the specified role in the specified group. • false: The logged-in user is not assigned to the specified role in the specified group.

The following example shows how to check whether the sys_user_group group has the role_name role.

```
var group = new GlideRecord('sys_user_group');
group.addQuery('name', 'GROUP_NAME');
group.setLimit(1);
group.query();
if (group.next()) {
   if (gs.hasRoleInGroup('role_name', group)) {
      gs.print('User has role in group');
   } else {
      gs.print('User does NOT have role in group');
   }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - hoursAgo(Number hours)

Returns a date and time for the specified number of hours ago. The returned value is adjusted for the time zone of the instance.

Parameters

Name	Type	Description
hours	Number	Number of hours ago.

Returns

Type	Description
String	UTC date and time for the specified number of hours ago. Format: yyyy-mm-dd hh:mm:ss

```
var currentDateTime = gs.hoursAgo(0);
gs.info("Current date/time: " + currentDateTime);

var agoDateTime = gs.hoursAgo(1);
gs.info("Ago date/time: " + agoDateTime);
```

Output

```
Current date/time: 2021-03-17 20:53:25
Ago date/time: 2021-03-17 19:53:25
```

Scoped equivalent

To use the *hoursAgo()* method in a scoped application, use the corresponding scoped method: hoursAgo().

GlideSystem - hoursAgoEnd(Number hours)

Returns a date and time for the end of the hour for the specified number of hours ago. The returned value is adjusted for the time zone of the instance.

Parameters

Name	Type	Description
hours	Number (Integer)	Number of hours ago.

Returns

Type	Description
String	UTC date and time for the end of the specified number of hours ago. Format: yyyy-mm-dd hh:mm:ss

```
var currentDateTime = gs.hoursAgoEnd(0);
gs.print("Current date/time: " + currentDateTime);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var agoDateTime = gs.hoursAgoEnd(1);
gs.print("Ago date/time: " + agoDateTime);
```

Output

```
Current date/time: 2021-03-17 20:59:59
Ago date/time: 2021-03-17 19:59:59
```

Scoped equivalent

To use the *hoursAgoEnd()* method in a scoped application, use the corresponding scoped method: hoursAgoEnd().

GlideSystem - hoursAgoStart(Number hours)

Returns a date and time for the start of the hour for the specified number of hours ago. The returned value is adjusted for the time zone of the instance.

Parameters

Name	Type	Description
hours	Number	Number of hours ago.

Returns

Type	Description
String	UTC date and time for the end of the specified number of hours ago. Format: yyyy-mm-dd hh:mm:ss

```
var currentDateTime = gs.hoursAgoStart(0);
gs.print("Current date/time: " + currentDateTime);

var agoDateTime = gs.hoursAgoStart(1);
gs.print("Ago date/time: " + agoDateTime);
```

Output

```
Current date/time: 2021-03-17 20:00:00
Ago date/time: 2021-03-17 19:00:00
```

Scoped equivalent

To use the *hoursAgoStart()* method in a scoped application, use the corresponding scoped method: hoursAgoStart().

GlideSystem - isFirstDayOfMonth(Object date)

Checks whether the date in the specified date object is the first day of the month.

Parameters

Name	Type	Description
date	Object	Date object on which to check the date, such as GlideDateTime or GlideDate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the date in the specified date object is the first day of the month. Possible values: • true: First day of the month. • false: Not the first day of the month.

This example show how to determine whether the date in the specified date object is the first day of the month.

```
var gdt = new GlideDateTime();
gdt.setValue('2021-04-01 12:00:00');
var currentDay = gs.isFirstDayOfMonth(gdt);
gs.print("First day of month: " + currentDay);

gdt.setValue('2021-04-21 12:00:00');
var currentDay = gs.isFirstDayOfMonth(gdt);
gs.print("First day of month: " + currentDay);
```

Output

```
First day of month: true
First day of month: false
```

GlideSystem - isFirstDayOfWeek(Object date)

Checks whether the date in the specified date object is the first day of the week. This method uses the ISO standard of Monday being the first day of the week.

Parameters

Name	Type	Description
date	Object	Date object on which to check the date, such as GlideDateTime or GlideDate.

Returns

Type	Description
Boolean	Flag that indicates whether the date in the current date object is the first day of the week (Monday). Possible values: • true: First day of the week. • false: Not the first day of the week.

This example show how to determine whether the date in the specified date object is the first day of the week.

```
var gdt = new GlideDateTime();
gdt.setValue('2021-03-02 12:00:00');
var currentDay = gs.isFirstDayOfWeek(gdt);
gs.info("First day of week: " + currentDay);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gdt.setValue('2021-03-22 12:00:00');
var currentDay = gs.isFirstDayOfWeek(gdt);
gs.info("First day of week: " + currentDay);
```

Output

```
First day of week: false
First day of week: true
```

GlideSystem - isFirstDayOfYear(Object date)

Checks whether the date in the specified date object is the first day of the year.

Parameters

Name	Type	Description
date	Object	Date object on which to check the date, such as GlideDateTime or GlideDate.

Returns

Type	Description
Boolean	Flag that indicates whether the date in the specified date object is the first day of the year. Possible values: • true: First day of the year. • false: Not the first day of the year.

This example show how to determine whether the date in the specified date object is the first day of the year.

```
var gdt = new GlideDateTime();
gdt.setValue('2020-12-31 12:00:00');
var currentDay = gs.isFirstDayOfYear(gdt);
gs.info("First day of year: " + currentDay);

gdt.setValue('2021-01-01 12:00:00');
var currentDay = gs.isFirstDayOfYear(gdt);
gs.info("First day of year: " + currentDay);
```

Output

```
First day of year: false
First day of year: true
```

GlideSystem - isInteractive()

Checks if the current session is interactive.

An example of an interactive session is when a user logs in using the log-in screen. An example of a non-interactive session is using a SOAP request to retrieve data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the session is interactive. Possible values: • true: Session is interactive. • false: Session is not interactive.

```
if (!gs.hasRole('admin') && gs.isInteractive()) {
  var qc1 = current.addQuery('u_group', '');
  var gra = new GlideRecord('sys_user_grmember');
  gra.addQuery('user', gs.getUserID());
  gra.query();
  while (gra.next()) {
    qc1.addOrCondition('u_group', gra.group);
  }
}
```

Scoped equivalent

To use the *`isInteractive()`* method in a scoped application, use the corresponding scoped method: isInteractive().

GlideSystem - isLastDayofMonth(Object date)

Checks whether the date in the specified date object is the last day of the month.

Parameters

Name	Type	Description
date	Object	Date object on which to check the date, such as GlideDateTime or GlideDate.

Returns

Type	Description
Boolean	Flag that indicates whether the date in the specified date object is the last day of the month. Possible values: • true: Last day of the month. • false: Not the last day of the month.

This example show how to determine whether the date in the specified date object is the last day of the month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gdt = new GlideDate();
gdt.setValue('2020-12-31 12:00:00');
var currentDay = gs.isLastDayOfMonth(gdt);
gs.print("First day of year: " + currentDay);

gdt.setValue('2021-01-01 12:00:00');
var currentDay = gs.isLastDayOfMonth(gdt);
gs.print("First day of year: " + currentDay);
```

Output

```
Last day of month: true
Last day of month: false
```

GlideSystem - isLastDayOfWeek(Object date)

Checks whether the date in the specified date object is the last day of the week. This method uses the ISO standard of Sunday being the last day of the week.

Parameters

Name	Type	Description
date	Object	Date object on which to check the date, such as GlideDateTime or GlideDate.

Returns

Type	Description
Boolean	Flag that indicates whether the date in the current date object is the last day of the week (Sunday). Possible values: • true: Last day of the week. • false: Not the last day of the week.

This example show how to determine whether the date in the specified date object is the last day of the week.

```
var gdt = new GlideDate();
gdt.setValue('2021-03-01 12:00:00');
var currentDay = gs.isLastDayOfWeek(gdt);
gs.info("Last day of week: " + currentDay);

gdt.setValue('2021-03-21 12:00:00');
var currentDay = gs.isLastDayOfWeek(gdt);
gs.info("Last day of week: " + currentDay);
```

Output

```
First day of week: false
First day of week: true
```

GlideSystem - isLastDayOfYear(Object date)

Checks whether the date in the specified date object is the last day of the year.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
date	Object	Date object on which to check the date, such as GlideDateTime or GlideDate.

Returns

Type	Description
Boolean	Flag that indicates whether the date in the current date object is the last day of the year. Possible values: • true: Last day of the year. • false: Not the last day of the year.

This example show how to determine whether the date in the specified date object is the last day of the year.

```
var gdt = new GlideDateTime();
gdt.setValue('2020-12-31 12:00:00');
var currentDay = gs.isLastDayOfYear(gdt);
gs.info("Last day of year: " + currentDay);

gdt.setValue('2021-01-01 12:00:00');
var currentDay = gs.isLastDayOfYear(gdt);
gs.info("Last day of year: " + currentDay);
```

Output

```
Last day of year: true
Last day of year: false
```

GlideSystem - isLoggedIn()

Determines if the current user is currently logged in.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current user is logged in. Possible values: • true: User is logged in. • false: User is not logged in.

This example show how to determine whether the current user is logged in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if(gs.isLoggedIn())
  gs.info("Current user is logged in");
else
  gs.info("Current user is NOT logged in");
```

Output

```
Current user is logged in
```

Scoped equivalent

To use the *isLoggedIn()* method in a scoped application, use the corresponding scoped method: isLoggedIn().

GlideSystem - isMobile()

Determines whether the request came from a mobile device.

You can use this method in UI action conditions and business rules.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the request came from a mobile device. Possible values: • true: Mobile device. • false: Non-mobile device.

This example show how to determine whether the current device is a mobile device.

```
if(gs.isMobile())
    gs.info("Submitted from mobile UI");
  else
   gs.info("NOT submitted from mobile UI");
```

Output

```
Submitted from mobile UI
```

Scoped equivalent

To use the *isMobile()* method in a scoped application, use the corresponding scoped method: isMobile().

GlideSystem - lastWeek()

Returns the date and time one week ago in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Date and time one week ago. Format: yyyy-MM-dd hh:mm:ss

This example show how to obtain the date that is one week from the date in the current date object.

```
var gdt = new GlideDateTime();
gdt.setValue('2021-03-22 01:00:00');

gs.info("Current date: " + gs.nowDateTime());

gs.info("One week earlier: " + gs.lastWeek());
```

Output

```
Current date: 2021-03-22 15:27:07
One week earlier: 2021-03-15 15:27:07
```

GlideSystem - log(String message, String source)

Logs a message to the system log and saves it to the syslog table.

Parameters

Name	Type	Description
message	String	Message to log.
source	String	Optional. Source of the message.

Returns

Type	Description
void	

The following example shows how to post a log entry using constants and variables.

```
var count = new GlideAggregate('incident');
count.addQuery('active', 'true');
count.addAggregate('COUNT', 'category');
count.query();
while (count.next()) {
   var category = count.category;
   var categoryCount = count.getAggregate('COUNT', 'category');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   gs.log("The are currently " + categoryCount + " incidents
 with a category of " + category, "Incident Counter");
}
```

GlideSystem - logError(String message, String source)

Logs an error to the system log and saves it to the syslog table.

Parameters

Name	Type	Description
message	String	Error message to log.
source	String	Optional. Source of the message.

Returns

Type	Description
void	

The following example logs an error if the Incident table cannot be found.

```
var gr_NOW = new GlideRecord("incident");
if (!gr_NOW.isValid()) {
  gs.logError('Incident table could not be found');
  return;
}
```

GlideSystem - logWarning(String message, String source)

Logs a warning to the system log and saves it to the syslog table.

Parameters

Name	Type	Description
message	String	Message to log.
source	String	Optional. Source of the message.

Returns

Type	Description
void	

The following example logs a warning if the Incident table cannot be found.

```
var gr_NOW = new GlideRecord("incident");
if (!gr_NOW.isValid()) {
  gs.logWarning('Incident table could not be found');
  return;
}
```

GlideSystem - minutesAgo(Number minutes)

Returns a date and time for the specified number of minutes ago.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
minutes	Number	Number of minutes in the past to return.

Returns

Type	Description
String	UTC date and time for the specified number of minutes ago. Format: yyyy-mm-dd hh:mm:ss

This example shows how to use the minutesAgo() method in an addQuery() call.

```
// Check to see if the user has failed to login too many times
// when the limit is reached, lock the user out of the system
//
//Check failed logins in the last 15 minutes
var now_GR = new GlideRecord('sysevent');
now_GR.addQuery('name', 'login.failed');
now_GR.addQuery('parm1', event.parm1.toString());
now_GR.addQuery('sys_created_on','>=', gs.minutesAgo(15));
now_GR.query();
var rowCount = now_GR.getRowCount();
if(rowCount >= 5){
  var now_GR = new GlideRecord("sys_user");
  now_GR.addQuery("user_name", event.parm1.toString());
  now_GR.query();
  if (now_GR.next()) {
    now_GR.locked_out = true;
    now_GR.update();
    gs.log("User " + event.parm1 + " locked out due to too many
 invalid login attempts");
  }
}
```

GlideSystem - minutesAgoEnd(Number minutes)

Returns a date and time for the end of the minute a certain number of minutes ago.

Parameters

Name	Type	Description
minutes	Number	Integer number of minutes ago, such as 5 or 11.

Returns

Type	Description
String	GMT the specified number of minutes ago, at the end of the minute (59 seconds). Format: yyyy-mm-dd hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example displays the current date and time and the date and time 30 minutes ago at the end of the minute in GMT.

```
var nowDateTime = new GlideDateTime();
gs.print("Now: " + nowDateTime);
var thirtyMinutesAgoDateTime = gs.minutesAgoEnd(30);
gs.print("Thirty minutes ago end time: " +
 thirtyMinutesAgoDateTime);
```

Output

```
Now: 2021-10-20 15:22:13
Thirty minutes ago end time: 2021-10-20 14:52:59
```

Scoped equivalent

To use the *minutesAgoEnd()* method in a scoped application, use the corresponding scoped method: minutesAgoEnd().

GlideSystem - minutesAgoStart(Number minutes)

Returns a date and time for the start of the minute a certain number of minutes ago.

Parameters

Name	Type	Description
minutes	Number	Integer number of minutes ago, such as 15 or 112.

Returns

Type	Description
String	GMT the specified number of minutes ago, at the start of the minute. Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time 30 minutes ago at the start of the minute in GMT.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var thirtyMinutesAgoDateTime = gs.minutesAgoStart(30);
gs.info("Thirty minutes ago: " + thirtyMinutesAgoDateTime);
```

Output

```
Now: 2021-10-20 14:56:18
Thirty minutes ago: 2021-10-20 14:26:00
```

Scoped equivalent

To use the *minutesAgoStart()* method in a scoped application, use the corresponding scoped method: minutesAgoStart().

GlideSystem - monthsAgo(Number months)

Returns a date and time for a certain number of months ago.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
months	Number	Integer number of months ago.

Returns

Type	Description
String	GMT of the specified number of months ago at the exact same time. Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time one month ago at the same time in GMT.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var oneMonthAgoDateTime = gs.monthsAgo(1);
gs.info("One month ago: " + oneMonthAgoDateTime);
```

Output

```
Now: 2021-10-20 15:29:15
One month ago: 2021-09-20 15:29:15
```

Scoped equivalent

To use the *monthsAgo()* method in a scoped application, use the corresponding scoped method: monthsAgo().

GlideSystem - monthsAgoEnd(Number months)

Returns a date and time for the last day of the month a certain number of months ago.

Parameters

Name	Type	Description
months	Number	Integer number of months, such as 4 or 16.

Returns

Type	Description
String	GMT end of the month the specified number of months ago. Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time two months ago at the end of the business month.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var endOfTheMonthDateTime = gs.monthsAgoEnd(2);
gs.info("End of the month: " + endOfTheMonthDateTime);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output

```
Now: 2021-10-20 19:23:35
End of the month: 2021-09-01 06:59:59
```

GlideSystem - monthsAgoStart(Number months)

Returns a date and time for the start of the month a certain number of months ago.

Parameters

Name	Type	Description
months	Number	Integer number of months ago, such as 5 or 14.

Returns

Type	Description
String	GMT start of the month the specified number of months ago. Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time three months ago in GMT.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var threeMonthsAgoDateTime = gs.monthsAgoStart(3);
gs.info("Three months ago start date and time: " +
 threeMonthsAgoDateTime);
```

Output

```
Now: 2021-10-20 15:05:27
Three months ago start date and time: 2021-07-01 07:00:00
```

Scoped equivalent

To use the *monthsAgoStart()* method in a scoped application, use the corresponding scoped method: monthsAgoStart().

GlideSystem - nil(Object obj)

Queries an object and returns true if the object is null or contains an empty string.

Parameters

Name	Type	Description
obj	Object	The object to be checked.

Returns

Type	Description
Boolean	True if null or empty string; otherwise, false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if ((!current.u_date1.nil()) && (!current.u_date2.nil())) {
  var start =
 current.u_date1.getGlideObject().getNumericValue();
  var end = current.u_date2.getGlideObject().getNumericValue();
  if (start > end) {
    gs.addInfoMessage('start must be before end');
    current.u_date1.setError('start must be before end');
    current.setAbortAction(true);
  }
}
```

Scoped equivalent

To use the *nil()* method in a scoped application, use the corresponding scoped method: nil().

GlideSystem - now()

Returns the current date in UTC.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current date in the user-defined format, in UTC.

```
// When the user password changes then set the
 u_password_last_reset field
// to now so we know when to force another update

var now_GR = new GlideRecord("sys_user");
if (now_GR.get(event.parm1.toString())) {
    // Do something based on the Password Changing
    gs.log("The user password changed so do something else...");
    now_GR.u_password_last_reset = gs.now();
    now_GR.update();
}
```

GlideSystem - nowNoTZ()

Returns the current date and time in UTC format.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The current UTC date time

```
// When the user password changes then set the
 u_password_last_reset field
// to now so we know when to force another update

var now_GR = new GlideRecord("sys_user");
if (now_GR.get(event.parm1.toString())) {
    // Do something based on the Password Changing
    gs.log("The user password changed so do something else...");
    now_GR.u_password_last_reset = gs.nowNoTZ();
    now_GR.update();
}
```

GlideSystem - nowDateTime()

Returns the current date and time in the user-defined format.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Current date and time in the user-defined format. For more information on setting the system date and time format, see Date and Date/Time fields.

```
var currentDateTime = gs.nowDateTime();
gs.print("Current date/time: " + currentDateTime);
```

Output

```
Current date/time: 2021-03-17 14:04:02
```

When setting a variable in a workflow script to the current date and time, use the *setDisplayValue()* method. The following script sets the workflow variable *end_date* to the current date and time.

```
current.variables.end_date.setDisplayValue(gs.nowDateTime());
```

GlideSystem - nowGlideDateTime()

Gets a GlideDateTime object with the current date and time.

After you get a GlideDateTime object with the current date and time, you can use the GlideDateTime methods to perform date-time operations, such as performing date-time calculations, formatting a date-time, or converting between date-time formats.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	GlideDateTime object with the current date and time in GMT format.

Sets the field u_target_date to the current date and time in GMT format.

```
current.u_target_date = gs.nowGlideDateTime();
```

GlideSystem - print(String message)

Writes a message to the system log.

This method does not write the message to the syslog table unless debug has been activated.

Parameters

Name	Type	Description
message	String	The message to log

Returns

Type	Description
void	

```
var rec = new GlideRecord('incident');
rec.addQuery('active',false);
rec.query();
while (rec.next()) {
 gs.print('Inactive incident ' + rec.number + ' deleted');
 rec.deleteRecord();
}
```

GlideSystem - quartersAgo(Number quarters)

Returns a date and time for a certain number of quarters ago.

Parameters

Name	Type	Description
quarters	Number	Integer number of the quarters ago.

Returns

Type	Description
String	GMT of the quarter that was the specified number of quarters ago.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time four quarters ago at the same time.

```
var nowDateTime = new GlideDateTime();
gs.print("Now: " + nowDateTime);
var fourQuartersAgoDateTime = gs.quartersAgo(4);
gs.print("Four quarters ago: " + fourQuartersAgoDateTime);
```

Output

```
Now: 2021-10-20 16:27:32
Four quarters ago: 2020-10-20 16:27:32
```

GlideSystem - quartersAgoEnd(Number quarters)

Returns a date and time for the last day of the quarter, for a specified number of quarters ago.

Parameters

Name	Type	Description
quarters	Number	An integer number of quarters

Returns

Type	Description
String	GMT end of the quarter that was the specified number of quarters ago, in the format yyyy-mm-dd hh:mm:ss

Scoped equivalent

To use the *quartersAgoEnd()* method in a scoped application, use the corresponding scoped method: quartersAgoEnd().

GlideSystem - quartersAgoStart(Number quarters)

Returns a date and time for the first day of the quarter, for a specified number of quarters ago.

Parameters

Name	Type	Description
quarters	Number	An integer number of quarters

Returns

Type	Description
String	GMT end of the month that was the specified number of quarters ago, in the format yyyy-mm-dd hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *quartersAgoStart()* method in a scoped application, use the corresponding scoped method: quartersAgoStart().

GlideSystem - setProperty(String key, String value, String description)

Sets the specified key to the specified value.

Note: Care should be taken when setting system properties (sys_properties) using this method as it causes a system-wide cache flush. Each flush can cause system degradation while the caches rebuild. If a value must be updated often, it should not be stored as a system property. In general, you should only place values in the sys_properties table that do not frequently change.

Parameters

Name	Type	Description
key	String	The key for the property to be set.
value	String	The value of the property to be set.
description	String	A description of the property.

Returns

Type	Description
void	

```
gs.setProperty("glide.foo","bar","foo");
gs.info(gs.getProperty("glide.foo"));
```

Output: bar

Scoped equivalent

To use the *setProperty()* method in a scoped application, use the corresponding scoped method: setProperty().

GlideSystem - setRedirect(Object URI)

Sets the redirect URI for this transaction, which then determines the next page the user will see.

Parameters

Name	Type	Description
URI	Object	URI to set as the redirect

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example redirects the user to a particular catalog item, and passes along the current email as a parameter.

```
gs.setRedirect("com.glideapp.servicecatalog_cat_item_view.do?sys
parm_id=d41ce5bac611227a0167f4bf8109bf70&sysparm_user="
+ current.sys_id + "&sysparm_email=" + current.email)
```

Scoped equivalent

To use the `setRedirect()` method in a scoped application, use the corresponding scoped method: setRedirect().

GlideSystem - setReturn(Object URI)

Sets the return URI for this transaction. This determines what page the user will be directed to when they return from the next form.

Parameters

Name	Type	Description
URI	Object	URI to set as the return location.

Returns

Type	Description
void	

This example ensures that the user will be returned to the current page when they are done with the next one.

```
gs.setReturn (current.getLink(true));
```

GlideSystem - tableExists(String tableName)

Determines if a database table exists in the ServiceNow instance.

Parameters

Name	Type	Description
tableName	String	Name of the table to check.

Returns

Type	Description
Boolean	Flag that indicates whether the specified table exists in the ServiceNow instance. Possible values: • true: Table exists • false: Table does not exist

This example shows checking whether the incident and foo tables exist in the ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info("Does the incident table exist? " +
 gs.tableExists("incident"));

gs.info("Does the foo table exist? " + gs.tableExists("foo"));
```

Output

```
Does the incident table exist? true
Does the foo table exist? false
```

Scoped equivalent

To use the *tableExists()* method in a scoped application, use the corresponding scoped method: tableExists().

GlideSystem - userID()

Returns the sys_id of the user associated with this session. Use *getUserID()* instead.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the current user.

The following example shows how to unassign all active Incident records assigned to the current user.

```
var incidentGR = new GlideRecord('incident');
incidentGR.addActiveQuery();

// Filter results to incidents assigned to the current user
var currentUserSysId = gs.userID();
incidentGR.addQuery('assigned_to', currentUserSysId);
incidentGR.query();

while (incidentGR.next()) {
    incidentGR.setValue('assigned_to', 'NULL');
    incidentGR.update();
    gs.info(
        'Unassigned Incident: {0}: {1}',
        incidentGR.number.toString(),
        incidentGR.short_description.toString()
    );
}
```

Output:

```
Unassigned Incident: INC0000057: Performance problems with wifi
Unassigned Incident: INC0009001: Unable to post content on a
 Wiki page
Unassigned Incident: INC0008111: ATF : Test1
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideSystem - workflowFlush(Object glideRecord)

Deletes any open scheduled job records in the Schedule (sys_trigger) table for the specified GlideRecord.

Parameters

Name	Type	Description
glideRecord	Object	The GlideRecord

Returns

Type	Description
void	

GlideSystem - yearsAgo(Number years)

Gets a date and time for a certain number of years ago.

Parameters

Name	Type	Description
years	Number	An integer number of years

Returns

Type	Description
String	GMT beginning of the year that is the specified number of years ago, in the format yyyy-mm-dd hh:mm:ss.

Scoped equivalent

To use the `yearsAgo(Number years)` method in a scoped application, use the corresponding scoped method: yearsAgo(Number years).

GlideSystem - yesterday()

Returns yesterday's time (24 hours ago).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT for 24 hours ago, in the format yyyy-mm-dd hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the `yesterday()` method in a scoped application, use the corresponding scoped method: yesterday().

GlideSystem - Scoped

The scoped `GlideSystem` API provides a number of convenient methods to obtain information about the system, the current logged in user, and other system level information.

Many of the `GlideSystem` methods facilitate the easy inclusion of dates in query ranges, and are most often used in filters and reporting.

Scoped GlideSystem - addErrorMessage(String message)

Adds an error message for the current session.

Parameters

Name	Type	Description
message	String	Message to add.

Returns

Type	Description
void	

```
gs.include("PrototypeServer");
  var ValidatePasswordStronger = Class.create();
  ValidatePasswordStronger.prototype = {
       process : function() {
          var user_password =
 request.getParameter("user_password");
          var min_len = 8;
          var rules = "Password must be at least " + min_len +
             " characters long and contain a digit, an uppercase
 letter, and a lowercase letter.";
          if (user_password.length() < min_len) {
             gs.addErrorMessage("TOO SHORT: " + rules);
             return false;
          }
          var digit_pattern = new RegExp("[0-9]", "g");
          if (!digit_pattern.test(user_password)) {
             gs.addErrorMessage("DIGIT MISSING: " + rules);
             return false;
          }
          var upper_pattern = new RegExp("[A-Z]", "g");
          if (!upper_pattern.test(user_password)) {
             gs.addErrorMessage("UPPERCASE MISSING: " + rules);
             return false;
          }
          var lower_pattern = new RegExp("[a-z]", "g");
          if (!lower_pattern.test(user_password)) {
             gs.addErrorMessage("LOWERCASE MISSING: " + rules);
             return false;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            }
            return true; // password is OK
        }
    }
```

Scoped GlideSystem - addInfoMessage(String message)

Adds an info message for the current session. This method is not supported for asynchronous business rules.

Parameters

Name	Type	Description
message	String	Info message to add.

Returns

Type	Description
void	

```
if ((!current.u_date1.nil()) && (!current.u_date2.nil())) {
  var start =
 current.u_date1.getGlideObject().getNumericValue();
  var end = current.u_date2.getGlideObject().getNumericValue();
  if (start > end) {
    gs.addInfoMessage('start must be before end');
    current.u_date1.setError('start must be before end');
    current.setAbortAction(true);
  }
}
```

Scoped GlideSystem - base64Encode(String source)

Creates a base64 string from the specified string.

Parameters

Name	Type	Description
source	String	String to encode.

Returns

Type	Description
String	Encoded base64 string.

The following code example shows how to call this method.

```
var mac = new CertificateEncryption;
var key = "sample_key";
key = gs.base64Encode(key);
mac.generateMac(key, "HmacSHA256", "sample_data");
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideSystem - base64Decode(String source)

Returns an ASCII string from the specified base64 string.

Parameters

Name	Type	Description
source	String	A base64 encoded string.

Returns

Type	Description
String	The decoded string.

Scoped GlideSystem - beginningOfLastMonth()

Returns the date and time for the beginning of last month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of last month, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - beginningOfLastWeek()

Returns the date and time for the beginning of last week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of last week, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - beginningOfNextMonth()

Returns the date and time for the beginning of next month in GMT.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	GMT beginning of next month, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - beginningOfNextWeek()

Returns the date and time for the beginning of next week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The GMT beginning of next week, in the format yyyy-mm-dd hh:mm:ss.

Scoped GlideSystem - beginningOfNextYear()

Returns the date and time for the beginning of next year in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of next year, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - beginningOfThisMonth()

Returns the date and time for the beginning of this month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of this month, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - beginningOfThisQuarter()

Returns the date and time for the beginning of this quarter in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of this quarter, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - beginningOfThisWeek()

Returns the date and time for the beginning of this week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of this week, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - beginningOfThisYear()

Returns the date and time for the beginning of this year in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT beginning of this year, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - dateGenerate(String date, String range)

Generates a date and time for the specified date in GMT.

Parameters

Name	Type	Description
date	String	Date to generate the GMT for. Format: yyyy-mm-dd
range	String	Start, end, or a time in the 24 hour format hh:mm:ss.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Generated date and time. If the range is `start`, the returned value is yyyy-mm-dd 00:00:00. If range is `end` the return value is yyyy-mm-dd 23:59:59. Format: yyyy-mm-dd hh:mm:ss

This example shows using *`dateGenerate()`* to set the start date when querying records in the Incident table.

```
var tableData = new GlideRecord('incident');
tableData.addEncodedQuery("sys_created_onBETWEENjavascript:gs.da
teGenerate('2015-10-07','00:00:00')@javascript:gs.daysAgoEnd(0)^
priority=1^severityIN1,2");
tableData.query();
gs.info("Count: " + tableData.getRowCount());
```

Output

```
Count: 7
```

Scoped GlideSystem - daysAgo(Number days)

Returns the date and time for a specified number of days ago.

Parameters

Name	Type	Description
days	Number	Integer number of days

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

```
function contractNoticeDue() {
    var now_GR = new GlideRecord("contract");
    now_GR.addQuery("u_contract_status", "Active");
    now_GR.query();
    while (now_GR.next()) {
    if ((now_GR.u_termination_date <= gs.daysAgo(-90)) &&
 (now_GR.u_contract_duration == "Long")) {
            now_GR.u_contract_status = "In review";
        }
        else if ((now_GR.u_termination_date <= gs.daysAgo(-50))
 && (now_GR.u_contract_duration == "Medium")) {
        now_GR.u_contract_status = "In review";
        }
        else if ((now_GR.u_termination_date <= gs.daysAgo(-10))
 && (now_GR.u_contract_duration == "Short")) {
            now_GR.u_contract_status = "In review";
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            }
        }
        now_GR.update();
}
```

Scoped GlideSystem - daysAgoEnd(Number days)

Returns the date and time for the end of the day a specified number of days ago.

Parameters

Name	Type	Description
days	Number	Integer number of days

Returns

Type	Description
String	GMT end of the day in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - daysAgoStart(Number days)

Returns the date and time for the beginning of the day a specified number of days ago.

Parameters

Name	Type	Description
days	String	Integer number of days

Returns

Type	Description
String	GMT start of the day in the format yyyy-mm-dd hh:mm:ss

```
var now_GR = new GlideRecord('sysapproval_approver');
now_GR.addQuery('state', 'requested');
now_GR.addQuery('sys_updated_on', '<', gs.daysAgoStart(5));
now_GR.query();
```

Scoped GlideSystem - debug(String message, Object parm1, Object parm2, Object parm3, Object parm4, Object parm5)

Writes a debug message to the system log.

Parameters

Name	Type	Description
message	String	The log message with place holders for any variable arguments.
param1	Object	(Optional) First variable argument.
param2	Object	(Optional) Second variable argument.
param3	Object	(Optional) Third variable argument.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
param4	Object	(Optional) Fourth variable argument.
param5	Object	(Optional) Fifth variable argument.

Returns

Type	Description
void	

```
gs.debug("This is a debug message");
var myFirstName = "Abel";
var myLastName = "Tuter";
gs.debug("This is a debug message from {0}.{1}", myFirstName,
 myLastName);
```

Output:

```
This is a debug message (sys.scripts extended logging)
This is a debug message from Abel.Tuter (sys.scripts extended
 logging)
```

Scoped GlideSystem - endOfLastMonth()

Returns the date and time for the end of last month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT end of last month, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfLastWeek()

Returns the date and time for the end of last week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT end of last week, in the format yyyy-mm-dd hh:mm:ss

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideSystem - endOfLastYear()

Returns the date and time for the end of last year in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfNextMonth()

Returns the date and time for the end of next month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfNextWeek()

Returns the date and time for the end of next week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfNextYear()

Returns the date and time for the end of next year in GMT.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfThisMonth()

Returns the date and time for the end of this month in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfThisQuarter()

Returns the date and time for the end of this quarter in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfThisWeek()

Returns the date and time for the end of this week in GMT.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - endOfThisYear()

Returns the date and time for the end of this year in GMT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - error(String message, Object parm1, Object parm2, Object parm3, Object parm4, Object parm5)

Writes an error message to the system log.

This method accepts up to five variable arguments (varargs) in the message using the Java MessageFormat placeholder replacement pattern.

Note: Variables must contain valid values for this method to provide correct output.

Parameters

Name	Type	Description
message	String	The log message with place holders for any variable arguments.
param1	Object	(Optional) First variable argument.
param2	Object	(Optional) Second variable argument.
param3	Object	(Optional) Third variable argument.
param4	Object	(Optional) Fourth variable argument.
param5	Object	(Optional) Fifth variable argument.

Returns

Type	Description
void	

```
gs.error("This is an error message");
var myFirstName = "Abel";
var myLastName = "Tuter";
gs.error("This is an error message from {0}.{1}", myFirstName,
 myLastName);
```

Output:

```
This is an error message
This is an error message from Abel.Tuter
```

Scoped GlideSystem - eventQueue(String name, Object instance, String parm1, String parm2, String queue)

Queues an event for the event manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Name of the event being queued.
instance	Object	GlideRecord object, such as "current".
parm1	String	Optional. Saved with the instance if specified.
parm2	String	Optional. Saved with the instance if specified.
queue	String	Optional. Name of the queue.

Returns

Type	Description
void	

```
if (current.operation() != 'insert' &&
 current.comments.changes()) {
    gs.eventQueue('incident.commented', current, gs.getUserID(),
 gs.getUserName());
}
```

Scoped GlideSystem - eventQueueScheduled(String name, Object instance, String parm1, String parm2, Object expiration)

Queues an event in the event manager.

The passed in event schedule information is stored in the Events [sysevent] table. For additional information on events, see Events.

Parameters

Name	Type	Description
name	String	Name of the event to queue.
instance	Object/ String	GlideRecord object or the sys_id of the record to which this event applies.
parm1	String	Optional. String to pass into the event script. This parameter is free-form and depends on the implementation of the event script. Default: If the *instance* parameter is a GlideRecord object, then the default is the display value for that GlideRecord (now_GR.getDisplayValue) otherwise it is `null`.
parm2	String	Optional. String to pass into the event script. This parameter is free-form and depends on the implementation of the event script. Default: `null`
expiration	Object	Optional. GlideDateTime object or a date/time type element that specifies the date and time to process the event. Default: Current date/time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to call the method using a GlideRecord, two parameters that are passed to the event script, and a specified time to schedule the event.

```
var requestXml = requestBody.dataString;
var processTime = new GlideDateTime();
processTime.addDaysLocalTime(7);
gs.eventQueueScheduled('sn_app.user.deactivate', now_GR,
 requestXML, gs.getUserID(), processTime);
```

This example shows how to call the method using a sys_id and the default values for the optional parameters.

```
gs.eventQueueScheduled('event.test',
 '0e29421383101000dada83ec37d9292d', '', '', '');
```

Scoped GlideSystem - executeNow(GlideRecord job)

Executes a job for a scoped application.

You can only use this method on a job in the same application as the script calling this method.

Parameters

Name	Type	Description
job	GlideRecord	Job to run.

Returns

Type	Description
String	Returns the sys_id of the scheduled job. Returns null if the job is global.

```
scheduleImportJob: function () {
  var jobId = '61847fe04c603300fa9bb64c2b491dac';
  var now_GR = new GlideRecord('sysauto_script');
  if (!now_GR.get(jobId)) {
    throw new Error('Unable to find import job');
  }
  gs.executeNow(now_GR);
}
```

Scoped GlideSystem - generateGUID()

Generates a GUID that can be used when a unique identifier is required.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	A 32-character hexadecimal GUID.

The following code example shows how to call this method.

```
personalId = gs.generateGUID();
gs.info(personalId);
```

Output:

```
af770511ff013100e04bfffffffffff6
```

Scoped GlideSystem - getCallerScopeName()

Gets the caller scope name; returns null if there is no caller.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The caller's scope name, or null if there is no caller.

This example shows two script includes that are set to Accessible from all application scopes. One script include is created within app_scope_a.

```
var Scopea = Class.create();

Scopea.prototype = {
    initialize: function() {
    },

    callerScope: function() {
        var scopeb = new app_scope_b.Scopeb();
        return scopeb.callerscope();
    },

    type: 'Scopea'
}
```

Output:

This example shows another script include created within app_scope_b.

```
var Scopeb = Class.create();

Scopeb.prototype = {
    initialize: function() {
        this._constructorCallerScope = gs.getCallerScopeName();
    },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    callerscope: function() {
        return gs.getCallerScopeName();
    },

    getConstructorCallerScope: function() {
        return this._constructorCallerScope;
    },

    type: 'Scopeb'
}
```

Output:

This script can be used within scope app_scope_a to get the scope name of the caller—in this case app_scope_b.

```
gs.info(new Scopea().getCallerScopeName());
```

Scoped GlideSystem - getCssCacheVersionString()

Gets a string representing the cache version for a CSS file.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The CSS cache version.

The following code example shows how to call this method.

```
var verStr = gs.getCssCacheVersionString();
gs.info(verStr);
```

Output:

```
_d82979516f0171005be8883e6b3ee4cf&theme=
```

Scoped GlideSystem - getCurrentApplicationId()

Gets the ID of the current application as set using the Application Picker.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current application's sys_id, or global in none is set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var currentId = gs.getCurrentApplicationId();
gs.info(currentId);
```

Output

```
04936cb16f30b1005be8883e6b3ee4e0
```

Scoped GlideSystem - getCurrentScopeName()

Gets the name of the current scope.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current scope name.

The following code example shows how to call this method.

```
var currentScope = gs.getCurrentScopeName();
gs.info(currentScope);
```

Output:

```
s_snc_test_scope
```

Scoped GlideSystem - getDateFormat(String)

Returns the date format associated with the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The date format associated with the current user.

The following example returns the date format associated with the user.

```
var userDateFormat = gs. getDateFormat();
gs.info(userDateFormat);
```

Output:

```
yyyy-MM-dd
```

Scoped GlideSystem - getDateTimeFormat()

Returns the date and time format associated with the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The date and time format associated with the current user.

The following example returns the format of the date and time that is associated with the user.

```
var userDateTimeFormat = gs.getDateTimeFormat();
gs.info(userDateTimeFormat);
```

Output:

```
yyyy-MM-dd HH:mm:ss
```

Scoped GlideSystem - getErrorMessages()

Returns the error messages that were added by `addErrorMessage()` for the session.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array of Strings	Error messages associated with the session.

Scoped GlideSystem - getEscapedMessage(String id, Array args)

Retrieves the specified message from the Message [sys_ui_message] table. If the message has HTML special characters, replaces them with the corresponding HTML name codes. For example, & becomes `&`.

If the specified message identifier (Key) exists in the Message [sys_ui_message] table for the current language, the method returns the translated message with all special characters returned as escape sequences. If the specified message identifier does not exist for the current language, then the method returns the English version of the message with all special characters returned as escape sequences. If the message identifier does not exist in the table, then it returns the message ID.

For additional information about the Message table, see Message table.

Note: If the UI message has a tick ('), there may be issues with the message in the script; to escape the ticks ('), use `getMessageS(String, Object)`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
id	String	Message identifier. You can locate this value in the Key field of the Message [sys_ui_message] table. Note the Key field may look exactly like the actual message string.
args	Array	Optional. List of strings or other values defined by java.text.MessageFormat that replace the variables within the specified message. For example: `gs.getMessage("Abort adding action '{0}', same subflow can't be added twice in this subflow.", current.action.name);` In this example *`'{0}'`* is replaced with the content of *`current.action.name`*. **Note:** The passed in values are not translated. They are inserted verbatim in the message.

Returns

Type	Description
String	UI message with HTML special characters replaced with HTML name codes.

This example shows the ampersand character being replaced with the equivalent ampersand HTML name code.

```
var my_message = gs.getEscapedMessage("Is the summary & details
 accurate?");
alert(my_message);
```

Output

```
Is the summary &amp; details accurate?
```

This example shows how to replace a single variable within a message and how the < and > symbols in the message are transposed to the corresponding HTML name codes of &lt and &gt.

```
// current.action.name is "update record"
var my_message = gs.getEscapedMessage("Abort adding action
 '{0}', same <subflow> can't be added twice in this subflow.",
 current.action.name);
alert(my_message);
```

Output

```
Abort adding action update record, same &ltsubflow&gt can't be
 added twice in this subflow.
```

Scoped GlideSystem - getMessage(String id, Array args)

Retrieves translated messages from the Message [sys_ui_message] table to display in a UI.

If the specified message identifier (key) exists in the Message [sys_ui_message] table for the current language, then the method returns the translated message. If the specified message

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

identifier does not exist for the current language, then the method returns the English version of the message. If the message identifier does not exist in the table, then it returns the message ID.

For additional information about the Message table, see Message table

Note: If the UI message has a tick ('), there may be issues with the message in the script; to escape the ticks ('), use *getMessageS(String, Object)*.

Parameters

Name	Type	Description
id	String	Message identifier. You can locate this value in the Key field of the Message [sys_ui_message] table. Note the Key field may look exactly like the actual message.
args	Array	Optional. List of strings or other values defined by java.text.MessageFormat that replace the variables within the specified message. For example: `gs.getMessage("Abort adding action '{0}', same subflow can't be added twice in this subflow.", current.action.name);` In this example *'{0}'* is replaced with the content of *current.action.name*. **Note:** The passed in values are not translated. They are inserted verbatim in the message.

Returns

Type	Description
String	UI message.

This example shows the message returned for the current user when Spanish is the current language.

```
var my_message = gs.getMessage("rows will not be updated");
alert(my_message);
```

Output:

```
las filas no se actualizarán
```

This example shows how to replace a single variable within a message.

```
// current.action.name is "update record"
var my_message = gs.getMessage("Abort adding action '{0}',
 same subflow can't be added twice in this subflow.",
 current.action.name);
alert(my_message);
```

Output:

```
Abort adding action update record, same subflow can't be added
 twice in this subflow.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to replace multiple variables within a message.

```
// current.sub_flow.name is 'schedule users'
// current.action.name is "update record"
var my_message = gs.getEscapedMessage("Abort adding action
 '{0}', same subflow can't be added twice in {1} subflow.",
 [current.action.name, current.sub_flow.name]);
alert(my_message);
```

Output:

```
Abort adding action update record, same subflow can't be added
 twice in schedule users subflow.
```

Scoped GlideSystem - getProperty(String key, Object alt)

Gets the value of a Glide property. If the property is not found, returns an alternate value.

Parameters

Name	Type	Description
key	String	The key for the property whose value should be returned.
alt	Object	(Optional) Alternate object to return if the property is not found.

Returns

Type	Description
String	The value of the Glide property, or the alternate object defined above.

The following code example shows how to call this method.

```
var attachment_link = gs.getProperty('glide.servlet.uri');
gs.info(attachment_link);
```

Output:

```
https://instance.service-now.com/
```

Scoped GlideSystem - getSession()

Gets a reference to the current Glide session.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A reference for the current session.

```
if (!gs.hasRole("admin") && !gs.hasRole("user_admin") &&
 gs.getSession().isInteractive()) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  current.addQuery("active", "true");
}
```

Scoped GlideSystem - getSessionID()

Retrieves the GlideSession session ID.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The session ID.

```
var myUserObject = gs.getSessionID();
gs.info(myUserObject);
```

Output:

```
A0D4E5416F3F21005BE8883E6B3EE4B8
```

Scoped GlideSystem - getSessionToken()

This method is no longer available. Instead, use `gs.getSession().getSessionToken()`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The session token.

Scoped GlideSystem - getTimeFormat()

Returns the time format associated with the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The time format associated with the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this method.

```
var userTimeFormat = gs. getTimeFormat();
gs.info(userTimeFormat);
```

Output:

```
HH:mm:ss
```

Scoped GlideSystem - getTimeZoneName()

Returns the name of the time zone associated with the current user.

This method has been deprecated. Instead, use the getTimeZoneName() method in the *GlideSession* API.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The time zone name.

The following code example shows how to call this method.

```
gs.info(gs.getTimeZoneName());
```

Scoped GlideSystem - getUrlOnStack()

Gets the current URI for the session.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The URI.

```
gs.info(gs.getUrlOnStack());
```

Scoped GlideSystem - getUser()

Returns a reference to the scoped GlideUser object for the current user.

See GlideUser - Scopedfor a list of available methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideUser	Reference to a scoped user object.

```
var myUserObject = gs.getUser();
gs.info(myUserObject);
```

Output

```
com.glide.script.fencing.ScopedUser@6c0645
```

Scoped GlideSystem - getUserDisplayName()

Gets the display name of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name field of the current user. For example, this method returns Abel Tuter as opposed to abel.tuter.

This example gets the current user's display name.

```
gs.info(gs.getUserDisplayName());
```

Output:

```
System Administrator
```

Scoped GlideSystem - getUserID()

Gets the sys_id of the current user.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The sys_id of the current user.

The following example shows how to unassign all active Incident records assigned to the current user.

```
var incidentGR = new GlideRecord('incident');
incidentGR.addActiveQuery();

// Filter results to incidents assigned to the current user
var currentUserSysId = gs.getUserID();
incidentGR.addQuery('assigned_to', currentUserSysId);
incidentGR.query();

while (incidentGR.next()) {
    incidentGR.setValue('assigned_to', 'NULL');
    incidentGR.update();
    gs.info(
        'Unassigned Incident: {0}: {1}',
        incidentGR.number.toString(),
        incidentGR.short_description.toString()
    );
}
```

Output:

```
Unassigned Incident: INC0000057: Performance problems with wifi
Unassigned Incident: INC0009001: Unable to post content on a
 Wiki page
Unassigned Incident: INC0008111: ATF : Test1
```

Scoped GlideSystem - getUserName()

Returns the user name of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The user name of the current user. For example, this method returns abel.tuter as opposed to Abel Tuter.

This example gets the user name of the current user.

```
gs.info("The current user name is: " + gs.getUserName());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
The current user name is: admin
```

Scoped GlideSystem - hasRole(Object role)

Determines if the current user has the specified role.

Parameters

Name	Type	Description
role	Object	The role to check.

Returns

Type	Description
Boolean	True if the user had the role. Returns true for users with the administrator role.

```
if (!gs.hasRole("admin") && !gs.hasRole("groups_admin")  &&
 gs.getSession().isInteractive()) {
  var qc = current.addQuery("u_hidden", "!=", "true"); //cannot
 see hidden groups...
  qc.addOrCondition("sys_id",
 "javascript:getMyGroups()"); //...unless in the hidden group
  gs.info("User has admin and groups admin roles");
}
else {
  gs.info("User does not have both admin and groups admin
 roles");
}
```

Scoped GlideSystem - hoursAgo(Number hours)

Returns the date and time for a specified number of hours ago.

Parameters

Name	Type	Description
hours	Number	Integer number of hours

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

```
if (current.operation() == 'insert') {
 // If no due date was specified, calculate a default
 if (current.due_date == '') {

  if (current.urgency == '1') {
   // Set due date to 4 hours ahead of current time
   current.due_date = gs.hoursAgo(-4);
  }

  if (current.urgency == '2') {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    // Set due date to 2 days ahead of current time
    current.due_date = gs.daysAgo(-2);
   }

   if (current.urgency == '3') {
    // Set due date to 7 days ahead of current time
    current.due_date = gs.daysAgo(-7);
   }
  }
}
```

Scoped GlideSystem - hoursAgoEnd(Number hours)

Returns the date and time for the end of the hour a specified number of hours ago.

Parameters

Name	Type	Description
hours	Number	Integer number of hours

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - hoursAgoStart(Number hours)

Returns the date and time for the start of the hour a specified number of hours ago.

Parameters

Name	Type	Description
hours	Number	Integer number of hours

Returns

Type	Description
String	GMT in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - include(String name)

Provides a safe way to call a script include from the sandbox, allowing only the inclusion of trusted scripts.

Parameters

Name	Type	Description
name	String	Name of the script to include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the script include worked. Possible values: • true: Script include worked. • false: Script include failed.

This example gets the LDAPUtils in the current script context.

```
var ldapServer = new GlideRecord("ldap_server_config");
ldapServer.addActiveQuery();
ldapServer.query();
gs.include("LDAPUtils");
var ldapUtils = new LDAPUtils();
var errMsg = "";
while (ldapServer.next()) {
  var ldap = new GlideLDAP();
  var dn = ldapServer.dn;
  var env = ldap.setup();
  if (env == null) {
    errMsg = "Failed environment setup, missing URL";
    gs.eventQueue("ldap.connection_failed",   ldapServer,
 ldapServer.getDisplayValue(), errMsg);
    gs.logError("LDAP server " + ldapServer.getDisplayValue() +
 " failed scheduled connection test: " + errMsg, "LDAP");
 }
}
```

Scoped GlideSystem - info(String message, Object parm1, Object parm2, Object parm3, Object parm4, Object parm5)

Writes an info message to the system log.

Parameters

Name	Type	Description
message	String	The log message with place holders for any variable arguments.
param1	Object	(Optional) First variable argument.
param2	Object	(Optional) Second variable argument.
param3	Object	(Optional) Third variable argument.
param4	Object	(Optional) Fourth variable argument.
param5	Object	(Optional) Fifth variable argument.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info("This is an info message");
var myFirstName = "Abel";
var myLastName = "Tuter";
gs.info("This is an info message from {0}.{1}", myFirstName,
 myLastName);
```

Output:

```
This is an info message
This is an info message from Abel.Tuter
```

Scoped GlideSystem - isDebugging()

Determines if debugging is active for a specific scope.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if either session debugging is active or the log level is set to debug for the specified scope.

```
gs.debug("This is a log message");
var myFirstName = "Abel";
var myLastName = "Tuter";
gs.debug("This is a log message from {0}.{1}", myFirstName,
 myLastName);
gs.info(gs.isDebugging());
```

Scoped GlideSystem - isInteractive()

Checks if the current session is interactive. An example of an interactive session is when a user logs in normally. An example of a non-interactive session is using a SOAP request to retrieve data.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the session is interactive.

```
if (!gs.hasRole("admin") && gs.getSession().isInteractive()) {
    var qc1 = current.addQuery('u_group',"");
    var gra = new GlideRecord('sys_user_grmember');
    gra.addQuery('user', gs.getUserID());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    gra.query();
    while (gra.next()) {
        qc1.addOrCondition('u_group', gra.group);
    }
}
```

Scoped GlideSystem - isLoggedIn()

Determines if the current user is currently logged in.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the current user is logged in.

```
gs.info(gs.isLoggedIn());
```

Scoped GlideSystem - isMobile()

You can determine if a request comes from a mobile device.

This method can be used in UI action conditions and business rules.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the request comes from a mobile device; otherwise, false.

```
if (gs.isMobile())
  gs.info("submitted from mobile UI");
 else
   gs.info("NOT submitted from mobile UI");
```

Output

```
NOT submitted from mobile UI
```

Scoped GlideSystem - minutesAgoEnd(Number minutes)

Returns the date and time for the end of the minute a specified number of minutes ago.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
minutes	Number	Integer number of minutes ago, such as 5 or 126.

Returns

Type	Description
String	GMT the specified number of minutes ago, at the end of the minute (59 seconds). Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time 30 minutes ago at the end of the minute in GMT.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var thirtyMinutesAgoDateTime = gs.minutesAgoEnd(30);
gs.info("Thirty minutes ago end time: " +
 thirtyMinutesAgoDateTime);
```

Output:

```
Now: 2021-10-20 15:22:13
Thirty minutes ago end time: 2021-10-20 14:52:59
```

Scoped GlideSystem - minutesAgoStart(Number minutes)

Returns the date and time for the start of the minute a specified number of minutes ago.

Parameters

Name	Type	Description
minutes	Number	Integer number of minutes ago, such as 15 or 112.

Returns

Type	Description
String	GMT the specified number of minutes ago, at the start of the minute. Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time 30 minutes ago at the start of the minute in GMT.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var thirtyMinutesAgoDateTime = gs.minutesAgoStart(30);
gs.info("Thirty minutes ago: " + thirtyMinutesAgoDateTime);
```

Output:

```
Now: 2021-10-20 14:56:18
Thirty minutes ago: 2021-10-20 14:26:00
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideSystem - monthsAgo(Number months)

Returns the date and time for a specified number of months ago.

Parameters

Name	Type	Description
months	Number	Integer number of months ago.

Returns

Type	Description
String	GMT of the specified number of months ago at the exact same time. Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time one month ago at the same time in GMT.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var oneMonthAgoDateTime = gs.monthsAgo(1);
gs.info("One month ago: " + oneMonthAgoDateTime);
```

Output:

```
Now: 2021-10-20 15:29:15
One month ago: 2021-09-20 15:29:15
```

Scoped GlideSystem - monthsAgoStart(Number months)

Returns the date and time for the start of the month a specified number of months ago.

Parameters

Name	Type	Description
months	Number	Integer number of months ago, such as 3 or 14.

Returns

Type	Description
String	GMT start of the month the specified number of months ago. Format: yyyy-mm-dd hh:mm:ss

The following example displays the current date and time and the date and time three months ago in GMT.

```
var nowDateTime = new GlideDateTime();
gs.info("Now: " + nowDateTime);
var threeMonthsAgoDateTime = gs.monthsAgoStart(3);
gs.info("Three months ago start date and time: " +
 threeMonthsAgoDateTime);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output

```
Now: 2021-10-20 15:05:27
Three months ago start date and time: 2021-07-01 07:00:00
```

Scoped GlideSystem - nil(Object o)

Queries an object and returns true if the object is null, undefined, or contains an empty string.

Parameters

Name	Type	Description
o	Object	The object to check.

Returns

Type	Description
Boolean	True if the object is null, undefined, or contains an empty string; otherwise, returns false.

```
var now_GR = new GlideRecord();
gs.info(gs.nil(now_GR));
```

Output

```
true
```

Scoped GlideSystem - quartersAgoEnd(Number quarters)

Returns the date and time for the last day of the quarter for a specified number of quarters ago.

Parameters

Name	Type	Description
quarters	Number	Integer number of quarters

Returns

Type	Description
String	GMT end of the quarter that was the specified number of quarters ago, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - quartersAgoStart(Number quarters)

Returns the date and time for the first day of the quarter for a specified number of quarters ago.

Parameters

Name	Type	Description
quarters	Number	Integer number of quarters

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	GMT end of the month that was the specified number of quarters ago, in the format yyyy-mm-dd hh:mm:ss

Scoped GlideSystem - setProperty(String key, String value, String description)

Sets the specified key to the specified value if the property is within the script's scope.

Note: Care should be taken when setting system properties (sys_properties) using this method as it causes a system-wide cache flush. Each flush can cause system degradation while the caches rebuild. If a value must be updated often, it should not be stored as a system property. In general, you should only place values in the sys_properties table that do not frequently change.

Parameters

Name	Type	Description
key	String	The key for the property to be set.
value	String	The value of the property to be set.
description	String	A description of the property.

Returns

Type	Description
void	

The following code example shows how to call this method.

```
gs.setProperty("glide.foo","bar","foo");
gs.info(gs.getProperty("glide.foo"));
```

Output:

```
bar
```

Scoped GlideSystem - setRedirect(Object o)

Sets the redirect URI for this transaction, which then determines the next page the user will see.

Parameters

Name	Type	Description
o	Object	URI object or URI string to set as the redirect

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.setRedirect("com.glideapp.servicecatalog_cat_item_view.do?sys
parm_id=d41ce5bac611227a0167f4bf8109bf70&sysparm_user="
+ current.sys_id + "&sysparm_email=" + current.email)
```

Scoped GlideSystem - tableExists(String name)

Determines if a database table exists.

Parameters

Name	Type	Description
name	String	Name of the table to check for existence.

Returns

Type	Description
Boolean	True if the table exists. False if the table was not found.

This example shows checking whether the incident and foo tables exist in the ServiceNow instance.

```
gs.info("Does the incident table exist? " +
 gs.tableExists("incident"));

gs.info("Does the foo table exist? " + gs.tableExists("foo"));
```

Output:

```
Does the incident table exist? true
Does the foo table exist? false
```

Scoped GlideSystem - urlEncode(String url)

Encodes non-ASCII characters, unsafe ASCII characters, and spaces so the returned string can be used on the Internet. Uses UTF-8 encoding. Uses percent (%) encoding.

Parameters

Name	Type	Description
url	String	The string to encode.

Returns

Type	Description
String	A string with non-ASCII characters, unsafe ASCII characters, and spaces encoded.

Scoped GlideSystem - urlDecode(String url)

Replaces UTF-8 encoded characters with ASCII characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
url	String	UTF-8 percent (%) encoded characters.

Returns

Type	Description
String	Encoded characters replaced with ASCII characters.

Scoped GlideSystem - warn(String message, Object parm1, Object parm2, Object parm3, Object parm4, Object parm5)

Writes a warning message to the system log.

Parameters

Name	Type	Description
message	String	The log message with place holders for any variable arguments.
param1	Object	(Optional) First variable argument.
param2	Object	(Optional) Second variable argument.
param3	Object	(Optional) Third variable argument.
param4	Object	(Optional) Fourth variable argument.
param5	Object	(Optional) Fifth variable argument.

Returns

Type	Description
void	

```
gs.warn("This is a warning");
var myFirstName = "Abel";
var myLastName = "Tuter";
gs.warn("This is a warning from {0}.{1}", myFirstName,
 myLastName);
```

Output:

```
This is a warning
This is a warning from Abel.Tuter
```

Scoped GlideSystem - xmlToJSON(String xmlString)

Takes an XML string and returns a JSON object.

Parameters

Name	Type	Description
xmlString	String	The XML string to be converted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	A JSON object representing the XML string. Null if unable to process the XML string.

The following code example shows how to call this method.

```
var jsonObject = gs.xmlToJSON(xmlString);
```

Scoped GlideSystem - yearsAgo(Number years)

Returns a date and time for a certain number of years ago.

Parameters

Name	Type	Description
years	Number	An integer number of years

Returns

Type	Description
String	GMT beginning of the year that is the specified number of years ago, in the format yyyy-mm-dd hh:mm:ss.

Scoped GlideSystem - yesterday()

Returns yesterday's time (24 hours ago).

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	GMT for 24 hours ago, in the format yyyy-mm-dd hh:mm:ss

GlideSystemRunLevel - Global

The `GlideSystemRunLevel` API provides methods to get and set the current system run level.

Setting the system run level allows applications to change or limit their features based on operational toggles. For more information about using operational toggles, see Operational toggles.

The system run level can be set to one of the defined system run levels.

- Fully Operational
- Slightly Degraded

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Moderately Degraded
- Severely Degraded

The system run level set on one node is synchronized to all nodes in the instance.

The admin role is required to use this API.

GlideSystemRunLevel – getCurrentLevel()

Retrieves the current system run level.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The current system run level. Possible values: • fully_operational • slightly_degraded • moderately_degraded • severely_degraded

Gets the current system run level.

```
var currentRunLevel =
 sn_run_level.GlideSystemRunLevel.getCurrentLevel();
gs.info(currentRunLevel);
```

Output:

```
fully_operational
```

GlideSystemRunLevel – switchLevel(String newLevel)

Switches the system run level.

Parameters

Name	Type	Description
newLevel	String	The ID value of the new system run level. This value is from the **ID** field in the System Run Level [sys_run_level] table.

Returns

Type	Description
String	ID of the previous system run level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Possible values: • fully_operational • slightly_degraded • moderately_degraded • severely_degraded

Sets the system run level to Slightly Degraded.

```
sn_run_level.GlideSystemRunLevel.switchLevel('slightly_degraded
');
```

Output:

```
SystemRunLevel requested to change from: fully_operational to:
 slightly_degraded
```

GlideTableHierarchy - Scoped

The *GlideTableHierarchy* API provides methods for handling information about table relationships.

GlideTableHierarchy - GlideTableHierarchy(String tableName)

Instantiates a GlideTableHierarchy object.

Parameters

Name	Type	Description
tableName	String	The name of the table.

```
var table = new GlideTableHierarchy("incident");
gs.info(table.getTables());
```

Output:

```
incident,task
```

GlideTableHierarchy - getAllExtensions()

Returns an array of strings containing all tables that extend the current table and includes the current table.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	An array of strings containing the tables in the hierarchy that includes the current table.

```
var table = new GlideTableHierarchy("task");
gs.info(table.getAllExtensions());
```

Output: Line breaks added for clarity.

```
task,sc_task,problem_task,change_phase,sc_req_item,kb_submissi
on,
release_phase,problem,ticket,sm_task,hr_task,change_task,change_
request,
change_request_imac,incident,release_task,vtb_task,sm_order,hr_c
ase,
sysapproval_group,sc_request
```

GlideTableHierarchy - getBase()

Returns the parent class.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The parent class.

```
var table = new GlideTableHierarchy("cmdb_ci_server");
gs.info(table.getBase());
```

Output:

```
cmdb_ci_computer
```

GlideTableHierarchy - getHierarchy()

Returns an array of strings containing all classes in the hierarchy of the current table.

Parameters

Name	Type	Description
none		

Returns

Type	Description
Array	An array of strings of the classes in the hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var table = new GlideTableHierarchy("incident");
gs.info(table.getHierarchy());
```

Output:

```
incident,task
```

GlideTableHierarchy - getName()

Returns the table's name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The table's name.

```
var table = new GlideTableHierarchy("incident");
gs.info(table.getName());
```

Output:

```
incident
```

GlideTableHierarchy - getRoot()

Returns the top level class in the hierarchy.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the root class.

```
var table = new GlideTableHierarchy("cmdb_ci_server");
gs.info(table.getRoot());
```

Output:

```
cmdb
```

GlideTableHierarchy - getTables()

Returns an array of strings of the table names in the hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of strings containing the names of tables in the hierarchy.

```
var table = new GlideTableHierarchy("incident");
gs.info(table.getTables());
```

Output:

```
incident,task
```

GlideTableHierarchy - getTableExtensions()

Returns an array of strings containing all tables that extend the current table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of strings containing the tables that extend the current table.

```
var table = new GlideTableHierarchy("task");
gs.info(table.getTableExtensions());
```

Output: Line breaks added for clarity

```
sc_task,problem_task,change_phase,sc_req_item,kb_submission,rele
ase_phase,problem,
ticket,sm_task,hr_task,change_task,change_request,change_request
_imac,incident,
release_task,vtb_task,sm_order,hr_case,sysapproval_group,sc_requ
est
```

GlideTableHierarchy - isBaseClass()

Returns true if this is a base class.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the current table has no parent and has extensions.

```
var table = new GlideTableHierarchy("incident");
gs.info(table.isBaseClass());
```

Output:

```
false
```

GlideTableHierarchy - isSoloClass()

Returns true if this table is not in a hierarchy.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the current table has no parent and no extensions.

```
var table = new GlideTableHierarchy("sys_user");
gs.info(table.isSoloClass());
```

Output:

```
true
```

GlideTableHierarchy - hasExtensions()

Returns true of this class has been extended.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the current table has extensions.

```
var table = new GlideTableHierarchy("incident");
gs.info(table.hasExtensions());
```

Output:

```
false
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideTextReader - Scoped

The *GlideTextReader* API provides the ability to read single lines from an input stream. Because an input stream is used, it is not subject to the 5MB attachment size limit.

GlideTextReader - GlideTextReader(GlideScriptableInputStream inputStream)

Creates a scoped GlideTextReader object for the specified input stream.

Parameters

Name	Type	Description
inputStream	GlideScriptableInputStream	The input stream to be read.

GlideTextReader - getEncoding()

Returns the character encoding of the input stream.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The character encoding of the input stream.

GlideTextReader - readLine()

Returns a single line from the input stream and returns a string. Since this is working off of a stream, it is not subject to the 5MB size limit.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A single line of input up to the carriage return. Does not include the carriage return. Returns null if there is no content.

```
var is = new
 GlideSysAttachment().getContentStream(attachmentSysId);
var reader = new GlideTextReader(is);
var ln = ' ';
while((ln = reader.readLine()) != null) {
  gs.info(ln);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideTime - Scoped

The *GlideTime* API provides methods for performing operations on GlideTime objects, such as instantiating GlideTime objects or working with GlideTime fields.

For guidance on date time input strings with a list of common format conflicts, refer to Date and time format guidelines.

GlideTime - GlideTime()

Instantiates a GlideTime object with the current time.

Parameters

Name	Type	Description
None		

```
var gt = new GlideTime();
gs.info(gt.getDisplayValue());
```

GlideTime - GlideTime(Number milliseconds)

Instantiates a GlideTime object with its time starting at midnight UTC plus the passed in value.

The value is adjusted for the timezone in which the instance resides. For example, if the user's instance is in a time zone that is -8 hours from the UTC, and 1000 is passed in, the time in the GlideTime object is 16:00:10 (00:00:00 - 8 hours +10 seconds.)

Parameters

Name	Type	Description
milliseconds	Number	Time to add to midnight UTC. Unit: Milliseconds

This example shows adding 10 seconds to midnight (UTC), which is then adjusted for the time zone in which the instance resides. In this case, -8 hours from UTC.

```
var gt = new GlideTime(10000);
gs.info(gt.getDisplayValue());
```

Output:

```
16:00:10
```

GlideTime - getByFormat(String format)

Returns the time in the specified format.

For information on the time formats that you can pass into this method, see Global date and time field format. You can pass these values in any order and add separators such as a dash, space, backslash, or colon. In addition, you can also pass the character "a" to return am/pm.

Parameters

Name	Type	Description
format	String	String to use to format the time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example, if the current time is 10:30:20 then: • hh:mm:ss = 10:30:20 • HH = 10 • HH –- ss = 10 –- 20 • hh a = 10 AM • s:m:H ss:mm:hh = 20:30:10 20:30:10 • HH/mm/ss = 10/30/20

Returns

Type	Description
String	Time in the specified format.

```
var gt = new GlideTime();
gt.setValue('12:00:00');
gs.info(gt.getByFormat("HH:mm"));
```

Output:

```
12:00
```

GlideTime - getDisplayValue()

Gets the time in the current user's display format and time zone.

When designing business rules or script includes remember that this method may return values in different formats for different users.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The time in the user's format and time zone.

```
var gt = new GlideTime();
gt.setDisplayValue("12:00:00"); // User Time Zone
gs.info(gt.getDisplayValue()); // User Time Zone
```

GlideTime - getDisplayValueInternal()

Gets the display value in the current user's time zone and the internal format (HH:mm:ss).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The time value for the GlideTime object in the current user's time zone and the internal time format of HH:mm:ss.

```
var gt = new GlideTime();
gt.setValue("01:00:00"); //Internal Time Zone , UTC
gs.info(gt.getDisplayValueInternal()); //User Time Zone
```

GlideTime - getHourLocalTime()

Returns the hours part of the time using the local time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The hours using the local time zone.

GlideTime - getHourOfDayLocalTime()

Returns the hours part of the time using the local time zone. The number of hours is based on a 24 hour clock.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The hours using the local time zone. The number of hours is based on a 24 hour clock.

GlideTime - getHourOfDayUTC()

Returns the hours part of the time using the UTC time zone. The number of hours is based on a 24 hour clock.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The hours using the UTC time zone. The number of hours is based on a 24 hour clock.

GlideTime - getHourUTC()

Returns the hours part of the time using the UTC time zone. The number of hours is based on a 12 hour clock. Noon and midnight are represented by 0, not 12.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The hours using the UTC time zone. The number of hours is based on a 12 hour clock. Noon and midnight are represented by 0, not 12.

GlideTime - getMinutesLocalTime()

Returns the number of minutes using the local time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of minutes using the local time zone.

GlideTime - getMinutesUTC()

Returns the number of minutes in the hour based on the UTC time zone.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	The number of minutes in the hour using the UTC time zone.

GlideTime - getSeconds()

Returns the number of seconds in the current minute.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The number of seconds in the minute.

GlideTime - getValue()

Gets the time value stored in the database by the GlideTime object in the internal format, HH:mm:ss, and the system time zone.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The time value in the internal fomat and system time zone.

```
var gt = new GlideTime();
gs.info(gt.getValue()); // Internal Time Zone, UTC
```

GlideTime - setDisplayValue(String asDisplayed)

Sets a time value using the current user's display format and time zone.

Parameters

Name	Type	Description
asDisplayed	String	The time in the current user's display format and time zone. The parameter must be formatted using the current user's preferred display format, such as HH:mm:ss.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var gt = new GlideTime();
gt.setDisplayValue('01:00:00');   // User Time Zone
gs.info(gt.getDisplayValueInternal()); // User Time Zone
```

GlideTime - setValue(String o)

Sets the time of the GlideTime object in the internal time zone.

Parameters

Name	Type	Description
o	String	The time in hh:mm:ss format.

Returns

Type	Description
None	

```
var gt = new GlideTime();
gt.setValue('01:00:00');  //Internal Time Zone, UTC
gs.info("time is "+ gt.getByFormat('hh:mm:ss'));
```

GlideTime - subtract(GlideTime startTime, GlideTime endTime)

Gets the duration difference between two GlideTime object values.

Parameters

Name	Type	Description
startTime	GlideTime	The start value.
endTime	GlideTime	The end value.

Returns

Type	Description
GlideDuration	The duration between the two values.

```
var gd1 = new GlideTime();
gd1.setDisplayValue("09:00:00");
var gd2 = new GlideTime();
gd2.setDisplayValue("09:10:00");

var dur = GlideDate.subtract(gd1, gd2); //the difference between
 gdt1 and gdt2
gs.info(dur.getDisplayValue());
```

GlideTimeline - Global

The *GlideTimeline* API provides the core implementation for configuring and displaying a Glide Windowing Toolkit Timeline.

For security, the GlideTimeline has already been instantiated as a single instance variable called *GlideTimeline*. All configurations should be made in the client script section of the corresponding schedule page that references this instance variable.

GlideTimeline - groupByParent(Boolean b)

Specifies whether or not to group timeline items by their parent. If **true**, this will nest all child items inside their parent. This affects the ordering of display and children will always be listed immediately after their parent. The default value for the *groupByParent* property is **false**.

If **true**, this will nest all child items inside their parent. This affects the ordering of display and children will always be listed immediately after their parent. The default value for the *groupByParent* property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, displays Timeline Items grouped by parent.

Returns

Type	Description
void	

```
glideTimeline.groupByParent(true);
```

GlideTimeline - registerEvent(String strServerEvent, String strScriptIncludeName)

Registers the specified Timeline server event. The *strServerEvent* must be one of the allowed events for registration to work correctly. When the event occurs, the *GlideTimeline* sends a request to the server and processes the event as handled inside the *strScriptIncludeName* class.

The *strServerEvent* must be one of the allowed events for registration to work correctly. When the event occurs, the *GlideTimeline* sends a request to the server and processes the event as handled inside the *strScriptIncludeName* class.

Parameters

Name	Type	Description
strServerEvent	String	Specifies one of the following case-sensitive events: • *getItems* • *elementMoveX* • *elementMoveY* • *elementMoveXY* • *elementSuccessor* • *elementTimeAdjustStart*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• *elementTimeAdjustEnd* • *inputBox* • *itemMove*
strScriptIncludeName	String	Specifies the name of the class to receive the *strServerEvent*. This class must be defined in a script include that extends *AbstractTimelineSchedulePage*.

Returns

Type	Description
void	

```
glideTimeline.registerEvent("getItems",
 "TimelineGanttSchedulePage");
```

GlideTimeline - setAutoRefresh(Number intSeconds)

Specifies the number of seconds to wait before performing an auto refresh of the data on the timeline. Setting the number of seconds to 0 will turn auto refresh off. By default, auto refresh is disabled. If *intSeconds* is greater than 0 and less than the minimum allowed time in seconds (10), it will be set to 10 seconds.

Setting the number of seconds to 0 will turn auto refresh off. By default, auto refresh is disabled. If intSeconds is greater than 0 and less than the minimum allowed time in seconds (10), it will be set to 10 seconds.

Parameters

Name	Type	Description
intSeconds	Number	An integer specifying the time in seconds between auto-refreshing.

Returns

Type	Description
void	

```
glideTimeline.setAutoRefresh(15); // Sets the interval for
 auto-refreshing to 15 seconds.
```

GlideTimeline - setDefaultPointIconClass(String icon_class)

Specifies the default icon class to use for Timeline Spans with zero duration if no icon class was explicitly specified in the properties of the Timeline Span returned from the server. The default value for the *setDefaultPointIconClass* property is *milestone*.

The default value for the *setDefaultPointIconClass* property is *milestone*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
icon_class	String	String that specifies one of the following values: • `milestone` • `blue_square` • `sepia_square` • `green_square` • `red_square` • `black_square` • `blue_circle` • `sepia_circle` • `green_circle` • `red_circle` • `black_circle`

Returns

Type	Description
void	

```
glideTimeline.setDefaultPointIconClass('blue_circle');
```

GlideTimeline - setExtraAjaxParam(String strName, String strValue)

Allows setting of additional parameters in the client script to be made available to the corresponding Script Include events by using the *`getParameter()`* method. URI parameters that are prefixed with `sysparm_timeline_` will automatically be included in all server side AJAX calls.

URI parameters that are prefixed with `sysparm_timeline_` will automatically be included in all server side AJAX calls.

Parameters

Name	Type	Description
strName	String	The URI parameter name.
strValue	String	The value of strName.

Returns

Type	Description
void	

```
glideTimeline.setExtraAjaxParam("sysparm_timeline_limit", "5");
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideTimeline - setInitialViewRange(String objStartDate, String objEndDate)

Specifies the initial viewable range for the timeline. The format of the start and end dates must be in the default timestamp format: yyyy-MM-dd HH:mm:ss. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

The format of the start and end dates must be in the default timestamp format: yyyy-MM-dd HH:mm:ss. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

Parameters

Name	Type	Description
objStartDate	String	The start time of the view range in format: yyyy-MM-dd HH:mm:ss .
objEndDate	String	The end time of the view range in format: yyyy-MM-dd HH:mm:ss .

Returns

Type	Description
void	

```
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM
 and end on June 28th, 2010 at 2:00 PM UTC time.
     glideTimeline.setInitialViewRange("2010-06-20 08:00:00",
 "2010-06-28 14:00:00");
```

GlideTimeline - setInitialViewRange(Number objStartDate, Number objEndDate)

Specifies the initial viewable range for the timeline. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

Parameters

Name	Type	Description
objStartDate	Number	The start time of the view range in milliseconds.
objEndDate	Number	The end time in milliseconds.

Returns

Type	Description
void	

```
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM
 and end on June 28th, 2010 at 2:00 PM UTC time.
```

```
     glideTimeline.setInitialViewRange(1277046000000,
1277647200000);
```

GlideTimeline - setInitialViewRange(String objStartDate, Number objEndDate)

Specifies the initial viewable range for the timeline. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

Parameters

Name	Type	Description
objStartDate	String	The start time of the view range in format: yyyy-MM-dd HH:mm:ss .
objEndDate	Number	The end time in milliseconds.

Returns

Type	Description
void	

ExampleExplanation

```
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM
 and end on June 28th, 2010 at 2:00 PM UTC time.
     glideTimeline.setInitialViewRange("2010-06-20 08:00:00",
1277647200000);
```

GlideTimeline - setInitialViewRange(Number objStartDate, String objEndDate)

Specifies the initial viewable range for the timeline. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the *initialViewRange* property is specified, it will override the default range.

Parameters

Name	Type	Description
objStartDate	Number	The start time of the view range in milliseconds.
objEndDate	String	The end time of the view range in format: yyyy-MM-dd HH:mm:ss .

Returns

Type	Description
void

```
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM
 and end on June 28th, 2010 at 2:00 PM UTC time.
     glideTimeline.setInitialViewRange(1277046000000,
 "2010-06-28 14:00:00");
```

GlideTimeline - setReadOnly(Boolean b)

Enables or disables all timeline event interaction. If enabled, event interaction is determined from the corresponding attributes specified by each *Timeline* Item. The default value for the *readOnly* property is **false**.

If enabled, event interaction is determined from the corresponding attributes specified by each *Timeline* Item. The default value for the *readOnly* property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, marks the entire timeline as **read-only** (non-interactive).

Returns

Type	Description
void	

```
glideTimeline.setReadOnly(true);
```

GlideTimeline - showDependencyLines(Boolean b)

Specifies whether or not to show dependency lines between Timeline Spans. This method applies only if the set of Timeline Items returned from the server includes dependency relationships. The default value for the showDependencyLines property is **false**.

This method applies only if the set of Timeline Items returned from the server includes dependency relationships. The default value for the showDependencyLines property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, displays dependency lines on the timeline; otherwise, does not.

Returns

Type	Description
void	

```
glideTimeline.showDependencyLines(true);
```

GlideTimeline - showGridLines(Boolean bShowGridlines, Number amount)

Specifies whether or not to show grid lines for each row of data on the timeline. By default, grid lines are enabled.

By default, grid lines are enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
bShowGridlines	Boolean	If **true**, timeline shows grid lines; otherwise, does not display grid lines.
amount	Number	amount

Returns

Type	Description
void	ReturnValue

```
glideTimeline.showGridLines(false); // Disables grid lines.
```

GlideTimeline - showLeftPane(Boolean b)

Specifies whether or not to show the left hand pane in the timeline. The default value for the *leftPane* property is **true**.

The default value for the *leftPane* property is **true**.

Parameters

Name	Type	Description
b	Boolean	If **true**, the timeline shows the left pane; otherwise, the left pane is not be displayed.

Returns

Type	Description
void	

```
glideTimeline.showLeftPane(false);
```

GlideTimeline - showLeftPaneAsTree(Boolean b)

Specifies how to show child items in the left pane of the timeline. Child items are displayed either as nested, indented nodes with expand and collapse capability or on a single indent level. The default value for the *showLeftPaneAsTree* property is **false**.

The default value for the *showLeftPaneAsTree* property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, child item nodes are shown as indented with expand/collapse capability; otherwise, all left pane items are displayed at a single indent level.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
glideTimeline.showLeftPaneAsTree(true);
```

GlideTimeline - showLeftPaneInputBox(Boolean b, String strDefaultValue)

Specifies whether or not to show the text input box at the bottom of the left pane with a default value as specified by **strDefaultValue**. If the left pane is diabled via *showLeftPane()*, the input box will not be visible. The default value for the *showLeftPaneInputBox* property is **false**.

If the left pane is diabled via *showLeftPane()*, the input box will not be visible. The default value for the *showLeftPaneInputBox* property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, show the left pane input box.
strDefaultValue	String	The default value to display in the input box.

Returns

Type	Description
void	

```
glideTimeline.showLeftPaneInputBox(true, 'Add a new task ...');
```

GlideTimeline - showSummaryPane(Boolean b)

Specifies whether or not to show the summary pane at the bottom of the timeline. The default value for the showSummaryPane property is **true**.

The default value for the showSummaryPane property is **true**.

Parameters

Name	Type	Description
b	Boolean	If **true**, the timeline includes the summary pane; otherwise, the summary pane is not displayed.

Returns

Type	Description
void	

```
glideTimeline.showSummaryPane(false);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideTimeline - showTimelineText(Boolean b)

Specifies whether or not to show the timeline text underneath each Timeline Span in the primary timeline pane. The default value for the showTimelineText property is **false**.

The default value for the showTimelineText property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, displays descriptive text underneath each Timeline Span; otherwise, no text is displayed underneath each Timeline Span.

Returns

Type	Description
void	

```
glideTimeline.showTimelineText(true);
```

GlideTimeline - snapVertScrollingIntoRows(Boolean b)

Specifies whether or not the vertical movement of timeline span objects (if appropriately registered to perform this event) should snap adjust into the closest row. By default this value is enabled.

By default this value is enabled.

Parameters

Name	Type	Description
b	Boolean	If **true**, snaps vertical movement of timeline span objects into rows; otherwise, items move exactly with respect to the mouse.

Returns

Type	Description
void	

```
glideTimeline.snapVertScrollingIntoRows(false);
```

GlideTimeline - sortByLeftLabelText(Boolean b)

Specifies whether or not to group items by their left label text. The default value for the *`sortByLeftLabelText`* property is **false**.

The default value for the *`sortByLeftLabelText`* property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, sort Timeline Items alphabetically by the text specified in each item's left label.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
glideTimeline.sortByLeftLabelText(true);
```

GlideTimeline - sortByStartDate(Boolean b)

Specifies whether or not to sort the list of Timeline Items returned by the earliest start date of an item's Timeline Span objects. If *groupByParent()* is set **true**, items are sorted after grouping has occurred. The default value for the *sortByStartDate* property is **false**.

If *groupByParent()* is set **true**, items are sorted after grouping has occurred. The default value for the *sortByStartDate* property is **false**.

Parameters

Name	Type	Description
b	Boolean	If **true**, sort Timeline Items chronologically starting with their earliest start date.

Returns

Type	Description
void	

```
glideTimeline.sortByStartDate(true);
```

GlideTimeline - sortByTimelineLabelText(Boolean b)

Specifies whether or not to sort the list of Timeline Items returned in alphabetical order according to the text that was specified to show in the Timeline Pane.

Note: This sort order still applies even if the timeline text has been set **false** via the *showTimelineText()* method. Additionally, if *groupByParent()* is set **true**, items will be sorted appropriately after grouping has occurred.

The default value for the *sortByTimelineLabelText* property is **false**.

Parameters

Name	Type	Description
b	Boolean	If true, sorts Timeline Items alphabetically by the text specified in each item's timeline span text.

Returns

Type	Description
void	

```
glideTimeline.sortByTimelineLabelText(true);
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideTimelineItem - Global

The *GlideTimelineItem* API extends the abstract *ScheduleItem* class to define additional properties that are specific to the time line.

A time line item is essentially any item that displays in a singular row across the time line. A GlideTimelineItem has zero or more associated spans (TimelineSpan objects).

GlideTimelineItem - GlideTimelineItem(String tableName)

Create a "dummy" *GlideTimelineItem* object.

This is useful for creating rows that do not allow any YMoving into; however, contain nested children (e.g. The top-level "Users" row in the Group Resource Timeline). The *sys_id* needs to be unique for DOM level functions to parse correctly. By default this object will not be "droppable" because a table name was not specified.

Parameters

Name	Type	Description
tableName	String	The name of the table associated with current object.

Returns

Type	Description
void	

GlideTimelineItem - GlideTimelineItem(String tableName, String sys_id)

Constructor that sets the required table and *sys_id* properties.

The rest of this object's properties should be set by the caller. By default, this object instance is "droppable" since a table name is specified.

Parameters

Name	Type	Description
tableName	String	The name of the table associated with current object.
sys_id	String	The sys ID for the object.

Returns

Type	Description
void	

GlideTimelineItem - createTimelineSpan(String tableName)

Creates a new *TimelineSpan* object associated with the current instance object.

If no other *TimelineSpan* objects exist, the newly created object will share the same *sys_id* as current instance object. Otherwise, a randomly generated GUID will be used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
tableName	String	The name of the table associated with current object.

Returns

Type	Description
Object	The newly-created span object instance.

GlideTimelineItem - createTimelineSpan(String tableName, String sys_id)

Creates a new *TimelineSpan* object associated with the current instance object using the specified table and sys_id.

Parameters

Name	Type	Description
tableName	String	Name of the table associated with current object
sys_id	String	Sys_id for the object.

Returns

Type	Description
Object	Newly-created span object instance.

The following example shows how to use *createTimelineSpan()* to create a new TimelineSpan object.

```
var project_id="741cc7491b6f1c5043de32231b4bcbc5"; // Project ID
var grUser = new GlideRecord('user_resource');
grUser.addQuery('planned_task', project_id);
grUser.setQueryReferences(true);
grUser.orderBy('user.name', 'DESC');
grUser.query();
while (grUser.next()) {
  var item = new GlideTimelineItem(grUser.getTableName(),
 grUser.user);
  /* Specify the text to display in the left pane for this item.
 */
  item.setLeftLabelText(grUser.user.name);
  /* Set the name of the image file (including it's path) */
  item.setImage('../images/icons/user.gifx');
  /* Specify whether or not to bold the text style of the item
 in the left pane. */
  item.setTextBold(true);
  /* Set whether or not the current instance object can be
 clicked and dragged into another GlideTimelineItem */
  item.setIsDraggable(true);
  /* Create a new TimelineSpan object associated with the
 current instance object using the specified table and sys_id.
 */
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  item.createTimelineSpan(grUser.getTableName(),
 grUser.getUniqueValue());
}
```

GlideTimelineItem - getImage( )

Returns a string specifying the name of the image file associated with the current *GlideTimelineItem*.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The name of the image file associated with the current GlideTimelineItem. If no image is associated with the current item, an empty string ("") is returned.

GlideTimelineItem - getIsDroppable( )

Indicates whether or not the current instance object should be allowed as a "drop zone" when moving timeline elements vertically.

Parameters

Name	Type	Description
none		

Returns

Type	Description
Boolean	True if droppable; false otherwise.

GlideTimelineItem - getLeftLabelText( )

Returns the text to be displayed in the left pane (if enabled).

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The value of the text to be displayed in the left pane.

GlideTimelineItem - getParent( )

Returns the unique *sysId* of the current *GlideTimelineItem*'s parent object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
none		

Returns

Type	Description
String	The unique sysId of the current GlideTimelineItem's parent object. If the parent does not exist, this will return an empty string ("").

GlideTimelineItem - getTimelineSpans( )

Returns all the *TimelineSpan* objects associated with the current instance in an ArrayList.

Parameters

Name	Type	Description
none		

Returns

Type	Description
Object Array	The list of TimelineSpan objects associated with the current instance.

GlideTimelineItem - isTextBold( )

Indicates if the left pane text is set to display using a bold style.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the text should be bold. Possible values: • true: Text should be bold. • false: Text should not be bold.

The following example checks if an incident's state is "New" and sets the item text to bold.

```
var NewIncidentTimelineScriptInclude = Class.create();
NewIncidentTimelineScriptInclude.prototype =
 Object.extendsObject(AbstractTimelineSchedulePage, {

  getItems: function() {
    // Specify the page title
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    this.setPageTitle('New Incident Timeline');

    var groupNew = new GlideTimelineItem('new');
    groupNew.setLeftLabelText('New Incidents');

    groupNew.setImage('../images/icons/all.gifx');
    this.add(groupNew);

    // Get all the new incidents and add them to a new label
    var grIncident = new GlideRecord('incident');
    grIncident.query();
    while (grIncident.next()) {
      // Loop through all and capture new incidents
      if (grIncident.incident_state != '1') continue;

      // Create the item and the span item.
      var item = new
 GlideTimelineItem(grIncident.getTableName(),
 grIncident.sys_id);
      var span =
 item.createTimelineSpan(grIncident.getTableName(),
 grIncident.sys_id);

      if (grIncident.incident_state == '1') { // New
        item.setParent(groupNew.getSysId());
        // Check and set bold text
          item.setTextBold(item.isTextBold() ? false : true);
        }
      item.setImage('../images/icons/open.gifx');

 span.setTimeSpan(grIncident.getElement('opened_at').getGlideObj
ect().getNumericValue(),

 grIncident.getElement('opened_at').getGlideObject().getNumericV
alue());

      // Show different colors based upon the priorities only
 for new incidents
      switch (grIncident.getElement('priority').toString()) {
        case '1':
          span.setPointIconClass('red_circle');
          break;
        case '2':
          span.setPointIconClass('red_square');
          break;
        case '3':
          span.setPointIconClass('blue_circle');
          break;
        case '4':
          span.setPointIconClass('blue_square');
          break;
        case '5':
          span.setPointIconClass('sepia_circle');
          break;

          default: // Otherwise, the default point icon class
 will be used (Milestone)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      }

      // Common item properties
      item.setLeftLabelText(grIncident.short_description);

      // Common span properties
      span.setSpanText(grIncident.short_description);
      span.setSpanColor('blue');
      span.setTooltip('<strong>' +
 GlideStringUtil.escapeHTML(grIncident.short_description) +
        '</strong><br>' + grIncident.number);
      this.add(item);
    }
  }

});
```

GlideTimelineItem - setImage(String strImageName)

Sets the name of the image file (including it's path) to use as the icon for the item in the left pane.

Parameters

Name	Type	Description
strImageName	String	Name of the image, including its path.

Returns

Type	Description
void	

The following example shows how to use *`setImage()`* to define the image that should appear for the icon in the left pane.

```
var project_id="741cc7491b6f1c5043de32231b4bcbc5"; // Project ID
var grUser = new GlideRecord('user_resource');
grUser.addQuery('planned_task', project_id);
grUser.setQueryReferences(true);
grUser.orderBy('user.name', 'DESC');
grUser.query();
while (grUser.next()) {
  var item = new GlideTimelineItem(grUser.getTableName(),
 grUser.user);
  /* Specify the text to display in the left pane for this item.
 */
  item.setLeftLabelText(grUser.user.name);
  /* Set the name of the image file (including it's path) */
  item.setImage('../images/icons/user.gifx');
  /* Specify whether or not to bold the text style of the item
 in the left pane. */
  item.setTextBold(true);
  /* Set whether or not the current instance object can be
 clicked and dragged into another GlideTimelineItem */
  item.setIsDraggable(true);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideTimelineItem - setIsDraggable(Boolean b)

Sets whether or not the current instance object can be clicked and dragged into another *GlideTimelineItem*.

Parameters

Name	Type	Description
b	Boolean	Flag that indicates whether the item can be moved using click and drag. Valid values: • true: Item can be moved using click and drag. • false: Item cannot be moved using click and drag.

Returns

Type	Description
void	

The following example shows how to use *setIsDraggable()* to enable the current object to be dragged into another GlideTimelineItem.

```
var project_id="741cc7491b6f1c5043de32231b4bcbc5"; // Project ID
var grUser = new GlideRecord('user_resource');
grUser.addQuery('planned_task', project_id);
grUser.setQueryReferences(true);
grUser.orderBy('user.name', 'DESC');
grUser.query();
while (grUser.next()) {
  var item = new GlideTimelineItem(grUser.getTableName(),
 grUser.user);
  /* Specify the text to display in the left pane for this item.
 */
  item.setLeftLabelText(grUser.user.name);
  /* Set the name of the image file (including it's path) */
  item.setImage('../images/icons/user.gifx');
  /* Specify whether or not to bold the text style of the item
 in the left pane. */
  item.setTextBold(true);
  /* Set whether or not the current instance object can be
 clicked and dragged into another GlideTimelineItem */
  item.setIsDraggable(true);
}
```

GlideTimelineItem - setLeftLabelText(String strText)

Specifies the text to display in the left pane for this item.

Parameters

Name	Type	Description
strText	String	Text to display in the left pane for this item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

The following example shows how to use *setLeftLabelText()* to set the text in the left pane.

```
var project_id="741cc7491b6f1c5043de32231b4bcbc5"; // Project ID
var grUser = new GlideRecord('user_resource');
grUser.addQuery('planned_task', project_id);
grUser.setQueryReferences(true);
grUser.orderBy('user.name', 'DESC');
grUser.query();
while (grUser.next()) {
  var item = new GlideTimelineItem(grUser.getTableName(),
 grUser.user);
  /* Specify the text to display in the left pane for this item.
 */
  item.setLeftLabelText(grUser.user.name);
  /* Set the name of the image file (including it's path) */
  item.setImage('../images/icons/user.gifx');
  /* Specify whether or not to bold the text style of the item
 in the left pane. */
  item.setTextBold(true);
  /* Set whether or not the current instance object can be
 clicked and dragged into another GlideTimelineItem */
  item.setIsDraggable(true);
}
```

GlideTimelineItem - setParent(String sysId)

Sets the parent of the current *GlideTimelineItem*.

Parameters

Name	Type	Description
sysId	String	The sysID of the GlideTimelineItem that should become the parent of the current GlideTimelineItem.

Returns

Type	Description
void	

GlideTimelineItem - setTextBold(Boolean b)

Specifies whether or not to bold the text style of the item in the left pane.

Parameters

Name	Type	Description
b	Boolean	Flag that indicates whether the text in left pane should be bold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: Text should be bold. • false: Text should not be bold.

Returns

Type	Description
void	

The following example shows how to set the text in the left pane to bold.

```
var project_id="741cc7491b6f1c5043de32231b4bcbc5"; // Project ID
var grUser = new GlideRecord('user_resource');
grUser.addQuery('planned_task', project_id);
grUser.setQueryReferences(true);
grUser.orderBy('user.name', 'DESC');
grUser.query();
while (grUser.next()) {
  var item = new GlideTimelineItem(grUser.getTableName(),
 grUser.user);
  /* Specify the text to display in the left pane for this item.
 */
  item.setLeftLabelText(grUser.user.name);
  /* Set the name of the image file (including it's path) */
  item.setImage('../images/icons/user.gifx');
  /* Specify whether or not to bold the text style of the item
 in the left pane. */
  item.setTextBold(true);
  /* Set whether or not the current instance object can be
 clicked and dragged into another GlideTimelineItem */
  item.setIsDraggable(true);
}
```

GlideTransformLog - Scoped, Global

The *GlideTransformLog* API provides methods to create a GlideTransformLog object to log messages to localhost logs.

Related topics

GlideImportLog

GlideImportSetRun

GlideImportSetTable

GlideImportSetTransformer

GlideImportSetTransformMap

GlideTransformLog - GlideTransformLog()

Instantiates an GlideTransformLog object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

```
var importLog = new GlideTransformLog();
```

GlideTransformLog - error(String message)

Logs a message of type Error to localhost logs.

Parameters

Name	Type	Description
message	String	Transform log message.

Returns

Type	Description
None	

```
var importLog = new GlideTransformLog();
importLog.error('Error executing transform');
```

GlideTransformLog - info(String message)

Logs a message of type Info to localhost logs.

Parameters

Name	Type	Description
message	String	Transform log message.

Returns

Type	Description
None	

```
var importLog = new GlideTransformLog();
importLog.info('Successfully executed the transform.');
```

GlideTransformLog - warn(String message)

Logs a message of type Warn to localhost logs.

Parameters

Name	Type	Description
message	String	Transform log message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var importLog = new GlideTransformLog();
importLog.warn('Transform taking longer than expected');
```

GlideUICompatibility - Scoped

The `GlideUICompatibility` API provides the ability for scoped applications to define their own minimum browser versions. This is done by creating system properties for the scoped application.

You create the properties using the sys_properties list and assign a version number. When you do this from the scoped application, the <scope-name> prefix is automatically added to the property name. The scoped application UI compatibility properties are:

- <scope-name>.ui.ie_minimum
- <scope-name>.ui.chrome_minimum
- <scope-name>.ui.firefox_minimum
- <scope-name>.ui.safari_major_version_minimum

You can then use the `GlideUICompatibility` class to determine if the current browser is supported.

GlideUICompatibility - GlideUICompatibility(String scopeName)

Creates a GlideUICompatibility object.

Parameters

Name	Type	Description
scopeName	String	Application's scope name.

GlideUICompatibility - getCompatibility()

Returns the terms "block" or "allow" based upon the browser version.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Either `block` or `allow`.

```
UICompatibility = new
 GlideUICompatibility(gs.getCurrentScopeName());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var blockOrAllow = UICompatibility.getCompatibility();
gs.info(blockOrAllow);
```

Output:

```
allow
```

GlideUICompatibility - isBlocked()

Determines if the browser is not supported (blocked).

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the browser is blocked. Possible values: • true: Browser is blocked. • false: Browser is valid and not blocked.

```
UICompatibility = new
 GlideUICompatibility(gs.getCurrentScopeName());
var blocked = UICompatibility.isBlocked();
gs.info(blocked);
```

Output:

```
false
```

GlideURI - Global

The *GlideURI* API provides methods to handle URI parameters in a global application.

Note: Do not use the *GlideURI* API in scripts that are executed during export or in background jobs.

For more information on using URIs:

- Navigate by URL
- Navigation stack

See also Action - getGlideURI().

GlideURI - deleteMatchingParameter(String match)

Deletes one or more parameters from the URI that match the beginning of the provided string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
match	String	Partial name of one or more parameters to remove from the query portion of a URI.

Returns

Type	Description
None	

The following example shows how to delete URI parameters that partially match the name provided.

```
// create the GlideURI object
var uri = action.getGlideURI();

uri.deleteMatchingParameter('sysparm_list_');
uri.deleteMatchingParameter('sysparm_record_');
```

Scoped equivalent

This method is not available in scoped applications.

GlideURI - deleteParameter(String name)

Removes a specified parameter from the query portion of the URI.

Parameters

Name	Type	Description
name	String	Name of the parameter to remove from the query portion of a URI.

Returns

Type	Description
None	

The following example shows how to delete a URI parameter.

```
// create the GlideURI object
var uri = action.getGlideURI();

uri.deleteParameter('sysparm_referring_url');
```

Scoped equivalent

This method is not available in scoped applications.

GlideURI - get(String name)

Returns the value of the specified parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	The parameter name.

Returns

Type	Description
String	The value for the specified parameter.

```
// create the GlideURI object
var uri = action.getGlideURI();
uri.set('sysparm_query', 'priority=2^active=true' );
var fileString = uri.get('sysparm_query');
gs.info(fileString);
```

Output:

```
priority=2^active=true
```

Scoped equivalent

To use the *get()* method in a scoped application, use the corresponding scoped method: GlideURI - get(String name) .

GlideURI - getFileFromPath()

Returns the file name portion of the URI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The file name portion of the URI.

```
var gURI = action.getGlideURI();

var fileString = gURI.getFileFromPath();
gs.info(fileString);
```

Scoped equivalent

To use the *getFileFromPath()* method in a scoped application, use the corresponding scoped method: GlideURI - getFileFromPath() .

GlideURI - getMap()

Returns a map (key value pairs) containing each parameter in the query and its associated value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	

The following example shows how to get `sysparm_query` parameters. See also Action - getGlideURI() .

```
gs.action.getGlideURI().getMap().get('sysparm_query');
```

Scoped equivalent

This method is not available in scoped applications.

GlideURI - set(String name, String value)

Sets the specified parameter to the specified value.

Parameters

Name	Type	Description
name	String	The parameter name.
value	String	The value.

Returns

Type	Description
None	

The following example shows how to set value of a sysparm_query field. See also Action - getGlideURI() .

```
var gURI = action.getGlideURI();
gURI.set('sysparm_query', 'priority=2^active=true' );
var fileString = gURI.get('sysparm_query');
gs.info(fileString);
```

Output:

```
priority=2^active=true
```

Scoped equivalent

To use the *set()* method in a scoped application, use the corresponding scoped method: GlideURI - set(String name, String value) .

GlideURI - setView(String view)

Adds the *sysparm_view* parameter to the query with the named view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A view defines the elements that appear when a user opens a form or a list. The *sysparm_view* parameter specifies the view to be used for a list or a form. For more information on views, see View management .

See also:

- Action - getGlideURI()
- GlideModalV3 - switchView()

Parameters

Name	Type	Description
view	String	Name of the *sysparm_view* parameter to set in the URI query.

Returns

Type	Description
None	

The following example shows how to add the major incidents view to the URI query in the Incidents [incident] table. For example, `sysparm_view=Major%20Incidents`. See also Action - getGlideURI() .

```
// create the GlideURI object
var uri = action.getGlideURI();

// Adds the Major incidents to the query
uri.setView('Major Incidents');

//
 https://instance.service-now.com/incident.do?sys_id=0&sysparm_v
iew=Major%20Incidents ...
```

Scoped equivalent

This method is not available in scoped applications.

GlideURI - toString(String path)

Reconstructs the URI string and performs the proper URL encoding by converting non-valid characters to their URL code. For example, converting & to '%26'.

Parameters set with the *set()* method are encoded with the URI as well.

Parameters

Name	Type	Description
path	String	The base portion of the system URL to which the URI is appended.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The URL.

The following examples shows how to convert invalid characters to URL code in an instance URL. See also Action - getGlideURI() .

```
var gURI = action.getGlideURI();
fileString = gURI.toString('https://<your
 instance>.service-now.com/navpage.do');
```

Scoped equivalent

To use the *toString()* method in a scoped application, use the corresponding scoped method: GlideURI - toString(String path) .

GlideURI - Scoped

The *GlideURI* API provides methods to handle URI parameters in a scoped application.

Note: Do not use the *GlideURI* API in scripts that are executed during export or in background jobs.

For more information on using URIs:

- Navigate by URL
- Navigation stack

See also: GlideURI - Global .

Scoped GlideURI - GlideURI()

Instantiates a GlideURI object.

Parameters

Name	Type	Description
None		

Scoped GlideURI - get(String name)

Returns the value of the specified parameter.

Parameters

Name	Type	Description
name	String	The parameter name.

Returns

Type	Description
String	The value for the specified parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gURI = new GlideURI();
gURI.set('sysparm_query', 'priority=2^active=true' );
var fileString = gURI.get('sysparm_query');
gs.info(fileString);
```

Output:

```
priority=2^active=true
```

Scoped GlideURI - getFileFromPath()

Returns the file name portion of the URI.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The file name portion of the URI.

```
var gURI = new GlideURI();

var fileString = gURI.getFileFromPath();
gs.info(fileString);
```

Scoped GlideURI - set(String name, String value)

Sets the specified parameter to the specified value.

Parameters

Name	Type	Description
name	String	The parameter name.
value	String	The value.

Returns

Type	Description
None	

```
var gURI = new GlideURI();
gURI.set('sysparm_query', 'priority=2^active=true' );
var fileString = gURI.get('sysparm_query');
gs.info(fileString);
```

Output:

```
priority=2^active=true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped GlideURI - toString(String path)

Reconstructs the URI string and performs the proper URL encoding by converting non-valid characters to their URL code. For example, converting & to '%26'.

Parameters set with the `set()` method are encoded with the URI as well.

Parameters

Name	Type	Description
path	String	The base portion of the system URL to which the URI is appended.

Returns

Type	Description
String	The URL.

```
var gURI = new GlideURI();
fileString = gURI.toString('https://<your
 instance>.service-now.com/navpage.do');
```

GlideUser - Scoped

The `GlideUser` API provides methods to access information about the current user and current user roles.

Using the `GlideUser` API avoids the need to use the slower GlideRecord queries to get user information.

Scoped GlideUser - getCompanyID()

Returns the current user's company sys_id.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Company sys_id.

```
var currentUser = gs.getUser();
gs.info(currentUser.getCompanyID());
```

Scoped GlideUser - getDisplayName()

Returns the current user's display name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's display name

```
var currentUser = gs.getUser();
gs.info(currentUser.getDisplayName());
```

Scoped GlideUser - getEmail()

Returns the user's email address.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's email address.

```
var currentUser = gs.getUser();
gs.info(currentUser.getEmail());
```

Scoped GlideUser - getFirstName()

Returns the user's first name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's first name.

```
var currentUser = gs.getUser();
gs.info(currentUser.getFirstName());
```

Scoped GlideUser - getID()

Gets the sys_id of the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's sys_id.

```
var currentUser = gs.getUser();
gs.info(currentUser.getID());
```

Scoped GlideUser - getLastName()

Returns the user's last name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's last name.

```
var currentUser = gs.getUser();
gs.info(currentUser.getLastName());
```

Scoped GlideUser - getName()

Returns the user ID, or login name, of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User ID or login name.

```
var currentUser = gs.getUser();
gs.info(currentUser.getName());
```

Scoped GlideUser - getPreference(String name)

Gets the specified user preference value for the current user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Name of the preference.

Returns

Type	Description
String	Preference value.

```
var currentUser = gs.getUser();
currentUser.savePreference('myPref','red');
gs.info(currentUser.getPreference('myPref'));
```

Scoped GlideUser - getRoles()

Returns a list of roles that includes explicitly granted roles, inherited roles, and roles acquired by group membership.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	List of all roles available to the user

```
var currentUser = gs.getUser();
gs.info(currentUser.getRoles());
```

Scoped GlideUser - getUserRoles()

Returns the list of roles explicitly granted to the user.

Unlike the `getRoles()` method, this method does not return roles the user inherits or roles acquired from group membership.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	List of roles explicitly assigned to the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var currentUser = gs.getUser();
gs.info(currentUser.getUserRoles());
```

Scoped GlideUser - hasAssignedRole(String roleName)

Returns true if the user has the specified role.

Parameters

Name	Type	Description
roleName	String	Checks if the user has this role. **Note:** For the current user, this method checks for the role in their elevated privilege roles only if they elevated to that role in the current session. For non current users, this method checks for the role in all of their elevated privilege roles.

Returns

Type	Description
Boolean	Flag that indicates whether the user has the specified role. Valid values: • true: The user has the specified role. • false: The user doesn't have the specified role.

This example checks if the current user has the admin role.

```
var currentUser = gs.getUser();
gs.info(currentUser.hasAssignedRole('admin'));
```

Output:

```
true
```

Scoped GlideUser - hasRole(String role)

Returns true if the user has the specified role or the admin role.

Parameters

Name	Type	Description
role	String	Checks if the user has this role.

Returns

Type	Description
Boolean	Flag that indicates whether the user has the specified role or the admin role. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: The user has the specified role or the admin role. • false: The user doesn't have the specified role or the admin role.

This example checks if the current user has the admin role.

```
var currentUser = gs.getUser();
gs.info(currentUser.hasRole('admin'));
```

Output:

```
true
```

Scoped GlideUser - isMemberOf(String group)

Determines if the current user is a member of the specified group.

Parameters

Name	Type	Description
group	String	Group to check.

Returns

Type	Description
Boolean	Flag that indicates whether the user is a member of the specified group. Possible values: • true: User is a member of the specified group. • false: User isn't a member of the specified group.

```
var currentUser = gs.getUser();
gs.info(currentUser.isMemberOf('Capacity Mgmt'));
```

Scoped GlideUser - savePreference(String name, String value)

Saves a user preference value to the database.

Parameters

Name	Type	Description
name	String	Preference to save.
value	String	Preference value.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var currentUser = gs.getUser();
currentUser.savePreference('myPref','red');
gs.info(currentUser.getPreference('myPref'));
```

GlideUser - Global

The `GlideUser` API provides methods to access information about the current user and current user roles.

Using the `GlideUser` API avoids the need to use the slower GlideRecord queries to obtain user information.

GlideUser - getCompanyID()

Returns the current user's company sys_id.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Company sys_id

```
var currentUser = gs.getUser();
gs.info(currentUser.getCompanyID());
```

Scoped equivalent

To use the `getCompanyID()` method in a scoped application, use the corresponding scoped method: getCompanyID().

GlideUser - getDisplayName()

Returns the current user's display name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's display name

```
var currentUser = gs.getUser();
gs.info(currentUser.getDisplayName());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the `getDisplayName()` method in a scoped application, use the corresponding scoped method: getDisplayName().

GlideUser - getDomainDisplayValue()

Returns the display value of the user's session domain.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The display value of the user's session domain.

```
var currentUser = gs.getUser();
gs.info(currentUser.getDomainDisplayValue());
```

Scoped equivalent

There is no workaround for scoped applications.

GlideUser - getDomainID()

Returns the identifier of the user's current session domain.

The identifier that is returned depends on the domain type and the instantiation of that domain.

- If the user is configured in the global domain, and does not use the domain picker to switch domains, the method returns null.
- If the user uses the domain picker to switch to the global domain, the method returns the string "global".
- For all other domains, the method returns the sys_id of that domain.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Domain identifier.

```
var domain = new GlideRecord('domain');
domain.get(gs.getUser().getDomainID());
gs.info(domain.name);
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideUser - getEmail()

Returns the user's email address.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's email address

```
var currentUser = gs.getUser();
gs.info(currentUser.getEmail());
```

Scoped equivalent

To use the *getEmail()* method in a scoped application, use the corresponding scoped method: getEmail().

GlideUser - getFirstName()

Returns the user's first name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object/ String	User's first name. **Note:** The data type for the returned value is object, however, the information is returned as a string.

```
var currentUser = gs.getUser();
var userName = currentUser.getFirstName();
gs.info('User First Name: + userName);
gs.info('Data type: ' + typeof userName);
```

```
*** Script: User First Name: John
*** Script: Data type: object
```

Scoped equivalent

To use the *getFirstName()* method in a scoped application, use the corresponding scoped method: getFirstName().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideUser - getID

Returns the sys_id of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User's sys_id

```
var currentUser = gs.getUser();
gs.info(currentUser.getID());
```

Scoped equivalent

To use the *getID()* method in a scoped application, use the corresponding scoped method: getID().

GlideUser - getLastName()

Returns the user's last name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object/ String	User's last name. **Note:** The data type for the returned value is object, however, the information is returned as a string.

```
var currentUser = gs.getUser();
var userName = currentUser.getLastName();
gs.info('User Last Name: + userName);
gs.info('Data type: ' + typeof userName);
```

```
*** Script: User Last Name: Smith
*** Script: Data type: object
```

Scoped equivalent

To use the *getLastName()* method in a scoped application, use the corresponding scoped method: getLastName().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GlideUser - getMyGroups()

Returns an iterator containing the list of all groups to which the user belongs. Only active groups are returned.

Parameters

Name	Type	Description
None		

Returns

Type	Description
iterator	A list of sys_ids for the active groups to which the user belongs.

The following example shows how to return a list of groups the user belongs to.

```
var groupsArray = gs.getUser().getMyGroups().toArray();
gs.info(groupsArray[0]);
```

Output:

```
cfcbad03d711110050f5edcb9e61038f
```

Scoped equivalent

There is no scoped equivalent for this method.

GlideUser - getName()

Returns the user ID, or login name, of the current user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	User ID

```
var currentUser = gs.getUser();
gs.info(currentUser.getName());
```

Scoped equivalent

To use the *getName()* method in a scoped application, use the corresponding scoped method: getName().

GlideUser - getRoles()

Returns a list of roles associated with the user. Includes explicitly granted roles, inherited roles, and roles acquired by group membership.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: Use *hasRole()* instead of *getRoles()* if any session-related role changes occur, like role masking or role delegation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Comma-separated list of user roles.

```
var currentUser = gs.getUser();
gs.info(currentUser.getRoles());
```

Output:

```
admin,hr_fulfiller,itsa_fulfiller,security_admin
```

Scoped equivalent

To use the *getRoles()* method in a scoped application, use the corresponding scoped method: getRoles().

GlideUser - getUserByID (String id)

Returns the user object associated with the passed-in user ID (sys_id in sys_user) or user_name.

Parameters

Name	Type	Description
id	String	Unique ID (sys_id) or user_name of the desired user record.

Returns

Type	Description
Object	User object associated with the specified sys_id or user_name.

Example using user name (user_name).

```
var currentUser = gs.getUser();
gs.info(currentUser.getFirstName()); // print the first name of
 the logged in user
var newUser = currentUser.getUserByID('abel.tuter'); // fetch a
 different user using the user_name field
gs.info(newUser.getFirstName()); // print the first name of the
 Abel Tuter user
```

Example using user ID (sys_id).

```
var currentUser = gs.getUser();
gs.info(currentUser.getFirstName()); // print the first name of
 the logged in user
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var newUser =
 currentUser.getUserByID('62826bf03710200044e0bfc8bcbe5df1'); //
 fetch Abel Tuter user using sys_id from sys_user record
gs.info(newUser.getFirstName()); // print the first name of the
 Abel Tuter user
```

GlideUser - getUserRoles()

Returns the list of roles explicitly granted to the user.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object/ String	List of comma-separated roles explicitly assigned to the user. **Note:** The data type for the returned value is object, however, the information is returned as a string.

```
var currentUser = gs.getUser();
var userRoles = currentUser.getUserRoles();
gs.info('User Roles: ' + userRoles);
gs.info('Data type: ' + typeof userRoles);
```

```
*** Script: User Roles: ,admin,security_admin
*** Script: Data type: object
```

Scoped equivalent

To use the *`getUserRoles()`* method in a scoped application, use the corresponding scoped method: getUserRoles().

GlideUser - hasAssignedRole(String roleName)

Returns true if the user has the specified role.

Parameters

Name	Type	Description
roleName	String	Checks if the user has this role. **Note:** For the current user, this method checks for the role in their elevated privilege roles only if they elevated to that role in the current session. For non current users, this method checks for the role in all of their elevated privilege roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the user has the specified role. Valid values: • true: The user has the specified role. • false: The user doesn't have the specified role.

This example checks if the current user has the admin role.

```
var currentUser = gs.getUser();
gs.info(currentUser.hasAssignedRole('admin'));
```

Output:

```
true
```

Scoped equivalent

To use the *hasAssignedRole()* method in a scoped application, use the corresponding scoped method: hasAssignedRole().

GlideUser - hasRole(String role)

Returns true if the user has the specified role or the admin role.

Note: Use *hasRole()* instead of *getRoles()* if any session-related role changes occur, like role masking or role delegation.

Parameters

Name	Type	Description
role	String	Checks if the user has this role.

Returns

Type	Description
Boolean	Flag that indicates whether the user has the specified role or the admin role. Valid values: • true: The user has the specified role or the admin role. • false: The user doesn't have the specified role or the admin role.

This example checks if the current user has the admin role.

```
var currentUser = gs.getUser();
gs.info(currentUser.hasRole('admin'));
```

Output:

```
true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *hasRole()* method in a scoped application, use the corresponding scoped method: hasRole().

GlideUser - isExplicitMemberOf(String group)

Determines if the current user is an explicit member of the specified group. Only active groups are evaluated by this method.

The *isMemberOf()* method returns true for a parent group if the user is a member of the child group. Use this method if you only want to return true for parent groups.

Parameters

Name	Type	Description
group	String	Sys_id of the user group to check.

Returns

Type	Description
Boolean	Flag that indicates whether the current user is an explicit member of the specified group. Valid values: • true: The current user is an explicit member of the specified group. • false: The current user is not an explicit member of the specified group.

The following example shows how to check if the current user is an explicit member of the specified group.

```
var isExplMem =
 gs.getUser().isExplicitMemberOf('b8ef24616fc331003b3c498f5d3ee4
34');
gs.info(isExplMem);
```

Output:

```
false
```

Scoped equivalent

There is no scoped equivalent for this method.

GlideUser - isMemberOf(String group)

Determines if the current user is a member of the specified group. Only active groups are evaluated by this method.

This method returns true for a parent group if the user is a member of the child group. Use the *isExplicitMemberOf()* if you only want to return true for parent groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
group	String	Sys_id of the user group to check.

Returns

Type	Description
Boolean	Flag that indicates whether the current user is a member of the specified group. Valid values: • true: The current user is a member of the specified group. • false: The current user is not a member of the specified group.

The following example shows how to check if the current user is a member of the specified group.

```
var currentUser = gs.getUser();
gs.info(currentUser.isMemberOf('Capacity Mgmt'));
```

Scoped equivalent

To use the *`isMemberOf()`* method in a scoped application, use the corresponding scoped method: isMemberOf().

GlideXMLUtil - Scoped, Global

The *`GlideXMLUtil`* API provides methods to remove invalid characters from an XML string and to validate an XML string.

Access these methods using the static object GlideXMLUtil. This class is available in scoped and global scripts.

GlideXMLUtil - removeInvalidChars(String xmlString)

Removes invalid characters from an XML string.

Parameters

Name	Type	Description
xmlString	String	The string to be processed.

Returns

Type	Description
String	A string with invalid characters removed.

```
var test = "test\btab";
var removedTest = GlideXMLUtil.removeInvalidChars(test);

gs.info(removedTest);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output: testtab

GlideXMLUtil - validateXML(String xmlString, Boolean nsAware, Boolean forgiveUnclosed)

Determines if the specified string is valid XML.

Parameters

Name	Type	Description
xmlString	String	The string to be validated.
nsAware	Boolean	When true, the validation is aware of name spaces. When false, the validation ignores name spaces.
forgiveUnclosed	Boolean	When true, the validation does not check for <xml> tags enclosing the string.

Returns

Type	Description
String	Returns null if the string is valid. Returns an error string describing the error if the specified string is not valid.

```
var s = "<?xml version=\"1.0\" encoding=\"UTF-8\"?><unload
 unload_date=\"2017-11-27 21:56:14\"><incident
 action=\"INSERT_OR_UPDATE\"><active>true</active></incident></u
nload>";
var xml = GlideXMLUtil.validateXML(s,false, false);
gs.info(xml);
```

Output: null

GSLog - Scoped, Global

GSLog is a script include that simplifies script logging and debugging by implementing levels of log output, selectable by per-caller identified sys_properties values.

Logs can be at the level of debug, info, notice, warning, err, or crit (after BSD syslog.h and followers). The default logging level is notice, so levels should be chosen accordingly.

Use for any server-side script where you want to implement event logging.

For more information, see Debugging scripts.

GSLog – GSLog()

Instantiates a *GSLog* object.

Parameters

Name	Type	Description
traceProperty	String	System property that contains a value indicating the level at or above which messages will be written to the log.
caller	String	Name of the script calling the logger.

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GSLog – debugOn()

Determines if debug is turned on.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether debug is on or off. Valid values: • true: Debug is on. • false: Debug is off.

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.setLevel("debug");
gs.print(gl.debugOn());
```

Output:

```
*** Script : true
```

GSLog – getLevel(String level)

Returns the log level.

Parameters

Name	Type	Description
level	String	Optional. Log level.

Returns

Type	Description
String	Log level.

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.setLevel("debug");
gs.print(gl.getLevel());
```

Output:

```
*** Script: debug
```

GSLog – initialize(String traceProperty, String caller)

Called by the Prototype JavaScript Framework during object creation to initialize a new instance of this class. Provide the input parameters, but do not call this method directly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
traceProperty	String	System property that contains a value indicating the level at or above which messages will be written to the log.
caller	String	Name of the script calling the logger.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
```

GSLog – log(String level, String msg)

Logs a message at the specified level.

Parameters

Name	Type	Description
level	String	Log level.
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.log("debug", "debug message");
```

GSLog – logAlert(String msg)

Logs alert events.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logAlert("This is an alert");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
*** Script [TaskSLA]: This is an alert
```

GSLog – logCrit(String msg)

Logs critical events.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logCrit("This is a critical message");
```

Output:

```
*** Script [TaskSLA]: This is a critical message
```

GSLog – logDebug(String msg)

Logs debug events.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logDebug("This is a debug message");
```

Output:

```
*** Script [TaskSLA]: This is a debug message
```

GSLog – logEmerg(String msg)

Logs emergency events.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logEmerg("This is an emergency message");
```

Output:

```
*** Script  [TaskSLA ] : This is an emergency message
```

GSLog – logErr(String msg)

Logs error events.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logErr("This is an error message");
```

Output:

```
*** Script [TaskSLA]: This is an error message
```

GSLog – logInfo(String msg)

Logs information events.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logInfo("This is an info message");
```

GSLog – logNotice(String msg)

Logs notice events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logNotice("This is a notice");
```

Output:

```
*** Script [TaskSLA]: This is a notice
```

GSLog – logWarning(String msg)

Logs warning events.

Parameters

Name	Type	Description
msg	String	Message to write to the log.

Returns

Type	Description
None	

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.logWarning("This is a warning message");
```

Output:

```
*** Script [TaskSLA]: This is a warning message
```

GSLog – setLevel(String level)

Sets the log level.

Parameters

Name	Type	Description
level	String	Log level to set.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gl = new GSLog("com.snc.sla.tasksla.log", "TaskSLA");
gl.setLevel("debug");
```

HermesEventPublisherOOB - Scoped

The *HermesEventPublisherOOB* script include provides methods to publish messages to the Hermes Messaging Service.

If you want to change the default functionality of this script include, you need to override the methods contained in this script include in the `HermesEventPublisher` script include. For additional information on overriding the methods in this script include, see Configure the Producer Event Notification Framework to use the Hermes Messaging Service.

This script include runs in the `sn_api_notif_mgmt` namespace.

HermesEventPublisherOOB - fetchMessageHeaders(Object message)

Returns the message headers associated with the passed message.

You must call this method before publishing the message through the Hermes Messaging Service.

The default implementation of this method only sets the *origin* header value to `TMT_SERVICENOW`. If any other header attributes should be passed back by this method based on your business requirements, you must override this method in the `HermesEventPublisher` script include and provide the additional header attributes.

Parameters

Name	Type	Description
message	Object	TMF event to publish to the Hermes Kafka message broker. For details on the format of this message, see TMF688 Event Management API User Guide v4.0.0.

Returns

Type	Description
Object	Kafka headers to use for the passed message. For example: `{ origin: 'TMT_SERVICENOW' }`

The following code example shows how to call this method.

```
publishMessageThroughProducerV2API: function(message) {
  if (gs.nil(message)) return;
  var comptableTopicSysIds =
 this.fetchTopicsForMessage(message);
  if (gs.nil(comptableTopicSysIds)) return;

  for (var i = 0; i < comptableTopicSysIds.length; i++) {
    var partitionKey = this.fetchPartionKey(message);
    var headers = this.fetchMessageHeaders(message)
    try {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      var producer = new sn_ih_kafka.ProducerV2();
      producer.send(comptableTopicSysIds[i], partitionKey,
 JSON.stringify(message), false, headers);
    } catch (ex) {
      this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
    }
  }
},
```

HermesEventPublisherOOB - fetchPartionKey(Object message)

Returns the partition key associated with the passed message.

You must call this method before publishing the message through the Hermes Messaging Service.

The default implementation for this method returns an auto-generated unique ID as the partition key. This type of implementation ensures that messages are evenly published across all partitions of the topic. If you want to modify the handling of partitions, you must override this method in the `HermesEventPublisher` script include. Another possible implementation is to return a unique partition key based on the message event type, or other attribute, to ensure the sequencing of messages of the same event type or attribute.

Parameters

Name	Type	Description
message	Object	Message to publish using the Hermes Kafka message broker. For details on the format of this message, see TMF688 Event Management API User Guide v4.0.0 .

Returns

Type	Description
String	Kafka partition key to use for the passed message. For example: 6B29FC40-CA47-1067-B31D-00DD010662DA

The following code example shows how to call this method.

```
publishMessageThroughProducerV2API: function(message) {
  if (gs.nil(message)) return;
  var comptableTopicSysIds =
 this.fetchTopicsForMessage(message);
  if (gs.nil(comptableTopicSysIds)) return;

  for (var i = 0; i < comptableTopicSysIds.length; i++) {
    var partitionKey = this.fetchPartionKey(message);
    var headers = this.fetchMessageHeaders(message)
    try {
      var producer = new sn_ih_kafka.ProducerV2();
      producer.send(comptableTopicSysIds[i], partitionKey,
 JSON.stringify(message), false, headers);
    } catch (ex) {
      this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
  }
},
```

The following code example shows how to override this method to include your own logic for determining the partition key to use for the specified message.

```
// Existing implementation for fetching a partition key which is
 an auto-generated unique ID.
fetchPartionKey: function(message) {
  // Implement it for custom partition key
  // Random message key ensures better distribution of messages
 across partitions.
  // Same message key ensures that messages always goes to the
 same partition. This ensures a strict sequencing
  //  of messages at the Kafka consumer group level.
  return gs.generateGUID();
},

// Implementation where the partition key is determined based on
 the event type.
fetchPartionKey: function(message) {
  var eventType = message.eventType;
  var partionKey = fetchPartionKeyForMessage(eventType);
  return partionKey;
},
```

HermesEventPublisherOOB - fetchTopicsForMessage(Object message)

Returns all Kafka topics that are associated with the passed message.

This method is not implemented in the base implementation, it only returns a static sys_id. You must override this method in the `HermesEventPublisher` script include and provide logic that determines which Kafka topic or topics to send the passed message to.

For additional information on how to implement this method, see Configure the Producer Event Notification Framework to use the Hermes Messaging Service.

Parameters

Name	Type	Description
message	Object	TMF message to publish to the Hermes Kafka message broker. For details on the format of this message, see TMF688 Event Management API User Guide v4.0.0.

Returns

Type	Description
Array	List of sys_ids of the Kafka topics to which the message should be sent. Located in the Kafka Topic [cmdb_ci_appl_kafka_topic] table. For example: `[ "9d385017c611228701d22104cc95c371",`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	<pre> "8438201ec613628421e13105d396d421"]</pre>

The following code example shows how to call this method.

```
publishMessageThroughProducerV2API: function(message) {
  if (gs.nil(message)) return;
  var comptableTopicSysIds =
 this.fetchTopicsForMessage(message);
  if (gs.nil(comptableTopicSysIds)) return;

  for (var i = 0; i < comptableTopicSysIds.length; i++) {
    var partitionKey = this.fetchPartionKey(message);
    var headers = this.fetchMessageHeaders(message)
    try {
      var producer = new sn_ih_kafka.ProducerV2();
      producer.send(comptableTopicSysIds[i], partitionKey,
 JSON.stringify(message), false, headers);
    } catch (ex) {
      this._logger.logErr("Publishing message to Hermes Kafka
 Failed, error is: " + ex);
    }
  }
},
```

The following code example shows how to override this method to return the same topic record sys_id for each passed message.

```
// Return the same topic for all messages if your
 // implementation only supports one kind of topic

fetchTopicsForMessage: function(message) {
// Return the same sys_id for all passed messages which
// implies that all of the messages are published to the same
 topic.
return ['91564fc087f8351063151f473cbb35f8'];
},
```

The following code example shows how to override this method to identify topics to send a message to based on the event type in the message.

```
// Fetch the topic based on the message content.
// This could be based on the message domain type or the message
 event type.

fetchTopicsForMessage: function(message) {
// Implement to return topic based on a message content
// Implementor may decide a topic based on 'eventType' or any
 other attribute.

var eventType = message.eventType;

var topicSysIdsArr = this.fetchTopicBasedOnEventType(eventType);
return topicSysIdsArr
```

```
},
```

HermesEventPublisherOOB - publishEventToHermesKafka(Object tmfEventPayload)

Publishes the passed TMF688-compliant payload using the Hermes Messaging Service.

This is a parent method that calls other methods to publish the event. It is unlikely that you will need to override this method unless you want to change the Kafka publishing mechanism, such as using Workflow Studio instead of using the ProducerV2 API.

Parameters

Name	Type	Description
tmfEventPayload	Object	TMF688-compliant event payload. For a description of the format of this event payload, refer to the TMF688 Event Management API User Guide.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
publishMessageToHermesKafka: function(tmfEventPayload) {
  new
 HermesEventPublisher().publishEventToHermesKafka(tmfEventPayloa
d);
},
```

HistoryWalker - Scoped, Global

The *HistoryWalker* API uses the audit/history tables to generate a historical version of an existing record. This historical version contains all updates to all fields for the specified glide record.

This API provides the ability to return a GlideRecord to a previous update count (walked GlideRecord) with the appropriate glide elements populated. After the walked GlideRecord is retrieved, the API provides the ability to move forward and backward between the update numbers, navigating through its historical updates.

This API enables you to:

- Instruct the *HistoryWalker* API to use a specific history walker implementation to retrieve audit data.
- Navigate through the historical version of a glide record.
- Apply the appropriate history/audit data to get an existing GlideRecord to the state it was in a specific update count.
- Turn off row-level access control.
- Turn off field-level access control.
- Turn off retrieval and processing of "changes" data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable journal fields.
- Enable variables.

The *HistoryWalker* API provides four ways to retrieve audit data:

1. HISTORY - History walker

   If not available or not up to date, creates a History Set [sys_history_set] record for the glide record that you passed when instantiating the *HistoryWalker* API, using the data in the Sys Audit [sys_audit] table. The sys_history_set table contains the name of the associated History [sys_history_line] table. The sys_history_line table contains a record for each field value that has been updated in the table being walked. Using this retrieval method, *HistoryWalker* methods retrieve history data from the generated sys_history_line table, instead of directly querying the sys_audit table.

   The records within the sys_history_line table are sorted and grouped by ascending Update [update] field values rather than by chronological order. The update field is loosely associated with the Updates [sys_mod_count] field on the task table.

   Note: Updates of the sys_mod_count by clients is not synchronized and therefore can be overwritten, making this count unreliable.

2. AUDIT - Audit walker

   Queries the sys_audit table for the glide record that you passed when instantiating the *HistoryWalker* API. Each record in the sys_audit table contains the changes to field values that occurred through the life of the record.

   Records are sorted ascending by the Update count [record_checkpoint] field rather than by chronological order. The record_checkpoint field is loosely associated with the Updates [sys_mod_count] field on the task table. One-to-one correlation is not guaranteed.

   Things to consider when deciding whether to use the AUDIT retrieval method:

   - Size of the sys_audit table. The sys_audit table can become quite large as the changes for all fields in all records are maintained in this table.
   - Possible lack of update zero record depending on the setting of the system property *glide.sys.audit_inserts*. This property defines whether an audit record is created with the initial field values when a record is first inserted in a table. In a base system, this property is set to "false" causing the *HistoryWalker* API to do additional processing to account for this missing information.

   As such, running the *HistoryWalker* API with AUDIT isn't as performant as either HISTORY or CHECKPOINT.

3. CHECKPOINT - Checkpoint walker

   Uses a hybrid approach to obtain historical data from the sys_history_set or sys_audit table depending on the setting of the system property *com.glide.history_walker.max_history_count*. If the record to walk has a sys_mod_count that exceeds the value set in this property, default value = 1,000, the checkpoint walker uses the sys_audit table to obtain history data. Otherwise it uses the sys_history_set table.

   The reason for this check is that the sys_history_set table provides a more performant approach for walking history data, but only up to a certain point. When the total number of field updates reaches a certain level, approximately 10K, the generation of the sys_history_set table can exceed the user transaction timeout. If the timeout is exceeded, the overall results are worse in performance than running against the sys_audit table that contains all table updates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The checkpoint walker uses the *com.glide.history_walker.max_history_count* to determine the optimal record set to use to achieve the best performance.

Records are grouped and sorted ascending by the Record Internal Checkpoint [internal_checkpoint] field. Since the internal_checkpoint field is a timestamp, the records are in chronological order. In addition, the internal_checkpoint field has no association to the task.sys_mod_count field.

The most important difference between the checkpoint walker and other walkers is that the other walkers are coupled to and driven by task.sys_mod_count entries and related to sys_audit.record_checkpoint and sys_history_line.update. The checkpoint walker uses the sys_audit.internal_checkpoint and sys_history_line.internal_checkpoint fields respectively.

The record internal checkpoint addresses both of these issues making the checkpoint walker the most reliable way to retrieve audit history data.

4. OFFLINE - Offline history walker

   Provides the offline history feature used by applications such as the Field Service mobile offline app. When a task table extension has fields with the dictionary attribute offline_timestamp_field set, the offline history walker runs irrespective of any property or explicit instruction to use another walker. The offline history walker uses the sys_history_line and sys_history_set tables, which contain history data purposely ordered by date and time, to support offline updates. Only the offline history walker can give accurate results for such tables.

   Note: For offline updates, the *HistoryWalker* API is initiated automatically and the only two methods that you can use are: *walkTo(0)* and *walkForward()*. You can't call other *HistoryWalker* methods for offline updates.

The system property *com.snc.walker.default* defines the default type of record walking to perform when instantiating the *HistoryWalker* API. For upgrading customers, this property is set to "HISTORY". For new customers, this property is set to "CHECKPOINT".

When you instantiate the *HistoryWalker* API as follows, the *com.snc.walker.default* property determines which record walker implementation the API uses.

```
var hw = new sn_hw.HistoryWalker(<table name>, <sys_id>);
```

You can also pass the type of record walker to use when instantiating the API. It's advisable to always include the desired walker implementation when instantiating this API.

```
var hw = new sn_hw.HistoryWalker(<table name>, <sys_id>,
 <walker>);
```

such as:

```
var hw = new sn_hw.HistoryWalker('incident',
 '1c741bd70b2322007518478d83673af3', 'CHECKPOINT');
```

To use this class in scoped and global applications, use the `sn_hw` namespace identifier. The History Walker plugin (com.glide.history_walker) that is enabled by default is required to access the *HistoryWalker* API.

HistoryWalker - HistoryWalker(String tableName, String sysId, String walker)

Instantiates the HistoryWalker object and retrieves the historic data for the specified glide record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
tableName	String	Name of table that contains the record to retrieve.
sysId	String	Sys_id of the record whose historic data you want to retrieve.
walker	String	Optional. Name of the history walker to use to retrieve the historic data for the specified record. Valid values: • AUDIT • CHECKPOINT • HISTORY • OFFLINE Default: Walker specified in the system property com.snc.walker.default.

The following code example shows how to call this method to walk through the changes made to the GlideRecord using the checkpoint walker.

```
var gr_Hw = new GlideRecord('sc_req_item');
gr_Hw.get('b0d3335d49534210f877468e89703a7c');

var hw = new sn_hw.HistoryWalker(gr_Hw.getTableName(),
 gr_Hw.getUniqueValue(), 'CHECKPOINT');
hw.walkTo('19096afcc800000001');
printChangedFields(hw);

function printChangedFields(hw) {
   var walkedGr = hw.getWalkedRecord();
   var fields =
 GlideScriptRecordUtil.get(walkedGr).getChangedFieldNames();
   gs.info('Fields changed at update ' + hw.getUpdateNumber() +
 ' were:');
   for (var j = 0; j < fields.size(); j++) {
      var fieldName = fields.get(j) + '';
      if (fieldName !== 'variables')
         gs.info(walkedGr.getValue('sys_updated_on') + ' ' +
 fieldName + '=' + walkedGr.getValue(fieldName));
   }

   var variables = walkedGr.variables;
   for (var variableName in variables) {
      if (variables[variableName].changes())
         gs.info(walkedGr.getValue('sys_updated_on') + ' ' +
 variableName + '=' + variables[variableName].getValue());
   }
   gs.info('');
}
```

Output:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Fields changed at update 3 were:
2024-07-09 08:50:21 price=1499
2024-07-09 08:50:21 state=2
2024-07-09 08:50:21 priority=2
2024-07-09 08:50:21 recurring_price=100
```

HistoryWalker - HistoryWalker(String tableName, String sysId, Boolean useAudit)

Fetches the database record based on the parameters, using the History Sets or Audit data to retrieve the historic data, depending on the third parameter.

Parameters

Name	Type	Description
tableName	String	Name of table containing the record to retrieve.
sysId	String	Sys_id of the record to retrieve.
useAudit	Boolean	Flag that indicates whether to use audit data to retrieve historic date. Valid values: • true: Use audit data to retrieve historic date. • false: Use history set to retrieve historic date.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue(), true);
if (hw.walkTo(3)) {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' +
 hw.getUpdateNumber() + ' was ' + oldPriority);
} else
    gs.info('Incident does not have update number 3');
```

Output:

```
Incident priority in update number 3 was 4
```

HistoryWalker - getUpdateNumber()

Gets the update number of the current walked glide record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
int	Current update number or -1 if record is not found.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
for(int i = 0; i < 2; i++) {
  hw.walkForward();
}
gs.info('Update number: ' + hw.getUpdateNumber());
```

Output:

```
Update number: 3
```

HistoryWalker - getWalkedRecord()

Gets the record filled with the history/audit data after walking to an update number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	The walked GlideRecord.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
hw.walkForward();
var walkedRecord = hw.getWalkedRecord();
gs.info('Priority in update number 0: ' +
 walkedRecord.priority);
hw.walkForward();
walkedRecord = hw.getWalkedRecord();
gs.info('Short description in update number 1: ' +
 walkedRecord.short_description);
```

Output:

```
 Priority in update number 0: 4
Short description in update number 1: My monitor has stopped
 working
```

HistoryWalker - getWalkedRecordCopy()

Returns a copy of the record filled with the history/audit data after walking to an update number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The `getWalkedRecord()` method might modify the obtained walkedRecord after walking to another update number. The `getWalkedRecordCopy()` method gets a clone to the walked record to prevent that.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	Copy of the walked GlideRecord.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var walkedRecord = [];
var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
hw.walkForward();
walkedRecord[0] = hw.getWalkedRecordCopy();
hw.walkForward();
walkedRecord[1] = hw.getWalkedRecordCopy();

gs.info('Priority in update number 0: ' +
 walkedRecord[0].priority);
gs.info('Short description in update number 1: ' +
 walkedRecord[1].short_description);
```

Output:

```
Priority in update number 0: 4
Short description in update number 1: My monitor has stopped
 working
```

HistoryWalker - isFieldLevelSecurity()

Specifies if the record-level read access is applied on the record when retrieving from the database.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether field-level security is enabled. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Field-level security is enabled. • false: Field-level security isn't enabled.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
gs.info('Field level security is active: ' +
 hw.isFieldLevelSecurity());
```

Output:

```
Field level security is active: true
```

HistoryWalker - isRecordLevelSecurity()

Specifies if the record-level read access is applied on the record when retrieving from the database.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether record-level security is enabled. Valid values: • true: Record-level security is enabled. • false: Record-level security isn't enabled.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
gs.info('Record level security is active: ' +
 hw.isRecordLevelSecurity());
```

Output:

```
Record level security is active: true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HistoryWalker - isWithChanges()

Specifies if any of the methods that walk the record from one update to another, support the "changes" data for each element.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether change support is enabled. Valid values: • true: Change support is enabled. • false: Change support isn't enabled.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
gs.info('Changes is active: ' + hw.isWithChanges());
```

Output:

```
Changes is active: true
```

HistoryWalker - isWithJournalFields()

Specifies if journal type fields are populated from the historical values.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether journal fields are populated. Valid values: • true: Journal fields are populated. • false: Journal fields aren't populated.

The following code example shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
gs.info('Populating journal fields is active: ' + hw.
 isWithJournalFields());
```

Output:

```
Populating journal fields is active: false
```

HistoryWalker - isWithVariables()

Specifies if values are set for variables that are recorded in the history.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether values are set for variables that are recorded in the history. Valid values: • true: Values are set. • false: Values aren't set.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
gs.info('Populating variables is active: ' + hw.
 isWithVariables());
```

Output:

```
Populating variables is active: false
```

HistoryWalker - setFieldLevelSecurity(Boolean fieldLevelSecurity)

Sets the field-level read access on each element before setting the historical value of that element in the GlideRecord. If the field-level security is enabled, it prevents the API from populating the fields of the walked record that the user of the API doesn't have access to.

Parameters

Name	Type	Description
fieldLevelSecurity	Boolean	Flag that indicates how to set the field-level read access security.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: Enable field-level security. • false: Disable field-level security. Default: true

Returns

Type	Description
void	

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
hw.setFieldLevelSecurity(false);
hw.walkForward();
```

HistoryWalker - setRecordLevelSecurity(Boolean recordLevelSecurity)

Sets the record-level read access on the record when retrieving from the database. The record-level security prevents the API from retrieving the walked record if the user of the API doesn't have access to the GlideRecord.

Parameters

Name	Type	Description
recordLevelSecurity	Boolean	Flag that indicates how to set the record-level read access security. Valid values: • true: Enable record-level security. • false: Disable record-level security. Default: true

Returns

Type	Description
void	

The following code example shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
hw.setRecordLevelSecurity(false);
hw.walkForward();
```

HistoryWalker - setWithChanges(Boolean withChanges)

Sets the "changes" data support for each element for a method that walks the record from one update to another.

Parameters

Name	Type	Description
withChanges	Boolean	Flag that indicates whether the changes data is supported for each element. Valid values: • true: Change data is supported for each element. • false: Change data is not supported for each element. Default: true

Returns

Type	Description
void	

This code example shows how to call this method with Changes data support. This example must be run in global scope.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');
var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
while (hw.walkForward()) {
  printChangedFields(hw);
}

function printChangedFields(hw) {
  var walkedGr = hw.getWalkedRecord();
  var fields =
 GlideScriptRecordUtil.get(walkedGr).getChangedFieldNames();
  gs.info("Fields changed at update " + hw.getUpdateNumber() + "
 were:");
  for (var j = 0; j < fields.size(); j++)
    gs.info(" " + fields.get(j));
  gs.info("");
}
```

This code example shows how to call this method without Changes data support. This example runs in both scoped and global environments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');
var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
hw.setWithChanges(false);

while (hw.walkForward()) {
  var oldPriority = hw.getWalkedRecord().priority;
  gs.info('Incident priority in update number ' +
 hw.getUpdateNumber() + ' was ' + oldPriority);
}
```

HistoryWalker - setWithJournalFields(Boolean withJournalFields)

Specifies if journal type fields are populated from the historical values.

Parameters

Name	Type	Description
withJournalFields	Boolean	Flag that indicates whether to include journal-type fields. Valid values: • true: Include journal-type fields. • false: Don't include journal-type fields. Default: false

Returns

Type	Description
void	

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');
var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
hw.setWithJournalFields(true);
if (hw.walkForward()) {
  var workNotes = hw.getWalkedRecord().work_notes;
  gs.info('Work Notes in update number ' + hw.getUpdateNumber()
 + ' was ' + workNotes);
}
```

HistoryWalker - setWithVariables(Boolean withVariables)

Specifies if variables are populated from the historical values.

Parameters

Name	Type	Description
withVariables	Boolean	Flag that indicates whether variables are populated from the historical values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • true: Variable are populated. • false: Variable aren't populated. Default: false

Returns

Type	Description
void	

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
hw.setWithVariables(true);
hw.walkTo(0);
if (hw.walkTo(0)) {
    var varUrgency = hw.getWalkedRecord().variables.urgency;
    gs.info('Variable Urgency in update number ' +
 hw.getUpdateNumber() + ' was ' + varUrgency);
}
```

HistoryWalker - walkBackward()

Applies the appropriate history/audit data to get a walked GlideRecord to the state when it was one update number backward. If the previous update count is missing from the history/audit data, it will walk to the previous available update count.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether walking to the specified update number was possible. Valid values: • true: Able to walk to the specified update number. • false: Unable to walk to the specified update number. Possible reasons: Already walked to the update number 0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');
var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());

while (hw.walkBackward()) {
  var oldPriority = hw.getWalkedRecord().priority;
  gs.info('Incident priority in update number ' +
 hw.getUpdateNumber() + ' was ' + oldPriority);
}
```

Output:

```
Incident priority in update number 5 was 2
Incident priority in update number 4 was 4
Incident priority in update number 3 was 4
Incident priority in update number 2 was 4
Incident priority in update number 1 was 4
Incident priority in update number 0 was 4
```

HistoryWalker - walkForward()

Applies the appropriate history/audit data to get a walked GlideRecord to the state when it was one update number forward. If next update count is missing from the history/audit data, it will walk to the next available update count.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether walking to the specified update number was possible. Valid values: • true: Able to walk to the specified update number. • false: Unable to walk to the specified update number. Possible reasons: Already walked to the GlideRecord update count.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');
var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());

while (hw.walkForward()) {
  var oldPriority = hw.getWalkedRecord().priority;
  gs.info('Incident priority in update number ' +
 hw.getUpdateNumber() + ' was ' + oldPriority);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
Incident priority in update number 0 was 4
Incident priority in update number 1 was 4
Incident priority in update number 2 was 4
Incident priority in update number 3 was 4
Incident priority in update number 4 was 4
Incident priority in update number 5 was 2
```

HistoryWalker - walkTo(int updateCount)

Applies the appropriate history/audit data to get a GlideRecord to the state it was in a specific update count. Use *getWalkedRecord()* or *getWalkedRecordCopy()* after walking to an update number to retrieve the "walked" GlideRecord.

Note: This method is not supported by the checkpoint walker implementation. Call the HistoryWalker - walkTo(String checkpoint) method when using the checkpoint walker.

Parameters

Name	Type	Description
updateCount	Integer	Update number to walk to.

Returns

Type	Description
Boolean	Flag that indicates whether walking to the specified update number was possible. Valid values: • true: Able to walk to the specified update number. • false: Unable to walk to the specified update number. Possible reasons: The requested update is greater than the update count of the GlideRecord or there is no history/audit data for the requested update number.

The following code example shows how to call this method.

```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(),
 incGr.getUniqueValue());
if (hw.walkTo(3)) {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' +
 hw.getUpdateNumber() + ' was ' + oldPriority);
} else
    gs.info('Incident does not have update number 3');
```

Output:

```
Incident priority in update number 3 was 4
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HistoryWalker - walkTo(String checkpoint)

Applies the appropriate history/audit data to get a GlideRecord to the state it was in for a specific record internal checkpoint. Use the *getWalkedRecord()* or *getWalkedRecordCopy()* method after walking to a record's internal checkpoint to retrieve the "walked" GlideRecord.

Note: This method is only supported by the checkpoint walker implementation.

Parameters

Name	Type	Description
checkpoint	String	Record's internal checkpoint to walk to. You can find this value in the internal_checkpoint field of the Sys Audit [sys_audit] or History [sys_history_line] table.

Returns

Type	Description
Boolean	Flag that indicates whether walking to the specified record's internal checkpoint was possible. Possible values: • true: Able to walk to the specified record's internal checkpoint. • false: Unable to walk to the specified record's internal checkpoint. Possible reasons: The internal checkpoint doesn't exist.

The following code example shows how to call this method to walk through the changes made to the GlideRecord.

```
var gr_Hw = new GlideRecord('sc_req_item');
gr_Hw.get('b0d3335d49534210f877468e89703a7c');

var hw = new sn_hw.HistoryWalker(gr_Hw.getTableName(),
 gr_Hw.getUniqueValue(), 'CHECKPOINT');
hw.walkTo('19096afcc800000001');
printChangedFields(hw);

function printChangedFields(hw) {
   var walkedGr = hw.getWalkedRecord();
   var fields =
 GlideScriptRecordUtil.get(walkedGr).getChangedFieldNames();
   gs.info('Fields changed at update ' + hw.getUpdateNumber() +
 ' were:');
   for (var j = 0; j < fields.size(); j++) {
      var fieldName = fields.get(j) + '';
      if (fieldName !== 'variables')
         gs.info(walkedGr.getValue('sys_updated_on') + ' ' +
 fieldName + '=' + walkedGr.getValue(fieldName));
   }

   var variables = walkedGr.variables;
   for (var variableName in variables) {
      if (variables[variableName].changes())
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        gs.info(walkedGr.getValue('sys_updated_on') + ' ' +
 variableName + '=' + variables[variableName].getValue());
   }
   gs.info('');
}
```

Output:

```
Fields changed at update 3 were:
2024-07-09 08:50:21 price=1499
2024-07-09 08:50:21 state=2
2024-07-09 08:50:21 priority=2
2024-07-09 08:50:21 recurring_price=100
```

HostnameJS - Global

The *HostnameJS* script include provides methods to format host names according to property settings.

Use with any server-side script when you need to format host names.

HostnameJS - format(String hostname, String source)

Formats the specified host name according to the property settings.

Parameters

Name	Type	Description
hostname	String	The host name to format
source	String	The property settings source

Returns

Type	Description
String	The system name

HostnameJS - getDomainName()

Returns the DNS domain name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The domain name

```
var hjs = new HostnameJS();
hjs.getDomainName();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HostnameJS - getSysName()

Returns the current system name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The system name

```
var hjs = new HostnameJS();
hjs.getSysName();
```

hr_ActivitySet - Scoped

The `hr_ActivitySet` API handles lifecycle event activity set cases.

Lifecycle event activity sets represent different stages in the lifecycle event process. You must define when the activity set is triggered, such as immediately upon creation of the lifecycle event case or after the completion of another activity set. Each activity set is associated with a single lifecycle event.

The `hr_ActivitySet` API requires the HR Lifecycle Events plugin (com.sn_hr_lifecycle_events) and runs in the `sn_hr_le` namespace.

For additional information, see Understanding Enterprise Onboarding and Transitions.

hr_ActivitySet - hr_ActivitySet()

Instantiates an instance of the hr_ActivitySet class.

Parameters

Name	Type	Description
None		

hr_ActivitySet - createLECaseByService(String hrService, Object caseValues)

Creates a lifecycle event case based on a specified HR service.

Parameters

Name	Type	Description
hrService	String	Sys ID of HR service in the HR Services [sn_hr_core_service] table to be assigned to the lifecycle event case.
caseValues	Object	Key-value pairs containing a value for each case field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
caseValues.subject_person	String	Sys ID of subject person's name in the User [sys_user] table.
caseValues.opened_for	String	Sys ID of case opened for subject person in the Users [sys_user] table.
caseValues.subject_person_job	String	Sys ID of subject person's Business title in the Jobs [sn_hr_core_job] table.
caseValues.location	String	Sys ID of subject person's location in HR profile in the Locations [cmn_location] table.
caseValues.department	String	Sys ID of subject person's department in HR profile in the Departments [cmn_department] table.
caseValues.subject_person_hr_profile	String	Sys ID of subject person's HR profile in the HR Profiles [sn_hr_core_profile] table.
caseValues.short_description	String	Case description.
caseValues.state	Number	Number representing uniquely-defined custom case state.

Returns

Type	Description
String	Sys ID of the created case in the HR Lifecycle Events Cases [sn_hr_le_case] table.

Output includes summary with Operation Table and Row Count columns. Click the link in the row count column adjacent sn_hr_le_case table to view the new case.

```
var caseValues = {
              'subject_person':
 '62826bf03710200044e0bfc8bcbe5df1',
              'opened_for': '0e826bf03710200044e0bfc8bcbe5d7c',
              'subject_person_job':
 'f8d56900587d3700964f4efae452b3db',
              'location': '25ab9d1d0a0a0bb300537fd25687439d',
              'department': '93b25282c0a8000b0b55c8ab34e2f1e6',
              'subject_person_hr_profile':
 '330370019f22120047a2d126c42e7012',
              'short_description': 'Short description',
              'state': 10
          };

  var activity = new sn_hr_le.hr_ActivitySet();
  var createCase = new
 activity.createLECaseByService('4719647c67a60300132a6c3b5685ef1
6', caseValues);
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
...
insert sn_hr_le_case 1
...
```

hr_ActivitySet - hasActiveCaseByService(String spUser, String hrService, String jobId)

Checks for a case matching the specified combination of subject person user, HR service, and job.

Parameters

Name	Type	Description
spUser	String	Sys ID of subject person user in the Users [sys_user] table.
hrService	String	Sys ID of HR service in the HR Services [sn_hr_core_service] table.
jobId	String	Sys ID of subject user's job title in the HR Services [sn_hr_core_service] table.

Returns

Type	Description
Boolean	True if matching case exists, false otherwise.

```
var userId = '62826bf03710200044e0bfc8bcbe5df1'; //Abel Tuter
var hrServiceId =
 '64fa4c53534222003066a5f4a11c0875'; //Onboarding HR Service
var jobId = '3D62826bf03710200044e0bfc8bcbe5df1'; // Sample Job
 sys_id for the example

var activity = new sn_hr_le.hr_ActivitySet();

var hasActiveLECase = activity.hasActiveCaseByService(userId,
 hrServiceId, jobId);

gs.info('User has an active HR case: ' + hasActiveLECase);
```

Output:

```
sn_hr_le: User has an active HR case: false
```

hr_ActivityUtils - Scoped

The *`hrActivityUtils`* script include enables you to create HR cases from a record producer.

This script include requires the HR Lifecycle Events plugin (com.sn_hr_lifecycle_events) and runs in the `sn_hr_le` namespace.

hr_ActivityUtils - createCaseFromProducer(GlideRecord current, Object producer, String cat_item.sys_id)

Creates a case from a record producer and service. This method is intended to be called as-is to create a producer and does not require supplying data.

The following variables can be configured in a record producer to provide additional capabilities as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `job` – References sn_hr_core_job and maps to subject_person_job in an HR case
- `opened_for` – References sys_user and maps opened_for in an HR case
- `concurrent_job` – If the record producer includes this variable (by activating checkbox) and parameters have job information, creates a new job in sn_hr_core_job table

Parameters

Name	Type	Description
current	GlideRecord	GlideRecord for case to be created.
producer	Object	Comma-separated key value pair containing data as questions and answers that are automatically provided when a user submits an answer to a record producer question.
cat_item.sys_id	String	Looks up the HR service of case being created and variable names to populate the description.

Returns

Type	Description
Object	New case in related table, varies by product.

This method is intended to be called as-is to create a producer and does not require supplying data.

```
new
 sn_hr_core.hr_ActivityUtils(current).createCaseFromProducer(pro
ducer, cat_item.sys_id);
```

hr_Utils - Scoped

The *`hr_Utils`* API provides basic functionality for the Human Resource (HR) application.

This API requires the HR core plugin (com.sn_hr_core) and runs in the `sn_hr_core` namespace.

hr_Utils - hr_Utils()

Instantiates an instance of the hr_Utils class.

Parameters

Name	Type	Description
None		

hr_Utils - getPrimaryJob(String userId)

Gets the Sys ID of the active primary job for a provided user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
userID	String	Sys ID of the HR user from the User [sys_user] table assigned an active or future job in which Primary is true.

Returns

Type	Description
String	If present and active, Sys ID of the primary job from the Jobs [sn_hr_core_job] table, null otherwise.

```
var result = new
 sn_hr_core.hr_Utils().getPrimaryJob('5137153cc611227c000bbd1bd8
cd2007');
gs.info('Result: ' + result);
```

Output:

```
Result: eb3c69463cd63740964fb8b1ce04f9ae
```

hr_Utils - switchPrimaryJob(String userId String jobId)

Switches the primary job of a user.

Parameters

Name	Type	Description
userId	String	Sys ID of HR user from the Users [sys_user] table.
jobId	String	Job Sys ID from the Jobs [sn_hr_core_job] table.

Returns

Type	Description
String	Encoded JSON with message and status, error otherwise.

```
var result = new
 sn_hr_core.hr_Utils().switchPrimaryJob('5137153cc611227c000bbd1
bd8cd2007', 'bc884e723c0ebf00964fb8b1ce04f9d7');
gs.info('Result: ' + result);
```

Output:

```
Result: {"message":"Switched primary job for the user
 successfully","status":"success"}
```

HttpRequestAuthedData - Scoped

The *HttpRequestAuthedData()* API provides methods to access and set values in a signed REST or SOAP request.

Generate outbound signing requests using these APIs in the following order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. `HttpRequestData`: Build the API request.
2. `AuthCredential`: Create a credential object or update an existing one. Use the credential to sign the request through the `RequestAuthAPI` class.
3. `RequestAuthAPI`: Sign the request and return an HttpRequestAuthedData object.
4. `HttpRequestAuthedData`: Get information about the signed request.
5. `GlideHTTPRequest`: Send the signed request.

Before using these APIs, you must configure an authentication algorithm to sign the request and associate it with the credential used to authenticate the request.

Use this API in scoped scripts with the `sn_auth` namespace identifier. You can instantiate this class using the constructor, or you can return an HttpRequestAuthedData object from the `generateAuth()` method in the `RequestAuthAPI` class.

HttpRequestAuthedData - HttpRequestAuthedData()

Instantiates an HttpRequestAuthedData object.

You can instantiate this class using the constructor, or you can return an HttpRequestAuthedData object from the `generateAuth()` method in the `RequestAuthAPI` class.

Parameters

Name	Type	Description
None		

HttpRequestAuthedData - addHeader(String key, String value)

Adds a header to the HttpRequestAuthedData object.

Parameters

Name	Type	Description
key	String	Name of the HTTP header.
value	String	Value of the HTTP Header.

Returns

Type	Description
void	

```
// Define HttpRequestData
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Get AuthCredential
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();

// Update the signed response
output.addHeader('access-rights', 'public-read');
```

HttpRequestAuthedData - addQueryParam(String key, String value)

Adds a query parameter to the HttpRequestAuthedData object.

Parameters

Name	Type	Description
key	String	Name of the query parameter.
value	String	Value of the query parameter.

Returns

Type	Description
void	

```
// Define HttpRequestData
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);

//Get AuthCredential
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();

// Update the signed response
output.addQueryParameter('api_version', 'v2');
```

HttpRequestAuthedData - getCredentialValue()

Returns the credential value that was included when the request was signed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use a credential value to store a cookie, signature, or other value needed for an authentication algorithm. For example, create a Get Connection Info (GCI) step with a script that retrieves and stores a one-time token for a REST or SOAP call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Text of the credential value.

This example shows the retrieval of a credential value.

```
var RequestAuthGCISigner = Class.create();
RequestAuthGCISigner.prototype = Object.extend(new
 RequestAuthInternal(), {
  initialize: function() {
    RequestAuthInternal.prototype.initialize.call(this);
  },

  generateAuth: function(authAPI) {
    var requestData = authAPI.getHttpRequestData();

    // get credentials
    var credential = authAPI.getAuthCredential();
    var username = credential.getAttribute("user_name");
    var password = credential.getAttribute("password");
    var httpRequestSignedData = new
 sn_auth.HttpRequestAuthedData();
    var directive = requestData.getDirective();

    // set CREDENTIAL_VALUE

 httpRequestSignedData.setCredentialValue(username+":"+passwor
d);
    httpRequestSignedData.setDirective("CREDENTIAL_VALUE");
    httpRequestSignedData.setStatus("SUCCESS");

    gs.info("The Credential Value is " +
 httpRequestSignedData.getCredentialValue());
    return httpRequestSignedData;
  },
  type: 'RequestAuthGCISigner'
});
```

Output:

```
The Credential Value is someUsername:somePassword
```

HttpRequestAuthedData - getDirective()

Returns whether the signature is applied to the request in the header, as a query parameter, or as a credential value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the system applies the signature to the header. You can apply the signature as a query parameter or credential value by using the *setDirective()* API.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Whether the signature is applied to the header, as a query parameter, or as a credential value. Values include: • HEADER: The signature is applied to the request header. • QUERY: The signature is applied as a query parameter. • CREDENTIAL_VALUE: The signature is applied as a credential value.

```
// Define HttpRequestData
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);

//Get AuthCredential
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();
output.setDirective("header");

gs.info("Signature applied to: " + output.getDirective());
```

Output:

```
Signature applied to: HEADER
```

HttpRequestAuthedData - getHeaderMap()

Returns an object containing the headers that were included when the request was signed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Key-value pairs that define all of the headers included when the request was signed. Each key-value pair includes these parts: • key: String. Name of the header. • value: String. Value of the header.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );

// Get an AuthCredential object
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();

// get the signed response detail
var authH = headerM["Authorization"];
var xamzdateH = headerM["X-Amz-Date"];
var content256 = headerM["x-amz-content-sha256"];

gs.debug('authH:' + authH );
gs.debug('xamzdateH:' + xamzdateH );
gs.debug('content256:' + content256 );
```

Output:

```
*** Script: [DEBUG] authH:AWS4-HMAC-SHA256
 Credential=lsjfljljfllfwek/20191127/us-east-1/s3/aws4_request,
SignedHeaders=host;x-amz-acl;x-amz-content-sha256;x-amz-date,

bed7d02b90
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
*** Script: [DEBUG] xamzdateH:20191127T175210Z
*** Script: [DEBUG] content256:UNSIGNED-PAYLOAD
```

HttpRequestAuthedData - getQueryMap()

Returns an object containing the query parameters included when the request was signed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Key-value pairs that define the query parameters included when the request was signed. Each key-value pair includes these parts: • key: String. Name of the query parameter. • value: String. Value of the query parameter.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2' );
httpRequestData.addQueryParam('limit', '1000' );
httpRequestData.addQueryParam('offset', '1' );

// Get an AuthCredential object
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f7353330f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();

// Get the signed response
queryMap = output.getQueryMap();

gs.info("API Version is: " + queryMap["api_version"]);
```

Output:

```
API Version is: v2
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HttpRequestAuthedData - getStatus()

Returns the status of the request signing.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The status of the request signing. Possible values: • SUCCESS: The system successfully signed the request. • FAIL: The system failed to sign the request. • SKIPPED: The system skipped signing because the information was incomplete.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);

// Get an AuthCredential object
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();

// Get the signed status
gs.info("Status is: " + output.getStatus());
```

Output:

```
Status is: SUCCESS
```

HttpRequestAuthedData - getStatusMessage()

Returns a detailed message about the request signing. If the request signing fails, this method returns the error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Message about the request signing. If the request signing fails, returns one of these error messages: • `credential is not valid`: Check the AuthCredential object you used to sign the request. Make sure an authentication algorithm is associated with the credential. For more information, see Configure an authentication algorithm. • `Request data is empty. Request auth is skipped`: Check the HttpRequestData object because required information may be missing. • `Can't find script includes scope`: Verify that the authentication algorithm record and associated script includes used to sign the request are in the correct scope.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2' );
httpRequestData.addQueryParam('limit', '1000' );
httpRequestData.addQueryParam('offset', '1' );

// Get AuthCredential object and set an attribute
var credential = new sn_auth.AuthCredential();
credential.setAttribute("user_name", "admin");
credential.setAttribute("password", "admin");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();

// Get the signed status
gs.info("Status message is: " + output.getStatusMessage());
```

Output:

```
Status message is: credential is not valid.
```

HttpRequestAuthedData - setCredentialValue(String credential_value)

Sets a credential value for the HttpRequestAuthedData object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use a credential value to store a cookie, signature, or other value needed for an authentication algorithm. For example, create a Get Connection Info (GCI) step with a script that retrieves and stores a one-time token for a REST or SOAP call.

Use the *setCredentialValue()* method to set the **Credential Value** data pill for REST, SOAP, and GCI steps in Workflow Studio.

Parameters

Name	Type	Description
credential_value	String	Text of the credential value.

Returns

Type	Description
None	

This example shows how to set a credential value for a GCI step.

```
var RequestAuthGCISigner = Class.create();
RequestAuthGCISigner.prototype = Object.extend(new
 RequestAuthInternal(), {
  initialize: function() {
    RequestAuthInternal.prototype.initialize.call(this);
  },

  generateAuth: function(authAPI) {
    var requestData = authAPI.getHttpRequestData();

    // get credentials
    var credential = authAPI.getAuthCredential();
    var username = credential.getAttribute("user_name");
    var password = credential.getAttribute("password");
    var httpRequestSignedData = new
 sn_auth.HttpRequestAuthedData();
    var directive = requestData.getDirective();
    var b64data =
 GlideStringUtil.base64encode(username+":"+password);

    // set CREDENTIAL_VALUE
    httpRequestSignedData.setCredentialValue("Basic " +
 b64data);
    httpRequestSignedData.setDirective("CREDENTIAL_VALUE");
    httpRequestSignedData.setStatus("SUCCESS");
    return httpRequestSignedData;
  },
  type: 'RequestAuthGCISigner'
});
```

HttpRequestAuthedData - setDirective(String directive)

Defines whether to apply the signature to the signed request in the header, as a query parameter, or as a credential value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
directive	String	Whether to apply the signature to the header, query parameter, or credential value of the signed request. Values include: • `query`: Applies signature as a query parameter. • `header`: Applies signature to the request header. • `credential_value` : Applies signature to the credential value.

Returns

Type	Description
void	

```
// Define HttpRequestData
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);

//Get AuthCredential
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();
output.setDirective("header");
```

HttpRequestAuthedData - setStatus(String status)

Sets the status of the request signing.

Parameters

Name	Type	Description
status	String	The status of the request signing. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• `success`: The system successfully signed the request. • `fail`: The system failed to sign the request. • `skipped`: The system skipped signing because the information was incomplete.

Returns

Type	Description
void	

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);

// Get an AuthCredential object
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();
output.setStatus("fail");

// Get the signed status
gs.info("Status is: " + output.getStatus());
```

Output:

```
 Status is: FAIL
```

HttpRequestAuthedData - setStatusMessage(String statusMessage)

Sets a status message for the request signing.

Parameters

Name	Type	Description
statusMessage	String	Message to set for the request signing status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);

// Get an AuthCredential object
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();
output.setStatusMessage("The request was successfully signed.");

// Get the signed status message
gs.info("Status message is: " + output.getStatusMessage());
```

Output:

```
Status message is: The request was successfully signed.
```

HttpRequestData - Scoped

The *HttpRequestData* API provides methods to build and manipulate a REST request before applying a signature and sending it to an endpoint.

Generate outbound signing requests using these APIs in the following order:

1. *HttpRequestData*: Build the API request.
2. *AuthCredential*: Create a credential object or update an existing one. Use the credential to sign the request through the *RequestAuthAPI* class.
3. *RequestAuthAPI*: Sign the request and return an HttpRequestAuthedData object.
4. *HttpRequestAuthedData*: Get information about the signed request.
5. *GlideHTTPRequest*: Send the signed request.

Before using these APIs, you must configure an authentication algorithm to sign the request and associate it with the credential used to authenticate the request.

Use this API in scoped scripts with the `sn_auth` namespace identifier. You can instantiate this class using the constructor, or you can return an HttpRequestData object from the *getHttpRequestData()* method in the *RequestAuthAPI* class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HttpRequestData - HttpRequestData()

Instantiates an HttpRequestData object.

Parameters

Name	Type	Description
None		

```
var httpRequestData = new sn_auth.HttpRequestData();
```

HttpRequestData - addHeader(String key String value)

Adds a header to the HttpRequestData object.

Parameters

Name	Type	Description
key	String	Name of the HTTP header.
value	String	Value of the HTTP Header.

Returns

Type	Description
void	

This example creates a REST request payload.

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read' );
```

HttpRequestData - addQueryParam(String key, String value)

Adds a query parameter to the HttpRequestData object.

Parameters

Name	Type	Description
key	String	Name of the query parameter.
value	String	Value of the query parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2 );
```

HttpRequestData - deleteHeader(String key)

Removes a header from the HttpRequestData object.

Parameters

Name	Type	Description
key	String	Name of the HTTP header to remove.

Returns

Type	Description
void	

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.deleteHeader('x-amz-acl');
```

HttpRequestData - getConnectionAliasID()

Returns the sys_id of the Connection & Credential alias associated with the Integration Hub REST step.

You can pass the sys_id to the *`ConnectionInfoProvider`* API to retrieve information about the connection.

Note: You can only use this method in an Integration Hub REST step. For more information, see REST step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the alias record from the Connection & Credential Aliases [sys_alias] table associated with the request.

```
var httpRequestData = new sn_auth.HttpRequestData();
var id = httpRequestData.getConnectionAliasID();

var credential = new sn_cc.ConnectionInfoProvider().
var connectionInfo = credential.getConnectionInfo(id);
```

HttpRequestData - getConnectionExtendedAttribute(String name)

Returns the value of a connection attribute associated with the Connection & Credential alias associated with Integration Hub REST step.

Note: You can only use this method in an Integration Hub REST step. For more information, see REST step.

For more information about connection attributes, see Create connection attributes for Integration Hub.

Parameters

Name	Type	Description
name	String	Name of the connection attribute.

Returns

Type	Description
String	Value of the connection attribute.

This example returns the value of a connection attribute set on the Connection & Credential alias associated with the REST step.

```
var httpRequestData = new sn_auth.HttpRequestData();
gs.info("API Version is: " +
 httpRequestData.getConnectionExtendedAttribute('api_version'));
```

HttpRequestData - getContent()

Returns the content of the request in the HttpRequestData object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Content of the request.

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );
var ct = httpRequestData.getContent();
```

Output:

```
Action=SendMessage&MessageBody=This is a test message
```

HttpRequestData - getDate()

Returns the date when the request was signed.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	The difference between January 1, 1970 UTC and when the request was signed. Unit: Milliseconds

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');

gs.info( "Date: " + httpRequestData.getDate());
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Date: 1349333576093
```

HttpRequestData - getDirective()

Returns whether the signature is applied to the request in the header or as a query parameter.

By default, the system applies the signature to the header. You can apply the signature as a query parameter using the *setDirective()* API.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Whether the signature is applied to the header or as a query parameter. Values include: • HEADER: The signature is applied to the request header. • QUERY: The signature is applied as a query parameter.

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');

gs.info( "Signature applied to: " +
 httpRequestData.getDirective() );
```

Output:

```
Signature applied to: HEADER
```

HttpRequestData - getEndpoint()

Returns the endpoint set for the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Endpoint set for the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDirective("query");
gs.info( "Endpoint is: " + httpRequestData.getEndpoint() );
```

Output:

```
Endpoint is: https://s3.amazonaws.com
```

HttpRequestData - getExpiry()

Returns the time in seconds before the signature expires starting when the request was signed using the *generateAuth()* method in the *RequestAuthAPI* class.

The expiration is commonly set by the third-party service you are sending the request to, which overrides any value set by the *setExpiry()* method. For example, if the expiration is set to 900 seconds by the third-party service and you use the *setExpiry()* method to set the expiration to 300 seconds, the *getExpiry()* method returns 900 seconds.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Time before the signature expires. Unit: Seconds

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDirective("query");
httpRequestData.setExpiry(300);

gs.info("Signature expires in: " + httpRequestData.getExpiry());
```

Output:

```
Signature expires in: 300
```

HttpRequestData - getHeader(String key)

Returns the value associated with the given HTTP header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
key	String	Name of HTTP header.

Returns

Type	Description
String	Value of the given HTTP header.

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read' );

gs.info( "Header value is: " +
 httpRequestData.getHeader('x-amz-acl') );
```

Output:

```
Header value is: public-read
```

HttpRequestData - getHeaderMap()

Returns an object containing the headers included in the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Key-value pairs that define all of the headers associated with the request. Each key-value pair includes these parts: • Key: String. Name of the header. • Value: String. Value of the header.

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read' );
httpRequestData.addHeader('content-type', 'application/json' );

var map = httpRequestData.getHeaderMap();

for(var x in map) {
    var y = map[x]

    gs.info(x, y);
}
```

Output:

```
*** Script: x-amz-acl
*** Script: content-type
```

HttpRequestData - getHost()

Returns the host used in the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Host used in the request.

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setHost('myHost')
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );

gs.info("Host is: " + httpRequestData.getHost());
```

Output:

```
Host is: myHost
```

HttpRequestData - getHttpMethod()

Returns the HTTP method used in the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	HTTP method used in the request.

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read' );

gs.info("HTTP method is: " + httpRequestData.getHttpMethod());
```

Output:

```
HTTP method is: PUT
```

HttpRequestData - getQueryParam(String key)

Returns the value of the specified query parameter.

Parameters

Name	Type	Description
key	String	Name of the query parameter to get the value of.

Returns

Type	Description
String	Value of the query parameter.

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2' );
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info("API version is: " +
 httpRequestData.getQueryParam('api_version'));
```

Output:

```
API version is: v2
```

HttpRequestData - getQueryParamMap()

Returns an object containing the query parameters included in the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Key-value pairs that define the query parameters associated with the request. Each key-value pair includes these parts: • Key: String. Name of the query parameter. • Value: String. Value of the query parameter.

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2' );
httpRequestData.addQueryParam('limit', '1000' );
httpRequestData.addQueryParam('offset', '1' );

var map = httpRequestData.getQueryParamMap();
gs.info("api_version is: " + map['api_version']);
```

Output:

```
api_version is: v2
```

HttpRequestData - getRegion()

Returns the region for the request that will be used in signing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the region.

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);

gs.info("Region is: " + httpRequestData.getRegion());
```

Output:

```
Region is: us-east-1
```

HttpRequestData - getService()

Returns the service defined in the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Service defined in the request.

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');

gs.info("Service is: " + httpRequestData.getService());
```

Output:

```
Service is: s3
```

HttpRequestData - setContent(String content)

Defines the content to send in the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This method is not supported in script includes or MID server scripts.

Parameters

Name	Type	Description
content	String	Content to send in the request.

Returns

Type	Description
void	

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "This is a test message";
httpRequestData.setContent(content);
```

HttpRequestData - setDate(Number date)

Defines the date of the request used for signing.

Use this method only when testing whether the signature is created correctly based on a time stamp. In production, the signing request uses the time that you generated the signature; manually setting this value may cause the signing request to fail.

Parameters

Name	Type	Description
date	Number	The difference between January 1, 1970 UTC and the date used to sign the request. Unit: Milliseconds

Returns

Type	Description
void	

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDate(1349333576093);
```

HttpRequestData - setDirective(String directive)

Defines whether to apply the signature to the request in a header or as a query parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
directive	String	Whether to apply the signature to the header or as a query parameter. Values include: • `query`: Applies signature as a query parameter. • `header`: Applies signature to the request header. Default: header

Returns

Type	Description
void	

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDirective("query");
```

HttpRequestData - setEndpoint(String endpoint)

Defines the endpoint to send the request to.

Parameters

Name	Type	Description
endpoint	String	Endpoint to send the request to. The endpoint can include query parameters, path, and version.

Returns

Type	Description
void	

```
var
 endpoint="https://
third-party-endpoint/path-parameters/version";

var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
```

HttpRequestData - setExpiry(Number expiry)

Sets the amount of time before the signature expires starting when the request is signed using the *`generateAuth()`* method in the *`RequestAuthAPI`* class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The expiration is commonly set by the third-party service you are sending the request to, which overrides any value set by the `setExpiry()` method. For example, if the expiration is set to 900 seconds by the third-party service and you use the `setExpiry()` method to set the expiration to 300 seconds, the `getExpiry()` method returns 900 seconds.

Parameters

Name	Type	Description
expiry	Number	Amount of time before the signature expires. Unit: Seconds

Returns

Type	Description
void	

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setExpiry(300);
```

HttpRequestData - setHost(String host)

Defines the host used in the request.

Parameters

Name	Type	Description
host	String	Name of the HTTP request host.

Returns

Type	Description
void	

```
var endpoint= "https:third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setHost('myHost')
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read' );
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HttpRequestData - setHttpMethod(String httpMethod)

Sets the HTTP method to use in the request.

Parameters

Name	Type	Description
httpMethod	String	HTTP method to use in the request.

Returns

Type	Description
void	

```
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
```

HttpRequestData - setRegion(String region)

Defines the region to use for the request in signing.

Parameters

Name	Type	Description
region	String	The region to use to sign the request. Available values are determined by the third-party API's requirements.

Returns

Type	Description
void	

```
var endpoint= "https:third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
```

HttpRequestData - setService(String service)

Defines the service for the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
service	String	The service for the request.

Returns

Type	Description
void	

```
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
```

ICalUtilSNC - Global

The *ICalUtilSNC* script include provides functions to generate iCalendar compliant events.

ICalUtilSNC - formatICalComponent(Array arrEvents)

Generates a formatted VCALENDAR component.

Parameters

Name	Type	Description
arrEvents	Array	Properties that make up a VCALENDAR component.

Returns

Type	Description
Array	Properties needed to form a VCALENDAR.

ICalUtilSNC - formatICalEvent(Array arrEvent, Boolean useAlarm)

Generates a formatted VEVENT.

Parameters

Name	Type	Description
arrEvent	Array	Contains the individual properties that make up a VEVENT.
useAlarm	Boolean	If true, adds a VALARM to the VEVENT.

Returns

Type	Description
String	The formatted VEVENT.

ICalUtilSNC - formatRecurringRule (Object ruleObj)

Formats the RRULE property for a VEVENT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
ruleObj	Object	Contains the properties for the RRULE property.

Returns

Type	Description
String	The formatted RRULE property.

ICalUtilSNC - getDateFromScheduleDateTime (GlideScheduleDateTime scheduleDateTime)

Returns the date from the GlideScheduleDateTime.

Parameters

Name	Type	Description
scheduleDateTime	GlideScheduleDateTime	A GlideScheduleDateTime representation of the date and time.

Returns

Type	Description
String	Formatted date.

Example: cURL example

```
var scheduleDateTime = new GlideScheduleDateTime();
var myICalUtilSNC = new ICalUtilSNC();
var scheduleDate =
 myICalUtilSNC.getDateFromScheduleDateTime(scheduleDateTime);

gs.info(scheduleDateTime);
gs.info(scheduleDate);
```

Output:

```
2023-02-08 09:05:22
20230208
```

ICalUtilSNC - getSDT(String sdtStr, String timeZone)

Returns a GlideScheduleDateTime object based on the passed date and time string.

Parameters

Name	Type	Description
sdtStr	String	Formatted ScheduleDateTime.
timeZone	String	Optional. Time zone to use when generating the GlideScheduleDateTime object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideScheduleDateTime	A GlideScheduleDateTime representation of the passed date and time string.

ICalUtilSNC - getTimeFromScheduleDateTime (GlideScheduleDateTime scheduleDateTime)

Returns the time from the GlideScheduleDateTime.

Parameters

Name	Type	Description
scheduleDateTime	GlideScheduleDateTime	A GlideScheduleDateTime representation of the date and time.

Returns

Type	Description
String	Formatted time.

The following code example shows how to call this method.

```
var scheduleDateTime = new GlideScheduleDateTime();
var myICalUtilSNC = new ICalUtilSNC();
var scheduleDate =
 myICalUtilSNC.getTimeFromScheduleDateTime(scheduleDateTime);

gs.info(scheduleDateTime);
gs.info(scheduleDate);
```

Output:

```
2023-02-08 10:21:43
102143Z
```

IdentificationEngine - Scoped

The *`IdentificationEngine`* API uses the Identification and Reconciliation framework to minimize the creation of duplicate configuration items (CIs) and to reconcile CI attributes by only accepting information from authorized data sources when updating the Configuration Management Database (CMDB).

When using this class in a scoped application, use the `sn_cmdb` namespace identifier.

IdentificationEngine - createOrUpdateCI(String source, String input)

Inserts or updates configuration items (CI) and non-Configuration Management Database (CMDB) CIs (classes not extending from cmdb_ci) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

For additional information on non-CMDB table ingestion, see IRE support for non-CMDB tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
input	String	Required. Input payload. A JS formatted string of configurati items to add or update. `"input" { "items": [Array], "referenceItems": [Array], "relations": [Arra }`
input.items	Array of Objects	Items to add or update. `"items": [ { "className": "String", "display_values {Object}, "internal_id": "String", "lookup": [Arra "related": [Arr "settings": {Object}, "sys_object_source o": {Object}, "values": {Obje } ]`
input.items.className	String	Required. Class/table name, sys_class_name, of the configuration item (CI) to crea update. This value can be any CMDB table, such as cmdb_ci_linux_ or cmdb_ci_win_server.
input.items.display_values	Object	Reference fields to create or u for this related item as name-value pairs, where the name i field name and the value is th referenced display value. If yo want to use the sys_id instead the display value for reference fields, pass the information in *input.items.lookup.v* parameter instead of in this parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		Reference field names depen
		the fields selected by the use
		as:
		`"display_values": {`
		`  "model_id": "Stri`
		`  "location": "Stri`
		`}`

input.items.internal_id	String	Unique item identifier for the associated payload. This can be any value, but mu unique within the payload.

input.items.lookup	Array of Objects	Identifies the top-level item containing the lookup (lookup
		based identification). These
		records are used to identify th
		configuration item based on a
		lookup table that has a refere
		back to cmdb_ci.
		
		For example:
		`"lookup": [`
		`  {`
		`  "className":`
		`"String",`
		`  "internal_id":`
		`"String",`
		
		`  "sys_object_source`
		`o": {Object},`
		`  "values": {Obje`
		`  }`
		`]`

input.items.lookup.className	String	Required. Class/table name, sys_class_name, of the configuration item (CI) to crea update. This value can be any CMDB table, such as cmdb_serial_nu or cmdb_ci_network_adapter.
input.items.lookup.internal_id	String	Unique item identifier for the associated payload. This can be any value, but mu unique within the payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
input.items.lookup.sys_object_source_info	Object	Unique CI identifier for a spec source. `"sys_object_source_o": { "source_feed": "String", "source_name": "String", "source_native_ke "String", "source_recency_ti amp": "String" }`
input.items.lookup.sys_object_source_info.source_feed	String	If the source can have multipl feeds, use this field to provide name of the feed sending this The data source generates th feed name. It can be any strin uniquely identifies the source
input.items.lookup.sys_object_source_info.source_name	String	Data source of the CI informa This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci]
input.items.lookup.sys_object_source_info.source_native_key	String	Unique key/id for the item fro source. The data source generates th It can be any string that is uni the item.
input.items.lookup.sys_object_source_info.source_recency_timestamp	String	UTC date and time that the ite scanned. Format: YYYY-MM-DD hh:mm
input.items.lookup.values	Object	Fields to create or update for related item as name/value pa where the name is the field na For a reference field, the valu must be the referenced sys_i you want to use the display va instead of the sys_id for refere fields, pass this information in *display_values* object in of in the *values* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Field names and types deper the fields selected by the use as: `"values": { "host_name": "String", "ip_address": "String", "name": "String", "os_name": "Strin "sys_class_name": "String" }`
input.items.related	Array	Reference to the top-level iter contains the related list. Rules Related Entry [cmdb_related_ define what type of records ca in this array. These records ar to add items based on a relate table that has a reference to t that is being identified. The related table may or may extend cmdb_ci. These record are not used to identify the configuration item. `"related" [ { "className": "String", "internal_id": "String", "sys_object_source o": {Object}, "values": {Obje } ]`
input.items.related.className	String	Required. Class/table name, sys_class_name, of the configuration item (CI) to crea update. This value can be any CMDB class/table, such as cmdb_software_instance or cmdb_key_value.
input.items.related.internal_id	String	Unique item identifier for the associated payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		This can be any value, but mu unique within the payload.
input.items.related.sys_object_source_info	Object	Unique CI identifier for a spec source. `"sys_object_source_ o": { "source_feed": "String", "source_name": "String", "source_native_ke "String", "source_recency_ti amp": "String" }`
input.items.related.sys_object_source_info.source_feed	String	If the source can have multipl feeds, use this field to provide name of the feed sending this The data source generates th feed name. It can be any strin uniquely identifies the source
input.items.related.sys_object_source_info.source_name	String	Data source of the CI informa This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci]
input.items.related.sys_object_source_info.source_native_key	String	Unique key/id for the item fro source. The data source generates th It can be any string that is uni the item.
input.items.related.sys_object_source_info.source_recency_timestamp	String	UTC date and time that the ite scanned. Format: YYYY-MM-DD hh:mm
input.items.related.values	Object	Fields to create or update for related item as name/value pa where the name is the field na For a reference field, the value must be the referenced sys_id you want to use the display va instead of the sys_id for refere fields, pass this information in

Parameters (continued)

Name	Type	Description
		<pre>"child_id": "String", "parent_id": "String", "sys_rel_source_info": {Object}, "type": "String" }]</pre>
input.relations.child	Number	Integer index of the CI object in the *items* array that represents the child in the relationship (item, items.related, or items.lookup
input.relations.child_id	String	The *internal_id* of the child item in the relation (item, items.related, or items.lookup
input.relations.parent	Number	Integer index of the parent item in the *items* array (item, items.related, or items.lookup
input.relations.parent_id	String	The *internal_id* of the parent item in the relation (item, items.related, or items.lookup
input.relations.sys_rel_source_info	Object	Discovery source information for relationship. For non-dependent relationships, this information is saved in the Relationship Source [sys_rel_source] table (not per for *identifyCIEnhanced()* or *identifyCI()* methods.) Data type: Object <pre>"sys_rel_source_info": { "source_name": "String", "source_feed": "String" }</pre>
input.relations.sys_rel_source_info.source_name	String	Discovery source name. Default: Discovery source passed in the API method parameter.
input.relations.sys_rel_source_info.source_feed	String	Any string that is a sub-discovery scan within the discovery sou

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: 'UNKNOWN' is stored source_feed column when cre a record in sys_rel_source tab
input.relations.type	String	Type of relationship that exists between the parent and child items. This must be a name fie value from the CI Relationship [cmdb_rel_type] table.
source	String	Identifies the data source of th CI information. This value mus one of the choice values defin for the discovery_source field cmdb_ci table.

Returns

Type	Description
<String>	JSON formatted string that is a list of results for the configuration items in the input string. Each result string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs. Data type: String
<String>.additionalCommittedItems	No values are currently returned.
<String>.additionalCommittedRelations	No values are currently returned.

<String>.items	Description of the created or updated CIs.
	
	Data type: Object
	
	`"items": {`
	
	`"additionalRelatedItems": [Array],`
	`"className": "String",`
	`"duplicateIndices": [Array],`
	`"errorCount": Number,`
	`"errors": [Array],`
	
	`"identificationAttempts": [Array],`

Returns (continued)

Type	Description

	<pre>"identifierEntrySysId": "String",
	"info": [Array],
	"inputIndices": [Array],
	"maskedAttributes": [Array],
	"operation": "String",
	"relatedItems": [Array],
	"relatedSysIds": [Array],
	"sysId": "String"
	}</pre>

<String>.items.additionalRelatedItems	List of information about additional lookup and related items that were processed but not provided as part of the input payload. These items are from partial payloads.
	
	This information is not currently returned.
	
	Data type: Array of Objects
	<pre>"additionalRelatedItems": [
	{
	"className": "String",
	"inputIndices": [Array],
	"operation": "String",
	"sysId": "String"
	}
	]</pre>

<String>.items.additionalRelatedItems.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.additionalRelatedItems.inputIndices	Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects.

Returns (continued)

Type	Description
	Data type: Array of Numbers or Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Number } ]`
<String>.items.additionalRelatedItems.inputIndices.mainIndex	Index value from the request body *items* array that corresponds to the CI parent of the additional related item. Data type: Number
<String>.items.additionalRelatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array that corresponds to the additional related item. Data type: Number
<String>.items.additionalRelatedItems.operation	Type of operation. Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String
<String>.items.additionalRelatedItems.sysId	Sys_id of the additional related items. Data type: String
<String>.items.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.duplicateIndices	List of indexes of CIs that are duplicates of the current item.

Returns (continued)

Type	Description
	Data type: Array
<String>.items.errorCount	Number of errors. Data type: Number
<String>.items.errors	List of errors encountered while processing this CI. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`
<String>.items.errors.error	Type of error encountered while processing the CI. Data type: String
<String>.items.errors.message	Error message associated with the error. Data type: String
<String>.items.identificationAttempts	List of attempts that were made to identify the CIs. Data type: Array of Objects `"identificationAttempts": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttributes": [Array], "identifierName": "String", "searchOnTable": "String" } ]`
<String>.items.identificationAttempts.attemptResult	Results of the attempt to identify the CI.

Returns (continued)

Type	Description
	Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes. • MULTI_MATCH: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes. • NO_MATCH: Identification failed. No CI was found in the identifier rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied. Data type: String
<String>.items.identificationAttempts.attributes	List of CI identifier entry attributes that were used during the identification process. Data type: Array Attribute names and types depend on the request body data and the identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type": "String", ]`
<String>.items.identificationAttempts.hybridEntryCiAttributes	No values are currently returned.
<String>.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt. Data type: String
<String>.items.identificationAttempts.searchOnTable	Name of the table searched during the identification process.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<String>.items.identifierEntrySysId	Sys_id for the identifier rule used to identify the CI. Located in the Identifier Entry [cmdb_identifier_entry] table. Data type: String
<String>.items.info	List that contain additional information about the processing of the item. Data type: Array of Objects `"info": [ { "code": "String", "message": "String", "ruleSysId": "String" } ]`
<String>.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRADE • SKIPPED_CLASS_UPGRADE Data type: String
<String>.items.info.message	Message that provides additional insights into the reason for skipping the reclassification. Data type: String
<String>.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matched. Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due to a payload or global flag. Data type: String

Returns (continued)

Type	Description
<String>.items.inputIndices	Index values for CIs from the request body *items* array that correspond to this CI. Data type: Array
<String>.items.maskedAttributes	List of attributes whose update by a non-authoritative data source was skipped as defined by the Reconciliation Rules. Data type: Array
<String>.items.relatedItems	List that provides information about the processed related items. Data type: Array of Objects `"relatedItems": [ { "className": "String", "errors": [Array], "errorCount": Number, "inputIndices": [Array], "operation": "String", "sysId": "String" } ]`
<String>.items.relatedItems.className	Class/table name (sys_class_name) of the related item. Data type: String
<String>.items.relatedItems.errors	List of errors that occurred during processing. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<String>.items.relatedItems.errorCount	Number of errors detected during processing. Data type: Number
<String>.items.relatedItems.inputIndices	Indexes of the corresponding related items. Data type: Array or Numbers `"inputIndices": [ { "mainIndex": Number, "subIndex": Number } ]`
<String>.items.relatedItems.inputIndices.mainIndex	Integer value from the request body *items* array that corresponds to the CI parent of the related item. Data type: Number
<String>.items.relatedItems.inputIndices.subIndex	Integer value from the request body *items.lookup* array that corresponds to the related item. Data type: Number
<String>.items.relatedItems.operation	Type of operation. Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String
<String>.items.relatedSysIds	List of the sys_id values for related items (table lookup items) from the request body *items.lookup* array. Notable values - null: No sys_id was identified for this related item. Data type: Array

Returns (continued)

Type	Description
<String>.items.sys_id	Sys_id of the CI that was updated or created. Data type: String
<String>.relations	Information about the processed relations. Data type: Array of Objects `"relations":[ { "className": "String", "errorCount": Number, "inputIndices": [Array], "operation": "String", "sysId": "String" } ]`
<String>.relations.className	Sys_class_name of this dependent relationship CI. Only supported value: cmdb_rel_ci: CI Relationship table. Data type: String
<String>.relations.errorCount	Number of errors. Data type: Number
<String>.relations.inputIndices	Indexes of the corresponding input relations. Data type: Array
<String>.relations.operation	Type of operation performed. Possible values: • INSERT • UPDATE • NO_CHANGE Data type: String
<String>.relations.sysId	Sys_id of the dependent relationship CI.

Returns (continued)

Type	Description
	Data type: String

The following shows how to reclassify a configuration item.

```
var payload = {
  "items": [
    {
      "className": "cmdb_ci_win_server",
      "values": {
        "short_description": "Linux server description",
        "name": "Linux Server 1"
      }
    }
  ]
};

var input = JSON.stringify(payload);
var output =
 sn_cmdb.IdentificationEngine.createOrUpdateCI('ServiceNow',
 input);

gs.info(JSON.stringify(JSON.parse(output), null, 2));
```

Output:

```
{
  "items": [
    {
      "className": "cmdb_ci_linux_server",
      "operation": "NO_CHANGE",
      "sysId": "440577800f321010150efc91ff767e94",
      "identifierEntrySysId":

IdentificationEngine - createOrUpdateCIEnhanced(String source, String input, Object options)

Inserts or updates configuration items (CI) and non-Configuration Management Database (CMDB) CIs (classes not extending from cmdb_ci) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

In addition to providing the functionality of the *`createOrUpdateCI()`* method, this method also supports:

- Handling partial payloads
- Handling partial commits
- Removing duplicate items within a payload
- Generating output summaries

For additional information on IRE and more detailed explanations of the data used by this method, see Identification and Reconciliation (IRE).

For additional information on non-CMDB table ingestion, see IRE support for non-CMDB tables.

Parameters

Name	Type	Description
input	String	Required. Input payload. A JS add or update. `"input" { "items": [Array],`

Parameters (continued)

Name	Type	Description
		Default: Uses the value in the glide.identification_engine.sk property.
options.skip_updating_source_last_discovered_to_now	Boolean	Flag that indicates whether to last_discovered fields in the C Valid values: • true: If last_discovered is no not update the discovery_s • false: Update the discovery Default: Uses the value in the glide.identification_engine.sk system property.
source	String	Data source of the CI informal values defined for the discove [cmdb_ci] table.

Returns

Parameter	Description
<String>	JSON formatted string that is list of results for the configur items in the input string. Data type: String `{ "additionalCommit tems": [Array], "additionalCommit elations": [Array] "hasError": Bool "hasWarning": Boolean, "items": [Array] "relations": [Array], "summary": {Obje }`
<String>.additionalCommittedItems	List of CIs that were committ during the IRE processing of the current payload, but wer not present in the current in payload.

Returns (continued)

Parameter	Description
<String>.additionalCommittedItems.errors.message	Error message encountered processing the additional CI Data type: String
<String>.additionalCommittedItems.identificationAttempts	Array of objects in which eac object describes an attempt to identify this additional CI. Data type: Array of Objects `"identificationAtt s": [ { "attemptResult "String", "attributes": [Array], "hybridEntryCiAtt tes": [Array], "identiferName "String", "searchOnTable [Array] } ]`
<String>.additionalCommittedItems.identificationAttempts.attemptResult	Outcome of this additional C identification attempt. Data type: String Possible values: • MATCHED: Identification succeeded. A unique CI w found in the identifier rule which exactly matched the specified attributes. • MULTI_MATCH: Identificat failed with an error. Duplic were found in the identifie table when matching agai specified attributes. • NO_MATCH: Identification No CI was found in the ide rule table which matched specified attributes. • SKIPPED: Identification no attempted. The attributes

Returns (continued)

Parameter	Description
<String>.additionalCommittedItems.inputIndices	Index values for CIs from the request body *items* array t correspond to this additiona Data type: Array of Numbers `"inputIndices": [ { Number } ]`
<String>.additionalCommittedItems.markers	Marker values for internal us Data type: Array `"markers": []`
<String>.additionalCommittedItems.mergedPayloads	Sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged durin processing of this additiona Data type: Array `"mergedPayloadIds" "String" ]`
<String>.additionalCommittedItems.operation	Operation performed for this additional CI. Data type: String Possible values: • DELETE: An existing CI is removed from the target ta • INSERT: The additional CI inserted into the target tab new record. • NO_CHANGE: No operatio performed for the addition • UPDATE: An existing CI in target table is updated. • UPDATE_WITH_DOWNGR An existing CI in the targe table is updated and its cl changed to a more generi (ancestor class).

IdentificationEngine - identifyCI(String jsonString)

Determines the operation (insert/update) to perform with the specified payload without committing the operation in the database.

This works just like *`createOrUpdateCI()`*, but does not commit the result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
jsonString	String	A JSON formatted string of configuration items to be added or updated. Each input string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs. The possible name-value pairs within the items list are: • className: Sys_class_name of the CI to be created or updated. • lookup:[{}]: List of records with each item having name-value pairs like the items list. • values:{}: Field information for the CI as name-value pairs, where the name is the field name. Possible name-value pairs within the relations list are: • child: Index of the child item in the dependency relation • parent: Index of the parent item in the dependency relation • type: Relationship type. This is one of the name field values from the cmdb_rel_type table.

Returns

Type	Description

String	A JSON formatted string that is a list of results. Each result string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs.
	
	The possible name-value pairs within the items list are:
	• className: Sys_class_name for the CI that was updated or created.
	• duplicateIndices: List of indexes of items that are duplicates of the current item.
	• errors: List of errors in the format of (error, message string)
	• identificationAttempts: List of attempts.
	  ○ attemptResult: One of SKIPPED, NO_MATCH, MATCHED, MULTI_MATCH.
	  ○ attributes: Attributes of identifier entry used during identification.
	  ○ identiferName: CI identifier to which this identifier entry belongs.
	  ○ searchOnTable: Table searched during the identification process.
	• identifierEntrySysId: Sys_id of identifier entry used during matching.
	• operation: Operation to perform, which is one of the following:
	  ○ DELETE
	  ○ INSERT
	  ○ UPDATE
	  ○ UPDATE_WITH_DOWNGRADE
	  ○ UPDATE_WITH_SWITCH
	  ○ UPDATE_WITH_UPGRADE

Returns (continued)

Type	Description
	• relatedSysIds: List of sys_id values of CIs used during lookup based identification. • sysId: Sys_id of the CI that was updated or created. Possible name-value pairs within the relations list are: • className: Relationship CI's class name and is always cmdb_rel_ci • operation: Type of operation: INSERT, UPDATE, NO_CHANGE • sysId: Sys_id of the relationship CI inserted or updated

The following shows how to reclassify a configuration item.

```
var payload = {
  "items": [
    {
      "className": "cmdb_ci_win_server",
      "values": {
        "short_description": "Linux server description",
        "name": "Linux Server 1"
      }
    }
  ]
};

var input = JSON.stringify(payload);
var output = sn_cmdb.IdentificationEngine.identifyCI(input);

gs.info(JSON.stringify(JSON.parse(output), null, 2));
```

Output:

```
{
  "items": [
    {
      "className": "cmdb_ci_linux_server",
      "operation": "NO_CHANGE",
      "sysId": "44057780f321010150efc91ff767e94",

```

IdentificationEngine - identifyCIEnhanced(String source, String input, Object options)

Determines the Configuration Management Database (CMDB) operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Use this method to simulate submission of a payload.

This method is similar to the IdentificationEngine - identifyCI(String jsonString) method, however it also supports the following functionality:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is INSERT_AS_PARTIAL or INSERT_INCOMPLETE.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

Parameters

Parameters (continued)

Name	Type	Description
		key/value pairs, with values defined for those items. `"relations": [ { "child_id": "S "parent_id": " "sys_rel_sourc "type": "Strin } ]`
input.relations.child	Number	Integer index of the CI object in the relationship (items, item
input.relations.child_id	String	The *internal_id* of the ch or items.lookup.)
input.relations.parent	Number	Integer index of the parent ite or items.lookup.)
input.relations.parent_id	String	The *internal_id* of the pa or items.lookup.)
input.relations.sys_rel_source_info	Object	Discovery source information relationships, this information [sys_rel_source] table (not pe *identifyCI()* methods.) Data type: Object `"sys_rel_source_inf "source_name": "S "source_feed": "S }`
input.relations.sys_rel_source_info.source_name	String	Discovery source name. Default: Discovery source pas
input.relations.sys_rel_source_info.source_feed	String	Any string that is a sub-discov Default: 'UNKNOWN' is stored record in sys_rel_source table
input.relations.type	String	Type of relationship that exist must be a name field value fro table.
options	Object	Optional, but {} or null must be features. **Note:** By default or if *pa partial_commits* an enabled, even if they are for partial payloads functi

Parameters (continued)

Name	Type	Description

		<pre>"options": {
		"deduplicate_paylo
		"generate_summary"
		"partial_commits":
		"partial_payloads"
		"skip_updating_las
		"skip_updating_sou
		Boolean
		}</pre>

options.deduplicate_payloads	Boolean	Flag that indicates whether du errors. Valid values: • true: Merge duplicate items • false: Consider duplicate ite Default: true
options.generate_summary	Boolean	Flag that indicates whether th information. For the details of *<String>.summary* in the Valid values: • true: Include summary infor • false: Don't include summa Default: false
options.partial_commits	Boolean	Flag that indicates whether pa additional information on part Valid values: • true: Partial commit enable • false: Partial commit disable Default: true
options.partial_payloads	Boolean	Flag that indicates whether pa additional information on part and Create an IRE data source Valid values: • true: Partial payload enable • false: Partial payload disabl Default: true

Parameters (continued)

Name	Type	Description
options.skip_updating_last_scan_to_now	Boolean	Flag that indicates whether to last_scan time field. Valid values: • true: If the *source_rece* passed in *sys_object_* sys_object_source's last_sc • false: Update the sys_objec Default: Uses the value in the glide.identification_engine.sk property.
options.skip_updating_source_last_discovered_to_now	Boolean	Flag that indicates whether to last_discovered fields in the C Valid values: • true: If last_discovered is nc not update the discovery_s • false: Update the discovery Default: Uses the value in the glide.identification_engine.sk system property.
source	String	Data source of the CI informa values defined for the discove [cmdb_ci] table.

Returns

Type	Description
<String>	JSON formatted string that is a list of results for the configuration items in the input string. Data type: String `{ "additionalCommittedItems": [Array], "additionalCommittedRelations": [Array], "hasError": Boolean, "hasWarning": Boolean, "items": [Array], "relations": [Array], "summary": {Object} }`
<String>.additionalCommittedItems	List of CIs that were committed during the IRE processing of the current payload, but were not present in the current input payload.

Returns (continued)

Type	Description
	Data type: Array of Objects `"additionalCommittedItems": [ { "className": "String", "errorCount": Number, "operation": "String", "identificationAttempts": [Array], "inputIndices": [Array], "markers": [Array], "mergedPayloads": [Array], "sysId": "String" } ]`
<String>.additionalCommittedRelations	Description of a dependent relationship CI that was not included in the request body *relations* list to insert or update. Data type: Array of Objects `"additionalCommittedRelations": [ { "className": "String", "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "operation": "String" } ]`
<String>.hasError	Flag that indicates whether any item or relation has errors. Data type: Boolean
<String>.hasWarning	Flag that indicates whether any item or relation has warnings. Data type: Boolean
<String>.items	Description of the created or updated CIs. Data type: Array of Objects `"items": [ { "additionalRelatedItems": [Array], "className": "String", "duplicateIndices": [Array], "errorCount": Number, "errors": [Array], "identificationAttempts": [Array], "identifierEntrySysId": "String", "info": [Array], "inputIndices": [Array], "maskedAttributes": [Array],`

Returns (continued)

Type	Description

	<pre>"operation": "String",
	"relatedSysIds": [Array],
	"sysId": "String"
	}
	]</pre>

<String>.items.additionalRelatedItems	Related items about additional lookup and related items that were processed but not provided as part of the input payload. These items are from partial payloads.
	
	Data type: Array of Objects
	<pre>"additionalRelatedItems": [
	{
	"className": "String",
	"inputIndices": [Array],
	"mergedPayloadIds": [Array],
	"operation": "String",
	"sysId": "String"
	}
	]</pre>

<String>.items.additionalRelatedItems.className	Class table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.additionalRelatedItems.inputIndices	Related values from CI from the request body *items* array that correspond to this related item. Data type: Array of Numbers
<String>.items.additionalRelatedItems.mergedPayloadIds	List of sys_ids of the partial payloads that were merged into the related item. Located in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table. Data type: Array
<String>.items.additionalRelatedItems.operation	Type of operation Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String
<String>.items.additionalRelatedItems.sysId	Sys_id of the CI that was updated or created. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<String>.items.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.duplicateIndices	List of indexes of CIs that are duplicates of the current item. Data type: Array
<String>.items.errorCount	Number of errors encountered while processing the item. Data type: Number
<String>.items.errors	List of errors encountered while processing this CI. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`
<String>.items.errors.error	Type of error encountered while processing the CI. Data type: String
<String>.items.errors.message	Error message encountered while processing the CI. Data type: String
<String>.items.identificationAttempts	List of attempts that were made to identify the CIs. Data type: Array of Objects `"identificationAttempts": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttributes": [Array], "identifierName": "String", "searchOnTable": "String" } ]`
<String>.items.identificationAttempts.attemptResult	Results of the attempt to identify the CI. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes. • MULTI_MATCH: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes.

Returns (continued)

Type	Description
	• NO_MATCH: Identification failed. No CI was found in the identifier rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied. Data type: String
<String>.items.identification_attempts.attributes	List of CI identifier attributes that were used during the identification process. Data type: Array Attribute names and types depend on the request body data and the identifier in use, such as: `"attributes": [ "serial_number": "String", "serial_number_type": "String", ]`
<String>.items.identification_attempts.identifier_name	Identifier used for this CI identification attempt. Data type: String
<String>.items.identification_attempts.table	Name of the table searched during the identification process. Data type: String
<String>.items.identifier_sys_id	Sys_id of the identifier rule used to identify the CI. Located in the Identifier Entry [cmdb_identifier_entry] table. Data type: String
<String>.items.info	Additional information about the processing of the item. Data type: Array of Objects `"info": [ { "code": "String", "message": "String", "ruleSysId": "String" } ]`
<String>.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRADE • SKIPPED_CLASS_UPGRADE

Returns (continued)

Type	Description
	Data type: String
<String>.items.info.messages	Message that provides additional insights into the reason for skipping the reclassification. Data type: String
<String>.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matched. Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due to a payload or global flag. Data type: String
<String>.items.inputIndices	Indexes of the corresponding input CI. For top-level items, it is a list of integers. For related or lookup CIs, it is list of JSON objects. Data type: Array of Numbers
<String>.items.maskedAttributes	List of attributes whose update by a non-authoritative data source was skipped as defined by the Reconciliation Rules.
<String>.items.operation	Operation that took place. Possible values: • INSERT: New CI was inserted into the database. • INSERT_AS_INCOMPLETE: Item was saved in cmdb_ire_incomplete_payloads table. • INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payloads table. • UPDATE: Existing CI was updated. • UPDATE_WITH_DOWNGRADE: CI was updated and the class changed to a more generic class (ancestor class). • UPDATE_WITH_SWITCH: CI was updated and the class changed to a class that is not ancestor or descendent. • UPDATE_WITH_UPDRADE: CI was updated and the class changed to a more specialized class (descendent class). Data type: String
<String>.items.relatedItems	Information about the processed related items. Data type: Array of Objects `"relatedItems": [ { "className": "String", "errorCount": Number, "errors": [Array],`

Returns (continued)

Type	Description

	<pre>"inputIndices": [Array],
	"mergePayloadIds": [Array],
	"operation": "String",
	"sysId": "String",
	"warningCount": Number,
	"warnings": [Array]
	}
	]</pre>

<String>.items.relatedItems.className	Class/table name (sys_class_name) of the related item. Data type: String
<String>.items.relatedItems.errorCount	Number of errors detected while processing the related items. Data type: Number

<String>.items.relatedItems.errors	List of errors that occurred during processing of the related item.
	
	Data type: Array of Objects
	<pre>"errors": [
	{
	"error": "String",
	"message": "String"
	}
	]</pre>

<String>.items.relatedItems.errors.error	Type of error encountered while processing the related item. Data type: String
<String>.items.relatedItems.errors.message	Error message encountered while processing the related item. Data type: String

<String>.items.relatedItems.inputIndices	Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects.
	
	Data type: Array of Numbers or Array of Objects
	<pre>"inputIndices": [
	{
	"mainIndex": Number,
	"subIndex": Number
	}
	]</pre>

<String>.items.relatedItems.mainIndex	Index value from the request body *items* array that corresponds to the CI parent of the related item. Data type: Number
<String>.items.relatedItems.subIndex	Index value from the request body *items.lookup* array that corresponds to the related item.

Returns (continued)

Type	Description
	Data type: Number
<String>.items.relatedItems.messages.payloads	List of sys_id values of partial payloads that were merged into the CI during processing. Data type: Array
<String>.items.relatedItems.operation	Operation that took place. Possible values: • INSERT: New related CI was inserted into the database. • INSERT_AS_INCOMPLETE: Item was saved in cmdb_ire_incomplete_payloads table. • INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payloads table. • NO_CHANGE: No related CI changes were made. • UPDATE: Existing related CI was updated. • UPDATE_WITH_DOWNGRADE: Related CI was updated and the class changed to a more generic class (ancestor class). • UPDATE_WITH_SWITCH: Related CI was updated and the class changed to a class that is not ancestor or descendent. • UPDATE_WITH_UPDRADE: Related CI was updated and the class changed to a more specialized class (descendent class). Data type: String
<String>.items.relatedItems.sys_id	Sys_id of the related item. Data type: String
<String>.items.relatedItems.warningCount	Number of warnings encountered when processing the related items. Data type: Number
<String>.items.relatedItems.warnings	Descriptions of warnings encountered while processing the related items. Data type: Array of Objects `"warnings": [ { "error": "String", "message": "String" } ]`
<String>.items.relatedSysIds	List of the sys_id values of the CIs used during lookup-based identification of related items. Data type: String

Returns (continued)

Type	Description
<String>.items.sys_id	Sys_id of the CI that was updated or created. Data type: String
<String>.relations	Information about the processed relations. Data type: Array of Objects `"relations": [ { "className": "String", "errorCount": Number, "errors": [Array], "inputIndices": [Array], "operation": "String", "sysId": "String" } ]`
<String>.relations.className	Sys_class_name of this dependent relationship CI. Only supported value: cmdb_rel_ci: CI Relationship table. Data type: String
<String>.relations.errorCount	Number of errors encountered when processing the dependent relationship CI. Data type: Number
<String>.relations.errors	List that describes errors that were encountered while processing this dependent relationship CI. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`
<String>.relations.inputIndices	Indexes for the dependent relationship CI objects in the request body *`relations`* array that correspond to this dependent relationship CI. Data type: Array
<String>.relations.operation	Type of operation performed. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• INSERT: The dependent relationship CI was inserted into the target table as a new record. • INSERT_AS_INCOMPLETE: The dependent relationship CI had errors and was inserted into the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table. • INSERT_AS_PARTIAL: The dependent relationship CI had errors and was inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table. • NO_CHANGE: No operation was performed. • UPDATE: An existing dependent relationship CI in the target table was updated. Data type: String
<String>.relations.sysId	Sys_id of the dependent relationship CI. Data type: String
<String>.summary	List of JSON properties that provide statistics on how many items were inserted, updated, and such, per class. Data type: Array
<String>.summary.<class_name>	Statistics for a specific class. Data type: Object `<class_name>: { "additionalInsertedItemCount": Number, "errorCount": Number, "incompleteItemCount": Number, "insertedItemCount": Number, "partialItemCount": Number, "skippedItemCount": Number, "unchangedItemCount": Number, "updatedItemCount": Number, "warningCount": Number }`
<String>.summary.<class_name>.additionalInsertedItemCount	Number of items inserted due to processing of partial payloads. Data type: Number
<String>.summary.<class_name>.errorCount	Number of errors counter when processing items. Data type: Number
<String>.summary.<class_name>.incompleteItemCount	Number of items inserted into the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table. Data type: Number

IdentificationEngine - runIdentificationAudit(GlideRecord now_GR)

Runs an identification audit against the specified configuration item (CI) to detect duplicates.

If duplicates are found, duplication tasks are created. Only use this method on CI types with independent identification rules.

Parameters

Name	Type	Description
now_GR	GlideRecord	CI on which to run the audit to detect duplicates. The CI must have independent identification rules.

Returns

Type	Description
void	

The following example shows how to check a record in the Linux Servers [cmdb_ci_linux_server] table for duplicates.

```
var sysId = '<cbdb_ci_sys_id>';
var gr = new GlideRecord('cmdb_ci_linux_server');
gr.get(sysId);
sn_cmdb.IdentificationEngine.runIdentificationAudit(gr);
```

IdentificationEngineScriptableApi - Global

The *IdentificationEngineScriptableApi* uses the Identification and Reconciliation framework to minimize the creation of duplicate configuration items (CIs) and to reconcile CI attributes by only accepting information from authorized data sources when updating the Configuration Management Database (CMDB).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IdentificationEngineScriptableApi - createOrUpdateCI(String source, String input)

Inserts or updates configuration items (CI) and non-Configuration Management Database (CMDB) CIs (classes not extending from cmdb_ci) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

You must pass non-CMDB CIs as lookup or related items in the IRE payload. For additional information on non-CMDB table ingestion, see IRE support for non-CMDB tables.

Parameters

Name	Type	Description
input	String	Required. Input payload. A JS formatted string of configurati items to add or update. `"input" { "items": [Array], "referenceItems": [Array], "relations": [Arra }`
input.items	Array of Objects	Items to add or update. `"items": [ { "className": "String", "display_values {Object}, "internal_id": "String", "lookup": [Arra "related": [Arr "settings": {Object}, "sys_object_source o": {Object}, "values": {Obje } ]`
input.items.className	String	Required. Class/table name, sys_class_name, of the configuration item (CI) to crea update. This value can be any CMDB table, such as cmdb_ci_linux_ or cmdb_ci_win_server.
input.items.display_values	Object	Reference fields to create or u for this related item as name-value pairs, where the name i field name and the value is th

Parameters (continued)

Name	Type	Description

		referenced display value. If yo want to use the sys_id instead the display value for reference fields, pass the information in *input.items.lookup.v* parameter instead of in this parameter.
		
		Reference field names depen the fields selected by the use as:
		`"display_values": {`
		`"model_id": "Stri`
		`"location": "Stri`
		`}`

input.items.internal_id	String	Unique item identifier for the associated payload. This can be any value, but mu unique within the payload.

input.items.lookup	Array of Objects	Identifies the top-level item containing the lookup (lookup based identification). These records are used to identify th configuration item based on a lookup table that has a refere back to cmdb_ci.
		
		For example:
		`"lookup": [`
		`{`
		`"className": "String",`
		`"internal_id": "String",`
		`"sys_object_source": {Object},`
		`"values": {Obje`
		`}`
		`]`

input.items.lookup.className	String	Required. Class/table name, sys_class_name, of the configuration item (CI) to crea update.

Parameters (continued)

Name	Type	Description
		This value can be any CMDB table, such as cmdb_serial_nu or cmdb_ci_network_adapter.
input.items.lookup.internal_id	String	Unique item identifier for the associated payload. This can be any value, but mu unique within the payload.
input.items.lookup.sys_object_source_info	Object	Unique CI identifier for a spec source. `"sys_object_source_o": { "source_feed": "String", "source_name": "String", "source_native_ke "String", "source_recency_ti amp": "String" }`
input.items.lookup.sys_object_source_info.source_feed	String	If the source can have multipl feeds, use this field to provide name of the feed sending this The data source generates th feed name. It can be any strin uniquely identifies the source
input.items.lookup.sys_object_source_info.source_name	String	Data source of the CI informat This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci]
input.items.lookup.sys_object_source_info.source_native_key	String	Unique key/id for the item fro source. The data source generates th It can be any string that is uni the item.
input.items.lookup.sys_object_source_info.source_recency_timestamp	String	UTC date and time that the ite scanned. Format: YYYY-MM-DD hh:mm
input.items.lookup.values	Object	Fields to create or update for related item as name/value pa

Parameters (continued)

Name	Type	Description

		<pre>"source_native_ke
		"String",
		
		"source_recency_ti
		amp": "String"
		}</pre>

input.items.sys_object_source_info.source_feed	String	If the source can have multipl feeds, use this field to provide name of the feed sending this The data source generates th feed name. It can be any strin uniquely identifies the source
input.items.sys_object_source_info.source_name	String	Data source of the CI informat This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci]
input.items.sys_object_source_info.source_native_key	String	Unique key/id for the item fro source. The data source generates th It can be any string that is uni the item.
input.items.sys_object_source_info.source_recency_timestamp	String	UTC date and time that the ite scanned. Format: YYYY-MM-DD hh:mm

input.items.values	Object	Fields to create or update for
		related item as name/value pa
		where the name is the field na
		For a reference field, the value
		must be the referenced sys_id
		you want to use the display va
		instead of the sys_id for refere
		fields, pass this information in
		display_values object in
		of in the *values* object.
		
		Field names and types deper
		the fields selected by the use
		as:
		<pre>"values": {
		"host_name":
		"String",
		"ip_address":
		"String",
		"name": "String",</pre>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"os_name": "Strin
		"sys_class_name":
		"String"
		}</pre>

input.referenceItems	Array of Objects	List that define references be items in the input payload.
		<pre>"referenceItems": [
		{
		"referenced":
		"String",
		"referencedBy":
		"String",
		"referenceField
		"String"
		}
		]</pre>

input.referenceItems.referenced	String	The *internal_id* defined item being referenced by ano item.
input.referenceItems.referencedBy	String	The *internal_id* defined item that references another i
input.referenceItems.referenceField	String	Name of the reference field in class/table for the *referen* item.

input.relations	Array of Objects	List that specifies relationship between items in the input pa
		
		An object in this array can use of two formats.
		• The object can define a relationship between two to items (only) using *parent* *child* name-value pairs, w values representing item in from the payload *items* ar
		<pre>"relations": [
		{
		"child": Numbe
		"parent": Numb
		
		"sys_rel_source_i
		o": {Object},
		"type": "Strin
		}
		]</pre>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• The object can define a relationship between any tw items, including top-level, related, or lookup items, usi *parent_id* and *child_* key/value pairs, with values representing *internal_* values defined for those ite `"relations": [ { "child_id": "String", "parent_id": "String", "sys_rel_source_i o": {Object}, "type": "Strin } ]`
input.relations.child	Number	Integer index of the CI object the *items* array that represe the child in the relationship (it items.related, or items.lookup
input.relations.child_id	String	The *internal_id* of the child item in the relation (item items.related, or items.lookup
input.relations.parent	Number	Integer index of the parent item in the *items* array (item items.related, or items.lookup
input.relations.parent_id	String	The *internal_id* of the parent item in the relation (ite items.related, or items.lookup
input.relations.sys_rel_source_info	Object	Discovery source information relationship. For non-depend relationships, this information saved in the Relationship Sou [sys_rel_source] table (not pe for *identifyCIEnhanced identifyCI()* methods.) Data type: Object `"sys_rel_source_inf { "source_name": "String",`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description

		<pre>"source_feed": "String"
		}</pre>

input.relations.sys_rel_source_info.source_name	String	Discovery source name. Default: Discovery source pas the API method parameter.
input.relations.sys_rel_source_info.source_feed	String	Any string that is a sub-discov scan within the discovery sou Default: 'UNKNOWN' is stored source_feed column when cre a record in sys_rel_source tab
input.relations.type	String	Type of relationship that exist between the parent and child items. This must be a name fie value from the CI Relationship [cmdb_rel_type] table.
source	String	Identifies the data source of t CI information. This value mus one of the choice values defir for the discovery_source field cmdb_ci table.

Returns

Type	Description
<String>	JSON formatted string that is a list of results for the configuration items in the input string. Each result string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs. Data type: String
<String>.additionalCommittedItems	No values are currently returned.
<String>.additionalCommittedRelations	No values are currently returned.
<String>.items	Description of the created or updated CIs. Data type: Object

Returns (continued)

Type	Description

	"items": {
	"additionalRelatedItems": [Array],
	"className": "String",
	"duplicateIndices": [Array],
	"errorCount": Number,
	"errors": [Array],
	"identificationAttempts": [Array],
	"identifierEntrySysId": "String",
	"info": [Array],
	"inputIndices": [Array],
	"maskedAttributes": [Array],
	"operation": "String",
	"relatedItems": [Array],
	"relatedSysIds": [Array],
	"sysId": "String"
	}

<String>.items.additionalRelatedItems	List of information about additional lookup and related items that were processed but not provided as part of the input payload. These items are from partial payloads. This information is not currently returned. Data type: Array of Objects "additionalRelatedItems": [{ "className": "String", "inputIndices": [Array], "operation": "String", "sysId": "String"

Returns (continued)

Type	Description
	<pre> }]</pre>
<String>.items.additionalRelatedItems.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String

<String>.items.additionalRelatedItems.inputIndices	Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects.
	
	Data type: Array of Numbers or Array of Objects
	
	<pre>"inputIndices": [
	  {
	  "mainIndex":
	Number,
	  "subIndex": Number
	  }
	]</pre>

<String>.items.additionalRelatedItems.inputIndices.mainIndex	Index value from the request body *items* array that corresponds to the CI parent of the additional related item. Data type: Number
<String>.items.additionalRelatedItems.inputIndices.subIndex	Index value from the request body *items.lookup* array that corresponds to the additional related item. Data type: Number
<String>.items.additionalRelatedItems.operation	Type of operation. Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String

Returns (continued)

Type	Description
<String>.items.additionalRelatedItems.sysId	Sys_id of the additional related items. Data type: String
<String>.items.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.duplicateIndices	List of indexes of CIs that are duplicates of the current item. Data type: Array
<String>.items.errorCount	Number of errors. Data type: Number
<String>.items.errors	List of errors encountered while processing this CI. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`
<String>.items.errors.error	Type of error encountered while processing the CI. Data type: String
<String>.items.errors.message	Error message associated with the error. Data type: String
<String>.items.identificationAttempts	List of attempts that were made to identify the CIs. Data type: Array of Objects `"identificationAttempts": [ { "attemptResult": "String", "attributes": [Array],`

Returns (continued)

Type	Description

	<pre>"hybridEntryCiAttributes": [Array],
	"identifierName": "String",
	"searchOnTable": "String"
	}
	]</pre>

<String>.items.identificationAttempts.attemptResult	Results of the attempt to identify the CI. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes. • MULTI_MATCH: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes. • NO_MATCH: Identification failed. No CI was found in the identifier rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied. Data type: String

<String>.items.identificationAttempts.attributes	List of CI identifier entry attributes that were used during the identification process.
	
	Data type: Array
	
	Attribute names and types depend on the request body data and the identifier in use, such as:
	
	<pre>"attributes": [
	"serial_number": "String",</pre>

Returns (continued)

Type	Description

	<pre>"serial_number_type": "String",
	]</pre>

<String>.items.identificationAttempts.hybridEntryCiAttributes	No values are currently returned.
<String>.items.identificationAttempts.identifierName	Identifier rule used for this CI identification attempt. Data type: String
<String>.items.identificationAttempts.searchOnTable	Name of the table searched during the identification process. Data type: String
<String>.items.identifierEntrySysId	Sys_id for the identifier rule used to identify the CI. Located in the Identifier Entry [cmdb_identifier_entry] table. Data type: String

<String>.items.info	List that contain additional information about the processing of the item.
	
	Data type: Array of Objects
	<pre>"info": [
	{
	"code": "String",
	"message": "String",
	"ruleSysId": "String"
	}
	]</pre>

<String>.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRADE • SKIPPED_CLASS_UPGRADE Data type: String
<String>.items.info.message	Message that provides additional insights into the reason for skipping the reclassification.

Returns (continued)

Type	Description
	Data type: String
<String>.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matched. Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due to a payload or global flag. Data type: String
<String>.items.inputIndices	Index values for CIs from the request body *items* array that correspond to this CI. Data type: Array
<String>.items.maskedAttributes	List of attributes whose update by a non-authoritative data source was skipped as defined by the Reconciliation Rules. Data type: Array
<String>.items.relatedItems	List that provides information about the processed related items. Data type: Array of Objects `"relatedItems": [ { "className": "String", "errors": [Array], "errorCount": Number, "inputIndices": [Array], "operation": "String", "sysId": "String" } ]`
<String>.items.relatedItems.className	Class/table name (sys_class_name) of the related item. Data type: String

Returns (continued)

Type	Description
<String>.items.relatedItems.errors	List of errors that occurred during processing. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`
<String>.items.relatedItems.errorCount	Number of errors detected during processing. Data type: Number
<String>.items.relatedItems.inputIndices	Indexes of the corresponding related items. Data type: Array or Numbers `"inputIndices": [ { "mainIndex": Number, "subIndex": Number } ]`
<String>.items.relatedItems.inputIndices.mainIndex	Integer value from the request body *items* array that corresponds to the CI parent of the related item. Data type: Number
<String>.items.relatedItems.inputIndices.subIndex	Integer value from the request body *items.lookup* array that corresponds to the related item. Data type: Number
<String>.items.relatedItems.operation	Type of operation. Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<String>.items.relatedSysIds	List of the sys_id values for related items (table lookup items) from the request body *items.lookup* array. Notable values - null: No sys_id was identified for this related item. Data type: Array
<String>.items.sys_id	Sys_id of the CI that was updated or created. Data type: String
<String>.relations	Information about the processed relations. Data type: Array of Objects `"relations":[ { "className": "String", "errorCount": Number, "inputIndices": [Array], "operation": "String", "sysId": "String" } ]`
<String>.relations.className	Sys_class_name of this dependent relationship CI. Only supported value: cmdb_rel_ci: CI Relationship table. Data type: String
<String>.relations.errorCount	Number of errors. Data type: Number
<String>.relations.inputIndices	Indexes of the corresponding input relations. Data type: Array
<String>.relations.operation	Type of operation performed.

Returns (continued)

Type	Description
	Possible values: • INSERT • UPDATE • NO_CHANGE Data type: String
<String>.relations.sysId	Sys_id of the dependent relationship CI. Data type: String

The following shows how to reclassify a configuration item.

```
var payload = {
  "items": [
    {
      "className": "cmdb_ci_win_server",
      "values": {
        "short_description": "Linux server description",
        "name": "Linux Server 1"
      }
    }
  ]
};
var input = new JSON().encode(payload);
var output =
 SNC.IdentificationEngineScriptableApi.createOrUpdateCI('Service
Now', input);
gs.print(output);
```

Output:

```
{
  "items": [

Scoped equivalent

To use the *createOrUpdateCI(String source, String input)* method in a scoped application, use the corresponding scoped IdentificationEngine method: createOrUpdateCI(String source, String input).

IdentificationEngineScriptableApi - createOrUpdateCIEnhanced(String source, String input, Object options)

Inserts or updates configuration items (CI) and non-Configuration Management Database (CMDB) CIs (classes not extending from cmdb_ci) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

You must pass non-CMDB CIs as lookup or related items in the IRE payload. For additional information on non-CMDB table ingestion, see IRE support for non-CMDB tables.

In addition to providing the functionality of the *createOrUpdateCI()* method, this method also supports:

- Handling partial payloads
- Handling partial commits

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Removing duplicate items within a payload
- Generating output summaries

For additional information on IRE and more detailed explanations of the data used by this method, see Identification and Reconciliation (IRE).

For additional information on non-CMDB table ingestion, see IRE support for non-CMDB tables.

Parameters

Name	Type	Description

input	String	Required. Input payload. A JS add or update.
		`"input" {`
		`"items": [Array],`
		`"referenceItems":`
		`"relations": [Arra`
		`}`

input.items	Array of Objects	Items to add or update.
		`"items": [`
		`{`
		`"className": "S`
		`"display_values`
		`"internal_id":`
		`"lookup": [Arra`
		`"related": [Arr`
		`"settings": {Ob`
		`"sys_object_sou`
		`"values": {Obje`
		`}`
		`]`

input.items.className	String	Required. Class/table name, s (CI) to create or update. This value can be any CMDB cmdb_ci_win_server.

input.items.display_values	Object	Reference fields to create or u value pairs, where the name is referenced display value. If yo the display value for reference *input.items.lookup.v* parameter.
		Reference field names depen
		`"display_values": {`
		`"model_id": "Stri`
		`"location": "Stri`
		`}`

input.items.internal_id	String	Unique item identifier for the a

IdentificationEngineScriptableApi - identifyCI(String jsonString)

Determines the operation (insert/update) to perform with the specified payload without committing the operation in the database.

Note: If your identification rules are configured to do so, this method can also ingest non-CMDB tables. For additional information on non-CMDB table ingestion, see IRE support for non-CMDB tables.

This works just like `createOrUpdateCI()`, but does not commit the result.

Parameters

Name	Type	Description
jsonString	String	A JSON formatted string of configuration items to be added or updated. Each input string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs. The possible name-value pairs within the items list are: • className: Sys_class_name of the CI to be created or updated. • lookup:[{}]: List of records with each item having name-value pairs like the items list. • values:{}: Field information for the CI as name-value pairs, where the name is the field name. Possible name-value pairs within the relations list are: • child: Index of the child item in the dependency relation • parent: Index of the parent item in the dependency relation • type: Relationship type. This is one of the name field values from the cmdb_rel_type table.

Returns

Type	Description

String	A JSON formatted string that is a list of results. Each result string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs.
	
	The possible name-value pairs within the items list are:
	• className: Sys_class_name for the CI that was updated or created.
	• duplicateIndices: List of indexes of items that are duplicates of the current item.
	• errors: List of errors in the format of (error, message string)
	• identificationAttempts: List of attempts.
	  ○ attemptResult: One of SKIPPED, NO_MATCH, MATCHED, MULTI_MATCH.
	  ○ attributes: Attributes of identifier entry used during identification.
	  ○ identiferName: CI identifier to which this identifier entry belongs.
	  ○ searchOnTable: Table searched during the identification process.
	• identifierEntrySysId: Sys_id of identifier entry used during matching.

Returns (continued)

Type	Description

	• operation: Operation to perform, which is one of the following:
	  ○ DELETE
	  ○ INSERT
	  ○ UPDATE
	  ○ UPDATE_WITH_DOWNGRADE
	  ○ UPDATE_WITH_SWITCH
	  ○ UPDATE_WITH_UPGRADE
	• relatedSysIds: List of sys_id values of CIs used during lookup based identification.
	• sysId: Sys_id of the CI that was updated or created.
	
	Possible name-value pairs within the relations list are:
	• className: Relationship CI's class name and is always cmdb_rel_ci
	• operation: Type of operation: INSERT, UPDATE, NO_CHANGE
	• sysId: Sys_id of the relationship CI inserted or updated

Identify an independent CI with lookup-based identification.

```
var payload = {items: [
 {className:'cmdb_ci_netgear',
   values: {name:'ny8500-nbxs08',
            ports:'1200'},
   lookup: [{className:'cmdb_serial_number',
             values:{serial_number:'1234ABCD',
 serial_number_type:'uuid',absent:'false',valid:'true'}},
            {className:'cmdb_serial_number',
             values:{serial_number:'3456EFGH',
 serial_number_type:'system',absent:'false',valid:'true'}}]}]};

var jsonUntil = new JSON();
var input = jsonUntil.encode(payload);
var output =
 SNC.IdentificationEngineScriptableApi.identifyCI(input);
gs.print(output);
```

Output:

```

Scoped equivalent

To use the *identifyCI(String jsonString)* method in a scoped application, use the corresponding scoped IdentificationEngine method: identifyCI(String jsonString).

IdentificationEngineScriptableApi - identifyCIEnhanced(String source, String input, Object options)

Determines the Configuration Management Database (CMDB) operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Note: If your identification rules are configured to do so, this method can also ingest non-CMDB tables. For additional information on non-CMDB table ingestion, see IRE support for non-CMDB tables.

Use this method to simulate submission of a payload.

This method is similar to the IdentificationEngineScriptableApi - identifyCI(String jsonString) method, however it also supports the following functionality:

- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is INSERT_AS_PARTIAL or INSERT_INCOMPLETE.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

Parameters

Name	Type	Description

input	String	Required. Input payload. A JS add or update.
		`"input" {`
		`"items": [Array],`
		`"referenceItems":`
		`"relations": [Arra`
		`}`

Parameters (continued)

Name	Type	Description
input.referenceItems	Array of Objects	List that define references be `"referenceItems": [ { "referenced": " "referencedBy": "referenceField } ]`
input.referenceItems.referenced	String	The *internal_id* defined item.
input.referenceItems.referencedBy	String	The *internal_id* defined
input.referenceItems.referenceField	String	Name of the reference field in item.

input.relations	Array of Objects	List that specifies relationship
		An object in this array can use
		• The object can define a rela using *parent* and *child* item indexes from the paylo
		`"relations": [ { "child": Numbe "parent": Numb "sys_rel_sourc "type": "Strin } ]`
		• The object can define a rela top-level, related, or lookup key/value pairs, with values defined for those items.
		`"relations": [ { "child_id": "S "parent_id": " "sys_rel_sourc "type": "Strin } ]`

input.relations.child	Number	Integer index of the CI object in the relationship (items, item
input.relations.child_id	String	The *internal_id* of the ch or items.lookup.)

Parameters (continued)

Name	Type	Description
input.relations.parent	Number	Integer index of the parent ite or items.lookup.)
input.relations.parent_id	String	The *internal_id* of the pa or items.lookup.)

input.relations.sys_rel_source_info	Object	Discovery source information
		relationships, this information
		[sys_rel_source] table (not pe
		identifyCI() methods.)
		
		Data type: Object
		`"sys_rel_source_inf`
		`"source_name": "S`
		`"source_feed": "S`
		`}`

input.relations.sys_rel_source_info.source_name	String	Discovery source name. Default: Discovery source pas
input.relations.sys_rel_source_info.source_feed	String	Any string that is a sub-discov Default: 'UNKNOWN' is stored record in sys_rel_source table
input.relations.type	String	Type of relationship that exist must be a name field value fr table.

options	Object	Optional, but {} or null must be
		features.
		
		Note: By default or if *pa*
		partial_commits an
		enabled, even if they are
		for partial payloads functi
		
		`"options": {`
		`"deduplicate_paylo`
		`"generate_summary"`
		`"partial_commits":`
		`"partial_payloads"`
		`"skip_updating_las`
		`"skip_updating_sou`
		`Boolean`
		`}`

options.deduplicate_payloads	Boolean	Flag that indicates whether du errors. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Merge duplicate items • false: Consider duplicate ite Default: true
options.generate_summary	Boolean	Flag that indicates whether th information. For the details of *<String>.summary* in the Valid values: • true: Include summary infor • false: Don't include summar Default: false
options.partial_commits	Boolean	Flag that indicates whether pa additional information on part Valid values: • true: Partial commit enabled • false: Partial commit disable Default: true
options.partial_payloads	Boolean	Flag that indicates whether pa additional information on part and Create an IRE data source Valid values: • true: Partial payload enable • false: Partial payload disabl Default: true
options.skip_updating_last_scan_to_now	Boolean	Flag that indicates whether to last_scan time field. Valid values: • true: If the *source_rece* passed in *sys_object_* sys_object_source's last_sc • false: Update the sys_objec Default: Uses the value in the glide.identification_engine.sk property.

Parameters (continued)

Name	Type	Description
options.skip_updating_source_last_discovered_to_now	Boolean	Flag that indicates whether to last_discovered fields in the C Valid values: • true: If last_discovered is no not update the discovery_s • false: Update the discovery Default: Uses the value in the glide.identification_engine.sk system property.
source	String	Data source of the CI informat values defined for the discove [cmdb_ci] table.

Returns

Type	Description
<String>	JSON formatted string that is a list of results for the configuration items in the input string. Data type: String `{ "additionalCommittedItems": [Array], "additionalCommittedRelations": [Array], "hasError": Boolean, "hasWarning": Boolean, "items": [Array], "relations": [Array], "summary": {Object} }`
<String>.additionalCommittedItems	List of CIs that were committed during the IRE processing of the current payload, but were not present in the current input payload. Data type: Array of Objects `"additionalCommittedItems": [ { "className": "String", "errorCount": Number, "operation": "String", "identificationAttempts": [Array], "inputIndices": [Array], "markers": [Array], "mergedPayloads": [Array], "sysId": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<String>.additionalCommittedRelations	Description of a dependent relationship CI that was not included in the request body *relations* list to insert or update. Data type: Array of Objects `"additionalCommittedRelations": [ { "className": "String", "inputIndices": [Array], "markers": [Array], "mergedPayloadIds": [Array], "operation": "String" } ]`
<String>.hasError	Flag that indicates whether any item or relation has errors. Data type: Boolean
<String>.hasWarning	Flag that indicates whether any item or relation has warnings. Data type: Boolean
<String>.items	Description of the created or updated CIs. Data type: Array of Objects `"items": [{ "additionalRelatedItems": [Array], "className": "String", "duplicateIndices": [Array], "errorCount": Number, "errors": [Array], "identificationAttempts": [Array], "identifierEntrySysId": "String", "info": [Array], "inputIndices": [Array], "maskedAttributes": [Array], "operation": "String", "relatedSysIds": [Array], "sysId": "String" }]`
<String>.items.additionalRelatedItems	Related items about additional lookup and related items that were processed but not provided as part of the input payload. These items are from partial payloads. Data type: Array of Objects `"additionalRelatedItems": [ { "className": "String", "inputIndices": [Array],`

Returns (continued)

Type	Description

	<pre>"mergedPayloadIds": [Array],
	"operation": "String",
	"sysId": "String"
	}
	]</pre>

<String>.items.additionalClassName	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.additionalRelatedItems	Related items from the request body *items* array that correspond to this related item. Data type: Array of Numbers
<String>.items.additionalSysIds	List of sys_ids of the Partial Payloads that were merged into the related item. Located in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table. Data type: Array
<String>.items.additionalType	Type of operation Possible values: • INSERT: New CI was inserted into the database. • NO_CHANGE: No CI changes were made. • UPDATE: Existing CI was updated. Data type: String
<String>.items.additionalSysId	Sys_id of the CI that was updated or created. Data type: String
<String>.items.className	Class/table name (sys_class_name) of the CI that was created or updated. Data type: String
<String>.items.duplicateIndices	List of indexes of CIs that are duplicates of the current item. Data type: Array
<String>.items.errorCount	Number of errors encountered while processing the item. Data type: Number
<String>.items.errors	List of errors encountered while processing this CI. Data type: Array of Objects

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`"errors": [ { "error": "String", "message": "String" } ]`
<String>.items.errors.error	Type of error encountered while processing the CI. Data type: String
<String>.items.errors.message	Error message encountered while processing the CI. Data type: String
<String>.items.identificationAttempts	List of attempts that were made to identify the CIs. Data type: Array of Objects `"identificationAttempts": [ { "attemptResult": "String", "attributes": [Array], "hybridEntryCiAttributes": [Array], "identifierName": "String", "searchOnTable": "String" } ]`
<String>.items.identificationAttempts.attemptResult	Result of the attempt to identify the CI. Possible values: • MATCHED: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes. • MULTI_MATCH: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes. • NO_MATCH: Identification failed. No CI was found in the identifier rule table which matched the specified attributes. • SKIPPED: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied. Data type: String
<String>.items.identificationAttempts.attributes	List of identifying attributes that were used during the identification process. Data type: Array Attribute names and types depend on the request body data and the identifier in use, such as:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"attributes": [
	  "serial_number": "String",
	  "serial_number_type": "String",
	]</pre>

<String>.items.identification_attempts.identifier_name	Identifier used for this CI identification attempt. Data type: String
<String>.items.identification_attempts.table_name	Name of the table searched during the identification process. Data type: String
<String>.items.identifierSysId	Sys_id of the identifier rule used to identify the CI. Located in the Identifier Entry [cmdb_identifier_entry] table. Data type: String

<String>.items.info	Additional information about the processing of the item.
	
	Data type: Array of Objects
	<pre>"info": [
	 {
	  "code": "String",
	  "message": "String",
	  "ruleSysId": "String"
	 }
	]</pre>

<String>.items.info.code	Reclassification type that was skipped. Possible values: • SKIPPED_CLASS_SWITCH • SKIPPED_CLASS_DOWNGRADE • SKIPPED_CLASS_UPGRADE Data type: String
<String>.items.info.message	Message that provides additional insights into the reason for skipping the reclassification. Data type: String
<String>.items.info.ruleSysId	Sys_id of the reclassification restriction rule that was matched. Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due to a payload or global flag. Data type: String
<String>.items.inputIndices	Indexes of the corresponding input CI. For top-level items, it is a list of integers. For related or lookup CIs, it is list of JSON objects.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Array of Numbers
<String>.items.maskedAttributes	List of attributes whose update by a non-authoritative data source was skipped as defined by the Reconciliation Rules. Data type: Array
<String>.items.operation	Operation that took place. Possible values: • INSERT: New CI was inserted into the database. • INSERT_AS_INCOMPLETE: Item was saved in cmdb_ire_incomplete_payloads table. • INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payloads table. • UPDATE: Existing CI was updated. • UPDATE_WITH_DOWNGRADE: CI was updated and the class changed to a more generic class (ancestor class). • UPDATE_WITH_SWITCH: CI was updated and the class changed to a class that is not ancestor or descendent. • UPDATE_WITH_UPDRADE: CI was updated and the class changed to a more specialized class (descendent class). Data type: String
<String>.items.relatedItems	Information about the processed related items. Data type: Array of Objects `"relatedItems": [ { "className": "String", "errorCount": Number, "errors": [Array], "inputIndices": [Array], "mergePayloadIds": [Array], "operation": "String", "sysId": "String", "warningCount": Number, "warnings": [Array] } ]`
<String>.items.relatedItems.className	Class/table name (sys_class_name) of the related item. Data type: String
<String>.items.relatedItems.errorCount	Number of errors detected while processing the related items.

© 2026 ServiceNow, Inc. All rights reserved.

Returns (continued)

Type	Description
	Data type: Number
<String>.items.relatedItems.errors	List of errors that occurred during processing of the related item. Data type: Array of Objects `"errors": [ { "error": "String", "message": "String" } ]`
<String>.items.relatedItems.errors.error	Type of error encountered while processing the related item. Data type: String
<String>.items.relatedItems.errors.message	Error message encountered while processing the related item. Data type: String
<String>.items.relatedItems.inputIndices	Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects. Data type: Array of Numbers or Array of Objects `"inputIndices": [ { "mainIndex": Number, "subIndex": Number } ]`
<String>.items.relatedItems.inputIndices.mainIndex	Index value from the request body *`items`* array that corresponds to the CI parent of the related item. Data type: Number
<String>.items.relatedItems.inputIndices.subIndex	Index value from the request body *`items.lookup`* array that corresponds to the related item. Data type: Number
<String>.items.relatedItems.merged_payloads	List of merged payloads. Payloads are partial payloads that were merged into the CI during processing. Data type: Array
<String>.items.relatedItems.operation	Operation that took place. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• INSERT: New related CI was inserted into the database. • INSERT_AS_INCOMPLETE: Item was saved in cmdb_ire_incomplete_payloads table. • INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payloads table. • NO_CHANGE: No related CI changes were made. • UPDATE: Existing related CI was updated. • UPDATE_WITH_DOWNGRADE: Related CI was updated and the class changed to a more generic class (ancestor class). • UPDATE_WITH_SWITCH: Related CI was updated and the class changed to a class that is not ancestor or descendent. • UPDATE_WITH_UPDRADE: Related CI was updated and the class changed to a more specialized class (descendent class). Data type: String
<String>.items.relatedItems.sys_id	Sys_id of the related item. Data type: String
<String>.items.relatedItems.warningCount	Number of warnings encountered when processing the related items. Data type: Number
<String>.items.relatedItems.warnings	Descriptions of warnings encountered while processing the related items. Data type: Array of Objects `"warnings": [ { "error": "String", "message": "String" } ]`
<String>.items.relatedSysIds	List of the sys_id values of the CIs used during lookup-based identification of related items. Data type: String
<String>.items.sys_id	Sys_id of the CI that was updated or created. Data type: String
<String>.relations	Information about the processed relations. Data type: Array of Objects `"relations": [ {`

Returns (continued)

Type	Description

	<pre>"className": "String",
	"errorCount": Number,
	"errors": [Array],
	"inputIndices": [Array],
	"operation": "String",
	"sysId": "String"
	}
	]</pre>

<String>.relations.className	Sys_class_name of this dependent relationship CI. Only supported value: cmdb_rel_ci: CI Relationship table. Data type: String
<String>.relations.errorCount	Number of errors encountered when processing the dependent relationship CI. Data type: Number

<String>.relations.errors	List that describes errors that were encountered while processing this dependent relationship CI.
	
	Data type: Array of Objects
	<pre>"errors": [
	{
	"error": "String",
	"message": "String"
	}
	]</pre>

<String>.relations.inputIndices	Indexes for the dependent relationship CI objects in the request body *`relations`* array that correspond to this dependent relationship CI. Data type: Array
<String>.relations.operation	Type of operation performed. Possible values: • INSERT: The dependent relationship CI was inserted into the target table as a new record. • INSERT_AS_INCOMPLETE: The dependent relationship CI had errors and was inserted into the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table. • INSERT_AS_PARTIAL: The dependent relationship CI had errors and was inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table. • NO_CHANGE: No operation was performed. • UPDATE: An existing dependent relationship CI in the target table was updated.

Returns (continued)

Type	Description
	Data type: String
<String>.relations.sysId	Sys_id of the dependent relationship CI. Data type: String
<String>.summary	List of JSON properties that provide statistics on how many items were inserted, updated, and such, per class. Data type: Array
<String>.summary.<class_name>	Statistics for a specific class. Data type: Object `<class_name>: { "additionalInsertedItemCount": Number, "errorCount": Number, "incompleteItemCount": Number, "insertedItemCount": Number, "partialItemCount": Number, "skippedItemCount": Number, "unchangedItemCount": Number, "updatedItemCount": Number, "warningCount": Number }`
<String>.summary.<class_name>.additionalInsertedItemCount	Number of items inserted due to processing of partial payloads. Data type: Number
<String>.summary.<class_name>.errorCount	Number of errors encountered when processing items. Data type: Number
<String>.summary.<class_name>.incompleteItemCount	Number of items inserted into the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table. Data type: Number
<String>.summary.<class_name>.insertedItemCount	Number of items created Data type: Number
<String>.summary.<class_name>.partialItemCount	Number of items saved in the Partial Payload table [cmdb_ire_partial_payloads]. Data type: Number
<String>.summary.<class_name>.skippedItemCount	Number of items that were skipped. Data type: Number
<String>.summary.<class_name>.unchangedItemCount	Number of items that were processed but were not modified.

IdentificationEngineScriptableApi - runIdentificationAudit(GlideRecord now_GR)

Runs an identification audit against the specified configuration item (CI) to detect duplicates.

If duplicates are found, duplication tasks are created. Only use this method on CI types with independent identification rules.

Parameters

Name	Type	Description
now_GR	GlideRecord	CI on which to run the audit to detect duplicates. The CI must have independent identification rules.

Returns

Type	Description
void	

The following example shows how to check the server for duplicate tasks and creates a remediate duplicate task if any exist.

```
var grServer = new GlideRecord('cmdb_ci_server');
grServer.query();
while (grServer.next()) {

 SNC.IdentificationEngineScriptableApi.runIdentificationAudit(gr
Server);
}
```

Scoped equivalent

To use the *runIdentificationAudit(GlideRecord now_GR)* method in a scoped application, use the corresponding scoped IdentificationEngine method: runIdentificationAudit(GlideRecord now_GR).

IDResult - Global

The *IDResult* script include is a container class for the result of a CI Identifier.

Use with any server-side discovery script.

IDResult - IDResult(Boolean explore, String sysID)

Creates an instance of the IDResult class.

Parameters

Name	Type	Description
explore	Boolean	Set to true if the CI should be explored; otherwise, false.
sysID	String	An existing CI's sys_id, or null if no existing CI could be found.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IEventSender - Global

The *IEventSender* API provides methods to send events from a MID Server to a ServiceNow instance and to query the status of the event queue.

Before calling any methods within this class, you must call the *SNEventSenderProvider.getEventSender()* method to instantiate an IEvent object.

Use the *Event* API to add/update fields within an event. Use the *SNEventSenderProvider* API to instantiate an event sender object. Then use the *IEventSender* API to send the event to a ServiceNow instance.

You must activate the Event Management (com.glideapp.itom.snac) plugin before attempting to access this API. The Event Management plugin requires a separate subscription and must be activated. This plugin includes demo data and activates related plugins if they are not already active.

For additional information on event management, see Event Management.

IEventSender - getQueueSize()

Returns the size of the event queue.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Size of the event queue. If an event queue is not currently implemented, returns "0".

```
var event = new Event();
event.setField("source","SAP Solman");
event.setField("severity","3");
event.setField("time_of_event", "2019-18-05 13:12:05");
event.setField("type", "SAP object");
event.setField("user", "admin"); // parameter added to
 additional info section

var eventSender = SNEventSenderProvider.getEventSender();
var sendStatus = eventSender.sendEvent(event); //send event
var queueSize = eventSender.getQueueSize() // check the size of
 the event queue
```

IEventSender - isFullQueue()

Checks if the event queue has exceeded its maximum size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the event queue has exceeded its maximum size. When this happens, no additional event messages can be queued until the queue decreases in size. Valid values: • true: Event queue is full. • false: Event queue is not full and can add more event entries.

```
var eventSender = SNEventSenderProvider.getEventSender();
if (!eventSender.isFullQueue()) // If queue is not full, send
 event
  eventSender.sendEvent(event);
```

IEventSender - sendEvent(Object event)

Places the specified event in the event queue.

Parameters

Name	Type	Description
event	IEventSender	Event object to place in the events queue.

Returns

Type	Description
Boolean	Flag that indicates whether the event was successfully queued Valid values: • true: Event was queued • false: Error

```
var eventSender = SNEventSenderProvider.getEventSender();
eventSender.sendEvent(event); //send event
```

Image - Scoped, Global

Creates an Image object representing an image and its layout insert in a PDF. Enables defining attributes such as scale, alignment, and border color.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API is a component used with the Document API to generate a PDF.

You can add an image to a PDF using one of the following methods:

- Cell – addImage(Image image) – Adds an image to a table cell
- Table – addImageCell(Image image) – Adds a cell that contains an image to a table.
- Document – addImage(Image image) - Adds an image to a page

Image - Image(String attachmentSysId)

Instantiates a new *Image* object. Used to verify if an image attachment exists and is available for modification.

Parameters

Name	Type	Description
attachmentSysId	String	Sys_id of an image in the Attachments [sys_attachment] table.

The following example shows how to create a *Image* object.

```
var image = new sn_pdfgeneratorutils.Image("<sys_id>");
```

Image – scaleAbsolute(Number width, Number height)

Scales an image to absolute width and height sizes. This setting does not preserve the width-height ratio of the image and might result in undesired stretching if settings are not precise.

To scale to an absolute size that preserves width-height ratio of an image, use the scaleToFit() method.

Parameters

Name	Type	Description
width	Number	Image width in points.
height	Number	Image height in points.

Returns

Type	Description
None	

The following example shows how to add an image to a PDF with absolute width and height settings.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var scaleAbsPic = new
 sn_pdfgeneratorutils.Image("<img_sys_id>");
scaleAbsPic.scaleAbsolute(25,50);

document.addImage(scaleAbsPic);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
document.saveAsAttachment("incident", "<record_sys_id>",
 "docWithImg.pdf");
```

Image – scaleToFit(Number width, Number height)

Scales an image to an absolute size while preserving the width-height ratio.

Resulting output varies by image aspect ratio. If the width and height parameter values do not match the image aspect ratio, one value renders smaller in output than the value given.

Parameters

Name	Type	Description
width	Number	Maximum image width in points.
height	Number	Maximum image height in points.

Returns

Type	Description
None	

The following example shows how to insert an image scaled to fit using the Cell – addImage() method.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// add a table
var table = new sn_pdfgeneratorutils.Table([1,3],false);

// text for the left column
var text = "sample image";

// add a table cell for the image in the right column
var imgCell = new sn_pdfgeneratorutils.Cell(1, 1);

// add an image and set it scale-to-fit
var scaleToFitPic = new
 sn_pdfgeneratorutils.Image("<img_sys_id>");
scaleToFitPic.scaleToFit(90,175);

// add the image to the cell
imgCell.addImage(scaleToFitPic);

table.addTextCell(text);
table.addCell(imgCell);

// Here's a paragraph
var para = new sn_pdfgeneratorutils.Paragraph("The following
 table image uses scale to fit.");

document.addParagraph(para);
document.addTable(table);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
document.saveAsAttachment("incident", "<record_sys_id>",
 "imgScaleToFit.pdf");
```

Image – setAutoScale(Boolean value)

Enables scaling width and height to a page or cell while retaining dimensions.

Parameters

Name	Type	Description
value	Boolean	Flag that indicates whether to automatically scale an image. Valid values: • true: Automatically scales the image • false: Image does not scale Default: false

Returns

Type	Description
None	

The following example shows how to add an image to a PDF with automatic scaling. The image is added using the Table – addImageCell() method.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// Add a table
var table = new sn_pdfgeneratorutils.Table([1,2],false);

// Text in left column
var text = "sample image";

// Image in right column
var autoScaledPic = new
 sn_pdfgeneratorutils.Image("<image_sys_id>");
autoScaledPic.setAutoScale(true);

table.addTextCell(text);
table.addImageCell(autoScaledPic);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>",
 "imgAutoScale.pdf");
```

Image – setColoredBorder(Color color, Number width)

Sets a border on a PDF in the specified color.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
color	Color	Image border color.
width	Number	Width of the border in points.

Returns

Type	Description
None	

The following example shows how to set a five-point red-colored border on an image.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var borderColor = new sn_pdfgeneratorutils.Color([1.0,0.0,0.0]);

// declare image using sys attachment
var image = new
 sn_pdfgeneratorutils.Image("<imgAttachment_sys_id>");

image.setColoredBorder(borderColor, 5);

document.addImage(image);
document.saveAsAttachment("incident", "<record_sys_id>",
 "docWithBorderedImage.pdf");
```

Image – setHorizontalAlignment(String alignment)

Sets the horizontal alignment of the image.

Parameters

Name	Type	Description
alignment	String	Positions image alignment on a page or block element. Valid values: • Center • Left • Right Default: Left

Returns

Type	Description
None	

The following example shows how to add a centered image on a PDF page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare image using sys attachment
var image = new
 sn_pdfgeneratorutils.Image("<imgAttachment_sys_id>");

String alignment = "Center";
image.setHorizontalAlignment(alignment);

document.addImage(image);
// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<sys_id>",
 "docWithImageCentered.pdf");
```

Image – setNoBorder()

Sets an image to have no border.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to add an image to a document without a border.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare image using sys attachment
var image = new
 sn_pdfgeneratorutils.Image("<imgAttachment_sys_id>");

image.setNoBorder();

document.addImage(image);
document.saveAsAttachment("incident", "<sys_id>",
 "docWithImgNoBorder.pdf");
```

Interaction - Scoped

The *Interaction* API provides methods that enable you to define the behavior for interaction records.

This class requires the Interaction Logging, Routing, and Queueing plugin (com.glide.interaction) and runs in the `sn_interaction` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Interaction - accept()

Accepts a new interaction.

Accepting a transfer only works for pending transfers. Find any pending transfers in the Interaction Agent Transfer [interaction_agent_transfer] table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the transfer is accepted.

```
var now_GR = new GlideRecord('interaction');
GR.get('b2c0a3af202a1300964f959e0488de75');
var interaction =
 sn_interaction.Interaction.getInteraction(GR).accept();
```

Interaction - create(Object options)

Creates an interaction.

Parameters

Name	Type	Description
options	Object	Field values for an interaction record. The channel field with the channel sys_id and channel metadata are required. If a queue is not included in the parameter, the system returns `Interaction b2c0a3af202a1300964f959e0488de75 has no queue specified... running queue matching rules.`

Returns

Type	Description
Object	Interaction

```
var interactionObj = sn_interaction.Interaction.create({
 channel: '28a59893873103002ae97e2526cb0b5d',
 channel_metadata:{},
 opened_for: '46d44a23a9fe19810012d100cca80666',
 queue: 'f3a50867b30303002186a72256a8dcb7'
});
```

Interaction - getInteraction(GlideRecord interaction)

Returns an interaction record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
interaction	GlideRecord	Interaction record from the interaction table [interaction] that is retrieved from the system.

Returns

Type	Description
Object	Interaction

```
var now_GR = new GlideRecord('interaction');
now_GR.get('608a21bd096a9300964ffbd57ba7dd8d');
var interaction =
 sn_interaction.Interaction.getInteraction(now_GR);
```

Interaction - transferToAgent(String sysID)

Transfers an interaction record to an agent using the sys_id for the agent.

When an interaction is transferred from one agent to another, the interaction needs to be accepted or rejected using GlideRecord APIs. Use the GlideRecord API to change the state of the interaction and update. For more information, see the GlideRecord - update method.

Note: This method has been deprecated.

Parameters

Name	Type	Description
SysID	String	The sys_id of the user you want to transfer an interaction record to.

Returns

Type	Description
void	

```
var now_GR = new GlideRecord('interaction');
GR.get('24b927ef202a1300964f959e0488de2d');
var interaction = sn_interaction.Interaction.getInteraction(GR);
interaction.transferToAgent('6816f79cc0a8016401c5a33be04be441');
```

Interaction - transferToQueue(String sysID)

Transfers an interaction record to an interaction queue.

Transferring an interaction from one queue to another closes the original interaction and creates an interaction in the new queue.

Note: This method has been deprecated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
SysID	String	The sys_id of the interaction queue you want to transfer the interaction record to.

Returns

Type	Description
void	

```
var now_GR = new GlideRecord('interaction');
GR.get('24b927ef202a1300964f959e0488de2d');
var interaction = sn_interaction.Interaction.getInteraction(GR);
interaction.transferToQueue('86fee1933b101300088d832b44efc474');
```

IPAddress - Scoped, Global

The *IPAddress* API provides methods that enable you to check for various states of a specified IP address, such as whether it is routable, unicast, multicast, public, or reserved. It also enables you to get the canonical (shortened/standard) and expanded forms of an IP address.

Access the global *IPAddress* class and its associated methods in the SNC global namespace.

In this API, some of the methods are static and some are non-static. The isV4() and isV6() methods provide both static and non-static implementations. The benefit of the non-static methods is that you don't have to call the IPAddress() method to instantiate an IPAddress object.

IPAddress - IPAddress(String ipAddress)

Instantiates an IPAddress object for the specified IP address.

Parameters

Name	Type	Description
ipAddress	String	IP address for which to create the IPAddress object.

The following code example shows how to call the IPAddress constructor when calling a non-static *IPAddress* method.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");

  var ip = grDiscover.getValue('network_ip');
  var ip2 = gs.getSession().getClientIP().toString();
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + ip2);
  gs.info("ip address 1 is routable?: " + new
 SNC.IPAddress(ip).isRoutable());
  gs.info("ip address 2 is routable?: " + new
 SNC.IPAddress(ip2).isRoutable());
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IPAddress - canonicalize(String ipAddress)

Returns the canonical (shortened/standard) form of the specified IP address by removing any zero padding from the address.

For example, the canonical form of the IPv6 address "0000:0000:0000:0000:0000:0000:0000:0001" is "::1". The canonical form of the IPv4 address "192.168.001.002" is "192.268.1.2".

Note: This is a static method.

Parameters

Name	Type	Description
ipAddress	String or Object	IP address to canonicalize or a scoped IPAddress object that contains the IP address.

Returns

Type	Description
String	Canonicalized (shortened/standardized) IP address.

The following example shows how to use the scoped version of this method to canonicalize an IPv6 IP address.

```
function() {
  var grCMDB = new GlideRecord('cmdb_ci');
  grCMDB.get("SYS_ID");
  var ip = grCMDB.getValue('ip_address');
  gs.info("ip address: " + ip);
  gs.info("canonicalized ip: " +
 SNC.IPAddress.canonicalize(ip));
}
```

Output:

```
ip address: 0000:0000:0000:0000:0000:0000:0000:0001
canonicalized ip: ::1
```

IPAddress - getExpanded(String ipAddress)

Returns the expanded form of the specified IP address

For example, the expanded form of the IPv6 address "::1" is "0000:0000:0000:0000:0000:0000:0000:0001". The expanded form of the IPv4 address "192.268.1.2" is "192.168.001.002".

Note: This is a static method.

Parameters

Name	Type	Description
ipAddress	String	IP address to expand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Expanded IP address.

The following example shows how to use the scoped version of this method to expand an IPv6 IP address.

```
function() {
  var grCMDB = new GlideRecord('cmdb_ci');
  grCMDB.get(SYS_ID);
  var ip = grCMDB.getValue('ip_address');
  gs.info("ip address: " + ip);
  gs.info("expanded ip: " + SNC.IPAddress.getExpanded(ip));
}
```

Output:

```
ip address: ::1
expanded ip: 0000:0000:0000:0000:0000:0000:0000:0001
```

IPAddress - isLinkLocal()

Determines whether the specified IPAddress object is a link-local IP address.

For further information on link-local IP addresses see RFC 3927 and RFC 4291.

Note: This is a non-static method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the IP address object is a link-local address. Valid values: • true: IP address is a link-local address. • false: IP address is not a link-local address.

The following code example shows how to use the scoped version of this method to check if the IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are link-local addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");

  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 1 is link local?: " + new
 SNC.IPAddress(ip).isLinkLocal());
  gs.info("ip address 2 is link local?: " + new
 SNC.IPAddress(start_ip).isLinkLocal());
}
```

Output:

```
ip address 1: ::1
ip address 2: fe80:1::1
ip address 1 is link local?: false
ip address 2 is link local?: true
```

IPAddress - isLocalhost()

Determines whether the specified IPAddress object is the loopback IP address.

For additional information on the loopback IP address, see IANA IPv4 Special-Purpose Address Registry and IANA IPv6 Special-Purpose Address Registry.

Note: This is a non-static method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the IP address object is the loopback IP address. Valid values: • true: IP address is the loopback IP address. • false: IP address is not the loopback IP address.

The following code example shows how to use the scoped version of this method to check if the IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are the loopback IP address.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 1 is localhost?: " + new
 SNC.IPAddress(ip).isLocalhost());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  gs.info("ip address 2 is localhost?: " + new
 SNC.IPAddress(ip2).isLocalhost());
}
```

Output:

```
ip address 1: 127.0.0.1
ip address 2: <current user's public IP Address>
ip address 1 is localhost?: true
ip address 2 is localhost?: false
```

IPAddress - isMulticast()

Determines whether the specified IPAddress object is a multicast IP address.

For further information on multicast IP addresses see RFC 2365 and RFC 3306.

Note: This is a non-static method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the IP address object is a multicast address. Valid values: • true: IP address is a multicast address. • false: IP address is not a multicast address.

The following code example shows how to use the scoped version of this method to check if the IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are multicast addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 1 is multicast?: " + new
 SNC.IPAddress(ip).isMulticast());
  gs.info("ip address 2 is multicast?: " + new
 SNC.IPAddress(start_ip).isMulticast());
}
```

Output:

```
ip address 1: ::1
ip address 2: 224.0.0.22
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ip address 1 is multicast?: false
ip address 2 is multicast?: true
```

IPAddress - isPublic()

Determines whether the specified IPAddress object is a public IP address. An IP address is considered public if it is routable, and it is not a reserved address.

Note: This is a non-static method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the IP address object is a public address. Valid values: • true: IP address is a public address. • false: IP address is not a public address.

The following code example shows how to use the scoped version of this method to check if the IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are public addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var ip2 = gs.getSession().getClientIP().toString();
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + ip2);
  gs.info("ip address 1 is public?: " + new
 SNC.IPAddress(ip).isPublic());
  gs.info("ip address 2 is public?: " + new
 SNC.IPAddress(ip2).isPublic());
}
```

Output:

```
ip address 1: 2001:1::1
ip address 2: <current user's public IP Address>
ip address 1 is public?: false
ip address 2 is public?: true
```

IPAddress - isReserved()

Determines whether the specified IPAddress object is a reserved IP address.

For additional information on reserved IP addresses, see IANA IPv4 Special-Purpose Address Registry and IANA IPv6 Special-Purpose Address Registry.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: This is a non-static method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the IP address object is a reserved address. Valid values: • true: IP address is a reserved address. • false: IP address is not a reserved address.

The following code example shows how to use the scoped version of this method to check if the IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are reserved addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var ip2 = gs.getSession().getClientIP().toString();
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + ip2);
  gs.info("ip address 1 is reserved?: " + new
 SNC.IPAddress(ip).isReserved());
  gs.info("ip address 2 is reserved?: " + new
 SNC.IPAddress(ip2).isReserved());
}
```

Output:

```
ip address 1: 2001:1::1
ip address 2: <current user's public IP Address>
ip address 1 is reserved?: true
ip address 2 is reserved?: false
```

IPAddress - isRoutable()

Determines whether the specified IPAddress object is a routable IP address.

An IP Address is considered to be routable if it is not a private address, a link-local address, or the loopback address. For additional information on private addresses, see RFC 1918 and RFC 4193.

Note: This is a non-static method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the IP address object is a routable address. Valid values: • true: IP address is a routable address. • false: IP address is not a routable address.

The following code example shows how to use the scoped version of this method to check if the IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are routable addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var ip2 = gs.getSession().getClientIP().toString();
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + ip2);
  gs.info("ip address 1 is routable?: " + new
 SNC.IPAddress(ip).isRoutable());
  gs.info("ip address 2 is routable?: " + new
 SNC.IPAddress(ip2).isRoutable());
}
```

Output:

```
ip address 1: ::1
ip address 2: <current user's public IP Address>
ip address 1 is routable?: false
ip address 2 is routable?: true
```

IPAddress - isSameVersionAs(String ipAddress)

Determines whether the passed IPAddress object is the is the same version, IPv4 or IPv6, as the specified IP address.

Note: This is a non-static method.

Parameters

Name	Type	Description
ipAddress	String	IP address to check against the IP address in the passed IPAddress object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the specified IP address is the same version as that in the IPAddress object. Valid values: • true: IP address version is the same. • false: IP address version is different.

The following code example shows how to use the scoped version of this method to compare whether various IP address are the same version (IPv4 or IPv6).

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  var end_ip = grDiscover.getValue('end_ip_address');
  gs.info("ip address 1: "+ ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 3: " + end_ip);
  var ip1 = new SNC.IPAddress(ip);
  var ip2 = new SNC.IPAddress(start_ip);
  var ip3 = new SNC.IPAddress(end_ip);
  gs.info("ip address 1 is same version as ip address 2?: " +
 ip1.isSameVersionAs(ip2));
  gs.info("ip address 1 is same version as itself?: " +
 ip1.isSameVersionAs(ip1));
  gs.info("ip address 2 is same version as ip address 3?: " +
 ip2.isSameVersionAs(ip3));
}
```

Output:

```
ip address 1: 192.168.0.1
ip address 2: ::2
ip address 3: ::3
ip address 1 is same version as ip address 2?: false
ip address 1 is same version as itself?: true
ip address 2 is same version as ip address 3?: true
```

IPAddress - isUnicast()

Determines whether the specified IPAddress object is a unicast IP address.

A unicast address is effectively an address that is not multicast.

Note: This is a non-static method.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the IP address object is a unicast address. Valid values: • true: IP address is a unicast address. • false: IP address is not a unicast address.

The following code example shows how to use the scoped version of this method to check if the IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are unicast addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 1 is unicast?: " + new
 SNC.IPAddress(ip).isUnicast());
  gs.info("ip address 2 is unicast?: " + new
 SNC.IPAddress(ip2).isUnicast());
}
```

Output:

```
ip address 1: 224.0.0.22
ip address 2: <current user's public IP Address>
ip address 1 is unicast?: false
ip address 2 is unicast?: true
```

IPAddress - isV4(String ipAddress)

Determines whether the specified IP address is a valid IPv4 address.

This method has both static and non-static implementations. The way in which you call the two method types is slightly different. For the non-static implementation you don't need to first instantiate an IPAddress object and you pass the IP address in the IPAddress class reference. Both return the same response.

Parameters

Name	Type	Description
ipAddress	String	IP address to validate. For the non-static implementation, the IP address is passed in the IPAddress class reference instead of the method call. For example `New SNC.IPAddress("::1").isV4();`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the specified IP address is a valid IPv4 address. Valid values: • true: IP address is valid. • false: IP address is invalid.

The following example shows how to use the scoped static version of this method to verify whether IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are valid IPv4 addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 1 is v4?: " + SNC.IPAddress.isV4(ip));
  gs.info(("ip address 2 is v4?: " +
 SNC.IPAddress.isV4(start_ip));
}
```

Output:

```
ip address 1: 192.168.0.1
ip address 2: ::2
ip address 1 is v4?: true
ip address 2 is v4?: false
```

The following example shows how to use the non-static version of this method to verify whether IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are valid IPv4 addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 1 is v4?: " + new
 SNC.IPAddress(ip).isV4());
  gs.info("ip address 2 is v4?: " + new
 SNC.IPAddress(start_ip).isV4());
}
```

Output:

```
ip address 1: 192.168.0.1
ip address 2: ::2
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ip address 1 is v4?: true
ip address 2 is v4?: false
```

IPAddress - isV6(String ipAddress)

Determines whether the specified IP address is a valid IPv6 address.

This method has both static and non-static implementations. The way in which you call the two method types is slightly different. For the non-static implementation you don't need to first instantiate an IPAddress object and you pass the IP address in the IPAddress class reference. Both return the same response.

Parameters

Name	Type	Description
ipAddress	String	IP address to validate. For the non-static implementation, the IP address is passed in the IPAddress class reference instead of the method call. For example `New SNC.IPAddress("::1").isV6();`.

Returns

Type	Description
Boolean	Flag that indicates whether the specified IP address is a valid IPv6 address. Valid values: • true: IP address is valid. • false: IP address is invalid.

The following example shows how to use the scoped static version of this method to verify whether IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are valid IPv6 addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get(SYS_ID);
  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);
  gs.info("ip address 1 is v6?: " + SNC.IPAddress.isV6(ip));
  gs.info(("ip address 2 is v6?: " +
 SNC.IPAddress.isV6(start_ip));
}
```

Output:

```
ip address 1: 192.168.0.1
ip address 2: ::2
ip address 1 is v6?: false
ip address 2 is v6?: true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to use the scoped non-static version of this method to verify whether IP addresses in a record in the Discovery IP Ranges [discovery_range_item] table are valid IPv6 addresses.

```
function() {
  var grDiscover = new GlideRecord('discovery_range_item');
  grDiscover.get("SYS_ID");

  var ip = grDiscover.getValue('network_ip');
  var start_ip = grDiscover.getValue('start_ip_address');
  gs.info("ip address 1: " + ip);
  gs.info("ip address 2: " + start_ip);

  gs.info("ip address 1 is v6?: " + new
 SNC.IPAddress(ip).isV6());
  gs.info("ip address 2 is v6?: " + new
 SNC.IPAddress(start_ip).isV6());

}
```

Output:

```
ip address 1: 192.168.0.1
ip address 2: ::1
ip address 1 is v6?: false
ip address 2 is v6?: true
```

IPAddress - isValid(String ipAddress)

Determines whether the specified IP address is a valid IPv4 or IPv6 address.

Note: This is a static method.

Parameters

Name	Type	Description
ipAddress	String	IP address to validate.

Returns

Type	Description
Boolean	Flag that indicates whether the specified IP address is a valid IPv4 or IPv6 address. Valid values: • true: IP address is valid. • false: IP address is invalid.

The following code example shows how to use the scoped version of this method to check if the IP address in a record within the Configuration Items [cmdb_ci] is valid.

```
function() {
  var grCMDB = new GlideRecord('cmdb_ci');
  grCMDB.get("SYS_ID");
  var ip = grCMDB.getValue('ip_address');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  gs.info("ip address: " + ip)
  var ipAddress = new SNC.IPAddress(ip);
  gs.info("ip is valid?: " + ipAddress.isValid())
}
```

Output:

```
ip address: 127.0.0.1
ip is valid?: true
```

IPAddress - toExpanded()

Returns the expanded form of an IPAddress object.

Note: This is a non-static method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Expanded IP address.

The following example shows how to use the scoped version of this method to expand an IPv6 IP address.

```
function() {
  var grDiscover = new GlideRecord('cmdb_ci');
  grDiscover.get("SYS_ID");
  var ip = grDiscover.getValue('ip_address');
  gs.info("ip address: " + ip);
  gs.info("expanded ip address: " + new
 SNC.IPAddress(ip).toExpanded());
}
```

Output:

```
ip address: 2001:41::1
expanded ip address: 2001:0041:0000:0000:0000:0000:0000:0001
```

IPAddressFixup - Global

The *IPAddressFixup* script include provides methods that ensure that no other device has the same IP address, after a device has been successfully discovered. If any duplicates are found, the IP address field is cleared.

Use with any server-side Discovery script to validate IP addresses.

IPAddressFixup - dedupe(String tableName, String ip)

Removes duplicates of the specified IP address in the specified table.

After a device has been successfully discovered, you can use the *dedupe()* method to remove the duplicate IP addresses for that device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
tableName	String	Table to check for duplicates.
ip	String	IP address to check for.

Returns

Type	Description
void	

The following example shows how to use *dedupe()* in a background script to remove duplicate IP addresses for the specified IP address within the cmdb_ci_hardware table.

```
var grDiscovery=new GlideRecord("discovery_device_history");
grDiscovery.addQuery('sys_id','<sys id of the record>'); //
 sys_id of the device discovery_device_history
grDiscovery.query();
if(grDiscovery.next())
  {
    var fx=new IPAddressFixup(grDiscovery.cmdb_ci); //
 Instantiate IPAddressFixup - pass cmdb reference
    fx.dedupe('cmdb_ci_hardware','192.161.1.1'); // Pass the IP
 address and table which removes duplicates of the specified IP
 address in the specified table.
  }
```

The following example shows how to use *dedupe()* in a business rule to remove duplicate IP addresses for the specified IP address within the cmdb_ci_hardware table.

```
(function executeRule(current, previous /*null when async*/) {

var cmdb_ci = current.cmdb_ci + '';
if (cmdb_ci)
  {
    var ipf = new IPAddressFixup(cmdb_ci); // Instantiate
 IPAddressFixup - pass cmdb reference
    ipf.dedupe('cmdb_ci_hardware','168.128.1.1'); // Removes
 duplicates of the specified IP address in the specified table.
  }
})(current, previous);
```

IPAddressFixup - dedupeAll()

Removes all duplicate IP addresses from the tables.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

The following example shows how to use *dedupeAll()* in a background script to remove all duplicate IP addresses.

```
var grDiscovery=new GlideRecord("discovery_device_history");
grDiscovery.addQuery('sys_id','<sys id of the record>'); //
 sys_id of the device discovery_device_history
grDiscovery.query();
if(grDiscovery.next())
{
  var fx=new IPAddressFixup(grDiscovery.cmdb_ci); // Call script
 include IPAddressFixup and pass cmdb reference
  fx.dedupeAll(); //Removes all duplicate IP addresses from the
 tables.
}
```

The following example shows how to use *dedupeAll()* in a business rule to remove all duplicate IP addresses.

```
(function executeRule(current, previous /*null when async*/) {

var cmdb_ci = current.cmdb_ci + '';
if (cmdb_ci)
{
  var ipf = new IPAddressFixup(cmdb_ci); //call script include
 IPAddressFixup and pass cmdb reference
  ipf.dedupeAll(); //Removes all duplicate IP addresses from the
 tables.
})(current, previous);
```

IPAddressFixup - fix()

Removes all duplicate IP addresses and ensures that the parent ip_address record is set to one of the network interface card's (NIC) IP addresses.

After a device has been successfully discovered, you can use the *dedupe()* method to remove the duplicate IP addresses for that device and set the parent ip_address record value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

The following example shows how to use *fix()* in a background script to remove duplicate IP addresses and set the parent IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var grDiscovery=new GlideRecord("discovery_device_history");
grDiscovery.addQuery('sys_id','<sys id of the the record>'); //
 sys_id of the device discovery_device_history
grDiscovery.query();
if(grDiscovery.next())
  {
    var fx=new IPAddressFixup(grDiscovery.cmdb_ci); //
 Instantiate IPAddressFixup - pass cmdb reference
    fx.fix(); // Remove all duplicate IP addresses and ensure
 that the parent ip_address record is set to one of the NIC's IP
 addresses.
  }
```

The following example shows how to use *fix()* in a business rule to remove duplicate IP addresses and set the parent IP address.

```
(function executeRule(current, previous /*null when async*/) {

var cmdb_ci = current.cmdb_ci + '';
if (cmdb_ci)
  {
    var ipf = new IPAddressFixup(cmdb_ci); // Instantiate
 IPAddressFixup - pass cmdb reference
    ipf.fix(); /// Remove all duplicate IP addresses and ensure
 that the parent ip_address record is set to one of the NIC's IP
 addresses.
  }
})(current, previous);
```

IPAddressFixup - getParentIP()

Returns the parent IP address for the current device.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Parent IP address

The following example shows how to use *getParentIP()* in a background script to obtain the parent IP address.

```
var grDiscovery=new GlideRecord("discovery_device_history"); //
 current.cmdb_ci can be used in case of Business rule on
 discovery_device_history table
grDiscovery.addQuery('sys_id','<sys id of the the record>'); //
 sys_id of the device discovery_device_history
grDiscovery.query();
if(grDiscovery.next())
  {
    var fx=new IPAddressFixup(grDiscovery.cmdb_ci); //
 Instantiate IPAddressFixup - pass cmdb reference
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    gs.info(fx.getParentIP()); // Display the parent IP address
 of the device
  }
```

Output:

```
172.21.12.11
```

The following example shows how to use *getParentIP()* in a business rule to obtain the parent IP address.

```
((function executeRule(current, previous /*null when async*/) {

var cmdb_ci = current.cmdb_ci + '';
if (cmdb_ci)
  {
    var ipf = new IPAddressFixup(cmdb_ci); // Instantiate
 IPAddressFixup - pass cmdb reference
    gs.log(ipf.getParentIP()); // Log the parent IP address of
 the device. Located in the system logs table
  }
})(current, previous);
```

IPAddressFixup - setParentIP(String ip)

Sets the parent IP address field for the current CI.

Parameters

Name	Type	Description
ip	String	Parent IP address for the current CI.

Returns

Type	Description
void	

The following example shows how to use *setParentIP()* in a background script to store the parent IP address.

```
var grDiscover=new GlideRecord("discovery_device_history");
grDiscover.addQuery('sys_id','a14e43b31bb4051070cb96c6b04bcb23')
; // sys_id of the device in discovery_device_history table. Put
 your own sys_id here.
grDiscover.query();
if(grDiscover.next())
  {
    var fx=new IPAddressFixup(grDiscover.cmdb_ci); //
 Instantiate IPAddressFixup - pass cmdb reference.
    fx.setParentIP('197.111.1.1'); // Pass IP address to set as
 new IP on current mentioned CI.
  }
```

The following example shows how to use *setParentIP()* in a business rule to store the parent IP address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
((function executeRule(current, previous /*null when async*/) {

var cmdb_ci = current.cmdb_ci + '';
if (cmdb_ci)
  {
    var ipf = new IPAddressFixup(cmdb_ci); // Instantiate
 IPAddressFixup - pass cmdb reference
    fx.setParentIP('195.11.1.1'); // Set the new IP address of
 the CI
  }
})(current, previous);
```

IPAddressFixup - syncIP()

Ensures that the parent ip_address record is set to one of the NIC's IP addresses, or leaves it alone if there were no NICs.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This shows an example of using the *syncIP()* method in a background script.

```
var grDevHistory=new GlideRecord("discovery_device_history");
grDevHistory.addQuery('sys_id','a14e43b31bb4051070cb96c6b04bcb23
'); // Sys_id of the device in discovery_device_history table.
 Put your own sys_id here.
grDevHistory.query();
if(grDevHistory.next())
  {
    var fx=new IPAddressFixup(grDevHistory.cmdb_ci); // Call the
 script include IPAddressFixup and pass cmdb reference
    fx.syncIP(); // Ensures that the parent ip_address record
 is set to one of the NIC's IP addresses, or leaves it alone if
 there were no NICs.
  }
```

This shows an example of using the *syncIP()* method in a business rule.

```
(function executeRule(current, previous /*null when async*/) {

var cmdb_ci = current.cmdb_ci + '';
if (cmdb_ci)
  {
    var ipf = new IPAddressFixup(cmdb_ci); // Call script
 include IPAddressFixup and pass cmdb reference
    ipf.syncIP(); // Ensures that the parent ip_address record
 is set to one of the NIC's IP addresses, or leaves it alone if
 there were no NICs.
  }
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
})(current, previous);
```

IPService - Global

The *IPService* script include provides methods that encapsulate an IP Service.

Use this class during the discovery scanning phase.

See also AbstractDBObject - isValid().

IPService - IPService(Object source)

Creates an instance of the IPService class.

Parameters

Name	Type	Description
source	Object	Either a GlideRecord instance or a sys_id string

IPService - creates

The table where this service creates entries.

Field

Name	Type	Description
creates	String	The table where this service creates entries.

IPService - description

Description of the IPService.

Field

Name	Type	Description
description	String	Description of the IPService.

IPService - getFromArrayList(Array list)

Returns an array of IPService instances specified by a Java ArrayList of sys_ids.

Parameters

Name	Type	Description
list	Array	List of sys_ids.

Returns

Type	Description
Array	IPService instances

IPService - port

The TCP or UDP port used by the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
port	String	The TCP or UDP port used by the service.

IPService - protocol

The protocol used by the service ("UDP", "TCP", or "TCP/UDP").

Field

Name	Type	Description
protocol	String	The protocol used by the service ("UDP", "TCP", or "TCP/UDP").

IPService - name

A short name or handle for the IPService.

Field

Name	Type	Description
name	String	Name of the IPService

IPService - serviceName

A long, descriptive English name for the IPService.

Field

Name	Type	Description
serviceName	String	A long, descriptive English name for the IPService.

IPService - sysID

The sys_id of this record.

Field

Name	Type	Description
sysID	String	The sys_id of this record.

JavascriptProbe - Global

The `JavascriptProbe` script include provides methods for using the JavascriptProbe on the MID Server.

Use these methods in server scripts to send a probe to the MID Server For more information, see Create a JavaScript Probe activity.

JavascriptProbe - JavascriptProbe(String midServer)

Creates an instance of the JavascriptProbe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
midServer	String	The MID server name

The following example shows how to use an instance of *JavascriptProbe*.

```
var jspr = new JavascriptProbe('midserver_name');

var func = function () {
    // Java FileWriter class of java.io package. FileWriter is
 write data in character.
    var FileWriter = Packages.java.io.FileWriter;

    // Constructs a FileWriter object given a file name.
    var file = new FileWriter("TestMessage.txt");

    // Gets the parameter from the ECC queue payload.
    var message = probe.getParameter("message");

    // Write the message to a file.
    file.write(message);

    // Close the FileWriter.
    file.close();
    file = null;
}

// Add parameter to pass to MIDServer.
jspr.addParameter('message', 'ServiceNow Message');

// Set the script to be executed by the MIDServer as a string
jspr.setJavascript('(' + func.toString() + ')();');

// Send to MIDServer. The MIDServer will execute the Script
 immediately.
jspr.create();
```

JavascriptProbe - addParameter(String name, String value)

Adds a parameter with the specified value to the probe.

Parameters

Name	Type	Description
name	String	The parameter name
value	String	The parameter's value

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('jspr_source');
jspr.addParameter('support_feat', 'yes');
```

JavascriptProbe - create()

Creates the probe for the current MID server, puts it on the output queue, and sets its state to "ready".

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('jspr_source');
jspr.setJavascript('jspr_script');
jspr.create();
```

JavascriptProbe - setJavascript(String script)

Adds a script to the probe.

Parameters

Name	Type	Description
script	String	The script to add to the probe

Returns

Type	Description
void	

```
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('jspr_source');
jspr.setJavascript('jspr_script');
```

JavascriptProbe - setName(String name)

Sets the name of the JavascriptProbe

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	The name to give the JavascriptProbe.

Returns

Type	Description
void	

```
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
```

JavascriptProbe - setSource(String ip)

Sets the source of the probe.

Parameters

Name	Type	Description
ip	String	The IP address of the target probe.

Returns

Type	Description
void	

```
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('100.100.100.1');
```

j2js - Global

The `j2js` script include enables you to convert Java objects to JavaScript objects.

If the given value is a Java object that can be converted to an equivalent JavaScript object, that conversion is performed and the result is returned. Otherwise the original Java object is returned.

The `j2js` class is available to server-side scripts.

The specific conversion performed in the order they are checked.

- Java String -> JavaScript string
- Java Boolean -> JavaScript boolean
- Java Integer -> JavaScript number
- Java Long -> JavaScript number
- Java Double -> JavaScript number
- Java Byte -> JavaScript number
- Java Float -> JavaScript number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Java Short -> JavaScript number
- Java Character -> JavaScript number
- Java Array -> JavaScript Array with order preserved
- Java List -> JavaScript Array with order preserved
- Java Map -> JavaScript Object with the key/value pairs translated into property/value pairs
- Java Set -> JavaScript Array in arbitrary order

Conversions are performed recursively on the elements of arrays, lists, or collections. For example, given a Java ArrayList of ArrayLists of strings, this will return a JavaScript Array of Arrays of strings.

j2js - j2js(Object javaObject)

Converts a Java object from system code to a JavaScript object.

Parameters

Name	Type	Description
javaObject	Object	A Java object from system code such as a Packages call.

Returns

Type	Description
Object	A JavaScript object if the parameter can be converted, otherwise it returns the Java object.

```
var tu = new TableUtils("cmdb_ci_win_server");
var classes = tu.getHierarchy();
//getHierarchy returns a Java ArrayList, which is not exactly
 like a JavaScript Array
//for example you cannot get length
gs.print("classes = " + classes);
gs.print("classes.length = " + classes.length);

//convert to a JavaScript Array
gs.include("j2js");
var jsClasses = j2js(classes);
gs.print("jsClasses = " + jsClasses);
gs.print("jsClasses.length = " + jsClasses.length);
```

Output:

```
classes = [cmdb_ci_win_server, cmdb_ci_server, cmdb_ci_computer,
 cmdb_ci_hardware, cmdb_ci]
classes.length = undefined
jsClasses =
 cmdb_ci_win_server,cmdb_ci_server,cmdb_ci_computer,cmdb_ci_hard
ware,cmdb_ci
jsClasses.length = 5
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JSON - Global

The *JSON* script include provides methods to create JSON objects from a string, and to turn JSON objects into strings.

This API has dynamic and static methods. You access the dynamic methods by creating a JSON object. To use the dynamic methods in a scoped application, add the global prefix when calling the constructor. You access the static methods by using the static JSON object.

The JavaScript ES5 native JSON object is used instead of the JSON static methods. If your script needs the old behavior, use the *encode()* and *decode()* methods.

This example creates a JSON object.

```
// obj is a JSON formatted object
var parser = new JSON(); // encode() and decode() are dynamic
 methods.
var str = parser.encode(obj);
```

The *encode()* and *decode()* methods are deprecated. Use the JavaScript JSON object instead.

This example creates a JSON object in a scoped script.

```
// obj is a JSON formatted object
var parser = new global.JSON();
var str = parser.encode(obj);
```

This example uses the static methods.

```
// obj is a JSON formatted object
var str =  JSON.stringify(obj);
// str is a string containing content to be turned into a JSON
 formatted object
var obj = JSON.parse(str);
```

JSON - JSON()

Creates an instance of the JSON class.

This class is deprecated. Use the JavaScript JSON object instead.

Parameters

Name	Type	Description
None		

JSON - decode(String str)

Creates an object or primitive type from a JSON formatted string.

Note: This class is deprecated. Use the JavaScript JSON object instead.

Parameters

Name	Type	Description
str	String	A JSON formatted string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	An object created from the specified string.

```
var str = '{"name":"George","lastname":"Washington"}';
var parser = new JSON();
var obj = parser.decode(str);
gs.info('The first name is '  + obj.name);
```

Output: The first name is George

To use in a scoped script.

```
var str = '{"name":"George","lastname":"Washington"}';
var parser = new global.JSON();
var obj = parser.decode(str);
gs.info('The first name is '  + obj.name);
```

Output: The first name is George

JSON - encode(Object jsonObject)

Creates a string from a JSON object.

Note: This class is deprecated. Use the JavaScript JSON object instead.

Parameters

Name	Type	Description
jsonObject	Object	The JSON object to be turned into a string.

Returns

Type	Description
String	A JSON formatted string.

```
var obj = {"name":"George","lastname":"Washington"};
var parser = new JSON();
var str = parser.encode(obj);
gs.info('The object '  + str);
```

Output: The object {"lastname":"Washington","name":"George"}

To use in a scoped script.

```
var obj = {"name":"George","lastname":"Washington"};
var parser = new global.JSON();
var str = parser.encode(obj);
gs.info('The object '  + str);
```

JSON - parse(String str)

Creates an object or primitive type from a JSON formatted string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The JavaScript ES5 native JSON object is used instead of the JSON static methods. If your script needs the old behavior, use the *encode()* and *decode()* methods.

Parameters

Name	Type	Description
str	String	A JSON formatted string.

Returns

Type	Description
Object	An object created from the specified string.

```
var str = '{"name":"George","lastname":"Washington"}';
var obj = JSON.parse(str);
gs.info('The first name is '  + obj.name);
```

Output: The first name is George

JSON - stringify(Object jsonObject)

Creates a string from a JSON object.

The *JSON.stringify()* method can only convert numbers, strings, and Java native objects to strings. It cannot convert user-defined objects to strings, unless those objects provide a *toJSON()* method. The call to *current.sys_id()* returns a GlideElement object which does not have a *toJSON()* method, so the return value for stringify is empty: "{}". The JavaScript ES5 native JSON object is used instead of the JSON static methods. If your script needs the old behavior, use the *encode()* and *decode()* methods.

JSON.stringify() converts a value to JSON notation using the following guidelines:

- If the value has a *toJSON()* method, it is responsible for defining the data that is serialized.
- Boolean, number, and string objects are converted to the corresponding primitive values during stringification; in accordance with the traditional conversion semantics.
- If a function, undefined, or a symbol is encountered during conversion, it is either omitted (when it is found in an object) or censored to null (when it is found in an array). *JSON.stringify()* also returns undefined when passing in "pure" values, such as `JSON.stringify(function(){})` or `JSON.stringify(undefined)`.
- All symbol-keyed properties are ignored, even when using a *replacer()* function.
- Instances of Date implement the *toJSON()* function by returning a string (the same as *date.toISOString()*), thus they are treated as strings.
- The numbers Infinity and NaN, as well as the value null, are all considered null.
- For all other object instances, only their enumerable properties are serialized.

Parameters

Name	Type	Description
jsonObject	Object	JSON object to turn into a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	JSON formatted string.

```
var obj = {"name":"George","lastname":"Washington"};
var str =  JSON.stringify(obj);
gs.info('The object '  + str);
```

Output: The object {"name":"George","lastname":"Washington"}

It is also possible to define a *replacer()* function and use that in the *stringify()* call. This function leverages the *GlideElement.toString()* method to provide a string representation of the GlideElement object.

```
function replacer(name, val) {
   // convert GlideElement to string
   if ( val && val.constructor === GlideElement ) {
       return val.toString();
   } else {
       return val; // return as is
   }
};

var s = global.JSON.stringify(json_obj, replacer);
gs.info("json="+s);
```

JSON - Scoped

The *JSON* script include provides scoped methods to create JSON objects from a string, and to turn JSON objects into strings.

For scoped applications, the *JSON* API uses static methods that call the JavaScript ES5 native JSON object.

Note: Use the global keyword with *JSON* method calls in scoped scripts, for example, `global.JSON.stringify()`. Not using the global keyword could result in an error message, such as `ScopedRhinoObjectWrapper: not a wrappable type: com.glide.script.FieldGlideDescriptor`.

Scoped JSON - parse(String str)

Creates an object or primitive type from a JSON formatted string.

Parameters

Name	Type	Description
str	String	JSON formatted string.

Returns

Type	Description
Object	Object created from the specified string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var str = '{"name":"George","lastname":"Washington"}';
var obj = global.JSON.parse(str);
gs.info('The first name is ' + obj.name);
```

Output:

```
The first name is George
```

Scoped JSON - stringify(Object jsonObject)

Creates a string from a JSON object.

Parameters

Name	Type	Description
jsonObject	Object	JSON object to turn into a string.

Returns

Type	Description
String	JSON-formatted string.

```
var obj = {"name":"George","lastname":"Washington"};
var str =  global.JSON.stringify(obj);
gs.info('The object ' + str);
```

Output:

```
The object {"name":"George","lastname":"Washington"}
```

JSONParser - Global (deprecated)

The *JSONParser* API provides a JSON parser that does not use the JavaScript *eval()* function.

Note: This class is deprecated. Use the JavaScript JSON object instead.

Note: The methods of the *JSONParser* API do not validate the JSON string.

This class cannot be used in a scoped application. Use the JavaScript JSON object instead.

JSONParser - JSONParser()

Creates a JSONParser object.

This class cannot be used in a scoped application. Use the JavaScript JSON object instead.

This class is deprecated. Use the JavaScript JSON object instead.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JSONStreamingAPI - Scoped

Build a large streaming JSON payload to use in a REST or SOAP request to send bulk data to a third-party API. You can also create the payload as a JSON string for a non-streaming option.

Use these methods in the Workflow Studio script step with the `sn_ih` namespace identifier. For example, you can use this API to create a JSON payload in the Workflow Studio Script step and pass the returned value to the REST step to send the request to a third-party service. For more information, see the Workflow Studio Script step.

You can only use this API within the Workflow Studio environment.

To use this class, you must call the *`build()`* method in the *`JSONStreamingBuilder`* class to return a JSONStreamingAPI object. See JSONStreamingBuilder - Scoped.

API call order

Generate JSON payloads using these APIs in the following order:

`JSONStreamingBuilder`: **Creates a builder object**

Use these methods in the following order to create a builder object:

1. *`JSONStreamingBuilder()`*: Instantiates the JSONStreamingBuilder object.
2. *`withAttachment()`*: Optional. Creates the JSON object as a streaming attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you do not call this method, the API creates the payload as a JSON string.
3. *`expiresAt()`*: Optional. Sets a time when the attachment expires. Must also call the *`withAttachment()`* method.
4. *`build()`*: Returns a JSONStreamingAPI object.

`JSONStreamingAPI`: **Builds the JSON payload**

Use these methods in the following order to create the JSON payload:

1. *`startObject()`*: Creates the parent JSON object.
2. Methods to generate the JSON key-value pairs, such as *`writeFieldName()`*, *`writeString()`*, and *`writeNumberField()`*.
3. *`endObject()`*: Closes the parent JSON object.
4. *`getJSONString()`* or *`getAttachmentId()`*: Returns the JSON string or attachment ID that you created.
5. *`close()`*: Closes the JSONStreamingAPI object.

Size limits

Payloads generated through this API cannot exceed these size limits:

- Attachments: 200 MB
- Strings: 5 MB

Example

This example create a JSON object and stores it in the Attachment [sys_attachment] table with a defined expiration date. You can use this option to create payloads under 5 MB.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, this example uses the API in the Script step and creates the payload as a JSON string. You can use this option to create payloads under 5 MB.

```
(function execute(inputs, outputs) {

  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .enablePrettyPrint()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
      .writeStringField("streetAddress", "21 2nd Street")
      .writeStringField("city", "Santa Clara")
      .writeStringField("state", "CA")
      .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
      .startObject()
        .writeFieldName("type")
        .writeString("home")
        .writeFieldName("number")
        .writeString("212 555-1234")
      .endObject()
      .startObject()
        .writeFieldName("type")
        .writeString("fax")
        .writeFieldName("number")
        .writeString("646 555-4567")
      .endObject()
    .endArray()
    .endObject()

  outputs.payload = builder.getJSONString();

})(inputs, outputs);
```

Output:

```
{
"firstName" : "John",
"lastName" : "Smith",
"age" : 25,
"address" : {
  "streetAddress" : "21 2nd Street",
  "city" : "Santa Clara",
  "state" : "CA",
  "postalCode" : "11111"
},
"phoneNumber" : [ {
  "type" : "home",
  "number" : "212 555-1234"
```

```
}, {
  "type" : "fax",
  "number" : "646 555-4567"
} ]
}
```

JSONStreamingAPI - close()

Closes the JSONStreamingAPI object. Must call this method to close the stream after building a JSON object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .writeFieldName("number")
    .writeString("212 555-1234")
   .endObject()
   .startObject()               // Add another object to the
 array
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
   .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - disablePrettyPrint()

Ends pretty print JSON formatting.

Before calling this method, you must first call *`enablePrettyPrint()`* to add JSON formatting to a specific section.

Parameters

Name	Type	Description
None		

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example adds pretty print formatting to the `address` object.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .enablePrettyPrint()
    .writeFieldName("address")
    .startObject()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .disablePrettyPrint()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

Output:

```
{"firstName":"John","lastName":"Smith","age":25,
"address" : {
  "streetAddress" : "21 2nd Street",
  "city" : "Santa Clara",
  "state" : "CA",
  "postalCode" : "11111"
},"phoneNumber":[{"type":"home","number":"212
 555-1234"},{"type":"fax","number":"646 555-4567"}]}
```

JSONStreamingAPI - enablePrettyPrint()

Adds pretty print formatting to a JSON object, or a section of a JSON object.

To disable pretty print formatting in a JSON object section, use the *disablePrettyPrint()* method.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.enablePrettyPrint()
    .startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

Output:

```
{
"firstName" : "John",
"lastName" : "Smith",
"age" : 25,
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"address" : {
  "streetAddress" : "21 2nd Street",
  "city" : "Santa Clara",
  "state" : "CA",
  "postalCode" : "11111"
},
"phoneNumber" : [ {
  "type" : "home",
  "number" : "212 555-1234"
}, {
  "type" : "fax",
  "number" : "646 555-4567"
} ]
}
```

JSONStreamingAPI - endArray()

Closes an array within the parent JSON object.

Call the *`startArray()`* method first to open the array.

Parameters

Name	Type	Description
None		

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - endObject()

Closes an object within the parent JSON object.

Call the *`startObject()`* method first to open the object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
```

© 2026 ServiceNow, Inc. All rights reserved.

```
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - getAttachmentId()

Returns the sys_id of the attachment record in the Streaming Attachments [streaming_attachment] table that contains the JSON payload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must call the *withAttachment()* method in the *JSONStreamingBuilder* class to save the JSON payload as an attachment before calling this method. See JSONStreamingBuilder - Scoped.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Sys_id of the attachment record in the Streaming Attachments [streaming_attachment] table that contains the JSON payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - getJSONString()

Returns the JSON object as a string.

To return the JSON object as a string, do not call the *`withAttachment()`* method in the *`JSONStreamingBuilder`* class. See JSONStreamingBuilder - Scoped.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Contains the JSON object built using the *`JSONStreamingAPI`*.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

Output:

```
{
"firstName" : "John",
"lastName" : "Smith",
"age" : 25,
"address" : {
  "streetAddress" : "21 2nd Street",
  "city" : "Santa Clara",
  "state" : "CA",
  "postalCode" : "11111"
},
"phoneNumber" : [ {
  "type" : "home",
  "number" : "212 555-1234"
}, {
  "type" : "fax",
  "number" : "646 555-4567"
} ]
}
```

JSONStreamingAPI - startArray()

Opens an array within the parent JSON object.

Include the *`endArray()`* method to close the array.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - startArrayField(String fieldName)

Creates an array within the parent JSON object.

Surround this method with the *`startArray()`* and *`endArray()`* methods to open and close the array.

Parameters

Name	Type	Description
fieldName	String	The name of the array.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .startArrayField("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
```

```
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - startObject()

Opens an object within the parent JSON object.

Requires the *endObject()* method to close the object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
```

```
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - writeBoolean(Boolean state)

Adds a Boolean value to the parent JSON object.

Parameters

Name	Type	Description
state	Boolean	The boolean value to add to the parent JSON object. Valid values: • true • false

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();
```

```
  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeFieldName("activeUser")
    .writeBoolean(true)
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - writeBooleanField(String fieldName, Boolean value)

Adds a Boolean field and value to the parent JSON object.

Parameters

Name	Type	Description
fieldName	String	The name of the field to add to the parent JSON object.
value	Boolean	The boolean value to add to the parent JSON object. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.

Parameters (continued)

Name	Type	Description
		• true • false

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeBooleanField("activeUser", true)
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
```

```
  builder.close();
}
```

JSONStreamingAPI - writeFieldName(String name)

Adds a field name to the parent JSON object.

Parameters

Name	Type	Description
name	String	Field name to add to the parent JSON object.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
```

```
  .startObject()                // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - writeNull()

Adds a null value to the parent JSON object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeFieldName("activeUser")
    .writeNull()
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
```

```
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - writeNullField(String fieldName)

Adds a field with a null value to the parent JSON object.

Parameters

Name	Type	Description
fieldName	String	The name of the null field.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNullField("activeUser")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
```

```
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - writeNumberField(String fieldName, String encodedValue)

Adds a number field and value to the parent JSON object.

Parameters

Name	Type	Description
fieldName	String	The name of the number field.
encodedValue	String	The value of the number field.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
```

```
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

 builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

 gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - writeRaw(String text)

Adds a raw value to the parent JSON object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
text	String	Raw text to add to the parent JSON object.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeFieldName("filePath")
    .writeRaw("C:\Users\profile\aboutme.html")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  builder.close();
}
```

JSONStreamingAPI - writeString(String text)

Adds a string value to the parent JSON object.

Parameters

Name	Type	Description
text	String	The string value to add to the parent JSON object.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  .startObject()                // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingAPI - writeStringField(String fieldName, String value)

Adds a string field and value to the parent JSON object.

Parameters

Name	Type	Description
fieldName	String	The name of the field to add to the parent JSON object.
value	String	The value of the field.

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                   // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingBuilder - Scoped

Create a builder object used to build a large streaming JSON payload to use in a REST or SOAP request to send bulk data to a third-party API. You can also create the payload as a JSON string for a non-streaming option.

Use these methods in the Workflow Studio script step with the `sn_ih` namespace identifier. For example, you can use this API to create a JSON payload in the Workflow Studio Script step and pass the returned value to the REST step to send the request to a third-party service. For more information, see the Workflow Studio Script step.

You can only use this API within the Workflow Studio environment.

API call order

Generate JSON payloads using these APIs in the following order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`JSONStreamingBuilder`**: Creates a builder object**

Use these methods in the following order to create a builder object:

1. `JSONStreamingBuilder()`: Instantiates the JSONStreamingBuilder object.
2. `withAttachment()`: Optional. Creates the JSON object as a streaming attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you do not call this method, the API creates the payload as a JSON string.
3. `expiresAt()`: Optional. Sets a time when the attachment expires. Must also call the `withAttachment()` method.
4. `build()`: Returns a JSONStreamingAPI object.

`JSONStreamingAPI`**: Builds the JSON payload**

Use these methods in the following order to create the JSON payload:

1. `startObject()`: Creates the parent JSON object.
2. Methods to generate the JSON key-value pairs, such as `writeFieldName()`, `writeString()`, and `writeNumberField()`.
3. `endObject()`: Closes the parent JSON object.
4. `getJSONString()` or `getAttachmentId()`: Returns the JSON string or attachment ID that you created.
5. `close()`: Closes the JSONStreamingAPI object.

Size limits

Payloads generated through this API cannot exceed these size limits:

- Attachments: 200 MB
- Strings: 5 MB

Examples

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

Alternatively, this example shows how to use the API in the Script step and create the payload as a JSON string. You can use this option to create payloads under 5 MB.

```
(function execute(inputs, outputs) {

  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .enablePrettyPrint()
    .writeTextElement("firstName","John")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
      .writeStringField("streetAddress", "21 2nd Street")
      .writeStringField("city", "Santa Clara")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      .writeStringField("state", "CA")
      .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
      .startObject()
        .writeFieldName("type")
        .writeString("home")
        .writeFieldName("number")
        .writeString("212 555-1234")
      .endObject()
      .startObject()
        .writeFieldName("type")
        .writeString("fax")
        .writeFieldName("number")
        .writeString("646 555-4567")
      .endObject()
    .endArray()
    .endObject()

  outputs.payload = builder.getJSONString();

})(inputs, outputs);
```

Output:

```
{
"firstName" : "John",
"lastName" : "Smith",
"age" : 25,
"address" : {
  "streetAddress" : "21 2nd Street",
  "city" : "Santa Clara",
  "state" : "CA",
  "postalCode" : "11111"
},
"phoneNumber" : [ {
  "type" : "home",
  "number" : "212 555-1234"
}, {
  "type" : "fax",
  "number" : "646 555-4567"
} ]
}
```

JSONStreamingBuilder - JSONStreamingBuilder()

Instantiates the JSONStreamingBuilder object.

Parameters

Name	Type	Description
None		

```
var builder = new sn_ih.JSONStreamingBuilder()
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

JSONStreamingBuilder - build()

Returns a JSONStreamingAPI object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
JSONStreamingAPI	Streaming JSON object used to construct the payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

 builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    .writeFieldName("number")
    .writeString("646 555-4567")
   .endObject()
  .endArray()
  .endObject()

   gs.log(builder.getAttachmentId()); // Returns the sys_id of
  the attachment.
}

catch (err) {
   gs.log(err);
}

finally {
   builder.close();
}
```

JSONStreamingBuilder - expiresAt(Object expiresAt)

Sets a time when the attachment expires. Must also call the *withAttachment()* method. If you do not call this method, the attachment expires two hours from the time the attachment is created.

Parameters

Name	Type	Description
expiresAt	GlideDateTime	Object that is set when the attachment expires. • Minimum value: 7200 seconds, or two hours, from the time the attachment is created. Default. • Maximum value: 172800 seconds, or 48 hours, from the time the attachment is created.

Returns

Type	Description
JSONStreamingBuilder	Builder object used to initiate the JSON payload.

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```
try {
   var ttl = new GlideDateTime("2011-01-01 12:00:00");
   var builder = new sn_ih.JSONStreamingBuilder()
     .withAttachment() // Creates the JSON object in streaming
  mode within an attachment.
     .expiresAt(ttl) // Sets an expiration date for the
  attachment.
     .build(); // Creates the JSONStreamingAPI object.

   builder.startObject()  // Begins generating the JSON object.
  .writeFieldName("firstName")  // Adds a "firstName" field
  .writeString("John")          // Writes the value of the
  "firstName" field
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                   // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
```

JSONStreamingBuilder - withAttachment()

Creates the JSON object as a streaming attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you do not call this method, the API creates the payload as a JSON string.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
JSONStreamingBuilder	Builder object used to initiate the JSON payload.

This example shows how to build the JSON payload and save it as an attachment.

```
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming
 mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the
 attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject()  // Begins generating the JSON object.
 .writeFieldName("firstName")  // Adds a "firstName" field
 .writeString("John")          // Writes the value of the
 "firstName" field
 .writeFieldName("lastName")
 .writeString("Smith")
 .writeNumberField("age","25") // Write a number field named
 "age" with value "25"
 .writeFieldName("address")
 .startObject()                // Start a new object nested
 under the parent object
  .writeStringField("streetAddress", "21 2nd Street")
  .writeStringField("city", "Santa Clara")
  .writeStringField("state", "CA")
  .writeStringField("postalCode", "11111")
 .endObject()
 .writeFieldName("phoneNumber")
 .startArray()                    // Start an array
  .startObject()               // Add the first object to the
 array
   .writeFieldName("type")
   .writeString("home")
   .writeFieldName("number")
   .writeString("212 555-1234")
  .endObject()
  .startObject()               // Add another object to the
 array
   .writeFieldName("type")
   .writeString("fax")
   .writeFieldName("number")
   .writeString("646 555-4567")
  .endObject()
 .endArray()
 .endObject()

  gs.log(builder.getAttachmentId()); // Returns the sys_id of
 the attachment.
}

catch (err) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  gs.log(err);
}

finally {
  builder.close();
}
```

This example shows how to build the JSON payload and save it as a string.

```
try {
  var builder = new sn_ih.JSONStreamingBuilder().build();

  builder.startObject()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
    .startObject()
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject()
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

  gs.log(builder.getJSONString());
}

catch (err) {
  gs.log("Exception: " + err);
}

finally {
  builder.close();
}
```

Output:

```
{
"firstName" : "John",
"lastName" : "Smith",
```

© 2026 ServiceNow, Inc. All rights reserved.

```
"age" : 25,
"address" : {
  "streetAddress" : "21 2nd Street",
  "city" : "Santa Clara",
  "state" : "CA",
  "postalCode" : "11111"
},
"phoneNumber" : [ {
  "type" : "home",
  "number" : "212 555-1234"
}, {
  "type" : "fax",
  "number" : "646 555-4567"
} ]
}
```

JSUtil - Global

The *JSUtil* script include provides shortcuts for common JavaScript routines.

This API is available in global server-side scripts, not scoped scripts.

JSUtil - doesNotHave(Object item)

Checks if item is null or is undefined.

Parameters

Name	Type	Description
item	Object	The object to check

Returns

Type	Description
Boolean	True if the specified object is null or undefined.

```
var x = "the quick brown fox";
var y = "";
var z;

gs.print("x = '" + x + "', JSUtil.doesNotHave(x) = " +
 JSUtil.doesNotHave(x));
gs.print("y = '" + y + "', JSUtil.doesNotHave(y) = " +
 JSUtil.doesNotHave(y));
gs.print("z = '" + z + "', JSUtil.doesNotHave(z) = " +
 JSUtil.doesNotHave(z))
```

Output:

```
x = 'the quick brown fox', JSUtil.doesNotHave(x) = false
y = '', JSUtil.doesNotHave(y) = false
z = 'undefined', JSUtil.doesNotHave(z) = true
```

JSUtil - escapeAttr(String text)

Escape ampersands commonly used to define URL attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
text	String	The text

Returns

Type	Description
String	The text with ampersands properly escaped.

```
var attr = "sysparm_query=active=true&sysparm_view=special";

gs.print(JSUtil.escapeAttr(attr));
```

Output: This is the returned text. If the text is displayed in the application, the page will render the escaped ampersand with a single ampersand.

```
sysparm_query=active=true&sysparm_view=special
```

JSUtil - escapeText(String text)

Escapes invalid XML characters such as "< > &".

Parameters

Name	Type	Description
text	String	The text

Returns

Type	Description
String	The text with escape characters added.

```
var html = "<b>This is my title</b>";

gs.print(JSUtil.escapeText(html));
```

Output: This is the value returned. If the result is displayed in the application, the page renders the brackets back so it appears that it is not escaped.

```
<b>This is my title</b>
```

JSUtil - getBooleanValue(GlideRecord now_GR, String field)

Returns the value in a boolean GlideRecord field.

Parameters

Name	Type	Description
now_GR	GlideRecord	A GlideRecord
field	String	The field from which to retrieve the boolean value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Returns the value in a boolean GlideRecord field, returns true if value of field is true, "true", 1, or "1".

```
var inc = new GlideRecord("incident");
//get an active incident
inc.addActiveQuery();
inc.setLimit(1);
inc.query();
inc.next();

gs.print(JSUtil.getBooleanValue(inc, "active"));
```

Output: true

JSUtil - has(Object item)

Checks if item is not null and is not undefined.

Parameters

Name	Type	Description
item	Object	The Object to check

Returns

Type	Description
Boolean	True if the specified object is not null and is not undefined.

```
var x = "the quick brown fox";
var y = "";
var z;

gs.print("x = '" + x + "', JSUtil.has(x) = " + JSUtil.has(x));
gs.print("y = '" + y + "', JSUtil.has(y) = " + JSUtil.has(y));
gs.print("z = '" + z + "', JSUtil.has(z) = " + JSUtil.has(z));
```

Output:

```
x = 'the quick brown fox', JSUtil.has(x) = true
y = '', JSUtil.has(y) = true
z = 'undefined', JSUtil.has(z) = false
```

JSUtil - instance_of(Object item, String class)

Checks to see if the specified object is a member of the specified class.

For JavaScript objects, this method behaves exactly like the JavaScript operator "instanceof", but also supports Java objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
item	Object	The object to check
class	String	The class to check

Returns

Type	Description
Boolean	True if the specified object is a member of the specified class.

```
var a = ['a','b','c'];
var b = 10;
var c = new GlideRecord("incident");

gs.print("JSUtil.instance_of(a,'Array') = " +
 JSUtil.instance_of(a,Array));
gs.print("JSUtil.instance_of(a,'String') = " +
 JSUtil.instance_of(a,String));

gs.print("JSUtil.instance_of(b,'String') = " +
 JSUtil.instance_of(b,String));

gs.print("JSUtil.instance_of(c,'GlideRecord') = " +
 JSUtil.instance_of(c,GlideRecord));
```

Output:

```
JSUtil.instance_of(a,'Array') = true
JSUtil.instance_of(a,'String') = false
JSUtil.instance_of(b,'String') = false
JSUtil.instance_of(c,'GlideRecord') = true
```

JSUtil - isJavaObject(Object value)

Checks if the specified object is a Java class.

Parameters

Name	Type	Description
value	Object	The object to check

Returns

Type	Description
Boolean	True if the specified object is an instance of a Java class.

```
var tu = new TableUtils("incident");
var classes = tu.getHierarchy(); //Java ArrayList
var tables = ["task, incident"]; //JavaScript Array
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print("JSUtil.isJavaObject(classes) = " +
 JSUtil.isJavaObject(classes));
gs.print("JSUtil.isJavaObject(tables) = " +
 JSUtil.isJavaObject(tables));
```

Output:

```
JSUtil.isJavaObject(classes) = true
JSUtil.isJavaObject(tables) = false
```

JSUtil - logObject(Object obj, String name)

Logs all the properties in the given object: name, type, and value.

Output is written to the console if you are running from a background script or have debug logging enables. The output is also written to the system log.

Parameters

Name	Type	Description
obj	Object	The object for which to enumerate properties
name	String	Optional name for the logged object

Returns

Type	Description
void	

```
var arr = ["a","b","c"];

var inc = new GlideRecord("incident");
//get an active incident
inc.addActiveQuery();
inc.setLimit(1);
inc.query();
inc.next();

JSUtil.logObject(arr, "arr");
JSUtil.logObject(inc, "inc");
```

Output:

```
Log Object: arr
  Array of 3 elements
    [0]: string = a
    [1]: string = b
    [2]: string = c
Log Object: inc
  GlideRecord('incident') @ INC0000002
```

JSUtil - nil(Object item)

Checks if item is null, undefined, or evaluates to the empty string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
item	Object	The object to check

Returns

Type	Description
Boolean	True if the item is null, undefined, or evaluates to the empty string.

```
var x = "the quick brown fox";
var y = "";
var z;

gs.print("x = '" + x + "', JSUtil.nil(x) = " + JSUtil.nil(x));
gs.print("y = '" + y + "', JSUtil.nil(y) = " + JSUtil.nil(y));
gs.print("z = '" + z + "', JSUtil.nil(z) = " + JSUtil.nil(z));
```

Output:

```
x = 'the quick brown fox', JSUtil.nil(x) = false
y = '', JSUtil.nil(y) = true
z = 'undefined', JSUtil.nil(z) = true
```

JSUtil - notNil(Object item)

Checks if an item is null, undefined, or evaluates to the empty string.

Note: This method returns an error if the object provided isn't declared.

Parameters

Name	Type	Description
item	Object	The object to check.

Returns

Type	Description
Boolean	Flag that indicates whether the item exists and isn't empty. An error returns if the object provided isn't declared. Valid values: • true: The object provided has been declared and defined. If the object is a string, it isn't empty. • false: The object provided is null, undefined, or evaluates to an empty string.

The following example shows results for a string variable, an empty string variable, and an undefined variable.

```
var x = "the quick brown fox";
var y = "";
var z;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.print("x = '" + x + "', JSUtil.notNil(x) = " +
 JSUtil.notNil(x));
gs.print("y = '" + y + "', JSUtil.notNil(y) = " +
 JSUtil.notNil(y));
gs.print("z = '" + z + "', JSUtil.notNil(z) = " +
 JSUtil.notNil(z));
```

Output:

```
x = 'the quick brown fox', JSUtil.notNil(x) = true
y = '', JSUtil.notNil(y) = false
z = 'undefined', JSUtil.notNil(z) = false
```

JSUtil - toBoolean(Object item)

Converts the specified object to a Boolean.

Parameters

Name	Type	Description
item	Object	The object to convert

Returns

Type	Description
Boolean	If the specified object is a boolean, it is passed through. Non-zero numbers return true. Null or undefined return false. Strings return true only if exactly equal to 'true'.

```
var zero = 0;
var one = 1;
var number = 12;
var trueBoolean = true;
var trueString = "true";
var otherString = "random text";

gs.print("JSUtil.toBoolean(zero) = " + JSUtil.toBoolean(zero));
gs.print("JSUtil.toBoolean(one) = " + JSUtil.toBoolean(one));
gs.print("JSUtil.toBoolean(number) = " +
 JSUtil.toBoolean(number));
gs.print("JSUtil.toBoolean(trueBoolean) = " +
 JSUtil.toBoolean(trueBoolean));
gs.print("JSUtil.toBoolean(trueString) = " +
 JSUtil.toBoolean(trueString));
gs.print("JSUtil.toBoolean(otherString) = " +
 JSUtil.toBoolean(otherString));
```

Output:

```
JSUtil.toBoolean(zero) = false
JSUtil.toBoolean(one) = true
JSUtil.toBoolean(number) = true
JSUtil.toBoolean(trueBoolean) = true
JSUtil.toBoolean(trueString) = true
JSUtil.toBoolean(otherString) = false
```

JSUtil - type_of(Object value)

Determines the type of the specified object.

Parameters

Name	Type	Description
value	Object	The object to check

Returns

Type	Description
String	The type of the specified object. • 'null' if the given value is null or undefined • 'string' if the given value is a primitive string or a String wrapper instance • 'number' if the given value is a primitive number or a Number wrapper instance • 'boolean' if the given value is a primitive boolean or a Boolean wrapper instance • 'function' if the given value is a function • 'object' otherwise

```
var a = ["a","b","c"];
var b = 10;
var c = new GlideRecord("incident");
var d = true;
var e;

gs.print("JSUtil.type_of(a) = " + JSUtil.type_of(a));
gs.print("JSUtil.type_of(b) = " + JSUtil.type_of(b));
gs.print("JSUtil.type_of(c) = " + JSUtil.type_of(c));
gs.print("JSUtil.type_of= " + JSUtil.type_of(d));
gs.print("JSUtil.type_of(e) = " + JSUtil.type_of(e));
```

Output:

```
JSUtil.type_of(a) = object
JSUtil.type_of(b) = number
JSUtil.type_of(c) = object
JSUtil.type_of= boolean
JSUtil.type_of(e) = null
```

JSUtil - unescapeAttr(String text)

Restore ampersands from escaped text.

Parameters

Name	Type	Description
text	String	The text

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The text with escape characters removed.

```
var attr = "sysparm_query=active=true&amp;sysparm_view=special";

gs.print(JSUtil.unescapeAttr(attr));
```

Output:

```
sysparm_query=active=true&sysparm_view=special
```

JSUtil - unescapeText(String text)

Removes escape characters.

Parameters

Name	Type	Description
text	String	The text to process.

Returns

Type	Description
String	The the text without escape characters.

```
var html = "&lt;b&gt;This is my title&lt;/b&gt;";

gs.print(JSUtil.unescapeText(html));
```

Output: This is the value returned. If the text is displayed in the application the page, it renders the html tags and displays the text in bold.

```
<b>This is my title</b>
```

KMFCryptoOperation - Scoped, Global

The *KMFCryptoOperation* class provides methods for performing cryptographic operations using a Key Management Framework (KMF) cryptographic module or a Column Level Encryption encryption module.

To use this API, you must have already created and configured a KMF cryptographic module or a CLE encryption module. The module must have one or more cryptographic specifications and you must create or import its associated key. For details, see Cryptographic modules.

The KMFCryptoOperation object generated using this API represents a cryptographic operation, such as a Symmetric Encryption. Use the *KMFCryptoOperations()* method to create this object, the builder methods to set properties on the object, and the *doOperation()* method to execute the operation.

You can use this API in both scoped and global applications. You must always specify the `sn_kmf_ns` namespace when calling this API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KMFCryptoOperation - KMFCryptoOperation(String cryptoModuleName, String operationName)

Creates a KMFCryptoOperation object for the specified module and operation.

This API leverages builder methods. Builder methods update properties on the KMFCryptoOperation object, such as changing the desired output format of the data. Not all builder methods are valid for all operations. The builder methods available for each operation are noted in the parameters table below.

The following builder methods are valid for all operation types:

- withInputFormat()
- withOutputFormat()
- withOutputType()

Important: Base64 input values used in this document must be URL safe (contains only A-Z, a-z, 0-9, dash(-) and underscore(_) characters).

Parameters

Name	Type	Description
cryptoModuleName	String	Name of the Key Management Framework (KMF) cryptographic module or Column Level Encryption encryption module to use. You must create the module before calling this method. For details, see Cryptographic module overview.

operationName	String	Name of the operation to perform.
		
		Valid values (not case-sensitive):
		• ASYMMETRIC_DECRYPTION: Data decryption using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Data Decryption cryptographic purpose.
		  ○ Additional builder methods: `withAdditionalInput()`
		  ○ Default input format: Formatted - Formatted to the KMF specifications
		  ○ Default output format: KMFBase64 - Base64 encoded
		  ○ Default output type: String
		• ASYMMETRIC_ENCRYPTION: Data encryption using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Data Encryption cryptographic purpose.
		  ○ Additional builder methods: `withAdditionalInput()`
		  ○ Default input format: KMFBase64 - Base64 encoded
		  ○ Default output format: Formatted - Formatted to the KMF specifications

Parameters (continued)

Name	Type	Description
		○ Default output type: String . Output can also be an KMFEncryptionPayload object. RSA and EC-IES are compatible with both. For additional information on the KMFEncryptionPayload object, see withAdditionalInput(). • ASYMMETRIC_UNWRAPPING: Key unwrapping using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Key Unwrapping cryptographic purpose. ○ Additional builder methods: `withAlgorithm()` ○ Default input format: Formatted - Formatted to the KMF specifications ○ Default output format: KMFBase64 - Base64 encoded ○ Default output type: String • ASYMMETRIC_WRAPPING: Key wrapping using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Key Wrapping cryptographic purpose. ○ Additional builder methods: `withAlgorithm()`, `withSysId()` ○ Default input format: KMFBase64 - Base64 encoded ○ Default output format: Formatted - Formatted to the KMF specifications ○ Default output type: String • MAC_GENERATION: Generation of a Message Authentication Code (MAC). Symmetric-key algorithm based to provides data integrity and authentication. Requires a KMF cryptographic module with a Symmetric Authenticity cryptographic purpose. ○ Additional builder methods: None ○ Default input format: KMFBase64 - Base64 encoded ○ Default output format: Formatted - Formatted to the KMF specifications ○ Default output type: String • MAC_VERIFICATION: Verification of a MAC. Symmetric-key algorithm based to provide data integrity and authentication. Requires a KMF cryptographic module with a Symmetric Authenticity cryptographic purpose. ○ Additional builder methods: `withAdditionalInput()` ○ Default input format: KMFBase64 - Base64 encoded ○ Default output format: KMFNone - No decoding ○ Default output type: Boolean

Parameters (continued)

Name	Type	Description

		• SIGNATURE_GENERATION: Generation of a digital signature. Asymmetric-key algorithm based to provide data integrity and authentication. Requires a KMF cryptographic module with a Signature Generation cryptographic purpose.
		  ○ Additional builder methods: None
		  ○ Default input format: KMFBase64 - Base64 encoded
		  ○ Default output format: Formatted - Formatted to the KMF specifications
		  ○ Default output type: String
		• SIGNATURE_VERIFICATION: Verification of a digital signature. Asymmetric-key algorithm based to provide data integrity and authentication. Requires a KMF cryptographic module with a Signature Verification cryptographic purpose.
		  ○ Additional builder methods: `withAdditionalInput()`
		  ○ Default input format: KMFBase64 - Base64 encoded
		  ○ Default output format: KMFNone - No decoding
		  ○ Default output type: Boolean
		• SYMMETRIC_ENCRYPTION: Data encryption using a symmetric-key algorithm. If the algorithm is not equality preserving, only formatted output is allowed. Requires a KMF cryptographic module with a Symmetric Data Encryption/Decryption cryptographic purpose.
		  ○ Additional builder methods: None
		  ○ Default input format: KMFBase64 - Base64 encoded
		  ○ Default output format: Formatted - Formatted to the KMF specifications
		  ○ Default output type: String
		• SYMMETRIC_DECRYPTION: Data decryption using a symmetric-key algorithm. If the algorithm is not equality preserving, KMFBase64 input is allowed. Requires a KMF cryptographic module with a Symmetric Data Encryption/Decryption cryptographic purpose.
		  ○ Additional builder methods: None
		  ○ Default input format: Formatted - Formatted to the KMF specifications
		  ○ Default output format: KMFBase64 - Base64 encoded
		  ○ Default output type: String
		• SYMMETRIC_WRAPPING: Key wrapping using a symmetric-key algorithm. If the algorithm is not equality preserving, only formatted output is allowed. Requires a KMF cryptographic module with a Symmetric Key Wrapping/Unwrapping cryptographic purpose.

Parameters (continued)

Name	Type	Description
		○ Additional builder methods: *withAlgorithm()* and *withSysId()* ○ Default input format: KMFBase64 - Base64 encoded ○ Default output format: Formatted - Formatted to the KMF specifications ○ Default output type: String • SYMMETRIC_UNWRAPPING: Key unwrapping using a symmetric-key algorithm. If the algorithm is not equality preserving, KMFBase64 input is allowed. Requires a KMF cryptographic module with a Symmetric Key Wrapping/ Unwrapping cryptographic purpose. ○ Additional builder methods: *withAlgorithm()* ○ Default input format: Formatted - Formatted to the KMF specifications ○ Default output format: KMFBase64 - Base64 encoded ○ Default output type: String

This example instantiates a KMFCryptoOperation object for the module global.sj_cm to perform a Symmetric Encryption operation. You must include the namespace for both global and scoped applications.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_ENCRYPTI
ON");
```

This example shows how to specify options to update the default output type and output format.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_ENCRYPTI
ON")
  .withOutputType("STRING").withOutputFormat("FORMATTED");

var cipherText=op.doOperation("hi");
```

This example shows how to perform an Asymmetric Encryption operation using an Integrated Encryption Scheme (EC-IES). Note that long values, such as *signature*, have been truncated and replaced with an ellipse for readability.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","ASYMMETRIC_ENCRYPT
ION")
.withInputFormat("KMFNONE")
.withOutputType("PAYLOAD");

var cipherText = op.doOperation("hi");

/*
cipherText contains an object similar to this JSON: {
  "signature": "pkg…",
  "ephemeral_key": "BDi…",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "ciphertext": "afFS…"
}
*/
```

This example shows how to perform an Asymmetric Decryption operation using EC-IES.

```
var op = new
sn_kmf_ns.KMFCryptoOperation("global.sj_cm","ASYMMETRIC_DECRYPTI
ON")
  .withAdditionalInput({
  "signature": "pkg… ",
  "ephemeral_key": "BDi…"
})
.withOutputFormat("KMFNONE");

var clearText = op.doOperation("afFS…");
```

KMFCryptoOperation - doOperation(Object data)

Performs the cryptographic operation defined by the current KMFCryptoOperation object on the supplied data and returns the result.

Parameters

Name	Type	Description
data	Object	Required except if the *withSysId()* builder method has previously been called on the associated KMFCryptoOperation object. Input data on which to perform the cryptographic operation.

Returns

Type	Description
Depends on the operation type. • *MAC_VERIFICATION* and *SIGNATURE_VERIFICATION*: Boolean • All others: String	Data results after performing the operation specified in the associated KMFCryptoOperation object.

This example uses the *doOperation()* to create a MAC.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","MAC_GENERATION");
var data = "aGk=";
var mac = op.doOperation(data);
```

KMFCryptoOperation - withAdditionalInput(Object additionalInput)

Sets the additional input needed to perform the cryptographic operation.

For example, during a Message Authentication Code (MAC) verification, use this method to pass in the generated MAC tag. Similarly, during signature verification, use it to pass in the signature. You can also use this method to pass additional data, a KMFEncryptionPayload object, when

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

performing an asymmetric operation with an integrated cipher, such as Elliptic Curve Integrated Encryption Scheme (EC-IES.)

Note: The additional input does not have to be in the same format that is currently set on the KMFCryptoOperation object.

Parameters

Name	Type	Description
additionalInput	String or Object	Optional, except for Asymmetric Decryption operations when using EC-IES. Additional input data needed to perform the cryptographic operation specified in the KMFCryptoOperation object. Supported string formats: • FORMATTED: Formatted to the Key Management Framework (KMF) specifications. • KMFBASE64: Base64 encoded. KMFEncryptionPayload object format: `{ "ciphertext": String, "derivation_secret": String, "ephemeral_key": String, "ephemeral_key_format": String, "signature": String }`
additionalInput.ciphertext	String (Base64)	Required for Asymmetric Decryption, optional for all other operations. Valid values: • If using an RSA algorithm: RSA ciphertext • If using an EC-IES algorithm: Integrated AES ciphertext Available from the Asymmetric Encryption operation when the output type is set to *payload*.
additionalInput.derivation_secret	String (Base64)	Optional, only used for the Asymmetric Encryption or Asymmetric Decryption operations with EC-IES. Shared secret to use during the key derivation process of the integrated scheme.
additionalInput.ephemeral_key	String (Base64)	Required for the Asymmetric Decryption operation when using EC-IES, optional for all other operations. Ephemeral public key to use during the basic agreement process of the integrated scheme. Available from the Asymmetric Encryption operation when the output type is set to *payload*.
additionalInput.ephemeral_key_format	String	Optional, only used for the Asymmetric Encryption or Asymmetric Decryption operations with EC-IES. Overrides the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		format of the public key represented by the *ephemeral_key* parameter. Valid values: • x962 • der
additionalInput.signature	String (Base64)	Required for the Asymmetric Decryption operation with EC-IES, optional for all others. The signature of the ciphertext to validate using the signature verification process of the integrated scheme. Available from the Asymmetric Encryption operation when the output type is set to *payload*.

Returns

Type	Description
None	

This example uses *withAdditionalInput()* to add a string-based signature to the KMFCryptoOperation object.

```
var signature = "John Doe";
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SIGNATURE_VERIFICA
TION")
  .withAdditionalInput(signature);

var value = GlideStringUtil.base64Encode("Text to encode"); //
 Default input format is KMFBase64
var result = op.doOperation(String(value));
```

This example uses *withAdditionalInput()* to add a signature and ephemeral key to the KMFCryptoOperation object. Note that long values, such as those in the *doOperation()* call and *payload* description, have been truncated and replaced with an ellipse for readability.

```
var payload = new sn_kmf_ns.KMFEncryptionPayload();
payload.signature = "pkg...";
payload.ephemeral_key = " BDi...";
payload.ephemeral_key_format = "x962";

var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","ASYMMETRIC_DECRYPT
ION")
  .withAdditionalInput(payload)
  .doOperation("afFS...";
```

KMFCryptoOperation - withAlgorithm(String algorithm)

Sets the algorithm associated with the key material to wrap.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
algorithm	String	Algorithm to use. Valid values: • AES: Symmetric key type • EC: Asymmetric key type • HMAC: Symmetric key type • RSA: Asymmetric key type

Returns

Type	Description
None	

This example uses *withAlgorithm()* to change the encryption algorithm used to EC.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","ASYMMETRIC_WRAPPIN
G").withAlgorithm("EC");
var value = GlideStringUtil.base64Encode("Sample key"); //
 Default input format is KMFBase64
var result = op.doOperation(String(value));
```

KMFCryptoOperation - withInputFormat(String inputFormat)

Sets the data format for the input data on which the cryptographic operation will be performed. Uses the specified format when decoding the data.

Parameters

Name	Type	Description
inputFormat	String	Format of the input data. Valid values: • FORMATTED: Formatted to the Key Management Framework (KMF) specifications. • KMFBASE64: Base64 encoded. • KMF_GLIDE_ENCRYPTER_FORMATTED: Support decryptions of both KMF encrypted values and GlideEncrypter encrypted values. • KMFNONE: No encoding. Default: Value determined by the operation specified when the KMFCryptoOperation object was instantiated. For more information, see KMFCryptoOperation - KMFCryptoOperation(String cryptoModuleName, String operationName).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This example uses *withInputFormat()* to change the input format to have no encoding.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_ENCRYPTI
ON").withInputFormat("KMFNone");
var result = op.doOperation("Text with no encoding"); // Pass in
 unencrypted String
```

This example uses *withInputFormat()* to change the input format to KMF_GLIDE_ENCRYPTER_FORMATTED.

```
var encryptOp = new
 sn_kmf_ns.KMFCryptoOperation("<module_name>",
 "SYMMETRIC_DECRYPTION")
 .withInputFormat("KMF_GLIDE_ENCRYPTER_FORMATTED")
 .withOutputFormat("KMFNone");

var clear_text = encryptOp.doOperation(<encrypted_text>);
```

KMFCryptoOperation - withOutputFormat(String outputFormat)

Sets the data format of the output data that is returned by the cryptographic operation. Uses the specified format when encoding the data.

Parameters

Name	Type	Description
outputFormat	String	Format of the output data. Valid values: • FORMATTED: Formatted to the Key Management Framework (KMF) specifications. • KMFBASE64: Base64 encoded. • KMFNONE: No decoding. Only supported for MAC_VERIFICATION and SIGNATURE_VERIFICATION. Default if this method is not called: Value determined by the operation specified when the KMFCryptoOperation object was instantiated. For more information, see KMFCryptoOperation - KMFCryptoOperation(String cryptoModuleName, String operationName).

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example uses *withOutputFormat()* to set the output format of the decryption to KMFNone (default is KMFBase64.)

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_DECRYPTI
ON").withOutputFormat("KMFNone");
var clear_data = op.doOperation(<FORMATTED_data>); // Pass in
 default of FORMATTED data
```

KMFCryptoOperation - withOutputType(String outputType)

Sets the data type for the output data returned after the cryptographic operation is performed.

Note: When you instantiate the KMFCryptoOperation object for *MAC_VERIFICATION* or *SIGNATURE_VERIFICATION* operations, you must also call this method, passing boolean, to set the correct output type or an exception is thrown when you execute the operation.

Parameters

Name	Type	Description
outputType	String	Type of output data. Not all output types are applicable to all operations. For an unsupported type, an exception is thrown. Valid values (not case-sensitive): • String: Not valid for *MAC_VERIFICATION* or *SIGNATURE_VERIFICATION* operations. • Boolean: Only valid for *MAC_VERIFICATION* or *SIGNATURE_VERIFICATION* operations. • Payload: Only valid for the *ASYMMETRIC_ENCRYPTION* operation. Use this output type for EC-IES. **Note:** When specifying an output of `Payload`, the output of the *doOperation()* method is a KMFEncryptionPayload object. For more information on the structure of this object, see withAdditionalInput(). Default: Value determined by the operation, specified when the KMFCryptoOperation object was instantiated. For more information, see KMFCryptoOperation - KMFCryptoOperation(String cryptoModuleName, String operationName).

Returns

Type	Description
None	

This example uses *withOutputType()* to set the output type for MAC_VERIFICATION to Boolean.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","MAC_VERIFICATION")
  .withOutputType("Boolean").withAdditionalInput(<MAC>);
var value = GlideStringUtil.base64Encode("Text to sign"); //
 Default input type is KMFBase64
var result = op.doOperation(String(value));
```

KMFCryptoOperation - withSysId(String sysId)

Sets the sys_id of the key to wrap on the KMFCryptoOperation object. Applicable to symmetric and asymmetric wrapping of keys.

Parameters

Name	Type	Description
sysId	String	Sys_id of the key to wrap. Located in the Module Key [sys_kmf_module_key] table.

Returns

Type	Description
None	

This example uses *`withSysId()`* to define the key to wrap.

```
var op = new
 sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_WRAPPING
").withSysId("0d06ce525b231010f86d1b341d81c777");
var wrappedKey = operation.doOperation(); // No need to pass
 data when using withSysId()
```

LeadtoCashCore - Scoped

The *`LeadtoCashCore`* script include provides methods to orchestrate a lead-to-cash workflow in the Lead to Cash Core life cycle.

The Lead to Cash Core (com.snd.l2c.core) plugin must be activated for *`LeadtoCashCore`* script includes to be available in an instance. This script include belongs to the sn_l2c_core namespace and requires the admin role.

In a lead to cash workflow, you map a source entity to a target entity. An entity is defined as a collection of tables. Source-to-target mapping allows you to transform the structure or content of the source entity to fit the structure or content needed in the target entity. The functionality provided by this script include represents the entity mapping feature available in the Lead to Cash feature. See Sales and Order Management workflows for more information.

To complete a workflow using the *`LeadtoCash`* script include, you pass return parameters from one method to the next. Typically, you call these methods in the following order:

1. LeadtoCashCore - createInstance(String headerSysIDs, String lineSysIDs, Boolean isTarget, Object additionalParams) - Fetches the data of a given entity. For example, customer order-related information including line items and their related data.

   Use the *`context`* parameter to declare one or more header or line IDs in the script. For such multi-select use cases, the output JSON contains a key items array where each entry represents a single entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. LeadtoCashCore - delta(Object sourceJSON, Object dirtyJSON, Object additionalParams) - Compares two JSON inputs and identifies any changes that occurred between them. For example, when something is added, deleted, or modified in an entity.
3. LeadtoCashCore - effect(Object sourceJSON, Object targetJSON, Object additionalParams) - Transforms the source JSON target into a target object.
4. LeadtoCashCore - commitInstance(Object targetJSON, Object additionalParams) - Commits the transformation made in the *effect()* script include to the database.

Note: If necessary, *delta()* may be skipped in this workflow. However, calling these methods out of order results in an unsuccessful workflow (for example, when calling *commitInstance()* and then *effect()*).

Prerequisites

Each of these methods are bundled with an extension point, sn_l2c_core.LeadToCashServiceEP. *PrimitiveUtil()* is a utility which provides methods to get the extension point service and invokes the script includes according to their available parameters. You must first provide *PrimitiveUtil()* with the *getPrimitivesEPService()* method, which specifies the table to get source and target information from. For more information, see LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context). Once *PrimitiveUtil()* and *getPrimitivesEPService()* are provided in the script, you can then call any of the *createInstance()*, *delta()*, *effect()*, or *commitInstance()* script includes as needed for your use case.

Example Lead to Cash Core workflow script

Though each of the available Lead to Cash Core script includes are documented individually, you can reference the following example to see how you can use these methods together to produce a Lead to Cash work flow.

```
var util = new sn_l2c_core.PrimitiveUtil();

var context = {"isMultiSelect": false}; // Set the
 context.isMultiSelect parameter as true to enable multi-select
 use cases

//Flow: Creation of Order from a sold product
var service =
 util.getPrimitivesEPService('sn_l2c_cust_flows_sp_to_order',
 context);

//CREATE INSTANCE to get the data of sold product with sys_id
 '06670ba3c3adbd501caee74bb0013166'
var SPInstance = service.createInstance(null,
 '06670ba3c3adbd501caee74bb0013166');
gs.info("SPInstance: "+JSON.stringify(SPInstance));

// DELTA
// construct the dirtyJSON as required
var deltaOutput = service.delta(SPInstance, dirtyJSON);/
gs.info("deltaOutput: "+JSON.stringify(deltaOutput));

// EFFECT
var effectOutput = service.effect(deltaOutput);
gs.info("effectOutput: " + JSON.stringify(effectOutput));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// COMMIT INSTANCE
var commitOutput = service.commitInstance(effectOutput);
gs.info("commitOutput: " + JSON.stringify(commitOutput));
```

In our example, a customer purchased a sold product but now requests a modification on the existing sold product. The required modifications are provided in the form of a dirtyJSON. To apply these modifications, we call the Lead to Cash Core methods in the following order:

1. The first call gets the existing sold product information using the *createInstance()* method.
2. We then compare this source JSON with the dirty JSON using the *delta()* method, which returns a delta JSON.
3. The *delta()* JSON is then transformed into a JSON of type order using the *effect()* method.
4. The order JSON is committed to the database using the *commitInstance()* method.

LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context)

Triggers the *PrimitiveUtil()* utility method.

To use any of the available methods in the *LeadtoCashCore* script include, you must first always call the scripted extension point *PrimitiveUtil()* in your script with the *getPrimitivesEPService()* utility method to trigger the implementation.

Parameters

Name	Type	Description
context	Object	Optional. Additional parameter options for displaying attribute values and for invoking more than one instance at a time. `"context": { "isMultiSelect": "Boolean" "loadDisplayValue": "Boolean" }`
context.isMultiSelect	Boolean	Optional. Flag that indicates whether to pass multiple entities as input to create the instance. Valid values: • true: Enables the passing of multiple entities as input. When true, you can pass multiple line items in a comma-separated list. • false: Doesn't enable the passing of multiple entities as input. Only one input may be passed in the API script. Default: false
context.loadDisplayValue	Boolean	Optional. Flag that indicates whether to load the display value for each attribute. Valid values: • true: Enables the loading of an attribute's display value. • false: Doesn't enable the loading of an attribute's display value.

Parameters (continued)

Name	Type	Description
		Default: false
sourceToTargetConfigID	String	Mapping configuration ID for the source-to-target mapping. Table: Lead To Cash Entity Mapping [sn_l2c_core_entity_mapping]

Returns

Type	Description
None	

The following example invokes *PrimitiveUtil()* and picks an implementation based on sn_l2c_cust_flows_sp_to_order, which is a Mapping Config ID in the Lead To Cash Entity Mapping [sn_l2c_core_entity_mapping] table.

```
//Utility to invoke createInstance API
var util = new sn_l2c_core.PrimitiveUtil();
var context = {"isMultiSelect": true}; // Set the
 context.isMultiSelect parameter as true to enable multi-select
 use cases

//Invokes the extension point and specifies an implementation
 based on sourceToTargetConfigID of a L2C flow.
var service =
 util.getPrimitivesEPService('sn_l2c_cust_flows_sp_to_order',
 context)
```

LeadtoCashCore - createInstance(String headerSysIDs, String lineSysIDs, Boolean isTarget, Object additionalParams)

Returns the data of one or more given entities with a JSON object containing various details such as header, lines, child lines, characteristics, and their attributes.

Use the output JSON of the *createInstance()* method in subsequent methods of the Lead to Cash Core workflow such as *delta()*, *effect()*, and *commitInstance()*.

Note: The *LeadtoCashCore* script include requires you to first call the script utility method *PrimitiveUtil()* with the LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context) utility method to trigger the implementation before calling *createInstance()* in your script. Per each flow, get the service only once and use the same service for all *LeadtoCashCore* methods.

Set the *getPrimitivesEPService()* boolean parameter *context.isMultiSelect* to true to enable *createInstance()* to pass multiple, comma-separated headerIDs or lineIDs at a time. Otherwise, you can only pass one ID at a time. See LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context) for more details. The single headerID use case with multiple lineIDs is supported without setting *context.isMultiSelect* to true.

Parameters

Name	Type	Description
additionalParams	Object	Optional. Additional parameters to use.
additionalParams.skipLines	Boolean	Optional. Flag that indicates whether to fetch line items for the specified entity. Valid values: • true: Skip returning line items information for the entity. • false: Return line items information for the entity. Default: false
headerSysIDs	String	Header sys_id(s) of an entity to retrieve data from. Required if you don't provide the *`lineSysIDs`* parameter. Pass `null` if you aren't passing any header sys_ids. To designate one or more header sys_ids in your script, set `context.isMultiSelect = true` in the *`getPrimitivesEPService()`* utility method. For more details, see the Parameters table in LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context). **Note:** At least one *`headerSysID`* or *`lineSysIDs`* parameter is required.
isTarget	Boolean	Optional. Flag that determines whether to fetch target entity data. Valid values: • true: Fetch data of the target entity. • false: Don't fetch data of the target entity. Default: false
lineSysIDs	String	Line item sys_id(s) of an entity to retrieve entity data from. Required if you don't provide *`headerSysIDs`* and if the entity structure starts with line items such as sold product. To designate one or more line item sys_ids in your script, set `context.isMultiSelect = true` in the *`getPrimitivesEPService()`* utility method. For more details, see the Parameters table in LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context). **Note:** At least one *`headerSysID`* or *`lineSysIDs`* parameter is required. If passing multiple *`lineSysIDs`*, all records must belong to the same *`headerSysID`*.

Returns

Type	Description
JSON Object	A JSON containing details of the entity record. Data type: Array of objects `{ "items": [ { "attributes": {Object}, "sys_id": {Object}, "table": "String", "lineItems": [ { "attributes": {Object}, "sys_id": {Object}, "table": "String", "characteristics": [Array], "lineItems": [Array] } ], "characteristics": [Array], "_state": "String" } ] }`
_state	Activity state of the entity. Possible values: • active: The entity is active. • inactive: The entity is inactive. Default: active Data type: String
characteristics	List of entity characteristics. Characteristics may vary between entities. Data type: Array of objects `"characteristics": [ { "attributes": {Object}, "sys_id": {Object}, "table": "String" } ]`
characteristics.attributes	One or more objects that contain information about attributes associated with the characteristic record. The <attribute type> can be different values based on the records/functionality associated with the characteristic. For example, this object could contain references

Returns (continued)

Type	Description
	to the attributes record's sys_id, associated characteristic records, characteristic option records, or sold product information. Data type: Object `"attributes": { "<attribute_type>": {Object} }`
characteristics.attributes.<attribute_type>	Information about the key name of the item attribute. `"<key_name>": { "value": "String" }` Data type: Object
characteristics.attributes.<attribute_type>.<key_name>	Typically the sys_id of the associate attribute record, but can be any meaningful text string that describes the associated attribute type. Data type: String
characteristics.sys_id	Object containing the sys_id of the associated characteristic record. Data type: Object `"sys_id": { "value": "String" }`
characteristics.sys_id.value	Sys_id of the associated characteristic record. Data type: String
characteristics.table	Name of the table that contains the characteristic record of the lead to cash entity. Data type: String
items	Contains an array of selected objects when *`context.isMultiSelect`* is set to true. Data type: Array of Objects `"items": [ { "attributes": {Object}, "sys_id": {Object}, "table": "String", "lineItems": [Array] }, ]`
items.attributes	Attributes of the item record. Attributes may vary between entities.

Returns (continued)

Type	Description

	<pre>"attributes": {
	  "account": {Object},
	  "name": {Object}
	}</pre>
	Data type: Object

items.attributes.account	Information about the account associated with the item attribute.
	<pre>"account": {
	  "value": "String"
	}</pre>

items.attributes.account.attribute	Attributes of the item. Attributes may vary between entities.
	<pre>"attributes": {
	  "account": {Object},
	  "<key_name>": {Object}
	}</pre>
	Data type: Object

items.attributes.<key_name>	Information about the key name of the item attribute.
	<pre>"<key_name>": {
	  "value": "String"
	}</pre>
	Data type: Object

items.attributes.<key_name>.value	Value of the key name attribute. Data type: String

items.sys_id	Object containing sys_id information about the entity item. Values vary between entities.
	
	Data type: Object
	<pre>"sys_id": {
	  "value": "String"
	}</pre>

items.sys_id.value	Sys_id of an associated item. Data type: String
items.table	Name of the table that contains line item record associated with the lead to cash entity. Data type: String
items.lineItems	JSON object that contains the line item details of the entity record. Data type: Array of objects

items.lineItems.sys_id	Object containing sys_id information about the associated line item record.
	
	Data type: Object
	<pre>"sys_id": {
	"value": "String"
	}</pre>

items.lineItems.sys_id.value	Sys_id of an associated line item record. Data type: String
items.lineItems.table	Name of the table that contains the line item record associated with the lead to cash entity. Data type: String

The example script below invokes the *createInstance()* method to load the data of a sold product, its entire hierarchy, and its characteristics.

```
//Utility to invoke createInstance API
var util = new sn_l2c_core.PrimitiveUtil();

//Invoke extension point, picks an implementation based on
 sourceToTargetConfigID of a L2C flow, the Mapping Config ID  in
 "sn_l2c_core_entity_mapping" table.
var service =
 util.getPrimitivesEPService('sn_l2c_cust_flows_sp_to_order');

//Invoke createInstance API with required params
var SPInstance = service.createInstance(null,
 '4e03cda2ec87310f87727ef5883a2cf');

//Print the returned JSON
gs.info("SPInstance: "+JSON.stringify(SPInstance));

//The returned JSON can be used for subsequent methods of the
 flow such as delta(), effect() and commitInstance()
```

Output:

```
{
  "lineItems": [
    {
```

```
      ]
    }
  ]
}
```

Example: Multi-select

The following script demonstrates how to use *isMultiSelect* to invoke the *createInstance()* method and load the data of two sold products with their entire hierarchy and characteristics.

```
//Utility to invoke createInstance API
var util = new sn_l2c_core.PrimitiveUtil();

//Set context variable isMultiSelect true to enable multi-select
var context = {"isMultiSelect": true};
//Invoke extension point, picks an implementation based on
 sourceToTargetConfigID of a L2C flow, the Mapping Config ID  in
 “sn_l2c_core_entity_mapping” table.
var service =
 util.getPrimitivesEPService('sn_l2c_cust_flows_sp_to_order’,
 context);

//Multiple sold products selected
var selectedLineitems =
 '4e03cda2ec87311Of87727ef5883a2cf,036a2349284d0210f877b68370fb2
e93';

//Invoke createInstance API with required params
var SPInstance = service.createInstance(null,
 selectedLineitems);

//Print the returned JSON
gs.info("SPInstance: "+JSON.stringify(SPInstance));

//The returned JSON can be used for subsequent APIs of the flow
 such as Delta, Effect and Commit Instance
```

Response:

```
{
  "items": [
    {
      "lineItems": [
        {
          "table": "sn_install_base_sold_product",
          "sys_id": {
            "value": "4e03cda2ec87311Of87727ef5883a2cf"
          },
          "attributes": {

LeadtoCashCore - delta(Object sourceJSON, Object dirtyJSON, Object additionalParams)

Compares the source and modified source JSON objects of a lead to cash entity and returns a JSON object that describes any changes made to the source JSON, such as any additions, deletions, or modifications.

Note: The *LeadtoCashCore* script include requires you to first call the scripted extension point *PrimitiveUtil()* with the LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context) utility method to trigger the implementation before calling *delta()* in your script. Per each flow, get the service only once and use the same service for all *LeadtoCashCore* methods.

Parameters

Name	Type	Description
sourceJSON	Object	JSON object of the source lead to cash entity. **Note:** Use the LeadtoCashCore - createInstance(String headerSysIDs, String lineSysIDs, Boolean isTarget, Object additionalParams) method to retrieve the source JSON of an entity.
dirtyJSON	Object	Modified source JSON of the lead to cash entity.
additionalParams	Object	Optional. Additional parameters to use.
additionalParams.delta_ignore_attributes	Object	The attributes to ignore during comparison between the source and dirtyJSON. Enables support of reconfiguration#use cases. `{ "<table_name>": [<attribute_name1>, attribute_name2>] }`
additionalParams.delta_ignore_attributes.<table_name>	String	The name of the table and its associated attributes to ignore. For example: `{ "sn_install_base_sold_product": ["state","unit_price"] }`
additionalParams.loadDisplayValue	Boolean	Optional. Flag that indicates whether to load the display value for each attribute. Valid values: • true: Enables the loading of an attribute's display value. • false: Doesn't enable the loading of an attribute's display value.

Parameters (continued)

Name	Type	Description
		Default: false

Returns

Type	Description
JSON Object	An object containing details of the entity record with any changes that occurred between the sourceJSON and dirtyJSON. Data type: Object `{ "lineItems": [Array] }`
lineItems	JSON object that contains the line item details of the entity record. For example, order line items or quote line items. Data type: Array of objects `"lineItems": [ { "_action": "String", "attributes": {Object} "characteristics": [Array] "lineItems": [Array], "sys_id": {Object}, "table": "String" } ]`
lineItems._action	Change action applied to the line item of the source JSON. Possible values: • add: Information was added to the source JSON. • change: Information was updated in the source JSON. • disconnect: Information was disconnected from the source JSON. • nochange: No change occurred on the source JSON. Data type: String
lineItems.attributes	Attributes of the line item. For example, the attribute's name and value. May contain varying fields based on the entity. Data type: Object `"attributes": { "<attribute_name>": {Object} }`
lineitems.attributes.<attribute_name>	Name of the line item attribute. For example, the name of an account or contact. May contain varying fields of the entity.

Returns (continued)

Type	Description
	Data type: Object `"attributes": { "<attribute_name>": { "value": "String" } }`
lineitems.attributes.<attribute_name>.value	Value of the line item attribute. Data type: String
lineItems.attributes.account	Information about the account associated with the item attribute. Data type: Object `"account": { "value": "String" }`
lineItems.attributes.account.sys_id	Sys_id of the account associated with the line item attribute. Data type: String
lineItems.characteristics	Characteristics of the line item. May contain varying fields based on the entity. Data type: Array of Objects `"characteristics": [ { "attributes": {Object}, "sys_id": {Object}, "table": "String" } ]`
lineItems.characteristics.attributes	Attributes of the header record characteristics. For example, the attribute's name and value. May contain varying fields based on the entity. Data type: Object `"attributes": { "<field_name>": { "value": "String" }}`
lineitems.characteristics.attributes.<field_name>	Attributes and values of the characteristic record associated with the line item. Data type: Object

Returns (continued)

Type	Description

	<pre>"<field_name>": {
	  "value": "String"
	}</pre>

lineItems.characteristics.value	Value of the field_name_value pair belonging to the characteristic record of an entity. Data type: String

lineItems.characteristics.sys_id	Sys_id object of the characteristic record.
	
	Data type: Object
	<pre>"sys_id": {
	  "value": "String"
	}</pre>

lineItems.characteristics.sys_id.value	Sys_id value of the associated characteristic record. The updated table may vary between entities. For example, Order [sn_ind_tmt_orm_order]. Data type: String
lineItems.characteristics.table	Table name of the characteristic record. Data type: String

lineItems.lineItems	Child line items of a parent line item. This object has the same format as the *lineItems* parameter.
	
	Data type: Array of Objects
	<pre>"lineItems": [
	 {
	  "_glide_action": "String",
	  "attributes": {Object},
	  "characteristics": [Array],
	  "lineItems": [Array],
	  "sys_id": {Object},
	  "table": "String"
	 }
	]</pre>

lineItems.sys_id	Sys_id of the associated item record.
	
	Data type: Object
	<pre>"sys_id": {
	  "value": "String"
	}</pre>

lineItems.sys_id.value	Sys_id of an associated item record. The updated table may vary between entities, like Order or Specification. For example, Order [sn_ind_tmt_orm_order].

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
lineItems.table	Name of the table that contains the item record associated with the lead to cash entity. Data type: String

The following example demonstrates how to call the *delta()* method by first calling the *PrimitiveUtil* utility method and *getPrimitiesEPService()*, and then providing the source and target JSON objects.

```
//Utility to invoke Delta API
var util = new sn_l2c_core.PrimitiveUtil();

//Invoke extension point, picks an implementation based on
 sourceToTargetConfigID of a L2C flow, the Mapping Config ID  in
 “sn_l2c_core_entity_mapping” table.
var service = util.getPrimitivesEPService('sp_order_macd');

//Invoke delta API with required params
// sourceJSON can be the output of createInstance or null
//dirtyJSON is the modified sourceJSON
var deltaOutput= service.delta(sourceJSON, dirtyJSON);

//Print the returned JSON
gs.info(" deltaOutput: "+JSON.stringify(deltaOutput));

//The returned JSON can be used for subsequent APIs of the flow
 such as Effect and Commit Instance
```

The output JSON shows that several line items were added to the sold base product:

```
{
  "lineItems": [
    {
      "table": "sn_install_base_sold_product",
      "sys_id": {
        "value": "-1"
      },
      "attributes": {
        "name": {
          "value": "Quadplay Home Tech Hub Bundle"
        },
        "account": {
          "value": "9e2fd2ee11b43110f877366201dea674"
        }
      },
      "lineItems": [
        {
          "table": "sn_install_base_sold_product",
          "sys_id": {
            "value": "-1"
          },
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "attributes": {
          "name": {
            "value": "Internet and OTT Bundle"
          },
          "account": {
            "value": "9e2fd2ee11b43110f877366201dea674"
          }
        },
        "lineItems": [
          {
            "table": "sn_install_base_sold_product",
            "sys_id": {
              "value": "-1"
            },
            "attributes": {
              "name": {
                "value": "Solana Sports streaming channel"
              },
              "account": {
                "value": "9e2fd2ee11b43110f877366201dea674"
              }
            },
            "lineItems": [],
            "characteristics": [],
            "_action": "add"
          }
        ],
        "characteristics": [],
        "_action": "add"
      }
    ],
    "characteristics": [
      {
        "table": "sn_prd_pm_product_characteristics",
        "sys_id": {
          "value": "-1"
        },
        "attributes": {
          "characteristic_value": {
            "value": ""
          },
          "characteristic": {
            "value": "4f31999fd0a63110f8770dbf976be178"
          },
          "characteristic_option": {
            "value": "4f31999fd0a63110f8770dbf976be179"
          },
          "sold_product": {
            "value": "4e03cda2ec873110f87727ef5883a2cf"
          },
          "action": {
            "value": "add"
          }
        },
        "_action": "add"
      }
    ],
```

```
      "_action": "add"
    }
  ]
}
```

Example: Multi-select

The following example shows how to form the multi-select *delta()* method by first calling *PrimitiveUtil* and *getPrimitivesEPService* and then providing the source and target JSON objects for multiple line or header IDs. Per each flow, get the service only once and use the same service for all the *LeadtoCashCore* methods.

```
/Utility to invoke Delta API
var util = new sn_l2c_core.PrimitiveUtil();

//Set context variable isMultiSelect true to enable multi-select
var context = {"isMultiSelect": true};

//Invoke extension point, picks an implementation based on
 sourceToTargetConfigID of a L2C flow, the Mapping Config ID  in
 “sn_l2c_core_entity_mapping” table.
var service =
 util.getPrimitivesEPService(‘sn_l2c_cust_flows_sp_to_order’,
 context);

//Invoke delta API with required params
// sourceJSON can be the output of createInstance for multiple
 lineIDs or headerIDs or null
//dirtyJSON is the modified sourceJSON
var deltaOutput= service.delta(sourceJSON, dirtyJSON);

//Print the returned JSON
gs.info(" deltaOutput: "+JSON.stringify(deltaOutput));

//The returned JSON can be used for subsequent APIs of the flow
 such as Effect and Commit Instance
```

The output JSON shows that several line items were added to the sold base product:

```
{
  "items": [
    {
      "lineItems": [
        {
          "table": "sn_install_base_sold_product",
          "sys_id": {
            "value": "4e03cda2ec87311Of87727ef5883a2cf"
          },
          "attributes": {
            "name": {
              "value": "Quadplay Home Tech Hub Bundle"
            },
            "account": {
              "value": "9e2fd2ee11b43110f877366201dea674"
            }
          },
          "lineItems": [
```

      }
    ]
}
```

LeadtoCashCore - effect(Object sourceJSON, Object targetJSON, Object additionalParams)

Transforms and applies the source JSON structure of a given entity to the target JSON of another entity. You can then commit the changed entity to the database using the *commitInstance()* method.

You can use the output JSON of the *delta()* method in the *effect()* request. Then, commit any *effect()* JSON output to the database using the *commitInstance()* to complete the lead to cash workflow.

Note: The *LeadtoCashCore* script include requires you to first call the scripted extension point *PrimitiveUtil()* with the LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context) utility method to trigger the implementation before calling *effect()* in your script. Per each flow, get the service only once and use the same service for all *LeadtoCashCore* methods.

Parameters

Name	Type	Description
sourceJSON	Object	JSON containing details of the source entity. **Note:** Use the LeadtoCashCore - createInstance(String headerSysIDs, String lineSysIDs, Boolean isTarget, Object additionalParams) to retrieve the source JSON of an entity.
targetJSON	Object	JSON containing details of the target entity.
additionalParams	Object	Optional. Additional parameters to use.
additionalParams.isFeature_state	Boolean	Optional. Use this to support reconfiguration use cases. Accepted values: • true: Provides context variable keys instead of dictionary field names. This allows you to provide all the attributes from the target entity instead of mapping attributes from source to target. • false: Provides dictionary field names. Default: false

Returns

Type	Description
JSON Object	Change that occurred and was applied from the source to target entity JSON objects at each of the header of the lead to cash entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Object `{ "_glide_action": "String", "_source_object": {Object}, "lineItems": [Array] "sys_id": "String", "table": "String" }`
_glide_action	Indicates the change that occurred at the item level between the source and target JSON. Possible values (case-sensitive): • DELETE: Information was removed between the source and target JSON structures. • INSERT: Information was added between the source and target JSON structures. • NO_CHANGE: No change occurred between the source and target JSON structures. • UPDATE: Information was modified between the source and JSON structures. Data type: String
lineItems	Line items of an entity. For example, order line items or quote line items. Data type: Array of Objects `"lineItems": [ { "table": "String", "sys_id": {Object}, "attributes": {Object} }, "_action": "String", "_state": {Object}, "lineItems": [Array], "characteristics": [Array] } ]`
lineItems._glide_action	Change action that occurred on the line item. Possible values: • DELETE: Information was removed between the source and target JSON structures. • INSERT: Information was added between the source and target JSON structures.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• NO_CHANGE: No change occurred between the source and target JSON structures. • UPDATE: Information was modified between the source and JSON structures. Data type: String
lineItems._source_object	Source entity record details to which the _glide_action was applied. This object may vary between entities. Data type: Object `"_source_object": { "sys_id": "String", "table": "String" }`
lineItems._source_object.sys_id	Sys_id of the source entity record that was updated. Data type: String
lineItems._source_object.table	Table location of the source entity record that was updated. This value may vary between entities. Data type: String
lineItems._state	State of the entity. Data type: Object `"_state": { "value": "String" }`
lineItems._state.value	The current state of the entity. Possible values: • active: The entity object is in an active state. • inactive: The entity object isn't in an active state. Data type: String
lineItems.attributes	Attributes of the line item. For example, the attribute's name and value. May contain varying fields based on the entity. Data type: Object `"attributes": { "<attribute_name>": {Object} }`
lineitems.attributes.<attribute_name>	Name of the line item attribute. For example, the name of an account or contact. May contain varying fields of the entity.

Returns (continued)

Type	Description
	Data type: Object `"attributes": { "<attribute_name>": { "value": "String" } }`
lineitems.attributes.<attribute_name>.value	Value of the line item attribute. Data type: String
lineItems.attributes.account	Information about the account associated with the item attribute. Data type: Object `"account": { "value": "String" }`
lineItems.attributes.account.value	Sys_id of the account associated with the line item attribute. Data type: String
lineItems.attributes.short_description	A brief description of the line item attribute. Data type: String
lineItems.characteristics	List of characteristics associated with the line item. Characteristics may vary between entities. Data type: Array of Objects `"characteristics": [ { "_glide_action: "String", "attributes": {Object}, "sys_id": {Object}, "table": "String" } ]`
lineitems.characteristics._glide_action	Action applied to the characteristic record belonging to the line item. Possible values: • add: Information was added to the characteristic. • change: Information was updated on the characteristic. • disconnect: Information was disconnected from the characteristic. • no-change: No change occurred to the characteristic. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
lineItems.characteristics.attributes	Attributes are objects that contain information about attributes associated with the characteristic record. The *<attribute type>* value can contain different values based on the records or functionality associated with the characteristic. For example, this object could contain references to the attributes record's sys_id, associated characteristic records, accounts or contacts, characteristic option records, or sold product information. Data type: Object `"attributes": { "<attribute_type>": {Object} }`
lineItems.characteristics.attributes.<attribute_type>	Value of the attribute type value. Data type: String
lineitems.characteristics.attributes.<field_name>	Attributes and the name of the characteristic record associated with the line item. Data type: Object `"<field_name>": { "value": "String" }`
lineitems.characteristics.attributes.<field_name>.value	Value of the field name belonging to the characteristic record of an entity. Data type: String
lineItems.characteristics.sys_id	Sys_id of the associated characteristic record. Data type: Object `"sys_id": { "value": "String" }`
lineItems.characteristics.sys_id.value	Sys_id value of the associated characteristic record. The updated table may vary between entities. For example, Order [sn_ind_tmt_orm_order]. Data type: String
lineItems.characteristics.table	Table name of the characteristic record. Data type: String
lineItems.lineItems	Child line items of a parent line item. This object has the same format as the *lineItems* parameter. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"lineItems": [
	  {
	  "_glide_action": "String",
	  "attributes": {Object},
	  "characteristics": [Array],
	  "lineItems": [Array],
	  "sys_id": {Object},
	  "table": "String"
	  }
	]</pre>

lineItems.sys_id	Sys_id of the associated item record.
	
	Data type: Object
	<pre>"sys_id": {
	  "value": "String"
	}</pre>

lineItems.sys_id.value	Sys_id of an associated item record. The updated table may vary between entities, like Order or Specification. For example, Order [sn_ind_tmt_orm_order]. Data type: String
lineItems.table	Name of the table that contains the item record associated with the lead to cash entity. Data type: String
sys_id	Sys_id of the entity. Data type: String
table	Name of the table in which the entity is found. Data type: String

The following example shows how to apply transformation logic using the output of the *`delta()`* method:

Note: The same script is applicable for both single select and multi-select use cases, as just the source JSON format changes and the output remains the same for both. For multi-select use cases, a single header is created with all the line items added to the same header.

```
//Utility to invoke effect API
var util = new sn_l2c_core.PrimitiveUtil();

//Invoke extension point, picks an implementation based on
 sourceToTargetConfigID of a L2C flow, the Mapping Config ID  in
 “sn_l2c_core_entity_mapping” table.
var service = util.getPrimitivesEPService('sp_order_macd');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
//Invoke effect API with required params
var effectOutput = service.effect(deltaOutput, null);

//Print the returned JSON
gs.info("effectOutput: " + JSON.stringify(effectOutput));

//The returned JSON can be used in the subsequent
 commitInstance() method.
```

Output:

```
{
  "sys_id": "-1",
  "table": "sn_ind_tmt_orm_order",
  "_glide_action": "INSERT",
  "_source_object": {},
  "lineItems": [
    {
      "sys_id": "-1",
      "table": "sn_ind_tmt_orm_order_line_item",
      "attributes": {

LeadtoCashCore - commitInstance(Object targetJSON, Object additionalParams)

Commits the JSON of a given lead to cash entity to the instance, returns a status message with updated information, and updates the Lead to Cash Core Entity table as a result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note: The *LeadtoCashCore* script include requires you to first call the scripted extension point *PrimitiveUtil()* with the LeadtoCashCore - getPrimitivesEPService(String sourceToTargetConfigID, Object context) utility method to trigger the implementation before calling *commitInstance()* in your script. Per each flow, get the service only once and use the same service for all *LeadtoCashCore* methods.

Parameters

Name	Type	Description
targetJSON	Object	JSON object containing the 'glide_action' of a target entity to commit. You can pass the output of the effect() method here. **Note:** 'glide_action' identifies the change action that occurred between the source and target JSON of a lead to cash entity.
additionalParams	Object	Optional. Additional parameters to use. **Note:** Additional parameters for *commitInstance()* are not available until a later release.

Returns

Type	Description
JSON Object	Details about the target entity record. Data type: Object `{ "dataObject": {Object}, "displayMessage":"String", "error": "String", "headerID": "String", "message": "String", "rootLineIDs": [Array], "status": "String" }`
dataObject	JSON object that contains detailed data on the commit operations performed at each level. Data type: Object `"dataObject": { "_commitObjectInfo": {Object}, "_glide_action": "String", "_source_object": {Object}, "lineItems": [Array], "sys_id": "String", "table": "String" }`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
dataObject._commitObjectInfo	JSON object that contains each object's commit status and sys_id if the line item change is an INSERT action. Data type: Object `"_commitObjectInfo": { "status": "String", "sys_id": "String" }`
dataObject._commitObjectInfo.status	Status of the commit operation performed on the particular entity. Possible values: • success: The entity commit operation was successful. • failure: The entity commit operation wasn't successful. Data type: String
dataObject._commitObjectInfo.sys_id	Sys_id of the inserted record. The API returns this parameter only if the *dataObject._glide_action* is INSERT. The updated table may vary between entities. For example, Order [sn_ind_tmt_orm_order]. Data type: String
dataObject._glide_action	Change action that occurred on the line item. Possible values: • DELETE: Information was removed between the source and target JSON structures. • INSERT: Information was added between the source and target JSON structures. • NO_CHANGE: No change occurred between the source and target JSON structures. • UPDATE: Information was modified between the source and target structures. Data type: String
dataObject._source_object	Source JSON object to which changes were applied. The object structure may vary between entities. Data type: Object `"_source_object": { "sys_id": "String", "table": "String" }`
dataObject._source_object.sys_id	Sys_id of the source entity record to which the _glide_action was applied. The updated table may vary between entities. For example, Order [sn_ind_tmt_orm_order].

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
dataObject._source_object.table	Name of the table of source entity record to which the _glide_action was applied. This may vary between entities. Data type: String
dataObject.lineItems	Line item details of the entity record. For example, order line items or quote line items. Data type: Array of Objects `"lineItems": [ { "_action": "String", "_commitObjectInfo": {Object}, "_glide_action": "String", "_source_object": {Object}, "_state": "String", "attributes": {Object}, "characteristics": [Array], "lineItems": [Array], "sys_id": {Object}, "table": "String", } ]`
dataObject.lineItems._action	Change action applied to the line item of the source JSON. Possible values: • add: Information was added to the source JSON. • change: Information was updated in the source JSON. • disconnect: Information was disconnected from the source JSON. • nochange: No change occurred on the source JSON. Data type: String
dataObject.lineItems._commitObjectInfo	Returned if the line item change is an `INSERT` action. Contains the object's commit status and sys_id. Data type: Object `"_commitObjectInfo": { "status": "String", "sys_id": "String" }`
dataObject.lineItems._commitObjectInfo.status	Status of the commit operation performed on the particular entity. Possible values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• success: The entity commit operation was successful. • failure: The entity commit operation wasn't successful. Data type: String
dataObject.lineItems._sys_id	Sys_id of the inserted record. The updated table may vary between entities. For example, Order [sn_ind_tmt_orm_order]. Data type: String
dataObject.lineItems._glide_action	Change action that occurred on the line item. Possible values: • DELETE: Information was removed between the source and target JSON structures. • INSERT: Information was added between the source and target JSON structures. • NO_CHANGE: No change occurred between the source and target JSON structures. • UPDATE: Information was modified between the source and JSON structures. Data type: String
dataObject.lineItems._source_object	Source entity record details to which the _glide_action was applied. This object may vary between entities. Data type: Object `"_source_object": { "sys_id": "String", "table": "String" }`
dataObject.lineItems._source_object.sys_id	Sys_id of the source entity record to which the _glide_action was applied. Data type: String
dataObject.lineItems._source_object.table	Table_object name of the source entity record to which the _glide_action was applied. Data type: String
dataObject.lineItems._state	State of the object. Possible values: • active: The entity object is in an active state. • inactive: The entity object isn't in an active state.

Returns (continued)

Type	Description
	Data type: String

dataObject.lineItems.attributes	Attributes of the line item. For example, the attribute's name and value. May contain varying fields based on the entity.
	
	Data type: Object
	
	`"attributes": {`
	`  "<attribute_name>": {Object}`
	`}`

dataObject.lineItems.attributes.<attribute_name>	Name of the line item attribute. For example, the name of an account or contact. May contain varying fields of the entity.
	
	Data type: Object
	
	`"attributes": {`
	`  "<attribute_name>": {`
	`  "value": "String"`
	`  }`
	`}`

dataObject.lineItems.attributes.<attribute_name>.value	Value of the line item attribute. Data type: String

dataObject.lineItems.characteristics	List of characteristics associated with the line item. Characteristics may vary between entities.
	
	Data type: Array of Objects
	
	`"characteristics": [`
	`  {`
	`  "_glide_action: "String",`
	`  "attributes": {Object},`
	`  "sys_id": {Object},`
	`  "table": "String"`
	`  }`
	`]`

dataObject.lineItems.characteristics._glide_action	Change action that occurred on the line item. Possible values: • DELETE: Information was removed between the source and target JSON structures. • INSERT: Information was added between the source and target JSON structures. • NO_CHANGE: No change occurred between the source and target JSON structures. • UPDATE: Information was modified between the source and JSON structures.

Returns (continued)

Type	Description
	Data type: String
dataObject.lineItems.characteristicAttributes	Characteristic attributes that contain information about attributes associated with the characteristic record. The *<attribute type>* value can contain different values based on the records or functionality associated with the characteristic. For example, this object could contain references to the attributes record's sys_id, associated characteristic records, accounts or contacts, characteristic option records, or sold product information. Data type: Object `"attributes": { "<attribute_type>": {Object} }`
dataObject.lineItems.characteristicAttributes.<attribute_type>	Name of the characteristic attribute. May contain varying fields of the entity. Data type: Object `"attributes": { "<attribute_name>": { "value": "String" } }`
dataObject.lineItems.characteristicAttributes.<attribute_type>.value	Value of the attribute. Data type: String
dataObject.lineItems[0].sys_id	Sys_id of the associated characteristic record. Data type: Object `"sys_id": { "value": "String" }`
dataObject.lineItems[0].sys_id.value	Sys_id value of the associated characteristic record. The updated table may vary between entities. For example, Order [sn_ind_tmt_orm_order]. Data type: String
dataObject.lineItems[0].characteristicTable	Characteristic table. Data type: String
dataObject.lineItems[0].childLineItems	Child line items of a parent line item. This object has the same format as the *lineItems* parameter. Data type: Array of Objects

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	"lineItems": [
	{
	"_glide_action": "String",
	"attributes": {Object},
	"characteristics": [Array],
	"lineItems": [Array],
	"sys_id": {Object},
	"table": "String"
	}
	]

dataObject.lineItems[0].sys_id	Sys_id of the associated item record.
	
	Data type: Object
	"sys_id": {
	"value": "String"
	}

dataObject.lineItems[0].sys_id.value	Sys_id value of an associated item record. The updated table may vary between entities, like Order or Specification. For example, Order [sn_ind_tmt_orm_order]. Data type: String
dataObject.lineItems[0].table	Name of the table that contains the item record associated with the lead to cash entity. Data type: String
dataObject.sys_id	Sys_id of the associated item record. The updated table may vary between entities. For example, Order [sn_ind_tmt_orm_order]. Data type: String
dataObject.table	Name of the table that contains the record of the lead to cash entity. Data type: String
displayMessage	Message that is displayed to the user in the UI. The display message is identical to the *`message`* string value. Data type: String
error	Error message that describes the failure of the *`commitInstance`* method. If the request is successful, this parameter returns an empty string. Data type: String
headerID	Sys_id of the target entity record created or updated by the *`commitInstance`* method. Stored in: The related table depending on the entity type, like sold product, order, etc.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
message	Message describing the success, error, or partially_success scenarios. This message is same as *displayMessage* string value and can be used by other application calls to the API. Data type: String
rootLineIDs	Comma-separated list of sys_ids of the target entity records inserted, updated, or deleted by the *commitInstance* method. Stored in: The related table depending on the entity type, like sold product, order, etc. Data type: Array of Strings
status	Status message confirming the success of the commit. Possible values: • success: The commit was successful. • failure: The root line or header glide operation failed. Retrigger the Lead to Cash Core API flow. • partial_success: There were failures while processing the entire JSON. Refer to processing logs to troubleshoot specific errors. Data type: String

The following example shows how to use each *LeadtoCashCore* method to retrieve, apply, and commit the details of a source-to-target entity. In this example, the commitInstance() method is used to commit the changed JSON to a lead to cash entity on the instance.

```
//Utility to invoke commitInstance API
var util = new sn_l2c_core.PrimitiveUtil();

//Invokes the PrimitiveUtil extension point, picks an
 implementation based on sourceToTargetConfigID of a
 Lead to Cash (L2C) flow. The Mapping Config ID  in
 “sn_l2c_core_entity_mapping” table.
var service = util.getPrimitivesEPService('sp_order_macd');

//Invoke commitInstance API with the required params
var commitOutput = service.commitInstance(effectOutput);

//Print the returned JSON
gs.info("commitOutput: "+JSON.stringify(commitOutput));
```

Output:

```
{
  "status": "success",
  "error": "",
  "message": "Commit operation successfully processed.",
```

```

Line - Scoped, Global

Creates a Line object using methods to draw a line in a PDF.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

Line - Line()

Instantiates a new *`Line`* object.

Parameters

Name	Type	Description
None		

The following examples shows how to create a *`Line`* object.

```
var line = new sn_pdfgeneratorutils.Line();
```

Line – drawLine(Document document, Number pageNo, Number xPos, Number yPos, Number width, Number lineWidth)

Places a line on a document page.

Parameters

Name	Type	Description
Document	Document	Name of the document object.
pageNo	Number	Page number on which you want to place the line.
xPos	Number	X-coordinate area of the page on which to place the line.
yPos	Number	Y-coordinate area of the page on which to place the line.
width	Number	Width area of the page in which you want to draw the line. Values are in points.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
lineWidth	Number	Optional. Value of line thickness in points. Default: 1

Returns

Type	Description
None	

The following example shows how to create a line at the lower margin of a document page. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var num = 1;
var xpos = 100;
var ypos = 100;
var width = 450;
var linewidth = 2.5;

document.addNewPage();

var line = new sn_pdfgeneratorutils.Line();

line.drawLine(document, num, xpos, ypos, width, linewidth);

document.saveAsAttachment("incident", "<sys_id>", "line.pdf");
```

Line – setColor(Color color)

Sets the color of a line.

Parameters

Name	Type	Description
color	Color	Line color.

Returns

Type	Description
None	

The following example shows how to create a line and set its color in a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var num = 1;
var xpos = 100;
var ypos = 100;
var width = 450;
var linewidth = 2.5;

var color = new sn_pdfgeneratorutils.Color([0.5,0.5,0.8]);
  //given as array of RGB values;

document.addNewPage();

var line = new sn_pdfgeneratorutils.Line();

line.setColor(color);

line.drawLine(document, num, xpos, ypos, width, linewidth);

document.saveAsAttachment("incident", "<sys_id>",
 "lineWithColor.pdf");
```

LinterCheckAstNode - Scoped, Global

The *LinterCheckAstNode* API provides methods for getting abstract syntax tree (AST) node details in linter checks.

This API is included with the Instance Scan (com.glide.instance_scan) plugin and runs in the `sn_instance_scan` namespace. For more information, see Instance Scan.

Use the methods in this class to run linter checks on AST node types by adding code to the **Script** field in the Linter Check form. For more information, see Advanced linter check scripts.

Create a linter check to identify any issues in a script. When a linter check is run on a record, an abstract syntax tree for its code is generated. You can use the abstract syntax tree to analyze issues with the code.

Access methods in this API using the Instance Scan *engine.rootNode* object.

LinterCheckAstNode - getNameIdentifier()

Retrieves the string value of a name node type. A name node represents a simple identifier that is not a keyword, such as a function or variable name.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	If the linter object is a name node type, return the name as a string. Null otherwise.

The following example uses the *Findings* API incrementWithNode() method in a linter check. Use this method in the Script field of the Linter Check form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
(function(engine) {
  engine.rootNode.visit(function(node) {
    if (node.getTypeName() === "NAME" &&
        node.getNameIdentifier() === "soughtFunction" &&
        node.getParent().getTypeName() === "CALL") {
      engine.finding.incrementWithNode(node);
    }
  });
})(engine);
```

LinterCheckAstNode - getParent()

Gets the parent node object of the accessed node.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Parent node object of the accessed node.

The following example uses the *Findings* API incrementWithNode() method in a linter check. Use this method in the Script field of the Linter Check form.

```
(function(engine) {
  engine.rootNode.visit(function(node) {
    if (node.getTypeName() === "NAME" &&
        node.getNameIdentifier() === "soughtFunction" &&
        node.getParent().getTypeName() === "CALL") {
      engine.finding.incrementWithNode(node);
    }
  });
})(engine);
```

LinterCheckAstNode - getTypeName()

Gets the type of the accessed node.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Type name of the accessed node. For example, a function call in the source is tokenized as a node with the type name of CALL.

```
(function(engine) {
  engine.rootNode.visit(function(node) {
    if (node.getTypeName() === "NAME" &&
        node.getNameIdentifier() === "soughtFunction" &&
        node.getParent().getTypeName() === "CALL") {
      engine.finding.incrementWithNode(node);
    }
  });
})(engine);
```

LinterCheckAstNode - visit(Function callbackFunction)

Accesses each node in the subtree starting from this node and executes a given callback function on each node.

Parameters

Name	Type	Description
callbackFunction	Function	Callback function to be executed on each node in the subtree of this node. This callback function takes a node as a parameter which is the node to be visited.

Returns

Type	Description
None	

The following example uses the *Findings* API incrementWithNode() method in a linter check. Use this method in the Script field of the Linter Check form.

```
(function(engine) {
  engine.rootNode.visit(function(node) {
    if (node.getTypeName() === "NAME" &&
        node.getNameIdentifier() === "soughtFunction" &&
        node.getParent().getTypeName() === "CALL") {
      engine.finding.incrementWithNode(node);
    }
  });
})(engine);
```

logger - Global

The *logger* API provides inbound email actions that append messages to the email log.

It provides methods that add information, warning, and error messages. The added message has its source set to `email.<Sys ID of incoming email>`.

logger - log(String msg)

Appends the specified message to the email log.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
msg	String	Text to append to the email log. These should be information type messages.

Returns

Type	Description
void	

This code example queries email from the sys_user table and then calls the appropriate logger method based on the sender information.

```
var grUser = new GlideRecord("sys_user");
grUser.addQuery("email", email.from);
grUser.query();
  if (grUser.next()) {
    if (grUser.user_name) {
      logger.log("Sender found: " + email.from); //Append
 information message to the email log
      createInc(grUser.sys_id);
    } else {
        logger.logWarning("Sender: " + email.from + " " + "found
 but no userID found, please take necessary actions"); //Append
 warning message to the email log.
        createInc(grUser.sys_id);
    }
  } else {
      logger.logError("Sender is not present in the system hence
 action aborted"); //Append error message to the email log.
      current.setAbortAction(true);
  }
```

logger - logError(String msg)

Appends the specified error message to the email log file.

Parameters

Name	Type	Description
msg	String	Error message to append to the email log

Returns

Type	Description
void	

This code example queries email from the sys_user table and then calls the appropriate logger method based on the sender information.

```
var grUser = new GlideRecord("sys_user");
grUser.addQuery("email", email.from);
grUser.query();
```

```
 if (grUser.next()) {
   if (grUser.user_name) {
     logger.log("Sender found: " + email.from); //Append
information message to the email log
     createInc(grUser.sys_id);
   } else {
       logger.logWarning("Sender: " + email.from + " " + "found
but no userID found, please take necessary actions"); //Append
warning message to the email log.
       createInc(grUser.sys_id);
   }
 } else {
     logger.logError("Sender is not present in the system hence
action aborted"); //Append error message to the email log.
     current.setAbortAction(true);
 }
```

logger - logWarning(String msg)

Appends the specified warning message to the email log file.

Parameters

Name	Type	Description
msg	String	Warning message to append to the email log

Returns

Type	Description
void	

This code example queries email from the sys_user table and then calls the appropriate logger method based on the sender information.

```
var grUser = new GlideRecord("sys_user");
grUser.addQuery("email", email.from);
grUser.query();
  if (grUser.next()) {
    if (grUser.user_name) {
      logger.log("Sender found: " + email.from); //Append
 information message to the email log
      createInc(grUser.sys_id);
    } else {
        logger.logWarning("Sender: " + email.from + " " + "found
 but no userID found, please take necessary actions"); //Append
 warning message to the email log.
        createInc(grUser.sys_id);
    }
  } else {
      logger.logError("Sender is not present in the system hence
 action aborted"); //Append error message to the email log.
      current.setAbortAction(true);
  }
```

LSOFParser - Global

The `LSOFParser` script include provides methods to parse the output of the `lsof` command: `lsof -i4TCP -n -P -F pcnfT`.

Use this script include with a discovery script when you need to parse `lsof` output.

LSOFParser - error(String msg)

Generates the specified error message.

Parameters

Name	Type	Description
msg	String	The error message

Returns

Type	Description
void	

LSOFParser - initFileDescriptor()

Initializes the file descriptor process.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

LSOFParser - initProcess()

Initializes the parser process.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

LSOFParser - on_c(String line)

Sets the current command.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
line	String	The command

Returns

Type	Description
void	

LSOFParser - on_endFileDescriptor()

Closes the file descriptor process.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

LSOFParser - on_endProcess()

Closes the parser process.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

LSOFParser - on_f(String line)

Sets the current file descriptor.

Parameters

Name	Type	Description
line	String	The file descriptor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

LSOFParser - on_n(String line)

Sets the current address.

Parameters

Name	Type	Description
line	String	The address

Returns

Type	Description
void	

LSOFParser - on_p(String line)

Sets the current PID.

Parameters

Name	Type	Description
line	String	The PID

Returns

Type	Description
void	

LSOFParser - on_T(String line)

Sets the current state.

Parameters

Name	Type	Description
line	String	The state

Returns

Type	Description
void	

LSOFParser - parse(String lsofOutput)

Parses the specified `lsof` output.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results are available in connections and listeners arrays, and errors are recorded in *`errorString()`* and *`isValid()`*.

Parameters

Name	Type	Description
lsofOutput	String	The `lsof` output

Returns

Type	Description
void	

Messaging - Scoped

The *`Messaging`* API provides methods to perform actions in a third-party messaging application.

This class requires the Messaging Notification plugin (com.glide.notification.messaging) and an integration with a third-party messaging application such as Slack or Teams. Use these methods in an action script in the Message Actions [messaging_observer_handler] table.

Use the `sn_notification` namespace to access the *`Messaging`* API.

Messaging - send(GlideRecord messagingApplication, String recipient, GlideRecord messagingContent, GlideRecord target)

Sends a custom message to a third-party application in response to a messaging event. For example, you can send a custom welcome message to a Slack channel when the Now Actions application installs.

Use this method in an action script in the Message Actions [messaging_observer_handler] table.

Parameters

Name	Type	Description
messagingApplication	GlideRecord	Third-party application to send a message to from the Messaging Entities [messaging_application] table.
recipient	String	Recipient of the message. When the instance receives an inbound message, you can send a response to a Slack channel, Team, or individual user ID found in the inbound payload.
messagingContent	GlideRecord	Message content to send from the Messaging Contents [messaging_content] table.
target	GlideRecord	Record used to define dynamic field values in the message. Table must match the **Target table** field in the Messaging Contents record. If the Messaging Contents record does not use a target table, set the value to null.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
//Send a message to a Teams user
var app = new GlideRecord('messaging_application');
app.get('1f2d26527f4213007f005212bdfa9102');

var content = new GlideRecord('messaging_content');
content.get('17f1f9617320130082999cfd7bf6a706');

sn_notification.Messaging.send(app,
 '29:1ojsgDg1xuA_jZ7OPDI2_6E7mn7P6Mc0wK7zOn2lblL-SaNXYVI1cR7i6qn
cllAGvdmhy2-kXh76IEVpUHXdz3w', content, null);

//Send a message to a Slack user
var app = new GlideRecord('messaging_application');
app.get('5d2e38c07f6113007f005212bdfa9160');

var content = new GlideRecord('messaging_content');
content.get('69c48ba77310130082999cfd7bf6a7af');

sn_notification.Messaging.send(app, 'U8P706QFQ', content, null);

//Send a message to a Slack channel
var app = new GlideRecord('messaging_application');
app.get('5d2e38c07f6113007f005212bdfa9160');

var content = new GlideRecord('messaging_content');
content.get('69c48ba77310130082999cfd7bf6a7af');

sn_notification.Messaging.send(app, 'CA6232N65', content, null);
```

MetricInfo - Scoped, Global

The *`MetricInfo`* API provides methods to check if a metric is in the MetricBase database, and if so, to report its retention policy. Retention policies are reported in minutes.

You can call this class in scoped and global server scripts. When using the *`MetricInfo`* class, use the `sn_clotho` namespace identifier.

This class is part of the MetricBase application.

MetricInfo – MetricInfo(String table, String metric)

Creates an instance of the *`MetricInfo`* class.

Parameters

Name	Type	Description
table	String	Metric table name listed in the Time Series Metrics [sys_metric] table.
metric	String	Metric field name listed in the Time Series Metrics [sys_metric] table. This field name must be mapped to the table name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to construct a *MetricInfo* object with the Altitude (mb_demo_mt_altitude) metric associated with the Drones [mb_demo_drone] table.

```
var metricInfo =  new
 sn_clotho.MetricInfo('mb_demo_drone','mb_demo_mt_altitude');
```

MetricInfo – getRetentionSchedulesInMinutes()

Gets the retention policy schedules of the specified metric.

See also MetricBase retention policies.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	JSON object containing key-value pairs that represent the retention policy schedules (in minutes) for the specified metric listed in the Retention Policies [sys_metric_retention_policy] table. For each retention policy schedule belonging to the metric, the object contains a corresponding key-value pair that maps the retention duration to the sampling period. • Key – Retention duration of the retention policy schedule in minutes. Data type: String • Value – Sampling period of the retention policy schedule in minutes. Data type: Number `"<retentionDuration>": <samplingPeriod>`

The following example shows how to loop over the retention policy schedules and compile a log message. The message contains the retention durations converted from minutes to days with their corresponding sampling periods.

```
// Function to convert minutes to days
function toDays(minutes) {
 return minutes / 60 / 24;
};

var metricInfo = new
 sn_clotho.MetricInfo('mb_demo_drone','mb_demo_mt_altitude');
var schedules = metricInfo.getRetentionSchedulesInMinutes();
var log = '';

// Compiles a log message with retention schedules
for (var duration in schedules) {
 log += "Retention duration is: " + toDays(duration) +
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 " days, Sampling period is: " + schedules[duration] + "
 minutes\n";
}

gs.info(log);
```

Output:

```
Retention duration is: 8 days, Sampling period is: 1 minutes
Retention duration is: 94 days, Sampling period is: 10 minutes
Retention duration is: 397 days, Sampling period is: 60 minutes
```

MetricInfo – isValid()

Indicates whether the specified metric is mapped to the table defined in a *MetricInfo* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the metric specified in a *MetricInfo* object is mapped to the specified table. Valid values: • true: Specified metric is valid. • false: Specified metric or table either does not exist or the metric is not mapped to the table.

The following example shows how to check if the Altitude (mb_demo_mt_altitude) metric is in the Drones [mb_demo_drone] table, and return its retention schedule if it is. The example output reflects the policy duration in minutes mapped to its interval sampling period.

```
var metricInfo =  new
 sn_clotho.MetricInfo('mb_demo_drone','mb_demo_mt_altitude');
if (metricInfo.isValid())
{
  var retentionSchedules =
 metricInfo.getRetentionSchedulesInMinutes();
  gs.info(JSON.stringify(retentionSchedules, null, 2));
}
else
{
  gs.info("metricInfo is invalid");
}
```

Output:

```
{
  "11520": 1,
  "135360": 10,
```

```
  "571680": 60
}
```

MIDServer - Global

The *MIDServer* script include provides methods to encapsulate the notion of a MID Server.

Use these methods in server scripts to manage a MID Server using Ajax.

MIDServer - getByName(String name)

Returns the specified MID server.

Parameters

Name	Type	Description
name	String	The MID server name

Returns

Type	Description
GlideRecord	The record of the requested MID server.

The following example shows how to access and display mid server details.

```
// Get a mid server object by name
var ms = MIDServer.getByName("windows_mid");

// Stringify the object for display purposes
gs.info(JSON.stringify(ms, null, 2));

// Show the value of each API property
gs.info('hostmane ' + ms.hostname);
gs.info('hostOS ' + ms.hostOS);
gs.info('ip ' + ms.ip);
gs.info('name ' + ms.name);
gs.info('routerIP ' + ms.routerIP);
gs.info('status ' + ms.status);
gs.info('sysID ' + ms.sysID);
gs.info('url ' + ms.url);
gs.info('version ' + ms.version);
gs.info('windowsDomain ' + ms.windowsDomain);
```

Output:

```
*** Script: {
  "valid": true,
  "sysID": "3cb25f0f874b3410c3a99999cebb35ba",
  "name": "windows_mid",

*** Script: url null
*** Script: version fixed
*** Script: windowsDomain null
```

MIDServer - getDefault(DiscoverySchedule schedule)

Returns the MID server associated with the specified schedule (the MID server with the same name). If there is no associated MID server, gets the next MID server in the ecc_agent table.

Parameters

Name	Type	Description
schedule	DiscoverySchedule	The discovery schedule

Returns

Type	Description
GlideRecord	The MID server

MIDServer - getForPing(DiscoverySchedule schedule, DiscoveryRange range)

Returns the MID Server with the specified schedule and range set.

Parameters

Name	Type	Description
schedule	DiscoverySchedule	The discovery schedule
range	DiscoveryRange	The discovery range set

Returns

Type	Description
GlideRecord	The MID server

MIDServer - hostname

The name of the MID server's host.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
hostname	String	The name of the MID server's host.

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would
 return the Host OS of the MID Server Record
var midServerIP = getMIDServerAttributes.ip; //would return the
 IP of the MID Server Record
var midServerName = getMIDServerAttributes.name; //would return
 the Name of the MID Server Record
var midServerRouterIP = getMIDServerAttributes.routerIP; //would
 return the router IP of the MID Server Record
var midServerStatus = getMIDServerAttributes.status; //would
 return the status of the MID Server Record (UP or Down)
var midServerSysID = getMIDServerAttributes.sysID; // Would
 return the Sys ID of the MID server record
var midServerURL = getMIDServerAttributes.url; // Would return
 the URL of the MID server record
var midServerVersion = getMIDServerAttributes.version; // Would
 return ServiceNow release version of the MID server record
var midServerwindowsDomain =
 getMIDServerAttributes.windowsDomain; // Would return windows
 domain of the MID server record

gs.info("\nMID Server Host Name - "+ midServerHostname +"\nMid
 Server Host OS - " + midServerHostOS + "\nMID Server IP - "+
 midServerIP + "
\nMID Server Name - " + midServerName + "\nMID Server Router

q

MIDServer - hostOS

The operating system of the MID server's host.

Field

Name	Type	Description
hostOS	String	The operating system of the MID server's host.

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would
 return the Host OS of the MID Server Record
var midServerIP = getMIDServerAttributes.ip; //would return the
 IP of the MID Server Record
var midServerName = getMIDServerAttributes.name; //would return
 the Name of the MID Server Record
var midServerRouterIP = getMIDServerAttributes.routerIP; //would
 return the router IP of the MID Server Record
var midServerStatus = getMIDServerAttributes.status; //would
 return the status of the MID Server Record (UP or Down)
var midServerSysID = getMIDServerAttributes.sysID; // Would
 return the Sys ID of the MID server record
var midServerURL = getMIDServerAttributes.url; // Would return
 the URL of the MID server record
var midServerVersion = getMIDServerAttributes.version; // Would
 return ServiceNow release version of the MID server record
var midServerwindowsDomain =
 getMIDServerAttributes.windowsDomain; // Would return windows
 domain of the MID server record

gs.info("\nMID Server Host Name - "+ midServerHostname +"\nMid
 Server Host OS - " + midServerHostOS + "\nMID Server IP - "+
 midServerIP + "
\nMID Server Name - " + midServerName + "\nMID Server Router

```
MID Server SYS ID - <mid_sys_id>
MID Server URL - null
MID Server Version - fixed
MID Server Windows Domain - null
```

MIDServer - ip

The IP address of the MID server's host.

Field

Name	Type	Description
ip	String	The IP address of the MID server's host.

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would
 return the Host OS of the MID Server Record
var midServerIP = getMIDServerAttributes.ip; //would return the
 IP of the MID Server Record
var midServerName = getMIDServerAttributes.name; //would return
 the Name of the MID Server Record
var midServerRouterIP = getMIDServerAttributes.routerIP; //would
 return the router IP of the MID Server Record
var midServerStatus = getMIDServerAttributes.status; //would
 return the status of the MID Server Record (UP or Down)
var midServerSysID = getMIDServerAttributes.sysID; // Would
 return the Sys ID of the MID server record
var midServerURL = getMIDServerAttributes.url; // Would return
 the URL of the MID server record
var midServerVersion = getMIDServerAttributes.version; // Would
 return ServiceNow release version of the MID server record
var midServerwindowsDomain =
 getMIDServerAttributes.windowsDomain; // Would return windows
 domain of the MID server record

gs.info("\nMID Server Host Name - "+ midServerHostname +"\nMid
 Server Host OS - " + midServerHostOS + "\nMID Server IP - "+
 midServerIP + "

MID Server Router IP - 10.11.111.1
MID Server Status - Up
MID Server SYS ID - <mid_sys_id>
MID Server URL - null
MID Server Version - fixed
MID Server Windows Domain - null
```

MIDServer - network

The network containing the MID server's host.

Field

Name	Type	Description
network	String	The network containing the MID server's host. For example, "10.10.10.0/24" or "10.10.10.0/255.255.255.0".

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would
 return the Host OS of the MID Server Record
var midServerIP = getMIDServerAttributes.ip; //would return the
 IP of the MID Server Record
var midServerName = getMIDServerAttributes.name; //would return
 the Name of the MID Server Record
var midServerRouterIP = getMIDServerAttributes.routerIP; //would
 return the router IP of the MID Server Record
var midServerStatus = getMIDServerAttributes.status; //would
 return the status of the MID Server Record (UP or Down)
var midServerSysID = getMIDServerAttributes.sysID; // Would
 return the Sys ID of the MID server record
var midServerURL = getMIDServerAttributes.url; // Would return
 the URL of the MID server record
var midServerVersion = getMIDServerAttributes.version; // Would
 return ServiceNow release version of the MID server record

```

MIDServer - routerIP

The IP address of the MID server host's default router.

Field

Name	Type	Description
routerIP	String	The IP address of the MID server host's default router.

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would
 return the Host OS of the MID Server Record
var midServerIP = getMIDServerAttributes.ip; //would return the
 IP of the MID Server Record
var midServerName = getMIDServerAttributes.name; //would return
 the Name of the MID Server Record
var midServerRouterIP = getMIDServerAttributes.routerIP; //would
 return the router IP of the MID Server Record
var midServerStatus = getMIDServerAttributes.status; //would

MID Server Status - Up
MID Server SYS ID - <mid_sys_id>
MID Server URL - null
MID Server Version - fixed
MID Server Windows Domain - null
```

MIDServer - url

The URL the MID server uses to contact the instance.

Field

Name	Type	Description
url	String	The URL the MID server uses to contact the instance.

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would

MID Server Status - Up
MID Server SYS ID - <mid_sys_id>
MID Server URL - null
MID Server Version - fixed
MID Server Windows Domain - null
```

MIDServer - version

Version of the MID server (WAR name).

Field

Name	Type	Description
version	String	Version of the MID server (WAR name).

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would
 return the Host OS of the MID Server Record
var midServerIP = getMIDServerAttributes.ip; //would return the
 IP of the MID Server Record
var midServerName = getMIDServerAttributes.name; //would return
 the Name of the MID Server Record
var midServerRouterIP = getMIDServerAttributes.routerIP; //would
 return the router IP of the MID Server Record
```

MID Server Status - Up
MID Server SYS ID - <mid_sys_id>
MID Server URL - null
MID Server Version - fixed
MID Server Windows Domain - null
```

MIDServer - windowsDomain

Windows domain of the MID server's host (if it is a Windows machine).

Field

Name	Type	Description
windowsDomain	String	The Windows domain of the MID server's host.

The following example shows how to execute and return all parameters of an available Mid server.

```
var getMIDServerAttributes = new MIDServer(<mid_sys_id>); //Pass
 the sys id of the MID server record
var midServerHostname = getMIDServerAttributes.hostname; //would
 return the Host name of the MID Server Record
var midServerHostOS = getMIDServerAttributes.hostOS; // would
 return the Host OS of the MID Server Record
var midServerIP = getMIDServerAttributes.ip; //would return the
 IP of the MID Server Record
```

```

Output:

```
MID Server Host Name - midSvrName.service-now.com
Mid Server Host OS - Windows
MID Server IP - 10.11.999.999
MID Server Name - Windows MID
MID Server Router IP - 10.11.111.1
MID Server Status - Up
MID Server SYS ID - <mid_sys_id>
MID Server URL - null
MID Server Version - fixed
MID Server Windows Domain - null
```

MIDServerAjax - Global

The *MIDServerAjax* script include provides AJAX functionality for sending a test probe to a MID Server

Use in server scripts to test a MID Server using AJAX.

MIDServerAjax - MIDServerAjax()

Creates an instance of MIDServerAjax.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MIDServerAjax - ajaxFunction_testProbe()

Sends a test probe to the MID server.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contains the agent name, test probe ID, topic, name, and source.

```
var msaj = new MIDServerAjax();
msaj.ajaxFunction_testProbe();
```

MIDServerCluster - Global

The *MIDServerCluster* script include provides methods to find MID Server clusters for a given MID Server and reassigns the jobs if necessary.

If the MID Server agent is up, this class gathers all MID Servers (including the original agent) in the load balance clusters that the original agent is part of. If the MID Server agent is down and the cluster is load balanced, the class gathers the other agents. If the server agent is down, and the cluster is failover, it gathers the next failover agent. The class then randomly returns the MID Server in the final list of MID Servers.

Use in server scripts to get MID Server cluster information.

MIDServerCluster - MIDServerCluster(GlideRecord agent)

Brief description of the method.

Parameters

Name	Type	Description
agent	GlideRecord	The MID server agent

Returns

Type	Description
void	

MIDServerCluster - clusterExists()

Determines if a cluster exists.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if a cluster exists; otherwise, false.

```
var midgr = new GlideRecord("ecc_agent");
midgr.addQuery("name", "al1winmid");
midgr.query();
midgr.next();

var mscl = new MIDServerCluster(midgr);
gs.print(mscl.clusterExists());
```

Output: true

MIDServerCluster - getClusterAgent()

Gets the cluster agent.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The agent name

```
// Assuming "mid1" and "mid2" are in a cluster
var midgr = new GlideRecord("ecc_agent");
midgr.addQuery("name", "mid1");
midgr.query();
midgr.next();

var mscl = new MIDServerCluster(midgr);
gs.print(mscl.getClusterAgent());
```

Output: mid2

MIDServerFileSync - Global

The *MIDServerFileSync* script include provides methods to check to see if there are any changes to attachments on tables that are instances of MID Server synchronized files (ecc_agent_sync_file) and, if so, notifies the MID Servers of a change.

The tables that extend the sync tables are MID Server JAR file (ecc_agent_jar) and MID Server MIB File (ecc_agent_mib).

Use in server scripts to notify MID Servers.

MIDServerFileSync - MIDServerFileSync()

Creates an instance of MIDServerFileSync.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

MIDServerFileSync - notifyMIDServers(String table)

Checks for any changes to attachments on the specified table that are instances of MID server synchronized files and, if so, notifies the MID servers of a change.

Parameters

Name	Type	Description
table	String	The table to check

Returns

Type	Description
void	

```
var msfs = new MIDServerFileSync();
msfs.notifyMIDServers('ex.table.name');
```

MIDServerFinder - Global

The `MIDServerFinder` script include provides methods to find a list of MID Servers for specified IP addresses.

Use in server scripts to get the MID Server list.

MIDServerFinder - MIDServerFinder()

Creates an instance of MIDServerFinder.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

MIDServerFinder - getMIDServers()

Gets the names of MID servers available for a given range and capability.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	An array of MID server names. If no MID servers are available, returns an empty array.

```
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
var msnames = msf.getMIDServers();

for(var i=0; i<msnames.length; i++) {
  gs.print(msnames[i]);
};
```

MIDServerFinder - getMIDServersBySysId()

Gets the sys_ids of MID servers available for a given range and capability.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of MID server sys_ids. If no MID servers are available, returns an empty array.

```
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
var msids = msf.getMIDServersBySysId();

for(var i=0; i<msids.length; i++) {
  gs.print(msids[i]);
};
```

MIDServerFinder - getStatusMessage()

Gets the state of the finder operation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The status message

```
var msf = new MIDServerFinder();
gs.print(msf.getStatusMessage());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MIDServerFinder - setActive(Boolean flag)

Sets whether to look for active or inactive MID servers. By default, searches are for active MID servers unless inactive is specified by this method.

Parameters

Name	Type	Description
flag	Boolean	If true, look for inactive MID servers. If false, do not look for inactive MID servers.

Returns

Type	Description
void	

```
var msf = new MIDServerFinder();
msf.setActive('true');
```

MIDServerFinder - setCapabilities(Array capabilities)

Sets the technologies for which to look.

Parameters

Name	Type	Description
capabilities	Array	Contains a list of capabilities, for example - `capabilities = ["ssh","wmi","snmp",{"os_domain":"disco"}, {"phase":1}];`

Returns

Type	Description
void	

```
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
var capab = ["ssh","wmi","snmp"];
msf.setCapabilities(capab);
```

MIDServerFinder - setDebug(Boolean onOrOff)

Turns debugging on or off.

Parameters

Name	Type	Description
onOrOff	Boolean	True to turn on debugging; false to turn debugging off.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var msf = new MIDServerFinder();
msf.setDebug('true');
```

MIDServerFinder - setRanges(String ranges)

Sets the range of IP addresses for which to look.

Parameters

Name	Type	Description
ranges	String	A comma-separated list in one of these formats. • IP addresses (10.10.10.1, 10.10.10.2) • IP networks (10.10.10.0/23) • IP ranges (10.10.10.1-10.10.11.254)

Returns

Type	Description
void	

```
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
```

MIDServerFinder - setRangesByIPOrHostname(String ipOrHostname)

Determines if the input is a single IP or a hostname, and passes the IP or multiple IPs to the setRanges() method.

If the value of ipOrHostname is an IP address, it is passed into the `setRanges()` method. It the value is a hostname, we look up the DNS table (cmdb_ip_address_dns_name) to try resolving the hostname. The result, either an IP or multiple IPs, is then passes into the `setRanges()` method.

Parameters

Name	Type	Description
ipOrHostname	String	The IP address, IP range, or host name.

Returns

Type	Description
void

```
var msf = new MIDServerFinder();
msf.setRangesByIPOrHostname('10.10.10.1-10.10.11.254');
```

MIDServerManage - Global

The *MIDServerManage* script include provides methods that allow you to manage a MID Server by sending messages to start, stop, upgrade, get logs, send test probes, and send system messages.

Use in server scripts to send messages to a MID Server.

MIDServerManage - MIDServerManage()

Creates an instance of MIDServerManage.

Parameters

Name	Type	Description
None		

MIDServerManage - grab_logs(String agentName, String logs)

Gets the logs for the specified MID server.

Parameters

Name	Type	Description
agentName	String	The MID server name
logs	String	The type of log to get (Optional)

Returns

Type	Description
String	The log message

```
var msm = new MIDServerManage();
msm.grab_logs('serv1');
```

Output: Background message, type:info, message: Grabbing MID Server Logs

MIDServerManage - restart(String agentName)

Restarts the specified MID server.

Parameters

Name	Type	Description
agentName	String	The MID server name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var msm = new MIDServerManage();
msm.restart('serv1');
```

MIDServerManage - stop(String agentName)

Stops the specified MID server.

Parameters

Name	Type	Description
agentName	String	The MID server name

Returns

Type	Description
void	

```
var msm = new MIDServerManage();
msm.stop('serv1');
```

MIDServerManage - system_msg(String agentName, String cmd, String name)

Creates a system message for the specified MID server.

Parameters

Name	Type	Description
agentName	String	The MID server name
cmd	String	The value of the probe source field
name	String	The name of the probe

Returns

Type	Description
void	

```
var msm = new MIDServerManage();
msm.test_probe('mid.server.serv1', 'command', 'probe_id');
```

MIDServerManage - text_probe(String agentName, String probeID, String topic, String ename, String source)

Sends a test probe for the specified MID server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
agentName	String	The MID server name
probeId	String	The ID of the probe to send
topic	String	The information for the topic field
ename	String	The name for the probe
source	String	The information for the source field

Returns

Type	Description
Object	The probe for the specified MID server

```
var msm = new MIDServerManage();
msm.test_probe('mid.server.serv1', 'probe_id', 'topic text',
 'name', 'source text');
```

MIDServerManage - upgrade(String agentName)

Upgrades the specified MID server.

Parameters

Name	Type	Description
agentName	String	The MID server name

Returns

Type	Description
void	

```
var msm = new MIDServerManage();
msm.upgrade('serv1');
```

MIDServerSelector - Global

The *`MIDServerSelector`* script include provides methods to find a MID Server based on capabilities and target IP address.

Use in server scripts to find a MID Server with specific capabilities.

MIDServerSelector - MIDServerSelector()

Creates an instance of MIDServerSelector.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

MIDServerSelector - findAgent(String target)

Finds the MID server based on the capabilities and target IP address.

Parameters

Name	Type	Description
target	String	The target IP address

Returns

Type	Description
void	

```
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
mss.findAgent('100.101.10.10');
```

MIDServerSelector - getError()

Gets the error messages for the current MID server.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
mss.findAgent('100.101.10.10');
mss.getError();
```

MIDServerSelector - getWarning()

Gets the warning messages for the current MID server.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
mss.findAgent('100.101.10.10');
mss.getWarning();
```

MIDServerSelector - setCapabilities(Array capabilities)

Sets the technologies for which to look.

Parameters

Name	Type	Description
capabilities	Array	A list of capabilities, for example - capabilities = ["ssh","wmi","snmp", {"os_domain":"disco"},{"phase":1}];

Returns

Type	Description
void	

```
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
```

MLPredictor - Global (deprecated)

The *`MLPredictor`* API provides utility methods for Predictive Intelligence predictions.

Note: This API has been deprecated and is intended to be removed in a future release. Refer to Using ML APIs for the most recent guidelines.

The *`MLPredictor`* API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

This class contains all methods necessary to get prediction results from input data.

MLPredictor - MLPredictor()

Instantiates a new MLPredictor object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

The following example shows how to use an MLPredictor object in a business rule to record final values after a prediction.

```
function executeRule(current, previous /*null when async*/) {
 var predictor = new MLPredictor();
 predictor.recordFinalValuesInPredictionResults(current, "On
 close");

}(current, previous);
```

MLPredictor - applyPrediction(GlideRecord now_GR, Array solutions)

Sets predicted values from an array of specified solutions to a specified record.

Parameters

Name	Type	Description
now_GR	GlideRecord	The record on which to apply the array of predicted solutions.
solutions	Array	Specified solution objects associated with the GlideRecord.

Returns

Type	Description
void	

The following example demonstrates using the applyPrediction() method in a business rule.

```
(function executeRule(current, previous /*null when async*/) {
    var mlPredictor = new MLPredictor();
    //Get the list of active solutions for the glide record
 table
    var solutions =
 mlPredictor.findActiveSolutionsForRecord(current);
    //Run prediction and apply predicted value to the record
    mlPredictor.applyPrediction(current, solution);

})(current, previous);
```

MLPredictor - applyPredictionForSolution(GlideRecord now_GR, Object solution)

Applies a predicted value from a specified classification solution to the specified GlideRecord.

For each solution in the GlideRecord, call this method to predict the results and set the field value on the incident to those results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord object containing values on which to run a prediction and apply the results.
solution	Object	Classification solution object to be executed.

Returns

Type	Description
Boolean	True upon prediction success, error otherwise.

To use this template, copy the Incident Based Prediction (Template) business rule, make the new record Active, and follow the commented instructions to initialize the solutionNames variable.

```
(function executeRule(current, previous /*null when async*/) {
 var solutionNames = ["solution1", "solution2", ...];

 /* For domain separation (MSP) use case */
// var solutionNames;
// if (current.sys_domain == "A")
//  solutionNames = ["solution_A1", "solution_A2", ...];
// else if (current.sys_domain == "B")
//  solutionNames = ["solution_B1", "solution_B2", ...];
// else
//  ...

 var predictor = new MLPredictor();
 var info = "";
 solutionNames.forEach(function(solutionName) {
  var solution = predictor.findActiveSolution(solutionName);
  if (!solution)
   return;

  /* The next line of code does the prediction and updates the
 current record. */
  predictor.applyPredictionForSolution(current, solution);

  /* If no prediction is done, do not build the prediction info
 message. */
  if (!predictor.applyPredictionForSolution(current, solution))
   return;

  /* If user doesn't have 'itil' role, we don't build prediction
 info message. */
  if (!gs.hasRole('itil'))
   return;

  /* Building prediction info message */
  var fieldName = solution.getPredictedField();
  var fieldLabel =
 current.getElement(fieldName).getED().getLabel();
  var predictedDisplayValue =
 current.getDisplayValue(fieldName);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 var msg = gs.getMessage("Predicted {0} for {1}.",
[predictedDisplayValue, fieldLabel]);
 if (info.length > 0)
  info += " ";
 info += msg;
});
/* Print out prediction info message on screen. */
if (info.length > 0) {
 var incidentUrl = "<a
href='"+current.getLink()+"'>"+current.number+":</a>";
 gs.addInfoMessage(incidentUrl + " " + info);
}
})(current, previous);
```

MLPredictor - findActiveSolution(String solutionName)

Gets the solution object.

This method only returns the solutions if the ml_solution definition and solution are active.

Parameters

Name	Type	Description
solutionName	String	Name of the ml_solution record.

Returns

Type	Description
Object	Solution object for the specified `solutionName` if the ml_solution definition and solution is active, null otherwise.

This example takes a hard-coded value and passes it to a specified Machine Learning model. You can use the outcome and confidence variables to set values or other business logic.

```
var solutionName = 'ml_incident_assignment';
  var shortDescriptionValue = "Unable to connect!"
  var input = {
  short_description : shortDescriptionValue
  };
  var MLP = new MLPredictor();
  var solution = MLP.findActiveSolution(solutionName);
  var predictedOutcome = solution.predictText(input);
  var outcome = predictedOutcome.predictedValue();
  var confidence = predictedOutcome.confidence();
  gs.info("Predicted value: " + outcome)
  gs.info("Confidence: " + confidence)
```

Output:

```
DxC_ML:
        ******* Finished Prediction********* *** Script:
 Predicted value: Software *** Script:
        Confidence: 80.78079080096245
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MLPredictor - findActiveSolutionsForRecord(GlideRecord now_GR)

Gets active solutions for a table in a specified GlideRecord.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord from which to collect active solution objects.

Returns

Type	Description
Array	Array of active solution objects associated with the table that the specified record is for.

This script passes a GlideRecord (such as an incident), and processes all solutions for the GlideRecord, returning the values for each.

```
/* This is only to get a hard-coded GR */
    var current = new GlideRecord('incident');
    current.get('965c9e5347c12200e0ef563dbb9a7156');
    var predictor = new MLPredictor();
    var solutions =
 predictor.findActiveSolutionsForRecord(current);
    solutions.forEach(function(solution) {
        var outcome = solution.predict(current);
        /* Use this to set the field to the predicted value in
 the GlideRecord */
        var fieldName = solution.getPredictedField();
        current[fieldName] = outcome.predictedValue();
        current.update();

        gs.info("Predicted value: " + outcome.predictedValue())
        gs.info("Confidence: " + outcome.confidence())
});
```

Output (Assignment Group prediction):

```
DxC_ML: ******* Finished Prediction*********
        *** Script: Predicted value: Software *** Script:
 Confidence:
       99.74530683715315
```

Output (Category prediction):

```
DxC_ML:
        ******* Finished Prediction********* *** Script:
 Predicted value: Software *** Script:
       Confidence: 98.7172805135524
```

MLPredictor - getPredictedValue(Object solution, Object outcome)

Gets the predicted value for a specified solution based on the specified prediction outcome.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
solution	Object	Solution from which to get the predicted value.
outcome	Object	Prediction outcome results for the specified solution (var outcome = solution.predict(now_GR)).

Returns

Type	Description
String	Predicted value for specified solution based on the specified outcome of the prediction.
Null	Returns null if the prediction confidence does not satisfy thresholds.

MLPredictor - getPredictions(GlideRecord now_GR, Object solution, Object options)

Gets predictions for a specified solution.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord to be predicted.
solution	Object	Solution object to be executed.
options	Object	Optional JSON object key value pair with the following properties: • options.top_n: If provided, returns results up to the expected number of predictions, otherwise default is read from the `glide.platform_ml.max_num_predictions` system property. • options.apply_threshold: Checks the threshold value (solution threshold for similarity, class level threshold for classification) for the solution and applies it to the result set. Default value is true.

Returns

Type	Description
Array	Array of predicted outcome objects

The following example calls a specified solution and executes predictions on it.

```
function printOutcomeArr(outcomeArr) {
gs.print('################### Results ###################');
for (var i=0; i<outcomeArr.length; i++) {
    var outcome = outcomeArr[i];
    gs.print((i+1) + ' : ' + outcome.predictedValue() + ', ' +
 outcome.predictedValueSysId() + ', ' + outcome.confidence());
}
}

var solutionName = 'ml_x_snc_global_prop_flip_test';
var predictor = new MLPredictor();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var solution = predictor.findActiveSolution(solutionName);

var now_GR = new GlideRecord('incident');
now_GR.get('1c741bd70b2322007518478d83673af3');

var options = {};
options.top_n = '10';            // top_n is an integer between
 1 and 1000
options.apply_threshold = false; // Value can be set to true or
 false

printOutcomeArr(predictor.getPredictions(now_GR, solution,
 options));
```

MLPredictor - isClassificationSolution(Object solution)

Identifies if a solution object is a classification type.

Parameters

Name	Type	Description
solution	Object	Name of the ML solution.

Returns

Type	Description
Boolean	Returns true if the input solution is a classification type, false otherwise.

```
var isClassificationSolution =
 this.isClassificationSolution(solution);

 //classification solution each class has different threshold
 //therefore needs to get all the results from ml engine
 if (applyThreshold && isClassificationSolution) {
  var maxClassificationTopN = 50;
  outcomeArr = solution.predictTopN(now_GR,
 maxClassificationTopN);
 }
 else  {
 outcomeArr = solution.predictTopN(now_GR, topN);
 }

 if (outcomeArr === null) {
  //instead of returning null returning empty array
  return [];
 }
```

MLPredictor - isSimilaritySolution(Object solution)

Identifies if a solution object is a similarity type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
solution	Object	Name of the ML solution; for example, ml_incident_categorization.

Returns

Type	Description
Boolean	Returns true if the input solution is a similarity type, false otherwise.

MLPredictor - outcome.confidence()

Gets the confidence of the predicted value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The estimated precision of the prediction as a percentage. For example, **53.84615375762915**.

```
var MLP = new MLPredictor();
  var solution = MLP.findActiveSolution(solutionName);
  var predictedOutcome = solution.predictText(input);
  var outcome = predictedOutcome.predictedValue();
  var confidence = predictedOutcome.confidence();
  gs.info("Predicted value: " + outcome)
  gs.info("Confidence: " + confidence)
```

MLPredictor - outcome.predictedValue()

Gets the predicted value from the MLPredictor outcome object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Predicted value from the Outcome object.

```
var MLP = new MLPredictor();
  var solution = MLP.findActiveSolution(solutionName);
  var predictedOutcome = solution.predictText(input);
  var outcome = predictedOutcome.predictedValue();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var confidence = predictedOutcome.confidence();
  gs.info("Predicted value: " + outcome)
  gs.info("Confidence: " + confidence)
```

MLPredictor - outcome.predictedValueSysId()

Gets the sys_id of the predicted value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Predicted value sys_id.

```
function printOutcomeArr(outcomeArr) {
gs.print('################## Results ##################');
for (var i=0; i<outcomeArr.length; i++) {
    var outcome = outcomeArr[i];
    gs.print((i+1) + ' : ' + outcome.predictedValue() + ', ' +
 outcome.predictedValueSysId() + ', ' + outcome.confidence());
}
```

MLPredictor - recordFinalValuesInPredictionResults(GlideRecord now_GR, String reason)

Sets final prediction result values to a specified GlideRecord with an optionally specified reason.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord on which to set the final prediction result values.
reason	String	Optional. Reason for applying results.

Returns

Type	Description
void	

In following example, the recordFinalValuesInPredictionResults() method is called when the incident is closed.

```
(function executeRule(current, previous /*null when async*/) {
 var predictor = new MLPredictor();
 predictor.recordFinalValuesInPredictionResults(current, "On
 close");

})(current, previous);
```

MLPredictor - solution.getCapability()

Gets the capability information of a trained solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Definition ID and version of the trained solution, error message otherwise

MLPredictor - solution.getName()

Gets the name of the solution used for prediction.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name of the solution to use for predictions; for example, `ml_incident_categorization`

MLPredictor - solution.getPredictedField()

Gets the predicted value of a solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Value of a solution's predicted output field

```
/* Get a hard-coded GR */
    var current = new GlideRecord('incident');
    current.get('965c9e5347c12200e0ef563dbb9a7156');
    var predictor = new MLPredictor();
    var solutions =
 predictor.findActiveSolutionsForRecord(current);
    solutions.forEach(function(solution) {
        var outcome = solution.predict(current);
        /* Use this to set the field to the predicted value in
 the GlideRecord */
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        var fieldName = solution.getPredictedField();
        current[fieldName] = outcome.predictedValue();
        current.update();
        gs.info("Predicted value: " + outcome.predictedValue())
        gs.info("Confidence: " + outcome.confidence())
});
```

MLPredictor - solution.getThreshold(String className)

Gets the solution threshold.

The threshold represents a percentage reflecting the minimum prediction accuracy.

Parameters

Name	Type	Description
className	String	A specified categorical value of the solution output field

Returns

Type	Description
Number	Value of the threshold represented as a percentage between 0 and 100.

MLPredictor - solution.getVersion()

Gets the version of the active solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Version of the active solution

MLPredictor - solution.isActive()

Determines if the specified solution is active.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the solution is active, false otherwise

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MLPredictor - solution.predict(GlideRecord now_GR, Object threshold)

Gets solution prediction results as an Outcome object.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord of the solution input table
threshold	Object	Threshold value (solution level threshold for similarity, class level threshold for classification)

Returns

Type	Description
Object	Prediction outcome result of the specified solution (var outcome = solution.predict(now_GR))

```
solutions.forEach(function(solution) {
        var outcome = solution.predict(current);
        /* Use this to set the field to the predicted value in
 the GlideRecord
        var fieldName = solution.getPredictedField();
        current[fieldName] = outcome.predictedValue();
        current.update();
        */
        gs.info("Predicted value: " + outcome.predictedValue())
        gs.info("Confidence: " + outcome.confidence())
});
```

MLPredictor - solution.predictTopN(GlideRecord now_GR, Object topN)

Returns a list of outcome objects up to the expected number of predictions. Maximum number 1000 predictions.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord of the solution
topN	Object	Expected number of predictions, any number over 1000 returns 1000 results

Returns

Type	Description
Array	List of outcome objects in an array including GlideRecord, threshold, system ID, and expected number of predictions (topN object)

```
var isClassificationSolution =
 this.isClassificationSolution(solution);

 //classification solution each class has different threshold
```

```
//therefore needs to get all the results from ml engine
if (applyThreshold && isClassificationSolution) {
 var maxClassificationTopN = 50;
 outcomeArr = solution.predictTopN(now_GR,
maxClassificationTopN);
}
else  {
 outcomeArr = solution.predictTopN(now_GR, topN);
}

if (outcomeArr === null) {
 //instead of returning null returning empty array
 return [];
}
```

MLSolution - Global

The *MLSolution* API provides methods for handling Predictive Intelligence predictions and retrieving solution objects for all capabilities: similarity, classification, and clustering).

This API provides methods commonly used among all solution capabilities and methods unique to classification and clustering solutions.

- Common methods used for all solution objects:
  - *getCapability()*
  - *getVersion()*
  - *isActive()*
  - *predict()*
- Methods only used for classification and regression solutions:
  - *applyPrediction()*
- Methods only used for clustering solutions:
  - *getClusterAssignments()*
  - *getClusterForRecord()*
  - *getClusterInfo()*

The *MLSolution* API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

The methods in this object are instantiated using MLSolutionFactory.

MLSolutionUtil

REST API: Get predictions for multiple solutions

MLSolution - applyPrediction(GlideRecord now_GR)

Gets the prediction result for a classification solution and applies it to the input GlideRecord if the confidence value is higher than the threshold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
now_GR	GlideRecord	GlideRecord object containing values on which to run a prediction and apply the results.

Returns

Type	Description
Boolean	Flag that indicates whether the prediction was applied: • true: Prediction applied • false: Prediction rejected

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization
");

var inputGR = new GlideRecord("incident");
inputGR.get("0ef47232db801300864adfea5e961912");

mlSolution.applyPrediction(inputGR);
```

MLSolution - getCapability()

Gets the capability information of a trained solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Type of trained solution. Possible values: • Similarity • Classification • Clustering

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_x_global_clustering");

// configure optional parameters
var options = {};
options.group_by = 'network';
options.cluster_id = 1;
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
options.top_n_per_cluster = 3;

if (mlSolution.getCapability() == 'clustering') {
 var results = mlSolution.getClusterAssignments(options);
 // pretty print JSON results
 gs.print(JSON.stringify(JSON.parse(results), null, 2));
}
```

MLSolution - getClusterAssignments(Object options)

Gets assignments for a clustering solution.

Parameters

Name	Type	Description
options	Object	Optional. Values to use to narrow down the returned results by group and level within a clustering solution. Default: Return cluster memberships for all clusters.
options.group_by	String	Optional. Identifies the segmentation field for which to retrieve cluster memberships, for example, assignment_group. This field provides the same grouping as options provided in the **Use Group By** check box in the **Clustering Definition** form. The information provided varies based on the table selected in the **Table** field. For more information, see Create and train a clustering solution .
options.cluster_id	String	Optional. Cluster ID of a trained solution in the Cluster Summary [ml_cluster_summary] table.
options.top_n_per_cluster	Number	Number of top results to receive for each cluster.

Returns

Type	Description
Object	JSON array containing cluster information in increasing order by cluster_id: • cluster_id: String. Unique cluster number within a solution of clusters. • rec_display_id: String. Record type and number. • rec_sys_id: String. Record sys_id. • group_by: If grouped, name of the segmentation field associated with this cluster.

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_x_global_clustering");

// configure optional parameters
var options = {};
options.group_by = 'network';
options.cluster_id = '1';
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// returns top 3 results per cluster
options.top_n_per_cluster = 3;

var results = mlSolution.getClusterAssignments(options);
```

Output:

```
[{"cluster_id":"1","rec_display_id":"Incident:
 INC0014483","rec_sys_id":"04e33e7adb401300864adfea5e961900","gr
oup_by":"network"},
 {"cluster_id":"1","rec_display_id":"Incident:
 INC0011133","rec_sys_id":"5bd23af2db401300864adfea5e96194d","gr
oup_by":"network"}]
```

MLSolution - getClusterForRecord(GlideRecord now_GR)

Gets the cluster information for a clustering solution.

Parameters

Name	Type	Description
now_GR	GlideRecord	Name of the input GlideRecord.

Returns

Type	Description
String	The cluster_id from the Cluster Summary [ml_cluster_summary] table if the record belongs to a cluster. Empty string returns if the record does not belong to a cluster.

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("solution_name");
var now_GR = new GlideRecord('incident');
if (mlSolution.getCapability() == 'clustering') {
var clusterId = mlSolution.getClusterForRecord(now_GR);
}
```

MLSolution - getClusterInfo(Object options)

Gets information for a specified clustering solution.

Parameters

Name	Type	Description
options	Object	Optional. Narrows down the returned results by group and level within a clustering solution. Default: Return cluster memberships for all clusters.
options.group_by	String	Optional. Identifies the segmentation field for which to retrieve cluster memberships, for example, assignment_group. This field provides the same grouping as options provided in the **Use Group By** check box in the

Parameters (continued)

Name	Type	Description
		Clustering Definition form. The information provided varies based on the table selected in the **Table** field. For more information, see Create and train a clustering solution .
options.cluster_id	String	Optional. Cluster ID of a trained solution in the Cluster Summary [ml_cluster_summary] table.

Returns

Type	Description
Object	JSON array containing cluster information in increasing order by cluster_id: • cluster_id: String. Unique cluster number within a solution of clusters. • cluster_quality: String. Number from 0 to 100. Higher numbers indicate higher cluster density. • cluster_size: String. Number of records in a cluster. • group_by: If grouped, name of the segmentation field associated with this cluster. • cluster_concept: String. Set of words that describe the cluster in descending order of frequency.

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_x_global_clustering");

// configure optional parameters
var options = {};
options.group_by = 'network';
options.cluster_id = 1;

var results = mlSolution.getClusterInfo(options);
```

Output:

```
[ {"cluster_id":"1","cluster_quality":"56.6","cluster_size":"46"
,"group_by":"SLA","cluster_concept":"issue occur capacity ..."},

 {"cluster_id":"2","cluster_quality":"55.47","cluster_size":"75"
,"group_by":"SLA","cluster_concept":"clone instance
 request ..."},
... ]
```

MLSolution - getVersion()

Gets the version of the active solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Version of the active solution.

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("solution_name");

var solutionVersion = mlSolution.getVersion();
```

MLSolution - isActive()

Determines if a solution is active.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the solution is active. • true: Solution active • false: Solution inactive

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("solution_name");

var isActive = mlSolution.isActive();
```

MLSolution - predict(Object input, Object options)

Gets the prediction results from the prediction server given a GlideRecord or an array of key-value pairs.

You can use this method to call prediction with multiple input records because GlideRecord is an iterator.

Parameters

Name	Type	Description
input	Object	*GlideRecord* or array of JSON objects containing field names and values as key-value pairs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
options	Object	Optional. JSON key-value pair with the following properties: • top_n: Number. If provided, returns the top results, up to the specified number of predictions. • apply_threshold: Boolean. Checks the threshold value for the solution and applies it to the result set. The threshold value is solution threshold for similarity or class-level threshold for classification. Default value is true. • custom_results_filter: String. Similarity solutions only. Specifies the allowed set from which results are returned using an encoded query.

Returns

Type	Description
Object	JSON object containing the prediction results sorted by sys_id or record_number. • predictedValue: String. Value representing the prediction result. • predictedSysId: String. The sys_id of the predicted value. Results can be from any table on which information is being predicted. • confidence: Number. Value of the confidence associated with the prediction. For example, 53.84. • threshold: Number. Value of the configured threshold associated with the prediction.

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization
");

// single GlideRecord input
var input = new GlideRecord("incident");
input.get("0ef47232db801300864adfea5e961912");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization
");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// multiple GlideRecord input
var input = new GlideRecord("incident");
input.addQuery("sys_created_onONLast
 week@javascript:gs.beginningOfLastWeek()@javascript:gs.endOfLas
tWeek()");
input.query();

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

Output:

```
{
    input_gr_sys_id1: [
                {
                    predictedValue : xxx,
                    predictedSysId : xx0,
                    confidence : xxx,
                    threshold : xxx

                },
                {
                    predictedValue : yyy,
                    predictedSysId : xx1,
                    confidence : xxx,
                    threshold : xxx
                }
        ],
    input_gr_sys_id2 : [
                {
                    predictedValue : xxx,
                    predictedSysId : xx0,
                    confidence : xxx,
                    threshold : xxx

                },
            ...
        ]
}
```

```
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization
");

// key-value pairs input
var input = [{"short_description":"my email is not working"},
   {short_description:"need help with password"}];

// configure optional parameters
var options = {};
```

```
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

MLSolutionFactory - Global

The *MLSolutionFactory* API is a factory class to get an MLSolution scriptable object.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace. For more information, see Predictive Intelligence.

For usage guidelines, refer to MLSolutionFactory scriptable objects.

Related topics

MLSolutionFactory - getSolution(String solutionName, Object options)

Gets an MLSolution object for a specified solution name.

Parameters

Name	Type	Description
solutionName	String	Name of the solution.
options	Object	Optional. options.version: If provided, creates MLSolution instance for provided version of solutionName.

Returns

Type	Description
Object	MLSolution object of the specified solution.

```
// basic usage
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization
");
```

```
// using options.version parameter
var options = {};
options.version = 1;
var mlSolution =
 sn_ml.MLSolutionFactory.getSolution("ml_incident_categorizatio
n", options);
```

MLSolutionResult - Global (deprecated)

The `MLSolutionResult` API provides methods for managing cluster information and members of a clustering solution. You can embed the results in business logic.

Note: This API has been deprecated and is intended to be removed in a future release. Refer to Using ML APIs for the most recent guidelines.

MLSolutionResult - MLSolutionResult()

Instantiates a new MLSolutionResult object.

Parameters

Name	Type	Description
None		

MLSolutionResult - findActiveSolution(String solutionName)

Returns the solution object.

This method only returns the solutions if the ml_solution definition and solution are active (that is, trained). For information, see Create and train a clustering solution .

Parameters

Name	Type	Description
solutionName	String	Name of the clustering ml_s record.

Returns

Type	Description
Object	Clustering solution object for the specified `solutionName` if the ml_solution definition and solution is active, null otherwise.

```
var solutionName = 'ml_incident_assignment';
  var MLS = new MLSolutionResult();
  var solution = MLS.findActiveSolution(solutionName);
  gs.print(solution);
```

MLSolutionResult - getClusterAssignments(String solutionName, Object options)

Returns all members of a clustering solution.

Parameters

Name	Type	Description
solutionName	String	Name of active cluster soluti
options	Object	Optional. Narrows down the Default: Return cluster memb

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
options.segmentation_field	String	Optional. Identifies the segm This field provides the same by table selected in the **Tabl**
options.cluster_id	String	Optional. The sys_id from th
options.rec_sys_id	String	Optional. The sys_id from th

Returns

Type	Description
Array	Array of outcome objects including: • segmentation – Field name by which to group data • cluster_num – Unique cluster number within a solution of clusters (that is, label) • rec_sys_id – The sys_id from the table record that the cluster solution is based on • rec_display_id – Name of the record associated with the record sys_id.

The following example shows how to return all cluster members for a solution without setting values for the options object.

```
var solutionName = "<Name_of_Active_Cluster_Solution>";
var solutionResult = new MLSolutionResult();
var outcome_array =
 solutionResult.getClusterAssignments(solutionName);
for (var i = 0; i < outcome_array.length; i++) {
   gs.print(outcome_array [i].segmentation + ' ' + outcome_array
 [i].cluster_num + ' ' + outcome_array [i].rec_sys_id + ' ' +
 outcome_array [i].rec_display_id);
}
```

The following example shows how to return all cluster members for one record using options.rec_sys_id.

```
var now_GR = new GlideRecord('incident');
now_GR.get('sys_id');

var solutionName = "solution_example";
var solutionResult = new MLSolutionResult();
var options = { "rec_sys_id": now_GR.getUniqueValue() };
var outcome_array =
 solutionResult.getClusterAssignments(solutionName, options);
for (var i = 0; i < outcome_array.length; i++) {
   gs.print(outcome_array [i].segmentation + ' ' + outcome_array
 [i].cluster_num + ' ' + outcome_array [i].rec_sys_id + ' ' +
 outcome_array [i].rec_display_id);
}
```

MLSolutionResult - getClusterInfo(String solutionName, Object options)

Returns all outcome information for a clustering solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

solutionName	String	Name of active cluster soluti
options	Object	Optional. Narrows down the Default: Return cluster memb
options.segmentation_field	String	Optional. Identifies the segm This field provides the same by table selected in the **Tabl**
options.cluster_id	String	Optional. The sys_id from th

Returns

Type	Description
Array	Array of outcome objects including: • segmentation – Field name by which to group data • cluster_num – Unique cluster number within a solution of clusters (that is, label) • total_members – Number of records in cluster (that is, size) • cluster_quality – Cluster quality percentile value

```
var solutionName = "solution_example";
var solutionResult = new MLSolutionResult();
var outcome_array = solutionResult.getClusterInfo(solutionName);
for (var i = 0; i < outcome_array.length; i++) {
gs.print(outcome_array[i].segmentation +
 ' ' + outcome_array[i].cluster_num + ' '
 + outcome_array[i].total_members + ' ' +
 outcome_array[i].cluster_quality);
}
```

MLSolutionUtil - Global

The *MLSolutionUtil* script include provides methods for getting Predictive Intelligence predictions.

This script include requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

For more information, see Using ML APIs.

Related topics

MLSolution

MLSolutionFactory

MLSolutionUtil - MLSolutionUtil()

Instantiates a new MLSolutionUtil object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

```
var mlSolutionUtil = new MLSolutionUtil();
```

MLSolutionUtil - getPredictions(Object input, Array solutionNames, Object options)

Gets predictions for one or more specified solutions.

Parameters

Name	Type	Description
input	Object	GlideRecord or array of JSON objects as key-value pairs.
solutionNames	Array	Array of solution names to retrieve predictions from.
options	Object	Optional. JSON object key-value pair with the following properties: • top_n: Number. If provided, returns the top results, up to the specified number of predictions. • apply_threshold: Boolean. Checks the threshold value for the solution and applies it to the result set. The threshold value is solution threshold for similarity or class-level threshold for classification. Default value is true. • custom_results_filter: String. Similarity solutions only. Specifies the allowed set from which results are returned using an encoded query.

Returns

Type	Description
Array	JSON key-value pair containing the prediction result grouped by solution name and sorted by sys_id or record_number. • predictedValue: String. Value representing the prediction result. • predictedSysId: String. The sys_id of the predicted value. Results can be from any table on which information is being predicted. • confidence: Number. Value of the confidence associated with the prediction. For example, 53.84. • threshold: Number. Value of the configured threshold associated with the prediction.

```
var solutionNames = ['soluton1', 'solution2'];

var input = new GlideRecord("incident");
input.get("0ef47232db801300864adfea5e961912");
```

- Now Mobile
- Mobile Agent
- Mobile Onboarding

Note:

The Mobile Onboarding application is being deprecated!

With the ServiceNow AI Platform Rome release in September 2021, we started phasing out support for the Mobile Onboarding application. Customers may no longer activate it, and we are not offering enhancements or non-critical bug fixes. Mobile onboarding features are available in the Now Mobile app for HR Service Delivery.

For example, create a link from an email, push notification, or Virtual Agent conversation that opens a record or list of records in the app. The form or list only includes data that the user has access rights to view.

For an example of this API used in a push notification, see Configure push notification message content. For additional information on deep links, see Deep linking for mobile.

MobileDeepLinkGenerator - MobileDeepLinkGenerator(String clientType)

Instantiates a MobileDeepLinkGenerator object for a specific mobile app.

Parameters

Name	Type	Description
clientType	String	Name of the app to create a link to. Options include: • agent: Creates a link to a list or screen in the Mobile Agent app. • request: Creates a link to a list or screen in the Now Mobile app. • onboarding: Creates a link to a list or screen in the Mobile Onboarding.

Note:

The Mobile Onboarding application is being deprecated!

With the ServiceNow AI Platform Rome release in September 2021, we started phasing out support for the Mobile Onboarding application. Customers may no longer activate it, and we are not offering enhancements or non-critical bug fixes. Mobile onboarding features are available in the Now Mobile app for HR Service Delivery.

```
var glide = new global.MobileDeepLinkGenerator('onboarding');
```

MobileDeepLinkGenerator - getFormScreenLink(String formScreenId, String tableName, String recordSysId)

Create a link to a form applet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
formScreenId	String	Sys ID of the applet record in the Applets [sys_sg_screen] table.
tableName	String	Name of the table containing the record in the *recordSysId* parameter.
recordSysId	String	Sys ID of the record to open in the applet.

Returns

Type	Description
String	Link to the record in the mobile app form applet.

```
var deepLinkGenerator = new
 global.MobileDeepLinkGenerator("agent");
var link = deepLinkGenerator.getFormScreenLink("<sys_id>",
 current.getTableName(), current.getValue("sys_id"));
```

MobileDeepLinkGenerator - getScreenLink(String documentId, Object uiParams)

Create a link to a list applet.

Parameters

Name	Type	Description
documentId	String	Sys ID of the applet record in the Applets [sys_sg_screen] table.
uiParams	Object	Optional. JSON object containing any URL parameters to include in the link. Determine which URL parameters to include by inspecting the URL you want to link to. In general, URL parameters filter records in the list. For example, `var param = {'<company-sys-id>': 'servicenow'}`, where `<company-sys-id>` is the Sys ID of a company UI parameter from the UI Parameters [sys_sg_ui_parameter] table for a specific mobile screen.

Returns

Type	Description
String	Link to the mobile app list applet.

```
var uiParams = {
    "b250294ab3c12300a0d56ad4c6a8dc8c": "servicenow",
    "7250294ab3c12300a0d56ad4c6a8dc90": "santa clara"}

var deepLinkGenerator = new
 global.MobileDeepLinkGenerator("request");
var link =
 deepLinkGenerator.getScreenLink("a75df1920f2033001befa68ca8767e
50", uiParams);
```

MonitorMIDServer - Global

The *MonitorMIDServer* script include provides methods to monitor MID Servers using the heartbeat probe to check for MID Servers that are down, sends heartbeat requests, and kills old heartbeat requests.

Use this script include in a server script to monitor MID Servers.

MonitorMIDServer - MonitorMIDServer()

Creates an instance of MonitorMIDServer.

Parameters

Name	Type	Description
None		

MonitorMIDServer - killOldRequests()

If there are any heartbeat probe requests that haven't been processed, cancels them so that they don't accumulate when a MID server is down for a while.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var mmsv = new MonitorMIDServer();
mmsv.killOldRequests();
```

MonitorMIDServer - markDowners()

Marks any non-responding MID servers as being down, by determining when the most recent heartbeat was sent and finding all non-responding servers.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var mmsv = new MonitorMIDServer();
mmsv.markDowners();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MonitorMIDServer - monitor()

Performs the functions required for a scheduled MID server monitor cycle, including killing old requests, marking the MID servers that are down, and sending heartbeat requests to all servers.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var mmsv = new MonitorMIDServer();
mmsv.monitor();
```

MonitorMIDServer - sendHeartbeatRequests()

Sends heartbeat requests to all MID servers and notes when by updating the server status record.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

```
var mmsv = new MonitorMIDServer();
mmsv.sendHeartbeatRequests();
```

NameValuePairs - Global

The *NameValuePairs* script include provides methods to convert between maps and strings representing the name/value pairs in the map.

The string form is: `<name> = <value>, <name> = <value, ...` where `<name>` is a string name, optionally surrounded by double quotes (Microsoft-style), and `<value>` is a string value, also optionally surrounded by double quotes.

The following are all examples of valid name/value strings:

- `name = value`
- `name = "My Value", name = value`
- `"My Name = this" = "My Value", "My Value, all the time", name = value`
- `"My Name" = "This" "name""", name = value`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the third example, the quoted values contain equals and commas. In the fourth example, the quoted value contains a quote.

Instances have the following properties initialized:

- map: The map (JavaScript object being used as a hashmap) form of the name/value pairs, with Microsoft-style quotes removed
- string: The string form of the name/value pairs, with Microsoft-style quoting.

Use with any server-side script where you need convert name/value pairs between maps and strings.

NameValuePairs - NameValuePairs(String stringForm)

Creates an instance of the class initialized with the specified string.

Parameters

Name	Type	Description
stringForm	String	The values to use when creating the object.

NameValuePairs - NameValuePairs(Object mapForm)

Creates an instance of the class initialized with the specified hash map.

Parameters

Name	Type	Description
mapForm	Object	The map to use when creating the object.

NameValuePairs - mapToString()

Produces `this.string` from `this.map`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

NameValuePairs - quotify(Object value)

If the specified value contains double quotes, equals, commas, or spaces, this method surrounds the value with double quotes and doubles up any enclosed double quotes.

Parameters

Name	Type	Description
value	Object	The value to process

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The value with added quotes.

NameValuePairs - stringToMap()

Produces `this.map` from `this.string`.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

NetwareHandler - Global

The *`NetwareHandler`* script include implements an SNMP handler for Netware OS.

This handler is designed to be invoked by Classify.java as an interim step toward completely moving the SNMP sensors into JavaScript.

Use this script include for SNMP classification.

NetwareHandler - classifyAndIdentify()

Classifies and identifies the SNMP device.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

Notify - Global

The *`Notify`* API allows you to interact with Notify calls and SMS messages using scripts.

Access the global *`Notify`* class and its associated methods in the `SNC` namespace.

Notify - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall, GlideRecord conferenceCallRecord, String userSysId, String groupSysId, GlideRecord sourceRecord)

Calls the specified E.164-compliant telephone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In addition, this method can automatically add the specified phone number to a specified conference call.

Parameters

Name	Type	Description
notifyPhoneNumber	String or NotifyPhoneNumber	Notify phone number from which to make the call. When you initiate a call, the outgoing call workflow for the number group associated with this number runs. Ensure this workflow includes a **join conference call** activity to connect the user to the conference call.
toPhoneNumber	String	Phone number to call. Called numbers are added to the conference call.
conferenceCall	GlideRecord	Optional. If this parameter is passed in, the callers identified in the *toPhoneNumber* parameter are automatically joined into the conference call identified by this record. GlideRecord for the Notify Call [notify_call] table that identifies the conference call record. This record is automatically added to the outgoing call workflow scratchpad as the workflow.scratchpad.conference_call variable.
userSysId	String	Optional. Unique identifier (sys_id) of the user associated with the call.
groupSysId	String	Optional. Unique identifier (sys_id) of the group associated with the call.
sourceRecord	GlideRecord	Optional. Source record that prompted this call.

Returns

Type	Description
void	

This example illustrates how to initiate a call to another phone number.

```
var from = '+14048007337';
var to = '+31646810495';

// set up call
new SNC.Notify().call(from, to);
```

This example illustrates how to initiate a call to list of telephone numbers and automatically join those numbers into a new conference call.

```
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789',
 '+31687654321'];

// set up a conference call
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call
 participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}
```

This example illustrates how to initiate a new conference call.

```
SNC.Notify.call('+15413970605', '+91406XXXXXXX',
 SNC.Notify.conferenceCall(), null, null, null);
```

This example illustrates how to initiate new a conference call using a user record.

```
var sysUserGr = new GlideRecord('sys_user');
sysUserGr.get('active conference sys id');

if (conferenceGr.isValid) {
    SNC.Notify.call('+15413970605', '+91406XXXXXXX',
 SNC.Notify.conferenceCall(), sysUserGr.getUniqueValue(), null,
 null);
}
```

This example illustrates how to initiate a new conference call with a user, group, and source record.

```
var sysUserGr = new GlideRecord('sys_user');
sysUserGr.get('active sys user sys id');

var sysUserGroupGr = new GlideRecord('sys_user_group');
sysUserGroupGr.get('active sys user group sys id');

var incidentGr = new GlideRecord('incident');
incidentGr.get('incident sys_id');

if (conferenceGr.isValid) {
    SNC.Notify.call('+15413970605', '+91406XXXXXXX',
        SNC.Notify.conferenceCall(),
        sysUserGr.getUniqueValue(),
        sysUserGroupGr.getUniqueValue(),
        incidentGr.getUniqueValue());
}
```

Scoped equivalent

To use the *call()* method in a scoped application, use the corresponding scoped method: NotifyScoped - call().

Notify - conferenceCall(GlideRecord sourceRecord)

Creates a new conference call GlideRecord.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sourceRecord	GlideRecord	Optional. Record that initiated the request to create the conference call. Used to populate the source and table fields on notify_conference_call record.

Returns

Type	Description
GlideRecord	New Notify conference call [notify_conference_call] record.

```
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789',
 '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call
 participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}
```

Scoped equivalent

To use the *conferenceCall()* method in a scoped application, use the corresponding scoped method: NotifyScoped - conferenceCall().

Related topics

Notify - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall, GlideRecord conferenceCallRecord, String userSysId, String groupSysId, GlideRecord sourceRecord)

Notify - dequeueCall(GlideRecord callRecord)

Resumes a call after it was put in a queue (on hold).

Use this method to resume calls that were put in a queue with the *queueCall()* method.

Parameters

Name	Type	Description
callRecord	GlideRecord	A GlideRecord object on the Notify Call [notify_call] table with the held call you want to resume.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

The following example shows how to reactivate a call that was put on hold.

```
var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    SNC.Notify.dequeueCall(notifyCallGr);
}
```

Scoped equivalent

To use the *dequeueCall()* method in a scoped application, use the corresponding scoped method: NotifyScoped - dequeueCall().

Notify - forwardCall(GlideRecord call, String destination, String dtmf)

Forwards the specified call to a different call recipient.

Parameters

Name	Type	Description
call	GlideRecord or String	Notify call record or the telephony provider call ID, of the call to be forwarded.
destination	GlideRecord or String	Notify phone number record or an E.164-compliant phone number, of the caller to which to forward the call.
dtmf	String	Dual Tone - Multi Frequency (DTMF) code to send upon call connection.

Returns

Type	Description
void	

The following example shows how to forward a call to another phone number.

```
var callID = 'CA92374b5aa561dab476a7001db6026edc'; // Twilio
 Call ID
var phoneNumber = '+91406xxxxxx';
var dtmfTones = null;

var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    SNC.Notify.forwardCall(notifyCallGr(or) callID, phoneNumber,
 dtmfTones)
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the `forwardCall()` method in a scoped application, use the corresponding scoped method: NotifyScoped - forwardCall().

Notify - getAvailableClients(String notifyNumber)

Returns a list of client sessions that are available to receive calls.

Parameters

Name	Type	Description
notifyNumber	String	Valid Notify phone number.

Returns

Type	Description
GlideRecord	GlideRecord from the notify_client_session table for the specified phone number. Returns "0" if there are no available client sessions.

The following example shows how to use the getAvailableClients() method to index into the notify_client_session table and then iterate across all available Notify clients.

```
var clientSessionGr =
 SNC.Notify.getAvailableClients('+185xxxxxxxx');
// Here clientSessionGr is of type GlideRecord on
 'notify_client_session' table.

var isLoggedInUserAvailable = false;
while (clientSessionGr.next()) {
  if (clientSessionGr.user == gs.getUserID())
    isLoggedInUserAvailable = clientSessionGr.available;
}
gs.info('isLoggedInUserAvailable - ' + isLoggedInUserAvailable);
```

Scoped equivalent

To use the `getAvailableClients()` method in a scoped application, use the corresponding scoped method: NotifyScoped - getAvailableClients().

Notify - getParentCallID(GlideRecord callRecord)

Returns the sys_id of a specified call's parent call.

Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.

Parameters

Name	Type	Description
callRecord	GlideRecord	Record on the Notify Call [notify_call] table for which to return the call status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Unique sys_id of the parent call record.

This example shows how to obtain the parent call of the specified call.

```
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecfffffffff28");

var notify = new SNC.Notify();
var parentCallID = notify.getParentCallID(callRecord);
```

Notify - getPhoneNumbers()

Returns all phone numbers and short codes available to Notify.

Parameters

Name	Type	Description
None		

Returns

Type	Description
List	List of NotifyPhoneNumber objects, each object representing one phone number available to Notify.

```
var list = SNC.Notify.getPhoneNumbers();
for (var i = 0; i < list.size(); i++) {
    var num = list.get(i);
    gs.info(num.getNumber())
}
```

Scoped equivalent

To use the *getPhoneNumbers()* method in a scoped application, use the corresponding scoped method: NotifyScoped - getPhoneNumbers().

Notify - getTokens(GlideRecord, record)

Returns client tokens for any active telephony drivers for use in WebRTC or mobile clients.

Parameters

Name	Type	Description
record	GlideRecord	GlideRecord to use to identify the Notify client, such as a group record or a user record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Web RTC tokens for the supported drivers, as a JSON string with the following format: {driverName1: "token1", driverName2: "token2"}, such as "TwilioDirect":"eyJhxxxx.eyJleHAiOiIxxxx.7fejxxx_mbLxxx"

This example shows how to obtain the client tokens for the currently logged in user.

```
// get Notify client Tokens per active Notify driver for the
 currently logged in user
var json = new SNC.Notify().getTokens();

// Parse the JSON that was return into a tokens object
var tokens = JSON.parse(json);

// Log line
gs.log('Notify client tokens for the currently logged in user');

 // iterate over the driver tokens
for (var driver in tokens) {
  gs.log(driver + ' Driver token: ' + tokens[driver]);
}
```

This example shows how to obtain the client tokens for every Notify group.

```
// instantiate Notify
var notify = new SNC.Notify();

// get all Notify Groups
var notifyGroup = new GlideRecord("notify_group");
notifyGroup.query();

// iterate over all notify groups
while (notifyGroup.next()) {
  // generate Notify Client tokens per active Notify Driver for
 this group
  var json = notify.getTokens(notifyGroup);
  var tokens = JSON.parse(json);

  for (var driver in tokens) {
    gs.log(gs.getMessage("Notify Client token for
 {0} driver and Notify Group '{1}': {2}", [driver,
 notifyGroup.getValue('name'), tokens[driver]]));
  }
}
```

Scoped equivalent

To use the *getTokens()* method in a scoped application, use the corresponding scoped method: NotifyScoped - getTokens().

Notify - getTokenTTL(String owner)

Returns the maximum amount of time that a client session stays active for a specified telephony driver before automatically timing out.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
owner	String	Name of the telephony driver for which to retrieve the session length. Valid values: • Twilio: for the old driver • TwilioDirect: for the new driver

Returns

Type	Description
Integer	Maximum length of the session (in seconds). Default: 1800 seconds

The following example shows how to properly call this method and the associated response. It also shows what is returned if an invalid driver is passed.

```
var owner = "TwilioDirect";  // Valid driver
var ttl = SNC.Notify.getTokenTTL(owner);
gs.info("Token TTL for " + owner + " --> " + ttl);

owner = "Abcxyz";  // Invalid driver
ttl = SNC.Notify.getTokenTTL(owner);
// For an invalid driver, we throw NoSuchNotifyDriverException
 saying that Abcxyzdriver is not available
// and return the default value of TTL
gs.info("Token TTL for " + owner + " --> " + ttl);
```

Scoped equivalent

To use the *getTokenTTL()* method in a scoped application, use the corresponding scoped method: NotifyScoped - getAvailableClients().

Notify - hasCapability(String notifyPhoneNumber, String capability)

Determines whether the specified phone number has the specified capability.

The telephony driver associated with the phone number contains a list of all of the capabilities of the phone.

Note: In the base system, the Notify JS driver only has 'show_speakers' as a capability; this can be modified.

Parameters

Name	Type	Description
notifyPhoneNumber	String	Phone number for which to check for the specified capability.
capability	String	Capability to detect. The string text must be an exact match to what is in the phone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the specified phone has the specified capability. • true: phone has the capability • false: phone does not have the capability

This example shows how to check if a phone has a specific capability.

```
// Each driver has a defined set of capabilities.

var capability = 'show_speakers';
gs.info(SNC.Notify.hasCapability('+185xxxxxxxx',
 capability)); // true

capability = 'send_sms';
gs.info(SNC.Notify.hasCapability('+185xxxxxxxx',
 capability)); // false
```

Scoped equivalent

To use the *hasCapability()* method in a scoped application, use the corresponding scoped method: NotifyScoped - hasCapability().

Notify - kick(GlideRecord participant)

Removes the specified caller from the current Notify conference call.

Parameters

Name	Type	Description
participant	GlideRecord	GlideRecord object containing the Notify Participant [notify_participant] record of the caller to remove from the conference call.

Returns

Type	Description
void	

The following example shows how to remove a participant from a conference call.

```
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    SNC.Notify.kick(notifyParticipantGr);
}
```

Scoped equivalent

To use the *kick()* method in a scoped application, use the corresponding scoped method: NotifyScoped - kick().

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notify - modifyCall(GlideRecord callRecord, NotifyAction notifyAction)

Performs one or more actions on an active Notify phone call.

Available actions that you can perform on calls include queuing or dequeueing the call, reading text, playing audio, or forwarding the call. You can also create custom actions Call the *modifyCall()* method after you have specified all the actions that you want to apply to the specified call. Refer to the NotifyAction API documentation for more information about available actions.

Parameters

Name	Type	Description
callRecord	GlideRecord	Notify Call [notify_call] record of the call for which to apply the actions.
notifyAction	NotifyAction	NotifyAction object describing one or more actions to perform on the call. Create this object by calling one or more of the *NotifyAction()* methods.

Returns

Type	Description
void	

This example shows how to modify a call.

```
// get the most recent call record
var callRecord = new GlideRecord('notify_call');
callRecord.orderByDesc('sys_created_on');
callRecord.query();

if (callRecord.next()) {
    // instantiate notify action container class
    var notifyAction = new SNC.NotifyAction();
    // The call is already in progress. Now, we want to modify
 the call behavior by putting this call in a queue.
    // So, we add a queue action to queue the call
    notifyAction.addQueue('my fancy queue');

    // modify the call by passing in the above action, putting
 the call in a queue
    new SNC.Notify().modifyCall(callRecord, notifyAction);
} else {
    gs.log('no such call record');
}
```

Scoped equivalent

To use the *modifyCall()* method in a scoped application, use the corresponding scoped method: NotifyScoped - modifyCall().

Notify - mute(GlideRecord participantRecord)

Mutes the specified conference call participant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
participantRecord	GlideRecord	GlideRecord from the notify_participant table for the participant to mute.

Returns

Type	Description
void	

The following example shows how to mute a caller.

```
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    SNC.Notify.mute(notifyParticipantGr);
}
```

Scoped equivalent

To use the *mute()* method in a scoped application, use the corresponding scoped method: NotifyScoped - mute().

Notify - queueCall(GlideRecord callRecord)

Puts the specified call into a queue (on hold).

Resume a queued call using the *dequeueCall()* method.

Parameters

Name	Type	Description
callRecord	GlideRecord	GlideRecord object of the Notify Call record (notify_call table) to put on hold.

Returns

Type	Description
void	

The following example shows how to put a call on hold (in the queue).

```
var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    SNC.Notify.queueCall(notifyCallGr);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *queueCall()* method in a scoped application, use the corresponding scoped method: NotifyScoped - queueCall().

Notify - sendBulkSMS(String notifyPhoneNumber, Array toPhoneNumbers, String messageBody, GlideRecord source)

Sends a specified SMS message to the specified list of Notify clients (phone numbers).

Parameters

Name	Type	Description
notifyPhoneNumber	String	Notify phone number from which the SMS message is being sent.
toPhoneNumbers	Array of Strings	Comma-separated list of phone numbers to which to send the SMS message. Format: E.164
messageBody	String	SMS text to send.
source	GlideRecord	Source record that prompted this SMS message, such as an incident.

Returns

Type	Description
String	Null

The following example shows how to send a bulk SMS message.

```
var incidentGr = new GlideRecord('incident');
incidentGr.get(active incident sys_id');
if (incidentGr.isValid()) {
    SNC.Notify.sendBulkSMS('+15413970605', ['+919885XXXXXX',
 '+919775XXXXXX'], 'Test automation message', incidentGr);
}
```

Scoped equivalent

To use the *sendBulkSMS()* method in a scoped application, use the corresponding scoped method: NotifyScoped - sendBulkSMS().

Notify - sendSMS(String notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source)

Sends an SMS text message to an E.164-compliant phone number.

This method creates a new record on the Notify Message [notify_message] table and associates it with the source record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
notifyPhoneNumber	String	Notify phone number from which the SMS message is being sent.
toPhoneNumber	String	E.164-compliant phone number to which to send the SMS message.
messageBody	String	Body of the SMS text message.
source	GlideRecord	Source record that prompted this SMS message, such as an incident.

Returns

Type	Description
String	Unique message SID; stored in the Notify Message [notify_message] record as message_id.

The following example shows how to send an SMS message.

```
var incidentGr = new GlideRecord('incident');
incidentGr.get('active incident sys_id');
if (incidentGr.isValid()) {
    SNC.Notify.sendSMS('+15413970605', '+919885XXXXXX', 'Test
 automation message', incidentGr);
}
```

Scoped equivalent

To use the *sendSMS()* method in a scoped application, use the corresponding scoped method: NotifyScoped - sendSMS().

Notify - unmute(GlideRecord participantRecord)

Unmutes the specified conference call participant.

Parameters

Name	Type	Description
participantRecord	GlideRecord	GlideRecord from the notify_participant table for the participant to unmute.

Returns

Type	Description
void	

The following example shows how to unmute a caller.

```
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    SNC.Notify.unmute(notifyParticipantGr);
}
```

Scoped equivalent

To use the *unmute()* method in a scoped application, use the corresponding scoped method: NotifyScoped - unmute().

NotifyScoped - Scoped

The *NotifyScoped* API allows you to interact with Notify calls and SMS messages using scripts.

Execute the *NotifyScoped* class and its associated methods from the `sn_notify` namespace.

NotifyScoped - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall, GlideRecord conferenceCallRecord, String userSysId, String groupSysId, GlideRecord sourceRecord)

Calls the specified E.164-compliant telephone number.

Parameters

Name	Type	Description
notifyPhoneNumber	String	Notify phone number from which to make the call. When you initiate a call, the outgoing call workflow for the number group associated with this number runs. Ensure this workflow includes a **join conference call** activity to connect the user to the conference call.
toPhoneNumber	String	Phone number to call. Called numbers are added to the conference call.
conferenceCall	GlideRecord	Optional. If this parameter is passed in, the callers identified in the *toPhoneNumber* parameter are automatically joined into the conference call identified by this record. GlideRecord for the Notify Call [notify_call] table which identifies the conference call record. This record is automatically added to the outgoing call workflow scratchpad as the workflow.scratchpad.conference_call variable.
userSysId	String	Optional. Unique identifier (sys_id) of the user associated with the call.
groupSysId	String	Optional. Unique identifier (sys_id) of the group associated with the call.
sourceRecord	GlideRecord	Optional. Source record that prompted this call.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example illustrates how to initiate a call to another phone number.

```
var from = '+14048007337';
var to = '+31646810495';

// set up call
new sn_notify.NotifyScoped().call(from, to);
```

This example illustrates how to initiate a call to a list of telephone numbers and automatically join those numbers into a new conference call.

```
var notify = new sn_notify.NotifyScoped();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789',
 '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call
 participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}
```

NotifyScoped - conferenceCall(GlideRecord sourceRecord)

Creates a new conference call GlideRecord.

Parameters

Name	Type	Description
sourceRecord	GlideRecord	Optional. Record that initiated the request to create the conference call. Used to populate the source and table fields on notify_conference_call record.

Returns

Type	Description
GlideRecord	New Notify conference call [notify_conference_call] record.

```
var notify = new sn_notify.NotifyScoped();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789',
 '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call
 participants
for (var i in participants) {
    var to = participants[i];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    notify.call(from, to, conferenceCall);
}
```

NotifyScoped - dequeueCall(GlideRecord callRecord)

Resumes a call after it was put in a queue (on hold).

Use this method to resume calls that were put in a queue with the *queueCall()* method.

Parameters

Name	Type	Description
callRecord	GlideRecord	GlideRecord object on the Notify Call [notify_call] table with the held call you want to resume.

Returns

Type	Description
void	

The following example shows how to reactivate a call that was put on hold.

```
var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    sn_notify.NotifyScoped.dequeueCall(notifyCallGr);
}
```

NotifyScoped - forwardCall(GlideRecord call, String destination, String dtmf)

Forwards the specified call to a different call recipient.

Parameters

Name	Type	Description
call	GlideRecord or String	Notify call record or the telephony provider call ID, of the call to be forwarded.
destination	GlideRecord or String	Notify phone number record or an E.164-compliant phone number, of the caller to which to forward the call.
dtmf	String	Dual Tone - Multi Frequency (DTMF) code to send upon call connection.

Returns

Type	Description
void	

The following example shows how to forward a call to another phone number.

```
var callID = 'CA92374b5aa561dab476a7001db6026edc'; // Twilio
 Call ID
var phoneNumber = '+91406xxxxxxx';
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var dtmfTones = null;

var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    sn_notify.NotifyScoped.forwardCall(notifyCallGr(or) callID,
 phoneNumber, dtmfTones)
}
```

NotifyScoped - getAvailableClients(String notifyNumber)

Returns a list of client sessions that are available to receive calls.

Parameters

Name	Type	Description
notifyNumber	String	Valid Notify phone number.

Returns

Type	Description
Array	GlideRecord from the notify_client_session table for the specified phone number. Returns "0" if there are no available client sessions.

The following example shows how to use the *`getAvailableClients()`* method to index into the notify_client_session table and then iterate across all available Notify clients.

```
var clientSessionGr =
 sn_notify.NotifyScoped.getAvailableClients('+185xxxxxxxx');
// Here clientSessionGr is of type GlideRecord on
 'notify_client_session' table.

var isLoggedInUserAvailable = false;
while (clientSessionGr.next()) {
  if (clientSessionGr.user == gs.getUserID())
    isLoggedInUserAvailable = clientSessionGr.available;
}
gs.info('isLoggedInUserAvailable - ' + isLoggedInUserAvailable);
```

NotifyScoped - getPhoneNumbers()

Returns all phone numbers and short codes available to Notify.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	List of NotifyPhoneNumber objects, each object representing one phone number available to Notify.

This example illustrates how to obtain the Notify phone numbers and then iterate over the list.

```
// Instantiate notify
var notify = new sn_notify.NotifyScoped();

// Retrieve all available phone numbers
var phoneNumbers = notify.getPhoneNumbers();

// Iterate over phone numbers
for (var i = 0; i < phoneNumbers.length; i++) {
  var number = phoneNumbers[i];

  // Perform any actions using each phone number

}
```

NotifyScoped - getShortCodes()

Returns all short codes available to Notify.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example illustrates how to obtain the Notify short codes and then iterate over the list.

```
// Instantiate notify
var notify = new sn_notify.NotifyScoped();

// Retrieve all available shortcodes
var shortCodes = notify.getShortCodes();

// Iterate over phone numbers
for (var i = 0; i < shortCodes.length; i++) {
  var shortCode = shortCodes[i];
  gs.log(shortCode.getNumber());

//perform any actions using each shortcode

}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyScoped - getTokens(GlideRecord, record)

Returns client tokens for any active telephony drivers for use in WebRTC or mobile clients.

This method uses the currently logged-in user record as the client.

Parameters

Name	Type	Description
record	GlideRecord	GlideRecord to use to identify the Notify client, such as a group record or a user record.

Returns

Type	Description
String	Web RTC tokens for the supported drivers, as a JSON string with the following format: {driverName1: "token1", driverName2: "token2"}, such as "TwilioDirect":"eyJhxxxx.eyJleHAiOiIxxxx.7fejxxx_mbLxxx"

This example shows how to obtain the client tokens for the currently logged in user.

```
// get Notify client Tokens per active Notify driver for the
 currently logged in user
var json = new sn_notify.NotifyScoped().getTokens();

// Parse the JSON that was return into a tokens object
var tokens = JSON.parse(json);

// Log line
gs.log('Notify client tokens for the currently logged in user');

 // iterate over the driver tokens
for (var driver in tokens) {
  gs.log(driver + ' Driver token: ' + tokens[driver]);
}
```

This example shows how to obtain the client tokens for every Notify group.

```
// instantiate Notify
var notify = new sn_notify.NotifyScoped.Notify();

// get all Notify Groups
var notifyGroup = new GlideRecord("notify_group");
notifyGroup.query();

// iterate over all notify groups
while (notifyGroup.next()) {
  // generate Notify Client tokens per active Notify Driver for
 this group
  var json = notify.getTokens(notifyGroup);
  var tokens = JSON.parse(json);

  for (var driver in tokens) {
    gs.log(gs.getMessage("Notify Client token for
 {0} driver and Notify Group '{1}': {2}", [driver,
 notifyGroup.getValue('name'), tokens[driver]]));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  }
}
```

This example illustrates how to obtain the client tokens for the active telephony drivers.

```
var notify = new sn_notify.NotifyScoped();
var now_GR = new GlideRecord('sys_user');
if (now_GR.get(gs.getUserID())) {
  gs.info(notify.getTokens(now_GR));
}
```

Output:

```
{"TwilioDirect":"eyJhxxxx.eyJleHAiOiIxxxx.7fejxxx_mbLxxx"}
```

NotifyScoped - getTokenTTL(String owner)

Returns the maximum amount of time that a client session stays active for a specified telephony driver before automatically timing out.

Parameters

Name	Type	Description
owner	String	Name of the telephony driver for which to retrieve the session length. Valid values: • Twilio: for the old driver • TwilioDirect: for the new driver

Returns

Type	Description
Integer	Maximum length of the session (in seconds). Default: 1800 seconds

The following example shows how to properly call this method and the associated response. It also shows what is returned if an invalid driver is passed.

```
var owner = "TwilioDirect";  // Valid driver
var ttl = SNC.Notify.getTokenTTL(owner);
gs.info("Token TTL for " + owner + " --> " + ttl);

owner = "Abcxyz";  // Invalid driver
ttl = SNC.Notify.getTokenTTL(owner);
// For an invalid driver, we throw NoSuchNotifyDriverException
 saying that Abcxyzdriver is not available
// and return the default value of TTL
gs.info("Token TTL for " + owner + " --> " + ttl);
```

NotifyScoped - hasCapability(String notifyPhoneNumber, String capability)

Determines whether the specified phone number has the specified capability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The telephony driver associated with the phone number contains a list of all of the capabilities of the phone.

Note: In the base system, the Notify JS driver only has 'show_speakers' as a capability; this can be modified.

Parameters

Name	Type	Description
notifyPhoneNumber	String	Phone number for which to check for the specified capability.
capability	String	Capability to detect. The string text must be an exact match to what is in the phone.

Returns

Type	Description
Boolean	Flag that indicates whether the specified phone has the specified capability. • true: phone has the capability • false: phone does not have the capability

This example shows how to check if a phone has a specific capability.

```
// Each driver has a defined set of capabilities.

var capability = 'show_speakers';
gs.info(sn_notify.NotifyScoped.hasCapability('+185xxxxxxxx',
 capability)); // true

capability = 'send_sms';
gs.info(sn_notify.NotifyScoped.hasCapability('+185xxxxxxxx',
 capability)); // false
```

NotifyScoped - kick(GlideRecord participant)

Removes the specified caller from the current Notify conference call.

Parameters

Name	Type	Description
participant	GlideRecord	GlideRecord object containing the Notify Participant [notify_participant] record of the caller to remove from the conference call.

Returns

Type	Description
void	

This example shows how to remove a participant from a call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var participant = new GlideRecord('notify_participant');
participant.get('<sys_id>');
if (participant.isValid()) {
    new sn_notify.NotifyScoped().kick(participant);
}
```

NotifyScoped - modifyCall(GlideRecord callRecord, NotifyAction notifyAction)

Performs one or more activities on an active Notify phone call.

Use this method to change the behavior of a call. For example, transferring a call, playing audio, or forcing a hangup.

Note: The scoped implementation of this method only supports custom Notify activities. Unlike the global implementation, it does not provide a *NotifyAction* API. For details on how to create a custom Notify activity, see Notify workflow activities.

Parameters

Name	Type	Description
callRecord	GlideRecord	Notify Call [notify_call] record of the call for which to apply the actions.
notifyAction	NotifyAction	NotifyAction object describing one or more activities to perform on the call.

Returns

Type	Description
void	

NotifyScoped - mute(GlideRecord participantRecord)

Mutes the specified conference call participant.

Parameters

Name	Type	Description
participantRecord	GlideRecord	GlideRecord from the notify_participant table for the participant to mute.

Returns

Type	Description
void	

The following example shows how to mute a caller.

```
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    sn_notify.NotifyScoped.mute(notifyParticipantGr);
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyScoped - queueCall(GlideRecord callRecord)

Puts the specified call into a queue (on hold).

Resume a queued call using the *dequeueCall()* method.

Parameters

Name	Type	Description
callRecord	GlideRecord	GlideRecord object of the Notify Call record (notify_call table) to put on hold.

Returns

Type	Description
void	

```
var call = new GlideRecord('notify_call');
call.get('<call record sys_id>');
if (call.isValid()) {
    new sn_notify.NotifyScoped().queueCall(call);
}
```

NotifyScoped - sendBulkSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumbers, String messageBody, GlideRecord source)

Sends a specified SMS message to the specified list of Notify clients (phone numbers).

Parameters

Name	Type	Description
notifyPhoneNumber	NotifyPhoneNumber	Phone number from which the SMS message is being sent.
toPhoneNumbers	String	Comma separated list phone numbers to which to send the SMS message. Format: E.164-compliant
messageBody	String	SMS text to send.
source	GlideRecord	Source record that prompted this SMS message, such as an incident.

Returns

Type	Description
String	Null

This example shows how to send an SMS message to multiple phone numbers (bulk SMS).

```
var incidentGr = new GlideRecord('incident');
incidentGr.get('active incident sys_id');
if (incidentGr.isValid()) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    sn_notify.NotifyScoped.sendBulkSMS('+15413970605',
 ['+919885XXXXXX', '+919775XXXXXX'], 'Test automation message',
 incidentGr);
}
```

NotifyScoped - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source)

Sends an SMS text message to an E.164-compliant phone number.

This method creates a new record on the Notify Message [notify_message] table and associates it with the source record.

Parameters

Name	Type	Description
notifyPhoneNumber	NotifyPhoneNumber	Notify phone number or short code to which to send this SMS message.
toPhoneNumber	String	E.164-compliant phone number to which to send the SMS message.
messageBody	String	SMS text message.
source	GlideRecord	Source record that prompted this SMS message, such as an incident.

Returns

Type	Description
String	Unique message SID; stored in the Notify Message [notify_message] record as message_id.

The following example shows how to send an SMS message.

```
var incidentGr = new GlideRecord('incident');
incidentGr.get('active incident sys_id');
if (incidentGr.isValid()) {
    sn_notify.NotifyScoped.sendSMS('+15413970605',
 '+919885XXXXXX', 'Test automation message', incidentGr);
}
```

NotifyScoped - unmute(GlideRecord participantRecord)

Unmutes the specified conference call participant.

Parameters

Name	Type	Description
participantRecord	GlideRecord	GlideRecord from the notify_participant table for the participant to unmute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to unmute a specified call participant.

```
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    sn_notify.NotifyScoped.unmute(notifyParticipantGr);
}
```

NotifyAction - Global

The *NotifyAction* API allows you to define actions to send to a telephony provider.

You add actions to a NotifyAction object by calling the respective add function for each type of action. Each add function returns an Action object, such as a SayAction object for the *addSay()* method. Refer to each method example for information about returned objects.

Note: The *NotifyAction* API is only valid within global applications. To utilize this type of functionality within scoped applications, you must create custom Notify workflow activities. For additional information on creating these activities, see Notify workflow activities.

NotifyAction - addConference()

Adds a conference action to move the current call into the current conference call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ConferenceAction	Action added to the NotifyAction object. Use the ConferenceAction object to define the conference call name, and the behavior of the conference call when a participant joins or leaves.

This example demonstrates how to add a conference action and set the name of the conference.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set its name
var conference = notifyAction.addConference();
conference.setName('Brown Bag: Week 3');
```

NotifyAction - addConference.setEndOnExit(Boolean endOnExit)

Defines whether the conference call should end when a specified caller exits the conference call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
endOnExit	Boolean	Flag that indicates whether the conference call should end when the specified caller exits the current conference call. • true: end the conference call when the specified caller exits the conference call • false: Default. End the conference call once all participants exit

Returns

Type	Description
void	

This example demonstrates how to add a conference call action and then set it so the conference call ends when the specified caller exits.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set the caller that starts
 the meeting
var conference = notifyAction.addConference();

// retrieve the participant for which the conference call should
 exit when they leave
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
conference.setEndOnExit(true);
}
```

NotifyAction - addConference.setHangupOnStar(Boolean hangupOnStar)

Defines whether the conference call should end when a participant presses the star (*) key.

Parameters

Name	Type	Description
hangupOnStar	Boolean	Flag that indicates whether the conference call should end when a participant presses the star (*) key. Valid values: • true: end the conference call • false: Default. Don't end the conference call

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example demonstrates how to add a conference action and then record the conference call.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set the hang up action
var conference = notifyAction.addConference();
conference.setHangupOnStar(true);
```

NotifyAction - addConference.setMuted(Boolean muted)

Defines whether the specified caller should be muted in the current conference call.

If you do not call this method, the caller is not muted by default.

Parameters

Name	Type	Description
muted	Boolean	Flag that indicates whether the specified caller should be muted in the current conference call. • true: caller should be muted • false: Default. Caller should not be muted

Returns

Type	Description
void	

This example demonstrates how to add a conference action and then mute a specified caller.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set it to mute the specified
 participant
var conference = notifyAction.addConference();

var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
conference.setMuted(true);
}
```

NotifyAction - addConference.setName(String name)

Sets the name of the current conference call to the specified name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	Name to associate with the current conference call.

Returns

Type	Description
void	

This example demonstrates how to add a conference action and set the name of the conference call.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set its name
var conference = notifyAction.addConference();

conference.setName('Brown Bag: Week 3');
```

NotifyAction - addConference.setRecord(Boolean record)

Defines whether the associated conference call should be recorded.

If you do not call this method, the conference call is not recorded by default.

Parameters

Name	Type	Description
record	Boolean	Flag that indicates whether the current conference call should be recorded. • true: start recording the conference call • false: Default. Conference call is not recorded. Recording is stopped if it is currently being recorded.

Returns

Type	Description
void	

This example demonstrates how to add a conference action and then record the conference call.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set it to be recorded
var conference = notifyAction.addConference();
conference.setRecord(true);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyAction - addConference.setStartOnEnter(Boolean startOnEnter)

Defines whether the conference call should start when the specified caller joins the conference call.

By default, whenever there are two or more callers, the conference call starts. To make it so the conference call only starts when a specific caller joins, you must call this method for each of the other callers and set the value to "false". By doing this, the conference call will not start until the desired person joins the conference call.

Parameters

Name	Type	Description
startOnEnter	Boolean	Flag that indicates whether the conference call should start when the selected caller joins the current conference call. • true: Default. Start the conference call when the specified caller joins the conference call. • false: start the conference call once it is added

Returns

Type	Description
void	

This example demonstrates how to add a conference action and then set it so the conference call does not start until the specified caller joins.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set the caller that starts
 the meeting
var conference = notifyAction.addConference();

// retrieve the participant for which the conference call should
 start when they arrive
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
conference.setStartOnEnter(true);
}
```

NotifyAction - addDial()

Forwards a call to a specified phone number or Notify Client.

Once the addDial action is created, the associated phone number (*`setPhoneNumber()`*) or Notify Client (*`setClientRecord()`*) must also be set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
DialAction	Action added to the NotifyAction object.

This example shows how to make an outbound call and record the call.

```
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an
 object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber)in DialAction.java to
 specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// Invoke setRecord(Boolean record) to record the call to this
 new number +919765xxxxxxx
dialAction.setRecord(true);
```

NotifyAction - addDial.setCallerID(String callerID)

Defines the caller ID for the outgoing call.

Parameters

Name	Type	Description
callerID	String	Caller identifier to set for the outgoing call.

Returns

Type	Description
void	

This example shows how to make an outbound call and set a call timeout.

```
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an
 object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber)in DialAction.java to
 specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Set the caller ID
dialAction.setCallerID('Planning Conf Call');
```

NotifyAction - addDial.setClientRecord(String tableName, String sysID)

Sets the current caller to a Notify caller by specifying the table in which to find the Notify caller record and the caller's unique identifier.

Parameters

Name	Type	Description
tableName	String	Name of the table that contains the desired caller's information.
sysID	String	Unique identifier (sys_id) of the desired Notify caller.

Returns

Type	Description
void	

This example shows how to set the current caller to a Notify caller using setClientRecord().

```
// set up a dial action to forward the
// call to the specified client
var action = new SNC.NotifyAction();
var dial = action.addDial();
dial.setClientRecord(notifyClientRecord.getTableName(),
 notifyClientRecord.getUniqueValue());
dial.setTimeout(activity.vars.timeout);
dial.setRecord(activity.vars.record);
```

NotifyAction - addDial.setDTMF(String value)

Defines the DTMF tones to play when the call connects.

Parameters

Name	Type	Description
value	String	Valid DTMF digits to play when the call connects.

Returns

Type	Description
void	

This example shows how to make an outbound call and defines the DTMF tones to play when the call connects.

```
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an
 object of type DialAction
var dialAction = notifyAction.addDial();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Call setPhoneNumber(String phoneNumber)in DialAction.java to
 specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// DTMF tones to play when call connects
dialAction.setDTMF("1246AF");
```

NotifyAction - addDial.setHangupOnStar(Boolean hangupOnStar)

Defines whether the call should end when the star (*) key is pressed.

Parameters

Name	Type	Description
hangupOnStar	Boolean	Flag that indicates whether the call should end when the star (*) key is pressed. • true: end the call • false: don't end the call

Returns

Type	Description
void	

This example shows how to make an outbound call and set the hang up key to star.

```
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an
 object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber)in DialAction.java to
 specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// End call by pressing star
dialAction.setHangupOnStar(true);
```

NotifyAction - addDial.setPhoneNumber(String phoneNumber)

Defines the phone number to call.

Parameters

Name	Type	Description
phoneNumber	String	E.164-compliant phone number to call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

This example shows how to make an outbound call and set a call timeout.

```
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an
 object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber)in DialAction.java to
 specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');
```

NotifyAction - addDial.setRecord(Boolean record)

Defines whether the outgoing call should be recorded.

Parameters

Name	Type	Description
record		Flag that indicates whether the outgoing call should be recorded. Valid values: • true: record the outgoing call • false: do not record the outgoing call

Returns

Type	Description
void	

This example shows how to make an outbound call and record the call.

```
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an
 object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber)in DialAction.java to
 specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// Record the call
dialAction.setRecord(true);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyAction - addDial.setTimeout(Integer timeout)

Sets the number of seconds after which the outgoing call times out.

Parameters

Name	Type	Description
timeout	Integer	Number of seconds after which the outgoing call times out. Default: 30

Returns

Type	Description
void	

This example shows how to make an outbound call and set a call timeout.

```
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an
 object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber)in DialAction.java to
 specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// Set the number of seconds to wait before timing out
dialAction.setTimeout(45);
```

NotifyAction - addGather()

Presents a specified interactive phone menu to the caller.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GatherAction	Action added to the NotifyAction object. Use the GatherAction object to define the menu settings and options to present to the user.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(1);    // the user can type 1 digit
gather.setFinishKey('#');       // # or *, useful for > 1 digit
gather.setTimeout(10);          // time to enter answer, in
 seconds
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// add first menu item
var usSay = gather.addSay();
usSay.setText('Press 1 for english');
usSay.setLanguage('en-US');

// add second menu item
var nlSay = gather.addSay();
nlSay.setText('Kies 2 voor Nederlands');
nlSay.setLanguage('nl-NL');

// add third menu item
var frSay = gather.addSay();
frSay.setText('Choisissez 3 pour le français.');
frSay.setLanguage('fr-FR');

// and finish off with an applause
var play = gather.addPlay();
play.setURL('http://
www.wavsource.com/snds_2015-04-12_5971820382841326/sfx/applause_
y.wav');
```

NotifyAction - addGather.addPlay()

Plays an audio file on the call.

Refer to the NotifyAction `addPlay()` method for a description of the supported child methods.

Parameters

Name	Type	Description
None		

Returns

Type	Description
PlayAction	Action added to the NotifyAction object. Use the PlayAction object to define the audio file URL and the number of times to loop the audio.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// Create the gather action object
var gather = notifyAction.addGather();

// Play an audio file
var play = gather.addPlay();
play.setURL('http://
www.wavsource.com/snds_2015-04-12_5971820382841326/sfx/applause_
y.wav');
```

NotifyAction - addGather.addSay()

Defines the text-to-speech to read on the call.

Refer to the NotifyAction `addSay()` method for a description of the supported child methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
SayAction	Action added to the NotifyAction object. Use the SayAction object to define the text and language to read.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(1);    // the user can type 1 digit
gather.setTimeout(20);          // time to enter answer, in
 seconds

// add first menu item
var gatherSay = gather.addSay();
gatherSay.setText('Press 1 for english');
gatherSay.setLanguage('en-US');
```

NotifyAction - addGather.setFinishKey(String finishKey)

Defines the key that the caller inputs to denote the end of their input.

Parameters

Name	Type	Description
finishKey	String	Key that denotes the end of caller input. Valid values: • 0-9 • # (default) • *

Returns

Type	Description
void	

This example shows how to add a gather action and define the key that denotes the end of the caller input.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var gather = notifyAction.addGather();
gather.setNumberOfDigits(4);    // the user can type four digit
gather.setFinishKey('#');       // # or *, useful for > 1 digit
```

NotifyAction - addGather.setNumberOfDigits(Integer numberOfDigits)

Defines the number of digits to collect.

Parameters

Name	Type	Description
numberOfDigits	Integer	Number of digits to collect. Zero is an invalid value.

Returns

Type	Description
void	

This example shows how to add a gather action and define the number of key strokes to collect.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(4);    // the user can type four digit
gather.setFinishKey('#');       // # or *, useful for > 1 digits
gather.setTimeout(20);          // time to enter answer, in
 seconds
```

NotifyAction - addGather.setTimeout(Integer timeout)

Defines the amount of time after which gathering of input will timeout.

Parameters

Name	Type	Description
timeout	Integer	Number of seconds to wait for caller input before timing out. Default: 10

Returns

Type	Description
void	

This example shows how to add a gather action and define the input timeout value.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(4);    // the user can type 1 digit
gather.setFinishKey('#');       // # or *, useful for > 1 digits
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gather.setTimeout(20);          // time to enter answer, in
 seconds
```

NotifyAction - addHangUp()

Ends an active phone call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
HangUpAction	Action added to the NotifyAction object.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// hang up
notifyAction.addHangUp();
```

NotifyAction - addQueue()

Queues the call, which puts the call on hold.

Parameters

Name	Type	Description
None		

Returns

Type	Description
QueueAction	Action added to the NotifyAction object. Use the QueueAction object to define the queue name, and queueing or dequeueing behavior.

This example shows how to add the call to the specified queue.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// queue the call
var queue = notifyAction.addQueue();
queue.setName('my queue');
```

This example shows how to remove the call from the queue.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// dequeue the call
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var queue = notifyAction.addQueue();
queue.setDequeue(true);
```

NotifyAction - addQueue.setDequeue(Boolean dequeue)

Removes the call from the current call queue (takes it off of "hold").

Parameters

Name	Type	Description
dequeue	Boolean	Flag that indicates whether to remove the current call from the queue. • true: remove the call from the queue • false: call is put in the queue

Returns

Type	Description
void	

This example shows how to remove the call from the queue.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// dequeue the call
var queue = notifyAction.addQueue();
queue.setDequeue(true);
```

NotifyAction - addQueue.setName(String name)

Defines the name associated with a queue.

Parameters

Name	Type	Description
name	String	Name to associate with the queue.

Returns

Type	Description
void	

This example shows how to define the name of a queue.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// queue the call
var queue = notifyAction.addQueue();
queue.setName('my queue');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyAction - addPlay()

Plays an audio file on the call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
PlayAction	Action added to the NotifyAction object. Use the PlayAction object to define the audio file URL and number of times to loop the audio.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(1);
```

NotifyAction - addPlay.setLoop(Integer loop)

Defines the number of times to play (loop through) the audio file.

Parameters

Name	Type	Description
loop	Integer	Number of times to play the audio file.

Returns

Type	Description
void	

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(2);
```

NotifyAction - addPlay.setURL(String url)

Defines the URL where to obtain the audio file to play.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
url	String	URL of the audio file to play.

Returns

Type	Description
void	

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(1);
```

NotifyAction - addRecord()

Adds an action to record the call to the current NotifyAction object.

The recording automatically ends when the call is completed or when a specified terminate is pressed (*`setFinishKey()`*). The recording is then placed in the notify_record table for the associated call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

This example demonstrates how to record a call.

```
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addRecord() of NotifyAction - This returns an object of
 type RecordAction
var recordAction = notifyAction.addRecord();

// Optional. Define the key that callers use to stop the
 recording
recordAction.setFinishKey('#'); // Stop the call recording when
 caller presses the '#' key.
```

NotifyAction - addRecord.setFinishKey(String finishKey)

Defines the key that terminates the recording.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
finishKey	String	Key that terminates the recording. Valid values: • 0-9 • # (default) • *

Returns

Type	Description
void	

This example demonstrates how to record a call and set the call termination key.

```
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Then we call addRecord() of NotifyAction
var recordAction = notifyAction.addRecord();

// Set the key that terminates the recording
recordAction.setFinishKey('#'); // This means that we stop the
 call recording when user presses the '#' key.
```

NotifyAction - addRecord.setMaxDuration(Integer seconds)

Defines the maximum length of the recording.

Parameters

Name	Type	Description
seconds	Integer	Maximum length of the recording in seconds. Default: 3600

Returns

Type	Description
void	

This example demonstrates how to record a call and set the call termination key.

```
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Then we call addRecord() of NotifyAction
var recordAction = notifyAction.addRecord();

// Set the maximum length of the recording
recordAction.setMaxDuration(4800);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyAction - addRecord.setTimeout(Integer timeout)

Sets the number of seconds of silence, after which, the recording ends.

Parameters

Name	Type	Description
timeout	Integer	Number of seconds of silence on the call, after which the recording ends. Default: 10

Returns

Type	Description
void	

This example demonstrates how to record a call and set the recording timeout value.

```
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Then we call addRecord() of NotifyAction
var recordAction = notifyAction.addRecord();

// Set the recoding timeout value
recordAction.setTimeout(360);
```

NotifyAction - addReject()

Rejects an incoming call.

Parameters

Name	Type	Description
None		

Returns

Type	Description
RejectAction	Action added to the NotifyAction object. Use the RejectAction object to define the reason for rejecting the call.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// reject the call
var rejectAction = notifyAction.addReject();
rejectAction.setReason('busy'); // 'busy' or 'rejected'
```

NotifyActon - addReject.setReason(String reason)

Defines the reason why the call was rejected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
reason	String	Reason why the call was rejected. Valid values: • busy • rejected All other values are ignored.

Returns

Type	Description
void	

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// reject the call
var rejectAction = notifyAction.addReject();
rejectAction.setReason('busy'); // 'busy' or 'rejected'
```

NotifyAction - addSay()

Defines the text-to-speech to read on the call.

Multiple languages are supported with text-to-speech. Available languages depend on the telephony provider.

Parameters

Name	Type	Description
None		

Returns

Type	Description
SayAction	Action added to the NotifyAction object. Use the SayAction object to define the text and language to read.

This example demonstrates reading text in several languages.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak english');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kan auch deutsch sprechen');
deSay.setLanguage('de-DE');
```

NotifyAction - addSay.setLanguage(String language)

Defines the language in which to speak the text.

Use this method in conjunction with the *setText()* method to define the verbiage to speak.

Parameters

Name	Type	Description
language	String	ISO 3166 language code that defines the language in which to speak the associated text. For example, "en-US" or "nl-NL".

Returns

Type	Description
void	

This example demonstrates reading text in several languages.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak english');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kan auch deutsch sprechen');
deSay.setLanguage('de-DE');
```

NotifyAction - addSay.setText(String text)

Defines the text to be read within the current call.

Use this method in conjunction with the *setLanguage()* method to define the language in which to speak the provided text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
text	String	Text to read aloud within the current call.

Returns

Type	Description
void	

This example demonstrates reading text in several languages.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak english');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kan auch deutsch sprechen');
deSay.setLanguage('de-DE');
```

NotifyAction - addSMS()

Sends an SMS message.

Note: When using this function with an active call, you do not need to call the *setTo* function on the returned SMSAction object. The SMS is automatically sent to the caller.

Parameters

Name	Type	Description
None		

Returns

Type	Description
SMSAction	Action added to the NotifyAction object. Use the SMSAction object to define the message text and the phone number to which to send the message.

```
// Instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// Define where to send the SMS to
var number = new GlideElementPhoneNumber();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
number.setPhoneNumber('+31612345678', true);

// Add an SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur
 adipiscing elit.');
sms.setTo(number);
```

NotifyAction - addSMS.setMessage(String message)

Defines the text of the SMS message to send.

Parameters

Name	Type	Description
message	String	Text of the SMS message to send.

Returns

Type	Description
void	

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// define where to send the sms to
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// add a SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur
 adipiscing elit.');
sms.setTo(number);
```

NotifyAction - addSMS.setTo(String to)

Sets the phone number to which to sent the SMS message.

Parameters

Name	Type	Description
to	String	E.164-compliant phone number to which to send the SMS message.

Returns

Type	Description
void	

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// define where to send the sms to
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// add a SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur
 adipiscing elit.');
sms.setTo(number);
```

NotifyAction - append(NotifyAction action)

Appends the specified NotifyAction object to the current client's NotifyAction object.

There are two types of NotifyActions: terminal and non-terminal. Once you append a terminal action to a client's NotifyAction object, you cannot append any additional actions. Non-terminal actions include:

- PlayAction
- RecordAction
- SayAction
- SMSAction

All others NotifyActions are terminal. If you try to add another NotifyAction after a terminal action, the call will fail.

Parameters

Name	Type	Description
action	NotifyAction	NotifyAction object to append to the NotifyAction object of the current caller.

Returns

Type	Description
void	

NotifyAction - fromJson(String json)

Deserialize a *`NotifyAction`* object from a JSON string.

Parameters

Name	Type	Description
json	String	A JSON string representation of a *`NotifyAction`* object.

Returns

Type	Description
void	

This example demonstrates deserializing a NotifyAction object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var json = ".... some json obtained from toJson ....";

// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// deserialize and reconstruct the notify action instance
notifyAction.fromJson(json);
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```

Output: *** Script: serialization result: {"fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]} *** Script: new serialization result: {"fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]} *** Script: the same: true

NotifyAction - setCallRecord(GlideRecord callRecord)

Defines the Notify call record in which to add subsequent actions.

Parameters

Name	Type	Description
callRecord	GlideRecord	GlideRecord containing the record of the caller (within the notify_call table) for which to add actions. This caller stays in affect until this method is called again with a different caller.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to set the caller to which you want to add actions.

```
public NotifyAction runIncomingCallWorkflow(NotifyPhoneNumber
 notifyPhoneNumber, GlideRecord callRecord) throws
 NoWorkflowConfiguredException, NoSuchNotifyGroupRecordException
 {
   NotifyAction notifyAction = runWorkflow(notifyPhoneNumber,
 COL_INCOMING_CALL_WF, callRecord);
   notifyAction.setCallRecord(callRecord);
   return notifyAction;
}
```

NotifyAction - toJson()

Serialize the *`NotifyAction`* object to a JSON string.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	JSON representation of this NotifyAction object.

This example demonstrates serializing a NotifyAction object.

```
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add one or more notify actions
// ...

// and serialize to json
var json = notifyAction.toJson();
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));
```

Output: *** Script: serialization result: {"fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]} *** Script: new serialization result: {"fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]} *** Script: the same: true

NotifyConferenceUtil - Scoped, Global

The *NotifyConferenceUtil* API provides methods to manage Notify conference calls and SMS messages for various telephony service providers, such as Zoom and Webex.

Using the *NotifyConferenceUtil* API you can:

- Create new conference calls
- Add participants by phone number or user ID
- Remove participants from a conference call
- Mute participants in a conference call
- Unmute participants in a conference call
- Obtain the capabilities of a specified service provider
- End a conference call

You can use this API in both scoped and global scripts. To use this API you must activate the Conference Notify plugin (com.snc.notify) which requires a separate subscription. For details on activating this plugin, see Activate Notify.

NotifyConferenceUtils - NotifyConferenceUtils()

Instantiates a NotifyConferenceUtils object (constructor).

Parameters

Name	Type	Description
None		

```
function () {
 var confGR = new GlideRecord('notify_conference_call');
 confGR.get('76d3364d0b5133008e64aabcb4673a6d');

 var confUtils = new NotifyConferenceUtils();
 var actionResult =
 confUtils.addToConferenceByPhoneNumber("+917799555331", confGR)
 if (actionResult.status)
  gs.info('Participant has been added to conference');
 else {
  gs.info('join operation failed');
  actionResult.warnMessages.forEach(function (msg) {
   gs.info(msg);
  });
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  actionResult.errorMessages.forEach(function (msg) {
   gs.info(msg);
  })
 }
})();
```

NotifyConferenceUtils - addToConferenceByPhoneNumber(String toNumber, GlideRecord confGR)

Adds a participant to a specified conference call using their phone number to identify the participant.

Parameters

Name	Type	Description
toNumber	String	Phone number of the participant to add to the conference call.
confGR	GlideRecord	GlideRecord of the conference call to which to add the specified participant. These records are located in the Notify Conference Call [notify_conference_call] table.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty.
	
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing.
	
	• Data type: Array of Strings
	
	`<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing.
	
	• Data type: Array of Strings

```
function () {
 var confGR = new GlideRecord('notify_conference_call');
 confGR.get('76d3364d0b5133008e64aabcb4673a6d');

 var confUtils = new NotifyConferenceUtils();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 var actionResult =
 confUtils.addToConferenceByPhoneNumber("+917799555331", confGR)
 if (actionResult.status)
  gs.info('Participant has been added to conference');
 else {
  gs.info('join operation failed');
  actionResult.warnMessages.forEach(function (msg) {
   gs.info(msg);
  });
  actionResult.errorMessages.forEach(function (msg) {
   gs.info(msg);
  })
 }
})();
```

NotifyConferenceUtils - addToConferenceByUserId(String userId, GlideRecord confGR)

Adds a participant to the conference call referenced by the passed in GlideRecord using their unique user identifier.

Parameters

Name	Type	Description
userId	String	Sys ID of the participant to add to the specified conference call. This information is located in the User [sys_user] table.
confGR	GlideRecord	GlideRecord of the conference call to add the specified participant. These records are located in the Notify Conference Call [notify_conference_call] table.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty.
	
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing.
	
	• Data type: Array of Strings
	
	`<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Data type: Array of Strings

```
(function () {
 var confGR = new GlideRecord('notify_conference_call');
 confGR.get('76d3364d0b5133008e64aabcb4673a6d');

 var confUtils = new NotifyConferenceUtils();
 var actionResult =
 confUtils.addToConferenceByUserId(gs.getUserID(), confGR)
 if (actionResult.status)
  gs.info('Participant has been added to conference');
 else {
  gs.info('join operation failed');
  actionResult.warnMessages.forEach(function (msg) {
   gs.info(msg);
  });
  actionResult.errorMessages.forEach(function (msg) {
   gs.info(msg);
  })
 }
})();
```

NotifyConferenceUtils - doConferenceAction(String action, Object data)

Performs the specified conference call action, such as starting/ending a conference call or joining, removing, muting, or unmuting participants from a conference call.

You can start a new conference call and add participants within a single call to this method or call the method multiple times to start the call and then manage participants separately. In addition, through the passed in data object, you can configure the method to:

- Save pointers in the conference call record to the specific record (source record), such as an incident or problem, that is the topic of discussion for the conference call.
- Allow/disallow multiple conference calls for a source record.
- Automatically log the participants that were in the conference call in the "Work Notes" field of the source record.
- Have a message read aloud when a participant answers an outgoing call from the conference.

Parameters

Name	Type	Description
action	String	Defines the conference call action to perform. The following are the available conference call actions: • start: Starts the conference call identified in *data.confId* • end: Terminates the conference call identified in *data.confId*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• join: Adds the participant specified in the *data.items* array to the conference call identified in *data.confId* • multiJoin: Adds the participants specified in the *data.items* array to the conference call identified in *data.confId* • selfJoin: Adds the currently logged in user to the conference call (no entry in *data.items* required.) • kick: Removes the participant specified in the *data.items* array from the conference call identified in *data.confId* • multiKick: Removes the participants specified in the *data.items* array from the conference call identified in *data.confId* • mute: Mutes the participant specified in the *data.items* array on the conference call identified in *data.confId* • multiMute: Mutes the participants specified in the *data.items* array on the conference call identified in *data.confId* • unmute: Unmutes the participant specified in the *data.items* array from the conference call identified in *data.confId* • multiUnmute: Unmutes the participants specified in the *data.items* array from the conference call identified in *data.confId*
data	Object	Object that describes the conference call.
data.addToWorkNotes	Boolean	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record in which to add the work notes. Default: false Actions for which this parameter is valid: • start • join • multiJoin • selfJoin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
data.allowMulticonference	Boolean	Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false Actions for which this parameter is valid: • start
data.confId	String	Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table. Actions for which this parameter is required: • end • join • multiJoin • selfJoin **Note:** Participant actions such as mute, unmute, and kick do not require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table.
data.fromNumber	String	Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table. Actions for which this parameter is required: • start
data.isNewConference	Boolean	Flag that indicates whether this is a new or an existing conference call. Valid values: • true: New conference call • false: Existing conference call Default: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Actions for which this parameter is valid: • start
data.items	Array	Information for each participant to include in the conference call. Valid array values: • id: Sys ID of user; located in the User [sys_User] table. Valid actions: join, multiJoin, start • notifyParticipantId: Sys ID of the Notify participant; located in the Notify Participant [notify_participant] table. Valid actions: join, kick, multiJoin, mute, start, unmute • phoneNumber: Phone number of the participant. If this value is passed in conjunction with either the *id* or *notifyParticipantId*, this value supersedes the phone numbers in the user/participant record and is used to place the call. Valid actions: join, multiJoin, start • email: Email address of the participant. Valid actions: join, multiJoin, start
data.message	String	Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance." Actions for which this parameter is valid: • start • join • multiJoin
data.serviceProvider	String	Required. Name of conference service provider, such as Zoom or Webex. Actions for which this parameter is required: • all
data.sysId	String	Sys ID of the source record to associate with the conference call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the *`data.Table`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start
data.table	String	Table that contains the source record to associate with the conference call. A source record can be any record, such as an "incident" or "problem", that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the *`data.sysId`*, *`data.addToWorkNotes`*, and *`allowMulticonference`* parameters. Actions for which this parameter is valid: • start

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty.
	
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Data type: Array of Strings `<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing. • Data type: Array of Strings

```
(function (confId) {
 var confUtils = new NotifyConferenceUtils();
 var data = confUtils.getConferenceInputDataTemplate();
 data.table = 'incident';
 data.sysId = '1234';
 data.addToWorkNotes = false;
 data.confId = confId;
 data.message = 'p1 incident has been created';
 data.fromNumber = 'twilio/Telephony driver number';
 data.items.push({ id: 'user3SysId', phoneNumber:
 '+917799555332' });
 data.items.push({ id: 'user4SysId', email:
 'yln99518@gmail.com' });

 var result = confUtils.doConferenceAction('start', data);
 if (result.status) {
  gs.info('Start conference action succeeded');
 } else
  gs.info('Start conference action failed');

 result.errorMessages.forEach(function (msg) {
  gs.info(msg);
 });
 result.warnMessages.forEach(function (msg) {
  gs.info(msg);
 });
 result.successMessages.forEach(function (msg) {
  gs.info(msg);
 });
})('activeConfSysId');
```

NotifyConferenceUtils - getConferenceInputDataTemplate()

Returns a JSON data template to use with the *`doConferenceAction()`* method. Using this template automatically structures the data object so that you don't have to manually create it.

Call this method prior to calling the *`doConferenceAction()`* method. For the desired conference call action, set the desired parameters within the template, and then pass the template in the *`doConferenceAction()`* call. For additional information on the valid parameters for each action, see doConferenceAction().

Note: This is a helper method. You can also manually construct this object and pass that object into the *`doConferenceAction()`* method and have the same outcome.

Parameters

Name	Type	Description
None		

Returns

Type	Description
data	Object that describes the conference call.
data.addToWorkNotes	Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record in which to add the work notes. Default: false Actions for which this parameter is valid: • start • join • multiJoin • selfJoin
data.allowMultconference	Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the *data.table* and *data.sysId* parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false Actions for which this parameter is valid: • start
data.confId	Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table. Actions for which this parameter is required: • end • join • multiJoin • selfJoin

 });
})('activeConfSysId');
```

NotifyConferenceUtils - getServiceProvidersCapabilities()

Returns the capabilities of all telephony service provider drivers in the instance.

Possible capabilities include:

- archive: archives the conference after it ends
- beepOnLeave: plays a "beep" tone when a participant leaves the conference call
- beepOnJoin: plays a "beep" tone when a participant joins the conference call
- end: ends the identified conference call
- filesharing: allows file sharing between participants
- join: adds a participant to a conference call
- kick: removes a participant from a conference call
- multiJoin: adds multiple participants to a conference call
- multiKick: removes multiple participants from a conference call
- muteOnJoin: mutes a participant when they initially join a conference call
- multiUnmute: unmutes multiple participants for a conference call
- record: records conference calls
- recording: provides an on-screen indicator when the conference call is being recorded
- screenSharing: allows participant screens to be shared with the group
- selfJoin: adds the current logged in user to a conference call
- speaking: provides an on-screen message as to who is currently speaking
- start: starts the identified conference call
- unmute: unmutes a participant in a conference call

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Key-value pairs of the status of each driver capability. Valid values: • isSupported = 0: capability is not supported • isSupported = 1: capability is supported

List driver capabilities for all telephony service provider drivers in the instance.

```
(function () {
 var confUtils = new NotifyConferenceUtils();
 var providerToCapability =
 confUtils.getServiceProvidersCapabilites();
 for (var provider in providerToCapability) {
  gs.info('{0} supported capabilities \n\n', provider);
  var capabilities = providerToCapability[provider]
  for (var cap in capabilities)

 if(confUtils.isActionSupported(capabilities[cap].isSupported))
    gs.info('"{0}" action supported', cap);
   else
    gs.info("'{0}' action is not supported by this conference
 driver", cap);
 }
})();
```

Output: The method returns a node similar to the following for each active telephony service provider within the instance.

```
{
    "Telephony": {
        "start": {
            "isSupported": 1,
            "meta": {}
        },
        "end": {
            "isSupported": 1,
            "meta": {}
        },
        "selfJoin": {
            "isSupported": 1,
            "meta": {}
        },
        "join": {
            "isSupported": 1,
            "meta": {}
        },
        "multiJoin": {
            "isSupported": 1,

NotifyConferenceUtils - isActionSupported(Number action)

Determines whether a Notify conference action is supported by a telephony service provider.

To use this method, you must first call the *getServiceProviderCapabilities()* method. This method returns an object that contains information about the availability of each possible Notify conference action for each service provider configured in your instance.

For example:

```
{
    "Telephony": {
        "start": {
            "isSupported": 1,
            "meta": {}
        },
        "end": {
            "isSupported": 1,
            "meta": {}
        },
        "selfJoin": {
            "isSupported": 1,
            "meta": {}
        },
        "join": {
            "isSupported": 1,
            "meta": {}
        },
        "multiJoin": {
            "isSupported": 1,
            "meta": {}
        },
        "mute": {
            "isSupported": 1,
            "meta": {}
        },
        "multiMute": {
            "isSupported": 1,
            "meta": {}
        },
        "unmute": {
            "isSupported": 1,
            "meta": {}
        },
        "multiUnmute": {
            "isSupported": 1,
            "meta": {}
        },
        "kick": {
            "isSupported": 1,
            "meta": {}
        },
        "multiKick": {
```

```
            "isSupported": 1,
            "meta": {}
        },
        "record": {
            "isSupported": 0,
            "meta": {}
        },
        "speaking": {
            "isSupported": 0,
            "meta": {}
        },
        "recording": {
            "isSupported": 0,
            "meta": {}
        },
        "screenSharing": {
            "isSupported": 0,
            "meta": {}
        },
        "fileSharing": {
            "isSupported": 0,
            "meta": {}
        },
        "archive": {
            "isSupported": 0,
            "meta": {}
        },
        "muteOnJoin": {
            "isSupported": 0,
            "meta": {}
        },
        "beepOnJoin": {
            "isSupported": 0,
            "meta": {}
        },
        "beepOnLeave": {
            "isSupported": 0,
            "meta": {}
        }
    }
}
```

Parameters

Name	Type	Description
action	Number	Value of the *isSupported* parameter returned by the *getServiceProvidersCapabilities()* method for a specific action and service provider. **Note:** Although the *isSupported* value may appear to be a Boolean, it is actually a Number. Do not try and evaluate the capabilities as Boolean values. Use this method as the associated values may be expanded in future versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the telephony service provider supports the specified action. Valid values: • true: action is supported by the service provider • false: action is not supported by the service provider

```
(function () {
  var confUtils = new NotifyConferenceUtils();
  var providerToCapability =
 confUtils.getServiceProvidersCapabilites();
    for (var provider in providerToCapability) {
      gs.info('{0} supported capabilities \n\n', provider);
      var capabilities = providerToCapability[provider]
      for (var cap in capabilities)
        if
 (confUtils.isActionSupported(capabilities[cap].isSupported))
          gs.info('"{0}" action supported', cap);
        else
          gs.info("'{0}' action is not supported by this
 conference driver", cap);
    }
})();
```

NotifyConferenceUtils - kickByParticipantGR(GlideRecord notifyParticipantGR)

Removes the participant associated with the passed in GlideRecord from the current conference call.

Parameters

Name	Type	Description
notifyParticipantGR	GlideRecord	GlideRecord object of the participant to remove from the conference call. These records are located in the Notify Participant [notify_participant] table.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	`<action>.successMessages`: If *status* is true, success message(s), else empty. • Data type: Array of Strings `<action>.warnMessages`: If *status* is false, any warning messages thrown during processing. • Data type: Array of Strings `<action>.errorMessages`: If *status* is false, any error messages thrown during processing. • Data type: Array of Strings

```
(function () {
    var confUtils = new NotifyConferenceUtils();
    var participantGR = new GlideRecord('notify_participant');
  // Participant record contains conf call ID
    participantGR.get('validParticipantSysId');
    var actionResult =
 confUtils.kickByParticipantGR(participantGR);
    if (actionResult.status)
        gs.info('Participant has been kicked out of
 conference');
    else {
        gs.info('kick operation failed');
        actionResult.warnMessages.forEach(function (msg) {
            gs.info(msg);
        });
        actionResult.errorMessages.forEach(function (msg) {
            gs.info(msg);
        })
    }
})()
```

NotifyConferenceUtils - muteByParticipantGR(GlideRecord notifyParticipantGR)

Mutes the participant associated with the passed in GlideRecord on the current conference call.

Parameters

Name	Type	Description
notifyParticipantGR	Object	GlideRecord object of the participant to mute. These records are located in the Notify Participant [notify_participant] table.

Returns

Type	Description
Object	Results of the conference action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	`<action>.status`: Status of the conference action.
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *`status`* is true, success message(s), else empty.
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *`status`* is false, any warning messages thrown during processing.
	• Data type: Array of Strings
	
	`<action>.errorMessages`: If *`status`* is false, any error messages thrown during processing.
	• Data type: Array of Strings

```
(function () {
    var confUtils = new NotifyConferenceUtils();
    var participantGR = new GlideRecord('notify_participant');
    participantGR.get('validSysId');
    var actionResult =
 confUtils.muteByParticipantGR(participantGR);
    if (actionResult.status)
        gs.info('Participant has been muted');
    else {
        gs.info('mute operation failed');
        actionResult.warnMessages.forEach(function (msg) {
            gs.info(msg);
        });
        actionResult.errorMessages.forEach(function (msg) {
            gs.info(msg);
        })
    }
})()
```

NotifyConferenceUtils - unmuteByParticipantGR(GlideRecord notifyParticipantGR)

Unmutes the participant associated with the passed in GlideRecord on the current conference call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
notifyParticipantGR	GlideRecord	GlideRecord object of the participant to unmute. These records are located in the Notify Participant [notify_participant] table.

Returns

Type	Description

Object	Results of the conference action.
	
	`<action>.status`: Status of the conference action.
	
	• Data type: Boolean
	• Valid values:
	  ○ true: Conference action succeeded
	  ○ false: Conference action failed
	
	`<action>.successMessages`: If *status* is true, success message(s), else empty.
	
	• Data type: Array of Strings
	
	`<action>.warnMessages`: If *status* is false, any warning messages thrown during processing.
	
	• Data type: Array of Strings
	
	`<action>.errorMessages`: If *status* is false, any error messages thrown during processing.
	
	• Data type: Array of Strings

```
(function () {
    var confUtils = new NotifyConferenceUtils();
    var participantGR = new GlideRecord('notify_participant');
    participantGR.get('validSysId');
    var actionResult =
 confUtils.unmuteByParticipantGR(participantGR);
    if (actionResult.status)
        gs.info('Participant has been Unmuted');
    else {
        gs.info('Unmute operation failed');
        actionResult.warnMessages.forEach(function (msg) {
            gs.info(msg);
        });
        actionResult.errorMessages.forEach(function (msg) {
            gs.info(msg);
        })
    }
})();
```

NotifyJsTelephonyDriver - Global

The *NotifyJsTelephonyDriver* API provides methods that you can use to obtain information about the capabilities of the associated telephony driver.

It is a scripted extension point that can only be used when its object is returned by another method, such as *NotifyUtil - getTelephonyDriverFromNotifyNumber()*. You cannot call this API directly. The calling method associates a specific driver to the interface, abstracting the details of determining the driver. Each of the available drivers implement the same interface, which is defined by the *NotifyJsTelephonyDriver* API.

In the following code example, the *getTelephonyDriverFromNotifyNumber()* method returns an implementation of this API, with the driver interface being determined by the passed in telephone number, such as TwilioNotifyJsTelephonyDriver.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
        driverName: driver.getName(),
        supportsCall: driver.supportsCall(),
        supportsSMS: driver.supportsSms()
      }
    }
}
```

To see which drivers are associated with the NotifyJsTelephonyDriver extension point, navigate to **System Extension Points**>**global.NotifyJsTelephonyDriver**. All associated driver implementations appear in the **Implementations** tab.

For additional information on scripted extension points, see Using extension points to extend application functionality point.

To use this API you must activate the Notify (com.snc.notify) plugin. To activate specific driver implementations, such as Twillo, you must activate their specific plugin.

NotifyJsTelephonyDriver - call(Object notifyPhoneNumber, String phoneNumber)

Calls a specified telephone number.

Parameters

Name	Type	Description
notifyPhoneNumber	NotifyPhoneNumber - Global	NotifyPhoneNumber record that contains the Notify phone number from which to make the call. Located in the Notify Phone Number [notify_number] table.
toPhoneNumber	String	Telephone number to call. Format: E.164

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {

    }
}
```

NotifyJsTelephonyDriver - getCapabilities()

Returns a list of the capabilities of the telephony driver.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

This example returns the capabilities of the associated telephony driver.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
       capabilities: driver.getCapabilities()
      }
    }
}
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyJsTelephonyDriver - getMaxSizeForBulkSms(String phoneNumber)

Returns the maximum number of telephone numbers to which the telephony driver associated with the passed in Notify telephone number can send an SMS message to at one time.

Parameters

Name	Type	Description
phoneNumber	String	Notify telephone number to check for the maximum number of telephone numbers that the associated driver is able to send to in one bulk SMS message.

Returns

Type	Description
Number	Maximum number of telephone numbers that an SMS message can be sent to in a single bulk SMS delivery.

This example returns the maximum number of telephone numbers that can be sent to in a single bulk SMS message for the associated telephony driver.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
       return {
       maxSmsNumbers: driver.getMaxSizeForBulkSMS(notifyNumber)
      }
    }
}
```

NotifyJsTelephonyDriver - getPhoneNumber(String phoneNumber)

Returns the Notify phone number record for the specified phone number.

Returns null if the specified phone number is not found in the Notify Phone Number [notify_number] table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
NotifyPhoneNumberAPI	Notify phone number record associated with the specified telephone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example obtains the telephony driver and returns the associated Notify phone number record for a specified phone number.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
       phoneNumberRecord: driver.getPhoneNumber(notifyNumber)
      }
    }
}
```

NotifyJsTelephonyDriver - getPhoneNumbers()

Returns a list of all Notify telephone numbers associated with the current telephony driver.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Comma-separated list of all Notify telephone numbers associated with the current driver.

This example obtains the telephony driver and returns the list of Notify phone numbers associated with the current telephony driver.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
       phoneNumbers: driver.getPhoneNumbers()
      }
    }
}
```

NotifyJsTelephonyDriver - isActive()

Checks whether the current telephony driver is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current telephony driver is active. Valid values: • true: Driver is active. • false: Driver is inactive.

This example obtains the telephony driver and returns whether the current telephony driver is active.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
        active: driver.isActive()
      }
    }
}
```

NotifyJsTelephonyDriver - kick(GlideRecord participantRecord)

Removes the specified caller from the current Notify conference call.

Parameters

Name	Type	Description
participantRecord	GlideRecord - Global	GlideRecord object containing the Notify Participant [notify_participant] record of the caller to remove from the conference call.

Returns

Type	Description
String	Only returned if error. Error message that describes why the caller was not removed from the call.

This example mutes the associated caller in the current conference call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      var notifyParticipantGr = new
 GlideRecord('notify_participant');
      notifyParticipantGr.get('active participant sys id');

      if (notifyParticipantGr.isValid) {
        driver.kick(notifyParticipantGr)
    }
}
```

NotifyJsTelephonyDriver - mute(GlideRecord participantRecord)

Mutes the specified caller in the current Notify conference call.

Parameters

Name	Type	Description
participantRecord	GlideRecord - Global	GlideRecord object containing the Notify Participant [notify_participant] record of the caller to mute in the conference call.

Returns

Type	Description
String	Only returned if error. Error message that describes why the caller was not muted.

This example mutes the associated caller in the current conference call.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      var notifyParticipantGr = new
 GlideRecord('notify_participant');
      notifyParticipantGr.get('active participant sys id');

      if (notifyParticipantGr.isValid) {
        driver.mute(notifyParticipantGr)
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
}
```

NotifyJsTelephonyDriver - sendAutonomousBulkSms(Object notifyPhoneNumber, Array toPhoneNumber, String message, GlideRecord source)

Sends the specified Short Message Service (SMS) message to the specified list of telephone numbers.

In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

Parameters

Name	Type	Description
message	String	Message to send.
notifyPhoneNumber	NotifyPhoneNumber - Global	Record that contains the phone number that is sending the bulk SMS message.
source	GlideRecord - Global	Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.
toPhoneNumber	Array	List of telephone numbers of the devices to receive the SMS message.

Returns

Type	Description
None	

This example shows how to send an autonomous bulk SMS.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {

    }
}
```

NotifyJsTelephonyDriver - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody)

Sends a specified Short Message Service (SMS) message to a specified telephone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
notifyPhoneNumber	NotifyPhoneNumber - Global	Notify phone number record that contains the telephone number that is sending the SMS message. Located in the Notify Phone Number [notify_number] table.
toPhoneNumber	String	Phone number to send the SMS message to. Format: E.164 compliant
message	String	Text to send in the SMS message.

Returns

Type	Description
None	

This example sends an SMS message to a specified telephone number.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {

    }
}
```

NotifyJsTelephonyDriver - supportsAutonomousBulkSms(String phoneNumber)

Checks whether the specified Notify telephone number is capable of handling autonomous bulk Short Message Service (SMS) messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the specified Notify telephone number supports autonomous bulk SMS. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Supports autonomous bulk SMS. • false: Does not support autonomous bulk SMS.

This example obtains the telephony driver and returns whether the driver supports autonomous bulk SMS.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
        supportsBulkSMS:
 driver.supportsAutonomousBulkSms(notifyNumber)
      }
    }
}
```

NotifyJsTelephonyDriver - supportsCall()

Checks whether the current telephony driver is capable of handling telephone calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current telephony driver supports telephone calls. Valid values: • true: Driver supports telephone calls. • false: Driver does not support telephone calls.

This example obtains the telephony driver and returns whether the driver supports telephone calls.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
```

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
        supportsCall: driver.supportsCall()
      }
    }
}
```

NotifyJsTelephonyDriver - supportsCallOverWebRtc()

Checks whether the specified Notify telephone number is capable of calls to a browser using WebRTC (Real-Time Communications.)

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the specified Notify telephone number supports browser calls using WebRTC. Valid values: • true: Supports WebRTC. • false: Does not support WebRTC.

This example obtains the telephony driver and returns whether the driver supports browser calls using WebRTC.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
        supportsWebRTC:
 driver.supportsCallOverWebRtc(notifyNumber)
      }
    }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyJsTelephonyDriver - supportsSMS()

Checks whether the current telephony driver is capable of handling Short Message Service (SMS) messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current telephony driver supports SMS. Valid values: • true: Driver supports SMS. • false: Driver does not support SMS.

This example obtains the telephony driver and returns whether the driver supports SMS.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      return {
        supportsSMS: driver.supportsSMS()
      }
    }
}
```

NotifyJsTelephonyDriver - unmute(GlideRecord participantRecord)

Unmutes the specified caller in the current Notify conference call.

Parameters

Name	Type	Description
participantRecord	GlideRecord - Global	GlideRecord object containing the Notify Participant [notify_participant] record of the caller to mute in the conference call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Only returned if error. Error message that describes why the caller was not muted.

This example mutes the associated caller in the current conference call.

```
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber
 || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver =
 nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
      var notifyParticipantGr = new
 GlideRecord('notify_participant');
      notifyParticipantGr.get('active participant sys id');

      if (notifyParticipantGr.isValid) {
        driver.unmute(notifyParticipantGr)
    }
}
```

NotifyNow (Legacy) - Global

The legacy *NotifyNow* API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

Note: This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the *Notify*, *NotifyAction*, *NotifyPhoneNumber*, and *NotifyClient* APIs.

NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Adds ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

Parameters

Name	Type	Description
conferenceCall	String or GlideRecord	The sys_id or GlideRecord of an active conference call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
participant	String or GlideRecord	The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.

Returns

Type	Description
GlideRecord	The participant record of the new participant that was added to the conference call.

```
// add a new participant by conference call sys_id (string) and
 phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910
f206fe39', '+31612345678'));
```

```
// add a new participant by conference call sys_id (string) and
 user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();

 gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d491
0f206fe39', user));

    // you could have added the user by sys_id as well:
    //
 nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe
39', user.getValue('sys_id'));
} else {
    gs.log('no such user');
}
```

```
// add a new participant by conference call record (GlideRecord)
 and phone number (string)
var conferenceCall = new
 GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant(conferenceCall,
 '+31612345678'));
} else {
    gs.log('no such conference call');
}
```

NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)

Converts a local phone number to an E.164-compliant phone number based on a user's location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
userID	String	The sys_id of a sys_user record to get location information from.
phoneNumber	String	The phone number.

Returns

Type	Description
String	The E.164-compliant phone number.

```
var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name',userName);
var E164Number = new
 SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueVal
ue(), localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number +
 ' based on ' + user.getValue('name') +
     '\'s location (' + user.getValue('location') + ')');
```

NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)

Returns all participants for a conference call.

Parameters

Name	Type	Description
conferenceCallId	String	The ID of the conference call.
isCallable	Boolean	An optional flag to return either only the users you can call (true) or those you cannot call (false).

Returns

Type	Description
GlideRecord	The participants

```
var nn = new SNC.NotifyNow();
var user =
 nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106f
e37');

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' +
 user.getValue('phone_number'));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
}
```

```
var nn = new SNC.NotifyNow();
var user =
 nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106f
e37', true);

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' +
 user.getValue('phone_number'));
    }
}
```

```
var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';

// get all participants
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in an
 active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId,
 false);
gs.log(user);
```

NotifyNow - getFrequentlyCalledUsers(Number limit)

Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.

Parameters

Name	Type	Description
limit	Number	The maximum number of results.

Returns

Type	Description
GlideRecord	The frequently called users in alphabetical order.

```
var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```
while (fc.hasNext() && fc.next()) {
    gs.log("got user " + fc.getValue('name') + ' - ' +
 fc.getValue('sys_id'));
}
```

NotifyNow - getPreferredE164SMSNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for SMS messages.

Parameters

Name	Type	Description
user	GlideRecord or String	The user record or the sys_id of a user to get the E.164-compliant phone number from.

Returns

Type	Description
String	The E.164-compliant phone number or null.

```
var userID = "<user sys_id>";
var E164Number = new
 SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications
 is ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for voice calls.

Parameters

Name	Type	Description
user	GlideRecord or String	The user record or the sys_id of a user to get the E.164-compliant phone number from.

Returns

Type	Description
String	The E.164-compliant phone number or null.

```
var userID = "<user sys_id>";
var E164Number = new
 SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is
 ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredEmailAddress(GlideRecord user)

Returns a user's preferred email address

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
user	GlideRecord or String	The user record or the sys_id of a user to get the email address from.

Returns

Type	Description
String	The email address or null.

```
var userID = "some user sys id";
var email = new
 SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email
 notifications is ' + email + ' for user with id: ' + userID);
```

NotifyNow - getReadyState()

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if Notify is set up correctly, otherwise false.

```
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" :  "NOT OK"));
```

NotifyNow - getStatus()

Returns the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	One of the possible status messages. Status: Description NO_NUMBER_MESSAGE: The account does not have a telephone number set up. Ensure tha NO_ENDPOINTS_MESSAGE: The account does not have its endpoints set up correctly. Ensure t ACCOUNT_OK_MESSAGE: The account is active and ready for use. ACCOUNT_NO_AUTH: The Twilio AuthToken is not valid. ACCOUNT_NOT_CONFIGURED: The Twilio AccountSID or AuthToken is not valid.

```
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)

Initiate a new conference call.

Parameters

Name	Type	Description
conferenceCallParticipants	String	One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.
conferenceCallTitle	String	Title of the conference call. This parameter has a maximum length of 40 characters.

Returns

Type	Description
GlideRecord	The conference call record, or null if there was an error.

This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```
var participants = ['+31205655548', '+31205655552',
 '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants,
 "testing12");
gs.log('started conference call: ' +
 conferenceCall.getUniqueValue());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)

Initiate a new conference call.

Parameters

Name	Type	Description
conferenceCallParticipants	String	One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.
conferenceCallTitle	String	Title of the conference call. This parameter has a maximum length of 40 characters.
sourceRecord	GlideRecord	Source record to associate to the conference call such as an incident or problem number.
private	Boolean	Value to control if a conference call is private. This value defaults to false.

Returns

Type	Description
GlideRecord	The conference call record, or null if there was an error.

This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```
// define phone number participants
var participants = ['+31205655548', '+31205655552',
 '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
 gs.log('adding user ' + user.getValue('name') + ' with phone
 number ' +
            user.getValue('mobile_phone') + ' to the
 participant array');
 participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord("cmdb_ci");
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
 // set up conference call
 var nn = new SNC.NotifyNow();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 var conferenceCall = nn.initiateConferenceCall(participants,
 "testing 1 2", source);

 // check if the conference call was successfully created
 if (conferenceCall != null) {
  gs.log('started conference call: ' +
 conferenceCall.getUniqueValue());
 } else {
  gs.log('could not start the conference call :(');
 }
}
```

NotifyNow - isCallable(String participant)

Determines whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

Parameters

Name	Type	Description
participant	String or GlideRecord	A sys_user or notifynow_participant record, or an E.164-compliant phone number.

Returns

Type	Description
boolean	Whether this participant can be called or not.

```
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
  gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
  gs.log('by participant: ' + nn.isCallable(participant));
```

NotifyNow - isSMSCapable()

Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Whether the telephone number associated with the Twilio account is capable of sending SMS messages.

```
gs.log('The twilio number is SMS capable: ' + ((new
 SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

NotifyNow - isSMSCapable(String userID)

Checks if a user is able to send SMS messages.

Parameters

Name	Type	Description
userID	String	The sys_id of the user you want to check for an SMS-capable phone number.

Returns

Type	Description
Boolean	If the user can send SMS messages.

```
gs.log('the user is able to send SMS messages (e.g. has a
 SMS device): ' + ((new SNC.NotifyNow().isSMSCapable('<user
 sys_id>')) ?
     'yes' : 'no'));
```

NotifyNow - isVoiceCapable()

Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Whether the telephone number associated with the Twilio account is capable of setting up phone calls.

```
gs.log('the Twilio number is Voice capable: ' + ((new
 SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

NotifyNow - isVoiceCapable(String userID)

Checks if a user is able to make voice calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
userID	String	The sys_id of the user you want to check for a voice-call capable phone number.

Returns

Type	Description
boolean	Whether the user has a voice-call capable phone number.

```
gs.log('the user is able to send SMS messages (e.g. has a SMS
 device): ' +
     ((new SNC.NotifyNow().isVoiceCapable('someuserid')) ?
 'yes' : 'no'));
```

NotifyNow - kick(GlideRecord participant)

Removes a participant from a conference call.

Parameters

Name	Type	Description
participant	GlideRecord	The conference call participant to remove from the call.

Returns

Type	Description
Boolean	True if the participant was removed, otherwise false.

```
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
     // kick participant
     result = new SNC.NotifyNow().kick(participant);
     gs.log('participant kicked: ' + result);
}
```

NotifyNow - mute(GlideRecord participant)

Mutes a participant on a conference call.

Parameters

Name	Type	Description
participant	GlideRecord	The conference call participant to mute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the participant was muted, otherwise false.

```
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
     // mute participant
     result = new SNC.NotifyNow().mute(participant);
     gs.log('participant muted: ' + result);
}
```

NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)

Send an email question to an email address.

The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

Parameters

Name	Type	Description
emailAddress	String	Email address to send the question to.
question	String or GlideRecord	The question record to send or the sys_id of a question record.
sourceRecord	GlideRecord	An optional source record to associate to the SMS question, such as an incident.
emailSubject	String	Optional text to override the default email subject.

Returns

Type	Description
String	The conversation sys_id.

This example demonstrates using the default email subject.

```
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");

new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
 "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
 "b6071733bf1111003cf585ce2c07390f", current,
        "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
 "b6071733bf1111003cf585ce2c07390f",
        "Please answer this question");
```

NotifyNow - sendSMS(String phoneNumber, String smsBody)

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

Parameters

Name	Type	Description
phoneNumber	String	The E.164-compliant phone number to send the message to.
smsBody	String	The message to send, maximum 1600 characters.

Returns

Type	Description
void	

```
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message
 without source record");
```

NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

See also: Advanced configuration for SMS.

Parameters

Name	Type	Description
phoneNumber	String	The E.164-compliant phone number to send the message to.
smsBody	String	The message to send, maximum 1600 characters.
source	GlideRecord	The source record to associate with this SMS message.

Returns

Type	Description
void	

```
var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}
```

This example uses dot-walking and the current record as the source record.

```
new SNC.NotifyNow().sendSMS("+31612345678", "this is a test",
 current);
```

NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)

Sends an SMS question.

Parameters

Name	Type	Description
phoneNumber		An E.164-compliant phone number to send the message to.
question	String or GlideRecord	The question record to send or the sys_id of a question record.
sourceRecord		An optional source record to associate to the SMS question, such as an incident.

Returns

Type	Description
String	The conversation sys_id, or null if the SMS was not sent successfully.

```
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
 // send the sms question
        var number = "+31612345678";
 var nn = new SNC.NotifyNow();
 nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}
```

NotifyNow - umute(GlideRecord participant)

Unmutes a participant on a conference call.

Parameters

Name	Type	Description
participant	GlideRecord	The muted conference call participant to unmute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if the participant was unmuted, otherwise false.

```
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
     // unmute participant
     result = new SNC.NotifyNow().unmute(participant);
     gs.log('participant unmuted: ' + result);
}
```

NotifyPhoneNumber - Global

The *NotifyPhoneNumber* API allows you to query information about a Notify phone number.

Access the global *NotifyPhoneNumber* class and its associated methods in the SNC namespace.

NotifyPhoneNumber - getDialCode()

Returns the international dialing code for a Notify phone number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	International phone code for a country.

This example shows how to obtain the dial code for a phone number.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getDialCode());
}
```

Scoped equivalent

To use the *getDialCode()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - getDialCode().

NotifyPhoneNumber - getID()

Returns the ID of this phone number as defined by the telephony provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Identifier of the number within the telephony provider.

This example shows how to obtain the unique identifier for a phone number.

```
var numbers = SNC.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getID());
}
```

Scoped equivalent

To use the *getID()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - getID().

NotifyPhoneNumber - getNumber()

Returns the numerical phone number for the current Notify caller.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	E.164-compliant phone number.

This example shows how to obtain a Notify caller's phone number.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getNumber());
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped equivalent

To use the *getNumber()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - getNumber().

NotifyPhoneNumber - getOwner()

Returns the telephony provider associated with this phone number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Telephony provider associated with the number: Twilio.

This example shows how to obtain the telephony provide that owns the specified phone number.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getOwner());
}
```

Scoped equivalent

To use the *getOwner()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - getOwner().

NotifyPhoneNumber - getTerritory()

Returns the country associated with the phone number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the country to which the phone number belongs.

This example shows how to obtain the country of a Notify caller.

```
var numbers = SNC.Notify.getPhoneNumbers();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getTerritory());
}
```

Scoped equivalent

To use the *getTerritory()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - getTerritory().

NotifyPhoneNumber - isShortCode()

Determines whether the current Notify phone number is a short code.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current Notify phone number is a short code. • true: phone number is a short code. • false: phone number is not a short code.

This example shows how to check if the current Notify phone number is a short code.

```
GlideRecord notifyNumber = new GlideRecord(TABLE_NOTIFY_NUMBER);
notifyNumber.query(COL_NUMBER, notifyPhoneNumber.getNumber());

if (!notifyNumber.next()) {
  notifyNumber.initialize();
  notifyNumber.setValue(COL_OWNER,
 notifyPhoneNumber.getOwner());
  if (notifyPhoneNumber.isShortCode()) {
    notifyNumber.setValue(COL_SHORT_CODE,
 notifyPhoneNumber.getNumber());
  } else {
    notifyNumber.setValue(COL_PHONE_NUMBER,
 notifyPhoneNumber.getNumber());
  }
```

NotifyPhoneNumber - supportsConferenceCall()

Determines if the Notify phone number supports conference calling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports conference calling. • true: phone number does support conference calling • false: phone number does not support conference calling

This example shows how to determine if a Notify caller supports conference calls.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsConferenceCall());
}
```

Scoped equivalent

To use the *supportsConferenceCall()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - supportsConferenceCall().

NotifyPhoneNumber - supportsIncomingPhoneCall()

Determines if the Notify phone number supports receiving phone calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports incoming phone calls. • true: phone number does support incoming phone calls • false: phone number does not support incoming phone calls

This example shows how to determine if a Notify caller can receive incoming phone calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsIncomingPhoneCall());
}
```

Scoped equivalent

To use the *supportsIncomingPhoneCall()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - supportsIncomingPhoneCall().

NotifyPhoneNumber - supportsIncomingSMS()

Determines if the Notify phone number supports receiving SMS messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports receiving incoming MMS messages. • true: phone number does support receiving incoming MMS messages • false: phone number does not support receiving incoming MMS messages

This example shows how to determine if a Notify caller can receive incoming SMS messages.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsIncomingSMS());
}
```

Scoped equivalent

To use the *supportsIncomingSMS()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - supportsIncomingSMS().

NotifyPhoneNumber - supportsOutgoingPhoneCall()

Determines if the Notify phone number supports initiating phone calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports initiating outgoing phone calls. • true: phone number does support initiating outgoing phone calls • false: phone number does not support initiating outgoing phone calls

This example shows how to determine if a Notify caller can make outgoing phone calls.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsOutgoingPhoneCall());
}
```

Scoped equivalent

To use the *supportsOutgoingPhoneCall()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - supportsOutgoingPhoneCall().

NotifyPhoneNumber - supportsOutgoingSMS()

Determines if the Notify phone number supports sending SMS messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports sending SMS messages. • true: phone number does support sending SMS messages • false: phone number does not support sending SMS messages

This example shows how to determine if a Notify caller can initiate outgoing SMS messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsOutgoingSMS());
}
```

Scoped equivalent

To use the *supportsOutgoingSMS()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - supportsOutgoingSMS().

NotifyPhoneNumber - supportsRecording()

Determines if the Notify phone number supports recording phone calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports recording phone calls. • true: phone number does support recording phone calls • false: phone number does not support recording phone calls

This example shows how to determine if a Notify caller can record calls.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsRecording());
}
```

Scoped equivalent

To use the *supportsRecording()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - supportsRecording().

NotifyPhoneNumber - supportsWebRTC()

Determines if the Notify phone number supports calls to a browser, such as in a WebRTC implementation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports calls to a browser. • true: phone number does support calls to a browser • false: phone number does not support calls to a browser

This example shows how to determine if a Notify caller can initiate/accept browser-to-browser calls.

```
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsWebRTC());
}
```

Scoped equivalent

To use the *supportsWebRTC()* method in a scoped application, use the corresponding scoped method: Scoped NotifyPhoneNumber - supportsWebRTC().

NotifyPhoneNumber - Scoped

The *NotifyPhoneNumber* API allows you to query information about a Notify phone number.

Execute the scoped *NotifyPhoneNumber* API and its associated methods in the `sn_notify` namespace.

Scoped NotifyPhoneNumber - getDialCode()

Returns the international dialing code for a Notify phone number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	International phone code for a country.

This example shows how to obtain the dial code for a phone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getDialCode());
}
```

Scoped NotifyPhoneNumber - getID()

Returns the ID of this phone number as defined by the telephony provider.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Identifier of the number within the telephony provider.

This example shows how to obtain the unique identifier for a phone number.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getID());
}
```

Scoped NotifyPhoneNumber - getNumber()

Returns the numerical phone number for the current Notify caller.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	E.164-compliant phone number.

This example shows how to obtain a Notify caller's phone number.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getNumber());
}
```

Scoped NotifyPhoneNumber - getOwner()

Returns the telephony provider associated with this phone number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Telephony provider associated with the number: Twilio.

This example shows how to obtain the telephony provide that owns the specified phone number.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getOwner());
}
```

Scoped NotifyPhoneNumber - getTerritory()

Returns the country associated with the phone number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the country to which the phone number belongs.

This example shows how to obtain the country of a Notify caller.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
```

© 2026 ServiceNow, Inc. All rights reserved.

```
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.getTerritory());
}
```

Scoped NotifyPhoneNumber - supportsConferenceCall()

Determines if the Notify phone number supports conference calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports conference calling. • true: phone number does support conference calling • false: phone number does not support conference calling

This example shows how to determine if a Notify caller supports conference calls.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsConferenceCall());
}
```

Scoped NotifyPhoneNumber - supportsIncomingPhoneCall()

Determines if the Notify phone number supports receiving phone calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports incoming phone calls. • true: phone number does support incoming phone calls • false: phone number does not support incoming phone calls

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to determine if a Notify caller can receive incoming phone calls.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsIncomingPhoneCall());
}
```

Scoped NotifyPhoneNumber - supportsIncomingSMS()

Determines if the Notify phone number supports receiving SMS messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports incoming SMS messages. • true: phone number does support incoming SMS messages • false: phone number does not support incoming SMS messages

This example shows how to determine if a Notify caller can receive incoming SMS messages.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsIncomingSMS());
}
```

Scoped NotifyPhoneNumber - supportsOutgoingPhoneCall()

Determines if the Notify phone number supports initiating phone calls.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports initiating outgoing phone calls. • true: phone number does support initiating outgoing phone calls • false: phone number does not support initiating outgoing phone calls

This example shows how to determine if a Notify caller can make outgoing phone calls.

```
var numbers = sn_notfy.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsOutgoingPhoneCall());
}
```

Scoped NotifyPhoneNumber - supportsOutgoingSMS()

Determines if the Notify phone number supports sending SMS messages.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports sending SMS messages. • true: phone number does support sending SMS messages • false: phone number does not support sending SMS messages

This example shows how to determine if a Notify caller can initiate outgoing SMS messages.

```
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsOutgoingSMS());
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoped NotifyPhoneNumber - supportsRecording()

Determines if the Notify phone number supports recording phone calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports recording phone calls. • true: phone number does support recording phone calls • false: phone number does not support recording phone calls

This example shows how to determine if a Notify caller can record calls.

```
var numbers = sn_notify.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsRecording());
}
```

Scoped NotifyPhoneNumber - supportsWebRTC()

Determines if the Notify phone number supports calls to a browser, such as in a WebRTC implementation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Value that indicates whether the Notify phone number supports browser-to-browser (WebRTC) calls. • true: phone number does support browser-to-browser (WebRTC) calls • false: phone number does not support browser-to-browser (WebRTC) calls

This example shows how to determine if a Notify caller can initiate/accept browser-to-browser calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var numbers = sn_notify.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
   var number = numbers.get(0);

   // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsWebRTC());
}
```

NotifySMS - Global

The *NotifySMS* script include provides methods that enable you to send Short Message Service (SMS) messages from Notify telephone numbers to devices using either their telephone numbers or a GlideRecord that has a field that contains telephone number information.

To use this script include you must activate the Notify (com.snc.notify) plugin.

NotifySMS - NotifySMS()

Creates an instance of a NotifySMS object.

Parameters

Name	Type	Description
None		

This example shows how to instantiate a NotifySMS object.

```
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var fromNumber = getFromNumber();
  var groupId = sourceRecord.assignment_group + '';
  var toGr = getRecipientGRs(groupId);
  var message = 'An Incident ' + sourceRecord.getDisplayValue()
 + ' has been assigned to your group';
  if (fromNumber && toGr) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToUsers(fromNumber, toGr, message,
 sourceRecord);
  }
}
```

NotifySMS - sendBulkSMS(String fromNumber, Array toNumber, String message, GlideRecord sourceRecord)

Triggers an asynchronous flow action that sends a Short Message Service (SMS) message from a specified Notify phone number to a list of phone numbers.

Parameters

Name	Type	Description
fromNumber	String	Notify telephone number sending the SMS message.
toNumber	Array	List of telephone numbers to receive the SMS message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
message	String	Message to send.
sourceRecord	GlideRecord	Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.

Returns

Type	Description
ScriptableFlowRunnerResult	ScriptableFlowRunnerResult - Scoped object.

The follow code example shows how you can use this method to send a bulk SMS message.

```
var fromNumber = getFromNumber();
var toNumbers = getRecipientNumbers();
var message = 'This is an example SMS';
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var notifySMS = new NotifySMS();
  notifySMS.sendBulkSMS(fromNumber, toNumbers, message,
 sourceRecord);
}

function getRecipientNumbers() {
  var userGr = new GlideRecord('sys_user');
  userGr.addActiveQuery();
  userGr.addQuery('first_name', 'STARTSWITH', 'A');
  userGr.setLimit(5);
  userGr.query();
  var userIds = [];
  while (userGr.next()) {
    userIds.push(userGr.getUniqueValue());
  }
  if (userIds.length > 0) {
    var nUtil = new NotifyUtil();
    return nUtil.getUniquePhoneNumbersForUsersAndGroups(null,
 userIds, null, 'sms', false);
  }
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
  }
  return prop;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NotifySMS - sendToNumber(String fromNumber, String toNumber, String message, Object sourceRecord)

Sends a Short Message Service (SMS) message from a specified Notify telephone number to a specified telephone number.

In addition, you can optionally associate the Incident record that caused the SMS message to be generated to the SMS message.

Parameters

Name	Type	Description
fromNumber	String	Notify telephone number sending the SMS message.
message	String	Message to send.
sourceRecord	GlideRecord - Global	Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.
toNumber	String	Telephone number of the device to receive the SMS message.

Returns

Type	Description
None	

The following example illustrates how to send an SMS message to a specified phone number and stamp the associated Incident record with the message information.

```
var fromNumber = getFromNumber();
var toNumber = '+123456789';
var message = 'This is an example SMS';
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var notifySMS = new NotifySMS();
  notifySMS.sendToNumber(fromNumber, toNumber, message,
 sourceRecord);
```

```
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
    }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NotifySMS - sendToNumbers(String fromNumber, Array toNumber, String message, Object sourceRecord)

Sends a Short Message Service (SMS) message from a specified Notify phone number to a list of phone numbers.

In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

Note: Internally this method uses the NotifySMS - sendBulkSMS(String fromNumber, Array toNumber, String message, GlideRecord sourceRecord) method to trigger an asynchronous flow action.

Parameters

Name	Type	Description
fromNumber	String	Notify telephone number sending the SMS message.
message	String	Message to send.
sourceRecord	GlideRecord - Global	Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.
toNumber	Array	List of telephone numbers to receive the SMS message.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example illustrates how to send an SMS message to multiple telephone numbers and store the information in the associated Incident record.

```
var fromNumber = getFromNumber();
var toNumbers = getRecipientNumbers()
var message = 'This is an example SMS';
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var notifySMS = new NotifySMS();
  notifySMS.sendToNumbers(fromNumber, toNumbers, message,
 sourceRecord);
}

function getRecipientNumbers() {
  var userGr = new GlideRecord('sys_user');
  userGr.addActiveQuery();
  userGr.addQuery('first_name', 'STARTSWITH', 'A');
  userGr.setLimit(5);
  userGr.query();
  var userIds = [];
  while (userGr.next()) {
    userIds.push(userGr.getUniqueValue());
  }
  if (userIds.length > 0) {
    var nUtil = new NotifyUtil();
    return nUtil.getUniquePhoneNumbersForUsersAndGroups(null,
 userIds, null, 'sms', false);
  }
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
  }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NotifySMS - sendToUser(String fromNumber, Object toGr, String message, Object sourceRecord)

Sends a Short Message Service (SMS) message from a specified phone number to the user identified in a specified GlideRecord.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This method extracts the telephone number from the specified GlideRecord. In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

Parameters

Name	Type	Description
fromNumber	String	Notify telephone number sending the SMS message.
message	String	Message to send.
sourceRecord	GlideRecord - Global	Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.
toGr	GlideRecord - Global	GlideRecord of a record type that contains a field that resolves to a user's telephone number. The record type must correlate with the record type used by the phone number resolver that is currently implemented. A phone number resolver is simply a method that obtains the user telephone number from a specific type of GlideRecord, such as a User record or a Case record. When using the default resolver, the records correspond to the User [sys_user] table. To change the type of record that the resolver uses to obtain the telephone number, use the NotifySMS - setRecordToNumberResolver(Object scriptIncludeInstance, String methodName) method.

Returns

Type	Description
None	

The following example illustrates how to send an SMS message to a user identified in the associated Incident record and stamp the associated Incident record with the message information.

```
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var fromNumber = getFromNumber();
  var toGr = sourceRecord.assigned_to.getRefRecord();
  var message = 'An Incident ' + sourceRecord.getDisplayValue()
 + ' has been assigned to you';
  if (fromNumber && toGr.isValidRecord()) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToUser(fromNumber, toGr, message,
 sourceRecord);
  }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
  }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NotifySMS - sendToUsers(String fromNumber, Object toGr, String message, Object sourceRecord)

Sends a Short Message Service (SMS) message from a specified Notify phone number to users found in a specified GlideRecord.

This method extracts the destination telephone numbers from the passed-in GlideRecord. In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

Note: Internally this method uses the NotifySMS - sendBulkSMS(String fromNumber, Array toNumber, String message, GlideRecord sourceRecord) method to trigger an asynchronous flow action.

Parameters

Name	Type	Description
fromNumber	String	Notify telephone number sending the SMS message.
message	String	Message to send.
sourceRecord	GlideRecord - Global	Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.
toGr	GlideRecord - Global	GlideRecord of a record type that contains a field that resolves to a user's telephone number. The record type must correlate with the record type used by the phone number resolver that is currently implemented. A phone number resolver is simply a method that obtains the user telephone number from a specific type of GlideRecord, such as a User record or a Case record. When using the default resolver, the records correspond to the User [sys_user] table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		To change the type of record that the resolver uses to obtain the telephone number, use the NotifySMS - setRecordToNumberResolver(Object scriptIncludeInstance, String methodName) method.

Returns

Type	Description
None	

This example shows how to send an SMS message to users within a specified incident record.

```
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var fromNumber = getFromNumber();
  var groupId = sourceRecord.assignment_group + '';
  var toGr = getRecipientGRs(groupId);
  var message = 'An Incident ' + sourceRecord.getDisplayValue()
 + ' has been assigned to your group';
  if (fromNumber && toGr) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToUsers(fromNumber, toGr, message,
 sourceRecord);
  }
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
  }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}

function getRecipientGRs(groupId) {
  if (!groupId)
    return;
  var userMemberGr = new GlideRecord('sys_user_grmember');
  userMemberGr.addQuery('group', groupId);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  userMemberGr.query();
  var userIds = [];
  while (userMemberGr.next()) {
    userIds.push(userMemberGr.user + '');
  }
  var userGr = new GlideRecord('sys_user');
  userGr.addActiveQuery();
  userGr.addQuery('sys_id', 'IN', userIds.join(','));
  userGr.query();
  return userGr;
}
```

NotifySMS - setRecordToNumberResolver(Object scriptIncludeInstance, String methodName)

Sets the method within a script include to use to obtain the target telephone number in the GlideRecord that is passed in the *`NotifySMS.sendToUser()`* and *`NotifySMS.sendToUsers()`* methods.

By default, the *`NotifyUtil.getSMSNumberForUser()`* method is used to obtain the telephone number from a User [sys_user] based GlideRecord. Use the *`setRecordToNumberResolver()`* method if you need to create a custom method to obtain this information from a different record type, such as a Case record.

Parameters

Name	Type	Description
methodName	String	Name of the method to use to obtain the target telephone number in a GlideRecord.
scriptIncludeInstance	Object	Instance of the script include that contains the specified number resolver method.

Returns

Type	Description
None	

This example shows how to set the phone number resolver to the *`getSMSNumberForConsumer()`* method within the csmUtils script include.

```
// Script include that contains the logic to retrieve a phone
 number for a consumer.
var csmUtils = new global.CSMExampleUtils();

// Example Case record used as source for sending SMS
var caseGr = new GlideRecord('sn_customerservice_case');
caseGr.get('3af265b3d1cb5010f877cb055160faxx'); // Case sys_id

var notifySms = new global.NotifySMS();

// Use the getSMSNumberForConsumer method of the csmUtils script
 include (CSMExampleUtils) to obtain the phone number of the
 consumer.
notifySms.setRecordToNumberResolver(csmUtils,
 'getSMSNumberForConsumer');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Send an SMS message to a user whose telephone number is in
 the specified Case GlideRecord.
var smsText = 'This is a test message for ' +
 caseGr.getValue('number');
notifySms.sendToUser('+1xxxxxxxxxx',
 caseGr.getValue('consumer'), smsText, caseGr); // First param
 is the Notify phone number
```

This example shows the code needed for the telephone resolver method *`getSMSNumberForConsumer()`*.

```
getSMSNumberForConsumer: function(consumerGrOrId) {
  if (!consumerGrOrId)
    return;

  var consumerId, consumerGr;
  if (typeof consumerGrOrId === "string")
    consumerId = consumerGrOrId;
  if (typeof consumerGrOrId === "object" &&
 consumerGrOrId["isValidRecord"]) {
    consumerGr = consumerGrOrId;
    consumerId = consumerGr.getUniqueValue();
  }

  if (!consumerId)
    return;

  if (!consumerGr) {
    consumerGr = new GlideRecord('csm_consumer');
    consumerGr.get(consumerId);
  }

  if (consumerGr.isValidRecord()) {
    return consumerGr.getValue('mobile_phone');
  }
}
```

NotifyUtil - Global

The *`NotifyUtil`* script include provides utility methods to use when interacting with Notify calls and SMS messages using server-side scripts.

To use this script include you must activate the Notify (com.snc.notify) plugin.

Using the *`NotifyUtil`* script include you can:

- Obtain all of the Notify telephone numbers and related Notify information from a specified source record.
- Obtain a list of unique Notify telephone numbers.
- Determine whether there are any active conference calls for the specified source record.
- Obtain the SMS-capable number associated with the specified Notify user.
- Validate a specified Notify telephone number.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NotifyUtil - NotifyUtil()

Instantiates a NotifyUtil class object.

Parameters

Name	Type	Description
None		

This example instantiates a NotifyUtil object.

```
var notifyUtil = new NotifyUtil();
notifyUtil.getTelephonyProviers();
```

NotifyUtil - getListOfNotifyNumbersAndProviders(String sourceTable, String sourceSysId, String notifyGroupSelectorSysId, Boolean filterSMSCapableNums)

Returns all of the Notify telephone numbers and related Notify information from a specified source record, such as an incident.

You can use this information to initiate a call or send an SMS message on a particular source record. The information that is returned is based on the configuration of the Notify Provider Selector framework. For additional information, see Notify

Parameters

Name	Type	Description
filterSMSCapableNums	Boolean	Optional. Flag that indicates if only numbers that are SMS-capable should be returned. Valid values: • true: Only return SMS-capable telephone numbers and information. • false: Return all notify telephone numbers and information. Default: false
notifyGroupSelectorSysId	String	Optional. Sys_id of a Notify group for which to return the notify numbers and information. Default: All groups
sourceSysId	String	Sys_id of the source record for which to return the Notify numbers and information. For example, this could be the sys_id of a record in the Incident [incident] table.
sourceTable	String	Name of the table that contains the source record that contains the desired Notify numbers and information.

Returns

Type	Description
confProviders	List of available conference providers. Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
numbers	List of objects, each describing a single Notify number. Data type: Array `"numbers": [{ "defaultFlag": Boolean, "name": "String", "number": "String", "shortCode": Boolean, "sysId": "String }]`
numbers.defaultFlag	Flag that indicates whether the associated Notify number is the default number. Possible values: • true: Default number • false: Not the default number Data type: Boolean
numbers.name	Name or label of the number. Data type: String
numbers.number	Notify number. Data type: String
numbers.shortCode	Flag that indicates whether the associated Notify number is a short code. Possible values: • true: Short code • false: Not a short code Data type: Boolean
numbers.sysId	Sys_id of the Notify number. Data type: String

This example shows how to obtain the Notify telephone numbers and related Notify information from a specified source record.

```
function updateConferenceBridges(sourceTable, sourceId) {

  var notifyUtil = new global.NotifyUtil();
  var numbersAndProviders =
 notifyUtil.getListOfNotifyNumbersAndProviders(sourceTable,
 sourceId);
  var confBridges = [];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  if (numbersAndProviders.confProviders) {

 numbersAndProviders.confProviders.forEach(function(provider){
    confBridges.push(provider);
    });
  }
  if (numbersAndProviders.numbers) {
    numbersAndProviders.numbers.forEach(function(number){
      confBridges.push(number.name);
    });
  }
}
```

NotifyUtil - getSMSNumberForUser(String userGrOrId)

Returns the SMS-capable number associated with the specified Notify user.

Parameters

Name	Type	Description
userGROrId	String or GlideRecord - Global	Sys_id of the user record, located in the User [sys_user] table, or the sys_user GlideRecord of the user for whom to return the SMS-capable telephone number.

Returns

Type	Description
String	User SMS-capable telephone number. Returns null if the specified user is not found.

This example shows how to obtain an SMS-capable telephone number using the associated GlideRecord.

```
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var fromNumber = getFromNumber();
  var nUtil = new NotifyUtil();
  var toNumber =
 nUtil.getSMSNumberForUser(sourceRecord.assigned_to.getRefRecord
());
  var message = 'Incident ' + sourceRecord.getDisplayValue() + '
 has been assigned to you.';
  if (fromNumber &&
 nUtil.validateOutboundNotifyPhoneNumber(fromNumber) && toNumber
 && nUtil.validatePhoneNumber(toNumber)) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToNumber(fromNumber, toNumber, message,
 sourceRecord);
  }
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    return getFallbackFromNumber();
  }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NotifyUtil - getUniquePhoneNumbersForUsersAndGroups(Array numbers, Array users, Array groups, String type, Boolean getData)

Returns a list of unique Notify telephone numbers.

If you don't pass any parameters in the call, all Notify numbers within the Notify Phone Number [notify_number] table are checked for duplicates, with each available phone number only appearing once in the returned list. You can refine the return results by specifying a list of users or groups to check, or by specifying a set of numbers or number types (SMS or voice.) You can also request that the metadata associated with each number be returned along with the unique numbers. If you do not want to use a parameter, simply pass `null` as a placeholder. For example: `return nUtil.getUniquePhoneNumbersForUsersAndGroups(null, userIds, null, 'sms', false);`.

Parameters

Name	Type	Description
getData	Boolean	Optional. Flag that indicates whether to return metadata along with the list of unique phone numbers. Valid values: • true: Return metadata. • false: Do not return metadata. Default: false
groups	Array	Optional. List of sys_id groups to check. Located in the Group [sys_user_group] table. Default: Check all groups.
numbers	Array	Optional. List of specific Notify telephone numbers to check. Default: Check all phone numbers.
type	String	Optional. Type of telephone numbers to check. Valid values (case-sensitive):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• voice • sms Default: Check all phone number types
users	Array	Optional. List of sys_ids of specific users to check. Located in the User [sys_user] table. Default: Check all users

Returns

Name	Description
numbers	Unique Notify telephone numbers. Data type: Array
result	Only returned if *getData* is set to true. Metadata associated with each unique number. Data type: Object `"result": { "number": "String", "sysId": "String", "type": "String", "valid": Boolean }`
result.number	Unique Notify telephone number. Data type: String
result.sysId	Sys_id of the record that contains the Notify telephone number. Located in the Notify Phone Number [notify_number] table. Data type: String
result.type	Always contains "u" for user. Data type: String
result.valid	Flag that indicates whether the Notify telephone number is in valid E.164 format. Possible values: • true: Valid E.164 format. • false: Not in E.164 format. Data type: Boolean

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to request a specific set of unique Notify telephone numbers that have SMS capabilities.

```
var fromNumber = getFromNumber();
var toNumbers = getRecipientNumbers();
var message = 'This is an example SMS';
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var notifySMS = new NotifySMS();
  notifySMS.sendToNumber(fromNumber, toNumbers, message,
 sourceRecord);
}

function getRecipientNumbers() {
  var userGr = new GlideRecord('sys_user');
  userGr.addActiveQuery();
  userGr.addQuery('first_name', 'STARTSWITH', 'A');
  userGr.setLimit(5);
  userGr.query();
  var userIds = [];
  while (userGr.next()) {
    userIds.push(userGr.getUniqueValue());
  }
  if (userIds.length > 0) {
    var nUtil = new NotifyUtil();
    return nUtil.getUniquePhoneNumbersForUsersAndGroups(null,
 userIds, null, 'sms', false);
  }
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
  }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NotifyUtil - hasActiveConferenceCalls(String sourceRecSysId)

Determines whether there are any active conference calls for the specified source record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sourceRecSysId	String	Sys_id of the record to check for active conference calls. For example the sys_id of a record in the Incident table.

Returns

Type	Description
Boolean	Flag that indicates whether the specified record has associated active conference calls. Possible values: • true: Active conference calls are available for the specified record. • false: No active conference calls.

This example displays an information message if there are any active conference calls associated with an incident record.

```
(function executeRule(current, previous /*null when async*/) {
  var nUtil = new NotifyUtil();
  if (nUtil.hasActiveConferenceCalls(current.getUniqueValue()))
 {
    gs.addInfoMessage("There are active conference calls related
 to this Incident.");
  }
})(current, previous);
```

NotifyUtil - validateOutboundNotifyPhoneNumber(String number)

Validates a specified Notify telephone number.

The method performs three types of validation:

1. Whether the Notify number exists in the Notify Phone Number [notify_number] table.
2. Whether the Notify number has a Notify group associated with it.
3. Whether the Notify number is active.

If any one of these validations fail, the method throws an exception.

Parameters

Name	Type	Description
number	String	Notify number to validate.

Returns

Type	Description
None	

This example illustrates how to validate a notify number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var fromNumber = getFromNumber();
  var nUtil = new NotifyUtil();
  var toNumber =
 nUtil.getSMSNumberForUser(sourceRecord.assigned_to.getRefRecord
());
  var message = 'Incident ' + sourceRecord.getDisplayValue() + '
 has been assigned to you.';
  if (fromNumber &&
 nUtil.validateOutboundNotifyPhoneNumber(fromNumber) && toNumber
 && nUtil.validatePhoneNumber(toNumber)) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToNumber(fromNumber, toNumber, message,
 sourceRecord);
  }
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
  }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NotifyUtil - validatePhoneNumber(String number)

Verifies that the specified number is a valid E.164 telephone number.

Parameters

Name	Type	Description
number	String	Telephone number to validate.

Returns

Type	Description
Boolean	Flag that indicates whether the specified number is a valid telephone number. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• true: Valid E.164 telephone number. • false: Invalid telephone number.

This example illustrates how to validate a telephone number.

```
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var fromNumber = getFromNumber();
  var nUtil = new NotifyUtil();
  var toNumber =
 nUtil.getSMSNumberForUser(sourceRecord.assigned_to.getRefRecord
());
  var message = 'Incident ' + sourceRecord.getDisplayValue() + '
 has been assigned to you.';
  if (fromNumber &&
 nUtil.validateOutboundNotifyPhoneNumber(fromNumber) && toNumber
 && nUtil.validatePhoneNumber(toNumber)) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToNumber(fromNumber, toNumber, message,
 sourceRecord);
  }
}

function getFromNumber() {
  var prop = gs.getProperty('custom_property_name', '');
  if (!prop){
    return getFallbackFromNumber();
  }
  return prop;
}

function getFallbackFromNumber() {
  var notifyNumGr = new GlideRecord("notify_number");
  notifyNumGr.addActiveQuery();
  notifyNumGr.addQuery('has_sms_out', 'yes');
  notifyNumGr.query();
  if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
  }
  return '';
}
```

NumberFormatter - Scoped, Global

The *NumberFormatter* API includes methods that return numbers formatted according to the language of the current user.

This API is available in scoped and global apps and runs in the *sn_i18n* namespace.

When formatted by language or locale, users can view numbers as expected. For example, if the locale is fr (French), a value provided as 100.00 returns as 100,00.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NumberFormatter – format(Number number)

Returns a string representation of a number formatted according to the language setting of the current user.

Parameters

Name	Type	Description
number	Number	Number of any size.

Returns

Type	Description
String	Number formatted according to the language setting of the current user.

The following example shows the return results for a user with their language set to Spanish.

```
gs.info("Number is: " +
 sn_i18n.NumberFormatter.format(123456.789));
gs.info("Number is: " +
 sn_i18n.NumberFormatter.format(-123456.789));
```

Output:

```
Number is: 123.456,789
Number is: -123.456,789
```

NumberFormatter – formatLang(Number number, String language)

Returns a string representation of a number formatted according to the language passed as a parameter.

Parameters

Name	Type	Description
number	Number	Number of any size.
language	String	Language tag conforming with IETF BCP-47.

Returns

Type	Description
String	Number formatted according to the language passed as a parameter.

The following example shows output for German language setting.

```
gs.info("Number is: " +
 sn_i18n.NumberFormatter.formatLang(123456.789, "de-de"));
gs.info("Number is: " +
 sn_i18n.NumberFormatter.formatLang(-123456.789, "de-de"));
```

Output:

```
Number is: 123.456,789
Number is: -123.456,789
```

NumberFormatter - parseWithLocale(String number, String language, String country)

Parses a number from a passed text string, traversing left-to-right, to extract the numeric value. It then uses the passed country and language codes to identify the locale of the number and returns the parsed number in that format.

This method parses the string until it reaches a character that it doesn't recognize as a numeric value or a currency separator.

Parameters

Name	Type	Description
number	String	String to parse. This string can contain numeric values and currency separators such as commas and decimal points. For example: `"24,506.55"` or `"45.677,89"`.
language	String	Two-character ISO-639 language code.
country	String	Two-character ISO-3166 country code.

Returns

Type	Description
Number	Parsed number in the specified locale's format. Throws an exception if the first character of the string can't be parsed. For example: • "123.34": Parses to 123.34 as long as the locale decimal separator is a period. • "1,234.56": Parses to 1234.56 as long as the locale grouping separator is a comma and the decimal separator is a period. • "1.234.567,89": If the grouping separator is anything but a period, parses to 1. • "123x456": Parses to 123. • "text123": Causes the method to throw a ParseException.

The following code example demonstrates parsing strings for various locales, as well as parsing a string with unexpected separators. The last example only partially parses the string because a space isn't a valid separator.

```
var x = sn_i18n.NumberFormatter.parseWithLocale("48,837.77",
 "en", "US");
var y =  sn_i18n.NumberFormatter.parseWithLocale("77.931,22",
 "de", "DE");
var z = sn_i18n.NumberFormatter.parseWithLocale("562 339,89",
 "fr", "FR");
var specialCase = sn_i18n.NumberFormatter.parseWithLocale("400
 797,67", "en", "US");

gs.info(x);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.info(y);
gs.info(z);
gs.info(specialCase);
```

Output:

```
48837.77
77931.22
562339.89
400
```

NumberFormatter - parseWithSeparators(String number, String groupingSeparator, String decimalSeparator)

Parses and returns a number from a passed text string, traversing left-to-right, until it encounters a character that it can't parse. Parsable values include numbers and the specified grouping and decimal separators.

Parameters

Name	Type	Description
number	String	String to parse. This string can contain numeric values and the specified separators such as commas and decimal points. For example: `"24,506.55"` or `"45.677,89"`.
groupingSeparator	String	Character that denotes the grouping separator, also known as the thousands separator, within the passed string. For example: Comma ",", period ".", or space " ".
decimalSeparator	String	Character that denotes the decimal separator within the passed string. For example: Comma ",", period ".", or space " ".

Returns

Type	Description
Number	Parsed number. Throws an exception if the first character of the string can't be parsed. For example: • "123.34": Parses to 123.34 as long as the locale decimal separator is a period. • "1,234.56": Parses to 1234.56 as long as the locale grouping separator is a comma and the decimal separator is a period. • "1.234.567,89": If the grouping separator is anything but a period, parses to 1. • "123x456": Parses to 123. • "text123": Causes the method to throw a ParseException.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following code example shows how to parse numbers using various separators. Note that the final parse example only parses the first three digits of the number as a space is not a valid separator.

```
var x = sn_i18n.NumberFormatter.parseWithSeparators('48,837.77',
 ',', '.');
var y =
 sn_i18n.NumberFormatter.parseWithSeparators('77.931,22', '.',
 ',');
var z = sn_i18n.NumberFormatter.parseWithSeparators('562
 339,89', ' ', ',');
var specialCase =
 sn_i18n.NumberFormatter.parseWithSeparators('400 797,67', '.',
 ',');

gs.info(x);
gs.info(y);
gs.info(z);
gs.info(specialCase);
```

Output:

```
48837.77
77931.22
562339.89
400
```

OAuthUtil - Global

The *OAuthUtil* script include modifies request parameters and parses the token response during runtime.

If the external OAuth provider returns a response other than an application/JSON type response, you can customize your own version of this script include to parse responses that are in different format. Extend or copy this script include, and then reference your version from the **OAuth API Script** field on the Application Registry form for third-party OAuth providers. The custom script include name must start with `OAuth`.

For example, if the OAuth provider requires a resource parameter with value `https://outlook.office365.com`, the code would look like:

```
preprocessAccessToken: function(requestParamMap) {
  requestParamMap.put("resource",
 "https://outlook.office365.com");
},
```

OAuthUtil - getOAuthProfile()

Returns a GlideRecord representing the current OAuth profile

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideRecord	GlideRecord representing the current OAuth profile

OAuthUtil - interceptRequestParameters(requestParamMap)

Adds a name:value pair to the request parameters.

Parameters

Name	Type	Description
requestParamMap	String	The name:value pair you want to add.

Returns

Type	Description
void	

OAuthUtil - parseTokenResponse(accessTokenResponse)

Parses the token received into a parameter map.

Parameters

Name	Type	Description
accessTokenResponse	String	The access token response that you want to parse.

Returns

Type	Description
void	

OAuthUtil - setEndpoint(url)

Set the endpoiont for your OAuth request

Parameters

Name	Type	Description
url	String	URL endpoint for your request

Returns

Type	Description
void	

OAuthUtil - setHeader(headerName, headerValue)

Add a header to an outbound token request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
headerName	String	Name of your token request header
headerValue	String	Value of your token request header

Returns

Type	Description
void	

OAuthUtil - setQueryParameter(paramName, paramValue)

Add a query parameter to an OAuth request.

Parameters

Name	Type	Description
paramName	String	Name of your parameter
paramValue	String	Value of your parameter

Returns

Type	Description
void	

OCRosterSpanApprovalUtil - Global

The `OCRosterSpanApprovalUtil` script include provides methods for the PTO approval feature.

OCRosterSpanApprovalUtil - approvePTOSpan (GlideRecord rosterSpanGr)

Changes the type of the roster_schedule_span to time-off from approval.

Parameters

Name	Type	Description
rosterSpanGr	GlideRecord	A roster_schedule_span_proposal record.

Returns

Type	Description
void	

OCRosterSpanApprovalUtil - getContextualCalUrlPerSpanProposal (GlideRecord rosterSpanProposalGr)

Returns a URL to the on-call calendar based on the rosterSpanProposalGr.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
rosterSpanProposalGr	GlideRecord	A roster_schedule_span_proposal record.

Returns

Type	Description
String	A URL to the on-call calendar based on the rosterSpanProposalGr.

OCRosterSpanApprovalUtil - getFromDateDisplayValuePerSpanProposal (GlideRecord rosterSpanProposalGr)

Returns a formatted GlideScheduleDateTime string based on the start date of the rosterSpanProposalGr.

Parameters

Name	Type	Description
rosterSpanProposalGr	GlideRecord	A roster_schedule_span_proposal record.

Returns

Type	Description
String	A formatted GlideScheduleDateTime string based on the start date of the rosterSpanProposalGr.

OCRosterSpanApprovalUtil - getPTOApproversList(GlideRecord rosterSpanProposalGr)

Returns an array of group managers based on the user's rota groups.

Parameters

Name	Type	Description
rosterSpanProposalGr	GlideRecord	A roster_schedule_span_proposal record.

Returns

Type	Description
Array	An array of group managers based on the user's rota groups.

The following example is an on-demand script include named *`OCPTOApprovalReminder`*. When called by running the scheduled job manually, the managers and their delegate managers are notified of employees who are scheduled for PTO on the following day.

```
function OCPTOApprovalReminder() {

 //Passing parameters in 'getDateFormat()' function with the
 days which needs to be added
 var startDate = getDateFormat(1); //We can use System property
 to set Start Date
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var endDate = getDateFormat(2); //We can use System property to
set End Date

//Building the encoded query all the Pending approval state
proposals whose start date is tomorrow
var encodedQuery =
'state=1^roster_schedule_span.start_date_time>' + startDate +
'^roster_schedule_span.start_date_time<' + endDate;

//Sends an event notification to all rota managers and their
delegate managers
getNotApprovedList(encodedQuery);

//Converts the date and time in ISO Format
function getDateFormat(daysToBeAdded) {

 //Getting today's date and adding '1' day
 var todaysDate = new GlideDate();
 todaysDate.addDaysUTC(daysToBeAdded);
 todaysDate = todaysDate.getValue();

 //Converting to today's date object to GlideDate object
 var addingDaysToDate = new GlideDate();
 addingDaysToDate.setValue(todaysDate);

 //Setting the time default to '12:00:00' and returning the
time in the specified format to match ISO
 var staticTime = new GlideTime();
 staticTime.setValue('00:00:00');
 staticTime.setValue(staticTime.getHourOfDayUTC() + ':' +
staticTime.getMinutesUTC() + ':' + staticTime.getSeconds());

 //Returns the date & time in the specified format
 var isoFormattedDateTime =
addingDaysToDate.getByFormat("yyyyMMdd") + 'T' +
staticTime.getByFormat("HHmmss") + 'Z';
 return isoFormattedDateTime;
}

//Gliding Roster schedule span proposal table with the
built-in query to fetch the records whose proposals are not
approved/rejected
function getNotApprovedList(addEncodedQuery) {
 var rosterScheduleEntryProposalGR = new
GlideRecord('roster_schedule_span_proposal');

rosterScheduleEntryProposalGR.addEncodedQuery(addEncodedQuery);
 rosterScheduleEntryProposalGR.query();
 while(rosterScheduleEntryProposalGR.next()) {

  //Call On-Call Scheduling OCRosterSpanApprovalUtil library
with 'getPTOApproversList' function
  //pass GlideRecord object of 'roster_schedule_span_proposal'
table
  var rotaManagers = new
OCRosterSpanApprovalUtil().getPTOApproversList(rosterScheduleEn
tryProposalGR);
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    rotaManagers = rotaManagers.join(",");

    // Pull only the unique sys_ids
    var managerList = new
 ArrayUtil().unique(getManagerDelegateApprovals(rotaManagers).to
String().split(','));

                      // Event to trigger a reminder notification
 for testing.
                      // To use, create a an event registry named
 "oc.manager.delegate.reminder"
                      // Call the event in a notification and
 uncomment the following line
    //gs.eventQueue("oc.manager.delegate.reminder",
 rosterScheduleEntryProposalGR, managerList, "");

                if(managerList)
    gs.info("Returns the list of manager and it's delegate
 members >>>>>> " + managerList);
  }
 }

 //Get the sys_ids of the managers and their delegate managers
 function getManagerDelegateApprovals(manager) {
  var answer = [];
        answer.push(manager);
  var delegateGR = new GlideRecord("sys_user_delegate");
  delegateGR.addQuery("user", 'IN', manager);
  delegateGR.addQuery("starts", "<=", gs.daysAgo(0));
  delegateGR.addQuery("ends", ">=", gs.daysAgo(0));
  delegateGR.addQuery("approvals", true);
  delegateGR.query();
  while(delegateGR.next()) {
   answer.push(delegateGR.getValue('user'));
   answer.push(delegateGR.getValue('delegate'));
  }
  return answer;
 }
}
```

Add the following call to a record in the Scheduled Script Execution [sysauto_script] table. This trigger calls the *OCPTOApprovalReminder* script include when the scheduled job is run manually.

```
OCPTOApprovalReminder();
```

OCRosterSpanApprovalUtil - getToDateDisplayValuePerSpanProposal (rosterSpanProposalGr GlideRecord)

Returns a formatted GlideScheduleDateTime string based on the end date of the rosterSpanProposalGr.

Parameters

Name	Type	Description
rosterSpanProposalGr	GlideRecord	A roster_schedule_span_proposal record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	A formatted GlideScheduleDateTime string based on the end date of the rosterSpanProposalGr.

OCRosterSpanApprovalUtil - getUserNamePerSpanProposal (GlideRecord rosterSpanProposalGr)

Returns the user's name based on rosterSpanProposalGr.

Parameters

Name	Type	Description
rosterSpanProposalGr	GlideRecord	A roster_schedule_span_proposal record.

Returns

Type	Description
String	The user's name based on rosterSpanProposalGr.

OCRosterSpanApprovalUtil - isPTOApprovalRequired ()

Checks whether the system property *com.snc.on_call_rotation.pto.approval.required* is true.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the system property *com.snc.on_call_rotation.pto.approval.required* is true..

OCRosterSpanApprovalUtil - rejectPTOSpan (rosterSpanGr GlideRecord)

Changes the type of the roster_schedule_span to rejected from approval.

Parameters

Name	Type	Description
rosterSpanGr	GlideRecord	A roster_schedule_span_proposal record.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.

OCRotation - Global

The *OCRotation* script include provides methods to build a data structure that is used to display a calendar.

The code builds up the GlideAJAXSchedulePage object which stores a list of span items. You can use this type for the Gwt (legacy) calendar. See the OCRotationV2 - Global script include for other calender types. This is part of On-Call Scheduling.

OCRotation - buildRotas()

Builds the on-call coverage based on your groups, rotas, and rosters. This is used by the OCRotationV2 - getSpans method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Void	

Related topics

OCRotationV2 - getSpans()

OCRotation - getEndDate()

Returns the end date for the time period for which you want to retrieve on-call coverage.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	End date for the time period for which you want to retrieve on-call coverage.

OCRotation - getGroupIds()

Returns a comma separated list of group sys_id (sys_user_group) values for an on-call schedule.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Comma separated list of group sys_id (sys_user_group) values for an on-call schedule.

OCRotation - getRosterIds()

Returns the rosters according to the selected rotas.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Rosters according to the selected rotas.

OCRotation - getRotaGr(String rotaIds, String groupIds, String rosterIds, String userIds)

Returns a GlideRecord for the cmn_rota table filtered by groups, rota, users, and roster.

Parameters

Name	Type	Description
rotaIds	String	Comma separated list of rota sys_id (cmn_rota) values for an on-call schedule.
groupIds	String	Comma separated list of group sys_id (sys_user_group) values for an on-call schedule.
rosterIds	String	Comma separated list of roster sys_id (cmn_rota_roster) values for an on-call schedule.
userIds	String	Comma separated list of user sys_id (sys_user) values for an on-call schedule.

Returns

Type	Description
GlideRecord	A GlideRecord for the cmn_rota table filtered by groups, rota, users, and roster.

OCRotation - getRotaIds()

Returns the rotas for the groups on your calendar.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Rotas for the groups on your calendar.

OCRotation - getStartDate()

Returns the start date for the time period for which you want to retrieve on-call coverage.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Start date for the time period for which you want to retrieve on-call coverage.

OCRotation - getTimezone()

Returns the timezone that your on-call calendar will use.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Timezone that your on-call calendar will use. For example, **Europe/Madrid** and **US/Pacific**.

OCRotation - getUserIDs()

This will filter the schedules return by users. Get comma separated list of user sys_id (sys_user) values used to filter on-call schedules.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Comma separated list of user sys_id (sys_user) values used to filter on-call schedules.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCRotation - setEndDate(String endDate, Boolean inclusive)

Set the end date for the time period for which you want to retrieve on-call coverage. If the end date is not set, then the last day of the next month is applied by default. Use in conjunction with OCRotationV2 - getSpans.

Parameters

Name	Type	Description
endDate	String	[Optional] End date of the on-call schedule.
inclusive	Boolean	[Optional] When true, the end date is included in the time span. If not specified, this value defaults to true.

Returns

Type	Description
Void	

Related topics

OCRotationV2 - getSpans()

OCRotation - setGroupIds(String groupIds)

Filters the schedules return by groups. Set comma separated list of group sys_id (sys_user_group) values for an on-call schedule. Use in conjunction with OCRotationV2 - getSpans.

Parameters

Name	Type	Description
groupIds	String	Comma separated list of group sys_id (sys_user_group) values for an on-call schedule.

Returns

Type	Description
Void	

Related topics

OCRotationV2 - getSpans()

OCRotation - setRosterIds(String rosterIds)

Sets the rosters according to the selected rotas. Use in conjunction with OCRotationV2 - getSpans.

Parameters

Name	Type	Description
RosterIds	String	Rosters according to the selected rotas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Returns

Type	Description
void	

Related topics

OCRotationV2 - getSpans()

OCRotation - setRotaIds(String rotaIds)

Sets the rotas for the groups on your calendar. Use in conjunction with OCRotationV2 - getSpans.

Parameters

Name	Type	Description
RotaIds	String	Rotas for the groups on your calendar.

Returns

Type	Description
Void	

Related topics

OCRotationV2 - getSpans()

OCRotation - setStartDate(String startDate)

Sets the start date for the time period for which you want to retrieve on-call coverage. If the start date is not set, then the first day of the previous month is applied by default. Use in conjunction with OCRotationV2 - getSpans.

Parameters

Name	Type	Description
startDate	String	[Optional] Start date for the time period for which you want to retrieve on-call coverage.

Returns

Type	Description
void	

Related topics

OCRotationV2 - getSpans()

OCRotation - setTimezone(String timezone)

Sets the timezone that your on-call calendar will use. Use in conjunction with OCRotationV2 - getSpans.

Type	Description
Void	

Related topics

OCRotationV2 - getSpans()

OCRotation - setUserIds(String userIds)

Sets comma separated list of user sys_id (sys_user) values used to filter on-call schedules. Use in conjunction with OCRotationV2 - getSpans.

Parameters

Name	Type	Description
UserIds	String	Comma separated list of user sys_id (sys_user) values used to filter on-call schedules.

Returns

Type	Description
Void	

Related topics

OCRotationV2 - getSpans()

OCRotationV2 - Global

The *OCRotationV2* script include is an extension of *OCRotation* script include, which is used by Fullcalendar.io and the DHTMLX On-Call Calendar.

Use this script include to obtain the schedule time span between two dates that are further filtered by groups, rotas, rosters, and users. You can also extend *OCRotationV2* to add or modify behavior. This is part of On-Call Scheduling.

OCRotationV2 - getGroups()

Returns an array of groups that have active rotas.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	An array of group objects. Each contains the following attributes: • sys_id of the sys_user_group record • name of the sys_user_group record

OCRotationV2 - getRostersByRotas(String rotaSysIds)

Returns an array of active rosters for a given rota ID.

Parameters

Name	Type	Description
rotaSysIds	String	Comma separated list of rota sys_id (cmn_rota) values.

Returns

Type	Description
Array	An array of rota objects. Each contains the following attributes: • sys_id of the cmn_rota_roster record • name of the cmn_rota_roster record • rota sys_id of the cmn_rota record

OCRotationV2 - getRotasByGroup(String groupSysIds)

Returns an array of active rotas for a given group ID.

Parameters

Name	Type	Description
groupSysIds	String	Comma separated list of group sys_id (sys_user_group) values.

Returns

Type	Description
Array	An array of rota objects. Each contains the following attributes: • sys_id of the cmn_rota record • name of the cmn_rota record • group sys_id of the sys_user_group record

OCRotationV2 - getSpans()

Get the spans from the specified start date to the specified end date. If no start and end dates are provided, the start date defaults to a month before and the end date defaults to a month after

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the current time. You can also use the groups IDs, rota IDs, roster IDs, user IDs to further filter the spans.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of spans. Each contains the following attributes: id, sys_id, table, rota_id, roster_id, user_id, text, description, color, textColor, start_date, end_date.

Get all spans for the default time period

```
var spans = new OCRotationV2().getSpans();
var firstSpanStartDate = spans[0].start_date; // get the first
 span's start date
```

Get all spans between 1st April 2014 and 5th June 2014

```
var spans = new OCRotationV2()
    .setStartDate("2014-04-01")
    .setEndDate("2014-06-05")
    .getSpans();
```

Get the Network group's spans for the default time period

```
var spans = new OCRotationV2()
     .setGroupIds("287ebd7da9fe198100f92cc8d1d2154e")
     .getSpans();
```

Get ITIL User's spans between 1st January 2014 and 31st January 2014

```
var spans = new OCRotationV2()
    .setStartDate("2014-01-01")
    .setEndDate("2014-01-31")
    .setUserIds("681b365ec0a80164000fb0b05854a0cd")
    .getSpans();
```

OCRotaICalendarSNC - Global

The *OCRotaICalendarSNC* script include provides iCal formatted events for the a specific user's rotation.

OCRotaICalendarSNC - cleanExpiredCache ()

Records in the cmn_rota_resp_cache table that have a From date prior to today.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

OCRotaICalendarSNC - createCalendarEvents (String groupId, String rotaId, String userId, Object dateRangeObj)

Returns list of AJAXScheduleItems for the user's on-call.

Parameters

Name	Type	Description
groupId	String	The group sys id.
rotaId	String	The rota sys id.
userId	String	The user sys id.
dateRangeObj	Object	Contains the from and to dates for the data set.

Returns

Type	Description
AJAXScheduleItem	Java list of AJAXScheduleItems.

OCRotaICalendarSNC - createCustomEvent (String groupName, Object scheduleItemSpan, String calendarLink)

Creates a VEVENT based on the scheduleItemSpan provided.

Parameters

Name	Type	Description
groupName	String	Name of the on-call group.
scheduleItemSpan	Object	Span of time for the on-call period.
calendarLink	String	A link back to the on-call calendar in the instance.

Returns

Type	Description
String	A VEVENT based on the scheduleItemSpan provided.

OCRotaICalendarSNC - createPlaceholderCalendar (GlideRecord rotaGR, Object dateRangeObj, String calendarLink)

Creates a formatted iCalendar if the user has no upcoming on-call.

Parameters

Name	Type	Description
rotaGR	GlideRecord	The cmn_rota glide record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
dateRangeObj	Object	Contains the from and to dates for the data set.
calendarLink	String	A link to the on-call calendar for this user.

Returns

Type	Description
String	Formatted iCalendar with a placeholder VEVENT.

OCRotaICalendarSNC - getCalendarEvents (String groupId , String rotaId, String userId , Object dateRangeObj, Boolean useCache)

Returns the formatted iCalendar for the user's rotation.

Parameters

Name	Type	Description
groupId	String	The group sys id.
rotaId	String	The rota sys id.
userId	String	The user sys id.
dateRangeObj	Object	Contains the from and to dates for the data set.
useCache	Boolean	If true, makes use of the cache table cmn_rota_resp_cache.

Returns

Type	Description
String	Formatted iCalendar for the user's rotation.

OCRotaICalendarSNC - getEventsFromTable (String groupId, String rotaId, String userId, Object dateRangeObj)

Returns the formatted iCalendar for the user's rotation if found in the cmn_rota_resp_cache table.

Parameters

Name	Type	Description
groupId	String	The group sys id.
rotaId	String	The rota sys id.
userId	String	The user sys id.
dateRangeObj	Object	Contains the from and to dates for the data set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Formatted iCalendar for the user's rotation if found in the cmn_rota_resp_cache table.

OCRotaICalendarSNC - getIntersectRotaSpanItem (ScheduleTimeSpan timeSpan, Array rotaSpanItems)

Checks whether the provided timeSpan intersects with one of the rota span items.

Parameters

Name	Type	Description
timeSpan	ScheduleTimeSpan	A single span for the user's on-call.
rotaSpanItems	Array	Contains the user's standard on-call spans.

Returns

Type	Description
Object	If the timeSpan intersects with one of the rota span items, returns an object containing the rota span item and the span that it intersects with.

OCRotaICalendarSNC - getMemberCalendarURL (String groupId, Object rotaId, String userId)

Creates the subscribable URL for the user's iCalendar.

Parameters

Name	Type	Description
groupId	String	The group sys id.
rotaId	Object	The rota sys id.
userId	String	The user sys id.

Returns

Type	Description
String	The subscribable URL for the user's iCalendar.

OCRotaICalendarSNC - getOnCallCalendarURL (GlideRecord rotaGR)

Returns a URL to the on-call calendar based on the rota record.

Parameters

Name	Type	Description
rotaGR	GlideRecord	A cmn_rota record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	URL to the on-call calendar based on the rota record.

OCRotaCalendarSNC - handleOverrideMember (AJAXScheduleItem scheduleItem)

Returns an array of the user's overrides (extra coverage).

Parameters

Name	Type	Description
scheduleItem	AJAXScheduleItem	A list of AJAXScheduleItems.

Returns

Type	Description
Array	An array of the user's overrides (extra coverage).

OCRotaCalendarSNC - handleRotaMember (AjaxSchedueItem scheduleItem , Object rotaSpanItems, Object definitionItems, Array repeatRotaSpanIdArr)

Returns an object containing the user's override (extra coverage) and excluded spans.

Parameters

Name	Type	Description
scheduleItem	AJAXSchedueItem	A list of AJAXScheduleItems.
rotaSpanItems	Object	Contains the user's standard on-call spans.
definitionItems	Object	Contains the rota's standard on-call spans.
repeatRotaSpanIdArr	Array	An array of rota span sys ids.

Returns

Type	Description
Object	Contains the user's override (extra coverage) and excluded spans.

OCRotaCalendarSNC - invalidateRotaRespCache (GlideRecord rotaRespCacheGR)

Used by business rules on the cmn_rota_member, cmn_schedule_span, and roster_schedule_span tables to update the cmn_rota_resp_cache table.

Parameters

Name	Type	Description
rotaRespCacheGR	GlideRecord	Record that has been updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

OCRotaICalendarSNC - matchRotaSpanRule(ScheduleTimeSpan timeSpan, Array rotaSpanItems, Array repeatRotaSpanIdArr, Object seriesStartTimes)

Checks whether the provided timeSpan matches one of the rotaSpanItems.

Parameters

Name	Type	Description
timeSpan	ScheduleTimeSpan	A single span for the user's on-call.
rotaSpanItems	Array	Contains the user's standard on-call spans.
repeatRotaSpanIdArr	Array	An array of rota span sys ids.
seriesStartTimes	Object	Start time of the rota spans.

Returns

Type	Description
Boolean	Returns true if the timeSpan matches one of the rotaSpanItems.

OCRotaICalendarSNC - populateCalendarSubscriptionSettings ()

Used by fixed job to populate the calendar subscription fields on the cmn_rota form

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

OCRotaICalendarSNC - processSeriesEvent (List scheduleItems, Array repeatRotaSpanIdArr , String userId)

Returns an object containing the user's rotations.

Parameters

Name	Type	Description
scheduleItems	List	The user's on-call rotation as an AJAXScheduleItem list.
repeatRotaSpanIdArr	Array	An array of the cmn_rota schedule span record sys_ids.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
userId	String	The user sys id.

Returns

Type	Description
Object	Contains the user's rotations.

OCRotaICalendarSNC - saveCalendarEvents (String groupId, String rotaId, String userId, Object dateRangeObj, String result)

Inserts the user's iCalendar into the cmn_rota_resp_cache table.

Parameters

Name	Type	Description
groupId	String	The group sys id.
rotaId	String	The rota sys id.
userId	String	The user sys id.
dateRangeObj	Object	Contains the from and to dates for the data set.
result	String	The user's iCalendar.

Returns

Type	Description
void	

OCRotaICalendarSNC - sendCalendarURL (GlideRecord rotaGR)

Queues events to send an email to all members of the rotation.

Parameters

Name	Type	Description
rotaGR	GlideRecord	A cmn_rota record.

Returns

Type	Description
void	

OCRotaICalendarSNC - updateExceptionList (AJAXScheduleItem scheduleItem, ScheduleTimeSpan timeSpan, Array rotaSpanItems)

Returns an object that contains all of the timeSpans that need to be excluded from the user's iCalendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
scheduleItem	AJAXScheduleItem	One AJAXScheduleItem.
timeSpan	ScheduleTimeSpan	A single user's standard on-call span.
rotaSpanItems	Array	Contains the user's standard on-call spans.

Returns

Type	Description
Object	Object that contains all of the timeSpans that need to be excluded from the user's iCalendar.

OCRotaICalendar - Global

The `OCRotaICalendar` script include is an extension of the `OCRotaICalendarSNC` script include.

OCRotaMember - Global

The `OCRotaMember` script include provide methods to perform maintenance operations on the On-call Member [cmn_rota_member] table.

OCRotaMember - deactivateUser (String userId, GlideDateTime deactivateDate)

Deactivates the user's rota member records according to the deactivate date.

Parameters

Name	Type	Description
userId	String	The sys id of the user.
deactivateDate	GlideDateTime	The date from which the user's rotation is deactivated.

Returns

Type	Description
void	

OCRotaMember - hasChanged (GlideRecord current, GlideRecord previous)

Checks whether the cmn_rota_member record has changed. Checks the Member, From, To, and Order fields have changed.

Parameters

Name	Type	Description
current	GlideRecord	The latest changes made to the cmn_rota_member record.
previous	GlideRecord	The original state of the cmn_rota_member record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

OCRotaMember - hasOrderChanged (GlideRecord current, GlideRecord previous)

On update of a cmn_rota_member record, checks whether the order of the record has changed.

Parameters

Name	Type	Description
current	GlideRecord	The latest changes made to the cmn_rota_member record.
previous	GlideRecord	The original state of the cmn_rota_member record.

Returns

Type	Description
Boolean	Returns true if the order has changed.

OCRotaMember - recalculate (GlideRecord current, GlideRecord previous)

Recalculates the schedule for the cmn_rota_member record.

Parameters

Name	Type	Description
current	GlideRecord	The latest changes made to the cmn_rota_member record.
previous	GlideRecord	The original state of the cmn_rota_member record.

Returns

Type	Description
void	

OCRotaMember - validateDates (String from, String to)

Ensures that the From date occurs before or on the same date as the To date.

Parameters

Name	Type	Description
from	String	Formatted date/
to	String	Formatted date/

Returns

Type	Description
Boolean	Returns true if the From date is before or on same date as To date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCSeriesEventGenerator - Global

The `OCSeriesEventGenerator` script include provide methods to generate the repeating VEVENTS for a user's iCalendar.

OCSeriesEventGenerator - getMemberCalendar (String groupId, String rotaId, String userId, Object dateRangeObj, Object memberSchedules, String calendarLink)

Returns an array of the repeating on-call events.

Parameters

Name	Type	Description
groupId	String	The group sys id.
rotaId	String	The rota sys id.
userId	String	The user sys id.
dateRangeObj	Object	Contains the from and to dates for the data set.
memberSchedules	Object	The user's schedule.
calendarLink	String	A link back to the on-call calendar in the instance.

Returns

Type	Description
Array	Array of the repeating on-call events.

OCSeriesEventGenerator - getRosterICalEvents (GlideRecord rotaScheduleSpanGR, GlideRecord memberScheduleSpanGR, Array seriesStartTimes, Object excludeItems, String repeatUntil, String timeZone, String calendarLink)

Returns an array of VEVENTs that represent the on-call for the provided rotaScheduleSpanGR and the memberScheduleSpanGR.

Parameters

Name	Type	Description
rotaScheduleSpanGR	GlideRecord	A cmn_schedule_span glide record for a rota.
memberScheduleSpanGR	GlideRecord	A cmn_schedule_span glide record for a rota member.
seriesStartTimes	Array	An array of the repeating rota span start times.
excludeItems	Object	The schedule items that need to be excluded.
repeatUntil	String	A formatted ScheduleDateTime string.
timeZone	String	Time zone for the on-call rota.
calendarLink	String	A link to the on-call calendar for this user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	An array of VEVENTs that represent the on-call for the provided rotaScheduleSpanGR and the memberScheduleSpanGR.

OCSeriesEventGenerator - getRosterMemberEvents (GlideRecord rotaMemberGR, Array seriesStartTimes, Object excludeItems, String repeatUntil, String calendarLink)

Returns an array of the repeating on-call VEVENTS.

Parameters

Name	Type	Description
rotaMemberGR	GlideRecord	A cmn_rota_member record.
seriesStartTimes	Array	An array of the repeating rota span start times.
excludeItems	Object	The schedule items that need to be excluded.
repeatUntil	String	A formatted ScheduleDateTime string.
calendarLink	String	A link to the on-call calendar for this user.

Returns

Type	Description
Array	An array of the repeating on-call VEVENTS

OCTimer - Global

The `OCTimer` script include provides methods to track the length of time it takes for a function to complete.

This script include requires the On-Call Scheduling (com.snc.on_call_rotation) plugin to be activated. For more information, refer to the topic Activate On-Call Scheduling.

OCTimer - log (String name, String entry)

Logs the entry based on the function name.

Parameters

Name	Type	Description
name	String	Function name.
entry	String	Text that will be part of the output in the log.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OCTimer - millisToTime (Integer millis)

Takes a millisecond value and returns a formatted duration.

Parameters

Name	Type	Description
millis	Integer	Duration in miliseconds.

Returns

Type	Description
String	A formatted duration.

OCTimer - result ()

Calculates the time taken for each function registered.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Time taken for each function registered.

The following code example benchmarks the time taken by a REST API to fetch IP addresses from devices in Network Gear and then inserts them into IP Address table. API calls may require some time to process, so it is advisable to benchmark execution time before executing them in production.

```
var user = "<user name>"; // ServiceNow login user name
var password = "<password>";  // ServiceNow login password
var instance = "<instance name>";   // ServiceNow instance name

// Insert new IP address to IP address table using REST API
function insertIPAddress(ip_address) {
 var request = new sn_ws.RESTMessageV2();
 request.setEndpoint('https://' + instance +
 '.service-now.com/api/now/table/cmdb_ci_ip_address');
 request.setHttpMethod('POST');

 request.setBasicAuth(user,password);
 request.setRequestHeader("Accept","application/json");
 request.setRequestHeader('Content-Type','application/json');req
uest.setRequestBody("{\"ip_address\":\"" + ip_address + "\"}");
 var response = request.execute();
}

// Retrieve IP address from devices in Network gear
function getIPAddresses() {
 var request = new sn_ws.RESTMessageV2();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 request.setEndpoint('https://' + instance +
 '.service-now.com/api/now/table/cmdb_ci_netgear?sysparm_fields=
ip_address');
 request.setHttpMethod('GET');

 request.setBasicAuth(user,password);
 request.setRequestHeader("Accept","application/json");

 var response = request.execute();
 return response.getBody();
}

var timer = new OCTimer();              // create OCTimer object

// get the IP addresses from Network Gear table
timer.start("getIPAddresses");          // start timer to time
 fetching IP addresses from Network Gear table
var ipAddressStr = getIPAddresses();
timer.stop('getIPAddresses');           // stop timer

// insert IP addresses to IP Address table
var ipAddressJson = JSON.parse(ipAddressStr);  // parse result
var ipAddressList = ipAddressJson.result;      // extract IP
 addresses to a list
for (var i=0; i<ipAddressList.length;i++) {    // loop through
 var ip_address = ipAddressList[i]["ip_address"].trim();
 if (ip_address.length > 0) {
  timer.start("insertIPAddress");    // start timer to time
 inserting IP address to IP Address table
  insertIPAddress(ip_address);       // insert IP address
  timer.stop('insertIPAddress');     // end timer
 }
}

var result = timer.result();          // get timer results
gs.info(result);                      // output timer result
```

Output:

```
getIPAddresses method was invoked 1 time and took 00.288 seconds
insertIPAddress method was invoked 37 times and took 02.352
 seconds
```

OCTimer - start (String name)

Initializes a timer based on the name provided.

Parameters

Name	Type	Description
name	String	Function name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

```
 var ip_address = ipAddressList[i]["ip_address"].trim();
 if (ip_address.length > 0) {
  timer.start("insertIPAddress");    // start timer to time
 inserting IP address to IP Address table
  insertIPAddress(ip_address);       // insert IP address
  timer.stop('insertIPAddress');     // end timer
 }
}

var result = timer.result();         // get timer results
gs.info(result);                     // output timer result
```

Output:

```
getIPAddresses method was invoked 1 time and took 00.288 seconds
insertIPAddress method was invoked 37 times and took 02.352
 seconds
```

OCTimer - stop (String name)

Registers the end of the timer for the provided name.

Parameters

Name	Type	Description
name	String	Function name.

Returns

Type	Description
void	

The following code example benchmarks the time taken by a REST API to fetch IP addresses from devices in Network Gear and then inserts them into IP Address table. API calls may require some time to process, so it is advisable to benchmark execution time before executing them in production.

```
var user = "<user name>"; // ServiceNow login user name

 seconds
```

OnCallContactPreferenceUtil - Global

The *OnCallContactPreferenceUtil* script include provides methods for handling contact preferences.

For contact preference configuration, see Configure contact preferences.

This script include supports the OnCallRotation script include.

OnCallContactPreferenceUtil - OnCallContactPreferenceUtil()

Creates an instance of the OnCallContactPreferenceUtil class.

Parameters

Name	Type	Description
None		

OnCallContactPreferenceUtil - getContactsAtByEscalatee(Object escalatee, Number contactAttempt, GlideDateTime gdt, String rotaSysIds)

Gets a list of contacts with the escalatee object. Each returned contact contains a list of user contact preferences.

Parameters

Name	Type	Description
escalatee	Object	Mandatory. Escalatee object returned by the getEscalationPlan() method.
contactAttempt	Number	Optional. The attempt you are trying to contact [default value = 1]. • `1`: First attempt • `2`: First reminder • `3 or more`: Subsequent reminders
gdt	GlideDateTime	Optional. yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.admin
rotaSysIds	String	Optional. Comma-separated string of Sys IDs of shifts from the [cmn_rota] table. Default value returns Sys IDs of the shifts at current time.

Returns

Type	Description
Array object	Array of escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position. • type: String. Type of contact, e.g., user. • sys_id: String. Sys ID of the user from the [sys_user] table. • rota_id: String. Sys ID of the shift from the [cmn_rota] table. • roster_id: String. Sys ID of the roster from the [cmn_rota_roster] table. • escalation_step_id: String. If an escalation path has been defined, Sys ID of the escalation step from the [cmn_rota_esc_step_def] table. • forced_communication_channel: String. If specified in the preferences, mandatory communication channel. Supported values include SMS, voice or email. • override_user_contact_preference: Boolean. True if there are contact overrides, false otherwise.

Returns (continued)

Type	Description

	• preference_source: String. Source of preference, such as contact or group.
	• contact_attempt: Number. Contact attempts: 1 = first attempt, 2 = first reminder, and so on.
	• user_preferences: Array Object.
	  ○ type: String. User's preferred contact format, e.g. sms, email, or number.
	  ○ <name of preferred format, e.g., email or number>: String. Content of preferred contact type, e.g., email address or phone number.
	• contact_preferences, Array Object.
	  ○ type: String. User's preferred contact format, e.g., email or number.
	  ○ <name of preferred format, e.g., email or number>: String. Content of preferred contact type, e.g., email address or phone number.

```
var serviceDeskSysId = '<Sys_ID>';
var ocRotation = new OnCallRotation();
var escalationPlan =
 ocRotation.getEscalationPlan(serviceDeskSysId);
var escalatee = escalationPlan[0];

var onContactPrefUtil = new OnCallContactPreferenceUtil();
var contactAttempt = 1;
var gdt = new GlideDateTime();
var contacts =
 onContactPrefUtil.getContactsAtByEscalatee(escalatee,
 contactAttempt, gdt);
gs.log(JSON.stringify(contacts));
```

Output:

```
[{
    "type": "user",
    "sys_id": "<Sys_ID>",
    "rota_id": "<Rotation_ID>",
    "roster_id": "",
    "escalation_step_id": "<Escalation_Step_ID>",
    "forced_communication_channel": "",
    "override_user_contact_preference": true,
    "preference_source": "contact",
    "contact_attempt": 1,
    "user_preferences": [{
        "type": "sms",
        "number": "8587200477"
    }],
    "contact_preferences": [{
        "type": "voice",
        "number": "5555555555"
```

```
    }]
}]
```

OnCallContactPreferenceUtil - getUserPreferences(String userSysId, Number contactAttempt, GlideDateTime gdt, String communicationTypes)

Gets the list of contact preferences at the time at which the user has opted for communication. If no time is specified, then current time is used. This method is applicable to single and overlapping shifts.

Parameters

Name	Type	Description
userSysId	String	Sys ID of the user from the [sys_user] table.
contactAttempt	Number	Optional. The attempt you are trying to contact [default value = 1]. • `1`: First attempt • `2`: First reminder • `3 or more`: Subsequent reminders
gdt	GlideDateTime	Optional. yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.
communicationTypes	String	Optional. Comma-separated string containing one or more of the following values: • email • sms • voice Default includes all available communication types.

Returns

Type	Description
Array Object	On-call user contact preference. • type: String. User's preferred contact format, e.g. sms, email, or number. • <name of preferred format, e.g., email or number>: String. Content of preferred contact type, e.g., email address or phone number.

```
var onContactPrefUtil = new OnCallContactPreferenceUtil();
var contactAttempt = 1;
var gdt = new GlideDateTime();
var itilUserSysId = '<itilUserSysId>;
var userPreferences =
 onContactPrefUtil.getUserPreferences(itilUserSysId,
 contactAttempt, gdt);
gs.log(JSON.stringify(userPreferences));
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
[{
    "type": "sms",
    "number": "5555555555"
}, {
    "type": "voice",
    "number": "5555555555"
}]
```

OnCallContactPreferenceUtil - getCatchAllContacts(String rotaId, GlideDateTime gdt)

Gets a list of catch-all contacts and preferences.

Parameters

Name	Type	Description
rotaId	String	Sys ID of the shift from the [cmn_rota] table.
gdt	GlideDateTime	Optional. yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.

Returns

Type	Description

Array object	List of catch-all contacts with preferences.
	• type: String. Type of contact, e.g., user.
	• sys_id: String. Sys ID of the user from the [sys_user] table.
	• rota_id: String. Sys ID of the shift from the [cmn_rota] table.
	• roster_id: String. Sys ID of the roster from the [cmn_rota_roster] table.
	• escalation_step_id: String. If an escalation path has been defined, Sys ID of the escalation step from the [cmn_rota_esc_step_def] table.
	• forced_communication_channel: String. If specified in the preferences, mandatory communication channel. Supported values include SMS, voice or email.
	• override_user_contact_preference: Boolean. True if there are contact overrides, false otherwise.
	• preference_source: String. Source of preference, such as contact or group.
	• contact_attempt: Number. Contact attempts: 1 = first attempt, 2 = first reminder, and so on.
	• user_preferences: Array Object.
	  ○ type: String. User's preferred contact format, e.g. sms, email, or number.
	  ○ <name of preferred format, e.g., email or number>: String. Content of preferred contact type, e.g., email address or phone number.
	• contact_preferences, Array Object.

Returns (continued)

Type	Description
	○ type: String. User's preferred contact format, e.g., email or number. ○ <name of preferred format, e.g., email or number>: String. Content of preferred contact type, e.g., email address or phone number.

Example:

```
var onContactPrefUtil = new OnCallContactPreferenceUtil();
var contactAttempt = 1;
var gdt = new GlideDateTime();
var rotaSysId = '<Rotation_Sys_ID>';
var catchAllContacts =
 onContactPrefUtil.getCatchAllContacts(rotaSysId, gdt);
gs.log(JSON.stringify(catchAllContacts));
```

Output:

```
[{
    "type": "user",
    "sys_id": "<Sys_ID>",
    "rota_id": "<Rotation_ID>",
    "roster_id": "",
    "escalation_step_id": "<Escalation_Step_ID>",
    "forced_communication_channel": "",
    "override_user_contact_preference": true,
    "preference_source": "contact",
    "contact_attempt": 1,
    "user_preferences": [{
        "type": "sms",
        "number": "8587200477"
    }],
    "contact_preferences": [{
        "type": "voice",
        "number": "5555555555"
    }]
}]
```

OnCallContactPrefTemplate - Global

The *OnCallContactPrefTemplate* script include provides methods to apply contact preference templates to escalation sets.

For more information about the escalation process, see Defining On-Call Scheduling escalation process.

This script include requires the On-Call Scheduling plugin (com.snc.on_call_rotation).

OnCallContactPrefTemplate - OnCallContactPrefTemplate()

Instantiates an *OnCallContactPrefTemplate* object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

This example instantiates an *OnCallContactPrefTemplate* object.

```
var contactPrefTemp = new global.OnCallContactPrefTemplate();
```

OnCallContactPrefTemplate - copyContactPreferences(String templateSysId, String escalationSetSysId)

Applies a contact preference template to an escalation set.

When the template is applied to the escalation set, contact attempt records are created in the Shift Contact Preference [cmn_rota_contact_preference] table.

Before calling this method, call the *deleteContactPreferenceAttempts()* method to delete existing contact attempt records. If existing records are not deleted first, this method returns an error.

Parameters

Name	Type	Description
templateSysId	String	Sys_id of the contact preference template in the On-Call Contact Preference Template [on_call_template_contact_preference] table.
escalationSetSysId	String	Sys_id of the escalation set in the Shift Escalation Set [cmn_rota_escalation_set] table.

Returns

Type	Description
Object	Object containing error and warning messages. If the operation was successful, this object is empty. **Note:** If an error occurs, the operation stops and the template is not applied. If a warning occurs, the operation continues and some records are still created. `{ "error": "String", "warning": "String" }`
<Object>.error	Error message. Possible values: • Contact preference template sys_id is not correct • Escalation set sys_id is not correct • Contact attempts exist already

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.warning	Warning message. Data type: String

This example applies a contact preference template to the Service Desk – Default escalation set. The return object is empty because there are no errors or warnings.

```
var escSetSysId = "a47ac1abeb5a6110249e8d835d5228aa";
var templateSysId = "f8dac9ebeb5a6110249e8d835d522873";

var contactPrefTemp = new global.OnCallContactPrefTemplate();

// delete existing contact attempt records before applying the
 template
contactPrefTemp.deleteContactPreferenceAttempts(escSetSysId);

var result =
 contactPrefTemp.copyContactPreferences(templateSysId,
 escSetSysId);
gs.info(JSON.stringify(result));
```

Output:

```
{}
```

OnCallContactPrefTemplate - deleteContactPreferenceAttempts(String escalationSetSysId)

Deletes all contact preferences associated with an escalation set.

All contact attempt records for the escalation set are deleted from the Shift Contact Preference [cmn_rota_contact_preference] table.

Parameters

Name	Type	Description
escalationSetSysId	String	Sys_id of the escalation set in the Shift Escalation Set [cmn_rota_escalation_set] table.

Returns

Type	Description
None	

This example deletes all contact preferences associated with the Service Desk – Default escalation set.

```
var escSetSysId = "a47ac1abeb5a6110249e8d835d5228aa";
var contactPrefTemp = new global.OnCallContactPrefTemplate();

contactPrefTemp.deleteContactPreferenceAttempts(escSetSysId);
```

OnCallEscalationTemplateSNC - Global

The *OnCallEscalationTemplateSNC* script include provides methods to apply escalation policy templates to escalation sets.

For more information about the escalation process, see Defining On-Call Scheduling escalation process.

This script include requires the On-Call Scheduling plugin (com.snc.on_call_rotation).

OnCallEscalationTemplateSNC - OnCallEscalationTemplateSNC()

Instantiates an *OnCallEscalationTemplateSNC* object.

Parameters

Name	Type	Description
None		

This example instantiates an *OnCallEscalationTemplateSNC* object.

```
var escTemp = new global.OnCallEscalationTemplateSNC();
```

OnCallEscalationTemplateSNC - copyEscalationTemplatetoEscalationSet(String templateSysId, String escalationSetSysId)

Applies an escalation policy template to an escalation set.

When the template is applied to the escalation set, escalation step definition records are created in the Shift Escalation Step Definition [cmn_rota_esc_step_def] table.

Before calling this method, call the *deleteEscalationSetSteps()* method to delete existing escalation step definitions. If existing records are not deleted first, this method returns an error.

Parameters

Name	Type	Description
templateSysId	String	Sys_id of the escalation policy template in the On-Call Escalation Policy Template [on_call_template_escalation_policy] table.
escalationSetSysId	String	Sys_id of the escalation set in the Shift Escalation Set [cmn_rota_escalation_set] table.

Returns

Type	Description
Object	Object containing error and warning messages. If the operation was successful, this object is empty. **Note:** If an error occurs, the operation stops and the template is not applied. If a warning occurs, the operation continues and some records are still created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>{
	  "error": "String",
	  "warning": {Object}
	}</pre>

<Object>.error	Error message. Possible errors: • Escalation policy template sys_id is not correct. • Escalation set sys_id is not correct. • Escalation step definitions already exist on escalation set. Data type: String

<Object>.warning	Information about any warnings.
	
	Data type: Object
	<pre>{
	  "message": "String",
	  "skipped_steps": [Array],
	  "not_matching_steps": {Object},
	}</pre>

<Object>.warning.message	Warning message. Possible warnings: • Roster position does not match the rosters on the shift • There are no audiences defined on the escalation step template Data type: String
<Object>.warning.skipped_steps	Indexes of any escalation steps that were skipped (1-based). Data type: Array
<Object>.warning.not_matching_steps	Object containing information about any escalation steps that do not have available rosters in the format `{"step number":[roster number]}`. For example, if the return value is `{"3":[3]}`, then at escalation step three the tertiary roster is not available. Data type: Object

This example applies the Rotate through rosters escalation policy template to the Service Desk – Default escalation set. The return object is empty because there are no errors or warnings.

```
var escSetSysId = "32820dc3eb422110249e8d835d5228c3";
var templateSysId = "a89e2982eb592110249e8d835d522825";
var escTemp = new global.OnCallEscalationTemplateSNC();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// delete existing escalation step definitions before applying
 the template
escTemp.deleteEscalationSetSteps(escSetSysId);

var result =
 escTemp.copyEscalationTemplatetoEscalationSet(templateSysId,
 escSetSysId);
gs.info(JSON.stringify(result));
```

Output:

```
{}
```

This example applies the Rotate through roster escalation policy template to the Working Hours – Default escalation set. In this case, the Application Development shift has only two rosters but the template tries to assign a third roster. Since the number of rosters doesn't match, a warning is thrown. Two records are still created in the Shift Escalation Step Definition [cmn_rota_esc_step_def] table.

```
var escSetSysId = "e4f8f73deb562110249e8d835d522852";
var templateSysId = "a89e2982eb592110249e8d835d522825";
var escTemp = new global.OnCallEscalationTemplateSNC();

// delete existing escalation step definitions before applying
 the template
escTemp.deleteEscalationSetSteps(escSetSysId);

var result =
 escTemp.copyEscalationTemplatetoEscalationSet(templateSysId,
 escSetSysId);
gs.info(JSON.stringify(result));
```

Output:

```
{
   "warning": {
      "message": "Skipped copying templates for some of the
 steps since no audiences are defined",
      "not_matching_steps": {
         "3": [
            3
         ]
      },
      "skipped_steps": [
         "3"
      ]
   }
}
```

OnCallEscalationTemplateSNC - deleteEscalationSetSteps(String escalationSetSysId)

Deletes all escalation step definition records associated with an escalation set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
escalationSetSysId	String	Sys_id of the escalation set in the Shift Escalation Set [cmn_rota_escalation_set] table.

Returns

Type	Description
None	

This example deletes all escalation step definitions associated with the Service Desk – Default escalation set.

```
var escSetSysId = "32820dc3eb422110249e8d835d5228c3";

var escTemp = new global.OnCallEscalationTemplateSNC();

escTemp.deleteEscalationSetSteps(escSetSysId);
```

OnCallRotation - Global

The *OnCallRotation* script include provides methods to manage on-call schedules.

For information, see On-call scheduling.

OnCallRotation - OnCallRotation()

Creates an instance of the OnCallRotation class.

Parameters

Name	Type	Description
None		

```
var oncall = new OnCallRotation();
```

OnCallRotation - addCurrentToNotified()

Add the current escalation member to the list of notified users so that the API knows who has been contacted. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OnCallRotation - cancelEscalations(GlideRecord escalationGr)

Cancels any escalations for the GlideRecord that were started with the `startEscalations` API. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
escalationGr	GlideRecord	GlideRecord of Rotation escalation(cmn_rota_escalation

Returns

Type	Description
void	

OnCallRotation - continueEscalations(GlideRecord escalationGr)

Continue the escalations for a document(incident now_GR) and group. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
escalationGr	GlideRecord	GlideRecord of Rotation escalation(cmn_rota_escalation

Returns

Type	Description
void	

OnCallRotation - getCatchAll(String rotaID)

Gets the sys_id of the catch all person. Use together with the `getCatchAllType()` method to determine the source of the returned id. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
rotaID	String	The sys_id of the rota.

Returns

Type	Description
String	The sys_id of a sys_user, a cmn_rota_roster, or null.

```
var rotaSysId = '349f399173062300e7af6238edf6a75e';
var onCallRotation = new OnCallRotation();
var catchAll = onCallRotation.getCatchAll(rotaSysId);
gs.log(catchAll);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
46d44a23a9fe19810012d100cca80666
```

OnCallRotation - getCatchAllType(String rotaID)

Gets the type of _catch all_ that lives at the end of the escalation chain. When the escalation chain finishes without assigning an on-call person, if configured, the incident is assigned to the _catch all_. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
rotaID	String	The sys_id of the rota.

Returns

Type	Description
String	• Null: invalid rota id or catch all is not available. • Group_manager: the manager of the group linked to the rota is the catch all person. • Individual: a configured user is the catch all person. • All: all members of the configured roster are the catch all person.

```
var rotaSysId = '349f399173062300e7af6238edf6a75e';
var onCallRotation = new OnCallRotation();
var catchAllType = onCallRotation.getCatchAllType(rotaSysId);
gs.log(catchAllType);
```

Output:

```
group_manager
```

OnCallRotation - getEscalateeAt(String groupID, GlideDateTime dateTime, Number position)

Gets an item to escalate to, either a user [sys_user], group, or notification device [cmn_notif_device], for a group's shift at the specified date and time and at a certain position in the escalation lineup. This API is applicable for a single shift.

The method returns null if an invalid position or group is passed as an argument.

You can use the *`getTableName()`* method to check whether the returning GlideRecord comes from the sys_user or cmn_notif_device table.

Parameters

Name	Type	Description
groupID	String	The sys_id for the group from which to get the item to escalate.
dateTime	GlideDateTime	The date and time when the escalation lineup should begin.
position	Number	The position in the lineup to determine the item to escalate to (1-based, which means the count starts with 1).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
GlideRecord	The item to escalate to,that is, escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position. Returns null if nothing is found.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var escalatee = onCallRotation.getEscalateeAt(groupSysId,
 currentTime, 1);
gs.log(escalatee.name);
```

Output:

```
Abel Tuter
```

OnCallRotation - getEscalatees(String groupSysIds, String rotaSysIds, String rosterSysIds, GlideDateTime gdt, GlideRecord taskGr)

Gets a list of escalatees that are on-call for a given time. If no time is specified, then the current time is used. If no groupSysIds are provided, empty list is returned. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Note: Set the taskGR parameter to enable escalation plan evaluation.

Parameters

Name	Type	Description
groupSysIds	String	Comma-separated list of sys_ids of the sys_user_group, to filter the records by.
rotaSysIds	String	Comma-separated list of cmn_rota sys_ids to filter the records by.
rosterSysIds	String	Comma-separated list of cmn_rota_roster sys_ids to filter the records by.
gdt	GlideDateTime	Date in the UTC timezone
taskGr	GlideRecord	Optional. Current task record. If taskGr is empty, this method returns the default escalation plan. If taskGr is passed, escalation policies are evaluated in order and this method returns the corresponding escalation plan.

Returns

Type	Description
Object	Escalatee information such as userIds, deviceIds, and escalationGroups.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var onCallRotation = new OnCallRotation();
var result = onCallRotation.getEscalatees(groupSysId, "", "",
 currentTime);
gs.log(JSON.stringify(result));
```

Output:

For single shift:

```
[
  {
    "memberId": "119f399173062300e7af6238edf6a7e7",

```
var serviceDeskSysId = 'd625dccec0a8016700a222a0f7900d06';
var taskGr = new GlideRecord('incident');
taskGr.get('ed92e8d173d023002728660c4cf6a7bc');

var ocRotation = new OnCallRotation();
var escalatees = ocRotation.getEscalatees(serviceDeskSysId,
 null, null, null, null, taskGr);
gs.log(JSON.stringify(escalatees));
```

OnCallRotation - getEscalationPlan(String groupSysId, GlideDateTime gdt, String rotaSysIds, GlideRecord taskGr)

Gets a list of objects to escalate to, escalation plans that consist of either a user [sys_user] or notification device [cmn_notif_device], for a group's shift at the specified date and time. This API is applicable for a single shift, overlapping shifts, and custom escalation.

The Escalation object contains the following fields:

- Number order: the escalation order within the lineup
- String userId: sys_id of the sys_user record or null
- String deviceId: sys_id of the cmn_notif_device record or null
- Boolean isDevice: true or false depending on whether the item to escalate to is a device or user
- GlideDuration timeBetweenReminders: the time between reminders being sent
- Number reminderNum: number of reminders to be sent for each item to escalate to

Note: Set the taskGR parameter to enable escalation plan evaluation.

Parameters

Name	Type	Description
groupID	String	sys_id for the group for which you need the escalation plan.
gdt	GlideDateTime	Date and time when the escalation lineup should begin. Default is now. yyyy-MM-dd HH:mm:ss is the format in UTC timezone.
rotaSysIds	String	Comma-separated list of cmn_rota sys_ids to filter the records by.
taskGr	GlideRecord	Optional. Current task record. If taskGr is empty, this method returns the default escalation plan. If taskGr is passed, escalation policies are evaluated in order and this method returns the corresponding escalation plan.

Returns

Type	Description
Object	A list of escalation objects to escalate to.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
```

```
var result = onCallRotation.getEscalationPlan(groupSysId,
 currentTime);
gs.log(JSON.stringify(result));
```

Output:

For single shift:

var escalationPlan =
 ocRotation.getEscalationPlan(serviceDeskSysId, null, null,
 taskGr);
gs.log(JSON.stringify(escalationPlan));
```

OnCallRotation - getEscalationType(String rotaID)

Gets the type of escalation based on a simple calculation. If there is one active roster in the rota, rotate through members. If there is more than one active roster in the rota, rotate through rosters. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
rotaID	String	The sys_id for the rota to check for rosters.

Returns

Type	Description
String	• Member: if there is one roster in the rota. • Roster: if there is more than one roster in the rota. • No rosters in this rota: if none of the above. • Custom: If the custom escalation is applicable.

```
var rotaSysId = '349f399173062300e7af6238edf6a75e';
var onCallRotation = new OnCallRotation();
var escalationType =
 onCallRotation.getEscalationType(rotaSysId);
gs.log(escalationType);
```

Output:

```
custom
```

OnCallRotation - getEscalateesAt(String groupSysId, GlideDateTime gdt, Number position, GlideRecord taskGr)

Gets the escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position. This API is applicable for a single shift, overlapping shifts and custom escalation.

Note: Set the taskGR parameter to enable escalation plan evaluation.

Parameters

Name	Type	Description
groupSysId	String	ys_id of the group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
gdt	GlideDateTime	yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.
position	Number	Position of the escalation step.
taskGr	GlideRecord	Optional. Current task record. If taskGr is empty, this method returns the default escalation plan. If taskGr is passed, escalation policies are evaluated in order and this method returns the corresponding escalation plan.

Returns

Type	Description
GlideRecord	Array of escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var escalatees = onCallRotation.getEscalateesAt(groupSysId,
 currentTime, 1);
for (var i = 0; i < escalatees.length; i++) {
gs.log(escalatees[i].name);
}
```

Output:

For overlapping shifts:

```
Abel Tuter
Barbara Hindley
```

For custom escalation:

```
Abel Tuter
Beth Anglin
Change Management
Barbara Hindley
```

```
// Create a custom escalation for service desk shift with
 condition as P1 for Incident
var serviceDeskSysId = 'd625dccec0a8016700a222a0f7900d06';
// optional parameter taskGR
var taskGr = new GlideRecord('incident');
taskGr.get('ed92e8d173d023002728660c4cf6a7bc');

var ocRotation = new OnCallRotation();
var position = 1;
var escalatees = ocRotation.getEscalateesAt(serviceDeskSysId,
 new GlideDateTime(), position, taskGr);

// if taskGr is empty then it returns escalatees at a position
 in default escalation plan
```

```
// if taskGr is passed then escalation policies are
 executed evaluated in order and escalatees at a position in
 corresponding escalation plan is returned
for (var i = 0; i < escalatees.length; i++) {
    gs.log(escalatees[i].getDisplayValue());
}
```

OnCallRotation - getPrimaryUser()

Gets the sys_id of the current primary contact when there is a single shift.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	sys_id of the current primary contact.

Example:

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUser();
```

Output:

```
62826bf03710200044e0bfc8bcbe5df1
```

OnCallRotation - getPrimaryUserByRota(String rotaId)

Gets the sys_id of the current primary user of the specified shift. This API is applicable for a single shift and overlapping shifts.

Parameters

Name	Type	Description
rotaId	String	sys_id of the cmn_rota.

Returns

Type	Description
String	sys_id of the current primary user of the specified shift.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var rotaId = '349f399173062300e7af6238edf6a75e';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
```

```
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUserByRota(rotaId);
gs.log(primaryUser);
```

Output:

```
62826bf03710200044e0bfc8bcbe5df1
```

OnCallRotation - getPrimaryUserName()

Gets the name of the current primary contact. This API is applicable for a single shift.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the current primary contact.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUserName();
gs.log(primaryUser);
```

Output:

```
Abel Tuter
```

OnCallRotation - getPrimaryUserNameByRota(String rotaId)

Gets the name of the current primary user of the specified shift. This API is applicable for a single shift and overlapping shifts.

Parameters

Name	Type	Description
rotaId	String	sys_id of the cmn_rota.

Returns

Type	Description
String	Name of the current primary user of the specified shift.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var rotaId = '349f399173062300e7af6238edf6a75e';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
```

```
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser =
 onCallRotation.getPrimaryUserNameByRota(rotaId);
gs.log(primaryUser);
```

Output:

```
Abel Tuter
```

OnCallRotation - getPrimaryUsers()

Gets the list of primary contacts for a shift. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	List of primary contacts.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUser();
gs.log(JSON.stringify(primaryUser));
```

Output:

```
{
  "349f399173062300e7af6238edf6a75e": {
    "userSysId": "62826bf03710200044e0bfc8bcbe5df1",
    "userName": "Abel Tuter"
  },
  "35af799173062300e7af6238edf6a79e": {
    "userSysId": "d2826bf03710200044e0bfc8bcbe5dc9",
    "userName": "Barbara Hindley"
  }
}
```

OnCallRotation - spansOverlap(ArrayList parent, ArrayList child, String timeZone)

Checks if the parent span and child spans overlap.

Parameters

Name	Type	Description
parent	ArrayList	The parent spans to compare.
child	ArrayList	The child spans to compare.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
timeZone	String	The name of the time zone.

Returns

Type	Description
Boolean	Returns true if the parent and child spans overlap.

```
var onCall = new OnCallRotation();

// get a time range we are interested in
var timeZone = gs.getSession().getTimeZoneName();
var dateStart = new GlideDateTime();
var dateEnd = new GlideDateTime().addMonths(1);

// convert glidedatime to scheduledatetime because it is
 required
// by the function being called below
var scheduleStart = new GlideScheduleDateTime(dateStart);
var scheduleEnd =  new GlideScheduleDateTime(dateEnd);
scheduleStart.setTimeZone(timeZone);
scheduleEnd.setTimeZone(timeZone);

// calculate rotation items based on the date and time given
// for all the groups the currently logged in user is a member
 of
gs.include("OnCallRotationPersonal");
var rotation = new OnCallRotationPersonal();
var myGroups = gs.getUser().getMyGroups();
var groupIter = myGroups.iterator();

while(groupIter.hasNext()){
 var rotaItems = rotation.onCallDuringPeriod(groupIter.next(),
 scheduleStart, scheduleEnd);

 // loop through rotation schedules
 for (var i = 0; i < rotaItems.length - 1; i++) {
  var parentItem = rotaItems[i];
  var nextItem = rotaItems[i + 1];

  // check if previous and next time spans overlap
  var overlaps = onCall.spansOverlap(parentItem.getTimeSpans(),
 nextItem.getTimeSpans(),
   gs.getSession().getTimeZoneName());
 }
}
```

OnCallRotation - startEscalations(GlideRecord now_GR, String eventName, String escalationScriptName)

Start the escalations for a document(incident now_GR) and group, and specify the event name for the escalation notifications. In addition, specify the name of the business rule to call when an

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

escalation occurs. This method should be used after a succesful call to *who* or *whoAt* methods. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
now_GR	GlideRecord	Document glide record. For example, Incident now_GR.
eventName	String	Event name for the escalation notifications.
escalationScriptName	String	Business rule to call when escalation occurs

Returns

Type	Description
void	

OnCallRotation - who(String groupSysId, GlideDateTime gdt, Boolean nullifyOverrideRoster, String rotaSysIds, Boolean overrideCustomEscalation, GlideRecord taskGR)

Specifies if there is an on-call user, group, or device. This method is applicable for a single shift, overlapping shifts, and custom escalation.

Note: Pass the *taskGR* parameter to enable escalation plan evaluation.

Parameters

Name	Type	Description
groupSysId	String	Sys_id of the group to check for.
gdt	GlideDateTime	Date and time. Format: yyyy-MM-dd HH:mm:ss in the UTC time zone Default: Current date and time
nullifyOverrideRoster	Boolean	Flag that indicates whether the notification list for the group is for a specific roster. Valid values: • true: Not for a specific roster. • false: For a specific roster.
rotaSysIds	String	Comma-separated list of cmn_rota sys_ids to filter the records by.
overrideCustomEscalation	Boolean	Flag that indicates whether to override the default escalation policy with the custom escalation. Valid values: • true: Override the default escalation policy. • false: Do not override the default escalation policy.
taskGR	GlideRecord	Optional. Current task record. If passed, the method populates the escalatees based on the escalation conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether a match was found. Possible values: • true: At least one match was found. • false: No matches were found.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
gs.log(result);
```

Output:

```
true
```

The following example shows how to create a custom escalation for service desk shift with condition P1 for an incident.

```
/**
 * When the who() method is invoked with the optional taskGr
 parameter,
 * escalatees are populated based on the conditional escalations
**/

var serviceDeskSysId = 'd625dccec0a8016700a222a0f7900d06';
var taskGr = new GlideRecord('incident');
taskGr.get('ed92e8d173d023002728660c4cf6a7bc');

var ocRotation = new OnCallRotation();
ocRotation.who(serviceDeskSysId, null, null, null, null,
 taskGr);
while (ocRotation.next()) {
    gs.log(ocRotation.getUserName());
}
```

Output:

```
Beth Anglin
```

OnCallRotation - whoAt(String groupSysId, GlideDateTime gdt, String rotaSysIds)

Specifies if there is an on-call user, group, or device. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

Name	Type	Description
groupSysId	String	Sys ID of the group.
gdt	GlideDateTime	yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
rotaSysIds	String	Comma-separated list of cmn_rota Sys IDs to filter the records by.

Returns

Type	Description
Boolean	True if there is at least one on-call user, group, or device; false otherwise.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.whoAt(groupSysId, currentTime);
gs.log(result);
```

Output:

```
true
```

OnCallRotation - whoIsOnCall(String groupSysIds, String rotaSysIds, String rosterSysIds, GlideDateTime gdt)

Gets the list of users that are on-call at a given time. If no time is specified, then current time is used. This API is applicable for a single shift and overlapping shifts.

Parameters

Name	Type	Description
groupSysIds	String	Comma-separated list of sys_ids of the sys_user_group, to filter the records by.
rotaSysIds	String	Comma-separated list of cmn_rota sys_ids to filter the records by.
rosterSysIds	String	Comma-separated list of cmn_rota_roster sys_ids to filter the records by.
gdt	GlideDateTime	Date in the UTC timezone

Returns

Type	Description
Object	List of users, groups, or devices that are on-call at a given time. For example, information about userIds, deviceIds, and escalationGroups.

```
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var escalatees = onCallRotation. whoIsOnCall(groupSysId, "", "",
 currentTime);
gs.log(JSON.stringify(escalatees));
```

OnCallRotation - whoIsNext(GlideRecord escalationGr)

Escalation business rules determine who in the shift should be contacted next. The escalation record passed to the method tracks the escalation between invocations of the business rule. This API is applicable for a single shift, overlapping shifts, and custom escalation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
escalationGr	GlideRecord	GlideRecord of Rotation escalation [cmn_rota_escalation].

Returns

Type	Description
None	

OpenMessageBusEventPublisherOOB - Scoped

The *OpenMessageBusEventPublisherOOB* script include provides a method for sending messages to the spoke selector, which sends the messages to the configured REST proxy.

This script includes runs in the `sn_api_notif_mgmt` namespace. The admin role is required to access this script include.

For additional information on how to configure your instance to use this script include, see Configure the Producer Event Notification Framework to use the Open Message Bus.

OpenMessageBusEventPublisherOOB - publishMessageToComptibleRestProxy(Object tmfEventPayload, Array compatibleTopicArr)

Sends the passed message to a custom message platform's REST proxy using the spoke selector.

For additional information on this process, see Producing outbound API notifications using the open message bus. For information on how to implement this method, see Configure the Producer Event Notification Framework to use the Open Message Bus.

Parameters

Name	Type	Description
tmfEventPayload	Object	Event message to send. For additional information on the format, see TMF688 Event Management API User Guide v4.0.0. Format: TMF688
compatibleTopicArr	Array	List of topic record sys_ids for which the passed event payload should be published. Located in the Topic [sn_api_notif_mgmt_topic] table.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
publishEventToOpenMessageBus: function(tmfEventPayload) {
 // Fetch compatible topics
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var compatibleTopicArr = new
 TopicPickerUtilsOOB().fetchEventCompatibleTopic(tmfEventPayloa
d);
  // Publish event in topic through REST proxy
  new
 OpenMessageBusEventPublisherOOB().publishMessageToComptibleRest
Proxy(tmfEventPayload, compatibleTopicArr);
},
```

Optional - Scoped, Global

The *Optional* API interacts with a single record returned by the *GlideQuery*, *Stream*, or *GlideRecord* APIs, even when it does not exist. Write scripts that are less likely to result in an error by handling null or undefined query results.

You can get an *Optional* object in these ways:

- Return an *Optional* object from these methods in the *GlideQuery* class. For more information, see *GlideQuery*.
  - *getBy()*
  - *get()*
  - *insert()*
  - *insertOrUpdate()*
  - *update()*
  - *selectOne()*
  - *avg()*
  - *max()*
  - *min()*
  - *sum()*
- Return an *Optional* object from the *find()* method in the *Stream* class. For more information on *Stream*, see the *Stream* API.
- Use the *lazy()* method to generate the value of the Optional if ever needed.

These methods are static and do not require an instance of the class:

- *lazy()*
- *of()*
- *empty()*

You can use these static methods with any API that returns a single value such as *GlideRecord*.

Use the *Optional* API in scoped or global server-side scripts. This API requires the GlideQuery [com.sn_glidequery] plugin.

Implementation

This API can work with the *GlideQuery* and *Stream* APIs in a builder pattern where the method calls chain together, each method building on the returned result of the previous method. Use methods to define the attributes of the query. The methods do not execute until

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

you call a terminal method, a method that returns a query result, allowing you to define the requirements of the query before executing it.

If the query returns a single record, the system wraps the result in an Optional object. If the query returns a stream of records, the system wraps the result in a Stream object. These objects let you manage the result using a set of methods in each API.

For example, this script performs a query on the Task table, groups the records by priority, and returns each priority that has total reassignments greater than four.

```
var query = new global.GlideQuery('task')
    .where('active', true) //Returns new GlideQuery object with
 a "where" clause.
    .groupBy('priority') //Returns new GlideQuery object with a
 "group by" clause.
    .aggregate('sum', 'reassignment_count') //Returns new
 GlideQuery object with a "sum(reassignment_count)" clause.
    .having('sum', 'reassignment_count', '>', 4) //Returns
 new GlideQuery object with a "having reassignment_count > 4"
 clause.
    .select() //Returns a stream of records wrapped in a Stream
 object.
    .forEach(function (priority){ //Terminal method in the
 Stream class that executes the query and returns the result.
      gs.info("Priority " + priority.group.priority + ": " +
 priority.sum.reassignment_count + " reassignments");
    });
```

Output:

```
Priority 1: 11 reassignments
Priority 3: 6 reassignments
Priority 5: 5 reassignments
```

Terminal methods

For performance reasons, a query only fetches data when you call a terminal method. These are the terminal methods from the *Optional* class:

- *get()*
- *orElse()*
- *ifPresent()*
- *isEmpty()*
- *isPresent()*

Optional - empty(String reason)

Returns an empty Optional object. Use this method in an Else clause to handle a query that might not return a result.

Note: This method is static. You do not need an instance of the class to use this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
reason	String	Optional. Reason displayed in the log when *`Optional.get()`* is called on the empty Optional object.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows you how to generate an empty Optional object when a query does not return a result.

```
var now_GR = new GlideRecord('task');
now_GR.addQuery('approval', 'not requested');
now_GR.query();
var optional;
if (now_GR.next()) {
optional = Optional.of(now_GR.getUniqueValue());
} else {
    optional = Optional.empty("no results");
}

gs.info(optional.get());
```

Output:

```
NiceError: [2020-08-26T23:23:37.402Z]: get() called on empty
 Optional: no results
```

Optional - filter(Function predicate)

Applies a predicate function, a function that takes a single value and returns true or false, to the record inside the Optional object. If the function returns true, the method returns the Optional record unchanged. If the function returns false, it returns an empty Optional object.

Parameters

Name	Type	Description
predicate	Function	Predicate function to apply to the value inside the Optional object. Must return a Boolean value.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows you how to apply a filter function to an Optional result.

```
var filteredQuery = new global.GlideQuery('sys_user')
    .getBy({ sys_id: 'f682abf03710200044e0bfc8bcbe5d38' },
 ['phone'])
    .filter(function (user) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        return phoneRegex.test(user.phone);
    });
```

Optional - flatMap(Function fn)

Applies a function that returns an Optional object to the result of a query. Use this method to perform a second query using the result of the first.

Parameters

Name	Type	Description
fn	Function	Function to apply to the results of the query that returned the Optional object.

Returns

Type	Description
Optional	Object used to interact with a single record.

This example shows how to execute a query of the User table based on the result of a previous query.

```
new global.GlideQuery('alm_asset')
    .whereNotNull('owned_by')
    .selectOne('owned_by')
    .flatMap(function (asset) {
        return new global.GlideQuery('sys_user')
            .getBy({ sys_id: asset.owned_by }, ['first_name',
 'last_name', 'company.name'])
    })
    .ifPresent(GQ.jsonDebug);
```

Output:

```
{
  "sys_id": "46d59205a9fe198101d603f5de37bfa3",
  "first_name": "John",
  "last_name": "Bohnhamn",
  "company": {
    "name": "ACME North America"
  }
}
```

Optional - get()

Returns the record inside the Optional object, or throws an error if the query does not return a record.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Any	The record inside the Optional object. If the value is null or undefined, the system throws an error.

This example shows how to get the value of a single record.

```
var value = new global.GlideQuery('sys_user')
    .selectOne('first_name') //Returns the result of the query
 inside an Optional object
    .get(); //Calls Optional.get() on the Optional object

gs.info(JSON.stringify(value));
```

Output:

```
{
   "first_name":"fred",
   "sys_id":"005d500b536073005e0addeeff7b12f4"
}
```

Optional - ifPresent(Function fn)

Applies a function to the record within an Optional object. If the Optional object does not contain a record, the function does not execute.

Parameters

Name	Type	Description
fn	Function	The function to apply to the record within the Optional object.

Returns

Type	Description
None	

This example shows how to print a value if it exists.

```
var user = new global.GlideQuery('sys_user')
    .where('sys_id', 'f682abf03710200044e0bfc8bcbe5d38')
    .selectOne('zip')
    .ifPresent(function (user) {
      gs.info('Zip Code: ' + user.zip);
    });
```

Optional - isEmpty()

Returns true if the Optional object is empty.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the result of a query contains a value. Valid values: • true: The query returns null or undefined. • false: The query returns a value.

This example shows how to check whether the result of a query is empty.

```
var checkEmpty = new global.GlideQuery('sys_user')
    .where('last_name', 'Barker')
    .selectOne()
    .isEmpty();

gs.info(checkEmpty);
```

Output:

```
true
```

Optional - isPresent()

Checks whether an Optional object contains a value.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the result of a query contains a value. Valid values: • true: The query returns a value. • false: The query returns null or undefined.

This example shows how to check whether a query returns a result.

```
var checkPresent = new global.GlideQuery('sys_user')
   .where('last_name', 'Luddy')
   .selectOne('first_name')
   .isPresent();

gs.info(checkPresent);
```

Output:

```
true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Optional - lazy(Function lazyGetFn)

Returns a new Optional object. Instead of containing the record, the object contains a function to get the record that is only called if and when requested in the code.

Use this method to delay getting the value until it's needed. You might do this if requesting the value from a slow source and don't want to slow down your code unnecessarily. Otherwise, you can return an Optional object using the *GlideQuery* and *Stream* APIs.

Note: This method is static. You do not need an instance of the class to use this method.

Parameters

Name	Type	Description
lazyGetFn	Function	Function that returns a single record as a result of a query. For example: `var userGr = new GlideRecord('sys_user');`

Returns

Type	Description
Optional	Object containing the result of the query in the format `Optional<result>`.

This example shows how to get an Optional object based on a GlideRecord query.

```
var userOptional = global.Optional.lazy(function () {
    var userGr = new GlideRecord('sys_user');
    userGr.setLimit(1);
    userGr.query();
    return userGr.next() ? userGr.getUniqueValue() : null;
});

gs.info(userOptional);
```

Output:

```
Optional<005d500b536073005e0addeeff7b12f4>
```

Optional - map(Function fn)

Applies a function to the result of a query.

Parameters

Name	Type	Description
fn	Function	Function to apply to the result of the query.

Returns

Type	Description
Optional	Object containing the results of the query updated by the function in the format `Optional<result>`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example shows how to apply a function that transforms a value to upper case to the result of a query.

```
var value = new global.GlideQuery('sys_user')
    .whereNotNull('first_name')
    .selectOne('first_name')
    .map(function (user) {
        return user.first_name.toUpperCase();
    });

gs.info(value);
```

Output:

```
Optional<ABEL>
```

Optional - of(Any value)

Wraps a given value in an Optional object. For example, you can wrap the result of a GlideRecord query in an Optional object to use the associated methods.

Note: This method is static. You do not need an instance of the class to use this method.

Parameters

Name	Type	Description
value	Any	Value inside the Optional object.

Returns

Type	Description
Optional	Object containing the passed-in value in the format `Optional<value>`.

This example shows you how to generate an Optional object based on a GlideRecord query.

```
var now_GR = new GlideRecord('task');
now_GR.addQuery('approval', 'not requested');
now_GR.query();
var optional;
if (now_GR.next()) {
optional = Optional.of(now_GR.getUniqueValue());
} else {
    optional = Optional.empty("no results");
}

gs.info(optional.get());
```

Output:

```
00c269162d761010f87708b56757cbb3
```

Optional - orElse(Any defaultValue)

Adds a default value within the Optional object if the query does not return any results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
defaultValue	Any	Value within the Optional object if the query does not return any results.

Returns

Type	Description
Any	Value within the Optional object if the query does not return any results.

This example shows how to return a value, even when the query is incorrect.

```
var user = new global.GlideQuery('sys_user')
    .get('1234', ['first_name', 'last_name'])
    .orElse({ first_name: 'Default', last_name: 'User' });

gs.info(JSON.stringify(user))
```

Output:

```
{
   "first_name":"Default",
   "last_name":"User"
}
```

OrderGuide - Scoped

The *`OrderGuide`* API enables you to initialize and view order guide details.

To use this class in a scoped application, use the `sn_sc` namespace identifier. The Service Catalog Scoped API plugin (com.glideapp.servicecatalog.scoped.api) that is enabled by default is required to access the *`OrderGuide`* API.

OrderGuide - OrderGuide(String sys_id)

Creates an instance of the OrderGuide class with the specified sys_id.

Parameters

Name	Type	Description
sys_id	String	sys_id of the OrderGuide.

Example:

```
var cart=new
 sn_sc.OrderGuide("6690750f4f7b4200086eeed18110c761");
```

OrderGuide - getID()

Returns the sys_id of the order guide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	sys_id of the order guide.

Example:

```
var cart=new
 sn_sc.OrderGuide("6690750f4f7b4200086eeed18110c761");
 console.log(cart.getID());
```

Output:

```
6690750f4f7b4200086eeed18110c761
```

OrderGuide - init(Map request)

Initialises the order guide with the specified catalog items and the variables, and returns the order guide.

Parameters

Name	Type	Description
request	Map	A JSON object with the Catalog item and variable details.

Returns

Type	Description
Map	A JSON object with the initialised order guide details.

Example:

```
var guide = new
 sn_sc.OrderGuide('6690750f4f7b4200086eeed18110c761');

var map = {};
map.variables = {};
//map.sysparm_id = '6690750f4f7b4200086eeed18110c761';
map.variables['IOce433d0f4f7b4200086eeed18110c74d']
 = '221f3db5c6112284009f4becd3039cc9'; //Here
 ce433d0f4f7b4200086eeed18110c74d is the sys_id of the variable
 and 221f3db5c6112284009f4becd3039cc9 is its value
var includedItems = guide.init(map)
```

Output:

```
{
"cascade_variable_map":{
},
```

```
"items":[
{
"order":"-1",
"quantity":"1",
"show_quantity":false,
"sys_id":"a4022d7b87c20300e3010cf888cb0bb2"
},
{
"order":"300",
"quantity":"1",
"show_quantity":false,
"sys_id":"186d917a6fab7980575967ddbb3ee4f2"
},
{
"order":"600",
"quantity":"1",
"show_quantity":false,
"sys_id":"8b3ae7fedc1be1004ece5c08239e522b"
}
],
"variable_assignments":{
}
}
```

OrderGuide - isIncludeItems()

Specifies if the **Show Include Toggle** (include_items) check box is selected for the specified order guide.

Note: The **Show Include Toggle** field does not appear on the Order guide form by default.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the **Show Include Toggle** check box is selected for the specified order guide. Else, returns false.

```
var orderGuide=new
 sn_sc.OrderGuide("6690750f4f7b4200086eeed18110c761");
 console.log(orderGuide.isIncludeItems());
```

Output:

```
true
```

OrderGuide - isTwoStep()

Specifies if the two-step checkout is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the two-step checkout is enabled. Else returns false.

Example:

```
var orderGuide=new
 sn_sc.OrderGuide("6690750f4f7b4200086eeed18110c761");
 console.log(orderGuide.isTwoStep());
```

Output:

```
false
```

OrderGuide - isUseCustomCart()

Specifies if a separate cart (different from that for catalog items) usage is enabled for a two-step order guide.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if a separate cart usage is enabled for a two-step order guide. Else, returns false.

Example:

```
var orderGuide=new
 sn_sc.OrderGuide("6690750f4f7b4200086eeed18110c761");
 console.log (orderGuide.isUseCustomCart());
```

Output:

```
false
```

OrderGuide - navigateFromMap(Map itemDetails)

Navigates to the catalog items of an order guide.

Parameters

Name	Type	Description
itemDetails	Map	A JSON object with details of catalog items in the order guide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

Example:

```
var orderGuide=new
 sn_sc.OrderGuide.navigateFromMap(itemdetails);
```

PADomainUtils - Global

The *PADomainUtils* API enables you to copy Performance Analytics records between different domains on the same instance.

Use this API in server scripts to copy Performance Analytics records such as indicators, breakdowns, and dashboards, to different domains. This API enables you to create a Performance Analytics record in one domain and copy that record to any number of additional domains.

Note: This API cannot copy records into the Global domain.

Warning: When configuration records are moved to another domain, scores will not be accessible.

To use *PADomainUtils*, you must satisfy these requirements:

- Performance Analytics must be enabled.
- The user running the script must have the admin role.
- The instance must use domain separation.
- The script must be run from the global domain.
- When moving or copying records, the source and target domains must be different.

PADomainUtils - PADomainUtils()

Instantiates a new PADomainUtils object to move or copy Performance Analytics records from the global domain.

Use the *PADomainUtils(String domainFrom)* constructor instead when moving or copying records from a domain other than the global domain.

Parameters

Name	Type	Description
None		

```
// PADomainUtils initialized with the global domain
var globalUtils = new SNC.PADomainUtils();
```

PADomainUtils - PADomainUtils(String domainFrom)

Instantiates a new PADomainUtils object to move or copy Performance Analytics records from the specified domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the *PADomainUtils()* constructor instead when moving or copying from the global domain.

Parameters

Name	Type	Description
domainFrom	String	The domain to copy records from.

```
// c90d4b084a362312013398f051272c0d is the sys id of the ACME
 domain
var acmeUtils = new
 SNC.PADomainUtils('c90d4b084a362312013398f051272c0d');
```

PADomainUtils - copy(String runAs)

Copies Performance Analytics records to a different domain.

To copy dashboards or scheduled jobs, see copyDashboard and copyJob.

Parameters

Name	Type	Description
runAs	String	User whose domain you want to copy records to.

Returns

Type	Description
void	

```
// copy all the Performance Analytics records from global to
 user's domain
var pa = new SNC.PADomainUtils();
pa.copy('09ff3d105f231000b12e3572f2b4775d');
```

PADomainUtils - copyDashboard(String dashboardId, String runAs)

Copy a dashboard to another domain.

Parameters

Name	Type	Description
dashboardId	String	Sys_id of the dashboard to copy.
runAs	String	User whose domain you want to copy the dashboard to.

Returns

Type	Description
void	

```
//Copy Incident Management dashboard from global to user's
 domain
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var pa = new SNC.PADomainUtils();
pa.copyDashboard('a64b7031d7201100b96d45a3ce610335','09ff3d105f2
31000b12e3572f2b4775d');
```

PADomainUtils - copyJob(String paJob, String runAs)

Copies a Performance Analytics scheduled data collection job record to another domain.

Parameters

Name	Type	Description
paJob	String	Sys_id of a Performance Analytics scheduled data collection job [sysauto_pa] record.
runAs	String	User whose domain you want to copy the job to.

Returns

Type	Description
String	Error message if an error occurs, or an empty string if there is no error.

```
// No source domain needs to be set
var pa = new SNC.PADomainUtils();
// copy the '[PA Incident] Daily Data Collection job'
// set the 'run as' of the new record to be the 'acme.itil' user
// first argument is the sys_id of the sysauto_pa record
// the second is the sys_id of the acme.itil user record
pa.copyJob('82ba2023d7101100b96d45a3ce6103cd','797d14341f1310005
a3637b8ec8b7010');
```

PADomainUtils - isWriteable(String table, String id)

Evaluate if you can write to a specific record identified by table and sys_id.

Parameters

Name	Type	Description
table	String	The name of the table containing the record to query, such as pa_indicators.
id	String	The sys_id of the record to query.

Returns

Type	Description
Boolean	Indicates that you can write to the specified record. Returns true if the record exists within the domain of the current user. Returns false if the record does not exist, or is in a different domain.

```
var pa = new SNC.PADomainUtils();
pa.isWriteable('pa_incidents','cd8125b5140012007665a83e633b028d
');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PADomainUtils - move(String runAs)

Moves Performance Analytics records to a different domain.

Parameters

Name	Type	Description
runAs	String	The user whose domain you want to copy records to.

Returns

Type	Description
void	

```
// move all the Performance Analytics records from the global to
 the customers domain
var pa = new SNC.PADomainUtils();
pa.move('774190f01f1310005a3637b8ec8b70ef')
```

PADomainUtils - setFoundation(Boolean foundation)

Use this method to move or copy only foundational records in a hybrid domain configuration.

You can implement a hybrid approach by maintaining some types of record in a parent domain and some types in child domains. Generally, the parent domain contains foundational records and the child domain contains higher-level records, such as widgets. The following types of record are considered foundational records.

- Bucket groups
- Buckets
- Scripts
- Breakdown sources
- Indicator sources
- Filters
- Breakdowns
- Managed sources
- Manual breakdowns
- Breakdown mappings
- Breakdown relations

Other Performance Analytics records such as widgets and indicators are not foundational records. Set this method to false to move or copy these additional records as well.

Parameters

Name	Type	Description
foundation	Boolean	Indicates if only foundational records should be copied or moved by this PADomainUtils object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
PADomainUtils	The object calling this function.

```
var pa = new SNC.PADomainUtils().setFoundation(true);
pa.copy('bb6b58b01f1310005a3637b8ec8b70dd');
```

PADomainUtils - setOverrides(Boolean overrides)

Use this method before copying records to set the sys_override value of the new record to the original parent record.

Using this method enables you to automatically override records in a parent domain. By overriding the parent records, the parent records do not impact the child domain. If the source domain is not the parent of the target domain when copying records, setting the sys_override value will not have any impact on behavior. You can specify an override only when copying records, not when moving records.

Parameters

Name	Type	Description
overrides	Boolean	Indicates that copied records in a child domain should override the source record in the parent domain. This value is true by default.

Returns

Type	Description
PADomainUtils	The object calling this function.

```
var pa = new
 SNC.PADomainUtils('c90d4b084a362312013398f051272c0d');
pa.setOverrides(false);
pa.copy('bb6b58b01f1310005a3637b8ec8b70dd');
```

Paragraph - Scoped, Global

Creates a Paragraph object representing a block of text in a PDF.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

Paragraph - Paragraph(String text)

Instantiates a new *`Paragraph`* object containing a string.

Parameters

Name	Type	Description
text	String	Paragraph block of text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to create a *Paragraph* object. For a document usage example, see Document API.

```
var para = new Paragraph("hello");
```

Paragraph – addNewLine()

Adds an empty line after a paragraph in a document.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to add a new line after a paragraph in a document. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var myPara = new sn_pdfgeneratorutils.Paragraph("This is a
 paragraph.");
myPara.addNewLine();

document.addParagraph(myPara);
// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "addText.pdf");
```

Paragraph – addParagraph(Paragraph paragraph)

Adds a paragraph. You can use this method to create a block of paragraphs with automatic line breaks.

Parameters

Name	Type	Description
paragraph	Paragraph	Paragraph object.

Returns

Type	Description
None	

The following example shows how to add a section of paragraphs to a document. For a document usage example, see Document API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var sectionPara = new sn_pdfgeneratorutils.Paragraph("This is
 the first paragraph.");
var subPara1 = new sn_pdfgeneratorutils.Paragraph("Pellentesque
 nec neque interdum turpis ultricies tristique at ut lacus. Nam
 eget sollicitudin.");
var subPara2 = new sn_pdfgeneratorutils.Paragraph("Lorem ipsum
 dolor sit amet, consectetur adipiscing elit. Nulla vel ultrices
 erat.");
var subPara3 = new sn_pdfgeneratorutils.Paragraph("Aenean
 fermentum lorem congue metus faucibus, vitae viverra quam
 eleifend. Donec sed risus quis eros suscipit efficitur.");

sectionPara.addParagraph(subPara1);
sectionPara.addParagraph(subPara2);
sectionPara.addParagraph(subPara3);

document.addParagraph(sectionPara);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Paragraph – addString(String content)

Adds a string of text to a paragraph. This method does not automatically insert a space preceding the content.

Parameters

Name	Type	Description
content	String	Information to include in a paragraph.

Returns

Type	Description
None	

The following example shows how to add a new sentence to a paragraph. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var myPara = new sn_pdfgeneratorutils.Paragraph("This is the
 first sentence.");

myPara.addString(" This is the second sentence in the same
 paragraph. Spaces are not inserted automatically.")

document.addParagraph(myPara);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "filename.pdf");
```

Paragraph – addStyle(Style style)

Applies a predefined style to paragraph text.

Parameters

Name	Type	Description
style	Style	Style to apply to this element.

Returns

Type	Description
None	

The following example shows how to apply a style to a paragraph. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// Create a font color (result is purple)
var fontColor = new sn_pdfgeneratorutils.Color([0.5,0.0,0.5]);

// Create a style for your paragraph
var paraStyle = new sn_pdfgeneratorutils.Style();
paraStyle.setFontColor(fontColor);
paraStyle.setFontSize(10);

var myPara = new sn_pdfgeneratorutils.Paragraph("This paragraph
 has style.");

myPara.addStyle(paraStyle);

document.addParagraph(myPara);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "addStyle.pdf");
```

Paragraph – setFixedPosition(Number left, Number bottom, Number width)

Sets a paragraph element to a fixed position on the page.

Parameters

Name	Type	Description
left	Number	Indentation from the left side of the PDF page in points.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
bottom	Number	Position from the bottom of the PDF page in points.
width	Number	Width of the paragraph element in points. This value determines the length at which the line breaks.

Returns

Type	Description
None	

The following example shows how to set a fixed position on a page. For a document usage example, see Document API.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

// Create a style
var paraStyle = new sn_pdfgeneratorutils.Style();
paraStyle.setFontSize(48);
paraStyle.setBold();

// my paragraph
var para = new sn_pdfgeneratorutils.Paragraph("Document Title");

para.setFixedPosition(204,400,240);

para.setTextAlignment("text-center");
para.addStyle(paraStyle);

document.addParagraph(para);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "fileName.pdf");
```

Paragraph – setMargin(Number margin)

Sets each paragraph margin.

To set all four margins with one or more unique values, use setMargins().

Parameters

Name	Type	Description
margin	Number	Value of the top, right, bottom, and left margins in points.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set the all margins of the paragraph to 48 points.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var margins = 48.0;

var myPara = new sn_pdfgeneratorutils.Paragraph("Paragraph text
 with all margins set to the same value.");
myPara.setMargin(margins);

document.addParagraph(myPara);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "docName.pdf");
```

Paragraph – setMarginBottom(Number margin)

Sets the bottom margin of a paragraph.

Parameters

Name	Type	Description
margin	Number	Height of the bottom margin in points.

Returns

Type	Description
None	

The following example shows how to set the bottom margin of a paragraph to one point.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;

var paraMarginBottom = new
 sn_pdfgeneratorutils.Paragraph("Paragraph text with bottom
 margin set.");
paraMarginBottom.setMarginBottom(marginVal);

document.addParagraph(paraMarginBottom);

// save pdf as attachment to target record in the Incident table
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
document.saveAsAttachment("incident", "<record_sys_id>",
 "docName.pdf");
```

Paragraph – setMarginLeft(Number margin)

Sets the left margin of a paragraph.

Parameters

Name	Type	Description
leftMargin	Number	Width of the left margin in points.

Returns

Type	Description
None	

The following example shows how to set the left margin of a paragraph to one point.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;

var paraMarginLeft = new
 sn_pdfgeneratorutils.Paragraph("Paragraph text with left margin
 set.");
paraMarginLeft.setMarginLeft(marginVal);

document.addParagraph(paraMarginLeft);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "docName.pdf");
```

Paragraph – setMarginRight(Number margin)

Sets the right margin of a paragraph.

Parameters

Name	Type	Description
margin	Number	Width of the right margin in points.

Returns

Type	Description
None	

The following example shows how to set the right margin of a paragraph to one point.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;

var paraMarginRight = new
 sn_pdfgeneratorutils.Paragraph("Paragraph text with right
 margin set.");
paraMarginRight.setMarginRight(marginVal);

document.addParagraph(paraMarginRight);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "docName.pdf");
```

Paragraph – setMargins(Number marginTop, Number marginRight, Number marginBottom, Number marginLeft)

Sets a size for each paragraph margin.

To set each margin to the same value, use setMargin().

Parameters

Name	Type	Description
topMargin	Number	Height of the top margin in points.
rightMargin	Number	Width of the right margin in points.
bottomMargin	Number	Height of the bottom margin in points.
leftMargin	Number	Width of the left margin in points.

Returns

Type	Description
None	

The following example shows how to set paragraph margins.For a document usage example, see Document API.

```
var para = new sn_pdfgeneratorutils.Paragraph("Paragraph
 text.");

var topMargin = 1.0;
var rightMargin = 1.0;
var bottomMargin = 1.0;
var leftMargin = 1.5;

para.setMargins(marginTop, marginRight, marginBottom,
 marginLeft);
```

Paragraph – setMarginTop(Number margin)

Sets the top margin of a paragraph.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
margin	Number	Height of the top margin in points.

Returns

Type	Description
None	

The following example shows how to set the top margin of a paragraph to one point.

```
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new
 sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;

var paraMarginTop = new
 sn_pdfgeneratorutils.Paragraph("Paragraph text with top margin
 set.");
paraMarginTop.setMarginTop(marginVal);

document.addParagraph(paraMarginTop);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>",
 "docName.pdf");
```

Paragraph – setTextAlignment(String alignment)

Sets the text alignment of this paragraph.

Parameters

Name	Type	Description
alignment	String	Text alignment position. Valid values: • text-center: Aligns text to the center. • text-justified: Modifies the space between characters to completely fill text between the left and right sides. The final line is left-aligned. • text-justified-all: Justifies text alignment including the final line. • text-left: Align text to the left. • text-right: Align text to the right.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to set the paragraph text to left alignment.

```
var paragraph = new sn_pdfgeneratorutils.Paragraph("This
 paragraph text is centered.");

var alignment = "text-center";

paragraph.setTextAlignment(alignment);
```

PAScorecard - Scoped

The *PAScorecard* API enables you to fetch data about indicators and their associated records, such as breakdowns.

This API requires the Performance Analytics (com.snc.pa.analytics_center) application and runs in the SNC namespace.

PAScorecard - addParam(String parameter, String value)

Adds a query parameter to filter the returned scores.

Call this method multiple times on the same PAScorecard object to pass multiple parameters, such as the indicator sys_id and a breakdown sys_id. After specifying all parameters, call *query()* to run the query.

If you query a PAScorecard object with no parameters, the API returns a list of all indicators that are displayed on the Analytics Hub, with their scores.

Parameters

Name	Type	Description
breakdown	String	Sys_id of a breakdown to return chart information organized as defined by the breakdown. For example, the sys_id of a priority breakdown to return separate task chart information for each priority value, such as the number of open incidents / Priority / 2 - High.
breakdown_relation	String	Specify the sys_id of a breakdown relation to break down the returned data using that relation. You can view available breakdown relations by setting the *include_available_breakdowns* parameter to `true`.
contains	String	Comma-separated list of names or descriptions to return results only from indicators with a matching value. All the comma-separated list items must match, or no results are returned: The list follows AND logic, not OR logic.
display	String	Flag that indicates the type of indicators to return. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• true: Return only indicators that display on the Analytics Hub . • all: Return all indicators. Default: true
display_value	String	Data retrieval operation for reference and choice fields. Based on this value, the display value and/or the actual value in the database are retrieved. • *true* returns display values for all of the fields. • *false* returns actual values from the database. • *all* returns both actual and display values. Default: false
elements_filter	String	Specify the sys_id of an elements filter to apply that filter to the returned data. Data type: String
exclude_reference_link	Boolean	Flag that indicates whether to hide additional information provided for reference fields, such as the URI to the reference resource. Valid values: • true: Hide additional information provided for reference fields. • false: Do not hide additional information provided for reference fields. Default: false
favorites	Boolean	Flag that indicates whether to return only indicators that are favorites of the querying user. Valid values: • true: Return only indicators that are favorites of the querying user. • false: Return all indicators. Default: false
from	String	Earliest date to return scores from. Only scores from this date or later are returned. This parameter requires that *include_scores* is set to `true`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Format: ISO-8601 standard
include_available_aggregates	String	Flag that indicates whether to return all available aggregates for an indicator when no aggregate has been applied. Valid values: • true: Return all available aggregates for an indicator when no aggregate has been applied. • false: Return no aggregates. Default: false
include_available_breakdowns	Boolean	Flag that indicates whether to return all available breakdowns for an indicator. Valid values: • true: Return all available breakdowns for an indicator. • false: Return no breakdowns. Default: false
include_forecast_scores	Boolean	Flag that indicates whether to return the forecast_scores element that contains an array of date-value pairs that define the forecast data for the Analytics Hub . This parameter requires that *`include_scores`* is set to `true`. Valid values: • true: Return the forecast_scores element. • false: Do not return the forecast_scores element. Default: false
include_realtime	Boolean	Flag that indicates whether to return the realtime_enabled element which indicates if real-time scores are enabled for the indicator, and the realtime_value element which contains the real-time score value. This parameter is not supported for formula indicators. Valid values: • true: Return the realtime_enabled element. • false: Do not return the realtime_enabled element. Default: false

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
include_scores	Boolean	Flag that indicates whether to return indicator scores for the entire time range selected on the Analytics Hub . If a value is not specified, this parameter defaults to false and returns only the most recent score value. To constrain the date range of the scores that are returned, combine this parameter with *from* and *to*. Valid values: • true: Return indicator scores for the entire selected time range. • false: Do not return indicator scores for the entire selected time range. Default: false
include_target_color_scheme	Boolean	Flag that indicates whether to return the target_color_scheme element that contains the minimum and maximum values, and the color of each section of the target color scheme for the Analytics Hub . Valid values: • true: Return the target_color_scheme element. • false: Do not return the target_color_scheme element. Default: false
include_trendline_scores	String	Flag that indicates whether to return the trendline_scores element that contains an array of date-value pairs that define the Analytics Hub trendline. This parameter requires that *include_scores* is set to `true`.
key	Boolean	Flag that indicates whether to return results only for key indicators. Valid values: • true: Return the trendline_scores element. • false: Do not return the trendline_scores element . Default: false
limit	Number	Maximum number of scores to return.
page	String	Specify the page number. For example, when querying 20 indicators in the Analytics Hub with the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		default per_page value (10), specify a page value of 2 to retrieve the Analytics Hub for 11-20.
per_page	Number	Maximum number of indicators each query can return on a page. Default: 10 Maximum: 100
sortby	String	Value to use when sorting results. Valid values: • bullet • change • changeperc • date • default • direction • duedate • frequency • gap • gapperc • group • indicator_group • name • order • target • trend • value Default: value
sortdir	String	Sort direction. Valid values: • asc: Denotes ascending • des: Denotes descending Default: Descending
step	Number	Numeric value to skip scores, based on the indicator frequency. For example, specify a value of 3 to return only scores from every third day for a daily indicator, or from every third week for a weekly indicator.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
tags	String	Enter an indicator group sys_id to return the indicators in that group. Do not use *`uuid`* with this parameter.
target	Boolean	Flag that indicates whether to return results only for indicators that have a target set on the Analytics Hub . Valid values: • true: Only return results for indicators that have a target set. • false: Return results for all applicable indicators. Default: false
to	String	Latest date from which to return scores. Only scores from this date or earlier are returned. This parameter requires that *`include_scores`* is set to `true`.
uuid	String	Enter a colon-separated list of sys_id values to specify which indicators, breakdowns, aggregates, and domains to query. The parameter follows this format: <indicator_sys_id>:<breakdown_sys_id>:<elements_filter_sys_id or element_sys_ids>:<lvl-2 breakdown_sys_id>:<lvl-2 elements_filter_sys_id or element_sys_ids>:<aggregate_sys_id>;<domain_sys_id> The parameter must begin with the sys_id of an indicator record. Optionally, you can append the sys_id values of a breakdown and breakdown element to group the response based on the breakdown, and the sys_id of an aggregate to apply that aggregate. You can use a breakdown with an aggregate, or use only one. For information about obtaining the sys_id values of records, see Unique record identifier (sys_id). **Note:** If an indicator is configured to use a **Default time series**, all Analytics Hub values for that indicator use that time series aggregation.

Returns

Type	Description
None	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, the uuid parameter specifies the Number of open incidents indicator, and the breakdown parameter specifies the Priority breakdown. Both parameters have the sys_id of the respective records as their values. The query() function returns the results as an object.

```
var sc = new SNC.PAScorecard(); //in a scoped app, do not use
 the SNC namespace
sc.addParam('uuid', 'fb007202d7130100b96d45a3ce6103b4');
  // Number of open incidents
sc.addParam('breakdown', '0df47e02d7130100b96d45a3ce610399');
  // by Priority
var result = sc.query();  // Query results, which are returned
 as an object
for (var i = 0; i < result.length; i++)
gs.info(result[i].name + ': ' + result[i].value + ' ' +
 result[i].unit.display_value);
```

PAScorecard - query()

Perform a query based on the specified parameters and return the results as an object.

Before calling this method, configure parameters for the PAScorecard object by calling *`addParam(String parameter, String value)`*.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The PAScorecard object.

PAScorecard - result()

Get the last query result as an object.

This method does not perform a query. To perform a query before returning the result, use *`query()`*.

This function cannot run in a scope other than global.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The results from the last query, returned as a JS object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PASnapshot - Scoped

The *PASnapshot* API enables you to query information about Performance Analytics snapshots. Snapshots are the lists of records (sys_ids) that are collected at the time that the scores for those records are collected. A snapshot is made only for automated indicators with **Collect records** selected.

You can query information about a snapshot at a certain date using the indicator sys_id and date, and perform comparisons between snapshots for an indicator at different dates.

PASnapshot - getCompareIDs(String sys_id, Number date1, Number date2, String type)

Compares records in snapshots for a specified indicator at multiple dates, such as to identify records included in one snapshot but not the other.

Parameters

Name	Type	Description
sys_id	String	Indicator's sys_id.
date1	Number	Date of the first snapshot. Format: yyyymmdd
date2	Number	Date of the second snapshot. Format: yyyymmdd
type	String	Data to retrieve. Valid values: • all1: all records in the first snapshot • all2: all records in the second snapshot • shared: records that are in both snapshots • movedin: records that are in the first snapshot, but not the second • movedout: records that are in the second snapshot, but not the first

Returns

Type	Description
String	A comma-separated list of sys_id values.

```
var snapshot2 =
 PASnapshot.getCompareIDs('fb007202d7130100b96d45a3ce6103b4',
 20160430, 20160531, 'shared');
gs.info(snapshot2);
```

Output:

```
*** Script:
 09c01200d7002100b81145a3ce6103ab,19c01200d7002100b81145a3ce6103
e9,fcc01200d7002100b81145a3ce61035b,….
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PASnapshot - getCompareQuery(String sys_id, Number date1, Number date2, String type)

Returns the query used to compare records in snapshots for a specified indicator at multiple dates.

Parameters

Name	Type	Description
sys_id	String	Indicator's sys_id.
date1	Number	Date of the first snapshot. Format: yyyymmdd
date2	Number	Date of the second snapshot. Format: yyyymmdd
type	String	Specifies what data to retrieve. Valid values: • all1: all records in the first snapshot • all2: all records in the second snapshot • shared: records that are in both snapshots • movedin: records that are in the second snapshot, but not the first • movedout: records that are in the first snapshot, but not the second

Returns

Type	Description
String	The table, view, and encoded query as a JSON string.

```
var snapshot4 =
 PASnapshot.getCompareQuery('fb007202d7130100b96d45a3ce6103b4',
 20160530, 20160531, 'all1');
gs.info(snapshot4);
```

Output:

```
*** Script: {
  "view":"",
  "query":"sys_idINjavascript:new
 PAUtils().getCompareSnapshotIDs(\"fb007202d7130100b96d45a3ce610
3b4\",
  \"20160530\",
  \"20160531\",
  \"all1\")",
  "table":"incident"
}
```

PASnapshot - getIDs(String sys_id, Number date)

Returns the sys_id values for all records contained in the snapshot for a specified indicator at the specified date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sys_id	String	Indicator's sys_id.
date	Number	Date when the snapshot was taken. Format: yyyymmdd

Returns

Type	Description
String	A comma-separated list of sys_id values.

```
var snapshot1 =
 PASnapshot.getIDs('fb007202d7130100b96d45a3ce6103b4',
 20160530);
gs.info(snapshot1);
```

Output:

```
*** Script:
 09c01200d7002100b81145a3ce6103ab,19c01200d7002100b81145a3ce6103
e9,fcc01200d7002100b81145a3ce61035b,….
```

PASnapshot - getQuery(String sys_id, Number date)

Returns the query used to generate the snapshot for a specified indicator at the specified date.

Parameters

Name	Type	Description
sys_id	String	Indicator's sys_id.
date	Number	Date the snapshot was taken. Format: yyyymmdd

Returns

Type	Description
String	The table, view, and encoded query as a JSON string.

```
var snapshot3 =
 PASnapshot.getQuery('fb007202d7130100b96d45a3ce6103b4',
 20160530);
gs.info(snapshot3);
```

Output:

```
*** Script: {
  "view":"",
  "query":"sys_idINjavascript:new
 PAUtils().getSnapshotIDs(\"fb007202d7130100b96d45a3ce6103b4\",

}
```

PDAutomationProvider - Scoped, Global

The *PDAutomationProvider* API enables inserting an optional activity into a process while it's executing.

This API is part of the Playbooks plugin (com.glide.pad.core) and runs in the `sn_pad` namespace.

Calling scripts with this API requires at least one of the following:

- The caller must be in the same scope in which the optional activity trigger was created.
- Admin privileges.

A process is a series of activities ordered by lanes. An optional activity is predefined during process design. The activities aren't scheduled to run at a precise time. An activity can be assigned to a lane and made available to run during lane execution. An activity can be assigned to a process and made available to run during lane execution.

To create an optional activity, it must have the **Start rule** set to **Manual** in the Activities [sys_pd_activity] table. Playbooks doesn't currently support creating manual activities.

An agent adds the optional activity to a lane or activity relative to another activity. The process must be running to insert an optional activity.

See also:

- Design an automated process
- Process Automation Designer lanes and activities

PDAutomationProvider – activateProcess(String processDefinitionSysId)

Activates a playbook.

Parameters

Name	Type	Description
processDefinitionSysId	String	The sys_id of a playbook located in the Process Definitions [sys_pd_process_definition] table.

Returns

Property	Description
Object	Object containing process definition activation details. `{ "errors": [Array] "process_definition": {Object}, "state": "String" }`
errors	List of errors. Empty if successful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Property	Description
	Data type: Array of String(s)
process_definition	The activated playbook and its properties. Data type: Object `"process_definition": { "active": Boolean, "snapshot": {Object}, "status": "String" }`
process_definition.active	Flag that indicates whether the process definition for the deactivated playbook is active. Find process definitions in the Process Definitions [sys_pd_process_definition] list. Valid values: • true: The process definition for the deactivated playbook is active. • false: The process definition for the deactivated playbook is inactive. Data type: Boolean
process_definition.snapshot	Contains details about the process definition at the time of activation. Data type: Object `{ "snapshot": { "created": "String", "processDefinitionSysId": "String" } }`
process_definition. snapshot. created	The date that the playbook was created. Data type: String
process_definition. snapshot. processDefinitionSysId	The sys_id of the activated playbook. Data type: String
process_definition.status	Indicates the publishing status of the playbook. Possible values: • draft: The playbook is in draft state. • published: The playbook is in published state. Data type: String
state	Indicates whether your request to activate was successful or not.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Property	Description
	Possible values: • SUCCESS – The playbook was successfully activated. • FAILURE – The ID for the playbook was not found. Data type: Object

The following example shows how to activate a playbook.

```
var myPlaybook =
 sn_pad.PDAutomationProvider.activateProcess('cdd1b85e43000210d9
6e29c28ab8f275');
gs.info(JSON.stringify(myPlaybook));
```

Output:

```
{
  "process_definition": {
    "active": true,
    "snapshot": {
      "processDefinitionId": "cdd1b85e43000210d96e29c28ab8f275",
      "created": "2024-02-19 22:58:12"
    },
    "status": "published"
  },
  "state": "SUCCESS",
  "errors": []
}
```

PDAutomationProvider – addOptionalActivityRelativeToActivityContext(String contextID, String activityId, String where, String relativeToId)

Adds a specified optional activity to a process to be run relative to another activity during process execution.

An activity context is created for each activity when a process executes. The context also handles how the activity handles execution. For information, see Process Automation Designer lanes and activities.

Parameters

Name	Type	Description
contextID	String	Sys_id of the activity execution in which to add the optional activity. To access, click the process listed in the Process Executions [sys_pd_context] table. The execution selected must be in a state of **In Progress**.
activityId	String	Sys_id of the optional activity listed in the Activities [sys_pd_activity] table. **Note:** To create an optional activity, it must have the **Start rule** set to **Manual** in the Activities [sys_pd_activity] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
where	String	Indicates where to place the activity in the process. Valid values: • AFTER – Execute this activity after the relative activity context. • WITH – Execute the activity at the same time as another relative activity context.
relativeToId	String	ID of the relative activity context that the optional activity will run after or with. Listed in the Activity Context [sys_pd_activity_context] table.

Returns

Type	Description
Boolean	Flag that indicates whether the activity was successfully scheduled to run. Valid values: • true: Activity is successfully scheduled to run. The output is a string stating `success`. • false: Activity isn't successfully scheduled to run. The output is an array of one or more error messages. If errors, list of one or more error messages. Message stating `Array of 0 or more elements` otherwise.
Array	If errors, list of one or more error messages. Message stating `Array of 0 or more elements` otherwise. Possible error messages: • `Invalid Optional activity Id` – The sys_id provided for the *`activityId`* parameter is invalid. • `Invalid PD context Id` – The Process Designer (PD) sys_id provided in the *`contextID`* parameter is invalid. • `Invalid position type` – The position type provided is invalid. See the description of the *`where`* parameter for valid types. • `Invalid Relative-to Id` – The sys_id provided for the *`relativeToId`* parameter is invalid. • `Optional activity not found` – The sys_id provided for the *`activityId`* parameter wasn't found. • `Process must still be active` – The process containing this activity must be active to run the optional activity. • `Relative activity context not found` – The sys_id provided for the *`relativeToId`* parameter was not found.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to run an optional activity simultaneously with the relative activity context.

```
var contextId = '<context_id>';
var optionalActivityId = '<optional_activity_id>';
var where = 'WITH'; // options AFTER, WITH
var relativeToId = '<relative_activity_context_id>'; // relative
 activity context ID

var response =
 sn_pad.PDAutomationProvider.addOptionalActivityRelativeToActivi
tyContext(contextId, optionalActivityId, where, relativeToId);

gs.info(JSUtil.describeObject(response));
```

Output (success):

```
success: boolean = true
errors: Array of 0 elements
```

PDAutomationProvider – addOptionalActivityRelativeToLaneContext(String contextID, String activityId, String where, String relativeToId)

Assigns an optional activity to a lane to run during that lane's execution context.

A lane context is created for each lane when a process executes. The context also handles how the lane handles execution. For information, see Process Automation Designer lanes and activities.

Parameters

Name	Type	Description
contextID	String	Sys_id of the activity execution in which to add the optional activity. To access, click the process listed in the Process Executions [sys_pd_context] table. The execution selected must be in a state of **In Progress**.
activityId	String	Sys_id of the optional activity listed in the Activities [sys_pd_activity] table. **Note:** To create an optional activity, it must have the **Start rule** set to **Manual** in the Activities [sys_pd_activity] table.
where	String	Indicates where to place the activity in the process. Valid values: • LAST – Execute as the final activity in a lane context. • NEXT – Execute in the next activity in a lane context.
relativeToId	String	ID of the relative lane context in which the optional activity is to run. Listed in the Lane Context [sys_pd_lane_context] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the activity was successfully scheduled to run. Valid values: • true: Activity is successfully scheduled to run. The output is a string stating `success`. • false: Activity isn't successfully scheduled to run. The output is an array of one or more error messages.
Array	If errors, list of one or more error messages. Message stating `Array of 0 or more elements` otherwise. Possible error messages: • `Invalid Optional activity Id` – The sys_id provided for the *`activityId`* parameter is invalid. • `Invalid PD context Id` – The Process Designer (PD) sys_id provided in the *`contextID`* parameter is invalid. • `Invalid position type` – The position type provided is invalid. See the description of the *`where`* parameter for valid types. • `Invalid Relative-to Id` – The sys_id provided for the *`relativeToId`* parameter is invalid. • `Optional activity cannot be added to lane` – The optional activity provided in the *`activityId`* parameter can't be added relative to the lane provided in the *`relativeToId`* parameter. Make sure that the **Activity Execution** selected is in the **In Progress** state. • `Optional activity not found` – The sys_id provided for the *`activityId`* parameter wasn't found. • `Process must still be active` – The process containing this activity must be active to run the optional activity. • `Relative lane context not found` – The sys_id provided for the *`relativeToId`* parameter was not found.

The following example shows how to run an optional activity as the final activity in a lane context.

```
var contextId = '<context_id>';
var optionalActivityId = '<optional_activity_id>';
var where = 'LAST'; // options LAST, NEXT
var relativeToId = '<relative_lane_context_id>'; // relative
 lane context ID

var response =
 sn_pad.PDAutomationProvider.addOptionalActivityRelativeToLaneCo
ntext(contextId, optionalActivityId, where, relativeToId);

gs.info(JSUtil.describeObject(response));
```

Output (success):

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
success: boolean = true
errors: Array of 0 elements
```

PDAutomationProvider – deactivateProcess(String processDefinitionSysId)

Deactivates a playbook.

Parameters

Name	Type	Description
processDefinitionSysId	String	The sys_id of a playbook located in the Process Definitions [sys_pd_process_definition] table.

Returns

Property	Description
Object	Object containing process definition deactivation details. `{ "errors": [Array] "process_definition": {Object}, "state": "String" }`
errors	List of errors. Empty if successful. Data type: Array of String(s)
process_definition	The deactivated playbook and its properties. Data type: Object `"process_definition": { "active": Boolean, "snapshot": {Object}, "status": "String" }`
process_definition.active	Indicates whether the process definition for the deactivated playbook is active. Find process definitions in the Process Definitions [sys_pd_process_definition] list. Possible values: • true: The process definition for the deactivated playbook is active. • false: The process definition for the deactivated playbook is inactive. Data type: Boolean
process_definition.description	Details about your deactivated playbook. Data type: String
process_definition.label	The name of the deactivated playbook that users see in the interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Property	Description
	Data type: String
process_definition.name	The name for the deactivated playbook in the code. Only used as a request parameter in scripting. Data type: String
process_definition.scope	The sys_id of the application scope that your playbook is deactivated for. Data type: String
process_definition.status	If the playbook is published, it changes back to a draft. Data type: String
state	Indicates whether deactivation was successful. Possible values: • SUCCESS – The playbook was successfully deactivated. • FAILURE – The ID for the playbook was not found. Data type: String

Deactivate the playbook.

```
sn_pad.PDAutomationProvider.deactivateProcess('cdd1b85e43000210d96e29c28ab8f275')
```

Outputs:

```
{"process_definition":{"scope":"global","name":"test","active":true,"description":"","label":"test","status":"draft"},"state":"SUCCESS"}
```

PDAutomationProvider – duplicateProcess(String processDefinitionSysId, String label, String description, String scopeId, String triggerTypeId)

Duplicates a playbook.

Parameters

Name	Type	Description
processDefinitionSysId	String	The sys_id of a playbook located in the Process Definitions [sys_pd_process_definition] table.
label	String	The name of the duplicated playbook.
description	String	Optional. Add details about your playbook.
scopeId	String	The sys_id of the application scope that you want your playbook to run in. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`scope.name`. Entering the sys_id for the global scope lets your playbook run in any application scope.
triggerTypeId	String	The sys_id of the trigger from which to initiate playbook runs. Find the trigger type in the Trigger Type [sys_pd_trigger_type] table and copy its sys_id.

Returns

Property	Description
Object	Object containing process definition duplication details. `{ "errors": [Array] "processDefinitionSysId": "String", "state": "String" }`
errors	List of errors. Empty if successful. Data type: Array of String(s) Possible error messages: • `Scope not found for scopeId: xyz` • `Process definition not found for id: xyz` • `Trigger type not found for triggerTypeId: xyz`
processDefinitionSysId	The sys_id of the new playbook in the Process Definitions [sys_pd_process_definition] table. Data type: String
state	Indicates whether playbook duplication was successful. Possible values: • SUCCESS – The playbook was successfully duplicated. • FAILURE – The ID for the playbook, application scope, or trigger was not found. Data type: Object

This example shows how to duplicate a playbook with the sys_id `f8ca6192ec210210f8772cbd595eab20`. The new playbook is named **Playbook 2.0**, has an application scope of **Global**, and is triggered when a record is created. The **Record Create** trigger type has a sys_id of `ab6951170f1200108c87f4f0ff767e4f`.

```
sn_pad.PDAutomationProvider.duplicateProcess('f8ca6192ec210210f8
772cbd595eab20', 'Playbook 2.0', '', 'global',
 'ab6951170f1200108c87f4f0ff767e4f');
```

ate":"SUCCESS"}
```

PDFGenerationAPI - Scoped, Global

The *PDFGenerationAPI* provides support for PDF conversion and handling PDF fields.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

Note: The maximum PDF size is 50 MB.

The methods in this class enable the following tasks:

- Dynamically generate a PDF from an HTML string and attach it to a record
  - – PDFGenerationAPI – convertToPDF(String html, String targetTable, String targetTableSysId, String pdfName, String fontFamilySysId, Object documentConfiguration)
  - – PDFGenerationAPI – convertToPDFWithHeaderFooter(String html, String targetTable, String targetTableSysId, String pdfName, Object headerFooterInfo, String fontFamilySysId, Object documentConfiguration)
- Queue a PDF to be generated from an HTML string and attached to a record
  - –
  - –
- Fill fields in a PDF
  - PDFGenerationAPI – fillDocumentFieldsAndFlatten(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName, Object flatten)
  - PDFGenerationAPI – fillDocumentFields(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName)
  - PDFGenerationAPI – isDocumentFillable(String sysId)
- Sign a PDF
  - PDFGenerationAPI – fillFieldsAndMergeSignature(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName, PdfMergeSignRequestor requestor, Object flatten)
  - PDFGenerationAPI – getFilledDocumentWithSignatureAsBase64(Object fieldsMap, String sysId, PdfMergeSignRequestor requestor, Object flatten)
- Restrict editing filled fields as flattened or partially flattened – PDFGenerationAPI – fillDocumentFieldsAndFlatten(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName, Object flatten)
- Retrieve PDF page size and field data
  - PDFGenerationAPI – getPdfPageSizes(String sysId)
  - PDFGenerationAPI – getDocumentFieldsType(String sysId)
  - PDFGenerationAPI – getDocumentFields(String sysId)
- Redact information in a PDF – PDFGenerationAPI – redact(Object inputJson)

Note: These methods can also be used for documents created by non-catalog items.

- PdfMergeSignRequestor
- SVGToPDFConversionAPI

PDFGenerationAPI – PDFGenerationAPI()

Instantiates a new *PDFGenerationAPI* object.

Parameters

Name	Type	Description
None		

The following example shows how to create a *PDFGenerationAPI* object.

```
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
```

PDFGenerationAPI – convertToPDF(String html, String targetTable, String targetTableSysId, String pdfName, String fontFamilySysId, Object documentConfiguration)

Converts an HTML string to a PDF document.

This method creates a PDF using the page size A4 – 595 × 842 points. Content will be truncated if it exceeds this size.

To generate a PDF with additional settings, such as page size, orientation, and page numbers, use convertToPDFWithHeaderFooter().

Parameters

Name	Type	Description
html	String	HTML to convert to a PDF document.
targetTable	String	Name of the table on which to attach the converted PDF.
targetTableSysId	String	Sys_id of the record on which to attach the converted PDF.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.
fontFamilySysId	String	Optional. Sys_id of the font family to use for the PDF. This sys_id is from the PDF Generation Font Family [sys_pdf_generation_font_family] table. Default: none
documentConfiguration	Object	Optional. Object containing a table of contents configuration and a page number configuration. `{ "toc_config" : "String", "page_number_config": "String" }`
documentConfiguration.toc_config	String	Optional. Sys_id of the table of contents configuration to use for the PDF. This sys_id is from the Table of Contents Configuration [doc_toc_config] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: none
documentConfiguration.page_number_config	String	Optional. Sys_id of the page number configuration to use for the PDF. This sys_id is from the Page Number Configuration [doc_page_number_config] table. Default: none

Returns

Type	Description
Object	Object containing sys_id of the PDF attachment if conversion is successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "request_id": "String", "status": "String" }`
<Object>. attachment_id	If HTML conversion is successful, sys_id of the converted and attached PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error. Possible values: • Conversion failed. – No PDF created. Make sure the values provided are accurate. • Conversion is successful. – The HTML successfully converted to PDF. • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • No Form associated with pdf to fill. attachmentSysId: <sys_id> • No editable fields exist with specified names. Please check and try again. field names: <field names> • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.request_id	Sys_id of the change producer request record. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to convert HTML to a PDF and attach it to a record in the Incident [incident] table.

```
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;

//  (Option) get HTML from the description field of an incident
 record
var gr = new GlideRecord("incident");
var html;

if (gr.get("<tableSysId>")) {
 html = gr.description.toString();
}

var result = v.convertToPDF(html, "incident", "<target_sys_id>",
 "myPDF");
gs.info(JSON.stringify(result));
```

Output:

```
{"attachment_id":"<sys_id>","message":"Conversion is
 successful.","request_id":"<change_sys_id>","status":"success"}
```

PDFGenerationAPI – convertToPDFWithHeaderFooter(String html, String targetTable, String targetTableSysId, String pdfName, Object headerFooterInfo, String fontFamilySysId, Object documentConfiguration)

Converts an HTML string into a PDF with header and footer content.

Use this method to generate PDFs with page settings:

- Header and footer information
- Margin sizes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Orientation
- Enumeration
- Page size

Parameters

Name	Type	Description
html	String	HTML to convert to a PDF document.
targetTable	String	Name of the table on which to attach the converted PDF.
targetTableSysId	String	Sys_id of the record on which to attach the converted PDF.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.
headerFooterInfo	Object	Defines PDF header and footer details. `{ "FooterImageAlignment": "String", "FooterImageAttachmentId": "String", "FooterImageHeight": "String", "FooterText": "String", "FooterTextAlignment": "String", "GeneratePageNumber": "String", "HeaderImageAlignment": "String", "HeaderImageAttachmentId": "String", "HeaderImageHeight": "String", "LeftOrRightMargin": "String", "PageOrientation": "String", "PageSize": "String", "TopOrBottomMargin": "String" }`
headerFooterInfo. FooterImageAlignment	String	Sets the image position in the footer. Valid values: • BOTTOM_CENTER: Position the image in the bottom center of the footer. • BOTTOM_LEFT: Position the image in the bottom left area of the footer. • BOTTOM_RIGHT: Position the image in the bottom right area of the footer. • TOP_CENTER: Position the image in the top center of the footer.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• TOP_LEFT: Position the image in the top left area of the footer. • TOP_RIGHT: Position the image in the top right area of the footer.
headerFooterInfo. FooterImageAttachmentId	String	Sys_id of the footer image in the Attachments [sys_attachment] table. To determine if the file type is supported in your instance, Navigate to **System Properties** > **Security** and check if it's listed in **List of file extensions (comma-separated) that can be attached** field.
headerFooterInfo. FooterImageHeight	String	Height of footer image. Default: 50 points
headerFooterInfo. FooterText	String	Footer text to place at the bottom of each PDF page.
headerFooterInfo. FooterTextAlignment	String	Sets the text position in the footer. Make sure this value does not match or conflict with the area provided in *`headerFooterInfo.FooterImageAlignment`*. Valid values: • BOTTOM_CENTER: Position the text in the bottom center of the footer. • BOTTOM_LEFT: Position the text in the bottom left area of the footer. • BOTTOM_RIGHT: Position the text in the bottom right area of the footer. • TOP_CENTER: Position the text in the top center of the footer. • TOP_LEFT: Position the text in the top left area of the footer. • TOP_RIGHT: Position the text in the top right area of the footer.
headerFooterInfo. GeneratePageNumber	String	Flag that indicates whether to generate a PDF page number. Valid values: • true: Generate page numbers. • false: Do not generate page numbers. Default: true
headerFooterInfo. HeaderImageAlignment	String	Sets the image position in the header. Valid values:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• center: Position the image in the center of the header. • left: Position the image on the left side of the header. • right: Position the image on the right side of the header.
headerFooterInfo. HeaderImageAttachmentId	String	Sys_id of the header image in the Attachments [sys_attachment] table. To determine if the file type is supported in your instance, Navigate to **System Properties** > **Security** and check if it's listed in **List of file extensions (comma-separated) that can be attached** field.
headerFooterInfo. HeaderImageHeight	String	Height of the header image. Default: 50 points
headerFooterInfo. LeftOrRightMargin	String	Size of the left and right margins. If positioned in the left or right side of the page, header/footer details are placed within in this area. Default: 36 points
headerFooterInfo. PageOrientation	String	Page orientation. Valid values: • PORTRAIT • LANDSCAPE Default: Portrait
headerFooterInfo. PageSize	String	Document page size. Valid values: • A4 – 595 × 842 points • LETTER – 612 × 792 points • LEDGER – 792 x 1224 points Content will be truncated if it exceeds the page size.
headerFooterInfo. TopOrBottomMargin	String	Size of the top and bottom margins. Header and footer details are placed within in this area. Default: 72 points
fontFamilySysId	String	Optional. Sys_id of the font family to use for the PDF. This sys_id is from the PDF Generation Font Family [sys_pdf_generation_font_family] table. Default: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
documentConfiguration	Object	Optional. Object containing a table of contents configuration and a page number configuration. `{ "toc_config" : "String", "page_number_config": "String" }`
documentConfiguration.toc_config	String	Optional. Sys_id of the table of contents configuration to use for the PDF. This sys_id is from the Table of Contents Configuration [doc_toc_config] table. Default: none
documentConfiguration.page_number_config	String	Optional. Sys_id of the page number configuration to use for the PDF. This sys_id is from the Page Number Configuration [doc_page_number_config] table. Default: none

Returns

Type	Description
Object	Object containing sys_id of the PDF attachment if conversion is successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "request_id": "String", "status": "String" }`
<Object>. attachment_id	If HTML conversion is successful, sys_id of the converted and attached PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error. Possible values: • Conversion failed. – No PDF created. Make sure the values provided are accurate. • Conversion is successful. – The HTML successfully converted to PDF. • Footer Image alignment and text alignment cannot be in the same region with same alignment: <footerImageAlignment value> – Make sure that *headerFooterInfo.FooterImageAlignment* and *headerFooterInfo.FooterTextAlignment* values are not in the same area.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • Invalid footer image alignment: <invalid_option> is provided. – Provide a valid option in the *headerFooterInfo.FooterImageAlignment* property. • Invalid footer text alignment: " + <invalid_option> + " is provided. – Provide a valid option in the *headerFooterInfo.footerTextAlignment* property. • No Form associated with pdf to fill. attachmentSysId: <sys_id> • No editable fields exist with specified names. Please check and try again. field names: <field names> • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Unable to get the footer image. sysId: + <value provided> – Make sure the sys_id provided for *headerFooterInfo.footerImageId* is accurate. • Unable to get the header image. sysId: + <value provided> – Make sure the sys_id provided for *headerFooterInfo.headerImageId* is accurate. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.request_id	Sys_id of the change producer request record. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to convert HTML to a PDF named "myPDF" and add the PDF as an attachment to a record in the Incident [incident] table. The PDF contains header and footer provided via attachment.

```
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;

//  (Option) get HTML from the description field of an incident
 record
var gr = new GlideRecord("incident");
var html;

if (gr.get("<tableSysId>")) {
 html = gr.description.toString();
}

var hfInfo = new Object();
hfInfo["HeaderImageAttachmentId"] = "<hdrImgAttSysId>";
hfInfo["HeaderImageAlignment"] = "left";
hfInfo["FooterImageAttachmentId"] = "<ftrImgAttSysId>";
hfInfo["FooterImageAlignment"] = "TOP_CENTER";
hfInfo["FooterText"] = "Sample Footer Message";
hfInfo["PageSize"] = "A4";
hfInfo["GeneratePageNumber"] = "false";
hfInfo["TopOrBottomMargin"] = "36";
hfInfo["LeftOrRightMargin"] = "24";

var result = v.convertToPDFWithHeaderFooter(html, "incident",
 "<targetTbl_sys_id>", "myPDF", hfInfo);
gs.info(JSON.stringify(result));
```

Output:

```
{"attachment_id":"<sys_id>","message":"Conversion is
 successful.","request_id":"<change_sys_id>","status":"success"}
```

PDFGenerationAPI – fillDocumentFields(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName)

Fills fields in an editable PDF and attaches it to the provided record.

Use the following methods to determine if the PDF is fillable and get field information:

- isDocumentFillable()
- getDocumentFields()
- getDocumentFieldsType()

PDFGenerationAPI provides additional fill methods with different options:

- fillDocumentFieldsAndFlatten() – Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.
- fillFieldsAndMergeSignature() – Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.
- getFilledDocumentWithSignatureAsBase64() – Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldsMap	Object	Optional. Key value map by PDF field name and value to fill. Use the *getDocumentFields()* method to get the list of available fields.
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.
tableName	String	Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
tableSysId	String	Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.

Returns

Type	Description
Object	Object containing sys_id of the updated PDF attachment if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>. attachment_id	If the operation is successful, sys_id of the filled PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error. Valid values: • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • No Form associated with pdf to fill. attachmentSysId: <sys_id> • No editable fields exist with specified names. Please check and try again. field names: <field names> • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan.

Returns (continued)

Type	Description
	• Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to fill fields in an editable PDF.

```
var fieldMap = new Object();
fieldMap["Address"] = "Address value here";
fieldMap["State"] = "State value here";

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.fillDocumentFields(fieldMap, "<attachmentSysId>",
 "<tableName>", "<tableSysId>", "pdfName");
gs.info(JSON.stringify(result));
```

Output:

```
{"attachment_id":"<sys_id>","message":"Request completed
 successfully.","status":"success"}
```

PDFGenerationAPI – fillDocumentFieldsAndFlatten(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName, Object flatten)

Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.

Use the following methods to determine if the PDF is fillable and get field information:

- isDocumentFillable()
- getDocumentFields()
- getDocumentFieldsType()

PDFGenerationAPI provides additional fill methods with different options:

- fillDocumentFields() – Fills fields in an editable PDF and attaches it to the provided record.
- fillFieldsAndMergeSignature() – Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.
- getFilledDocumentWithSignatureAsBase64() – Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
fieldsMap	Object	Optional. Key value map by PDF field name and value to fill. Use the *getDocumentFields()* method to get the list of available fields.
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.
tableName	String	Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
tableSysId	String	Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.
flatten	Object	Optional. Flattening fields enable locking the fields so that other users cannot change the information. Specify the key as "FlattenType" and provide a flattening option as a string. Valid values: • donot_flatten - Do not flatten any fields. • partially_flatten - Flatten only the fields which are modified. • fully_flatten - Flattens all the fields. Default: fully_flatten `{ "FlattenType": "String" }`

Returns

Type	Description
Object	Object containing sys_id of the updated PDF attachment if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>. attachment_id	If the operation is successful, sys_id of the filled PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error.

Returns (continued)

Type	Description
	Valid values: • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • No Form associated with pdf to fill. attachmentSysId: <sys_id> • No editable fields exist with specified names. Please check and try again. field names: <field names> • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to fill fields and flatten an editable PDF.

```
var fieldMap = new Object();
fieldMap["Last Name First Name Middle Initial"] = "Tuter Abel
 E.";
fieldMap["Date of Birth"] = "08101952";
fieldMap["US SSN"] = "111-22-9999";
fieldMap["Address"] = "PO Box 344";
fieldMap["City"] = "Jerome";
fieldMap["State"] = "AZ";
fieldMap["Zip"] = "86331";

var flatten = new Object();
flatten["FlattenType"] = "partially_flatten";

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var result = v.fillDocumentFieldsAndFlatten(fieldMap,
 "<attachmentSysId>", "<tableName>", "<tableSysId>", "pdfName",
 flatten);
gs.info(JSON.stringify(result));
```

Output:

```
"attachment_id":"<sys_id>","message":"Request completed
 successfully.","status":"success"
```

PDFGenerationAPI – fillFieldsAndMergeSignature(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName, PdfMergeSignRequestor requestor, Object flatten)

Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.

Use the following methods to determine if the PDF is fillable and get field information:

- isDocumentFillable()
- getDocumentFields()
- getDocumentFieldsType()

PDFGenerationAPI provides additional fill methods with different options:

- fillDocumentFields() – Fills fields in an editable PDF and attaches it to the provided record.
- fillDocumentFieldsAndFlatten() – Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.
- getFilledDocumentWithSignatureAsBase64() – Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

Parameters

Name	Type	Description
fieldsMap	Object	Optional. Key value map by PDF field name and value to fill. Use the *getDocumentFields()* method to get the list of available fields.
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.
tableName	String	Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
tableSysId	String	Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
pdfName	String	Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.
requestor	PdfMergeSign Requestor	Signature input returned from *pdfMergeSignRequestor*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
flatten	Object	Optional. Flattening fields enable locking the fields so that other users cannot change the information. Specify the key as "FlattenType" and provide a flattening option as a string. Valid values: • donot_flatten - Do not flatten any fields. • partially_flatten - Flatten only the fields which are modified. • fully_flatten - Flattens all the fields. Default: fully_flatten `{ "FlattenType": "String" }`

Returns

Type	Description
Object	Object containing sys_id of the updated PDF attachment if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>. attachment_id	If the operation is successful, sys_id of the filled PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error. Valid values: • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • No Form associated with pdf to fill. attachmentSysId: <sys_id> • No editable fields exist with specified names. Please check and try again. field names: <field names> • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to fill fields with signature with default settings to completely flatten the fields.

```
var fieldMap = new Object();
fieldMap["Address_Salutation"] = "Address value here";

var paramMap = new Object();
paramMap["FlattenType"] = "partially_flatten";

var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;
requestor.createRequest("<attachmentSysId>", "incident",
 "<tableSysId>", "filledPdf");
requestor.addSignatureMapping(6, 40, 50, 188, 44,
 "<signatureSysId>");

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.fillFieldsAndMergeSignature(fieldMap,
 "<attachmentSysId>", "incident", "<tableSysId>", requestor,
 "filledPdf", paramMap);
gs.info(JSON.stringify(result));
```

Output:

```
{"attachment_id":"5440d993dbed3010d66be1191396194e","message":"R
equest completed successfully.","status":"success"}
```

PDFGenerationAPI – getDocumentFields(String sysId)

Gets a list of editable fields in a PDF document. Enables listing editable PDF fields without manually opening the file to check.

Parameters

Name	Type	Description
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Object containing ID of the signed PDF, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>.fields	If the request is successful, list containing the name of each field in the PDF. Data type: Array of strings `"fields": ["field_name"]`
<Object>.message	Message confirming success or error. Possible values: • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to retrieve fields in a PDF attachment.

```
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.getDocumentFields("attachmentSysId");
gs.info(JSON.stringify(result));
```

Output:

```
{"message":"Request completed
 successfully.","fields":["NP_formFillable","reset","print","1SS
N","Signature.1","5sigDate","Check Box21"],"status":"success"}
```

PDFGenerationAPI – getDocumentFieldsType(String sysId)

Gets the field type of set of editable fields from a PDF document.

Parameters

Name	Type	Description
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.

Returns

Type	Description
Object	Object containing each PDF field type if successful, error message otherwise. `{ "fields_type": {Object}, "message": "String", "status": "String" }`
<Object>.fields_type	Object listing each field in the specified PDF if successful, error message otherwise. Data type: Object `"fields_type": { "<field type>": {Object}, }`
<Object>.fields_type.<field>	Object containing page number of each field. The <field> name represents the field label, for example, "SSN", or an automated label representing the type. Data type: Object `"<field>": { "fieldsDetails": [Array], // Check boxes, radio buttons, choice boxes only "pageNumber": "String", "type": "String" }`
<Object>.fields_type.<field>.fieldsDetails	List of objects containing field name and corresponding value of each option for choice field types. Applicable types: • Check box • Choice box • Combo box • Multi select choice box Data type: Array

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"fieldsDetails": [
	  "fieldName": "String",
	  "value": "String"
	]</pre>

<Object>.fields_type.<field>.fieldsDetails.fieldName	Name of a choice field. Data type: String
<Object>.fields_type.<field>.fieldsDetails.value	Value of a choice field. Data type: String
<Object>.fields_type.<field>.pageNumber	PDF page number corresponding to this field. Data type: String
<Object>.fields_type.<field>.type	PDF field type. Possible values: • check_box • choice_box • combo_box • multi_select_choice_box • push_button • radio_button • signature • text Data type: String
<Object>.message	Message confirming success or error. Possible values: • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment.

Returns (continued)

Type	Description
	Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to retrieve field types in a PDF attachment. Results include manual returns for readability and are truncated for brevity.

```
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.getDocumentFieldsType("<attachmentSysId>");
gs.info(JSON.stringify(result));
```

Output:

```
{"fields_type":{"1ADDLINE2.25":{"pageNumber":2,"type":"text"},"1
ADDLINE2.24":{"pageNumber":2,"type":"text"},

PDFGenerationAPI – getFilledDocumentWithSignatureAsBase64(Object fieldsMap, String sysId, PdfMergeSignRequestor requestor, Object flatten)

Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

Base64 encoding enables you to output a PDF as a string within a text document, such as HTML or JSON, without damaging the binary character syntax.

Use the following methods to determine if the PDF is fillable and get field information:

- isDocumentFillable()
- getDocumentFields()
- getDocumentFieldsType()

PDFGenerationAPI provides additional fill methods with different options:

- fillDocumentFields() – Fills fields in an editable PDF and attaches it to the provided record.
- fillDocumentFieldsAndFlatten() – Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.
- fillFieldsAndMergeSignature() – Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.

Parameters

Name	Type	Description
fieldsMap	Object	Optional. Key value map by PDF field name and value to fill. Use the *getDocumentFields()* method to get the list of available fields.
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.
requestor	PdfMergeSignRequestor	Signature input returned from *pdfMergeSignRequestor*.
flatten	Object	Optional. Flattening fields enable locking the fields so that other users cannot change the information. Specify the key as "FlattenType" and provide a flattening option as a string. Valid values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		• donot_flatten - Do not flatten any fields. • partially_flatten - Flatten only the fields which are modified. • fully_flatten - Flattens all the fields. Default: fully_flatten `{ "FlattenType": "String" }`

Returns

Type	Description
String	If successful, PDF converted to Base64 format is added to the Attachments table [sys_attachment]. Contents reflect the PDF attachment provided with fields and signature filled. The fields are not editable unless an alternative flattening option was provided with the *`flatten`* parameter.
<Object>.message	Message confirming success or error. Valid values: • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. • No Form associated with pdf to fill. attachmentSysId: <sys_id> • No editable fields exist with specified names. Please check and try again. field names: <field names> • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to load two fields in a PDF attachment, flatten the fields, and convert the PDF to Base64 format.

```
var mymap = new Object();
mymap["City"] = "City value here";
mymap["State"] = "XX";

// create a requestor
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;
requestor.createRequest("<sys_id>", "tableName", "<tableSysId>",
 "pdfName");
requestor.addSignatureMapping(6, 40, 50, 188, 44,
 "<signImgSysId>");
var processedRequestObj = requestor.processRequest();

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;

var result = v.getFilledDocumentWithSignatureAsBase64(mymap,
 "<attachmentSysId>", processedRequestObj);
gs.info (JSON.stringify(result));
```

PDFGenerationAPI – getPdfPageSizes(String sysId)

Gets the page size of a PDF document.

Parameters

Name	Type	Description
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.

Returns

Type	Description

Object	Object containing the size of each page if successful, error message otherwise.
	
	`{`
	`  "pages_size": {Object},`
	`  "message": "String",`
	`  "status": "String"`
	`}`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.pages_size	If the operation is successful, width and height of each PDF page in points. The page number is returned as a string and the measurement values are returned as number data types. Data type: Object `"pages_size": {"<page number>":[<width>,<height>]}`
<Object>.message	Message confirming success or error. Possible values: • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to display the width and height of each page in a PDF attachment.

```
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.getPdfPageSizes ("<attachmentSysId>");
gs.info(JSON.stringify(result));
```

Output:

```
{"pages_size":{"1":[612,792],"2":[612,792],"3":[612,792],"4":[612,792],"5":[612,792]},"message":"Request completed successfully.","status":"success"}
```

PDFGenerationAPI – isDocumentFillable(String sysId)

Checks if the PDF document contains editable fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.

Returns

Type	Description
Object	Object containing the size of each page if successful, error message otherwise. `{ "document_editable": "String", "message": "String", "status": "String" }`
<Object>. document_editable	If the operation is successful, flag indicating whether the document is editable. Valid values: • true: PDF document has editable fields. • false: PDF document does not have editable fields. Data type: Boolean value provided as a string
<Object>.message	Message confirming success or error. Possible values: • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to determine if PDF document fields are editable.

```
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.isDocumentFillable("<attachmentSysId>");
gs.info(JSON.stringify(result));
```

Output:

```
{"message":"Request completed
 successfully.","document_editable":"true","status":"success"}
```

PDFGenerationAPI – redact(Object inputJson)

Applies redaction to a PDF document based on the given rectangle coordinates, search keywords, or both. A redacted copy of the original PDF is generated in the Attachments [sys_attachment] table.

Note:

- Redaction results might include an unexpected white redacted text block that overwrites text not intended to be redacted. If this event occurs, you can manually select the content for redaction using the *highlightedSections* property or the PDF Generation Utilities plugin. For more information, see Redact data from documents.
- This method doesn't support redaction in PDFs containing JBIG2 images.

Parameters

Name	Type	Description
inputJson	Object	Identifies the PDF and its content to be redacted. `{ "sysId": "String", "highlightedSections": [Array], "searchedKeywords": [Array] }`
inputJson.sysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table.
inputJson.highlightedSections	Array of Objects	List of rectangles coordinates provided as an object. Each coordinate represents the location of the content to be redacted on each page. Optional if including the *searchedKeywords* property. `[ { "pageNumber": Number, "x": Number, "y": Number, "width": Number, "height": Number } ]`
inputJson.highlightedSections.pageNumber	Number	PDF page number containing the content to select for redaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
inputJson.highlightedSections.x	Number	The X-axis (horizontal position) of the redaction rectangle on the PDF in points. The value at the bottom-left corner of the PDF page is 0. For example, a value of `306` places the rectangle approximately in the horizontal center of a letter-size PDF page.
inputJson.highlightedSections.y	Number	The Y-axis (vertical position) of the redaction rectangle on the PDF in points. The value at the bottom-left corner of the PDF page is 0. For example, a value of `396` places the rectangle approximately in the vertical center of a letter-size PDF page.
inputJson.highlightedSections.width	Number	Width of the redaction rectangle is in points. This value increases the size of the rectangle horizontally from the lower left point at which the x an y axes intersect.
inputJson.highlightedSections.height	Number	Height of the redaction rectangle in points. This value increases the size of the rectangle vertically from the lower left point at which the x an y axes intersect.
inputJson.searchedKeywords	Array	List of one or more strings used to find text for redaction. The redaction rectangle size matches the height and width of the text that is blocked out as a result. Optional if including the *`highlightedSections`* property. **Note:** In some cases, text strings containing special characters or punctuation such as `"items:"` and `"PDF."` aren't redacted. You can alternatively remove the character from the string or highlight the area to remove the text.

Returns

Type	Description
Object	Object containing sys_id of the updated PDF attachment if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>.attachment_id	If the operation is successful, sys_id of the filled PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Message confirming success or error. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• Can't parse this format – Unable to process an image embedded in the PDF. The PDF contains one or more images in an unsupported format, such as a JBIG2 image. • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan. • Request completed successfully – Operation is successful. • Undefined – Sys_id provided does not exist or is not a PDF attachment. Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to redact by rectangle and key word. On the redacted PDF, the areas selected on page 2 are blocked out. The string '23' is redacted on any page that it's found on.

```
var pdfRequest = {
  sysId: 'e4b3ae35fc128210f877789781ea59f3',
  highlightedSections: [
    {
      "pageNumber": 2,
      "x": 261.75,
      "y": 480,
      "width": 21,
      "height": 14.25
    },
    {
      "pageNumber": 2,
      "x": 249,
      "y": 390.75,
      "width": 63.75,
      "height": 15.75
    }
    // Add more coordinates as needed
  ],
  searchedKeywords: ['23']
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
};

// Convert the JSON object to a string
var jsonRequest = JSON.stringify(pdfRequest);
gs.info('JSON Request: ' + jsonRequest + '\n');

var PDFRedaction = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = PDFRedaction.redact(jsonRequest);
gs.info(JSON.stringify(result));
```

Output:

```
JSON Request:
 {"sysId":"e4b3ae35fc128210f877789781ea59f3","highlightedSection
s":[{"pageNumber":2,"x":261.75,"y":480,"width":21,"height":14.2
5},{"pageNumber":2,"x":249,"y":390.75,"width":63.75,"height":15.
75}],"searchedKeywords":[23]}

{"attachment_id":"1744ae35fc128210f877789781ea59fc","message":"R
equest completed successfully.","status":"success"}
```

PdfMergeSignRequestor - Scoped, Global

The *PdfMergeSignRequestor* API provides methods to add an image representing a signature to a PDF document.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API creates a signature object that can be implemented in a PDF using PDFGenerationAPI.

PdfMergeSignRequestor - PdfMergeSignRequestor()

Instantiates a new *PdfMergeSignRequestor* object.

Parameters

Name	Type	Description
None		

The following examples shows how to create a *PdfMergeSignRequestor* object.

```
var v = new sn_pdfgeneratorutils.PdfMergeSignRequestor;
```

PdfMergeSignRequestor - addSignatureMapping(Number pageNumber, Number leftMargin, Number topMargin, Number boxWidth, Number boxHeight, String sysId)

Assigns signature size and position requirements in the PDF.

Parameters

Name	Type	Description
pageNumber	Number	Number of the page on which to insert the signature.
leftMargin	Number	Value in points representing the left margin area of the page at which to insert the signature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
topMargin	Number	Value in points representing the top margin area of the page at which to insert the signature image.
boxWidth	Number	Value in points representing width of the box to contain the signature.
boxHeight	Number	Value in points representing height of the box to contain the signature image.
sysId	String	Sys_id of the signature image in the Attachments [sys_attachment] table.

Returns

Type	Description
None	

The following example shows how to add the signature mapping. For a complete example, see *processRequest()*.

```
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;

// For the purpose of this example, set signature sizes and page
 number for signature placement
var page = 2;
var leftMargin = 48;
var topMargin = 60;
var signatureWidth = 96;
var signatureHeight = 36;

requestor.addSignatureMapping(page, leftMargin, topMargin,
 signatureWidth, signatureHeight, "<signatureSysId>");
```

PdfMergeSignRequestor - createRequest(String targetSysId, String targetTable, String tableSysId, String targetFileName)

Creates a signature request with source and target inputs.

Parameters

Name	Type	Description
targetSysId	String	Sys_id of a PDF in the Attachments [sys_attachment] table. Use this value as the target PDF on which to add a signature.
targetTable	String	Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
tableSysId	String	Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.
targetFileName	String	Name of the target PDF without extension.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to create a signature request. For a complete example, see *processRequest()*.

```
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;

requestor.createRequest("<sys_id>", "tableName", "<tableSysId>",
 "pdfFileName");
```

PdfMergeSignRequestor - processRequest()

Processes requests and adds the signatures.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Object containing the size of each page if successful, error message otherwise. `{ "attachment_id": "String", "message": "String", "status": "String" }`
<Object>.attachment_id	If the request is successful, sys_id of the signed and attached PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String
<Object>.message	Possible values: • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. • No signature mapping specified. Cannot process this request – Provide signature mapping using the *addSignatureMapping()* method. • Request completed successfully. • Request failure. Exceptions while trying to add signatures to document. Please check again. • This request cannot be completed as the requested page does not exist. page No: <page number>

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.status	Status indicating whether the operation is successful. Possible values: • success - Operation was successful. • failure – Operation was not successful. The *message* provides details. Data type: String

The following example shows how to process the signature request.

```
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;

requestor.createRequest("<sys_id>", "tableName", "<tableSysId>",
 pdfFileName);

// For the purpose of this example, set signature sizes and page
 number for signature placement
var page = 6;
var leftMargin = 40;
var topMargin = 50;
var signatureWidth = 188;
var signatureHeight = 44;

requestor.addSignatureMapping(page, leftMargin, topMargin,
 signatureWidth, signatureHeight, "<signatureSysId>");

var result = requestor.processRequest();
gs.info(JSON.stringify(result));
```

PdfPage - Scoped, Global

Creates a PdfPage object representing a PDF page and its attributes; such as size, width, and color.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the `sn_pdfgeneratorutils` namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

PdfPage - PdfPage(String pageSize, String orientation)

Instantiates a new *PdfPage* object.

Parameters

Name	Type	Description
pageSize	String	PDF page size.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Valid values: • A4 – 595 x 842 points • EXECUTIVE – 522 x 756 points • LETTER – 612 x 792 points • LEDGER – 792 x 1224 points
orientation	String	Optional. PDF page orientation. Valid values: • LANDSCAPE • PORTRAIT Default: PORTRAIT

The following example shows how to create a *PdfPage* object.

```
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4",
 "LANDSCAPE");
```

PdfPage – getBottom()

Gets the Y-coordinate of the lower edge of a PDF page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Decimal value of the Y-coordinate at the lower edge of the PDF page.

The following example shows how to get the Y-coordinate of the lower edge of a PDF page.

```
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4",
 "LANDSCAPE");
 var bottom = pdfpage.getBottom();
```

PdfPage – getLeft()

Gets the X-coordinate of the left edge of a PDF page.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Number	Decimal value of the X-coordinate on the left edge of the page.

The following example shows how to get the X-coordinate of the left edge of a PDF page.

```
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4",
 "LANDSCAPE");
 var left = pdfpage.getLeft();
```

PdfPage – getPdfPageSize()

Gets the size of a PDF page

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to get the PDF page size.

```
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4",
 "LANDSCAPE");
var size = pdfpage.getPdfPageSize();
```

PdfPage – getRight()

Gets the X-coordinate of the right edge of a PDF page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Decimal value of the X-coordinate on the right edge of the page.

The following example shows how to get the X-coordinate of the right edge of a PDF page.

```
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4",
 "LANDSCAPE");
 var right = pdfpage.getRight();
```

PdfPage – getTop()

Gets the Y-coordinate of the upper edge of a PDF page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Decimal value of the Y-coordinate at the upper edge of the PDF page.

The following example shows how to get the Y-coordinate of the upper edge of a PDF page.

```
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4",
 "LANDSCAPE");
 var top  = pdfpage.getTop();
```

PdfPage – getWidth()

Gets the width of a PDF page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Number	Size of the page width in points.

The following example shows how to retrieve the width of a PDF page.

```
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4",
 "LANDSCAPE");
var width = PdfPage.getWidth();
```

PersonalAuthAPI - Scoped

The *PersonalAuthAPI* provides methods that enable you to manage access/refresh tokens for personal authentication credentials.

To access this API the Personal Authentication (com.snc.sn_ihub_personal_auth) plugin must be activated. This API runs in the `sn_cc` namespace.

Before accessing this API, Personal Authentication must be configured on your instance. For additional information, see Create a Connection & Credential alias.

PersonalAuthAPI - PersonalAuthAPI()

Instantiates a new PersonalAuthAPI object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

The following code example shows how to instantiate a PersonalAuthAPI object.

```
var personalAuthAPI = new sn_cc.PersonalAuthAPI();
```

PersonalAuthAPI - getInitiatorURL(String aliasId)

Returns the OAuth initiator URL for the personal authentication credential associated with a specified alias.

Parameters

Name	Type	Description
aliasId	String	Sys_id of the connection or credential alias whose OAuth initiator URL you want to retrieve. Located in the Connection & Credential Aliases [sys_alias] table.

Returns

Type	Description
String	OAuth initiator URL for the personal authentication credential associated with the specified alias. If the personal authentication credential doesn't exist for the specified alias, the method returns an empty string.

The following code example shows how to call this method.

```
var aliasId = "e41b9dd1532102104c4bddeeff7b1250";
var personalAuthAPI = new sn_cc.PersonalAuthAPI();
var result = personalAuthAPI.getInitiatorURL(aliasId);
gs.info(result);
```

Output:

```
/oauth_initiator.do?oauth_requestor_context=oauth_2_0_credentials&oauth_requestor=d84b5115532102104c4bddeeff7b12f2&oauth_provider_profile=d84b5115532102104c4bddeeff7b12ec&response_type=code&personal=true
```

PersonalAuthAPI - isTokenValid(String aliasId)

Checks whether a valid access/refresh token exists for the personal authorization credential associated with a specified alias.

Parameters

Name	Type	Description
aliasId	String	Sys_id of the connection or credential alias to check for the associated personal authorization credential. Located in the Connection & Credential Aliases [sys_alias] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether there's an associated personal authorization credential for the specified alias ID. Valid values: • true: A valid personal authorization credential exists. • false: A valid personal authorization credential doesn't exist.

The following code example shows how to call this method.

```
var aliasId = "e41b9dd1532102104c4bddeeff7b1250";
var personalAuthAPI = new sn_cc.PersonalAuthAPI();
var result = personalAuthAPI.isTokenValid(aliasId);
gs.info(result);
```

Output:

```
true
```

PersonalAuthAPI - revokeToken(String aliasId)

Revokes an existing access/refresh token for the personal authentication credential associated with a specified alias.

Parameters

Name	Type	Description
aliasId	String	Sys_id of the connection or credential alias whose access/refresh token for the personal authorization credential you want to revoke. Located in the Connection & Credential Aliases [sys_alias] table.

Returns

Type	Description
Object	Object that contains methods that you can call to obtain additional information about the status of the credential and method call. These methods are available until the next time this method is called. • `<object_name>.getResponseStatus()`: Returns the status of the `revokeToken()` method call, either `success` or `fail`. You can find additional information on any error in the error logs. • `<object_name>.getExpiryInSeconds();` Returns the number of seconds until the associated credential expires. If this value is anything other than zero, the revoke request failed. • `<object_name>.isAuthenticated()`: Returns a Boolean value that indicates whether the personal auth token exists. If the

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	revokeToken() method call was successful, this method should return `false`. • *<object_name>.getCredentialId()*: Returns the sys_id of the personal authorization credential associated with the token. Located in the OAuth 2.0 Credentials [oauth_2_0_credentials] table.

The following code example shows how to call this method.

```
var aliasId = "e41b9dd1532102104c4bddeeff7b1250";
var personalAuthAPI = new sn_cc.PersonalAuthAPI();
var personalAuthResponse = personalAuthAPI.revokeToken(aliasId);
gs.info(personalAuthResponse.getResponseStatus());
gs.info(personalAuthResponse.getExpiryInSeconds());
gs.info(personalAuthResponse.isAuthenticated());
gs.info(personalAuthResponse.getCredentialId());
```

Output:

```
SUCCESS
0
false
d84b5115532102104c4bddeeff7b12f2
```

PlaybookExperience - Scoped

The *PlaybookExperience* API provides methods for handling playbook executions.

This API requires the Playbook Experience Core plugin (com.glide.playbook_experience.config) and is provided within the `sn_playbook` namespace.

This API requires at least one playbook in the Process Definition [sys_pd_process_definition] table. To use this API, you must have the roles required to view and cancel a running process in Process Automation Designer. For more information, see Process Automation Designer.

PlaybookExperience - cancelPlaybook(String playbookContext, String cancellationReason, String playbookExperienceId, Boolean force)

Cancel an individual playbook.

Parameters

Name	Type	Description
playbookContext	GlideRecord	The [sys_pd_context] record that you want to cancel.
cancellationReason	String	The reason for canceling the playbook execution. This appears in the UI for runtime users as well.
playbookExperienceId	String	Optional. Sys_id of the playbook experience record in the Playbook Experience [sys_playbook_experience] table to use for the cancellation. Use this parameter if you've defined custom activity state mappings. See Playbook activity state mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: Sys_id of the Global Playbook Experience record.
force	Boolean	Optional. If set to true, cancels the underlying flows for activities that are In Progress. The cancellationReason parameter is not used when this parameter is set to true. You can only force cancel activities after the playbook is cancelled and the sys_pd_context is in a Pending Cancel state. **Note:** The flow engine attempts to cancel all underlying flows without creating issues when a playbook is canceled, but we cannot guarantee that no issues will occur.

Returns

Type	Description
<Object>.canceledPlaybookContext	The canceled playbook execution associated data, such as the reason why it was cancelled. Data type: Array `"canceledPlaybookContext": [{ "can_read": Boolean, "canceled_by": "String", "can_add_activity": Boolean, "snapshot_id": "string", "can_restart": Boolean, "can_cancel": Boolean, "cancellation_reason": "String", "errors": [Array], "parent_record": "String", "parent_table": "String", "playbook_id": "String", "playbook_table": "String", "scoped_name": "String", "variant_id": "String", "is_archived": Boolean, "state": {Object}, "sys_id": "String", "title": "String" }]`
<Object>.canceledPlaybookContext.can_add_activity	Flag that indicates whether a user can add an optional activity to the playbook. Valid values: • true: Current user can add an optional activity to the playbook. • false: Current user can't add an optional activity to the playbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Boolean
<Object>.canceledPlaybookContext.can_cancel	Flag that indicates whether a user can cancel a playbook. • true: The process definition for the deactivated playbook is active. • false: The process definition for the deactivated playbook is inactive. Data type: Boolean
<Object>.canceledPlaybookContext.can_read	Flag that indicates whether the current user can read the playbook execution record. The current user must have read access to the parent record to be able to read the playbook execution record. Valid values: • true: Current user has read access to the playbook execution record. • false: Current user doesn't have read access to the playbook execution record. Data type: Boolean
<Object>.canceledPlaybookContext.can_restart	Flag that indicates whether a user can restart a playbook, stage, or activity. • true: Current user can restart the playbook, stage, or activity. • false: Current user can’t restart the playbook, stage, or activity. Data type: Boolean
<Object>.canceledPlaybookContext.canceled_by	The **User ID** of the user who cancelled the playbook execution. Data type: String
<Object>.canceledPlaybookContext.cancelation_reason	The cancelation reason input by the user who cancelled the playbook execution. Data type: String
<Object>.canceledPlaybookContext.errors	List of cancelation errors. Each error is an object in the array. Data type: Array `"errors": [ { "message": "String", "type": "String" } ]`
<Object>.canceledPlaybookContext.message	The cancelation message. Data type: String
<Object>.canceledPlaybookContext.errors.type	The type of error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String
<Object>.canceledPlaybookContext.is_archived	Flag that indicates whether playbook context records are archived. Set to true. This value can't be modified. Possible values: • true: Playbook context records are archived. • false: Playbook context records aren't archived. Data type: Boolean
<Object>.canceledPlaybookContext.parent	Sys_id of the parent record that playbook executions were cancelled for. Data type: String
<Object>.canceledPlaybookContext.parent_table	The name of the table that the parent record is from. Data type: String
<Object>.canceledPlaybookContext.playbook	Sys_id of the playbook from the Process Definitions [sys_pd_process_definition] table. Data type: String
<Object>.canceledPlaybookContext.playbook_table	The name of the table that the playbook is from, generally the Process Definitions [sys_pd_process_definition] table. Data type: String
<Object>.canceledPlaybookContext.scoped_name	The scoped name of the playbook from the Process Definitions [sys_pd_process_definition] table in the format `scope.name`. Data type: String
<Object>.canceledPlaybookContext.snapshot	Sys_id of the snapshot of the playbook execution from the [sys_pd_snapshot] table. Data type: String
<Object>.canceledPlaybookContext.state	The state of the playbook execution from the Process Executions [sys_pd_context] table. Data type: Object `"state": { "displayValue": "String", "value": "String" }`
<Object>.canceledPlaybookContext.state.displayValue	The display value of the playbook execution state. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.canceledPlaybookContext.state	The value of the playbook execution state. Data type: String
<Object>.canceledPlaybookContext.sys_id	Sys_id of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String
<Object>.canceledPlaybookContext.title	The title of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String
<Object>.canceledPlaybookContext.variant_id	Sys_id of the playbook variant execution from the Process Executions [sys_pd_context] table.

This example shows how to cancel a single execution of a specific playbook that is running too long.

```
var process = new GlideRecord('sys_pd_context');

process.get("SYS_ID");

var cancelPlaybookReturn =
 sn_playbook.PlaybookExperience.cancelPlaybook(process, "This
 playbook ran for too long");

gs.info(JSON.stringify(cancelPlaybookReturn));
```

Output:

```
{
 "scoped_name": "global.test_user_form",
 "canceled_by": "maint",

```

PlaybookExperience - cancelPlaybooksByParentRecord(GlideRecord parentRecord, String cancellationReason, String scopedName, String playbookExperienceId)

Cancels playbook executions for a given parent record.

Parameters

Name	Type	Description
parentRecord	GlideRecord	The parent record to cancel playbook executions for. The parent record can be any record that has playbook executions, such as an interaction record or an onboarding case record.
cancellationReason	String	The reason for cancelling the playbook executions.
scopedName	String	Optional. The scoped name of the playbook to cancel. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format `scope.name`. If provided, only executions of this playbook are cancelled for the given parent record. If not provided, all executions of all playbooks are cancelled for the given parent record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
playbookExperienceId	String	Optional. Sys_id of the playbook experience record in the Playbook Experience [sys_playbook_experience] table to use for the cancellation. Use this parameter if you've defined custom activity state mappings. See Playbook activity state mapping. Default: Sys_id of the Global Playbook Experience record.

Returns

Type	Description
Object	Object containing the cancelled playbook executions and any skipped playbook executions that were unable to be cancelled. `{ "canceledPlaybookContext": [Array], "skippedPlaybookContext": [Array] }`
<Object>.canceledPlaybookContext	List of the cancelled playbook executions. Each playbook execution is an object in the array. Data type: Array `"canceledPlaybookContext": [{ "can_read": Boolean, "canceled_by": "String", "cancellation_reason": "String", "errors": [Array], "parent_record": "String", "parent_table": "String", "playbook_id": "String", "playbook_table": "String", "scoped_name": "String", "state": {Object}, "sys_id": "String", "title": "String" }]`
<Object>.canceledPlaybookContext.can_read	Flag that indicates whether the current user can read the playbook execution record. The current user must have read access to the parent record to be able to read the playbook execution record. Valid values: • true: Current user has read access to the playbook execution record. • false: Current user doesn't have read access to the playbook execution record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Boolean
<Object>.canceledPlaybookUserID	The User ID of the user who cancelled the playbook execution. Data type: String
<Object>.cancelationReason	The cancellation reason input by the user who cancelled the playbook execution. Data type: String
<Object>.cancelationErrors	List of cancellation errors. Each error is an object in the array. Data type: Array `"errors": [ { "message": "String", "type": "String" } ]`
<Object>.cancelationErrors.message	The error message. Data type: String
<Object>.cancelationErrors.type	The type of error. Data type: String
<Object>.parent_record	Sys_id of the parent record that playbook executions were cancelled for. Data type: String
<Object>.parent_table	The name of the table that the parent record is from. Data type: String
<Object>.playbook_id	Sys_id of the playbook in the Process Definitions [sys_pd_process_definition] table. Data type: String
<Object>.playbook_table	The name of the table the playbook is from, generally the Process Definitions [sys_pd_process_definition] table. Data type: String
<Object>.scoped_name	The scoped name of the playbook from the Process Definitions [sys_pd_process_definition] table in the format `scope.name`. Data type: String

Returns (continued)

Type	Description
<Object>.canceledPlaybookContext.state	The state of the playbook execution from the Process Executions [sys_pd_context] table. Data type: Object `"state": { "displayValue": "String", "value": "String" }`
<Object>.canceledPlaybookContext.state.displayValue	The display value of the playbook execution state. Data type: String
<Object>.canceledPlaybookContext.state.value	The value of the playbook execution state. Data type: String
<Object>.canceledPlaybookContext.sys_id	Sys_id of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String
<Object>.canceledPlaybookContext.title	The title of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String
<Object>.skippedPlaybookContext	List of the skipped playbook executions. Each playbook execution is an object in the array. For descriptions of the object properties, see the *`canceledPlaybookContext`* array. Data type: Array `"skippedPlaybookContext": [{ "can_read": Boolean, "canceled_by": "String", "cancellation_reason": "String", "errors": [Array], "parent_record": "String", "parent_table": "String", "playbook_id": "String", "playbook_table": "String", "scoped_name": "String", "state": {Object}, "sys_id": "String", "title": "String" }]`

This example shows how to cancel all executions of a specific playbook (in this case, the Playbook Experience Demo) for a given interaction record. To use this method in a UI action or business rule, pass the `current` object as the parentRecord instead.

PlaybookExperience - getPlaybooksForParentRecord(GlideRecord parentRecord)

Gets a list of playbook executions for a given parent record.

Parameters

Name	Type	Description
parentRecord	GlideRecord	The parent record to get playbook executions for. The parent record can be any record that can have playbook executions, such as an interaction record or an onboarding case record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Array	List of playbook executions for the parent record. Each playbook execution is an object in the array. `[ { "can_read": Boolean, "canceled_by": "String", "cancellation_reason": "String", "errors": [Array], "parent_record": "String", "parent_table": "String", "playbook_id": "String", "playbook_table": "String", "scoped_name": "String", "state": {Object}, "sys_id": "String", "title": "String" } ]`
<Array>.can_read	Flag that indicates whether the current user can read the playbook execution record. The current user must have read access to the parent record to be able to read the playbook execution record. Valid values: • true: Current user has read access to the playbook execution record. • false: Current user doesn't have read access to the playbook execution record. Data type: Boolean
<Array>.canceled_by	The **User ID** of the user who cancelled the playbook execution. Empty if the playbook is not cancelled. Data type: String
<Array>.cancellation_reason	The cancellation reason input by the user who cancelled the playbook execution. Empty if the playbook is not cancelled. Data type: String
<Array>.errors	List of errors. Each error is an object in the array. Data type: Array `"errors": [ { "message": "String", "type": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Array>.errors.message	The error message. Data type: String
<Array>.errors.type	The type of error. Data type: String
<Array>.parent_record	Sys_id of the parent record. Data type: String
<Array>.parent_table	The name of the table that the parent record is from. Data type: String
<Array>.playbook_id	Sys_id of the playbook from the Process Definitions [sys_pd_process_definition] table. Data type: String
<Array>.playbook_table	The name of the table that the playbook is from, generally the Process Definitions [sys_pd_process_definition] table. Data type: String
<Array>.scoped_name	The scoped name of the playbook from the Process Definitions [sys_pd_process_definition] table in the format `scope.name`. Data type: String
<Array>.state	The state of the playbook execution from the Process Executions [sys_pd_context] table. Data type: Object `"state": { "displayValue": "String", "value": "String" }`
<Array>.state.displayValue	The display value of the playbook execution state. Data type: String
<Array>.state.value	The value of the playbook execution state. Data type: String
<Array>.sys_id	Sys_id of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Array>.title	The label of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String

This example shows how to get playbook executions for a given interaction record. To use this method in a UI action or business rule, pass the `current` object as the parentRecord instead.

```
var parentRecord = new GlideRecordUtil().getGR("interaction",
 "148776e5818d7410f87701eb89fdc824");
var playbook =
 sn_playbook.PlaybookExperience.getPlaybooksForParentRecord(pare
ntRecord);
gs.info(JSON.stringify(playbook, null, 2));
```

Output:

```
[
  {
    "can_read": true,
    "sys_id": "bd87bae50b8d7410807a8ffed6d0909e",
    "scoped_name": "sn_pad_demo.playbook_experience_demo",
    "canceled_by": "",
    "playbook_table": "sys_pd_process_definition",
    "state": {
      "displayValue": "In Progress",
      "value": "IN_PROGRESS"
    },
    "title": "Playbook Experience Demo",
    "parent_record": "148776e5818d7410f87701eb89fdc824",
    "playbook_id": "0d35ee1807301010cc08d9630ad3002a",
    "cancellation_reason": "",
    "parent_table": "interaction",
    "errors": []
  }
]
```

PlaybookExperience - parentRecordContainsPlaybook(GlideRecord parentRecord, String scopedName)

Checks whether a parent record has playbook executions.

Parameters

Name	Type	Description
parentRecord	GlideRecord	The parent record to check for playbook executions. The parent record can be any record that can have playbook executions, such as an interaction record or an onboarding case record.
scopedName	String	Optional. The scoped name of the playbook to check for. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format `scope.name`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		If provided, only executions of this playbook are checked for. If not provided, executions of all playbooks are checked for.

Returns

Type	Description
Boolean	Flag that indicates whether the parent record has playbook executions. Valid values: • true: Parent record has playbook executions. • false: Parent record doesn't have playbook executions.

This example shows how to check if a given interaction record has executions of a specific playbook (in this case, the Playbook Experience Demo). To use this method in a UI action or business rule, pass the `current` object as the parentRecord instead.

```
var parentRecord = new GlideRecordUtil().getGR("interaction",
 "148776e5818d7410f87701eb89fdc824");

// demo playbook from Process Automation Experience Demo store
 app
var scopedName = "sn_pad_demo.playbook_experience_demo";

var hasPlaybooks =
 sn_playbook.PlaybookExperience.parentRecordContainsPlaybook(par
entRecord, scopedName);
gs.info(hasPlaybooks);
```

Output:

```
true
```

PlaybookExperience - restartPlaybook(GlideRecord playbookContextRecord, String laneContextId, String activityContextId, String playbookExperienceId)

Restarts an execution from the beginning (the entire playbook) or from a specific stage or activity of a playbook.

Note: Only playbooks that are In Progress, Queued, or Pending Cancel state can be restarted.

Parameters

Name	Type	Description
playbookContextRecord	GlideRecord	The playbook context record for the playbook run or execution that you want to restart. Table: Process Execution [sys_pd_context]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
laneContextId	String	Optional. The sys_id of the stage context record for the stage run or execution that you want to restart from. *laneContextId* and *activityContextId* are mutually exclusive; only one of these values can be specified at a time, while the other should be either an empty string or null. **Note:** Only complete stages can be restarted. Table: Lane Executions [sys_pd_lane_context]
activityContextId	String	Optional. The sys_id of the activity context record for the activity run or execution that you want to restart from. *laneContextId* and *activityContextId* are mutually exclusive; only one of these values can be specified at a time, while the other should be either an empty string or null. **Note:** Only complete activities can be restarted. Table: Activity Executions [sys_pd_activity_context]
playbookExperienceId	String	Optional. The sys_id of the playbook experience that you want to use for the restarted run. Use this parameter if you have defined custom activity state mappings. See . Default: Global Playbook Experience Table: Playbook Experience [sys_playbook_experience]

Returns

Property	Description

Object	Object containing the restarted playbook execution details.
	
	`{`
	`"can_add_activity": Boolean,`
	`"can_cancel": Boolean,`
	`"can_read": Boolean`
	`"can_restart": Boolean,`
	`"canceled_by": "String",`
	`"cancellation_reason": "String",`
	`"errors": [Array]`
	`"is_archived": Boolean`
	`"parent_record": "String",`
	`"parent_table": "String",`

Returns (continued)

Property	Description

	<pre>"title": "String",
	}</pre>

can_add_activity	Flag that indicates whether a user can add an optional activity to the playbook. Valid values: • true: Current user can add an optional activity to the playbook. • false: Current user can't add an optional activity to the playbook. Data type: Boolean
can_cancel	Flag that indicates whether a user can cancel a playbook. • true: The process definition for the deactivated playbook is active. • false: The process definition for the deactivated playbook is inactive. Data type: Boolean
can_read	Flag that indicates whether the current user can read the playbook execution record. The current user must have read access to the parent record to be able to read the playbook execution record. • true: Current user has read access to the playbook execution record. • false: Current user doesn't have read access to the playbook execution record. Data type: Boolean
can_restart	Flag that indicates whether a user can restart a playbook, stage, or activity. • true: Current user can restart the playbook, stage, or activity. • false: Current user can't restart the playbook, stage, or activity. Data type: Boolean
canceled_by	**User ID** of the user who canceled the playbook execution. Data type: String
cancellation_reason	Cancellation reason entered by the user who canceled the playbook execution. Data type: String

errors	List of restart errors. Each error is an object in the array.
	
	Data type: Array
	<pre>"errors": [
	{
	"message": "String",</pre>

Returns (continued)

Property	Description
	<pre> "type": "String" }]</pre>
is_archived	Flag that indicates whether playbook context records are archived. Possible values: • true: Playbook context records are archived. • false: Playbook context records aren't archived. Data type: Boolean
parent_record	Sys_id of the parent record that playbook executions were restarted for. Data type: String
parent_table	Name of the table that the parent record is from. Data type: String
playbook_id	Sys_id of the playbook. Data type: String Table: Process Definitions [sys_pd_process_definition]
playbook_table	Name of the table that the playbook is from, generally the Process Definitions [sys_pd_process_definition] table. Data type: String
scoped_name	Optional. The scoped name of the playbook to restart. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format `scope.name`. If provided, only executions of this playbook are restarted for the given parent record. If not provided, all executions of all playbooks are restarted for the given parent record. Data type: String

state	Indicates whether your request to activate was successful.
	
	Data type: Object
	
	Possible values:
	• SUCCESS: The playbook was successfully activated.
	• FAILURE: The ID for the playbook wasn't found.
	
	<pre>"state": [
	  {
	  "displayValue": "String",
	  "value": "String"</pre>

```

PlaybookExperience - triggerPlaybook(String scopedName, GlideRecord parentRecord)

Initiates a playbook for a parent record.

Parameters

Name	Type	Description
scopedName	String	The scoped name of the playbook to initiate. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format `scope.name`.
parentRecord	GlideRecord	The parent record to initiate a playbook for. The parent record can be any record that can have playbook executions, such as an interaction record or an onboarding case record.

Returns

Type	Description
String	Sys_id of the playbook execution from the Process Executions [sys_pd_context] table that was created for the parent record. Null if a playbook execution wasn't successfully created.

This example shows how to initiate a playbook for a given interaction record. To use this method in a UI action or business rule, pass the `current` object as the parentRecord instead.

```
var parentRecord = new GlideRecordUtil().getGR("interaction",
 "148776e5818d7410f87701eb89fdc824");

// demo playbook from Process Automation Experience Demo store
 app
var scopedName = "sn_pad_demo.playbook_experience_demo";

var playbookExecution =
 sn_playbook.PlaybookExperience.triggerPlaybook(scopedName,
 parentRecord);
gs.info(playbookExecution);
```

Output:

```
f059958267cdb410952864f0fed358cc
```

PolarisUI - Scoped

The *PolarisUI* API provides methods for enabling Next Experience on direct UI pages.

A UI page [sys_ui_page] is direct if the **Direct** field is **Selected**. A direct UI page doesn't include the common HTML page template and must include all CSS and JavaScript that you want to use in the page.

All non-direct UI pages use Next Experience by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about Next Experience, see the Next Experience UI.

The *PolarisUI* API is provided within the sn_ui namespace.

PolarisUI - canUsePolarisCSS()

Checks if the current page can use the Next Experience UI.

This method returns true if all of the following conditions are met.

- *sn_ui.PolarisUI.isEnabled()* is true.
- The request URL parameter *sysparm_use_polaris* is not set to false.
- The referrer HTTP request header does not contain sysparm_use_polaris=false.
- The page or its parent plugin are not denied use of Next Experience by a record in the Page Theme Support [sys_page_theme] table.

Use this method to conditionally change behavior or jelly output if Next Experience is enabled.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the current page can use the Next Experience UI. Valid values: • true: The current page can use the Next Experience UI. • false: The current page can't use the Next Experience UI.

This UI Action redirects to a different page if Next Experience is running on the current form.

```
var id = current.getUniqueValue();
if (sn_ui.PolarisUI.canUsePolarisCSS())
 action.setRedirectUrl("/now/custom/application/record/" + id);
return "/record.do?sys_id=" + id;
```

This jelly script sets a different style sheet for pages using Next Experience.

```
<g:evaluate var="jvar_css_path">
 // Core UI content css record
 var id = "5e8fde63d713310074304187ed61030d";

 if (sn_ui.PolarisUI.canUsePolarisCSS())
  id = "84f03cc87120a00cfab6dd207cb0b72";

 "/" + id + ".cssdbx";
</g:evaluate>
<link href="${jvar_css_path}" rel="stylesheet"
 type="text/css" />
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PolarisUI - getBodyClassNames()

Returns a list of CSS class names used by the Next Experience UI.

Use this method in the HTML `<body>` tag of a UI page to set the CSS classes required for Next Experience to render correctly.

```
<body class="$[sn_ui.PolarisUI.getBodyClassNames()]">
```

The returned class names change depending on system properties and if session debug output exists.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	List of CSS class names used by the Next Experience UI.

This jelly script adds Next Experience to a custom UI page.

```
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="true" xmlns:j="jelly:core" xmlns:g="glide"
 xmlns:g2="null">
    <g2:doctype name="html" />
    <g:inline template="dir_checker.xml"/>
    <html class="${jvar_text_direction}"
 lang="$[gs.getSession().getLanguage()]">
        <head>
            <g:inline template="set_theme_vars.xml" /> <!-- sets
 jvar_theme and jvar_css_cache_key -->
            <g:requires name="styles/css_includes_my_app.css"
 includes="true" params="$[jvar_css_cache_key]" />
            <g:if_polaris>
 <g:then><g:inline template="polarisberg_output.xml"/></g:when>
 <g:else><g:inline template="heisenberg_output.xml"
 type="css"/></g:else>
             </g:if_polaris>
        </head>
        <body class="$[sn_ui.PolarisUI.getBodyClassNames()]">
            Your UI page content here
        </body>
    </html>
</j:jelly>
```

PolarisUI - isEnabled()

Checks if the Next Experience UI is enabled for the current user.

This method checks if the *glide.ui.polaris.experience* system property and *glide.ui.polaris.use* user preference are both set to **true**.

- *glide.ui.polaris.experience* enables Next Experience on the instance.
- *glide.ui.polaris.use* disables Next Experience for specified users when set to **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about Next Experience system properties and user preferences, see Next Experience system properties.

Note: This method returns true even if Next Experience is disabled for the current page. This method is useful for conditionally enabling entire experiences or redirecting to different pages when Next Experience is enabled globally.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the Next Experience UI is enabled for the current user. Valid values: • true: The Next Experience UI is enabled for the current user. • false: The Next Experience UI isn't enabled for the current user.

This UI page displays a conditional message to the user if Next Experience is enabled for the current user.

```
<j:if test="${sn_ui.PolarisUI.isEnabled()}">
 <a href="...">Click here to learn more about the new UI
 changes</a>
</j:if>
```

This business rule shows an info message on record display that a user can click to view the record in Core UI instead of Next Experience. The business rule **Condition** field is set to `!current.isNewRecord() && sn_ui.PolarisUI.isEnabled() && sn_ui.PolarisUI.canUsePolarisCSS()`.

```
// business rule script field

(function executeRule(current, previous /*null when async*/) {

 var sysId = current.getUniqueValue();
 gs.addInfoMessage("<a href='/incident.do?sys_id="+ sysId
 +"&sysparm_use_polaris=false'>Click here to load this page in
 Core UI</a>");

})(current, previous);
```

PredictabilityEstimate - Global

The *`PredictabilityEstimate`* API is a scriptable object used in Predictive Intelligence stores. This object provides estimation of how predictable fields of a dataset can be, and which features can be useful for predicting those fields.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The predictability estimate setup-to-training flow is as follows:

1. Create a dataset using the *DatasetDefinition* API.
2. Use the constructor to create a predictability estimate object.
3. Add the predictability estimate object to the predictability estimate store using the *PredictabilityEstimateStore - add()* method.
4. Train the predictability estimate using the *submitTrainingJob()* method. This creates a version of the object that you can manage using the *PredictabilityEstimateVersion* API.
5. Get estimated predictive values using the *PredictabilityEstimateVersion - getResults()* method.

Note: This API runs with full privileges before the Vancouver Patch 7 Hotfix 2b and Washington DC Patch 7 releases. With later releases, grant access using ACLs. For more information see Query ACLs.

For usage guidelines, refer to Using ML APIs.

PredictabilityEstimate - PredictabilityEstimate(Object config)

Creates a predictability estimate.

To get new predictability estimates on the same dataset, use this constructor to create a new PredictabilityEstimate object with a unique name.

Parameters

Name	Type	Description
config	Object	JavaScript object containing configuration properties of the predictability estimate. `{ "dataset": {Object}, "domainName": "String", "inputFieldNames": [Array], "label": "String", "minRowCount": "String", "predictedFieldName": "String", "trainingFrequency": "String" }`
config.dataset	Object	*DatasetDefinition* name.
config.domainName	String	Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: Current domain, for example, `"global"`.
config.inputFieldNames	Array	List of candidate input fields as strings to be considered for estimation.
config.label	String	Identifies the prediction task.
config.minRowCount	String	Optional. Minimum number of records required in the dataset for training. Default: 10000
config.predictedFieldName	String	Identifies a field to be trained for predictability.
config.trainingFrequency	String	Optional. The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once

The following example shows how to create an estimation job and add it to the PredictabilityEstimate store.

```
var myIncidentData = new sn_ml.DatasetDefinition({
  'tableName' : 'incident',
  'encodedQuery' : 'activeANYTHING'
});

var myEstimate = new sn_ml.PredictabilityEstimate({
  'label': "predictability estimate",
  'dataset' : myIncidentData,
  'inputFieldNames':['short_description'],
  'predictedFieldName': 'category'
});

var myEstimateName =
 sn_ml.PredictabilityEstimateStore.add(myEstimate);
```

PredictabilityEstimate - cancelTrainingJob()

Cancels a job for a predictability estimate object that has been submitted for training.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to cancel an existing training job.

```
var myEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_sn_global_global_pred
ictability_estimate');

myEstimate.cancelTrainingJob();
```

PredictabilityEstimate - getActiveVersion()

Gets the active *PredictabilityEstimateVersion* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Active *PredictabilityEstimateVersion* object.

The following example shows how to get an active *PredictabilityEstimate* version from the store and return its training status.

```
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_p
redictability_estimate');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "predictability_estimate_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

PredictabilityEstimate - getAllVersions()

Gets all versions of a predictability estimate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Existing versions of a solution object. See also *PredictabilityEstimateVersion* API.

The following example shows how to get all *PredictabilityEstimate* version objects and call the *getVersionNumber()* and *getStatus()* estimate version methods on them.

```
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_p
redictability_estimate');

var mlEstimateVersions = mlEstimate.getAllVersions();

for (i = 0; i < mlEstimateVersions.length; i++) {
gs.print("Version " + mlEstimateVersions[i].getVersionNumber() +
 " Status: " + mlEstimateVersions[i].getStatus() +"\n");
};
```

Output:

```
Version 3 Status:
 {"state":"predictability_estimate_complete","percentComplete":"
100","hasJobEnded":"true"}

Version 2 Status:
 {"state":"predictability_estimate_complete","percentComplete":"
100","hasJobEnded":"true"}

Version 1 Status:
 {"state":"predictability_estimate_cancelled","percentComplete":
"0","hasJobEnded":"true"}
```

PredictabilityEstimate - getLatestVersion()

Gets the latest version of a predictability estimate.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*PredictabilityEstimateVersion* object corresponding to the latest version of a *PredictabilityEstimate()*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows how to get the latest version of a predictability estimate and return its training status.

```
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_p
redictability_estimate');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getLatestVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "predictability_estimate_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

PredictabilityEstimate - getName()

Gets the name of the object to use for interaction with the store.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the estimate object.

The following example shows how to update *`PredictabilityEstimate`* dataset information and print the name of the object.

```
// Update estimate
var myIncidentData = new sn_ml.DatasetDefinition({
   'tableName' : 'incident',
   'fieldNames' : ['category', 'short_description', 'priority'],
   'encodedQuery' : 'activeANYTHING'
});

var myEstimate = new sn_ml.PredictabilityEstimate({
   'label': "my estimate",
   'dataset' : myIncidentData,
   'inputFieldNames':['short_description'],
   'predictedFieldName': 'category'
});

// update estimate
sn_ml.PredictabilityEstimateStore.update('ml_x_snc_global_global
_my_definition_4', myEstimate);

// print estimate name
gs.print('Estimate Name: '+myEstimate.getName());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
Estimate Name: ml_x_snc_global_global_my_definition_4
```

PredictabilityEstimate - getProperties()

Gets predictability estimate object properties.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and *PredictabilityEstimate()* object details in the *PredictabilityEstimateStore*. `{ "datasetProperties": {Object}, "domainName": "String", "inputFieldNames": [Array], "label": "String", "name": "String", "predictedFieldName": "String", "scope": "String", "trainingFrequency": "String" }`
<Object>.datasetProperties	Lists the properties of the *DatasetDefinition()* object associated with the estimate. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }`
<Object>.datasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.datasetProperties.fieldNames.fieldDetails	List of JavaScript objects that specify field properties. `[ { "name": "String", "type": "String" } ]` Data type: Array.
<Object>.datasetProperties.fieldNames.fieldDetails.<object>.name	Name of the field defining the type of information to restrict this dataset to. Data type: String.
<Object>.datasetProperties.fieldDetails.<object>.type	Machine-learning field type. Data type: String.
<Object>.datasetProperties.fieldDetails.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.inputFieldNames	List of candidate input fields as strings to be considered for estimation. Data type: String.
<Object>.label	Identifies the prediction task. `{ "label": "my first prediction" }` Data type: String.
<Object>.name	System-assigned name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.

The following example gets properties of a predictability estimate object in the store.

```
var mySolution =
 sn_ml.PredictabilityEstimateStore.get('ml_sn_global_global_pred
ictability_estimate');

gs.print(JSON.stringify(JSON.parse(mySolution.getProperties()),
 null, 2));
```

Output:

```
*** Script: {
  "datasetProperties": {
    "tableName": "incident",
    "fieldNames": [
      "category",
      "short_description",
      "priority",
      "assignment_group.name"
    ],
    "fieldDetails": [
      {
        "name": "category",
        "type": "nominal"
      },
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      {
        "name": "short_description",
        "type": "text"
      }
    ]
  },
  "domainName": "global",
  "inputFieldNames": [
    "short_description"
  ],
  "label": "my estimate definition",
  "name": "ml_x_snc_global_global_my_definition_26",
  "predictedFieldName": "category",
  "processingLanguage": "en",
  "scope": "global",
  "stopwords": [
    "Default English Stopwords"
  ],
  "trainingFrequency": "run_once"
}
```

PredictabilityEstimate - getVersion(String version)

Gets a predictability estimate by provided version number.

Parameters

Name	Type	Description
version	String	Existing version number of a predictability estimate.

Returns

Type	Description
Object	Specified version of the *PredictabilityEstimate()* object on which you can call *PredictabilityEstimateVersion* API methods.

The following example shows how to get the training status of a predictability estimate by version number.

```
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_p
redictability_estimate');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getVersion('1').ge
tStatus()), null, 2));
```

Output:

```
{
  "state": "predictability_estimate_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PredictabilityEstimate - setActiveVersion(String version)

Activates a specified version of a predictability estimate in the store.

Parameters

Name	Type	Description
version	String	Name of the *PredictabilityEstimate()* object version to activate. Activating this version deactivates any other version.

Returns

Type	Description
None	

The following example shows how to activate a predictability estimate version in the store.

```
sn_ml.PredictabilityEstimate.setActiveVersion("ml_x_snc_global_g
lobal_my_estimate_definition");
```

PredictabilityEstimate - submitTrainingJob()

Submits a training job.

Note: Before running this method, you must first add a predictability estimate to the store using the *PredictabilityEstimateStore - add()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*PredictabilityEstimateVersion* object corresponding to the *PredictabilityEstimate* being trained.

The following example shows how to create a dataset, apply it to a predictability estimate, add it to a store, and submit the training job.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// Create an estimate
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var myEstimate = new sn_ml.PredictabilityEstimate({

  'label': "my estimate definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the estimate to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.PredictabilityEstimateStore.add(myEstimate);

// Train the estimate - this is a long running job
var myEstimateVersion = myEstimate.submitTrainingJob();
```

PredictabilityEstimateStore - Global

Enables storing and retrieving predictability estimates.

The *PredictabilityEstimateStore* API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

PredictabilityEstimateStore - add(Object mlEstimate)

Adds a new predictability estimate object to the store and returns a unique name.

Note: Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

Parameters

Name	Type	Description
mlEstimate	PredictabilityEstima	*PredictabilityEstimate()* object to add to the store.

Returns

Type	Description
String	System-generated predictability estimate name.

The following example shows how to add a predictability estimate to the store. Use *PredictabilityEstimate - submitTrainingJob()* to run the training job after adding it to the store.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Create an estimate
var myEstimate = new sn_ml.PredictabilityEstimate({

  'label': "my estimate definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the estimate to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.PredictabilityEstimateStore.add(myEstimate);
```

PredictabilityEstimateStore - deleteObject(String name)

Removes a specified predictability estimate object from the store.

Parameters

Name	Type	Description
name	String	Name of the *PredictabilityEstimate()* object to be deleted.

Returns

Type	Description
None	

The following example shows how to delete a predictability estimate from the store.

```
sn_ml.PredictabilityEstimateStore.deleteObject("ml_sn_global_glo
bal_estimate");
```

PredictabilityEstimateStore - get(String name)

Gets a predictability estimate object from a store.

Parameters

Name	Type	Description
name	String	Name of a predictability estimate in a store.

Returns

Type	Description
Object	*PredictabilityEstimate* object. Returns an error if the object does not exist.

The following example shows how to get a predictability estimate object from the store using the *get()* method and view its training status using the PredictabilityEstimate - getActiveVersion() and PredictabilityEstimateVersion - getStatus() methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Get status
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_incident_categorizati
on');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion()
.getStatus(), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

PredictabilityEstimateStore - getAllNames(Object options)

Gets the names of all predictability estimate definition records in the store.

Parameters

Name	Type	Description
options	Object	Options for restricting results within the specified properties. `{ "label": "String", "domainName": "String", "scope": "String" };`
options.label	String	Optional. Label of your solution object.
options.domainName	String	Optional. Name of the domain for your solution object. Refer to Domain separation and Predictive Intelligence.
options.scope	String	Optional. Name of an application scope for your solution object.

Returns

Type	Description
Array	List of strings representing predictability estimate object names in the store.

In the following example, the *getAllNames()* method returns a list of all names in the store.

```
gs.print(JSON.stringify(JSON.parse(sn_ml.PredictabilityEstimateS
tore.getAllNames()), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_predictability_estimate_1",
  "ml_x_snc_global_global_predictability_estimate",
  "ml_x_snc_global_global_predictability_estimate_2",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "ml_x_snc_global_global_my_estimate_definition"
]
```

In the following example, the *getAllNames()* method returns only names associated with values set in the *options* parameter.

```
var options = {
  'label' : 'my estimate definition',
  'domainName' : 'global',
  'scope' : 'global'
};
var solNames =
 sn_ml.PredictabilityEstimateStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_my_estimate_definition"
]
```

PredictabilityEstimateStore - update(String name, Object mlEstimate)

Updates a predictability estimate object in a store.

Parameters

Name	Type	Description
name	String	Name of the predictability estimate to update.
mlEstimate	*PredictabilitPredictabilityEstimate()* object properties to update.	

Returns

Type	Description
None	

The following example shows how to update a predictability estimate object in the store.

```
var estimateUpdate = new sn_ml.PredictabilityEstimate({
  'label': 'my estimate definition',
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames': ['short_description']
});

sn_ml.PredictabilityEstimateStore.update('ml_sn_global_global_in
cident_service', estimateUpdate);
```

PredictabilityEstimateVersion - Global

The *PredictabilityEstimateVersion* API is a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this API when working with predictability estimate versions based on PredictabilityEstimate API objects in the PredictabilityEstimate store.

The system activates the most recent version of the predictability estimate when it completes training, and only allows one version to be active at a time. However, you can activate any previously trained version you want to use to make predictions.

Methods in this API are accessible using the following *PredictabiltyEstimate* methods:

- *getActiveVersion()*
- *getAllVersions()*
- *getLatestVersion()*
- *getVersion()*

PredictabilityEstimateVersion - getProperties()

Gets predictability estimate object properties and version number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and PredictabilityEstimate version details. Results vary by object property setup. `{ "datasetProperties": {Object}, "domainName": "String", "inputFieldNames": [Array], "label": "String", "name": "String", "predictedFieldName": "String", "scope": "String", "trainingFrequency": "String", "versionNumber": "Number" }`
<Object>.datasetProperties	Lists the properties of the *DatasetDefinition()* object associated with the predictability estimate. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }` Data type: Object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.datasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.datasetProperties.fieldDetails	List of UnifiedFieldDetail objects that specify field properties. `[ { "name": "String", "type": "String" } ]` Data type: Array.
<Object>.datasetProperties.fieldDetails.name	Name of the field. Use the <object>.name information to restrict this dataset to. Data type: String.
<Object>.datasetProperties.fieldDetails.type	Machine-readable field type. Data type: String.
<Object>.datasetProperties.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.inputFieldNames	List of candidate input fields as strings to be considered for estimation. Data type: String.
<Object>.isActive	Flag that indicates whether this version is active. Valid values: • true: Version is active. • false: Version is not active. Data type: String
<Object>.label	Identifies the prediction task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	```{ "label": "my first prediction" }``` Data type: String.
<Object>.name	System-assigned name. Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.
<Object>.versionNumber	Version number of the *`PredictabilityEstimate`* object. Data type: String.

The following example gets properties of the active object version in the store.

```
// Get properties
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_incident_categorizati
on');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion()
.getProperties()), null, 2));
```

Output:

```
"datasetProperties": {
    "encodedQuery": "activeANYTHING^EQ",
    "fieldNames": [
      "short_description",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      "category"
    ],
    "tableName": "incident"
  },
  "domainName": "global",
  "inputFieldNames": [
    "short_description"
  ],
  "isActive": "true",
  "label": "Incident Categorization_Trainer",
  "name": "ml_incident_categorization",
  "predictedFieldName": "category",
  "processingLanguage": "en",
  "stopwords": [
    "Default English Stopwords"
  ],
  "versionNumber": "1"
}
```

PredictabilityEstimateVersion - getResults()

Returns JSON results containing suggested input fields for an output field.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	JSON object results containing suggested input field options for an output field.
<Object>.<output field name>	Output field name, e.g., `category`, containing suggested input fields. `{ "<output field name>": { "nominalInputFields": [Array], "textInputFields": [Array] } }` Data type: Object
<Object>.<output field name>.nominalInputFields	Nominal input field details. `"nominalInputFields": [ { "fieldName": "String", "modelImprovement": "String" } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Array.
<Object>.<output field name>.nominalInputFields.fieldName	Nominal input field name. Data type: String.
<Object>.<output field name>.nominalInputFields.modelImprovement	Score as a relative indication of how likely this field is to improve results. Data type: Number as a string.
<Object>.textInputFields	Text input field details. `"textInputFields": [ { "fieldName": "String", "density": "String" } ]` Data type: Array.
<Object>.textInputFields.fieldName	Text input field name. Data type: String.
<Object>.textInputFields.density	Value between 0 and 1.0 that represents frequency that the field is not empty. A value of 1.0 means that the field is not empty in all rows, and a value of 0 indicates that the field is empty in all rows. Data type: Number as a string.

The following example shows how to get results for a selected version of a predictability estimate in the store.

```
// Get results
var estimateName =
 "ml_x_snc_global_global_predictability_estimate;"
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get(estimateName);

var results = mlEstimate.getActiveVersion().getResults();

gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

Output:

```
{
  "category": {
    "nominalInputFields": [
      {
        "fieldName": "number",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "modelImprovement": "0.167052396325189"
      },
      {
        "fieldName": "task_effective_number",
        "modelImprovement": "0.167052396325189"
      }
    ],
    "textInputFields": [
      {
        "fieldName": "short_description",
        "density": "1.0"
      }
    ]
  }
}
```

PredictabilityEstimateVersion - getStatus(Boolean includeDetails)

Gets training completion status.

Parameters

Name	Type	Description
includeDetails	Boolean	Flag that indicates whether to return status *details*. Valid values: • true: Return additional details. • false: Don't return additional details. Default: False

Returns

Type	Description
Object	JavaScript object containing training status information for a PredictabilityEstimate object. `{ "state": "String", "percentComplete": "Number as a String", "hasJobEnded": "Boolean value as a String", "details": {Object} }`
<Object>.state	Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the *hasJobEnded* property is set to `true`. Possible values: • `fetching_files_for_training` • `preparing_data` • `retry`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `solution_cancelled` (terminal) • `solution_complete` (terminal) • `solution_error` (terminal) • `solution_incomplete` • `training_request_received` • `training_request_timed_out` (terminal) • `training_solution` • `uploading_solution` • `waiting_for_training` Data type: String
<Object>.hasJobEnded	Flag that indicates whether training is complete. Valid values: • true: Training is complete. • false: Training is incomplete. Data type: Boolean value as a String
<Object>.percentComplete	Training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out. Data type: Number as a String Range: 0 thru 100
<Object>.details	Object containing a list of additional training details. Data type: Object

The following example shows a successful result with training complete.

```
// Get status
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_incident_categorizati
on');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion()
.getStatus(true), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 "details":{"stepLabel":"Solution Complete"} // This information
 is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```
// Get status
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_m
y_estimate_definition');
var trainingStatus = mlEstimate.getLatestVersion().getStatus();

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

PredictabilityEstimateVersion - getVersionNumber()

Gets the version number of a predictability estimate object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Version number.

The following example shows how to get a version number.

```
// Get version number
var mlEstimate =
 sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_p
redictability_estimate');

gs.print("Version number:
 "+JSON.stringify(JSON.parse(mlEstimate.getActiveVersion().getVe
rsionNumber()), null, 2));
```

Output:

```
Version number: 1
```

PreferenceDestination - Scoped, Global

The *PreferenceDestination* API updates user notification preferences.

A notification destination is somewhere that a notification can be delivered to, such as a specific email address or phone number. This API is based on notifications from the Notification

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[sys_notification] table. Notifications are sent through channels such as email or Workspace. A channel can be used to send notifications to multiple types of destinations. For example, an email channel could send notifications to both personal email and work email destinations. Destination types are listed in the Notification Destination Type [sys_notif_destination_type] table.

A user can update their own notification preferences, and an admin can update notification preferences for any user. User notification preferences control which destinations will receive which notifications.

Use this API with the *`Preferences`* API. Before calling any methods in this class, you must call the *`Preferences.getDestinations()`* or *`Preferences.getDestinationsByChannel()`* methods to instantiate a PreferenceDestination object.

This class uses the `sn_notification` namespace identifier.

PreferenceDestination - getChannel()

Returns the channel that is used to send notifications to the destination.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	GlideRecord from the Notification Channel [sys_notification_channel] table for the channel that is used to send notifications to the destination.

This example prints the channel that is used to send notifications for each of Abel Tuter's destinations.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
for (var i=0; i<dests.length; i++) {
     gs.print('Channel for destination '+(i+1)+' is
 '+dests[i].getChannel().name);
}
```

Output:

```
Channel for destination 1 is Workspace
```

PreferenceDestination - getDeliverTo()

Returns the identifier for the destination.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The identifier for the destination. For example, an email address, push application install token, or sys_id.

This example prints the identifier for each of Abel Tuter's destinations. The output shows that the identifier for Abel's Workspace destination is the user sys_id.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
for (var i=0; i<dests.length; i++) {
     gs.print('The identifier for '+recipient.first_name+'\'s
 '+dests[i].getDestinationType().name+' destination is
 '+dests[i].getDeliverTo());
}
```

Output:

```
The identifier for Abel's Workspace destination is
 62826bf03710200044e0bfc8bcbe5df1
```

PreferenceDestination - getDestinationType()

Returns the type of destination, such as personal email or work email.

Parameters

Name	Type	Description
None		

Returns

Type	Description
GlideRecord	GlideRecord from the Notification Destination Type [sys_notif_destination_type] table for the destination type.

This example prints the identifier for each of Abel Tuter's destinations. The output shows that the identifier for Abel's Workspace destination is the user sys_id.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
for (var i=0; i<dests.length; i++) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    gs.print('The identifier for '+recipient.first_name+'\'s
 '+dests[i].getDestinationType().name+' destination is
 '+dests[i].getDeliverTo());
}
```

Output:

```
The identifier for Abel's Workspace destination is
 62826bf03710200044e0bfc8bcbe5df1
```

PreferenceDestination - isActive(GlideRecord notification)

Checks if the destination has permission to receive a notification.

Parameters

Name	Type	Description
notification	GlideRecord	Optional. Specify a notification to check if the destination has permission to receive that notification. An exception is thrown if the notification doesn't exist or if the notification isn't readable by the destination's user. If no notification is specified, this method checks if the destination has permission to receive any notifications.

Returns

Type	Description
Boolean	Flag that indicates whether the destination has permission to receive a notification. Valid values: • true: The destination has permission receive a notification. • false: The destination doesn't have permission to receive a notification.

This example checks if each of Abel Tuter's destinations has permission to receive the Approval Request notification.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
var notif = new GlideRecord('sys_notification');
notif.get('name', 'Approval Request');
for (var i=0; i<dests.length; i++) {
   var active = dests[i].isActive(notif) ? 'active' :
 'inactive';
   gs.print(dests[i].getDestinationType().name + ' ' +
 dests[i].getDeliverTo() + ' is ' + active + ' for this
 notification');
}
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Workspace 62826bf03710200044e0bfc8bcbe5df1 is active for this
 notification
```

PreferenceDestination - isOverriden(GlideRecord notification)

Checks if a notification overrides a user's preferences for the destination.

Parameters

Name	Type	Description
notification	GlideRecord	Specify a notification to check if it overrides user preferences for the destination. The notification should be a GlideRecord from the Notification [sys_notification] table.

Returns

Type	Description
Boolean	Flag that indicates whether the notification overrides user preferences for the destination. Valid values: • true: User preferences for the destination are ignored for this notification. • false: The destination receives or doesn't receive the notification according to the user preference.

This example checks if the Approval Request notification overrides user preferences for one of Abel Tuter's destinations. If the notification doesn't override user preferences, the destination is given permission to receive the notification. Otherwise, no preference is set because the notification overrides the preference.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
var notif = new GlideRecord('sys_notification');
notif.get('name', 'Approval Request');
var firstDest = dests[0];
if (!firstDest.isOverridden(notif)) {
     dests[0].setActive(notif, true);
} else {
     gs.print('This notification overrides user preference, so
 don't bother to set a preference.');
}
```

PreferenceDestination - setActive(GlideRecord notification, Boolean active)

Sets the user preference for a destination to receive or not receive notifications.

The `isOverriden()` method can be called first to check if the user preference will be ignored, but it is not required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
notification	GlideRecord	Optional. If a notification is specified, the user preference is set for the destination to receive or not receive that notification. The notification should be a GlideRecord from the Notification [sys_notification] table. If no notification is specified, the user preference is set for the destination to receive or not receive all notifications.
active	Boolean	Flag that indicates whether the destination has permission to receive a notification. Valid values: • true: The destination has permission receive a notification. • false: The destination doesn't have permission to receive a notification.

Returns

Type	Description
None	

This example checks if the Approval Request notification overrides user preferences for one of Abel Tuter's destinations. If the notification doesn't override user preferences, the destination is given permission to receive the notification. Otherwise, no preference is set because the notification overrides the preference.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
var notif = new GlideRecord('sys_notification');
notif.get('name', 'Approval Request');
var firstDest = dests[0];
if (!firstDest.isOverridden(notif)) {
    dests[0].setActive(notif, true);
} else {
    gs.print('This notification overrides user preference, so
 don't bother to set a preference.');
}
```

Preferences - Scoped, Global

The *Preferences* API gets notification destinations for a user.

A notification destination is somewhere that a notification can be delivered to, such as a specific email address or phone number. This API is based on notifications from the Notification [sys_notification] table. Notifications are sent through channels such as email or Workspace. A channel can be used to send notifications to multiple types of destinations. For example, an email channel could send notifications to both personal email and work email destinations. Destination types are listed in the Notification Destination Type [sys_notif_destination_type] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this API with the *PreferenceDestination* API to update user notification preferences.

This class uses the `sn_notification` namespace identifier.

Preferences - Preferences(GlideRecord recipient)

Instantiates a Preferences object for a specified user.

Parameters

Name	Type	Description
recipient	GlideRecord	GlideRecord from the User [sys_user] table for the user that you want to get notification destinations for.

This example instantiates a Preferences object for the user Abel Tuter.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
```

Preferences - getDestinations()

Returns a user's notification destinations.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Array of *PreferenceDestination* objects. If the user doesn't have any destinations, the array is empty.

This example gets all of Abel Tuter's notification destinations. The output shows that Abel has one destination.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
gs.print(dests);
```

Output:

```
[object PreferenceDestination]
```

Preferences - getDestinationsByChannel(GlideRecord channel)

Returns a user's notification destinations that use a specified channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
channel	GlideRecord	GlideRecord from the Notification Channel [sys_notification_channel] table for the channel you want to filter on.

Returns

Type	Description
Array	Array of *PreferenceDestination* objects. If the user doesn't have any notification destinations that use the channel or if the channel doesn't exist, the array is empty.

This example gets all of Abel Tuter's destinations that use the Workspace channel. The output shows that Abel has one destination that uses the Workspace channel.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var channel = new GlideRecord('sys_notification_channel');
channel.get('name', 'Workspace');
var dests = prefs.getDestinationsByChannel(channel);
gs.print(dests);
```

Output:

```
[object PreferenceDestination]
```

ProactiveTriggerAPI - Scoped

The *ProactiveTriggerAPI* enables you to create server-side triggers that send context-specific messages to a specified user.

This API uses rules and related actions based on those rules to send messages to a user. These rules and actions are context-specific and are based on real-time data gathered as the user navigates across portal pages. For additional information, see Proactive Triggers.

Before using this API, the trigger types, rules, and actions must be configured on your instance. For information on how to configure Proactive Triggers, see Configuring Proactive Triggers.

Using this API you can send messages to a specific user or to a user in a specific session.

For example, in the case where a customer adds items to their cart, you can have a Proactive Triggers event within a business rule that sends a reminder to the user to complete check-out after a specified amount of time.

Similarly, if a user performs an AI Search from a Service Portal and no results are returned, you can have logic in a business rule that creates a Proactive Triggers that sends alternate offerings to the user through the proactive pop over message web-client.

When calling the *ProactiveTriggerAPI*, there's a specific sequence in which you should call the methods. This API runs in the `sn_pt` namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

First, you should call the ProactiveTriggerAPI - createTrigger(String triggerTypeId) method to specify the type of trigger that you want to create. This call is required. For the list of available trigger types, see How Proactive Triggers work.

Next, you should call one of the methods that identifies the user to whom the messages should be sent. You can do this by calling one of the following methods:

- ProactiveTriggerAPI - setUserId(String userId): Identifies the user by the sys_id of their associated User [sys_users] record.
- ProactiveTriggerAPI - setUserName(String userName): Identifies the user by their user name, such as "abel.tuter".
- ProactiveTriggerAPI - setUserSessionId(String userId): Identifies the user by their current session sys_id.

Next, you should call the ProactiveTriggerAPI - setTriggerRecord(String triggerRecord) method to specify the trigger record on which to apply the Proactive Triggers' rules and actions.

Finally, call the ProactiveTriggerAPI - process() method to execute the call chain. Both the *`setTriggerRecord()`* and *`process()`* method calls are required.

For example:

```
var eventSysId =
 sn_pt.ProactiveTriggerAPI.createTrigger(triggerTypeId)
  .setUserName(userName).setTriggerRecord(userId).process();
```

ProactiveTriggerAPI - createTrigger(String triggerTypeId)

Creates a server-side Proactive Triggers event.

Parameters

Name	Type	Description
triggerTypeId	String	Unique ID of the trigger type to create. Located in the ID field of the Proactive Trigger Types [sys_cs_ptrigger_trigger_type] table. For example: `triggerTypeId = "sn_pt.ai_search_event"`

Returns

Parameter	Description
None	

The following business rule shows how to call the *`createTrigger()`* method inside a business rule.

```
try {
  var triggerTypeId = "sn_pt.ai_search_event";
  var userId = current.getValue("user");

  var eventSysId =
 sn_pt.ProactiveTriggerAPI.createTrigger(triggerTypeId)
       .setUserId(userId).setTriggerRecord(current).process();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // Returns the Proactive Trigger Event record's sys_id
  gs.info("Proactive Trigger Event Sys Id:"+ eventSysId);

} catch (e) {
    gs.info("error:"+e); // Log the error.
}
```

ProactiveTriggerAPI - process()

Executes the specified Proactive Triggers API request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
sys_id	Sys_id of the Proactive Trigger Event record that was created. Located in the Proactive Event [sys_cs_ptrigger_event] table. Data type: String

The following business rule shows how to call the *process()* method to execute the specified Proactive Triggers API request.

```
try {
  var triggerTypeId = "sn_pt.ai_search_event";
  var userId = current.getValue("user");

  var eventSysId =
 sn_pt.ProactiveTriggerAPI.createTrigger(triggerTypeId)
      .setUserId(userId).setTriggerRecord(current).process();

  // Returns the Proactive Trigger Event record's sys_id
  gs.info("Proactive Trigger Event Sys Id:"+ eventSysId);

} catch (e) {
    gs.info("error:"+e); // Log the error.
}
```

ProactiveTriggerAPI - setTriggerRecord(String triggerRecord)

Sets the trigger record on which to apply the Proactive Triggers' rules and actions.

These rules and actions are defined in the associated trigger type record, located in the Proactive Trigger Types [sys_cs_ptrigger_trigger_type] table.

Parameters

Name	Type	Description
triggerRecord	String or GlideRecord	Sys_id or GlideRecord of the trigger record on which to apply the associated Proactive Triggers' rules and actions. The trigger record is located in the table specified in the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		trigger_table field of the trigger type record that was specified in the *createTrigger()* method call. For example, if your *createTrigger()* call specified the AI Search Event trigger type, then the trigger table is the Search Event [sys_search_event] table. **Note:** This table is typically the same as the table that caused the business rule to execute. If it isn't the same, you will need to add this sys_id to the GlideRecord so you can pass it into this method.

Returns

Type	Description
None	

The following business rule shows how to call the *setTriggerRecord()* method.

```
try {
  var triggerTypeId = "sn_pt.ai_search_event";
  var userId = current.getValue("user");

  var eventSysId =
 sn_pt.ProactiveTriggerAPI.createTrigger(triggerTypeId)
       .setUserId(userId).setTriggerRecord(current).process();

  // Returns the Proactive Trigger Event record's sys_id
  gs.info("Proactive Trigger Event Sys Id:"+ eventSysId);

} catch (e) {
    gs.info("error:"+e); // Log the error.
}
```

ProactiveTriggerAPI - setUserId(String userId)

Sets the user to whom to send the message generated by the associated Proactive Triggers event using the user ID.

Parameters

Name	Type	Description
userId	String	Sys_id of the user to whom to send the associated Proactive Triggers message. Located in the User [sys_user] table or in the associated GlideRecord.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Parameter	Description
None	

The following code example shows how to call the *setUserId()* method using the value in the user field of the current GlideRecord.

```
try {
  var triggerTypeId = "sn_pt.ai_search_event";
  var userId = current.getValue("user");

  var eventSysId =
 sn_pt.ProactiveTriggerAPI.createTrigger(triggerTypeId)
       .setUserId(userId).setTriggerRecord(current).process();

  // Returns the Proactive Trigger Event record's sys_id
  gs.info("Proactive Trigger Event Sys Id:"+ eventSysId);

} catch (e) {
    gs.info("error:"+e); // Log the error.
}
```

ProactiveTriggerAPI - setUserName(String userName)

Sets the user to whom to send the message generated by the associated Proactive Triggers event using the user name.

Parameters

Name	Type	Description
userName	String	Name of the user to whom to send the proactive message. This name must correlate to the User ID field in the User [sys_user] table, such as "abel.tuter".

Returns

Parameter	Description
None	

The following business rule shows how to call the *setUserName()* method using the value in the sys_created_by field of the current GlideRecord.

```
try {
  var triggerTypeId = "sn_pt.ai_search_event";

  // User name of the user to whom to send the proactive
 message.
  var userName = current.getValue("sys_created_by");

  var eventSysId =
 sn_pt.ProactiveTriggerAPI.createTrigger(triggerTypeId)

 .setUserName(userName).setTriggerRecord(current).process();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  // Returns the Proactive Trigger Event record's sys_id
  gs.info("Proactive Trigger Event Sys Id:"+ eventSysId);

} catch (e) {
    gs.info("error:"+e); // Log the error.
}
```

ProactiveTriggerAPI - setUserSessionId(String userId)

Sets the user session ID on the associated Proactive Triggers event. When using this method, the Proactive message is only sent to the specific user associated with a specific session.

Parameters

Name	Type	Description
userSessionId	String	Sys_id of the current session of the user to whom the Proactive Triggers message should be sent. **Note:** Not all tables contain a session ID. Before using this endpoint, ensure that the table that you're referencing contains a valid session ID. If not, the latest available session ID is used which may cause erroneous results.

Returns

Parameter	Description
None	

The following business rule shows how to call the *`setUserSessionId()`* method using the value in the session field of the current GlideRecord.

```
try {
  var triggerTypeId = "sn_pt.ai_search_event";
  var sessionId = current.getValue("session");

  var eventSysId =
 sn_pt.ProactiveTriggerAPI.createTrigger(triggerTypeId)

 .setUserSessionId(sessionId).setTriggerRecord(current).process
();

  // Returns the Proactive Trigger Event record's sys_id
  gs.info("Proactive Trigger Event Sys Id:"+ eventSysId);

} catch (e) {
    gs.info("error:"+e); // Log the error.
}
```

ProbeHandlerCim - Global

The *`ProbeHandlerCim`* script include provides methods to configures a Common Information Model (CIM) probe.

You can use this script include in any server-side script where you need to configure a CIM probe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ProbeHandlerCim - getCimQueries()

Returns a string containing the CIM fields to fetch

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The CIM fields to fetch

ProbeHandlerCim - getNamespace()

Returns the CIM name space.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The name space

ProbeHandlerCim - getParameters()

Returns a hash map of the parameters added by this probe handler.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A hash map of the parameters

ProbeHandlerCim - run()

Runs the probe.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

ProbeHandlerCim - setProbeParameters(Object params)

Sets the probe parameters.

Parameters

Name	Type	Description
params	Object	The parameters to add

Returns

Type	Description
void	

ProbeHandlerMulti - Global

The `ProbeHandlerMulti` script include is a probe handler for multiprobes.

This script include does not work with probe parameters that have value_scripts and does not work with JavaScript probes.

You can use this script include in any server-side script where you need to configure a multiprobe.

ProbeHandlerMulti - addParameters(String parent, String sysID, GlideRecord probe)

Adds the probe parameters to the given XML parent element, taken from the given probe's parameter table.

Parameters

Name	Type	Description
parent	String	The XML parent element to add parameters to.
sysID	String	The sys_id of the probe to get parameters from.
probe	GlideRecord	Optional GlideRecord of the probe. If present, and there is a probe handler, it is called.

Returns

Type	Description
void	

ProbeHandlerMulti - addProbes(String parent, String sysID)

Adds the probes for this multiprobe to the document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
parent	String	The XML parent element to add the probes to.
sysID	String	The sys_id of the multi-probe

Returns

Type	Description
void	

ProbeHandlerMulti - run()

Runs the probe.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

ProbeHandlerMulti - runProbeHandler(String params, String sysID, GlideRecord probe)

If the given probe's GlideRecord is present and contains a probe handler, runs the probe handler and adds any parameters it creates to the given parameter element.

Parameters

Name	Type	Description
params	String	The XML parameter element to add parameters to.
sysID	String	The sys_id of the probe to get parameters from.
probe	GlideRecord	Optional GlideRecord of the probe. If present, and there is a probe handler, it is called.

Returns

Type	Description
void	

ProbeHandlerMulti - setParameter(String parent, String name, String value)

Sets the value of a given XML parameter element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
parent	String	The XML parent element to add the parameter to.
name	String	The name of the parameter to set
value	String	The value to set the parameter to.

Returns

Type	Description
void	

ProbeHandlerSNMP - Global

The *ProbeHandlerSNMP* script include is a discovery probe handler for SNMP probes, invoked when an SNMP probe is about to be created.

You can use this script include in any server-side script where you need to configure an SNMP probe.

ProbeHandlerSNMP - addBoolean(String dbName, String paramName, String paramMap)

Adds a boolean value to the parameter map.

Parameters

Name	Type	Description
dbName	String	The database name
paramName	String	The parameter name
paramMap	String	The parameter map

Returns

Type	Description
void	

ProbeHandlerSNMP - addDebug(String paramMap)

Adds debugging to the probe handler.

Parameters

Name	Type	Description
paramMap	String	The parameter map

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ProbeHandlerSNMP - addJavascriptHandlers(String paramMap)

Adds a JavaScript handler.

Parameters

Name	Type	Description
paramMap	String	The parameter map

Returns

Type	Description
void	

ProbeHandlerSNMP - addOIDAutoResolve(String paramMap)

Adds OID automatic resolution.

Parameters

Name	Type	Description
paramMap	String	The parameter map

Returns

Type	Description
void	

ProbeHandlerSNMP - addOIDSpec(String paramMap)

Adds OID specifications to the parameter map.

Parameters

Name	Type	Description
paramMap	String	The parameter map

Returns

Type	Description
void	

ProbeHandlerSNMP - addSensorHandler(String paramMap)

Adds a sensor handler.

Parameters

Name	Type	Description
paramMap	String	The parameter map

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

ProbeHandlerSNMP - addStage(String paramMap)

Adds the stage to the parameter map.

Parameters

Name	Type	Description
paramMap	String	The parameter map

Returns

Type	Description
void	

ProbeHandlerSNMP - addTimingSpecs(String paramMap)

Adds timing specifications to the parameter map.

Parameters

Name	Type	Description
paramMap	String	The parameter map

Returns

Type	Description
void	

ProbeHandlerSNMP - getParameters()

Returns the parameters added by this probe handler.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A hash map of the parameters added by this probe handler.

ProbeHandlerSNMP - run()

Runs the probe.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

ProbeHandlerSNMP - setProbeParameters(String params)

Sets the value of a given XML parameter element.

Parameters

Name	Type	Description
params	String	The probe's parameters

Returns

Type	Description
void	

ProbeHandlerWMI - Global

The `ProbeHandlerWMI` script include is the discovery probe handler for Windows Management Instrumentation (WMI) probes.

You can use this script include in any server-side script where you need to configure an WMI probe.

ProbeHandlerWMI - getParameters()

Returns the parameters added by this probe handler.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	A hash map of the parameters added by this probe

ProbeHandlerWMI - getWMIFields()

Generates a string containing the WMI fields to fetch.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The WMI fields to fetch.

ProbeHandlerWMI - run()

Runs the probe.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

ProbeHandlerWMI - setProbeParameters(Object params)

Sets the probe parameters.

Parameters

Name	Type	Description
params	Object	The probe parameters

Returns

Type	Description
void	

ProcessMiningForExternalData - Scoped, Global

The `ProcessMiningForExternalData` API contains a method that marks an external audit record for processing.

This external audit data may come for external systems such as SAP, SmartRecruiters, or Jira.

To access this API, the Process Mining for external data (sn_po_extdata) plugin must be installed and the calling entity must have the sn_process_optimization_admin role.

For additional information on external audit records and Process Mining, see Process Mining.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ProcessMiningForExternalData - scheduleCaseGeneration(String externalDataSysId)

Marks the specified record in the External dataset [sn_po_extdata_dataset] table for processing. Use this method to automate the processing of external audit data.

Before calling this method, the external audit data must have already been imported into the External dataset table.

You can choose your desired method of importing this data, such as by Integration Hub or Workflow Studio. You can schedule this import on some fixed interval such as weekly, monthly, or quarterly. For additional information, see Working with external datasets.

After the data is imported, you call this method to set the state field in the specified External dataset record to "Scheduled." This setting indicates that the specified external dataset record is ready for processing. When processed, the data within the external dataset record is used to create audit and case records. The names of these audit and case records appear in the associated External dataset record.

Note: When the call returns, it has only marked the record for processing. The actual processing of the record is done in the background.

This API is available in both global and scoped. Use the following syntax when calling this method:

- Global: `SNC.ProcessMiningForExternalData.scheduleCaseGeneration(String externalDataSysId);`
- Scoped: `ProcessMiningForExternalData.scheduleCaseGeneration(String externalDataSysId);`

Parameters

Name	Type	Description
externalDataSysId	String	Sys_id of the dataset record in the External dataset [sn_po_extdata_dataset] table to mark as ready to be processed.

Returns

Type	Description
message	Status of the method call. When successful, the message is always: `External dataset is scheduled for processing.` When an error occurs, the message describes why the call failed.
status	Status of the method call. Possible values: • error • success

The following code example shows how to call this method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
ProcessMiningForExternalData.scheduleCaseGeneration("o83ehu2yv91
8ehbu23eg928dg7jbcf52");
```

Output:

```
{
  "status": "success",
  "message": "External dataset is scheduled for processing"
}
```

Producer - Scoped (deprecated)

The *Producer* API provides methods that enable you to push data from a ServiceNow instance to a Kafka topic.

Note: This API is deprecated and replaced by the ProducerV2 - Scoped API.

This API requires the ServiceNow Integration Hub Action Step - Kafka Producer plugin (com.glide.hub.action_step.kafka) and is provided within the `sn_ih_kafka` namespace.

Producer - send(String topic, String key, String message, Boolean isSync)

Sends the specified message to the specified Kafka topic.

Parameters

Name	Type	Description
topic	String	Name of the topic to publish the message to. A topic stores messages of the same type. For example, a topic named Payments might store messages about recent payments. When you enter the topic name, include everything that comes after the instance name prefix. For example, if the complete topic name is `snc.<instancename>.sn_streamconnect.<topicname>`, enter `sn_streamconnect.<topicname>` in the topic field.
key	String	Name of the key for a specific partition. Topics can be partitioned. Messages with the same key are stored in the same partition. For example, payment messages with a key of June would all be stored in the same partition of the Payments topic.
message	String	Message text.
isSync	Boolean	Flag that indicates whether to require the flow to wait for the step to complete before continuing. Valid values: • true: Wait for the step to complete before continuing the associated flow. • false: Do not wait for the step to complete before continuing the associated flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

This example shows how to send changed incident information to the changed_incidents Kafka topic.

```
var message = {
  'number': current.number.toString(),
  'short_description': current.short_description.toString(),
  'caller_id': current.caller_id.getDisplayValue(),
  'priority': current.priority.toString(),
  'state': current.state.toString()
};

var producer = new sn_ih_kafka.Producer();
producer.send('changed_incidents', current.number.toString(),
 JSON.stringify(message), false);
```

ProducerV2 - Scoped

The *ProducerV2* API provides methods to publish messages from your ServiceNow instance to a Kafka topic.

Note: This API requires a Stream Connect subscription. For more information, see https://www.servicenow.com/products/automation-engine.html.

This API requires the ServiceNow Stream Connect Installer plugin (com.glide.hub.stream_connect.installer) and runs in the `sn_ih_kafka` namespace.

ProducerV2 - send(String topicSysID, String key, String message, Boolean isSync, Object headers, String schemaID)

Sends the specified message to the specified Kafka topic.

Parameters

Name	Type	Description
topicSysID	String	Sys_id of the topic to publish the message to. Topics are stored in the Kafka Topics [sys_kafka_topic] table.
key	String	Name of the key for a specific partition in the topic.
message	String	Message text.
isSync	Boolean	Flag that indicates whether to require the script to wait for the send method to complete before continuing. Valid values: • true: Wait for the step to complete before continuing the associated flow. • false: Do not wait for the step to complete before continuing the associated flow.
headers	Object	Headers for the message, defined as key-value pairs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		`"headers": { "<key>": "<value>" }` For example, `var headers = { "origin": "sn_business_rule" };` • `key`: String. Name of the header. • `value`: String. Value of the header.
schemaID	String	Sys_id of the schema record. Required if you're using a schema to convert plain-text messages to Avro messages and back. Schemas are stored in the Stream Connect Schemas [stream_connect_schema] table. For more information, see Schema management in Stream Connect.

Returns

Type	Description
None	

This example shows how to send changed incident information to the Kafka topic with a sys_id of 75135aa2ff0311105cf343d0653bf155, using a schema with a sys_id of f9d083f3ff610210ef7343d3653bf12e.

```
var message = {
  'number': current.number.toString(),
  'short_description': current.short_description.toString(),
  'caller_id': current.caller_id.getDisplayValue(),
  'priority': current.priority.toString(),
  'state': current.state.toString()
};

var headers = {
    'origin': 'sn_business_rule'
};

var producer = new sn_ih_kafka.ProducerV2();
producer.send('75135aa2ff0311105cf343d0653bf155',
 gs.generateGUID(), JSON.stringify(message), false, headers,
 'f9d083f3ff610210ef7343d3653bf12e');
```

ProductInstance - Scoped, Global

The *ProductInstance* API provides methods to generate a product instance identifier (PID), retrieve PID configuration data, and determine if a model category is a product instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API runs in the `sn_cmdb` namespace and requires the category_manager or snc_internal role. Access is also granted to users with access control lists (ACLs) for the Model Category [cmdb_model_category] table. You can view the ACLs in the Table [sys_db_object] table.

A PID is a unique identifier for a product instance and links asset, configuration item (CI), and an install base item (IBI) to synchronize updates between common product representations. A product instance is associated with assets of a particular model category.

Access to install base items requires the Customer Service Install Base Management (com.snc.install_base) plugin.

See also:

- Model categories
- Product Instance feature in Hardware Asset Management
- Create an install base item

ProductInstance – generatePID(String className, String modelCategorySysId, Object jsonKeyValues)

Generates the hashed value of the product instance and returns it.

This method can be invoked many times without affecting the performance of the calling application. This method doesn't modify any data in the database and caches the data required to compute the PID.

A product Instance Identifier (PID) is a unique identifier for a Product Instance and links assets, CIs, and install base items (IBI).

A PID is generated based on the following items defined in the Product Instance Identifier Configurations [product_instance_identifier_configuration] table:

- PID configurations (read only)
- Order assigned to each configuration

See also Product Instance feature in Hardware Asset Management.

Parameters

Name	Type	Description
className	String	Table name for the PID to be generated.
modelCategorySysId	String	The sys_id of the model category in the Model Categories [cmdb_model_category] table. For information, see Model categories.
jsonKeyValues	Object	JSON key-value pair of PID parameters configured in the Product Instance Identifier Configurations [product_instance_identifier_configuration] table. The key value pairs contain attribute names with their corresponding values. These values vary depending on the configuration properties defined for the PID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Information used to generate the PID. The object returns with an empty product_instance_id property value in the following conditions: • The PID is missing the required PID configuration attributes. The PID configuration is in the Product Instance Identifier Configurations [product_instance_identifier_configuration] table. • The given class doesn't have an associated product instance. `{ "model_category_sysId": "String", "parameters": [Array], "product_instance_id": "String" }`
<Object>.model_category_sysId	The sys_id of the product category in the Model Categories [cmdb_model_category] table. This value might be different from the input value if the model category hierarchy was used to generate the PID. Data type: String
<Object>.parameters	List of parameters used to generate the PID and defined in the Product Instance Identifier Configurations [product_instance_identifier_configuration] table. Data type: Array of Strings
<Object>.product_instance_id	PID in the product_instance_id field of an asset, CI, or install base item. The hashed value of the PID can be set on this property to synchronize common values in objects one of the following tables: • Assets [alm_asset] • Configuration Items [cmdb_ci] • Install Base Items [sn_install_base_item] Install base items require the Customer Service Install Base Management (com.snc.install_base) plugin. Data type: String

The following example shows how to create a PID for an asset in the Medical assets [sn_ent_medical_asset] table. This table is included with the Customer Service Install Base Management (com.snc.install_base) plugin.

```
var output =
 sn_cmdb.ProductInstance.generatePID('sn_ent_medical_asset',
 '4b8aa89a77710110dd5fca22fe5a9984', { "serial_number" :
 "SN1001"});
gs.info(JSON.stringify(output,null,'\t'));
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
{
  "model_category_sysId": "4b8aa89a77710110dd5fca22fe5a9984",
  "product_instance_id":
 "tw8QgznsS4cP3b4UO+rSbnbIWxirYpeVSquk3g81K/8=",
  "parameters": [
    "serial_number"
  ]
}
```

ProductInstance – getPIDConfig(String className, String modelCategorySysId)

Gets the PID configuration associated with the model category based on the hierarchy and class name.

This method scans all the hierarchies for the model category and returns the PID configuration(s) for the first found model category.

Parameters

Name	Type	Description
className	String	Table name for the PID to be generated.
modelCategorySysId	String	The sys_id of the model category in the Model Categories [cmdb_model_category] table. For information, see Model categories.

Returns

Type	Description
Object	JSON object containing the PID configurations associated with the given class name and model category. `{ "model_category_sysId": "String", "configs": [Array] }`
<Object>.model_category_sysId	The sys_id of the product category in the Model Categories [cmdb_model_category] table. This value might be different from the input value if the model category hierarchy was used to generate the PID. Data type: String
<Object>.configs	List of each configuration associated with the given model category. `"configs": [ { "configuration_order": Number, "parameters": [Array] } ]`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: Array
<Object>.configs.configuration_order	Returns the order of the configuration defined in the Product Instance Identifier Parameters [product_instance_identifier_parameters] table. Data type: Number
<Object>.configs.parameters	List of all the parameters associated with the configuration and its order. `"parameters": [ { "parameter_class_attribute_name": "String", "parameter_class_name": "String", "parameter_name": "String", "parameter_order": Number } ]` Data type: Array of Objects
<Object>.configs.parameters.parameter_class_attribute_name	Parameter class attribute name associated with the parameter_class_name property. This string represents the name of the column corresponding to that class. Data type: String
<Object>.configs.parameters.parameter_class_name	Class name associated with the parameter defined in the Product Instance Identifier Parameters [product_instance_identifier_parameters] table. Data type: String
<Object>.configs.parameters.parameter_name	Parameter name defined in the Product Instance Identifier Parameters [product_instance_identifier_parameters] table. Data type: String
<Object>.configs.parameters.parameter_order	Order of the parameter defined in the Product Instance Identifier Parameters [product_instance_identifier_parameters] table. Data type: Number

The following example shows how to retrieve configuration details for a model category named in the in the Medical assets [sn_ent_medical_asset] table. This table is included with the Customer Service Install Base Management (com.snc.install_base) plugin.

```
var config =
 sn_cmdb.ProductInstance.getPIDConfig('sn_ent_medical_asset',
 '4b8aa89a77710110dd5fca22fe5a9984');
gs.info(JSON.stringify(config,null,'\t'));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
  "model_category_sysId": "4b8aa89a77710110dd5fca22fe5a9984",
  "configs": [
    {
      "parameters": [
        {
          "parameter_class_attribute_name": "serial_number",
          "parameter_class_name": "sn_ent_medical_asset",
          "parameter_name": "serial_number",
          "parameter_order": 1
        }
      ],
      "configuration_order": 100
    },
    {
      "parameters": [
        {
          "parameter_class_attribute_name": "parent",
          "parameter_class_name": "sn_ent_medical_asset",
          "parameter_name": "parent_asset",
          "parameter_order": 1
        },
        {
          "parameter_class_attribute_name":
 "model_component_id",
          "parameter_class_name": "sn_ent_medical_asset",
          "parameter_name": "model_component_id",
          "parameter_order": 2
        }
      ],
      "configuration_order": 200
    }
  ]
}
```

ProductInstance – isProductInstance(String modelCategorySysId)

Checks if a given model category is a product instance.

If both of the following conditions are met, the model category qualifies as a product instance:

- The value of the model category's is_model_category flag is true.
- The model category has a valid configuration defined for it in the Product Instance Identifier Configurations [product_instance_identifier_configuration] table.

This method can be used in business rules before invoking the *`generatePID()`* method.

Parameters

Name	Type	Description
modelCategorySysId	String	The sys_id of the model category in the Model Categories [cmdb_model_category] table. For information, see Model categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates whether the model category provided is a product instance. Valid values: • true: The model category provided is a product instance. • false: The model category provided isn't a product instance.

The following example shows how to determine whether the model category provided is a product instance.

```
var isProductInstance =
 sn_cmdb.ProductInstance.isProductInstance('4b8aa89a77710110dd5f
ca22fe5a9984');
gs.info(isProductInstance);
```

Output:

```
true
```

PSBScratchpadUtil - Scoped

The *PSBScratchpadUtil* API provides methods that allow providers to share "extra" information that is outside of any other Service Exchange service, with their consumers.

This information is stored as name-value pairs in the Scratchpad [sn_sb_scratchpad] table. The shared information must be associated with tasks that are of one of two types: provider tasks or remote tasks.

If the associated task is active, the updated scratchpad information syncs to the consumer instance. If a task is deactivated or deleted, the information in the scratchpad is also deleted after a specified number of days; by default three. This default is defined in the sn_sb.scratchpad.autodelete.days property.

Both providers and consumers can add, update, and remove information to and from the Scratchpad table. Consumers update this information using the *CSBScratchpadUtil* API.

To access this API, the Service Exchange for Providers application (sn_sb_pro) must be installed. This API runs in the `sn_sb_pro` namespace.

PSBScratchpadUtil - get(GlideRecord taskGR, String name)

Returns the value of a specified scratchpad property.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task associated with the specified scratchpad property. These records are located in the Remote task [sn_sb_pro_remote_task] and Provider task [sn_sb_pro_provider_task] tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
name	String	Name of the scratchpad property whose value to retrieve. Located in the Scratchpad [sn_sb_scratchpad] table.

Returns

Type	Description
String or null	Value of the requested scratchpad property. Null if the property isn't found.

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_pro_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_pro.PSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
  gs.info(util.get(rtGR, "name1"));
}
```

Output:

```
"value1"
```

PSBScratchpadUtil - getAll(GlideRecord taskGR)

Returns the property names and values (name-value pairs) of all scratchpad properties associated with the specified task.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task whose associated scratchpad properties to return. These records are located in the Remote task [sn_sb_pro_remote_task] and Provider task [sn_sb_pro_provider_task] tables.

Returns

Type	Description
Object	All property names and values contained in the specified task. In the form: `{ name1: value1, name2: value2, … }`

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_pro_remote_task");
rtGR.setLimit(1);
rtGR.query();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_pro.PSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
  gs.info(JSON.stringify(util.getAll(rtGR)));
}
```

Output:

```
{ "name1": "value1" }
```

PSBScratchpadUtil - getNames(GlideRecord taskGR)

Returns the list of names of all scratchpad properties associated with the specified task record.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task for which to return the list of names of all associated scratchpad properties. These records are located in the Remote task [sn_sb_pro_remote_task] and Provider task [sn_sb_pro_provider_task] tables.

Returns

Type	Description
String Array	List of names of the scratchpad properties associated with the specified task record.

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_pro_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_pro.PSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
  gs.info(JSON.stringify(util.getNames(rtGR)));
}
```

Output:

```
[ "name1" ]
```

PSBScratchpadUtil - populateClientScratchpadBR(GlideRecord taskGR)

Places the scratchpad properties associated with the specified remote task or provider task in the client g_scratchpad.

You can call this method from a UI display business rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task whose associated scratchpad entries should be placed in the client g_scratchpad. These records are located in the Remote task [sn_sb_pro_remote_task] and Provider task [sn_sb_pro_provider_task] tables.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
new
 sn_sb_pro.PSBScratchpadUtil().populateClientScratchpadBR(curren
t);
```

PSBScratchpadUtil - remove(GlideRecord taskGR, String name)

Deletes the specified scratchpad property from the Scratchpad [sn_sb_scratchpad] table.

Note: Deletes are not synced to other ServiceNow instances. Scratchpad properties are automatically deleted in a specified number of days after the associated task record is deactivated or deleted.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task associated with the specified scratchpad property. These records are located in the Remote task [sn_sb_pro_remote_task] and Provider task [sn_sb_pro_provider_task] tables.
name	String	Name of the scratchpad property to remove from the Scratchpad [sn_sb_scratchpad] table.

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_pro_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_pro.PSBScratchpadUtil();
  util.update(rtGR, "name1", "value1");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  util.remove(rtGR, “name1”);
  gs.info(util.get(rtGR, "name1"));
}
```

Output:

```
undefined
```

PSBScratchpadUtil - update(GlideRecord taskGR, String name, String value, Boolean client_side_accessible)

Inserts a property or updates the value of a property in the Scratchpad [sn_sb_scratchpad] table.

Note: The maximum number of properties that you can update in one call is 50.

Parameters

Name	Type	Description
taskGR	GlideRecord	GlideRecord of the active remote task or provider task associated with the specified scratchpad property. These records are located in the Remote task [sn_sb_pro_remote_task] and Provider task [sn_sb_pro_provider_task] tables.
name	String	Name of a new or existing scratchpad property. This name must be unique across all scratchpad properties.
value	String	Value of the scratchpad property. Maximum: 4000 characters.
client_side_accessible	Boolean	Optional. Flag that indicates whether this property is available to the client-side *g_scratchpad* when *populateClientScratchpadBR* is called from a display business rule. Valid values: • true: Property is available. • false: Property isn't available. Default: false

Returns

Type	Description
None	

The following code example shows how to call this method.

```
var rtGR = new GlideRecord("sn_sb_pro_remote_task");
rtGR.setLimit(1);
rtGR.query();
rtGR.next()
if (rtGR.isValidRecord()) {
  var util = new sn_sb_pro.PSBScratchpadUtil();
  util.update(rtGR, "name1", "value2");
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  gs.info(util.get(rtGR, "name1"));
}
```

Output:

```
"value2"
```

Queue - Global

The *Queue* API (Advanced Work Assignment) provides methods to route a document to a queue.

This API is provided within the `sn_awa` namespace.

Requires the following:

- Advanced Work Assignment plugin (com.glide.awa)
- Role: awa_integration_user or admin

Queue - get(String queue_id)

Gets a queue record by sys_id.

Parameters

Name	Type	Description
queue_id	String	Represents sys_id of queue record from awa_queue table

Returns

Type	Description
Boolean	True if queue record exists, false otherwise.

```
var queue = sn_awa.Queue.get("<queue_id>");
var workItem = queue.route({
    document_sys_id: "<sys_id>",
    document_table: "<table>"
});
```

Queue – route(Object options)

Routes an active work item to the queue object.

If an active work item does not exist for the specified document, this method creates a work item and set its fields accordingly.

Parameters

Name	Type	Description
options	Object	Contains document sys_id and table associated with work item: • `document_sys_id: "<sys_id>"` • `document_table: "<table>"`, e.g., interaction

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	True if successful, error message otherwise.

```
var queue = sn_awa.Queue.get("<queue_id>");
var workItem = queue.route({
    document_sys_id: "<sys_id>",
    document_table: "<table>"
});
```

Queue - Scoped

The *Queue* API provides methods that allow you to retrieve or join a Connect Support chat queue.

To execute this class in a scoped application, use the `sn_connect` namespace identifier. The Connect Scriptable APIs plugin (ID: com.glide.connect.scriptable) must be enabled to access the *Queue* API.

Scoped Queue - get(String sysID)

Retrieves a specified chat queue.

Parameters

Name	Type	Description
SysID	String	Sys_id of a queue from the Chat Queue [chat_queue] table.

Returns

Type	Description
Object	Returns a conversation queue object.

```
var queue =
 sn_connect.Queue.get("ab73be7dc09a4300964f336ee6b74361");
```

Scoped Queue - join(String question)

Adds the current user to an existing Connect Support chat queue and posts the specified question.

Before calling this method, you must call the Scoped Queue - get(String sysID) method to retrieve the chat queue to which to attach the current user.

Parameters

Name	Type	Description
Question	String	Question to add to the chat queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Record (GlideRecord object) in the Chat Queue Entry [chat_queue_entry] table.

```
var queue =
 sn_connect.Queue.get("ab73be7dc09a4300964f336ee6b74361");
queue.join("How do I access my email?");
```

QuickRanges - Global

The *QuickRanges* script include provides methods to generate IP network, range, and address entries from a convenient comma-separated input field using conventional Classless Inter-Domain Range (CIDR) network notation, hyphenated range entries, or individual IP addresses.

You can use this script include with any server-side discovery script.

QuickRanges - createItem(String table, String id, String type)

Creates a new discovery range item.

Parameters

Name	Type	Description
table	String	The table where the item will be created.
id	String	The identifier to use for the new item.
type	String	The type of entries to generate: IP address, IP network, or IP range.

Returns

Type	Description
GlideRecord	The created entry

QuickRanges - onMakeRanges()

Returns the IP network, range, and address information to use when generating the entries.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

RecordToHTML - Global

The *RecordToHTML* script include is a utility class to turn a record into HTML.

This script include is available to server-side scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RecordToHTML - RecordToHTML(String table, String sys_id, String pattern, Boolean link)

Creates an instance of a *RecordToHTML* class.

Parameters

Name	Type	Description
table	String	Table name of the record.
sys_id	String	Sys_id of the record.
pattern	String	The pattern of the string to generate. The pattern can include ${} template literals to provide the content of existing field values. For example, the pattern "${number}" provides the number for the selected record.
link	Boolean	Flag that indicates whether generate results as an HTML link. Valid values: • true: The record information is generated as a link in an HTML tag. • false: The record information is generated as text. Default: False

The following example shows how to generate formatted incident record information in an HTML link.

```
var r2html = new RecordToHTML("incident",
 "e8e875b0c0a80164009dc852b4d677d5",
"incident: ${number}-${short_description}");
gs.print(r2html.toString());
```

Output:

```
<a
 href="incident.do?sys_id=e8e875b0c0a80164009dc852b4d677d5"><u>i
ncident: INC0000005-CPU load high for over 10 minutes</u></a>
```

RecordToHTML - setValue(String fieldName, String value)

Sets the specified field to the specified value.

Parameters

Name	Type	Description
fieldName	String	Name of the field to change.
value	String	Value to set the field to.

Returns

Type	Description
None	

The following example shows how to generate formatted incident record information including the user name as a string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var r2html = new
 RecordToHTML("incident","e8e875b0c0a80164009dc852b4d677d5",
 "incident: ${number}-${short_description} (${user})", true);
r2html.setValue("user", gs.getUserName());
gs.print(r2html.toString());
```

Output:

```
incident: INC0000005-CPU load high for over 10 minutes (admin)
```

RecordToHTML - toString()

Converts a RecordToHTML object to a string.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	HTML output of the record in the pattern set using the *RecordToHTML()* constructor.

The following example shows how to convert a *RecordToHTML* object to a string and display the results.

```
var r2html = new
 RecordToHTML("incident","e8e875b0c0a80164009dc852b4d677d5",
                         "incident:
 ${number}-${short_description}", true);
gs.print(r2html.toString());
```

Output:

```
<a
 href="incident.do?sys_id=e8e875b0c0a80164009dc852b4d677d5"><u>i
ncident: INC0000005-CPU load high for over 10 minutes</u></a>
```

RegressionSolution - Global

The *RegressionSolution* API is a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

The solution setup-to-training flow is as follows:

1. Create a dataset using the *DatasetDefinition* API.
2. Optional. Build an encoder using the *Encoder* API.
3. Use the constructor to create a regression solution object.
4. Add the solution object to the regression solution store using the *RegressionSolutionStore - add()* method.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Train the solution using the *submitTrainingJob()* method. This creates a version of the object that you can manage using the *RegressionSolutionVersion* API.
6. Get predictions using the *RegressionSolutionVersion - predict()* method.

Note: This API runs with full privileges before the Vancouver Patch 7 Hotfix 2b and Washington DC Patch 7 releases. With later releases, grant access using ACLs. For more information see Query ACLs.

For usage guidelines, refer to Using ML APIs.

RegressionSolution - RegressionSolution(Object config)

Creates a regression solution.

Parameters

Name	Type	Description
config	Object	JavaScript object containing configuration properties of the solution. `{ "algorithmConfig": {Object}, "dataset": {Object}, "domainName": "String", "encoder": {Object}, "inputFieldNames": [Array], "label": "String", "minRowCount": "String", "predictedFieldName": "String", "predictedInterval": [Array], "processingLanguage": "String", "stopwords": [Array], "trainingFrequency": "String" }`
config.dataset	Object	*DatasetDefinition* name.
config.domainName	String	Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Default: Current domain, for example, `"global"`.
config.encoder	Object	Optional. Trained encoder object to assign to this solution. See Encoder - Encoder(Object config).
config.inputFieldNames	Array	List of input field names as strings. The model uses these fields used to make predictions.
config.label	String	Identifies the prediction task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
config.minRowCount	String	Optional. Minimum number of records required in the dataset for training. Default: 10000
config.predictedFieldName	String	Mandatory unless setting *predictedInterval*. Identifies a field to be trained for predictability.
config.predictedInterval	Array	Mandatory unless setting *predictedFieldName*. Sets a range of fields to train your solution for confidence. Supports providing 2 non-numeric date fields. For example, `'predictedInterval': ['sys_updated_on', 'sys_created_on']`.
config.processingLanguage	String	Optional. Processing language in two-letter ISO 639-1 language code format. Default: "en"
config.stopwords	Array	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list.
config.trainingFrequency	String	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once

The following example shows how to create an object and add it to the RegressionSolution store.

```
var myNewData = new sn_ml.DatasetDefinition(
  {
     'tableName' : 'incident',
     'fieldNames' : ['category', 'short_description',
 'priority'],
     'fieldDetails' : [
       {
         'name' : 'category',
         'type' : 'nominal'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      },
      {
        'name' : 'short_description',
        'type' : 'text'
      }],
    'encodedQuery' : 'activeANYTHING'
  });

var mySimSolution = new sn_ml.SimilaritySolution({
  'label': "my solution definition",
  'dataset' : myNewData,
  'predictedFieldName' : 'category',
  'inputFieldNames': ['short_description']
});

var mySimilarityName =
 sn_ml.SimilaritySolutionStore.add(mySimSolution);
```

The following example shows how to create an object to train using the *predictedInterval* property.

```
var myIncidentData = new sn_ml.DatasetDefinition({
'tableName' : 'incident',
'fieldNames' : ['short_description',
 'sys_updated_on','sys_created_on'],
'encodedQuery' : 'activeANYTHING'
});

var mySolution = new sn_ml.RegressionSolution({
'label': 'reg assinGroup',
'dataset' : myIncidentData,
'predictedInterval': ['sys_updated_on', 'sys_created_on'],
'inputFieldNames': ['short_description']
});

var my_unique_name =
 sn_ml.RegressionSolutionStore.add(mySolution)
```

RegressionSolution - cancelTrainingJob()

Cancels a job for a solution object that has been submitted for training.

Parameters

Name	Type	Description
None		

Returns

Type	Description
None	

The following example shows how to cancel an existing training job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var mySolution =
 sn_ml.RegressionSolutionStore.get('ml_sn_global_global_regressi
on');

mySolution.cancelTrainingJob();
```

RegressionSolution - getActiveVersion()

Gets the active *RegressionSolutionVersion* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Active *RegressionSolutionVersion* object.

The following example shows how to get an active *RegressionSolution* version from the store and return its training status.

```
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regre
ssion');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

RegressionSolution - getAllVersions()

Gets all versions of a *RegressionSolution* object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	Existing versions of a solution object. See also *RegressionSolutionVersion* API.

The following example shows how to get all *RegressionSolution* version objects and call the *getVersionNumber()* and *getStatus()* solution version methods on them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regre
ssion');

var mlSolutionVersions = mlSolution.getAllVersions();

for (i = 0; i < mlSolutionVersions.length; i++) {
gs.print("Version " + mlSolutionVersions[i].getVersionNumber() +
 " Status: " + mlSolutionVersions[i].getStatus() +"\n");
};
```

Output:

```
Version 3 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 2 Status:
 {"state":"solution_complete","percentComplete":"100","hasJobEnd
ed":"true"}

Version 1 Status:
 {"state":"solution_cancelled","percentComplete":"0","hasJobEnde
d":"true"}
```

RegressionSolution - getLatestVersion()

Gets the latest version of a solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*RegressionSolutionVersion* object corresponding to the latest version of a *RegressionSolution()*.

The following example shows how to get the latest version of a solution and return its training status.

```
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regre
ssion');

gs.print(JSON.stringify(JSON.parse(mlSolution.getLatestVersion()
.getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "hasJobEnded": "true"
}
```

RegressionSolution - getName()

Gets the name of the object to use for interaction with the store.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the solution object.

The following example shows how to update *RegressionSolution* dataset information and print the name of the object.

```
// Update solution
var myIncidentData = new sn_ml.DatasetDefinition({
   'tableName' : 'incident',
   'fieldNames' : ['category', 'short_description', 'priority'],
   'encodedQuery' : 'activeANYTHING'
});

var eligibleFields =
 JSON.parse(myIncidentData.getEligibleFields('regression'));

var myRegression = new sn_ml.RegressionSolution({
   'label': "my regression solution",
   'dataset' : myIncidentData,
   'inputFieldNames': eligibleFields['eligibleInputFieldNames'],
   'predictedFieldName': 'category'
});

// update solution
sn_ml.RegressionSolutionStore.update('ml_x_snc_global_global_my_
solution_definition_4', myRegression);

// print solution name
gs.print('Solution Name: '+myRegression.getName());
```

Output:

```
Solution Name: ml_x_snc_global_global_my_solution_definition_4
```

RegressionSolution - getProperties()

Gets solution object properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and *RegressionSolution()* object details in the *RegressionSolutionStore*. `{ "datasetProperties": {Object}, "domainName": "String", "encoder": {Object}, "inputFieldNames": [Array], "label": "String", "name": "String", "predictedFieldName": "String", "predictedInterval": [Array], "processingLanguage": "String", "scope": "String", "stopwords": [Array], "trainingFrequency": "String" }`
<Object>.datasetProperties	Lists the properties of the *DatasetDefinition()* object associated with the solution. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array],`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>"tableName": "String"
	}</pre>
	Data type: Object.

<Object>.datasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.

<Object>.datasetProperties.fieldNames.fieldDetails	List of JavaScript objects that specify field properties.
	
	<pre>[
	{
	"name": "String",
	"type": "String"
	}
	]</pre>
	Data type: Array.

<Object>.datasetProperties.fieldNames.fieldDetails.<object>.name	Name of the field defining the type of information to restrict this dataset to. Data type: String.
<Object>.datasetProperties.fieldDetails.<object>.type	Machine-learning field type. Data type: String.
<Object>.datasetProperties.fieldDetails.encodedQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.encoder	Encoder object assigned to this solution. See Encoder - Encoder(Object config). Data type: Object.
<Object>.inputFieldNames	List of input field names as strings. The model uses these fields used to make predictions. Data type: String.
<Object>.label	Identifies the prediction task. `{ "label": "my first prediction" }` Data type: String.
<Object>.name	System-assigned name. Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.predictedInterval	Range of values specifying the prediction confidence level. Data type: Array
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *language* property setting. For details, see Create a custom stopwords list. Data type: Array.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.trainingFrequency	The frequency to retrain the model. Possible values: • every_30_days • every_60_days • every_90_days • every_120_days • every_180_days • run_once Default: run_once Data type: String.

The following example gets properties of a solution object in the store.

```
var mySolution =
 sn_ml.RegressionSolutionStore.get('ml_sn_global_global_regressi
on_solution');

gs.print(JSON.stringify(JSON.parse(mySolution.getProperties()),
 null, 2));
```

Output:

```
*** Script: {
  "datasetProperties": {
    "tableName": "cloudinfratext",
    "fieldNames": [
      "short_description",
      "sourcedc",
      "targetdc",
      "dbsize",
      "duration"
    ]
  },
  "domainName": "global",
  "encoderProperties": {
    "datasetsProperties": [],
    "name": "wc_regression"
  },
  "inputFieldNames": [
    "short_description",
    "sourcedc",
    "targetdc",
    "dbsize"
  ],
  "label": "Regression Test for DB Restore",
  "name": "ml_x_snc_global_global_regression",
```

```
  "predictedFieldName": "duration",
  "processingLanguage": "en",
  "scope": "global",
  "stopwords": [
    "Default English Stopwords"
  ],
  "trainingFrequency": "every_30_days"
}
```

RegressionSolution - getVersion(String version)

Gets a solution by provided version number.

Parameters

Name	Type	Description
version	String	Existing version number of a solution.

Returns

Type	Description
Object	Specified version of the *RegressionSolution()* object on which you can call *RegressionSolutionVersion* API methods.

The following example shows how to get the training status of a solution by version number.

```
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regre
ssion');

gs.print(JSON.stringify(JSON.parse(mlSolution.getVersion('1').ge
tStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

RegressionSolution - setActiveVersion(String version)

Activates a specified version of a solution in the store.

Parameters

Name	Type	Description
version	String	Name of the *RegressionSolution()* object version to activate. Activating this version deactivates any other version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
None	

The following example shows how to activate a solution version in the store.

```
sn_ml.RegressionSolution.setActiveVersion("ml_incident_categoriz
ation");
```

RegressionSolution - submitTrainingJob()

Submits a training job.

Note: Before running this method, you must first add a solution to the store using the *RegressionSolutionStore - add()* method.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	*RegressionSolutionVersion* object corresponding to the *RegressionSolution* being trained.

The following example shows how to create a dataset, apply it to a solution, add the solution to a store, and submit the training job.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// Create a solution
var mySolution = new sn_ml.RegressionSolution({

  'label': "my solution definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the solution to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.RegressionSolutionStore.add(mySolution);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Train the solution - this is a long running job
var myRegressionVersion = mySolution.submitTrainingJob();
```

RegressionSolutionStore - Global

Enables storing and retrieving solutions.

The *RegressionSolutionStore* API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

RegressionSolutionStore - add(Object mlSolution)

Adds a new solution object to the store and returns a unique name.

Note: Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

Parameters

Name	Type	Description
mlSolution	RegressionSolution	*RegressionSolution()* object to add to the store.

Returns

Type	Description
String	System-generated solution name.

The following example shows how to add a solution to the store. Use *RegressionSolution - submitTrainingJob()* to train the Solution after adding it to the store.

```
// Create a dataset
var myData = new sn_ml.DatasetDefinition({

  'tableName' : 'incident',
  'fieldNames' : ['assignment_group', 'short_description',
 'description'],
  'encodedQuery' : 'activeANYTHING'

});

// Create an solution
var mySolution = new sn_ml.RegressionSolution({

  'label': "my solution definition",
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames':['short_description']

});

// Add the solution to the store to later be able to retrieve
 it.
var my_unique_name =
 sn_ml.RegressionSolutionStore.add(mySolution);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RegressionSolutionStore - deleteObject(String name)

Removes a specified solution object from the store.

Parameters

Name	Type	Description
name	String	Name of the *RegressionSolution()* object to be deleted.

Returns

Type	Description
None	

The following example shows how to delete a solution from the store.

```
sn_ml.RegressionSolutionStore.deleteObject("ml_sn_global_global_
solution");
```

RegressionSolutionStore - get(String name)

Gets a solution object from the store.

Parameters

Name	Type	Description
name	String	Name of a solution in the store.

Returns

Type	Description
Object	*RegressionSolution* object. Returns an error if the object does not exist.

The following example shows how to get a solution object from the store using the *get()* method and view its training status using the RegressionSolution - getActiveVersion() and RegressionSolutionVersion - getStatus() methods.

```
// Get status
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_incident_categorization
');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus(), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RegressionSolutionStore - getAllNames(Object options)

Gets the names of all solution definition records in the store.

Parameters

Name	Type	Description
options	Object	Options for restricting results within the specified properties. `{ "label": "String", "domainName": "String", "scope": "String" };`
options.label	String	Optional. Label of your solution object.
options.domainName	String	Optional. Name of the domain for your solution object. Refer to Domain separation and Predictive Intelligence.
options.scope	String	Optional. Name of an application scope for your solution object.

Returns

Type	Description
Array	List of strings representing solution object names in the store.

In the following example, the *getAllNames()* method returns a list of all names in the store.

```
gs.print(JSON.stringify(JSON.parse(sn_ml.RegressionSolutionStore
.getAllNames()), null, 2));
```

Output:

```
[
  "ml_x_snc_global_global_my_solution_definition_3",
  "ml_incident_assignment",
  "ml_x_snc_global_global_my_solution_definition",
  "ml_x_snc_global_global_my_solution_definition_2",
  "ml_sn_global_global_incident_service"
]
```

In the following example, the *getAllNames()* method returns only names associated with values set in the *options* parameter.

```
var options = {
  'label' : 'my solution definition',
  'domainName' : 'global',
  'scope' : 'global'
};
var solNames =
 sn_ml.RegressionSolutionStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));
```

Output:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
[
  "ml_x_snc_global_global_my_solution_definition"
]
```

RegressionSolutionStore - update(String name, Object mlSolution)

Replaces an existing object in the store with the object passed as a parameter. The object name provided must be empty or match.

Parameters

Name	Type	Description
name	String	Name of the solution to update.
mlSolution	*RegressionSolRegressionSolution()* object	properties to update.

Returns

Type	Description
None	

The following example shows how to update a solution object in the store.

```
var solutionUpdate = new sn_ml.RegressionSolution({
  'label': 'my solution definition',
  'dataset' : myData,
  'predictedFieldName' : 'assignment_group',
  'inputFieldNames': ['short_description']
});

sn_ml.RegressionSolutionStore.update('ml_sn_global_global_incide
nt_service', solutionUpdate);
```

RegressionSolutionVersion - Global

The *RegressionSolutionVersion* API is a scriptable object used in Predictive Intelligence stores.

This API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

Use this API when working with solution versions based on RegressionSolution API objects in the RegressionSolution store.

The system creates a solution version each time you train a solution definition. Most versions are created during scheduled solution training.

Methods in this API are accessible using the following *RegressionSolution* methods:

- *getActiveVersion()*
- *getAllVersions()*
- *getLatestVersion()*
- *getVersion()*

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RegressionSolutionVersion - getProperties()

Gets solution object properties and version number.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	Contents of the Dataset and RegressionSolution version details. Results vary by object property setup. `{ "datasetProperties": {Object}, "domainName": "String", "encoder": {Object}, "inputFieldNames": [Array], "isActive": Boolean, "label": "String", "name": "String", "predictedFieldName": "String", "predictedInterval": [Array], "processingLanguage": "String", "scope": "String", "stopwords": [Array], "versionNumber": "Number" }`
<Object>.datasetProperties	Lists the properties of the *DatasetDefinition()* object associated with the solution. `{ "encodedQuery": "String", "fieldDetails": [Array], "fieldNames": [Array], "tableName": "String" }`
<Object>.datasetProperties.tableName	Name of the table for the dataset. For example, `"tableName" : "Incident"`. Data type: String.
<Object>.datasetProperties.fieldNames	List of field names from the specified table as strings. For example, `"fieldNames" : ["short_description", "priority"]`. Data type: Array.
<Object>.datasetProperties.fieldDetails	List of UnassignedObjects that specify field properties. `[ {`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description

	<pre>{
	  "name": "String",
	  "type": "String"
	}
	]</pre>
	Data type: Array.

<Object>.datasetProperties.fieldDetails	Name of the field. Details <object> information to restrict this dataset to. Data type: String.
<Object>.datasetProperties.fieldDetails	Machine learning (ML) field type. Data type: String.
<Object>.datasetProperties.filterQuery	Encoded query string in standard Glide format. See Encoded query strings. Data type: String.
<Object>.domainName	Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.
<Object>.encoder	Encoder object assigned to this solution. See Encoder - Encoder(Object config). Data type: Object.
<Object>.inputFieldNameList	List of input field names as strings. The model uses these fields used to make predictions. Data type: String.
<Object>.isActive	Flag that indicates whether this version is active. Valid values: • true: Version is active. • false: Version is not active. Data type: String

<Object>.label	Identifies the prediction task.
	<pre>{
	  "label": "my first prediction"
	}</pre>
	Data type: String.

<Object>.name	System-assigned name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	Data type: String.
<Object>.predictedFieldName	Identifies a field to be trained for predictability. Data type: String.
<Object>.predictedInterval	Range of values specifying the prediction confidence level. Data type: Array
<Object>.processingLanguage	Processing language in two-letter ISO 639-1 language code format. Data type: String.
<Object>.scope	Object scope. Currently the only valid value is `global`. Data type: String
<Object>.stopwords	Optional. Preset list of strings that the system automatically generates based on the *`language`* property setting. For details, see Create a custom stopwords list. Data type: Array.
<Object>.versionNumber	Version number of the *`RegressionSolution`* object.

The following example gets properties of the active object version in the store.

```
// Get properties
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_incident_categorization
');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getProperties()), null, 2));
```

Output:

```
{
  "datasetProperties": {
    "encodedQuery": "",
    "fieldNames": [
      "short_description",
      "sourcedc",
      "targetdc",
      "dbsize",
      "duration"
    ],
    "tableName": "cloudinfratext"
  },
  "domainName": "global",
  "encoderProperties": {
    "datasetsProperties": [],
    "name": "wc_regression"
  },
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "inputFieldNames": [
    "short_description",
    "sourcedc",
    "targetdc",
    "dbsize"
  ],
  "isActive": "true",
  "label": "Regression Test for DB Restore",
  "name": "ml_x_snc_global_global_regression",
  "predictedFieldName": "duration",
  "processingLanguage": "en",
  "stopwords": [
    "Default English Stopwords"
  ],
  "versionNumber": "1"
}
```

RegressionSolutionVersion - getStatus(Boolean includeDetails)

Gets training completion status.

Parameters

Name	Type	Description
includeDetails	Boolean	Flag that indicates whether to return status *details*. Valid values: • true: Return additional details. • false: Don't return additional details. Default: False

Returns

Type	Description
Object	JavaScript object containing training status information for a RegressionSolution object. `{ "state": "String", "percentComplete": "Number as a String", "hasJobEnded": "Boolean value as a String", "details": {Object} }`
<Object>.state	Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the *hasJobEnded* property is set to `true`. Possible values: • `fetching_files_for_training` • `preparing_data` • `retry`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
	• `solution_cancelled` (terminal) • `solution_complete` (terminal) • `solution_error` (terminal) • `solution_incomplete` • `training_request_received` • `training_request_timed_out` (terminal) • `training_solution` • `uploading_solution` • `waiting_for_training` Data type: String
<Object>.hasJobEnded	Flag that indicates whether training is complete. Valid values: • true: Training is complete. • false: Training is incomplete. Data type: Boolean value as a String
<Object>.percentComplete	Training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out. Data type: Number as a String Range: 0 thru 100
<Object>.details	Object containing a list of additional training details. Data type: Object

The following example shows a successful result with training complete.

```
// Get status
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_incident_categorization
');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion()
.getStatus(true), null, 2)));
```

Output:

```
{
 "state":"solution_complete",
 "percentComplete":"100",
 "hasJobEnded":"true",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 "details":{"stepLabel":"Solution Complete"} // This information
 is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```
// Get status
var solutionName = 'ml_x_snc_global_global_regression_solution';
var mlSolution =
 sn_ml.RegressionSolutionStore.get(solutionName);
var trainingStatus = mlSolution.getLatestVersion().getStatus();

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
 "state":"solution_error",
 "percentComplete":"100",
 "hasJobEnded":"true"
}
```

RegressionSolutionVersion - getVersionNumber()

Gets the version number of a solution object.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Version number.

The following example shows how to get a version number.

```
// Get version number
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_incident_categorization
');

gs.print("Version number:
 "+JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getVe
rsionNumber()), null, 2));
```

Output:

```
Version number: 1
```

RegressionSolutionVersion - predict(Object input, Object options)

Gets the input data for a prediction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
input	Object	*GlideRecord* or array of JSON objects containing field names and values as key-value pairs.
options	Object	Optional values for filtering prediction results. `{ "apply_threshold": Boolean, "top_n": Number }`
options.apply_threshold	Boolean	Flag that indicates whether to check the threshold value for the solution and apply it to the result set. Valid values: • true: Return results in which confidence is greater than threshold. • false: Return all results. Default: True
options.top_n	Number	If provided, returns the top results, up to the specified number of predictions.

Returns

Type	Description
Object	JSON object containing the prediction results sorted by sys_id or record_number. `{ <identifier>: [Array] }`
<Object>.<identifier>	List of objects with details for each prediction result. Data type: Array of Objects `<identifier>: [ { "confidence": Number, "predictedSysId": "String", "predictedValue": "String", "threshold": Number } ]`
<Object>.<identifier>.<object_id>.confidence	Value of the confidence associated with the prediction. For example, 53.84. Data type: Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns (continued)

Type	Description
<Object>.<identifier>.<object_id>.predictedSysId	The sys_id of the predicted value. Results can be from any table on which information is being predicted. Data type: String
<Object>.<identifier>.<object_id>.predictedValue	Value of the prediction result. Data type: String
<Object>.<identifier>.<object_id>.threshold	Value of the configured threshold associated with the prediction. Data type: Number

The following example shows how to display prediction results for a *predict()* method that takes a GlideRecord by sys_id for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_incident_categorization
');

// single GlideRecord input
var input = new GlideRecord("incident");
input.get("<sys_id>");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.getVersion(1).predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

```
{
        "<sys_id/now_GR>": [
    {
      "confidence": 62.10782320780268,
      "threshold": 20.36,
      "predictedValue": "Clone Issues",
      "predictedSysId": ""
    },
    {
      "confidence": 6.945237375770391,
      "threshold": 16.63,
      "predictedValue": "Instance Administration",
      "predictedSysId": ""
    },
    {
      "confidence": 5.321061076300759,
      "threshold": 23.7,
      "predictedValue": "Administration",
      "predictedSysId": ""
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
  ]
}
```

The following example shows how to display prediction results for a *predict()* method that takes an array of field names as key-value pairs for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```
var mlSolution =
 sn_ml.RegressionSolutionStore.get('ml_incident_categorization
');
// key-value pairs input
var input = [{"short_description":"my email is not working"},
 {short_description:"need help with password"}];
// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;
var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

```
{
  "1": [
    {
      "confidence": 37.5023032262591,
      "threshold": 10.72,
      "predictedValue": "Authentication",
      "predictedSysId": ""
    },
    {
      "confidence": 24.439964862166583,

```
      "confidence": 2.8773826570713514,
      "threshold": -1,
      "predictedValue": "Email (I/f)",
      "predictedSysId": ""
    }
  ]
}
```

RemedialActionEngine - Scoped

The *RemedialActionEngine* API provides methods for working with remedial actions.

This API is part of the Remedial Actions Framework and can be used to perform the following actions:

- Kick start a remedial action.
- Trigger the execution of a remedial action.
- Check the authorization of logged in user to execute the remedial action.
- Check the applicability of the remedial action against the target record.
- Get the current execution status and output payload of the targeted action.

This API requires the Remedial Actions Framework (com.snc.sn_reacf) store application and is provided within the `sn_reacf` namespace.

RemedialActionEngine - beginRemediation (String remedialAction, String parentTable, String parentRecord, Object actionParams, String targetRecord, String originRecord)

Starts any remedial action from the parent record against a target record. This method creates a new remedial action execution record in a 'Ready' state.

Note: When defining request parameters, remember that:

- If the parameter type is an object or array, define each property and its type.
- If the parameter type is GlideRecord, provide the associated table in your request.

Parameters

Name	Type	Description
remedialAction	String or GlideRecord	Sys_id or internal_name or GlideRecord of the femedial action [sn_reacf_remedial_action] table.
parentTable	String	Table name of the parent record.
parentRecord	String	Sys_id of the parent record.
actionParams	Object	Optional. Map of remedial action parameter names and values. `{ "<parameter name>": <parameter value> }` **Note:** Parameter value should be of type defined in remedial action Parameter [sn_reacf_remedial_action_parameter] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
targetRecord	String or GlideRecord	Optional. Sys_id or GlideRecord of the configured Target table.
originRecord	String or GlideRecord	Optional. Sys_id or GlideRecord of the Remedial Action Origin [sn_reacf_remedial_action_origin] table.

Returns

Type	Description
Object	`{ "statusCode": "String", "actionExecutionRequestId": "String", "parentRecord": "String", "parentTable": "String" }`
<Object>.statusCode	Status code of the remedial action execution request i.e. successful, duplicate_request or failed
<Object>.actionExecutionRequestId	Sys_id of the new Rremedial action execution record or duplicate concurrent Remedial Action Execution record
<Object>.parentRecord	Sys_id of the Parent record of the duplicate concurrent remedial action execution record.
<Object>.parentTable	Table name of the Parent record of the duplicate concurrent remedial action execution record.

The following example shows how to start any remedial action. Here, the remedial action uses a CI Action internally to kill a process on a CI.

```
var remedialAction = "9ef9924c436521101a24ff53e9b8f2d2" //sys_id
 of the Action
var parentTable = "incident"; //table name of the Parent record
var parentRecord = "62733787871e25105763ec6d0ebb3579" //sys_id
 of the Parent record

RemedialActionEngine - canCancel(String remedialActionExecution)

This method is used to check if the current user can or cannot cancel the given remedial action execution.

Note: When defining request parameters, remember that:

- If the parameter type is an object or array, define each property and its type.
- If the parameter type is GlideRecord, provide the associated table in your request.

Parameters

Name	Type	Description
remedialActionExecution	String GlideRecord	Sys_id or GlideRecord of the Remedial Action Execution [sn_reacf_remedial_action_execution] table.

Returns

Type	Description
Boolean	Flag that indicates whether the remedial action execution request can or cannot be canceled. Valid values: • true: The specified remedial action execution request can be canceled. • false: The specified remedial action execution request cannot be canceled.

The following example shows how to validate whether the current user can cancel any remedial action execution in its current state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var remedialActionExecutionId =
 "9ef9924c436521101a24ff53e9b8f2d2" //sys_id of
 sn_reacf_remedia_action_execution record

var remedialActionEngine = new sn_reacf.RemedialActionEngine();
var canCancel =
 remedialActionEngine.canCancel(remedialActionExecutionId)

gs.info("canCancel: " + canCancel);
```

Output:

```
canCancel: true
```

RemedialActionEngine - cancelExecution(String remedialActionExecution)

Cancels a remedial action execution request, then updates the execution record to the state 'cancelled' and returns true upon success.

Note: When defining request parameters, remember that:

- If the parameter type is an object or array, define each property and its type.
- If the parameter type is GlideRecord, provide the associated table in your request.

Parameters

Name	Type	Description
remedialActionExecution	String GlideRecord	Sys_id or GlideRecord of the Remedial Action Execution [sn_reacf_remedial_action_execution] table.

Returns

Type	Description
Boolean	Flag that indicates whether the remedial action execution request can or cannot be canceled. Valid values: • true: The specified remedial action execution request is canceled successfully. A status of true updates the execution record to the state 'cancelled'. • false: The specified remedial action execution request is not canceled successfully.

The following example shows how to cancel any remedial action execution from its current state.

```
var remedialActionExecutionId =
 "9ef9924c436521101a24ff53e9b8f2d2" //sys_id of
 sn_reacf_remedia_action_execution record

var remedialActionEngine = new sn_reacf.RemedialActionEngine();
var cancelExecution =
 remedialActionEngine.cancelExecution(remedialActionExecutionId)

gs.info('cancelExecution: ' + cancelExecution);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output:

```
cancelExecution : true
```

RemedialActionEngine - executeRemedialAction (String remedialActionExecution)

Triggers any remedial action execution that was started and is currently in Ready state. This method starts the targeted Action (e.g. CI Action) and moves the remedial action execution state to 'In Progress'.

Parameters

Name	Type	Description
remedialActionExecution	String GlideRecord	Sys_id or GlideRecord of the Remedial Action Execution [sn_reacf_remedial_action_execution] table.

Returns

Type	Description
Object	Object contains the action_execution_table and action_execution_id of the remedial action execution. `{ "action_execution_table": "String", "action_execution_id": "Sys_id" }`

The following example shows how to execute any remedial action.

```
var remedialActionExecution =
 "8ed58be387d2a5100295ebd73cbb35a3"; //Sys_id of the Remedial
 Action Execution record

var remedialActionEngine = new sn_reacf.RemedialActionEngine();
var response =
 remedialActionEngine.executeRemedialAction(remedialActionExecut
ion);
gs.info("Response: " + JSON.stringify(response, null, 2));
```

Output:

```
{
  "action_execution_table": "sn_cimaf_action_request",
  "action_execution_id": "2d7843a787d2a5100295ebd73cbb35d4"
}
```

RemedialActionEngine - getRemedialActionOutput (String remedialActionExecution)

Gets the current execution status and output payload of the targeted Action.

Parameters

Name	Type	Description
remedialActionExecution	String GlideRecord	Sys_id or GlideRecord of the Remedial Action Execution [sn_reacf_remedial_action_execution] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Object contains the status object having value and display value of the target Action status, and payload array having the target Action outputs executed as part of the Remedial Action execution. Data type: String `{ "status": { "value": "completed", "displayValue": "Completed" }, "payload": [ "{\"output\":\"SUCCESS: The process with PID 19604 has been terminated.\\r\\n\",\"cmd\":\"taskkill /pid 19604 /f\"}" ] }`

The following example shows how to get current execution status and output payload of the targeted Action.

```
var remedialActionExecution =
 "8ed58be387d2a5100295ebd73cbb35a3"; //sys_id of the Remedial
 Action Execution record

var remedialActionEngine = new sn_reacf.RemedialActionEngine();
var response =
 remedialActionEngine.getRemedialActionOutput(remedialActionExec
ution);

gs.info("Response: " + JSON.stringify(response, null, 2));
```

Output:

```
{
  "status": {
    "value": "completed",
    "displayValue": "Completed"
  },
  "payload": [
    "{\"output\":\"SUCCESS: The process with PID 19604 has been
 terminated.\\r\\n\",\"cmd\":\"taskkill /pid 19604 /f\"}"
  ]
}
```

RemedialActionEngine - isApplicable (String remedialAction, String targetRecord)

Checks the applicability of any remedial action against a target record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
remedialAction	String or GlideRecord	Sys_id or internal_name or GlideRecord of the remedial action [sn_reacf_remedial_action] table.
targetRecord	String or GlideRecord	Sys_id or GlideRecord of the configured Target table.

Returns

Type	Description
Boolean	Flag that indicates the target record's applicability for the remedial action. • true: the Remedial Action is applicable to the specified target record. • false: the Remedial Action is not applicable to the specified target record.

The following example shows how to check applicability of any remedial action against a target record.

```
var remedialAction =
 "9ef9924c436521101a24ff53e9b8f2d2"; //Sys_id of the Remedial
 Action Execution record
var targetRecord = "df3799a387a921100295ebd73cbb35c4"; //Sys_id
 of the Target Record

var remedialActionEngine = new sn_reacf.RemedialActionEngine();
var isApplicable =
 remedialActionEngine.isApplicable(remedialAction,
 targetRecord);
gs.info("Is applicable: " + isApplicable);
```

Output:

```
Is applicable: true
```

RemedialActionEngine - isAuthorized(String remedialAction)

Checks if the user is authorized to execute the remedial action.

Parameters

Name	Type	Description
remedialAction	String or GlideRecord	Sys_id or internal_name or GlideRecord of the Remedial Action [sn_reacf_remedial_action] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Boolean	Flag that indicates the resulting success status of the user's authorization. • true: The user's authorization is successful. • false: The user's authorization is unsuccessful.

The following example shows how to check authorization to execute any remedial action.

```
var actionSysId = "e62f550843e121101a24ff53e9b8f23b"; //Sys_id
 of the Action

var remedialActionEngine = new sn_reacf.RemedialActionEngine();
var isAuthorized =
 remedialActionEngine.isAuthorized(actionSysId);
gs.info("Is user authorized: " + isAuthorized);
```

Output:

```
Is user authorized: true
```

RenderProperties - Global

The *RenderProperties* API provides methods to obtain information about the current page and is available in Jelly scripts and in UI-action conditions and scripts.

Access *RenderProperties* methods using the static variable RP.

RenderProperties - getEncodedQuery()

Returns the encoded query from the URL sent to the page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Returns the encoded query from the URL sent to the form.

The following example is used in a condition for UI action named listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
RP.getEncodedQuery() != null &&
 (RP.getEncodedQuery().indexOf('table=global') < 0 &&
 RP.getEncodedQuery().indexOf('table=') >= 0)
```

RenderProperties - getListControl()

Returns the list control object for the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
SysListControl object	The list control object for the page.

The following example is used in a condition named New for CAB Agenda Items. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && !RP.getListControl().isOmitNewButton() &&
 RP.isRelatedList() && !RP.isManyToMany() && !RP.isInDevStudio()
 && (new sn_change_cab.CABMeeting(parent)).canAddAgendaItem()
```

RenderProperties - getParameterValue(String parameterName)

Returns the value of the specified URL parameter.

Parameters

Name	Type	Description
parameterName	String	Name of the parameter passed on the URL.

Returns

Type	Description
String	The parameter's value.

The following example is used in a condition for the Insert and Stay UI action for configuration items listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && (!current.instanceOf('task')
 || gs.getProperty('glide.ui.task.insert') ==
 'true') && (!current.instanceOf('sys_db_object')) &&
 JSUtil.nil(RP.getParameterValue("sysparm_changeset"))
```

RenderProperties - getReferringURL()

Returns the URL where the request originated.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The URL of the page where the request originated.

The following example is used in a condition for the Import Sets UI action for import set row listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
RP.getReferringURL().indexOf("sys_import_set.do") == -1 && new
 global.ImportSetRowHelper().canReadImportSets();
```

RenderProperties - getViewID()

Returns the view the page is using.

This method is not available in scoped applications.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The sys_id of the view being used.

RenderProperties - getViewName()

Returns the name of the view in use.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the view being used.

The following example is used in a condition named New for action assignment. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
RP.getViewName() != '' && RP.getViewName() != null &&
 RP.getViewName() != undefined
```

RenderProperties - getWindowProperties()

Returns the window's properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	The window's properties

RenderProperties - isInDevStudio()

Returns true if the page is part of Studio.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true if the page is part of Studio.

The following example is used in a condition named New for CAB Agenda Items. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && !RP.getListControl().isOmitNewButton() &&
 RP.isRelatedList() && !RP.isManyToMany() && !RP.isInDevStudio()
 && (new sn_change_cab.CABMeeting(parent)).canAddAgendaItem()
```

RenderProperties - isInteractive()

Returns true if this is an interactive session. An interactive session is when a user has logged in as opposed to a REST request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if this is an interactive session.

RenderProperties - isManyToMany()

Returns true when the `sysparm_collection_related_file` URL parameter is set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Returns true when the `sysparm_collection_related_file` URL parameter is set.

The following example is used in a condition named New for CAB Agenda Items. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && !RP.getListControl().isOmitNewButton() &&
 RP.isRelatedList() && !RP.isManyToMany() && !RP.isInDevStudio()
 && (new sn_change_cab.CABMeeting(parent)).canAddAgendaItem()
```

RenderProperties - isRelatedList()

Returns true when the `sys_is_related_list` URL-parameter is true. Returns false if the parameter is not present.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	True if the URL parameter `sys_is_related_list` is true.

The following example is used in a condition for a UI action listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && RP.isRelatedList()
```

RenderProperties - Scoped

The *`RenderProperties`* API provides methods to obtain information about the current page and is available in Jelly scripts and in UI-action conditions and scripts.

Access *`RenderProperties`* methods using the static variable `RP`.

Scoped RenderProperties - getEncodedQuery()

Returns the encoded query from the URL sent to the page.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	Encoded query from the URL sent to the form.

The following example is used in a condition for UI action named listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
RP.getEncodedQuery() != null &&
 (RP.getEncodedQuery().indexOf('table=global') < 0 &&
 RP.getEncodedQuery().indexOf('table=') >= 0)
```

Scoped RenderProperties - getListControl()

Returns the list control object for the page.

Parameters

Name	Type	Description
None		

Returns

Type	Description
ScopedSysListControl object	Lst control object for the page.

The following example is used in a condition named New for CAB Agenda Items. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && !RP.getListControl().isOmitNewButton() &&
 RP.isRelatedList() && !RP.isManyToMany() && !RP.isInDevStudio()
 && (new sn_change_cab.CABMeeting(parent)).canAddAgendaItem()
```

Scoped RenderProperties - getParameterValue(String parameterName)

Returns the value of the specified URL parameter.

Parameters

Name	Type	Description
parameterName	String	Name of the parameter passed on the URL.

Returns

Type	Description
String	The parameter's value.

The following example is used in a condition for the Insert and Stay UI action for configuration items listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && (!current.instanceOf('task')
 || gs.getProperty('glide.ui.task.insert') ==
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 'true') && (!current.instanceOf('sys_db_object')) &&
 JSUtil.nil(RP.getParameterValue("sysparm_changeset"))
```

Scoped RenderProperties - getReferringURL()

Returns the URL where the request originated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	URL of the page where the request originated.

The following example is used in a condition for the Import Sets UI action for import set row listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
RP.getReferringURL().indexOf("sys_import_set.do") == -1 && new
 global.ImportSetRowHelper().canReadImportSets();
```

Scoped RenderProperties - getViewName()

Returns the name of the view in use.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	Name of the view being used.

The following example is used in a condition named New for action assignment. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
RP.getViewName() != '' && RP.getViewName() != null &&
 RP.getViewName() != undefined
```

Scoped RenderProperties - getWindowProperties()

Returns the window's properties.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	Window's properties.

Scoped RenderProperties - isInDevStudio()

Returns true if the page is part of Studio.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the page is part of Studio. Possible values: • true: Page is part of Studio. • false: Page isn't part of Studio.

The following example is used in a condition named New for CAB Agenda Items. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && !RP.getListControl().isOmitNewButton() &&
 RP.isRelatedList() && !RP.isManyToMany() && !RP.isInDevStudio()
 && (new sn_change_cab.CABMeeting(parent)).canAddAgendaItem()
```

Scoped RenderProperties - isInteractive()

Returns true if this is an interactive session. An interactive session is when a user has logged in as opposed to a REST request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether this is an interactive session. Possible values: • true: Interactive session. • false: Not an interactive session.

Scoped RenderProperties - isManyToMany()

Returns true when the `sysparm_collection_related_file` URL parameter is set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the `sysparm_collection_related_file` URL parameter is set. Possible values: • true: Parameter is set. • false: Parameter isn't set.

The following example is used in a condition named New for CAB Agenda Items. This UI action is listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && !RP.getListControl().isOmitNewButton() &&
 RP.isRelatedList() && !RP.isManyToMany() && !RP.isInDevStudio()
 && (new sn_change_cab.CABMeeting(parent)).canAddAgendaItem()
```

Scoped RenderProperties - isRelatedList()

Returns true when the `sys_is_related_list` URL-parameter is true. Returns false if the parameter is not present.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Boolean	Flag that indicates whether the URL parameter `sys_is_related_list` is set to `true`. Possible values: • true: `sys_is_related_list` is set to `true`. • false: `sys_is_related_list` is set to `false`.

The following example is used in a condition for a UI action listed in the UI Actions [sys_ui_action] table. See also UI actions.

```
current.canCreate() && RP.isRelatedList()
```

ReportCiStatusOutputJS - Scoped

The *`ReportCiStatusOutputJS`* API provides methods that return specific object properties for the *`DiscoveryAPI reportCiIpAddressStatus`* method and then converts the information into a JSON string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This class runs is in the `sn_discovery` namespace.

ReportCiStatusOutputJS - getCiOperationStatus()

Returns the state of the scanned CI.

This is a calculated field based on the last_state field in discovery_device_history table and the state field in the discovery_status table.

Parameters

Name	Type	Description
None		

Returns

Type	Description
string	The three possible states returned by this method are: • Processing: Discovery is still processing the request. • Successful: A CI was created or updated. • NotSuccessful: A CI was not created or updated, and the Discovery status was Completed or Cancelled.

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
gs.info("ipResultObj(CiOperationStatus): " +
 ipResultObj.getCiOperationStatus());
```

ReportCiStatusOutputJS - getCmdbCI()

Returns the value in the cmdb_ci field from the discovery_device_history table for the CI being scanned.

Parameters

Name	Type	Description
None		

Returns

Type	Description
string	Sys_id of the CI created or updated. This value can be null in the case of intermediate results before a CI is created.

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
gs.info("ipResultObj(cmdb): " + ipResultObj.getCmdbCI());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReportCiStatusOutputJS - getDiscoveryState()

Returns the value from the **State** field in the Discovery Status [discovery_status] table.

The values returned by this method are used to calculate the value returned by the getCiOperationStatus() method

Parameters

Name	Type	Description
None		

Returns

Type	Description
string	The possible states returned by this method are: • Starting • Active • Complete • Cancelled

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
gs.info("ipResultObj(discoveryState): " +
 ipResultObj.getDiscoveryState());
```

ReportCiStatusOutputJS - getIpAddress()

Returns the value from the source field in the discovery_device_history table for the CI being scanned.

Parameters

Name	Type	Description
None		

Returns

Type	Description
string	The IP address of the CI being scanned.

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
gs.info("ipResultObj(IpAddress): " +
 ipResultObj.getIpAddress());
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ReportCiStatusOutputJS - getIssues()

Returns the value from the issues field in the discovery_device_history table for the CI being scanned.

Parameters

Name	Type	Description
None		

Returns

Type	Description
integer	Number of issues in this Discovery for this CI.

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
gs.info("ipResultObj(issues): " + ipResultObj.getIssues());
```

ReportCiStatusOutputJS - getIssuesLink()

Returns the value from the issues_link field in the discovery_device_history table for the CI being scanned.

Parameters

Name	Type	Description
None		

Returns

Type	Description
string	The issues_link field from the discovery_device_history table. This value may be null or an anchor tag defining a hyperlink to a page that provides the list of issues associated with the Discovery Status and CI (IP address).

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
gs.info("ipResultObj(issues_link): " +
 ipResultObj.getIssuesLink());
```

ReportCiStatusOutputJS - toJson()

Serializes the *ReportCiStatusOutputJS* object.

This method throws the *IllegalArgumentException* exception, `Cannot serialize object, e` when the method is unable to serialize the object. The **e** is the exception object, which provides the exception message and trace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
None		

Returns

Type	Description
string	Serialized instance of the *ReportCiStatusOutputJS* object into a JSON string.

```
var ipResultObj =
 sn_discovery.DiscoveryAPI.reportCiIpAddressStatus(ipAddress,
 discoveryStatus);
gs.info("ipResultObj(json): " + ipResultObj.toJson());
```

RequestAuthAPI - Scoped

The *RequestAuthAPI* provides methods to apply a signature to a REST request.

Generate outbound signing requests using these APIs in the following order:

1. *HttpRequestData*: Build the API request.
2. *AuthCredential*: Create a credential object or update an existing one. Use the credential to sign the request through the *RequestAuthAPI* class.
3. *RequestAuthAPI*: Sign the request and return an HttpRequestAuthedData object.
4. *HttpRequestAuthedData*: Get information about the signed request.
5. *GlideHTTPRequest*: Send the signed request.

Before using these APIs, you must configure an authentication algorithm to sign the request and associate it with the credential used to authenticate the request.

Use this API in scoped scripts with the `sn_auth` namespace identifier.

RequestAuthAPI - RequestAuthAPI(Object data, Object credential)

Instantiates a RequestAuthAPI object using a REST request and a credential.

Parameters

Name	Type	Description
data	Object	HttpRequestData object that contains the unsigned REST request. Use the *HttpRequestData* class to build this object. See HttpRequestData API.
credential	Object	Object that represents a record from the Credentials [discovery_credentials] table. Retrieve this object using the *AuthCredential* class. See AuthCredential API.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );

 // Get a credential record
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("8877
2d0d40990010f8772fdd9ebc8075");

// Instantiate a RequestAuthAPI object
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
```

RequestAuthAPI - generateAuth()

Signs the HttpRequestData object and returns an HttpRequestAuthedData object to use to send in the REST request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
HttpRequestAuthedData	Object. Data to use to obtain information about the signed result. Use the methods in the *HttpRequestAuthedData* class to interact with the signed result. See HttpRequestAuthedData API.

This example creates a request and gets a credential record to pass to the *RequestAuthAPI* API. The *generateAuth()* method then signs the request.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );

// Get a credential record
gs.info( "date:" + httpRequestData.getDate() );
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var output = signingAPI.generateAuth();
```

RequestAuthAPI - getAuthCredential()

Returns the credential record used to sign the request.

Parameters

Name	Type	Description
None		

Returns

Type	Description
AuthCredential	Object. Data to use to obtain information about the credential record used to sign the request. Use the methods in the *AuthCredential* class to interact with the credential. See AuthCredential API.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );

// Get a credential record
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61
c16f73533300f662cff8faf6a74b");

// Return the AuthCredential object
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var signingCredential = signingAPI.getAuthCredential();
```

RequestAuthAPI - getHttpRequestData()

Returns the HttpRequestData object that was used to instantiate the *RequestAuthAPI* class.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
HttpRequestData	Object. Contains the unsigned REST request. Use the methods in the *HttpRequestData* class to interact with the request. See HttpRequestData API.

```
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test
 message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );

 // Get a credential record
var credential = new
 sn_cc.StandardCredentialsProvider().getAuthCredentialByID("8877
2d0d40990010f8772fdd9ebc8075");

// Return the HttpRequestData object
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData,
 credential);
var unsignedRequest = signingAPI.getHttpRequestData();

gs.info("Endpoint is: " + unsignedRequest.getEndpoint());
```

Output:

```
Endpoint is: https://third-party-endpoint
```

RequestAuthAPI - resetAuthCredential()

Generates a temporary, limited privilege token that you can use to provide trusted users with temporary security credentials to control third-party resources.

To use this method, the third-party service must include an API or SDK that processes and manages limited access tokens.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Creates a temporary token
function(authAPI) {
    var requestData = authAPI.getHttpRequestData();
    var credential= authAPI.getAuthCredential();
    credential.setAttribute('Action', 'aws_sessionToken');
    authAPI.resetAuthCredential();

    //Returns status information
    var status =
 credential.getAttribute('credential_reset_status');
}
```

ResponseTemplate - Scoped, Global

The *ResponseTemplate* script include provides methods for managing response templates.

Response templates are reusable messages that agents can copy to case or task forms. They provide quick and consistent messages to users and display standard chat response messages to requesters in Agent Chat. This script include requires the Templated Responses plugin (com.sn_templated_snip), which is activated by default, and runs within the `sn_templated_snip` namespace.

For additional information on response templates, see Response templates.

ResponseTemplate - ResponseTemplate()

Instantiates a new ResponseTemplate object.

Parameters

Name	Type	Description
None		

```
new
 sn_templated_snip.ResponseTemplate().query("incident","ef4225a4
0a0a0b5700d0b8a790747812", "", 0, 0, true, "");
```

ResponseTemplate - query(String tableName, String recordId, String searchTerm, Number limit, Number offset, Boolean includeEvaluatedBody, String errorFormat, Object opts)

Returns all response templates from a specified table that match the passed in query criteria.

Parameters

Name	Type	Description
tableName	String	Name of the table to use to search the sn_templated_snip_note_template table to locate corresponding response templates. For example, incident or sn_hr_core_case.
recordId	String	Sys ID of the record to use to render the variables in the response template.
searchTerm	String	Optional. Text to use to filter the list of matching response templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		The method performs a CONTAINS search of this text on the name and body fields and a STARTS WITH search on the short name field. For example, if the search term is "crash", the method returns any response template that matches the query criteria and has crash in the name or body or the short name starts with crash. Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name. Default: Return all matching response templates.
limit	Number	Optional. Maximum number of response templates to return. Default: 50
offset	Number	Optional. For pagination, the index at which to start the search. Default: 0

includeEvaluatedBody	Boolean	Optional. Flag that indicates whether to render the template variables.
		
		Valid values:
		
		• false: Do not render the template variables. The response contains the message variables.
		
		For example:
		
		`Please note that your case ${number} has been escalated to ${assignment_group}.`
		
		• true: Renders the template variables and returns *evaluated_response* in the return results.
		
		For example:
		
		`Please note that your case INC100001 has been escalated to Facilities.`
		
		Default: false

errorFormat	String	Optional. HTML formatting to use for errors. For example: `"<span style='color:#ffff00'>${%s}</span>"`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
		Default: `"<span style='color:#ff0000'>${%s}</span>"`
opts	Object	Optional. Parameters to pass to the sn_templated_snip.response_template extension point. The format and content of these parameters are dependent on the implementation of the extension point. For additional information on extension points, see Using extension points to extend application functionality.

Returns

Type	Description

Object	Array of all templates that match the specified search criteria. Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name.
	
	Each node in the Array may contain the following parameters:
	
	• *sys_id*: String. Unique identifier of the response template.
	• *name*: String. Name of the response template.
	• *short_name*: String. Short name of the response template.
	• *body*: HTML. Body of the response template.
	• *short_name_match*: Boolean. Flag that indicates whether an exact match occurred on the short name of the response template.
	• *evaluated_response*: Array. Results of the template evaluation.
	  ◦ *success*: Boolean. Flag that indicates whether all variables rendered properly.
	  ◦ *evaluated_body*: HTML. Rendered response template body.
	  ◦ *error*: Array. Entry for each evaluation error that occurred.
	  ▪ *inAccessibleVariables*: String. Variables in the response template body that could not be resolved.
	  ▪ *unEvaluatedVariables*: String. Variablesin the response template body that were not evaluated.
	  ▪ *message*: String. Error message.

This example shows how to query for response templates associated with the incident table.

```
query("incident","ef4225a40a0a0b5700d0b8a790747812", "", 0, 0,
 false, "");
```

Successful response:

```
[
  {
    "sys_id": "5fc1d65993003300a9bc1d1e867ffb9c",
    "name": "Incident escalation",
    "short_name": "escalation",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "template_body": "<p>Dear
 ${caller_id.first_name},</p>\r\n<p>Please note that your
 incident ${number} has been escalated to ${assignment_group}.
 An agent will be assigned on your case and will keep you
 updated. If you have more questions please reach out to our
 team.</p>\r\n<p>Regards,</p>\r\n<p>${sys_updated_by}</p>"
  }
]
```

Same query with an error response.

```
query("incident","fe4225a40a0a0b5700d0b8a790747812", "", 0, 0,
 false, "");
```

Error response:

```
[
  {
    "sys_id": "5fc1d65993003300a9bc1d1e867ffb9c",
    "name": "Incident escalation",
    "short_name": "escalation",
    "template_body": "<p>Dear
 ${caller.first_name},</p>\r\n<p>Please note that your
 incident ${number} has been escalated to ${assignment_group}.
 An agent will be assigned on your case and will keep you
 updated. If you have more questions please reach out to our
 team.</p>\r\n<p>Regards,</p>\r\n<p>${sys_updated_by}</p>",
    "evaluated_response": {
      "success": false,
      "error": {
        "unEvaluatedVariables": "caller.first_name",
        "message": "Cannot evaluate following variables:
 caller.first_name"
      },
      "evaluated_body": "<p>Dear <span
 style='color:#ff0000'>${caller.first_name}</span>,</p>\r
\n<p>Please note that your incident INC0000049 has been
 escalated to Hardware. An agent will be assigned on your case
 and will keep you updated. If you have more questions please
 reach out to our team.</p>\r\n<p>Regards,</p>\r\n<p>admin</p>"
    }
  }
]
```

ResponseTemplate - render(String templateId, String tableName, String recordId, String errorFormat, Object opts)

Renders the HTML body of a specified response template.

During rendering, all variables are resolved using the information from the specified table and record. If variables cannot be resolved, or any other problem occurs during rendering, the method returns an error message in the results.

Parameters

Name	Type	Description
templateId	String	Sys ID of the response template to render.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters (continued)

Name	Type	Description
tableName	String	Name of the table to use when rendering the variables on the response template.
recordId	String	Sys ID of the record to use when rendering the variables on the response template. This record must be in the table specified by *tableName*.
errorFormat	String	Optional. HTML formatting to use for errors. For example: `"<span style='color:#ffff00'>${%s}</span>"` Default: `"<span style='color:#ff0000'>${%s}</span>"`
opts	Object	Optional. Parameters to pass to the sn_templated_snip.response_template extension point. The format and content of these parameters are dependent on the implementation of the extension point. For additional information on extension points, see Using extension points to extend application functionality.

Returns

Type	Description
Object	Results of the render. • *success*: Flag that indicates whether the render was successful. • *evaluated_body*: String. For success, rendered response template body. For error, response template body which includes both rendered and non-renderable variables. • *error*: Object. Error message if render was unsuccessful. ◦ *unEvaluatedVariables*: Variables that could not be rendered. ◦ *message*: Error message.

This code example shows how to request a rendered response template for the incident table.

```
render("5fc1d65993003300a9bc1d1e867ffb9c","incident","ef4225a40a
0a0b5700d0b8a790747812", "")
```

Successful response:

```
{
  "success": true,
  "evaluated_body": "<p>Dear Beth,</p>\r\n<p>Please note that
 your incident INC0000049 has been escalated to Hardware.
 An agent will be assigned on your case and will keep you
 updated. If you have more questions please reach out to our
 team.</p>\r\n<p>Regards,</p>\r\n<p>admin</p>"
}
```

Same render request but returning an error response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
render("5fc1d65993003300a9bc1d1e867ffb9c","incident","ef4225a40a
0a0b5700d0b8a790747812", "")
```

Error response:

```
{
  "success": false,
  "error": {
    "unEvaluatedVariables": "caller.first_name",
    "message": "Cannot evaluate following variables:
 caller.first_name"
  },
  "evaluated_body": "<p>Dear <span
 style='color:#ff0000'>${caller.first_name}</span>,</p>\r
\n<p>Please note that your incident INC0000049 has been
 escalated to Hardware. An agent will be assigned on your case
 and will keep you updated. If you have more questions please
 reach out to our team.</p>\r\n<p>Regards,</p>\r\n<p>admin</p>"
}
```

RESTAPIRequest - Scoped, Global

The *RESTAPIRequest* API provides methods that allow you to access scripted REST API request details in scripts.

This API runs in the `sn_ws` namespace.

Note: You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

RESTAPIRequest - body

The body of the request.

Field

Name	Type	Description
body	RESTAPIRequestBody	The body of the request. You can access data from the body object using the RESTAPIRequestBody API.

```
var requestBody = request.body // Returns instance of
 RESTAPIRequestBody
```

RESTAPIRequest - getHeader(String header)

Returns the value of a specific header from the web service request.

Parameters

Name	Type	Description
header	String	The name of the header, such as *accept* or *content-type*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
String	The value of the specified header.

```
var acceptHeader = request.getHeader('accept');
```

RESTAPIRequest - getSupportedResponseContentTypes()

Get the content types specified in the request Accept header.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Array	An array of string values where each string is a content type, such as application/json.

RESTAPIRequest - headers

All headers from the request.

Field

Name	Type	Description
headers	object	All headers from the request, and their values.

```
var headers = request.headers;
var acceptHeader = headers.Accept;
var myCustomHeader = headers.myCustom;
var specialHeader = headers['special - header'];
```

RESTAPIRequest - pathParams

The path parameters passed in the request URI.

Field

Name	Type	Description
pathParams	Object	The path parameters as a script object. Available path parameters depend on the web service configuration.

In this example, the scripted REST API endpoint follows this format: `https://instance.service-now.com/api/now/myservice/{tableName}/{id}`. The request being processed uses this URL: `https://instance.service-now.com/api/now/myservice/myApp_table/1234`.

```
var pathParams = request.pathParams;
var tableName = pathParams.tableName; //'myApp_table'
var id = pathParams.id; //'1234'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RESTAPIRequest - queryParams

The query parameters from the web service request.

Field

Name	Type	Description
queryParams	Array	The query parameters from the web service request.

In this example, the request being processed uses this URL: `https://<instance_rest_endpoint>?active=false&name=now`. Note the *active* and *name* parameters.

```
var queryParams = request.queryParams;
var isActiveQuery = queryParams.active; // [false]
var nameQueryVal = queryParams.name; // ['now']
```

RESTAPIRequest - queryString

The entire query added to the endpoint URI.

Field

Name	Type	Description
queryString	String	The entire query for the request.

In this example, the request being processed uses this URL: `https://<instance_rest_endpoint>?active=false&name=now`. Note the query `active=false&name=now`.

```
var query = request.queryString; //"active=false&name=now"
```

RESTAPIRequest - uri

The request URI, excluding domain information.

Field

Name	Type	Description
uri	String	The request URI, excluding domain information.

In this example, the request being processed uses this URL: `https://instance.service-now.com/api/now/table/myTable?active=false&name=now`.

```
var query = request.uri; //"api/now/table/myTable"
```

RESTAPIRequest - url

The entire request URL.

Field

Name	Type	Description
url	String	The entire request URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, the request being processed uses this URL: `https://instance.service-now.com/api/now/table/myTable?active=false&name=now`.

```
var query =
 request.url; //
"https://instance.service-now.com/api/now/table/myTable?active=false&name=now"
```

RESTAPIRequestBody - Scoped, Global

The *RESTAPIRequestBody* API provides methods that allow you to access the body content of a scripted REST API request in scripts.

The format of a RESTAPIRequestBody object may be JSON or XML, depending on the content-type header value from the request.

Note: You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

This API runs in the `sn_ws` namespace.

Single entry example-request-body in JSON format.

```
{
 "name": "user1",
 "id": 1234,
 "roles": [
  {
   "name": "admin"
  },
  {
   "name": "itil"
  }
 ]
}
```

Multiple entry example-request-body in JSON format.

```
[{
 "name": "user1",
 "id": 1234,
 "roles": [
  {
   "name": "admin"
  },
  {
   "name": "itil"
  }
 ]
},{
 "name": "user2",
 "id":9876,
 "roles": [
  {
   "name":"admin"
  }
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 ]
}]
```

RESTAPIRequestBody - data

The content of the request body.

Note: REST web services consume data, datastream, and dataString via stream. Because streams are only consumed once, only one can be called. For example, if calling both data and dataString, the second call will return empty.

Field

Name	Type	Description
data	Object or Array	The request content. This can be a single object or an array of objects depending on the request.

```
var entry;
var id;
var requestBody = request.body;
var requestData = requestBody.data; //May be an array or a
 single object
if (requestData instanceof Array) {
 entry = requestData[0].name; // 'user1'
 id = requestData[0].id; // '1234'
} else {
 entry = requestData.name; // 'user1'
 id = requestData.id; // '1234'
}
```

RESTAPIRequestBody - dataStream

The content of the request body, as a stream.

Note: REST web services consume data, datastream, and dataString via stream. Because streams are only consumed once, only one can be called. For example, if calling both data and dataString, the second call will return empty.

Field

Name	Type	Description
dataStream	Object	The content of the request body. You can pass the stream to a separate API, such as to create an attachment from the request or forward the request to a different endpoint.

```
var requestBody = request.body;
var requestStream = requestBody.dataStream;
```

RESTAPIRequestBody - dataString

The content of the request body, as a String.

Note: REST web services consume data, datastream, and dataString via stream. Because streams are only consumed once, only one can be called. For example, if calling both data and dataString, the second call will return empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field

Name	Type	Description
dataString	String	The content of the request body.

```
var requestBody = request.body;
var requestString = requestBody.dataString;
```

RESTAPIRequestBody - hasNext()

Determines if there are additional entries in the request body.

Use this method with the `nextEntry()` method to iterate over multiple request body entries.

Parameters

Name	Type	Description
None		

Returns

Type	Description
boolean	Flag indicating whether there are additional entries in the request body. Possible values: • true: Additional entries are available. As `nextEntry()` is called, `hasNext()` continues to be true until the last matching record is loaded. • false: No additional entries.

```
var requestBody = request.body;
requestBody.hasNext(); // returns true if the request contains a
 single entry or multiple entries
requestBody. nextEntry(); // returns next available entry

//calling second time
requestBody.hasNext(); // returns false if the request contains
 a single entry, or true if the request contains multiple
 entries
```

RESTAPIRequestBody - nextEntry()

Retrieve one entry from the request body as a script object.

Use this method with the hasNext() method to iterate over multiple request body entries.

Parameters

Name	Type	Description
None		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
Object	A single entry from the request body.

```
var requestBody = request.body;
var requestEntry = requestBody.nextEntry(); // returns available
 entry if there is only one entry, or the first entry if there
 are multiple.
var name = requestEntry.name; // 'user1'

// Calling second time
requestEntry = requestBody.nextEntry(); // returns undefined
 if there is only one entry, or the second entry if there are
 multiple.
```

This example demonstrates using hasNext() with nextEntry().

```
var requestBody = request.body;
while(requestBody.hasNext()){
var entry = requestBody.nextEntry();
}
```

RESTAPIResponse - Scoped, Global

The *RESTAPIResponse* API provides methods that allow you to build a RESTful response to a scripted REST API request.

This API runs in the `sn_ws` namespace.

Note: You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

RESTAPIResponse - getStreamWriter()

Returns the ResponseStreamWriter for this response, allowing you to write directly to the response stream.

Set the content type and status code using the *setHeaders* and *setStatus* functions prior to calling the *getStreamWriter* function.

Parameters

Name	Type	Description
None		

Returns

Type	Description
RESTAPIResponseStream - Scoped, Global	The ResponseStreamWriter for this response. You can use this object to write directly to the response stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
response.setContentType('application/json');
response.setStatus(200);
var writer = response.getStreamWriter();
```

RESTAPIResponse - setBody(Object body)

Sets the body content to send in the web service response.

Parameters

Name	Type	Description
body	Object	The response body, as a JavaScript object. The body content is automatically serialized to JSON or XML depending on the value of the *Accept* header passed in the request.

Returns

Type	Description
void	

```
var body = {};
body.name = "incident";
body.number = "1234";
body.caller = {"id": "user1"};
response.setBody(body);
```

```
var bodyArray = [];
var body = {};
body.name = "incident";
body.number = "1234";
body.caller = {"id":"user1"};
bodyArray.push(body);
response.setBody(bodyArray);
```

RESTAPIResponse - setContentType(String contentType)

Assigns a value to the Content-Type header in the web service response.

You must set a response content type before writing the response. The content type is set automatically for string responses, based on the request Accept header value.

Setting an invalid content type causes the response to default to JSON. Failing to set a content type results in a status code 500 error when sending a binary response.

See the W3 Content-Type header documentation for more information about this header.

Parameters

Name	Type	Description
contentType	String	The content type of the response body, such as application/json.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
response.setContentType('application/json');
```

RESTAPIResponse - setError(Object error)

Configures the REST response to return an error.

Parameters

Name	Type	Description
error	Object	Error object. For more information about the types of error objects that can be used, see Scripted REST API example - script samples.

Returns

Type	Description
void	

The following example shows how to return an error from within a scripted REST resource.

```
var queryParams = request.queryParams;
var userId = String(queryParams.user_id || '');
var fileId = String(queryParams.file_id || '');
if (!userId || !fileId){
  response.setError(new sn_ws_err.BadRequestError('Missing
 required parameters.'));
  return;
}
```

RESTAPIResponse - setHeader(String header, String value)

Assign a value to a REST service response header.

Parameters

Name	Type	Description
header	String	The header you want to set.
value	String	The value to assign the specified header.

Returns

Type	Description
void	

```
response.setHeader("Location","<URI>");
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RESTAPIResponse - setHeaders(Object headers)

Sets the headers for the web service response.

Parameters

Name	Type	Description
headers	Object	A JavaScript object listing each header and the value to assign that header.

Returns

Type	Description
void	

```
var headers = {};
headers.X-Total-Count=100;
headers.Location='https://
instance.service-now.com/<endpoint_to_resource>';
response.setHeaders(headers);
```

RESTAPIResponse - setLocation(String location)

Assigns a value to the Location header in the web service response.

See the W3 Location header documentation for more information about this header.

Parameters

Name	Type	Description
None	String	An absolute URI to redirect the response recipient to.

Returns

Type	Description
void	

RESTAPIResponse - setStatus(Number status)

Sets the status code number for the web service response.

Parameters

Name	Type	Description
status	Number	The status code to send in the response, such as 200 to indicate success. Passing a non-numerical value, such as a string, causes the status code to default to 0.

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
response.setStatus(200);
```

RESTAPIResponseStream - Scoped, Global

The *RESTAPIResponseStream* API provides methods that allow you to write directly to the scripted REST API response stream.

Use *RESTAPIResponseStream* methods to build web service APIs in the Scripted REST API feature.

This API runs in the `sn_ws` namespace.

Note: You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

RESTAPIResponseStream - writeStream(Object stream)

Write an input stream to the response stream.

You must set the content type and status code before calling the *writeStream()* method or the response will fail. You cannot modify these values after calling the *writeStream()* method.

Note:

It is the responsibility of the script author to obtain the stream from a third-party service.

Parameters

Name	Type	Description
stream	Object	An attachment or a response stream from a third-party service.

Returns

Type	Description
void	

The following example is for scoped applications:

```
(function process(/*RESTAPIRequest*/
 request, /*RESTAPIResponse*/ response) {

    response.setContentType('application/json');
    response.setStatus(200);

    var gsa = new GlideSysAttachment();
    var attachmentStream = new gsa.getContentStream(<sys_id of
 attachment>);
    var writer = response.getStreamWriter();
    writer.writeStream(attachmentStream);

})(request, response);
```

The following example is for global applications:

```
(function process(/*RESTAPIRequest*/
 request, /*RESTAPIResponse*/ response) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    response.setContentType('application/json');
    response.setStatus(200);

    var attachmentStream = new
 GlideSysAttachmentInputStream(<sys_id of attachment>);
    var writer = response.getStreamWriter();
    writer.writeStream(attachmentStream);

})(request, response);
```

RESTAPIResponseStream - writeString(String data)

Write string data to the response stream.

You must set the content type and status code before calling the *writeString()* method or the response will fail. You cannot modify these values after calling the *writeString()* method.

Parameters

Name	Type	Description
data	String	The string to add to the response data.

Returns

Type	Description
void	

```
response.setContentType('application/json');
response.setStatus(200);
var writer = response.getStreamWriter();
var body ={
  name:user1,
  id: 1234,
  roles: [
    {
      name: admin
    },
    {
      name: itil
    }
  ]
}
writer.writeString("{'name':'user','id':'1234'}");
writer.writeString(JSON.stringify(body));
```

RESTMessageV2 - Scoped, Global

The *RESTMessageV2* API provides methods that allow you to send outbound REST messages using JavaScript.

Use this API to manage the response returned by the REST provider.

The User-Agent value is "ServiceNow/1.0". To change this, add the glide.http.user.agent system property in the System Properties [sys_properties] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This API runs in the `sn_ws` namespace.

RESTMessageV2 - RESTMessageV2()

Instantiates an empty RESTMessageV2 object.

When using an object instantiated this way, you must manually specify an HTTP method and endpoint.

Parameters

Name	Type	Description
None		

```
var sm = new sn_ws.RESTMessageV2();
```

RESTMessageV2 - RESTMessageV2(String name, String methodName)

Instantiates a RESTMessageV2 object using information from a REST message record.

You must have a REST message record defined before you can use this constructor.

Parameters

Name	Type	Description
name	String	The name of the REST message record.
methodName	String	The name of the HTTP method to use, such as GET/get or PUT/put - case insensitive.

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
```

RESTMessageV2 - disableForcedVariableSubstitution()

Disables forced variable substitution in outbound REST messages.

Note: Use of curly brackets or dollar signs in your request may inadvertently return a truncated output. If your request erroneously truncates the response or splits the response onto new lines, refer to this Community article for a potential solution.

Parameters

Name	Type	Description
None		

Returns

Type	Description
void	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get");
sm.disableForcedVariableSubstitution();
var response = sm.execute();
```

RESTMessageV2 - execute()

Sends the REST message to the endpoint.

Parameters

Name	Type	Description
None		

Returns

Type	Description
RESTResponse	The response returned by the REST provider.

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var response = sm.execute(); //Might throw exception if http
 connection timed out or some issue with sending request itself
 because of encryption/decryption of password.
```

RESTMessageV2 - executeAsync()

Sends the REST message to the endpoint asynchronously. The instance does not wait for a response from the web service provider when making asynchronous calls.

Parameters

Name	Type	Description
None		

Returns

Type	Description
RESTResponse	The response returned by the REST provider.

In the following example, replace *REST_message_record* with the name of the REST message record from your instance. When using `executeAsync`, consider processing the response body in a separate business rule to take advantage of the asynchronous call.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var response = sm.executeAsync(); //Might throw exception if
 http connection timed out or some issue with sending request
 itself because of encryption/decryption of password.
```

RESTMessageV2 - getEndpoint()

Gets the URL of the endpoint for the REST message.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	The URL of the REST web service provider.

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var endpoint = sm.getEndpoint();
```

RESTMessageV2 - getRequestBody()

Gets the content of the REST message body.

Parameters

Name	Type	Description
None		

Returns

Type	Description
String	the REST message body.

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var body = sm.getRequestBody();
```

RESTMessageV2 - getRequestHeader(String headerName)

Gets the value for an HTTP header specified in the REST message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, this method cannot return the value for a header set automatically by the system. To grant this method access to all headers, set the property glide.http.log_debug to true.

Parameters

Name	Type	Description
headerName	String	Request header you want to get the value for.

Returns

Type	Description
String	The value of the specified header.

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var header = sm.getRequestHeader("Accept");
```

RESTMessageV2 - getRequestHeaders()

Gets HTTP headers that were set by the REST client and the associated values.

This method does not return headers set automatically by the system. To configure this method to return all headers, set the property glide.http.log_debug to true.

Parameters

Name	Type	Description
None		

Returns

Type	Description
Object	An Object that maps the name of each header to the associated value.

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
var headers = sm.getRequestHeaders();
```

RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName)

Configures the REST message to save the returned response body as an attachment record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you use this function with a REST message that is sent through a MID server, the MID server user must have any roles required to read and write attachment records, as well as any roles required to read and write records on the table specified in the *tableName* parameter.

The response body does not need to be a binary file to be saved as an attachment. Response bodies using text formats, such as JSON or XML can also be saved. If the instance fails to save the attachment, call *getErrorMessage()* on the related RESTResponseV2 object for error details.

Parameters

Name	Type	Description
tableName	String	Specify the table that contains the record you want to attach the saved file to.
recordSysId	String	Specify the sys_id of the record you want to attach the saved file to.
fileName	String	Specify the file name to give to the saved file.

Returns

Type	Description
void	

```
(function sampleRESTMessageV2() {
  try{
    var request  = new sn_ws.RESTMessageV2();
    request.setHttpMethod('get');

    var attachment_sys_id  = '<attachment_record_sys_id>',
      tablename = 'incident',
      recordSysId = '<incident_sys_id>',
      response,
      httpResponseStatus,
      filename ='<filename>';

    //endpoint - ServiceNow REST Attachment API

 request.setEndpoint('https://
<instance_name>.service-now.com/api/now/attachment/' +
 attachment_sys_id  +'/file');
    request.setBasicAuth('<username>', '<password>');

    //RESTMessageV2 - saveResponseBodyAsAttachment(String
 tableName, String recordSysId, String fileName)
    request.saveResponseBodyAsAttachment(tablename, recordSysId,
 filename);

    response = request.execute();
    httpResponseStatus = response.getStatusCode();

    gs.info(" http response status_code:  " +
 httpResponseStatus);
  }
  catch(ex){
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    var message  = ex.getMessage();
    gs.info(message);
  }
})();
```

RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName, String encryptContext)

Configures the REST message to save the returned response body as an encrypted attachment record.

When you use this function with a REST message that is sent through a MID server, the MID server user must have any roles required to read and write attachment records, as well as any roles required to read and write records on the table specified in the *`tableName`* parameter.

The response body does not need to be a binary file to be saved as an attachment. Response bodies using text formats, such as JSON or XML can also be saved. If the instance fails to save the attachment, call *`getErrorMessage()`* on the related RESTResponseV2 object for error details.

Parameters

Name	Type	Description
tableName	String	Specify the table that contains the record you want to attach the saved file to.
recordSysId	String	Specify the sys_id of the record you want to attach the saved file to.
fileName	String	Specify the file name to give to the saved file.
encryptContext	String	Specify the sys_id of an encryption context. The saved file is encrypted using this context.

Returns

Type	Description
void	

RESTMessageV2 - setAuthenticationProfile(String type, String profileId)

Sets the credentials for the REST message using an existing basic auth or OAuth 2.0 profile.

Parameters

Name	Type	Description
type	String	The type of authentication profile to use. Valid values are 'basic' to use basic authentication, or 'oauth2' to use OAuth 2.0.
profileId	String	The sys_id of an authentication profile record. When using basic auth, specify the sys_id of a Basic Auth Configuration [sys_auth_profile_basic] record. When using OAuth 2.0, specify the sys_id of a OAuth Entity Profile [oauth_entity_profile] record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var requestBody;
var responseBody;
var status;
var sm;
try{
      // Might throw exception if message doesn't exist or not
 visible due to scope.
 sm = new sn_ws.RESTMessageV2("<REST_message_record>", "get");

      //set auth profile to an OAuth 2.0 profile record.
 sm.setAuthenticationProfile('oauth2',
 '1234adsf123212131123qasdsf');

 sm.setStringParameter("symbol", "NOW");
 sm.setStringParameterNoEscape("xml_data","<data>test</data>");

      //In milliseconds. Wait at most 10 seconds for response
 from http request.
 sm.setHttpTimeout(10000);
      //Might throw exception if http connection timed out or
 some issue
      //with sending request itself because of
 encryption/decryption of password.
 response = sm.execute();
      responseBody = response.haveError() ?
 response.getErrorMessage() : response.getBody();
 status = response.getStatusCode();
} catch(ex) {
 responseBody = ex.getMessage();
 status = '500';
} finally {
 requestBody = sm ? sm.getRequestBody():null;
}
```

RESTMessageV2 - setBasicAuth(String userName, String userPass)

Sets basic authentication headers for the REST message.

Setting security values using this method overrides basic authentication values defined for the REST message record.

Parameters

Name	Type	Description
userName	String	Username you want to use to authenticate the REST message.
userPass	String	Password for the specified user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setBasicAuth("username","password");
```

RESTMessageV2 - setEccCorrelator(String correlator)

Associates outbound requests and the resulting response record in the ECC queue. This method only applies to REST messages sent through a MID Server.

The correlator provided populates the **Agent correlator** field on the ECC queue record for the response. Provide a unique correlator for each outbound request to associate the correct results in the ECC queue with the request when designing asynchronous automation through a MID Server.

Parameters

Name	Type	Description
correlator	String	Unique identifier

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setEccCorrelator("unique_identifier");
```

RESTMessageV2 - setEccParameter(String name, String value)

Overrides a value from the database by writing to the REST message payload. This method only applies to REST messages sent through a MID Server.

Use this method when a value from the REST message in the database is invalid, such as when the endpoint URL is longer than the maximum REST endpoint field length. You can set only the endpoint URL using this method by passing source as the name parameter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameters

Name	Type	Description
name	String	The name of the parameter, such as source.
value	String	The value to assign to the specified parameter.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setEccParameter("source","http://very.long.endpoint.url");
```

RESTMessageV2 - setEndpoint(String endpoint)

Sets the endpoint for the REST message.

By default, the REST message uses the endpoint specified in the REST message record. Use this method to override this default. You must call this method when using the RESTMessageV2 - RESTMessageV2() constructor with no parameters.

Parameters

Name	Type	Description
endpoint	String	The URL of the REST provider you want to interface with.

Returns

Type	Description
void	

```
var sm = new sn_ws.RESTMessageV2();
sm.setEndpoint("http://web.service.endpoint");
```

RESTMessageV2 - setHttpMethod(String method)

Sets the HTTP method this REST message performs, such as GET or PUT.

You must set an HTTP method when using the RESTMessageV2 - RESTMessageV2() constructor with no parameters.

Parameters

Name	Type	Description
method	String	HTTP method to perform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var sm = new sn_ws.RESTMessageV2();
sm.setHttpMethod("post");
```

RESTMessageV2 - setHttpTimeout(Number timeoutMs)

Sets the amount of time the REST message waits for a response from the web service provider before the request times out.

Parameters

Name	Type	Description
timeoutMs	Number	Amount of time in milliseconds before the call to the REST provider times out. **Note:** This value sets a timeout on the socket and only times out if the socket does not receive data within the specified time. For environments in which responses are streamed, it's possible that connections last much longer than the timeout value.

Returns

Type	Description
None	

To use the following example, replace *<REST_message_record>* with the name of the REST message record from your instance.

```
// Might throw exception if message doesn't exist or not visible
 due to scope.
var sm = new sn_ws.RESTMessageV2("<REST_message_record>",
 "get");
sm.setHttpTimeout(6000);
```

RESTMessageV2 - setLogLevel(String level)

Sets the log level for this message and the corresponding response.

Setting a log level using the RESTMessageV2 API overrides the log level configured on the REST message record. This log level may not apply if the endpoint domain is excluded, or if the property *glide.outbound_http_log.override* is true. To view outbound web service logs, navigate to **System Logs** > **Outbound HTTP Requests**.

Parameters

Name	Type	Description
level	String	The log level. Valid values are basic, elevated, and all.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returns

Type	Description
void	

```
var rm = new sn_ws.RESTMessageV2();
rm.setLogLevel('all');
```

RESTMessageV2 - setMIDServer(String midServer)

Configures the REST message to communicate through a MID Server.

Parameters

Name	Type	Description
midServer	String	Name of the MID Server to use. Your instance must have an active MID Server with the specified name.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setMIDServer("mid_server_name");
```

RESTMessageV2 - setMutualAuth(String profileName)

Sets the mutual authentication protocol profile for the REST message.

Setting a protocol profile using this method overrides the protocol profile selected for the REST message record.

Parameters

Name	Type	Description
profileName	String	The **Name** of the protocol profile to use for mutual authentication.

Returns

Type	Description
void	

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var sm = new
 sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
sm.setMutualAuth("mutual_auth_profile_name");
```

RESTMessageV2 - setQueryParameter(String name, String value)

Appends a parameter to the end of the request URL with the form name=value.

For example, the code setQueryParameter("sysparm_query","active=true^ORDERBYnumber^ORDERBYDESCcategory"); appends the text sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory to the request URL.

Parameters

Name	Type	Description
name	String	Name of the URL parameter to pass.
value	String	Value to assign the URL parameter.

Returns

Type	Description
void	

```
var sm = new sn_ws.RESTMessageV2();
//Set up message, including endpoint and authentication
sm.setQueryParameter("sysparm_query","active=true^ORDERBYnumber^
ORDERBYDESCcategory");
```

RESTMessageV2 - setRequestBody(String body)

Sets the body content to send to the web service provider when using PUT or POST HTTP methods.

When you set the body content using this method, variables in the body are not substituted for parameters from the REST message function record. You must explicitly define all values within the REST message body.

Parameters

Name	Type	Description
body	String	Request body to send.

Returns

Type	Description
void	

```
var sm = new sn_ws.RESTMessageV2("Update user","post"); //Might
 throw exception if message doesn't exist or not visible due to
 scope.
```

```
var body = "<Message body content>";
sm.setRequestBody(body);
```

RESTMessageV2 - setRequestBodyFromAttachment(String attachmentSysId)

Sets the request body using an existing attachment record.

When you use this function with a REST message that is sent through a MID Server, the MID Server user must have any roles required to read attachment records.

Parameters

Name	Type	Description
attachmentSysId	String	Sys_id of the Attachment [sys_attachment] record you want to send in this REST message.

Returns

Type	Description
void	

```
(function sampleRESTMessageV2() {
    try {
        var request = new sn_ws.RESTMessageV2();
        request.setHttpMethod('post');
        request.setEndpoint('<web service endpoint URL>');
        request.setRequestBodyFromAttachment('<attachment
 sys_id>');
